Var s2 as string = SHA512MBS.Hash("Frank jagt im komplett verwahrlosten Taxi quer durch Bayern")
Var e2 as string = EncodingToHexMBS(s2)

if e2 = "90B30EF9902AE4C4C691D2D78C2F8FA0AA785AFBC5545286B310F68E91DD2299C84A2484F0419FC5EAA7DE5
then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: Returns the digest as binary string.
Before you show it to the user, pass it through EncodingToHexMBS.

80.30.5 HashFile(file as FolderItem, Hex as boolean = true) as string

MBS Encryption Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates hash from whole file.
Notes: Plugin will start a preemptive thread to read in file and process all data in chunks.
Returns hash on success or empty string on failure. May raise OutOfMemoryException or IOException.
This function works best if called from a thread.
If hex is true, the result is encoded as hex string.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

80.30.6 HashText(data as string) as string

MBS Encryption Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convenience function to quickly create a hash for a given string.
Example:

```
Var s1 as string = SHA512MBS.HashText("Franz jagt im komplett verwahrlosten Taxi quer durch Bayern")

if s1 = "AF9ED2DE700433B803240A552B41B5A472A6EF3FE1431A722B2063C75E9F07451F67A28E37D09CDE769424C96A
then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: Returns the digest as text string with hexadecimal digits.

80.30.7 HMAC(key as string, data as string) as string

MBS Encryption Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the a specific HASH based on the key and the data string.

80.30.8 Reset

MBS Encryption Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resets the hash class so you can reuse it for the SHA-256 hash.

80.30.9 Result as string

MBS Encryption Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The final hash.

Notes: Returns the digest as binary string.
Before you show it to the user, pass it through EncodingToHexMBS.

80.30.10 ResultText as string

MBS Encryption Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The final hash.
Notes: Returns the digest as text string with hexadecimal digits.

80.31 class SignCertificateParametersMBS

80.31.1 class SignCertificateParametersMBS

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for the parameters for certificate signing.
Notes: Useful defauls:

If you are making a CA certificate:

Property	Value
basicConstraints	critical,CA:TRUE
keyUsage	critical,keyCertSign,cRLSign
subjectKeyIdentifier	hash
authorityKeyIdentifier	keyid:always,issuer

If you are making a server certificate:

Property	Value
basicConstraints	critical,CA:FALSE
keyUsage	critical,digitalSignature,keyEncipherment
extendedKeyUsage	critical,serverAuth
subjectAltName	DNS:www.example.com,DNS:example.org

If you are making a client certificate:

Property	Value
basicConstraints	critical,CA:FALSE
keyUsage	critical,digitalSignature,keyEncipherment
extendedKeyUsage	critical,clientAuth

- MBS Xojo Plugins, version 25.5pr1

80.31.2 Properties

80.31.3 AuthorityKeyIdentifier as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The AuthorityKeyIdentifier parameter.
Example:

```
Var param As New SignCertificateParametersMBS

param.subjectKeyIdentifier = "1f2a3c4b5d6e7f89aabbccddeeff001122334455"
param.BasicConstraints = "critical,CA:TRUE"
param.KeyUsage = "critical,keyCertSign,cRLSign"
param.authorityKeyIdentifier = "keyid:always,issuer"
param.expireAfterTime = 31536000 * 2 // 2 years
```

Notes: You need property key usage and subjectKeyIdentifier values to have this one work.
(Read and Write property)

80.31.4 BasicConstraints as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The basic constrains.
Notes: Default is "CA:FALSE".

e.g. "critical,CA:FALSE", "CA:FALSE", "critical,CA:TRUE"
(Read and Write property)

80.31.5 CSR as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The certificate signing request.
Notes: (Read and Write property)

80.31.6 expireAfterTime as Integer

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The expiration after time.

Notes: default is 31536000 for one year.

Expiration time in seconds.
(Read and Write property)

80.31.7 ExtendedKeyUsage as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The extended key usage.
Notes: e.g. "critical,serverAuth,clientAuth"
(Read and Write property)

80.31.8 KeyUsage as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The key usage.
Notes: The default is "digitalSignature,keyEncipherment".
(Read and Write property)

80.31.9 NameConstraints as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a name constrain.
Notes: (Read and Write property)

80.31.10 RootCert as X509MBS

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The root certificate.
Notes: (Read and Write property)

80.31.11 RootKey as PKeyMBS

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The root key.
Notes: (Read and Write property)

80.31.12 serialNumber as Integer

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The serial number for the new certificate.
Notes: (Read and Write property)

80.31.13 SerialNumberHex as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The serial number provided as a hex string.
Example:

```
Var params As New SignCertificateParametersMBS
params.SerialNumberHex = "AB12CD340123456789AB12CD340123456789"
```

Notes: Maximum 20 bytes, so as hex string 40 characters.
(Read and Write property)

80.31.14 SubjectAltName as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The Subject Alternative Name.
Notes: Lists DNS names or IPs.

SubjectAltName provides the X509v3 Subject Alternative Name and could e.g. be "DNS:example.com,DNS:www.example.com,IP:127.0.0.1"
(Read and Write property)

80.31.15 SubjectKeyIdentifier as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The subject key identifier.
Notes: Default value is "hash".

(Read and Write property)

80.32 module TwofishMBS

80.32.1 module TwofishMBS

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The module for Twofish encryption.
Example:

```
// encrypt and decrypt a text with Twofish in CBC mode
Var key As String = Crypto.SHA2_256("my secret password") // 32 byte key
Var iv As String = Crypto.GenerateRandomBytes(16)
Var plain As String = "Hello World. This is a secret message."

Var encrypted As String = TwofishMBS.EncryptCBC(key, plain, iv)
Var decrypted As String = TwofishMBS.DecryptCBC(key, encrypted, iv)
MessageBox EncodeHex(encrypted) + EndOfLine + decrypted.DefineEncoding(Encodings.UTF8)
```

Notes: You can use this class for compatibility to PHP.

80.32.2 Methods

80.32.3 DecryptCBC(Key as MemoryBlock, InputData as MemoryBlock, IV as MemoryBlock) as MemoryBlock

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decrypts with CBC mode and memoryblocks.
Example:

```
// key is 16 bytes, so 128 bit
Var key as MemoryBlock = "Hello World 1234"
Var IV as MemoryBlock = "1234567812345678" // 16 byte IV
```

```
// some UTF-8 input
Var InputText as string = "Just a test. √§√√º"
Var InputData as MemoryBlock = ConvertEncoding(InputText, encodings.UTF8)

Var EncryptedData as MemoryBlock = TwofishMBS.EncryptCBC(key, InputData, IV)
Var DecryptedData as MemoryBlock = TwofishMBS.DecryptCBC(key, encryptedData, IV)

// restore encoding
Var Decryptedtext as String = DefineEncoding(DecryptedData, encodings.UTF8)

// remove training zeros
Var p as Integer = instrb(Decryptedtext, chrb(0))
if p >0 then
Decryptedtext = leftb(Decryptedtext, p-1)
end if

// check
if Decryptedtext = InputText then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: IV can be nil for using zeros.
IV size should be 16 bytes.
Key length should be 16 for 128bit, 24 for 192 bit or 32 for 256 bit.
InputData should be aligned to 16byte size. Else the plugin will fill up with zero bytes.
See also:

- 80.32.4 DecryptCBC(Key as String, InputData as String, IV as String) as String 13915

80.32.4 DecryptCBC(Key as String, InputData as String, IV as String) as String

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decrypts with CBC mode and strings.
Example:

```
// key is 16 bytes, so 128 bit
Var key as String = "Hello World 1234"
Var IV as String = "1234567812345678" // 16 byte IV

// some UTF-8 input
Var InputText as string = "Just a test. √§√√º"
Var InputData as String = ConvertEncoding(InputText, encodings.UTF8)
```

```
Var EncryptedData as String = TwofishMBS.EncryptCBC(key, InputData, IV)
Var DecryptedData as String = TwofishMBS.DecryptCBC(key, encryptedData, IV)

// restore encoding
Var Decryptedtext as String = DefineEncoding(DecryptedData, encodings.UTF8)

// remove training zeros
Var p as Integer = instrb(Decryptedtext, chrb(0))
if p >0 then
Decryptedtext = leftb(Decryptedtext, p-1)
end if

// check
if Decryptedtext = InputText then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: IV can be empty for using zeros.
IV size should be 16 bytes.
Key length should be 16 for 128bit, 24 for 192 bit or 32 for 256 bit.
InputData should be aligned to 16byte size. Else the plugin will fill up with zero bytes.
See also:

- 80.32.3 DecryptCBC(Key as MemoryBlock, InputData as MemoryBlock, IV as MemoryBlock) as MemoryBlock 13914

80.32.5 DecryptECB(Key as MemoryBlock, InputData as MemoryBlock) as MemoryBlock

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decrypts with ECB mode and memoryblocks.
Example:

```
// key is 16 bytes, so 128 bit
Var key as MemoryBlock = "Hello World 1234"

// some UTF-8 input
Var InputText as string = "Just a test. √§√√º"
Var InputData as MemoryBlock = ConvertEncoding(InputText, encodings.UTF8)

Var EncryptedData as MemoryBlock = TwofishMBS.EncryptECB(key, InputData)
Var DecryptedData as MemoryBlock = TwofishMBS.DecryptECB(key, encryptedData)
```

```
// restore encoding
Var Decryptedtext as String = DefineEncoding(DecryptedData, encodings.UTF8)

// remove training zeros
Var p as Integer = instrb(Decryptedtext, chrb(0))
if p >0 then
Decryptedtext = leftb(Decryptedtext, p-1)
end if

// check
if Decryptedtext = InputText then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: Key length should be 16 for 128bit, 24 for 192 bit or 32 for 256 bit.
InputData should be aligned to 16byte size. Else the plugin will fill up with zero bytes.

- 80.32.6 DecryptECB(Key as String, InputData as String) as String 13917

80.32.6 DecryptECB(Key as String, InputData as String) as String

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decrypts with ECB mode and strings.
Example:

```
// key is 16 bytes, so 128 bit
Var key as string = "Hello World 1234"

// some UTF-8 input
Var InputData as string = "Just a test. √§√√º"
InputData = ConvertEncoding(InputData, encodings.UTF8)

Var Encrypted as string = TwofishMBS.EncryptECB(key, InputData)
Var Decrypted as string = TwofishMBS.DecryptECB(key, encrypted)

// restore encoding
Decrypted = DefineEncoding(Decrypted, encodings.UTF8)

// remove training zeros
Var p as Integer = instrb(Decrypted, chrb(0))
if p >0 then
Decrypted = leftb(Decrypted, p-1)
end if
```

```
// check
if Decrypted = InputData then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: Key length should be 16 for 128bit, 24 for 192 bit or 32 for 256 bit.
InputData should be aligned to 16byte size. Else the plugin will fill up with zero bytes.
See also:

- 80.32.5 DecryptECB(Key as MemoryBlock, InputData as MemoryBlock) as MemoryBlock 13916

80.32.7 EncryptCBC(Key as MemoryBlock, InputData as MemoryBlock, IV as MemoryBlock) as MemoryBlock

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Encrypts with CBC mode and memoryblocks.
Example:

```
// key is 16 bytes, so 128 bit
Var key as MemoryBlock = "Hello World 1234"
Var IV as MemoryBlock = "1234567812345678" // 16 byte IV

// some UTF-8 input
Var InputText as string = "Just a test. √§√√º"
Var InputData as MemoryBlock = ConvertEncoding(InputText, encodings.UTF8)

Var EncryptedData as MemoryBlock = TwofishMBS.EncryptCBC(key, InputData, IV)
Var DecryptedData as MemoryBlock = TwofishMBS.DecryptCBC(key, encryptedData, IV)

// restore encoding
Var Decryptedtext as String = DefineEncoding(DecryptedData, encodings.UTF8)

// remove training zeros
Var p as Integer = instrb(Decryptedtext, chrb(0))
if p >0 then
Decryptedtext = leftb(Decryptedtext, p-1)
end if

// check
if Decryptedtext = InputText then
MessageBox "OK"
else
MessageBox "Failed"
```

```
end if
```

Notes: IV can be nil for using zeros.
IV size should be 16 bytes.
Key length should be 16 for 128bit, 24 for 192 bit or 32 for 256 bit.
InputData should be aligned to 16byte size. Else the plugin will fill up with zero bytes.

- 80.32.8 EncryptCBC(Key as String, InputData as String, IV as String) as String 13919

80.32.8 EncryptCBC(Key as String, InputData as String, IV as String) as String

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Encrypts with CBC mode and string.
Example:

```
// key is 16 bytes, so 128 bit
Var key as String = "Hello World 1234"
Var IV as String = "1234567812345678" // 16 byte IV

// some UTF-8 input
Var InputText as string = "Just a test. √§√√º"
Var InputData as String = ConvertEncoding(InputText, encodings.UTF8)

Var EncryptedData as String = TwofishMBS.EncryptCBC(key, InputData, IV)
Var DecryptedData as String = TwofishMBS.DecryptCBC(key, encryptedData, IV)

// restore encoding
Var Decryptedtext as String = DefineEncoding(DecryptedData, encodings.UTF8)

// remove training zeros
Var p as Integer = instrb(Decryptedtext, chrb(0))
if p >0 then
Decryptedtext = leftb(Decryptedtext, p-1)
end if

// check
if Decryptedtext = InputText then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: IV can be empty for using zeros.

IV size should be 16 bytes.
Key length should be 16 for 128bit, 24 for 192 bit or 32 for 256 bit.
InputData should be aligned to 16byte size. Else the plugin will fill up with zero bytes.
See also:

- 80.32.7 EncryptCBC(Key as MemoryBlock, InputData as MemoryBlock, IV as MemoryBlock) as MemoryBlock 13918

80.32.9 EncryptECB(Key as MemoryBlock, InputData as MemoryBlock) as MemoryBlock

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Encrypts with ECB mode and memoryblocks.
Example:

```
// key is 16 bytes, so 128 bit
Var key as MemoryBlock = "Hello World 1234"

// some UTF-8 input
Var InputText as string = "Just a test. √§√√º"
Var InputData as MemoryBlock = ConvertEncoding(InputText, encodings.UTF8)

Var EncryptedData as MemoryBlock = TwofishMBS.EncryptECB(key, InputData)
Var DecryptedData as MemoryBlock = TwofishMBS.DecryptECB(key, encryptedData)

// restore encoding
Var Decryptedtext as String = DefineEncoding(DecryptedData, encodings.UTF8)

// remove training zeros
Var p as Integer = instrb(Decryptedtext, chrb(0))
if p >0 then
Decryptedtext = leftb(Decryptedtext, p-1)
end if

// check
if Decryptedtext = InputText then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: Key length should be 16 for 128bit, 24 for 192 bit or 32 for 256 bit.
InputData should be aligned to 16byte size. Else the plugin will fill up with zero bytes.
See also:

- 80.32.10 EncryptECB(Key as String, InputData as String) as String 13921

80.32.10 EncryptECB(Key as String, InputData as String) as String

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Encrypts with ECB mode and strings.
Example:

```
// key is 16 bytes, so 128 bit
Var key as string = "Hello World 1234"

// some UTF-8 input
Var InputData as string = "Just a test. √§√√º"
InputData = ConvertEncoding(InputData, encodings.UTF8)

Var Encrypted as string = TwofishMBS.EncryptECB(key, InputData)
Var Decrypted as string = TwofishMBS.DecryptECB(key, encrypted)

// restore encoding
Decrypted = DefineEncoding(Decrypted, encodings.UTF8)

// remove training zeros
Var p as Integer = instrb(Decrypted, chrb(0))
if p >0 then
Decrypted = leftb(Decrypted, p-1)
end if

// check
if Decrypted = InputData then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: Key length should be 16 for 128bit, 24 for 192 bit or 32 for 256 bit.
InputData should be aligned to 16byte size. Else the plugin will fill up with zero bytes.
See also:

- 80.32.9 EncryptECB(Key as MemoryBlock, InputData as MemoryBlock) as MemoryBlock 13920

80.33 class UUIDMBS

80.33.1 class UUIDMBS

MBS Util Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to create Universally Unique Identifier.
Example:

Var u as UUIDMBS

u=new UUIDMBS

MessageBox EncodingToHexMBS(u.ValueString)

Notes: This class creates a 128 bit UUID (or UID or GUID) which is random.

On Mac OS X: Uses CoreFoundation system functions from Mac OS X 10.3.
On Linux: Uses unix system functions (libuuid).
On Windows: Uses UUID functions from RPC functions (Rpcrt4.dll).

If you need to validate a GUID or UUID, please check the Validate function.

Xojo Developer Magazine

- 24.1, page 9: News

80.33.2 Methods

80.33.3 randomUUID as UUIDMBS

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a random v4 GUID.
Example:

```
// This example needs a window with ListBox1.
for i as Integer = 1 to 20
ListBox1.AddRow UUIDMBS.randomUUID.ValueFormattedString
next
```

Notes: This is using random numbers.
It is unlikely, but possible to have duplicates.
The UUID function checks for that.

80.33.4 UUID as UUIDMBS

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new UUID with system functions.
Example:

```
Var u as UUIDMBS = UUIDMBS.UUID

MessageBox u.ValueFormattedString
```

Notes: On Mac OS X: Uses CoreFoundation system functions from Mac OS X 10.3.
On Linux: Uses unix system functions (libuuid).
On Windows: Uses UUID functions from RPC functions (Rpcrt4.dll).

80.33.5 UUIDv7 as UUIDMBS

MBS Util Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new UUIDv7.
Example:

```
Var u as UUIDMBS = UUIDMBS.UUIDv7

MessageBox u.ValueFormattedString
```

Notes: UUIDv7 is a version of Universally Unique Identifier that combines a Unix timestamp with random bits, allowing for both uniqueness and sortability in high-load databases and distributed systems. It is designed to improve performance and reduce the likelihood of ID collisions compared to previous UUID versions.

80.33.6 Validate(UUID as string, mode as Integer = 0, requiredVersion as Integer = 0) as string

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validates the given UUID/GUID.
Example:

```
// wrong
Var w1 as string = UUIDMBS.Validate("hello") // wrong due to missing {
Var w2 as string = UUIDMBS.Validate("550e8400-z29b-11d4-a716-446655440000",1) // wrong with, with z
Var w3 as string = UUIDMBS.Validate(" { 550e8400-e29b-11d40716-446655440000 } ") // wrong with missing minus
Var w4 as string = UUIDMBS.Validate(" { 550e8400-e29b-11d4-a716-44665544000 } ") // wrong with being too short
Var w5 as string = UUIDMBS.Validate(" { 550e8400-e29b-11d4-a716-446655440000 } dssdsd",1) // wrong as it has extra chars on end
Var w6 as string = UUIDMBS.Validate("550e8400-e29b-11d4-a716-446655440000",1,4) // wrong as not version 4
Var w7 as string = UUIDMBS.Validate("6a12a4d5-e9e6-4568-ffcc-34c70b24a668",1,4) // wrong as not version 4

// okay
Var o1 as string = UUIDMBS.Validate("550e8400-e29b-11d4-a716-446655440000",1)
Var o2 as string = UUIDMBS.Validate(" { 550e8400-e29b-11d4-a716-446655440000 } ")
Var o3 as string = UUIDMBS.Validate("6a12a4d5-e9e6-4568-afcc-34c70b24a668", 1)
Var o4 as string = UUIDMBS.Validate("6a12a4d5-e9e6-4568-afcc-34c70b24a668", 3)
Var o5 as string = UUIDMBS.Validate(" { 550e8400-e29b-11d4-a716-446655440000 } ", 2)
Var o6 as string = UUIDMBS.Validate(" { 550e8400e29b11d4a716446655440000 } ", 2)
Var o7 as string = UUIDMBS.Validate(" { 550e8400-e29b-11d40716-446655440000 } ",4) // wrong with missing minus, but fixed
Var o8 as string = UUIDMBS.Validate("550e8400-e29b-11d40716-446655440000 } ",4) // wrong with missing { , but fixed
Var o9 as string = UUIDMBS.Validate("6a12a4d5-e9e6-4568-afcc-34c70b24a668", 4, 4) // is version 4
Var o10 as string = UUIDMBS.Validate("6a12a4d5-e9e6-1568-afcc-34c70b24a668", 4, 1) // is version 1
Var o11 as string = UUIDMBS.Validate(" { 550e8400-e29b-11d4-a716-446655440000 } dssdsd",1+4) // wrong as it has extra chars on end, but fixed

break // check in debugger
```

Notes: If the UUID is valid, you get it back.
If the UUID is invalid, you get an empty string back.

Pass 1 in mode to not require braces around UUID. Pass 2 to ignore minus characters. Pass 3 to combine those two.
You can add 4 to have the GUID fixed a bit like adding braces and minus chars if missing.
The requiredVersion parameter can be 1 to 5 to indicate the required GUID version you want to have.

80.33.7 ValueFormattedString(WithBrackets as Boolean = true) as String

MBS Util Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The UUID as a 38 character formatted hex string.
Example:

```
Var u as new UUIDMBS
MessageBox u.ValueFormattedString
```

Notes: example output: { D3ED4292-FC09-11DF-8AC5-7C6D628C4C29 }

Added WithBrackets parameter in version 22.1, so you can turn curly brackets off.

80.33.8 ValueHexString as String

MBS Util Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The UUID as a 32 character long hex string.
Example:

```
Var u as new UUIDMBS
MessageBox u.ValueHexString
```

Notes: example output: DCACAF4EFC0911DF92E37C6D628C4C29

80.33.9 ValueMemory as Memoryblock

MBS Util Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The UUID as a sixteen byte big memoryblock.

80.33.10 ValueString as String

MBS Util Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The UUID as a sixteen byte big binary string.
Example:

```
Var u as new UUIDMBS
MessageBox u.ValueString
```

Notes: This string is not for user display as it contains unreadable characters.

80.33.11 Properties

80.33.12 Lasterror as Integer

MBS Util Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Last error code.
Notes: -1 is for failure, 0 for okay.
Windows or Mac OS error codes else.
(Read and Write property)

80.33.13 Valid as Boolean

MBS Util Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the constructor was able to create an UUID.
Notes: (Read and Write property)

80.34 class X509MBS

80.34.1 class X509MBS

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a X509 certificate.
Example:

```
// read a certificate file in PEM or DER format and show its details
Var file As FolderItem = SpecialFolder.Desktop.Child("certificate.pem")
Var stream As BinaryStream = BinaryStream.Open(file)
Var data As String = stream.Read(stream.Length)
stream.Close

Var cert As X509MBS = X509MBS.Open(data)
If cert = Nil Then
MessageBox "Not a certificate."
Return
End If

MessageBox "Name: " + cert.Name + EndOfLine + _
"Serial: " + cert.SerialNumber + EndOfLine + _
"Valid until: " + cert.ValidNotAfterDateTime.ToString + EndOfLine + _
"Alternative names: " + cert.SubjectAlternativeName
```

Notes: Currently this class only implements a part of the X509 functionality of OpenSSL. If needed, we could add more.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

80.34.2 Methods

80.34.3 CheckCertificates(rootCertificates() as X509MBS, certificate as X509MBS, intermediates() as X509MBS = nil, Flags as Integer = 0) as Boolean

MBS Encryption Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validates certificate agains root certificates and may use intermediates for it.
Notes: Returns true if valid or false if not.

This function attempts to discover and validate a certificate chain based on parameters in context. The verification context, is constructed using given root certificates.

Flags: Optional flags for X509_verify_cert. Please check OpenSSL documentation.
See also:

- 80.34.4 CheckCertificates(rootCertificates() as X509MBS, certificate as X509MBS, intermediates() as X509MBS, Flags as Integer, byref ErrorCode as Integer, byref ErrorMessage as String) as Boolean 13928

80.34.4 CheckCertificates(rootCertificates() as X509MBS, certificate as X509MBS, intermediates() as X509MBS, Flags as Integer, byref ErrorCode as Integer, byref ErrorMessage as String) as Boolean

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validates certificate agains root certificates and may use intermediates for it.
Notes: Returns true if valid or false if not.

This function attempts to discover and validate a certificate chain based on parameters in context. The verification context, is constructed using given root certificates.

Flags: Optional flags for X509_verify_cert. Please check OpenSSL documentation.

ErrorCode and ErrorMessage report back any error from X509_verify_cert function.
See also:

- 80.34.3 CheckCertificates(rootCertificates() as X509MBS, certificate as X509MBS, intermediates() as X509MBS = nil, Flags as Integer = 0) as Boolean 13928

80.34.5 Constructor

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

80.34.6 Copy as X509MBS

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the certificate.

80.34.7 Data as String

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The data of the certificate.
Notes: You can write this to a PEM file.

80.34.8 Open(Data as MemoryBlock) as X509MBS

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a X509 PEM file.
Notes: Line endings must be LF, not CR.

Version 24.3 accepts binary certificate data, too.
See also:

- 80.34.9 Open(Data as String) as X509MBS 13930

80.34.9 Open(Data as String) as X509MBS

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a X509 PEM file.
Notes: Please read file via binarystream and pass here as string.
Line endings must be LF, not CR.

Version 24.3 accepts binary certificate data, too.
See also:

- 80.34.8 Open(Data as MemoryBlock) as X509MBS 13929

80.34.10 ReadFromPkcs12(Data as String, Pass as String, byref PKey as PKeyMBS, byref Cert as X509MBS, byref certs() as X509MBS) as Boolean

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads certificate and private key from a PKCS12 file.
Example:

```
Var f as FolderItem = FindFile("test.p12")
Var b as BinaryStream = BinaryStream.Open(f)
Var s as string = b.Read(b.Length)
Var c as X509MBS
Var p as PKeyMBS
Var others() as X509MBS

if X509MBS.ReadFromPkcs12(s, "HelloWorld", p, c, others) then
MessageBox c.Name
end if
```

Notes: Data is the content of the PKCS12 file.
Returns true on success or false on failure.

80.34.11 ReadFromPkcs7(Data as String, Pass as String, byref certs() as X509MBS) as Boolean

MBS Encryption Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads certificates from PKCS#7 data.
Example:

```
// This example needs a window with TextArea1.
Var contents as string // PKCS#7 file data
```

```
Var certs() As X509MBS
If X509MBS.ReadFromPkcs7(contents, "", certs) Then

Var x As X509MBS = certs(0)
If x <>Nil Then
// show it
TextArea1.Text= x.Description
end if
End If
```

Notes: Returns true on success.
Only for PKCS#7 data containing signatures.

80.34.12 Verify(PublicKey as PKeyMBS) as Integer

MBS Encryption Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Verifies the signature of certificate using given public key.
Notes: Returns 1 if valid, 0 if key is not valid, but -1 if format of key is invalid.
Calls X509_verify internally in OpenSSL.

80.34.13 WriteToPkcs12(friendlyName as String, Pass as String, PKey as PKeyMBS, Cert as X509MBS, certs() as X509MBS) as String

MBS Encryption Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a PKCS#12 file and returns it as string.
Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("signer.p12")
Var bstream As BinaryStream = BinaryStream.Open(file)
Var bdata As String = bstream.Read(bstream.Length)
Var cert As X509MBS
Var pKey As PKeyMBS
Var others() As X509MBS
var password as string = "12345"

If X509MBS.ReadFromPkcs12(bdata, password, pKey, cert, others) Then

var output as string = X509MBS.WriteToPkcs12("Test Certificate", password, pKey, cert, others)
Var newFile As FolderItem = SpecialFolder.Desktop.Child("other.p12")
bstream = BinaryStream.Create(newFile, True)
bstream.Write output
bstream.Close
```

```
Break // check result
End If
```

Notes: Returns empty string if something fails. Raises out of memory exception in case of allocation failing.

80.34.14 Properties

80.34.15 AuthorityKeyIdentifier as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Identifies the public key that signed this certificate, linking it to its issuer (CA).
Notes: (Read only property)

80.34.16 BasicConstraints as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Defines whether this certificate is a CA and, if so, how deep the chain it may issue.
Notes: (Read only property)

80.34.17 CertificatePolicies as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Lists policy identifiers under which the certificate was issued (e.g., compliance OIDs).
Notes: (Read only property)

80.34.18 Description as String

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The textual description of the certificate.
Notes: This is only for human to read.
(Read only property)

80.34.19 ExtendedKeyUsage as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Defines specific application purposes for the key (e.g., TLS server, code signing).
Notes: (Read only property)

80.34.20 ExtendedKeyUsageValue as Integer

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the extended key usage flags.
Notes: returns the value of the extended key usage extension. If extended key usage is present it will return zero or more of the flags: See kExtendedKeyUsage* constants.

If key usage is absent then 4294967295 is returned.
(Read only property)

80.34.21 Handle as Integer

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

80.34.22 IssuerAlternativeName as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Lists alternative names or contact info for the issuer (CA).
Notes: (Read only property)

80.34.23 IssuerName as Dictionary

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The issuer name.
Notes: (Read only property)

80.34.24 KeyUsage as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Specifies the allowed operations for the key (signing, encryption, CRL signing, etc.).
Notes: (Read only property)

80.34.25 KeyUsageValue as Integer

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the key usage flags.
Notes: Returns the value of the key usage extension. If key usage is present will return zero or more of the flags: kKeyUsage* constants.
If key usage is absent then 4294967295 is returned.
(Read only property)

80.34.26 Name as String

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the certificate.
Notes: (Read only property)

80.34.27 NameConstraints as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Restricts what names (DNS, email, etc.) subordinate CAs may issue certificates for.
Notes: (Read only property)

80.34.28 PolicyConstraints as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Limits or requires explicit policy mappings or certain policy OIDs in a chain.
Notes: (Read only property)

80.34.29 PolicyMappings as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Maps certificate policies between different hierarchies (for cross-certification).
Notes: (Read only property)

80.34.30 PublicKey as PKeyMBS

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts public key.
Notes: (Read only property)

80.34.31 SerialNumber as String

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The serial number as text.
Notes: (Read only property)

80.34.32 SubjectAlternativeName as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Lists alternative identities for the subject (DNS names, emails, IPs, URIs, etc.).
Notes: (Read only property)

80.34.33 SubjectKeyIdentifier as String

MBS Encryption Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: A unique fingerprint (usually SHA-1) of the certificate,Äôs public key, used to identify it.
Notes: (Read only property)

80.34.34 SubjectName as Dictionary

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The subject name.
Notes: (Read only property)

80.34.35 ValidNotAfter as Date

MBS Encryption Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The date where the certificate expires.
Example:

```
// read certificate
Var f As FolderItem = SpecialFolder.Desktop.Child("test.pem")
Var b As BinaryStream = BinaryStream.Open(f, False)
Var s As String = b.Read(b.Length)

// parse the certificate
Var x As X509MBS = X509MBS.Open(s)

// check dates
MessageBox x.ValidNotBefore.SQLDateTime + EndOfLine + x.ValidNotAfter.SQLDateTime
```

Notes: In GMT time zone.
(Read only property)

80.34.36 ValidNotAfterDateTime as DateTime

MBS Encryption Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The date where the certificate expires.
Notes: In GMT time zone.
(Read only property)

80.34.37 ValidNotBefore as Date

MBS Encryption Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The date where the certificate was created.
Example:

```
// read certificate
Var f As FolderItem = SpecialFolder.Desktop.Child("test.pem")
Var b As BinaryStream = BinaryStream.Open(f, False)
Var s As String = b.Read(b.Length)

// parse the certificate
Var x As X509MBS = X509MBS.Open(s)

// check dates
MessageBox x.ValidNotBefore.SQLDateTime + EndOfLine + x.ValidNotAfter.SQLDateTime
```

Notes: In GMT time zone.
(Read only property)

80.34.38 ValidNotBeforeDateTime as DateTime

MBS Encryption Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The date where the certificate was created.
Notes: In GMT time zone.
(Read only property)

80.34.39 Version as Integer

MBS Encryption Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version of the file.
Notes: Currently usually 2 for version 3.
(Read only property)

Chapter 81

Endian

81.1 Globals

81.1.1 EndianS16_BtoLMBS(n as Int16) as Int16

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 16 bit signed value from big endian to little endian byte order
Var value As Int16 = -2
Var converted As Int16 = EndianS16_BtoLMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.2 EndianS16_BtoNMBS(n as Int16) as Int16

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 16 bit signed value from big endian to native byte order
Var value As Int16 = -2
Var converted As Int16 = EndianS16_BtoNMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.3 EndianS16_LtoBMBS(n as Int16) as Int16

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 16 bit signed value from little endian to big endian byte order
Var value As Int16 = -2
Var converted As Int16 = EndianS16_LtoBMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.4 EndianS16_LtoNMBS(n as Int16) as Int16

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 16 bit signed value from little endian to native byte order
Var value As Int16 = -2
Var converted As Int16 = EndianS16_LtoNMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.5 EndianS16_NtoBMBS(n as Int16) as Int16

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 16 bit signed value from native to big endian byte order
Var value As Int16 = -2
Var converted As Int16 = EndianS16_NtoBMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.6 EndianS16_NtoLMBS(n as Int16) as Int16

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 16 bit signed value from native to little endian byte order
Var value As Int16 = -2
Var converted As Int16 = EndianS16_NtoLMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.7 EndianS32_BtoLMBS(n as Int32) as Int32

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 32 bit signed value from big endian to little endian byte order
Var value As Int32 = -123456
Var converted As Int32 = EndianS32_BtoLMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.8 EndianS32_BtoNMBS(n as Int32) as Int32

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 32 bit signed value from big endian to native byte order
Var value As Int32 = -123456
Var converted As Int32 = EndianS32_BtoNMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.9 EndianS32_LtoBMBS(n as Int32) as Int32

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 32 bit signed value from little endian to big endian byte order
Var value As Int32 = -123456
Var converted As Int32 = EndianS32_LtoBMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.10 EndianS32_LtoNMBS(n as Int32) as Int32

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 32 bit signed value from little endian to native byte order
Var value As Int32 = -123456
Var converted As Int32 = EndianS32_LtoNMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.11 EndianS32_NtoBMBS(n as Int32) as Int32

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 32 bit signed value from native to big endian byte order
Var value As Int32 = -123456
Var converted As Int32 = EndianS32_NtoBMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.12 EndianS32_NtoLMBS(n as Int32) as Int32

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 32 bit signed value from native to little endian byte order
Var value As Int32 = -123456
Var converted As Int32 = EndianS32_NtoLMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.13 EndianSwap16MBS(n as UInt16) as UInt16

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Swaps a 16 bit integer.
Example:

```
// swap the byte order of a 16 bit value
Var n As UInt16 = &h1234
MessageBox Hex(EndianSwap16MBS(n)) // 3412
```

81.1.14 EndianSwap32MBS(n as UInt32) as UInt32

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Swaps a 32 bit integer.
Example:

```
// swap the byte order of a 32 bit value
Var n As UInt32 = &h12345678
MessageBox Hex(EndianSwap32MBS(n)) // 78563412
```

81.1.15 EndianU16_BtoLMBS(n as UInt16) as UInt16

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 16 bit unsigned value from big endian to little endian byte order
Var value As UInt16 = &h1234
Var converted As UInt16 = EndianU16_BtoLMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.16 EndianU16_BtoNMBS(n as UInt16) as UInt16

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 16 bit unsigned value from big endian to native byte order
Var value As UInt16 = &h1234
Var converted As UInt16 = EndianU16_BtoNMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.17 EndianU16_LtoBMBS(n as UInt16) as UInt16

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 16 bit unsigned value from little endian to big endian byte order
Var value As UInt16 = &h1234
Var converted As UInt16 = EndianU16_LtoBMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.18 EndianU16_LtoNMBS(n as UInt16) as UInt16

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// read a little endian 16 bit value from a file header
Var m As New MemoryBlock(2)
m.Byte(0) = &h34
m.Byte(1) = &h12
Var value As UInt16 = EndianU16_LtoNMBS(m.UInt16Value(0))
MessageBox Hex(value) // 1234
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.19 EndianU16_NtoBMBS(n as UInt16) as UInt16

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 16 bit unsigned value from native to big endian byte order
Var value As UInt16 = &h1234
Var converted As UInt16 = EndianU16_NtoBMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.20 EndianU16_NtoLMBS(n as UInt16) as UInt16

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 16 bit unsigned value from native to little endian byte order
Var value As UInt16 = &h1234
Var converted As UInt16 = EndianU16_NtoLMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.21 EndianU32_BtoLMBS(n as UInt32) as UInt32

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 32 bit unsigned value from big endian to little endian byte order
Var value As UInt32 = &h12345678
Var converted As UInt32 = EndianU32_BtoLMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.22 EndianU32_BtoNMBS(n as UInt32) as UInt32

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 32 bit unsigned value from big endian to native byte order
Var value As UInt32 = &h12345678
Var converted As UInt32 = EndianU32_BtoNMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.23 EndianU32_LtoBMBS(n as UInt32) as UInt32

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 32 bit unsigned value from little endian to big endian byte order
Var value As UInt32 = &h12345678
Var converted As UInt32 = EndianU32_LtoBMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.24 EndianU32_LtoNMBS(n as UInt32) as UInt32

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 32 bit unsigned value from little endian to native byte order
Var value As UInt32 = &h12345678
Var converted As UInt32 = EndianU32_LtoNMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Int32) as Int32
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.25 EndianU32_NtoBMBS(n as UInt32) as UInt32

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 32 bit value from native byte order to big endian, e.g. for a network protocol
Var length As UInt32 = 1000
Var bigEndian As UInt32 = EndianU32_NtoBMBS(length) // swaps on Intel and Apple Silicon, nothing on big endian CPUs
Var m As New MemoryBlock(4)
m.UInt32Value(0) = bigEndian // bytes are now 00 00 03 E8
MessageBox EncodeHex(m.StringValue(0, 4))
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

81.1.26 EndianU32_NtoLMBS(n as UInt32) as UInt32

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
// convert a 32 bit unsigned value from native to little endian byte order
Var value As UInt32 = &h12345678
Var converted As UInt32 = EndianU32_NtoLMBS(value)
// on Intel and Apple Silicon (little endian) native = little endian
MessageBox Hex(value) + " ->" + Hex(converted)
```

Notes: e.g.:
EndianS32_BtoNMBS(n as Integer) as Integer
EndianU16_LtoBMBS(n as Integer) as Integer

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Chapter 82

Exif

82.1 class ExifTagMBS

82.1.1 class ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a data tag in EXIF.
Example:

```
// list tag number, name and value of all EXIF tags in a JPEG file
Var j As New JPEGImporterMBS
j.File = SpecialFolder.Desktop.Child("photo.jpg")
j.ReadExifData = True
If Not j.ReadHeader Then Return

Var exif As New ExifTagsMBS(j.ExifData)
For Each tag As ExifTagMBS In exif.Tags
Var info As String = "&h" + Hex(tag.Tag) + " " + tag.TagName + " = " + tag.StringValue
If tag.IsNumeric And tag.Components >1 Then info = info + " (" + tag.Components.ToString + " values)"
System.DebugLog info
Next
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 20.2pr3

82.1.2 Methods

82.1.3 Constructor

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

82.1.4 Destructor

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

82.1.5 Values as Variant()

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all values for the current tag.
Notes: Number of entries should be equal to components property.

82.1.6 Properties

82.1.7 ByteCount as Integer

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes used for this tag's data.
Notes: (Read only property)

82.1.8 Components as Integer

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of components.
Notes: Some values can be arrays, so components is greater than 1.
(Read only property)

82.1.9 DataPointer as Ptr

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The pointer to the data.
Notes: Points into the MemoryBlock stored in data property of ExifTagsMBS object.
(Read only property)

82.1.10 Endian as Integer

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The endian setting for this value.
Notes: See kEndian* constants.
(Read only property)

82.1.11 Format as Integer

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The data format of this entry.
Notes: See kFormat* constants.
(Read only property)

82.1.12 IsNumeric as Boolean

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this tag is a numeric data type.
Notes: False if format is invalid, string or undefined.
(Read only property)

82.1.13 StringValue as String

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value as string to display.
Notes: Returns list of values with comma separated if there are multiple numeric values.
String or unknown fields are interpreted as text and trimmed.
(Read only property)

82.1.14 Tag as Integer

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag ID.
Notes: See EXIF data format documentation for complete list of possible values.
(Read only property)

82.1.15 TagName as String

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the tag.
Notes: We have a list of known tags where we lookup the name for you.
(Read only property)

82.1.16 Value as Variant

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the tag.
Notes: First value for multi value objects (if Components >1).
(Read and Write property)
See also:

- 82.1.17 Value(ComponentIndex as Integer) as Variant 13956

82.1.17 Value(ComponentIndex as Integer) as Variant

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the given component.
Notes: ComponentIndex is from 0 to Components-1.
e.g. GPS Coordinate may be stored as 3 values (hour, minute and second)
(Read and Write computed property)
See also:

- 82.1.16 Value as Variant 13956

82.1.18 Constants

Constants

Constant	Value	Description
kTagArtist	&h13B	One of the tag constant.
kTagCopyright	&h8298	One of the tag constant.
kTagDateTime	&h132	One of the tag constant.
kTagDescription	&h10E	One of the tag constant.
kTagExposureTime	&h829A	One of the tag constant.
kTagFlashUsed	&h9209	One of the tag constant.
kTagFNumber	&h829D	One of the tag constant.
kTagGPSAltitude	6	One of the tag constant.
kTagGPSAltitudeRef	5	One of the tag constant.
kTagGPSAreaInformation	&h1C	One of the tag constant.
kTagGPSDateStamp	&h1D	One of the tag constant.
kTagGPSDestBearing	&h18	One of the tag constant.
kTagGPSDestBearingRef	&h17	One of the tag constant.
kTagGPSDestDistance	&h1A	One of the tag constant.
kTagGPSDestDistanceRef	&h19	One of the tag constant.
kTagGPSDestLatitude	&h14	One of the tag constant.
kTagGPSDestLatitudeRef	&h13	One of the tag constant.
kTagGPSDestLongitude	&h16	One of the tag constant.
kTagGPSDestLongitudeRef	&h15	One of the tag constant.
kTagGPSDifferential	&h1E	One of the tag constant.
kTagGPSDOP	11	One of the tag constant.
kTagGPSImgDirection	&h11	One of the tag constant.
kTagGPSImgDirectionRef	&h10	One of the tag constant.
kTagGPSLatitude	2	One of the tag constant.
kTagGPSLatitudeRef	1	One of the tag constant.
kTagGPSLongitude	4	One of the tag constant.
kTagGPSLongitudeRef	3	One of the tag constant.
kTagGPSMapDatum	&h12	One of the tag constant.
kTagGPSMeasureMode	10	One of the tag constant.
kTagGPSProcessingMethod	&h1B	One of the tag constant.
kTagGPSSatellites	8	One of the tag constant.
kTagGPSSpeed	13	One of the tag constant.
kTagGPSSpeedRef	12	One of the tag constant.
kTagGPSStatus	9	One of the tag constant.
kTagGPSTimeStamp	7	One of the tag constant.
kTagGPSTrack	15	One of the tag constant.
kTagGPSTrackRef	14	One of the tag constant.
kTagGPSVersion	0	One of the tag constant.
kTagImageHeight	&h101	One of the tag constant.
kTagImageWidth	&h100	One of the tag constant.
kTagMake	&h10F	One of the tag constant.
kTagModel	&h110	One of the tag constant.
kTagOrientation	&h112	One of the tag constant.
kTagResolutionUnit	&h128	One of the tag constant.
kTagSoftware	&h131	One of the tag constant.
kTagThumbnailLength	&h202	One of the tag constant.
kTagThumbnailOffset	&h201	One of the tag constant.
kTagUserComment	&h9286	One of the tag constant.
kTagXResolution	&h11A	One of the tag constant.
kTagYResolution	&h11B	One of the tag constant.

Endian Mode

Constant	Value	Description
kEndianBig	1	Value is stored in big endian format.
kEndianLittle	2	Value is stored in little endian format.
kEndianUnknown	0	Unknown

Flash Modes

Constant	Value	Description
kFlashAuto	&h18	Auto
kFlashFired	1	Fired
kFlashFlashFunctionPresent	&h20	Flash Function Present
kFlashNo	0	No flash
kFlashOff	&h10	Off
kFlashOn	8	On
kFlashRedEyeReduction	&h40	Red Eye Reduction
kFlashStrobeReturnLightDetected	6	Strobe Return Light Detected

Data Formats

Constant	Value	Description
kFormatByte	1	Byte data. (UInt8)
kFormatDouble	12	Double
kFormatInvalid	0	Invalid
kFormatSByte	6	Signed byte
kFormatSingle	11	Single
kFormatSLong	9	Signed long
kFormatSRational	10	Signed rational value.
kFormatSShort	8	Signed short. (Int16)
kFormatString	2	Text
kFormatULong	4	Unsigned long. (UInt32)
kFormatUndefined	7	Undefined
kFormatURational	5	Unsigned rational value.
kFormatUShort	3	Unsigned short. (UInt16)

Orientation

Constant	Value	Description
kOrientationBottomLeft	4	Bottom Left
kOrientationBottomRight	3	Bottom Right
kOrientationLeftBottom	8	Left Bottom
kOrientationLeftTop	5	Left Top
kOrientationRightBottom	7	Right Bottom
kOrientationRightTop	6	Right Top
kOrientationTopLeft	1	Top Left
kOrientationTopRight	2	Top Right

Units

Constant	Value	Description
kUnitCentimeter	3	Pixel per centimeter
kUnitInch	2	Pixel per Inches
kUnitUndefined	1	Undefined.

82.2 class ExifTagsMBS

82.2.1 class ExifTagsMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The EXIF class.
Example:

```
// read camera information from the EXIF data of a JPEG file
Var j As New JPEGImporterMBS
j.file = SpecialFolder.Desktop.Child("photo.jpg")
j.ReadExifData = True
j.Import

If j.ExifData = "" Then
MessageBox "No EXIF data."
Return
End If

Var exif As New ExifTagsMBS(j.ExifData)
Var lines() As String
If exif.Make <>Nil Then lines.Add "Make: " + exif.Make.StringValue
If exif.Model <>Nil Then lines.Add "Model: " + exif.Model.StringValue
If exif.ExposureTime <>Nil Then lines.Add "Exposure: " + exif.ExposureTime.StringValue

// or list all tags
For Each tag As ExifTagMBS In exif.Tags
lines.Add tag.TagName + ": " + tag.StringValue
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: This is a home grown class to parse Exif and allow small modifications.
Great to just read values or to update a date field.
This class does not allow to add values or to increase text lengths.
But you can take a template EXIF from one picture, change values and store it with another one.

See also CGImageSourceMBS class for MacOS and iOS for Apple's way to read/write EXIF data.
And see GMImageMBS class to read EXIF via attribute functions in GraphicsMagick.

82.2.2 Methods

82.2.3 Constructor(ExifData as MemoryBlock)

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor taking exif data as memoryblock.
Notes: Please use JPEGImporterMBS, GMImageMBS, NSImageMBS, PNGReaderMBS or other classes to get EXIF data block.
See also:

- 82.2.4 Constructor(ExifData as String) 13961

82.2.4 Constructor(ExifData as String)

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor taking exif data as string.
Notes: Please use JPEGImporterMBS, GMImageMBS, NSImageMBS, PNGReaderMBS or other classes to get EXIF data block.
See also:

- 82.2.3 Constructor(ExifData as MemoryBlock) 13961

82.2.5 TagByID(Tag as integer) as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a tag by ID.
Notes: This looks on the Tag property.

82.2.6 TagByIndex(index as integer) as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a tag by index.

82.2.7 Tags as ExifTagMBS()

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries an array with all tags found.

82.2.8 Properties

82.2.9 Artist as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for Artist.
Notes: May be nil if not found.
(Read only property)

82.2.10 Copyright as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for Copyright.
Notes: May be nil if not found.
(Read only property)

82.2.11 Count as Integer

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of tags found.
Notes: (Read only property)

82.2.12 Data as MemoryBlock

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The data of the Exif record.
Notes: This is a copy of what you passed to the constructor.
It may have been modified if you overwrote a value.
(Read only property)

82.2.13 DateTime as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for DateTime.
Notes: May be nil if not found.
(Read only property)

82.2.14 Description as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for Description.
Notes: May be nil if not found.
(Read only property)

82.2.15 ExposureTime as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for ExposureTime.
Notes: May be nil if not found.
(Read only property)

82.2.16 FlashUsed as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for FlashUsed.
Notes: May be nil if not found.
(Read only property)

82.2.17 FNumber as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for FNumber.
Notes: May be nil if not found.
(Read only property)

82.2.18 GPSAltitude as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSAltitude.
Notes: May be nil if not found.
(Read only property)

82.2.19 GPSAltitudeRef as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSAltitudeRef.
Notes: May be nil if not found.
(Read only property)

82.2.20 GPSAreaInformation as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSAreaInformation.
Notes: May be nil if not found.
(Read only property)

82.2.21 GPSDateStamp as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSDateStamp.
Notes: May be nil if not found.
(Read only property)

82.2.22 GPSDestBearing as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSDestBearing.
Notes: May be nil if not found.
(Read only property)

82.2.23 GPSDestBearingRef as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSDestBearingRef.
Notes: May be nil if not found.
(Read only property)

82.2.24 GPSDestDistance as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSDestDistance.
Notes: May be nil if not found.
(Read only property)

82.2.25 GPSDestDistanceRef as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSDestDistanceRef.
Notes: May be nil if not found.
(Read only property)

82.2.26 GPSDestLatitude as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSDestLatitude.
Notes: May be nil if not found.
(Read only property)

82.2.27 GPSDestLatitudeRef as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSDestLatitudeRef.
Notes: May be nil if not found.
(Read only property)

82.2.28 GPSDestLongitude as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSDestLongitude.
Notes: May be nil if not found.
(Read only property)

82.2.29 GPSDestLongitudeRef as ExifTagMBS

(Read only property)

82.2.41 GPSSatellites as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSSatellites.
Notes: May be nil if not found.
(Read only property)

82.2.42 GPSSpeed as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSSpeed.
Notes: May be nil if not found.
(Read only property)

82.2.43 GPSSpeedRef as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSSpeedRef.
Notes: May be nil if not found.
(Read only property)

82.2.44 GPSStatus as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSStatus.
Notes: May be nil if not found.
(Read only property)

82.2.45 GPSTimeStamp as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSTimeStamp.
Notes: May be nil if not found.
(Read only property)

82.2.46 GPSTrack as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSTrack.
Notes: May be nil if not found.
(Read only property)

82.2.47 GPSTrackRef as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSTrackRef.
Notes: May be nil if not found.
(Read only property)

82.2.48 GPSVersion as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for GPSVersion.
Notes: May be nil if not found.
(Read only property)

82.2.49 ImageHeight as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for ImageHeight.
Notes: May be nil if not found.
(Read only property)

82.2.50 ImageWidth as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for ImageWidth.
Notes: May be nil if not found.
(Read only property)

82.2.51 Make as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for Make.
Notes: May be nil if not found.
(Read only property)

82.2.52 Model as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for Model.
Notes: May be nil if not found.
(Read only property)

82.2.53 Orientation as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for Orientation.
Notes: May be nil if not found.
(Read only property)

82.2.54 ResolutionUnit as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for ResolutionUnit.
Notes: May be nil if not found.
(Read only property)

82.2.55 Software as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for Software.
Notes: May be nil if not found.
(Read only property)

82.2.56 ThumbnailLength as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for ThumbnailLength.
Notes: May be nil if not found.
(Read only property)

82.2.57 ThumbnailOffset as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for ThumbnailOffset.
Notes: May be nil if not found.
(Read only property)

82.2.58 ThumnnailData as MemoryBlock

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies thumbnail from the EXIF data.
Notes: Returns nil if not thumbnail exists.
(Read only property)

82.2.59 UserComment as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for UserComment.
Notes: May be nil if not found.
(Read only property)

82.2.60 XResolution as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for XResolution.
Notes: May be nil if not found.
(Read only property)

82.2.61 YResolution as ExifTagMBS

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the tag for YResolution.
Notes: May be nil if not found.
(Read only property)

Chapter 83

Filemapping and Shared Memory

83.1 class FileMappingMBS

83.1.1 class FileMappingMBS

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for file mapping and shared memory access.
Example:

```
// share data between two applications via named shared memory
// in the first application:
Var data As MemoryBlock = "Hello from the first app"
If Not FileMappingMBS.SetSharedMemoryValue("MyAppSharedData", data) Then
MessageBox "Failed to write shared memory."
End If

// in the second application:
If FileMappingMBS.HasSharedMemoryValue("MyAppSharedData") Then
Var value As MemoryBlock = FileMappingMBS.GetSharedMemoryValue("MyAppSharedData")
MessageBox value.StringValue(0, value.Size).DefineEncoding(Encodings.UTF8)
End If
```

Notes: FilemappingMBS is a clever way to map the content of a file into memory without loading it.
All applications are today loaded via mapping using the virtual memory manager. So your data is inside the file but some memory is used to cache it and you can access it as a memoryblock.

You can use this class in several ways:

1. file mapping read/write: Call the constructor with a file, open the file mapping and map memory in your

process to read or write a file.
2. file mapping read/write with temporary files: You can create (multi gigabyte) tempory memory storage to store data too big for your application own address space.
3. a variant of 2 is to pass nil to the constructor on Windows to have the data stored in the swap files.
4. use Constructor without paramaters and call CreateSharedMemory to create a shared memory object.
5. use Constructor without paramaters and call OpenSharedMemory to access a shared memory object from another process.

For shared memory objects, be careful how you design it. Your shared memory should have a flag for editing, so one app does not edit while another app edits. Add a version value to check your application versions. Also add a value for the revision of the content so your apps can see modifications. Finally your app should handle the possibility that the application crashes while writing data. So the data can be in a bad state.

Xojo Developer Magazine

- 19.2, page 10: News

83.1.2 Methods

83.1.3 CloseFile

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes the file you used for backstore.
Notes: Called by the destructor automatically.

83.1.4 CloseFileMapping

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes the file mapping.
Notes: Called by the destructor automatically.
You close all views, than you close the file mapping and finally the file.

83.1.5 Constructor

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The dummy constructor used if you create a shared memory object.
Notes: Use this constructor if you continue with OpenSharedMemory or CreateSharedMemory.
See also:

- 83.1.6 Constructor(file as folderitem, write as boolean = false) 13975

83.1.6 Constructor(file as folderitem, write as boolean = false)

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens or creates a file for file mapping.
Notes: On Windows you can pass nil for the file parameter in order to have a file mapping using the swap files for back storage.

If write is true, the file is opened/created for write access.
See also:

- 83.1.5 Constructor 13975

83.1.7 CreateSharedMemory(name as string, Size as Int64) as boolean

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a shared memory object with the given name.
Notes: Returns true on success and false on failure. The name must be unique on the whole PC.

On success, you can call MapView to access memory.
isWriteable is set to true as shared memory objects are always read and write.

Fails if the shared memory object does exist. In this case, call OpenSharedMemory.
If your application crashes, on the next run the object will still exist on Mac OS X and Linux, so you need

to open or delete & create it.

The Size should be a multiply of the page size (4096).
Sets DeleteSharedMemory to true so the object is deleted by the destructor. Set it to false if you don't want that behavior.

83.1.8 DeleteSharedMemory(name as string) as boolean

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Targets: All.

Function: Deletes the shared memory object.
Notes: Returns true on success and false on failure.
Called by the destructor if DeleteSharedMemory property is true.
See also:

- 83.1.20 DeleteSharedMemory as Boolean 13979

83.1.9 EnlargeFile(Size as Int64)

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resizes the file to the given size.
Notes: This is for file mappings used as temporary storage with a temporary file. You use the Constructor to create a temporary file. This file is enlarged to the size you need. Next you call OpenFileMapping and MapView. To cleanup, you close all views and the file mapping. Now before you close the file, you should call ShrinkFile. ShrinkFile reduces the file size to zero so the operating system doesn't start flushing the shared memory to the file. You can get this automatically if you set ShrinkFileOnClose to true.

83.1.10 GetSharedMemoryValue(name as string) as MemoryBlock

MBS Util Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries value of shared memory object.
Notes: Returns copy of the data.
Since data is stored in blocks of page size (usually 4K), the returned size has additional null bytes on the end to round size up.
If you store text there, you may look for the end of your data, e.g. for JSON do a trim(Chr(0)) to remove the null bytes.

83.1.11 HasSharedMemoryValue(name as string) as Boolean

MBS Util Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether shared memory object exists.

83.1.12 MapView(mem as MemoryBlock, offset as Int64, Size as Integer) as FileMappingViewMBS

MBS Util Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maps a portion of the file mapping or shared memory object into your application's address space.
Notes: Returns nil on any error.
Using invalide offset/size values can lead into a bad mapping.
Here you can pass your own memoryblock for back storage.
Make sure your memory is 4 or 64 KB aligned, depending on platform.
(Windows need 64 KB, Mac only 4 KB)

Changed Size parameter from Int32 to Integer in version 21.0.
Xojo may not handle ptr with offsets >2 GB as of version 2020r2. This is fixed in 2020r2.1.
See also:

- 83.1.13 MapView(offset as Int64, Size as Integer) as FileMappingViewMBS 13977

83.1.13 MapView(offset as Int64, Size as Integer) as FileMappingViewMBS

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maps a portion of the file mapping or shared memory object into your application's address space.
Notes: Returns nil on any error.
Using invalide offset/size values can lead into a bad mapping.
(Windows need 64 KB, Mac only 4 KB)

Changed Size parameter from Int32 to Integer in version 21.0.
Xojo may not handle ptr with offsets >2 GB as of version 2020r2. This is fixed in 2020r2.1.
See also:

- 83.1.12 MapView(mem as MemoryBlock, offset as Int64, Size as Integer) as FileMappingViewMBS 13977

83.1.14 OpenFileMapping(MaxSize as Int64 = 0) as boolean

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a file mapping.
Notes: If MaxSize is zero, the file size is used for creating the mapping.
The Size should be a multiply of the page size (4096).

Returns true on success.
Do not call after using OpenSharedMemory or CreateSharedMemory as they open the file mapping for you.

83.1.15 OpenSharedMemory(name as string) as boolean

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a shared memory object with the given name.
Notes: Returns true on success and false on failure.

On success, you can call MapView to access memory.
isWriteable is set to true as shared memory objects are always read and write.

Fails if the shared memory object does not exist. In this case, call CreateSharedMemory.

83.1.16 SetSharedMemoryValue(name as string, data as MemoryBlock) as Boolean

MBS Util Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets shared memory value.
Notes: Persistent object on Mac/Linux till computer restarts or shuts down.
On Windows object is destroyed when last application referring it quits.

Returns true on success.
Size of the data block will be rounded up to page size.

On Windows the shared memory objects can't be accessed from another login session. To create a truly global one, we would need to run your application as administrator and prefix the name with "Global\".

83.1.17 ShrinkFile

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resizes the file to by empty.
Notes: Useful if you used EnlargeFile before.

83.1.18 Properties

83.1.19 DeleteFileOnClose as Boolean

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to delete the file in the destructor.
Notes: Useful if a tempory file is used as backstore.
(Read and Write property)

83.1.20 DeleteSharedMemory as Boolean

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Targets: All.

Function: Whether to delete the shared memory object on closing.
Notes: True by default after Creating a shared memory object.

On Windows the shared memory objects exist as long as someone uses them.
On Mac OS X they live until you kill them even if your application is not running.
(Read and Write property)
See also:

- 83.1.8 DeleteSharedMemory(name as string) as boolean 13976

83.1.21 File as FolderItem

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file reference used for the backstore.
Notes: (Read only property)

83.1.22 isWriteable as Boolean

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether opened/created the file mapping with write permission.
Notes: Opening files for reading only in order to read inside gives the operating system some optimization possibilities.

(Read only property)

83.1.23 Lasterror as Integer

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: On Windows typically a Windows error code.
On Linux and Mac OS X typically 0 for success and other values for errors.
(Read and Write property)

83.1.24 LasterrorString as String

MBS Util Plugin, Plugin Version: 10.5, Platform: Windows, Targets: All.

Function: The string for the last error code.
Notes: Only implemented for Windows.
Returns "" on any error.
(Read only property)

83.1.25 Name as String

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name used for a named shared memory object.
Notes: (Read only property)

83.1.26 SharedMemorySize as Int64

MBS Util Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries shared memory object size.
Notes: Only valid for shared memory objects in handle.
(Read only property)

83.1.27 ShrinkFileOnClose as Boolean

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to call ShrinkFile automatically from the destructor.
Notes: Default false.
(Read and Write property)

83.2 class FileMappingViewMBS

83.2.1 class FileMappingViewMBS

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a file mapping view.
Notes: You can using file mapping with a 10 GB bit file. Your application has only 4 GB of address space and effectively you can only use 2 GB. So you can try to map in a few hundred mega bytes at a given time. But you can move this view on the large file to read the whole file. But remember: File mapping is only efficient if you read a little data form the file and jump a lot. For reading the whole file, use a binarystream.
Blog Entries

- MBS REALbasic Plugins, version 10.5pr4

83.2.2 Methods

83.2.3 FlushView

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flushes all data to the backstore.
Notes: For file mappings, the modified pages are written back to the file now. Normally you won't call this and let the operating system decide when to write the data to the file.

83.2.4 UnmapView

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Frees the memory allocated by the view.
Notes: Called automatically be the destructor.

83.2.5 Properties

83.2.6 FlushOnClose as Boolean

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to call FlushView for you in the destructor.
Notes: (Read and Write property)

83.2.7 Memory as Memoryblock

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The memoryblock for this view.
Example:

```
Var v as FileMappingViewMBS // your view

v.memory.cstring(0)="Hello World"
```

Notes: The memoryblock has no known size and it becomes invalid once this view object is destroyed. So keep a reference around as long as you use the memoryblock.
(Read only property)

83.2.8 Offset as Int64

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The offset used to create this view.
Notes: (Read only property)

83.2.9 Parent as FileMappingMBS

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The owner FileMapping object.
Notes: (Read only property)

83.2.10 Size as Integer

MBS Util Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size in bytes of this view.
Notes: (Read only property)

Chapter 84

Files

84.1 class ACLEntryMBS

84.1.1 class ACLEntryMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The class for an ACL entry.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.0pr1

84.1.2 Methods

84.1.3 Constructor

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The private constructor.

84.1.4 Copy(dest as ACLEntryMBS)

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Copy an ACL entry to another ACL entry.
Notes: see also acl_copy_entry man page.

84.1.5 GIDtoUUID(GID as Integer) as memoryblock

MBS MacOSX Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Queries the UUID for a group id.
Notes: Returns nil on any error.

84.1.6 GroupFromGID(GID as Integer) as string

MBS MacOSX Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Queries the group name for a Group ID.

84.1.7 MaximalPermsetMask as UInt64

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The maximal permset mask.
Notes: see also acl_maximal_permset_mask_np man page.

84.1.8 UIDtoUUID(UID as Integer) as memoryblock

MBS MacOSX Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Queries the UUID for an user id.
Notes: Returns nil on any error.

84.1.9 UserFromUID(UID as Integer) as string

MBS MacOSX Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Queries the user name for a UID.

84.1.10 UUIDtoID(UUID as memoryblock, byref ID as Integer, byref Type as Integer) as boolean

MBS MacOSX Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Queries the GID/UID for an UUID.
Notes: Type is 0 for user and 1 for group.

Returns true on success.

84.1.11 Properties

84.1.12 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

84.1.13 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

84.1.14 Parent as Variant

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The parent object.
Notes: (Read only property)

84.1.15 FlagSet as ACLFlagSetMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Get or Set the flag set.
Notes: see also acl_get_flagset_np/acl_set_flagset_np man page.
(Read and Write computed property)

84.1.16 PermSet as ACLPermSetMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Get/Set the permissions set.
Notes: see also acl_get_permset/acl_set_permset man page.

(Read and Write computed property)

84.1.17 PermSetMask as UInt64

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Get/Set the permission set mask.
Notes: see also acl_get_permset_mask_np/acl_set_permset_mask_np man page.
(Read and Write computed property)

84.1.18 Qualifier as Memoryblock

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Get/Set the qualifier.
Notes: Value is a 16byte big GUID as memoryblock.
see also acl_set_qualifier/acl_get_qualifier man page.
(Read and Write computed property)

84.1.19 TagType as Integer

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Sets or gets the tag type.
Notes: see also acl_get_tag_type/acl_set_tag_type man page.
(Read and Write computed property)

84.1.20 Constants

ACL entry tag type bits

Constant	Value	Description
kACLExtendedAllow	1	
kACLExtendedDeny	2	
kACLUndefinedTag	0	

84.2 class ACLFlagSetMBS

84.2.1 class ACLFlagSetMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The class for an ACL flag set.
Example:

```
// check and set inheritance flags of the first ACL entry of a folder
// entry is an ACLEntryMBS, e.g. from ACLRightMBS.Entry(0) for the folder
Var entry As ACLEntryMBS // your entry
If entry = Nil Then Return

Var flags As ACLFlagSetMBS = entry.FlagSet
System.DebugLog "Inherited by files: " + flags.HasFlag(ACLFlagSetMBS.kACLEntryFileInherit).ToString
flags.Add ACLFlagSetMBS.kACLEntryFileInherit
flags.Add ACLFlagSetMBS.kACLEntryDirectoryInherit
// write the ACL back to the folder afterwards, see ACLRightMBS
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

84.2.2 Methods

84.2.3 Add(flag as Integer)

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Adds a flag to the flag set.
Notes: see also acl_add_flag_np man page.

84.2.4 Clear

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Clears the flag set.
Notes: see also acl_clear_flags_np man page.

84.2.5 Constructor

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The private constructor.

84.2.6 Delete(flag as Integer)

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Deletes flag from flag set.
Notes: see also acl_delete_flag_np man page.

84.2.7 HasFlag(flag as Integer) as Boolean

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Checks if a flag is set in this flag set.
Notes: see also acl_get_flag_np man page.

84.2.8 Properties

84.2.9 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

84.2.10 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

84.2.11 Parent as Variant

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The parent object.
Notes: (Read only property)

84.2.12 Constants

ACL Entry Flags

Constant	Value	Description
kACLEntryDirectoryInherit	64	
kACLEntryFileInherit	32	
kACLEntryInherited	16	
kACLEntryLimitInherit	128	
kACLEntryOnlyInherit	256	
kACLFlagDeferInherit	1	
kACLFlagNoInherit	131072	

84.3 class ACLPermSetMBS

84.3.1 class ACLPermSetMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The class for an ACL permission set.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

84.3.2 Methods

84.3.3 Add(perm as Integer)

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Adds a permission.
Notes: see also acl_add_perm man page.

84.3.4 Clear

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Clears the permission set.
Notes: see also acl_clear_perms man page.

84.3.5 Constructor

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The private constructor.

84.3.6 Delete(perm as Integer)

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Deletes a permission.
Notes: see also acl_delete_perm man page.

84.3.7 HasPerm(perm as Integer) as Boolean

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Checks if permissions is included in this permission set.
Notes: see also acl_get_perm_np man page.

84.3.8 Properties

84.3.9 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

84.3.10 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

84.3.11 Parent as Variant

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The parent object.
Notes: (Read only property)

84.3.12 Constants

Constants

Constant	Value	Description
kACLMaxEntries	128	Maximum number of entries.

Individual object access permissions

Constant	Value	Description
kACLAddFile	4	
kACLAddSubDirectory	32	
kACLAppendData	32	
kACLChangeOwner	8192	
kACLDelete	16	
kACLDeleteChild	64	
kACLExecute	8	
kACLListDirectory	2	
kACLReadAttributes	128	
kACLReadData	2	
kACLReadExtraAttributes	512	
kACLReadSecurity	2048	
kACLSearch	8	
kACLWriteAttributes	256	
kACLWriteData	4	
kACLWriteExtraAttributes	1024	
kACLWriteSecurity	4096	

84.4 class ACLRightMBS

84.4.1 class ACLRightMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The class for ACL rights.
Example:

```
// show the access control list of a file as text
Var file As FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var acl As ACLRightMBS = ACLRightMBS.NewACLFromFile(file, ACLRightMBS.kACLTypeExtended)

If acl = Nil Then
MessageBox "No ACL entries for this file."
Else
MessageBox acl.Entries.Count.ToString + " entries:" + EndOfLine + acl.Text
End If
```

84.4.2 Methods

84.4.3 Constructor(count as Integer)

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Allocates and initializes the working storage for an ACL of at least count ACL entries.
Notes: see also acl_init man page.
See also:

- 84.4.4 Constructor(text as string) 13995

84.4.4 Constructor(text as string)

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Creates new ACL from text representation.
Notes: see also acl_from_text man page.
See also:

- 84.4.3 Constructor(count as Integer) 13995

84.4.5 CopyData(Native as boolean = false) as String

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Creates external representation.
Notes: see also acl_copy_int man page.

84.4.6 CreateEntry as ACLEntryMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Creates a new entry.
Notes: see also acl_create_entry man page.
See also:

- 84.4.7 CreateEntry(entryIndex as Integer, tag_type as Integer = 1) as ACLEntryMBS 13996

84.4.7 CreateEntry(entryIndex as Integer, tag_type as Integer = 1) as ACLEntryMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Creates a new entry.
Notes: see also acl_create_entry_np man page.
See also:

- 84.4.6 CreateEntry as ACLEntryMBS 13996

84.4.8 DeleteEntry(entry as ACLEntryMBS)

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Deletes an entry.
Notes: see also acl_delete_entry man page.

84.4.9 Duplicate as ACLRightMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Creates a duplicate of this right set.
Notes: see also acl_dup man page.

84.4.10 Entries as ACLEntryMBS()

MBS MacOSX Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Queries array with all entries in this ACL.
Notes: Lasterror is set.
see also acl_get_entry man page.

84.4.11 Entry(entryIndex as Integer) as ACLEntryMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Queries entry with given index.
Notes: You can use constants kACLFirstEntry, kACLLastEntry or kACLNextEntry.
see also acl_get_entry man page.

84.4.12 NewACL(count as Integer) as ACLRightMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Allocates and initializes the working storage for an ACL of at least count ACL entries.
Notes: see also acl_init man page.

84.4.13 NewACLFromExternal(data as string, native as boolean = false) as ACLRightMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Creates new ACL object from external representation.
Notes: see also acl_copy_ext man page.

84.4.14 NewACLFromFile(file as folderitem, type as Integer) as ACLRightMBS

MBS MacOSX Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Creates ACL object from file.
Notes: see also acl_get_file man page.
See also:

- 84.4.15 NewACLFromFile(path as string, type as Integer) as ACLRightMBS 13997

84.4.15 NewACLFromFile(path as string, type as Integer) as ACLRightMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Creates ACL object from file.
Notes: see also acl_get_file man page.
See also:

- 84.4.14 NewACLFromFile(file as folderitem, type as Integer) as ACLRightMBS 13997

84.4.16 NewACLFromFilePointer(FilePointer as Integer) as ACLRightMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Creates ACL object from FilePointer.
Notes: see also acl_get_fd man page.
See also:

- 84.4.17 NewACLFromFilePointer(FilePointer as Integer, type as Integer) as ACLRightMBS 13998

84.4.17 NewACLFromFilePointer(FilePointer as Integer, type as Integer) as ACLRightMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Creates ACL object from FilePointer.
Notes: see also acl_get_fd_np man page.
See also:

- 84.4.16 NewACLFromFilePointer(FilePointer as Integer) as ACLRightMBS 13998

84.4.18 NewACLFromLink(path as string, type as Integer) as ACLRightMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Creates ACL object from link.
Notes: see also acl_get_link_np man page.

84.4.19 NewACLFromText(text as string) as ACLRightMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Creates new ACL from text representation.
Notes: see also acl_from_text man page.

84.4.20 SetFile(Path as string, type as Integer) as boolean

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Applies this ACL to a file.
Notes: see also acl_set_file man page.

84.4.21 SetFilePointer(FilePointer as Integer) as boolean

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Applies this ACL to a file pointer.
Notes: see also acl_set_fd man page.
See also:

- 84.4.22 SetFilePointer(FilePointer as Integer, type as Integer) as boolean 13999

84.4.22 SetFilePointer(FilePointer as Integer, type as Integer) as boolean

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Applies this ACL to a file pointer.
Notes: see also acl_set_fd_np man page.
See also:

- 84.4.21 SetFilePointer(FilePointer as Integer) as boolean 13999

84.4.23 SetLink(Path as string, type as Integer) as boolean

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Applies this ACL to a link file.
Notes: see also acl_set_link_np man page.

84.4.24 Size as Int64

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Queries size of binary representation.
Notes: see also acl_size man page.

84.4.25 Text as String

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Queries text representation of this ACL.
Notes: see also acl_to_text man page.

84.4.26 Valid as boolean

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Checks if ACL is valid in general.
Notes: see also acl_valid man page.

84.4.27 ValidFile(Path as string, type as Integer) as boolean

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Checks if ACL is valid for this file.
Notes: see also acl_valid_file_np man page.

84.4.28 ValidFilePointer(FilePointer as Integer, type as Integer) as boolean

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Checks if ACL is valid for this file pointer.
Notes: see also acl_valid_fd_np man page.

84.4.29 Properties

84.4.30 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

84.4.31 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

84.4.32 FlagSet as ACLFlagSetMBS

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Get/Set the flag set.
Notes: see also acl_get_flagset_np/acl_set_flagset_np man page.
(Read and Write computed property)

84.4.33 Constants

ACL Entry Constants

Constant	Value	Description
kACLFirstEntry	0	Next entry.
kACLLastEntry	-2	Last entry.
kACLNextEntry	-1	Next entry.

ACL Types

Constant	Value	Description
kACLTypeAccess	0	Posix 1003.1e type, not supported.
kACLTypeAFS	2	No supported on Mac OS X, only for Linux/FreeBSD.
kACLTypeCODA	3	No supported on Mac OS X, only for Linux/FreeBSD.
kACLTypeDefault	1	Posix 1003.1e type, not supported.
kACLTypeExtended	256	Extended ACL.
kACLTypeNTFS	4	No supported on Mac OS X, only for Linux/FreeBSD.
kACLTypeNWFS	5	No supported on Mac OS X, only for Linux/FreeBSD.

84.5 class CopyFileMBS

84.5.1 class CopyFileMBS

MBS MacOSX Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The class for copyfile function.
Example:

```
// copy a file including metadata and extended attributes
Var source As FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var dest As FolderItem = SpecialFolder.Desktop.Child("test copy.txt")

Var c As New CopyFileMBS
Var e As Integer = c.CopyFile(source, dest, CopyFileMBS.kFlagsAll)

If e = 0 Then
MessageBox "Copied " + c.BytesCopied.ToString + " bytes."
Else
MessageBox "Copy failed: " + CopyFileMBS.ErrorMessage(e)
End If
```

Notes: We provide a class to hold state and get event for progress.
Uses low level copyfile API from MacOS.

See copyfile man page in terminal.

84.5.2 Methods

84.5.3 CopyFile(From as FolderItem, Dest as FolderItem, flags as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Copies files or folders.
Notes: Copy a file's data and/or metadata. (Metadata consists of permissions, extended attributes, access control lists, and so forth.)

Recursive Copies When given the kFlagsRecursive flag, copyfile() will use the fts(3) functions to recursively descend into the source file-system object. It then calls copyfile() on each of the entries it finds that way. If a progress event is given the event will be called four times for each directory object, and twice for all other objects. (Each directory will be examined twice, once on entry – before copying each of the objects contained in the directory – and once on exit – after copying each object contained in the directory, in order to perform some final cleanup.)

Returns error code or zero for success.
See also:

- 84.5.4 CopyFile(From as String, Dest as String, flags as Integer) as Integer 14003

84.5.4 CopyFile(From as String, Dest as String, flags as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Copies files or folders.
Notes: Copy a file's data and/or metadata. (Metadata consists of permissions, extended attributes, access control lists, and so forth.)

Recursive Copies When given the kFlagsRecursive flag, copyfile() will use the fts(3) functions to recursively descend into the source file-system object. It then calls copyfile() on each of the entries it finds that way. If a progress event is given the event will be called four times for each directory object, and twice for all other objects. (Each directory will be examined twice, once on entry – before copying each of the objects contained in the directory – and once on exit – after copying each object contained in the directory, in order to perform some final cleanup.)

Returns error code or zero for success.
See also:

- 84.5.3 CopyFile(From as FolderItem, Dest as FolderItem, flags as Integer) as Integer 14003

84.5.5 ErrorMessage(error as Integer) as String

MBS MacOSX Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Queries error message for unix error code.

84.5.6 Properties

84.5.7 BytesCopied as Int64

MBS MacOSX Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Get the number of data bytes copied so far.
Notes: Valid only in Progress event.
If a kFlagsClone or kFlagsCloneForce operation successfully cloned the requested objects, then this value will be 0.
(Read only property)

84.5.8 WasCloned as Boolean

MBS MacOSX Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Whether file was cloned.
Notes: Valid only in Progress event.
True if a kFlagsClone or kFlagsCloneForce operation successfully cloned the requested objects.
(Read only property)

84.5.9 XAttrName as String

MBS MacOSX Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Get the name of the extended attribute.
Notes: Valid only in Progress event.
(Read only property)

84.5.10 YieldTicks as Integer

MBS MacOSX Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: How much time is given back to Xojo for other ticks.
Example:

```
Var t as new CopyFileMBS
t.YieldTicks=6 // only use 1/10th of a second
```

Notes: If value is greater than zero, the application will yield to another RB thread after the given number of ticks have passed. 60 ticks are one second. Using a small value can slow down processing a lot while a big value keeps your application not responding to mouse clicks.
If you use this property with e.g. 6 as the value, you may also want to use this method in a thread so you can handle mouse events or let Xojo redraw a progressbar.
(Read and Write property)

84.5.11 Events

84.5.12 Progress(What as Integer, Stage as Integer, Source as String, Dest as String) as Integer

MBS MacOSX Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The progress event called while copying.
Notes: What is one of the kWhat* constants.
Stage is one of the kStage* constants.
Source and Dest point to the current files being copied.

Return one of the kReturn* constants.

84.5.13 Constants

Flags

Constant	Value	Description
kFlagsACL	1	Copy the source file's access control lists.
kFlagsAll	15	Copy the entire file; equivalent to BitwiseOr(kFlagsMetaData, kFlagsData).
kFlagsCheck	&h10000	Return a bitmask (corresponding to the flags argument) indicating which contents would be copied; no data are actually copied. (E.g., if flags was set to kFlagsCheck + kFlagsMetaData, and the from file had extended attributes but no ACLs, the return value would be kFlagsXAttr.)
kFlagsClone	&h1000000	Try to clone the file instead. This is a best try flag i.e. if cloning fails, fallback to copying the file. This flag is equivalent to BitwiseOr(kFlagsExcl, kFlagsACL, kFlagsStat, kFlagsXAttr, kFlagsData, kFlagsNoFollowSource). Note that if cloning is successful, progress event will not be invoked. Note also that there is no support for cloning directories: if a directory is provided as the source and kFlagsCloneForce is not passed, this will instead copy the directory. Recursive copying however is supported.
kFlagsCloneForce	&h2000000	Clone the file instead. This is a force flag i.e. if cloning fails, an error is returned. This flag is equivalent to BitwiseOr(kFlagsExcl, kFlagsACL, kFlagsStat, kFlagsXAttr, kFlagsData, kFlagsNoFollowSource). Note that if cloning is successful, progress callbacks will not be invoked. Note also that there is no support for cloning directories: if a directory is provided as the source, an error will be returned.
kFlagsData	8	Copy the source file's data.
kFlagsDataSparse	&h8000000	Copy a file sparsely. This requires that the source and destination file systems support sparse files with hole sizes at least as large as their block sizes. If kFlagsData is also specified, this will fall back to a full copy if sparse copying cannot be performed for any reason; otherwise, an error is returned.
kFlagsExcl	&h20000	Fail if the to file already exists.
kFlagsMetaData	7	Copy the metadata; equivalent to BitwiseOr(kFlagsSecurity, kFlagsXAttr).
kFlagsMove	&h100000	Unlink (using remove(3)) the from file. No error is returned if remove(3) fails. Note that remove(3) removes a symbolic link itself, not the target of the link.
kFlagsNoFollow	&hC00000	This is a convenience macro, equivalent to BitwiseOr(kFlagsNoFollowDest, kFlagsNoFollowSource).
kFlagsNoFollowDest	&h80000	Do not follow the to file, if it is a symbolic link.
kFlagsNoFollowSource	&h40000	Do not follow the from file, if it is a symbolic link.
kFlagsPack	&h400000	Serialize the from file. The to file is an Apple-Double-format file.
kFlagsRecursive	&h8000	Causes copyfile to recursively copy a hierarchy.
kFlagsRunInPlace	&h4000000	If the src file has quarantine information, add the QTN_FLAG_DO_NOT_TRANSLOCATE flag to the quarantine information of the dst file. This allows a bundle to run in place instead of being translocated.
kFlagsSecurity	3	Copy the source file's POSIX and ACL information; equivalent to BitwiseOr(kFlagsStat,kFlagsACL).
kFlagsStat	2	Copy the source file's POSIX information (mode, modification time, etc.).
kFlagsUnlink	&h200000	Unlink the to file before starting.
kFlagsUnpack	&h800000	Unserialize the from file. The from file is an AppleDouble-format file; the to file will have the extended attributes, ACLs, resource fork, and FinderInfo data from the to file, regardless of the flags argument passed in.
kFlagsVerbose	&h40000000	Verbose messages.
kFlagsXAttr	4	Copy the source file's extended attributes.

Event Return Values

Constant	Value	Description
kReturnContinue	0	The copy will continue as expected.
kReturnQuit	2	The data copy will be aborted; in the case of kStageProgress, result will be set to ECANCELED (89).
kReturnSkip	1	The data copy will be aborted, but without error.

Progress

Constant	Value	Description
kStageError	3	Indicates an error has happened at some stage.
kStageFinish	2	After copying has successfully finished.
kStageProgress	4	Copy in progress.
kStageStart	1	Before copying has begun.

What

Constant	Value	Description
kWhatCopyData	4	Data is copied currently.
kWhatCopyXAttr	5	Extended attributes are copied currently.
kWhatRecurseDir	2	The object being copied is a directory, and is being entered. (That is, none of the filesystem objects contained within the directory have been copied yet.)
kWhatRecurseDirCleanup	3	The object being copied is a directory, and all of the objects contained have been copied. At this stage, the destination directory being copied will have any extra permissions that were added to allow the copying will be removed.
kWhatRecurseError	0	There was an error in processing an element of the source hierarchy; this happens when fts(3) returns an error or unknown file type.
kWhatRecurseFile	1	The object being copied is a file (or, rather, something other than a directory).

84.6 class DADiskMBS

84.6.1 class DADiskMBS

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for a disk in Disk Arbitration.
Example:

```
// show details of the disk with the startup volume
Var session As New DASessionMBS
Var disk As DADiskMBS = DADiskMBS.CreateFromVolumePath(session, "/")
If disk = Nil Then Return

Var info As Dictionary = disk.Description
MessageBox "BSD name: " + disk.BSDName + EndOfLine + _
"Volume: " + info.Lookup(DADiskMBS.kDADiskDescriptionVolumeNameKey, "").StringValue + EndOfLine
+ _
"Bus: " + info.Lookup(DADiskMBS.kDADiskDescriptionBusNameKey, "").StringValue + EndOfLine + _
"Vendor: " + info.Lookup(DADiskMBS.kDADiskDescriptionDeviceVendorKey, "").StringValue
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr1

84.6.2 Methods

84.6.3 BSDName as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Obtains the BSD device name for the specified disk.
Example:

```
Var session as new DASessionMBS
Var d as DADiskMBS = DADiskMBS.CreateFromVolume(session,volume(0))
MessageBox d.BSDName
```

84.6.4 Constructor

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

84.6.5 CreateFromBSDName(session as DASessionMBS, name as string) as DADiskMBS

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new disk object.
Notes: session: The DASession in which to contact Disk Arbitration.
name: The BSD device name.

Returns a reference to a new DADisk.

84.6.6 CreateFromVolume(session as DASessionMBS, volume as folderitem) as DADiskMBS

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new disk object.
Notes: Creates a new disk object.

84.6.7 CreateFromVolumePath(session as DASessionMBS, path as string) as DADiskMBS

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new disk object.
Notes: session: The DASession in which to contact Disk Arbitration.
path: The BSD mount point.

Available in OS X v10.7 and later.

84.6.8 Description as dictionary

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Obtains the Disk Arbitration description of the specified disk.
Example:

```
Var session as new DASessionMBS
Var d as DADiskMBS = DADiskMBS.CreateFromVolume(session,volume(0))
```

```
Var dic as Dictionary = d.Description
MessageBox dic.Value(d.kDADiskDescriptionVolumeNameKey)
```

Notes: This function will contact Disk Arbitration to acquire the latest description of the specified disk, unless this function is called on a disk object passed within the context of an event, in which case the description is current as of that event.
Available in OS X v10.4 and later.

84.6.9 kDADiskDescriptionBusNameKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a String.

84.6.10 kDADiskDescriptionBusPathKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a String.

84.6.11 kDADiskDescriptionDeviceGUIDKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a memoryblock.

84.6.12 kDADiskDescriptionDeviceInternalKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a Boolean.

84.6.13 kDADiskDescriptionDeviceModelKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a String.

84.6.14 kDADiskDescriptionDevicePathKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a String.

84.6.15 kDADiskDescriptionDeviceProtocolKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a String.

84.6.16 kDADiskDescriptionDeviceRevisionKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a String.

84.6.17 kDADiskDescriptionDeviceUnitKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a Number.

84.6.18 kDADiskDescriptionDeviceVendorKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a String.

84.6.19 kDADiskDescriptionMediaBlockSizeKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a Number.

84.6.20 kDADiskDescriptionMediaBSDMajorKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a Number.

84.6.21 kDADiskDescriptionMediaBSDMinorKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a Number.

84.6.22 kDADiskDescriptionMediaBSDNameKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a String.

84.6.23 kDADiskDescriptionMediaBSDUnitKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a Number.

84.6.24 kDADiskDescriptionMediaContentKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a String.

84.6.25 kDADiskDescriptionMediaEjectableKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a Boolean.

84.6.26 kDADiskDescriptionMediaIconKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a Dictionary.

84.6.27 kDADiskDescriptionMediaKindKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a String.

84.6.28 kDADiskDescriptionMediaLeafKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a Boolean.

84.6.29 kDADiskDescriptionMediaNameKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a String.

84.6.30 kDADiskDescriptionMediaPathKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a String.

84.6.31 kDADiskDescriptionMediaRemovableKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a Boolean.

84.6.32 kDADiskDescriptionMediaSizeKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a Number.

84.6.33 kDADiskDescriptionMediaTypeKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a String.

84.6.34 kDADiskDescriptionMediaUUIDKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a CFUUIDMBS.

84.6.35 kDADiskDescriptionMediaWholeKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a Boolean.

84.6.36 kDADiskDescriptionMediaWritableKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a Boolean.

84.6.37 kDADiskDescriptionVolumeKindKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a String.

84.6.38 kDADiskDescriptionVolumeMountableKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a Boolean.

84.6.39 kDADiskDescriptionVolumeNameKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a String.

84.6.40 kDADiskDescriptionVolumeNetworkKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a Boolean.

84.6.41 kDADiskDescriptionVolumePathKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a folderitem.

84.6.42 kDADiskDescriptionVolumeUUIDKey as string

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the description dictionary.
Notes: The value in the dictionary for this key is a CFUUIDMBS.

84.6.43 Options as Integer

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Obtains the options for the specified disk.

84.6.44 SetOptions(options as Integer, value as boolean) as Integer

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the options for the specified disk.
Notes: options: The options to set or clear.
value: Pass true to set options; otherwise pass false to clear options.
Returns result code.

84.6.45 WholeDisk as DADiskMBS

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Obtain the associated whole disk object for the specified disk.

84.6.46 Properties

84.6.47 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

84.7 class DADissenterMBS

84.7.1 class DADissenterMBS

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for an error.
Example:

```
Var d as new DADissenterMBS(11, "Write Error")

MessageBox str(d.Status)+" "+d.StatusString
```

Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr1

84.7.2 Methods

84.7.3 Constructor(status as Integer, s as string)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new dissenter object.
Example:

```
Var d as new DADissenterMBS(11, "Write Error")

MessageBox str(d.Status)+" "+d.StatusString
```

Notes: status: The return code.
s: The return code string. Pass empty string for no reason.

84.7.4 Properties

84.7.5 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

84.7.6 Status as Integer

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Obtains the return code.
Notes: (Read only property)

84.7.7 StatusString as String

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Obtains the return code string.
Notes: (Read only property)

84.7.8 Constants

Error Constants

Constant	Value	Description
kDAReturnBadArgument	&hF8DA0003	Bad Argument
kDAReturnBusy	&hF8DA0002	Busy
kDAReturnError	&hF8DA0001	Error
kDAReturnExclusiveAccess	&hF8DA0004	Exclusive Access
kDAReturnNoResources	&hF8DA0005	No Resources
kDAReturnNotFound	&hF8DA0006	Not found
kDAReturnNotMounted	&hF8DA0007	Not mounted
kDAReturnNotPermitted	&hF8DA0008	Not permitted
kDAReturnNotPrivileged	&hF8DA0009	Not privileged
kDAReturnNotReady	&hF8DA000A	Not ready
kDAReturnNotWritable	&hF8DA000B	Not writable
kDAReturnSuccess	0	Success
kDAReturnUnsupported	&hF8DA000C	Unsupported

84.8 class DarwinChmodMBS

84.8.1 class DarwinChmodMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: A class to change the owner or mode of a file on Mac OS X.
Example:

```
Var c as DarwinChmodMBS
Var userfolder as FolderItem
Var darwinResult as Integer
Var s as string

c=new DarwinChmodMBS

userFolder=SpecialFolder.Desktop.Child("chmod.rb")
s=userFolder.NativePath

darwinResult = c.chmod( s, &B111111111 ) // all rwx

// 1 = ———x
// 2 = ——wx
// 7 = ——-rwx
// 8 = ——x—

darwinResult=c.lstat(s)

MessageBox s+" "+str(darwinResult)+" "+str(c.error)
```

Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.0pr1
- MBS Real Studio Plugins, version 12.4pr10

84.8.2 Methods

84.8.3 chflags(path as string, flags as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The file whose name is given by path has its flags changed to flags.
Notes: The flags specified are formed by or'ing the following values

The "UF_IMMUTABLE" and "UF_APPEND" flags may be set or unset by either the owner of a file or

UF_NODUMP	0x00000001	Do not dump the file.
UF_IMMUTABLE	0x00000002	The file may not be changed.
UF_APPEND	0x00000004	The file may only be appended to.
UF_OPAQUE	0x00000008	Directory is opaque wrt. union

the super-user.

The "SF_IMMUTABLE" and "SF_APPEND" flags may only be set or unset by the super-user. They may be set at any time, but normally may only be unset when the system is in single-user mode.

You can type "man 2 chflags" on the Mac OS X terminal for more details.

Upon successful completion, a value of 0 is returned. Otherwise, -1 is returned.
Returns -2 on bad parameter or if function is not available.

Chflags() will fail it:

ENOTDIR	A component of the path prefix is not a directory.
ENAMETOOLONG	A component of a pathname exceeded { NAME_MAX } characters, or an entire path name exceeded { PATH_MAX } characters.
ENOENT	The named file does not exist.
EACCES	Search permission is denied for a component of the path prefix.
ELOOP	Too many symbolic links were encountered in translating the pathname.
EPERM	The effective user ID does not match the owner of the file and the effective user ID is not the super-user.
EROFS	The named file resides on a read-only file system.
EFAULT	Path points outside the process's allocated address space.
EIO	An I/O error occurred while reading from or writing to the file system.

84.8.4 chmod(path as string, mode as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Sets the file permission bits of the file specified by the pathname path to mode.
Example:

```
Var f as FolderItem
Var g as FolderItem

f=SpecialFolder.Desktop.Child("test1")
g=SpecialFolder.Desktop.Child("test2")
```

```
Var d as DarwinChmodMBS

d=new DarwinChmodMBS

if d.stat(f.NativePath)=0 then // read mode
if d.chmod(g.NativePath,d.mode)=0 then // set mode
// worked
end if
end if
```

Notes: Chmod() verifies that the process owner (user) either owns the file specified by path (or fd), or is the super- user. A mode is created from or'd permission bit masks like this:

IRWXU	&o0000700	RWX mask for owner
IRUSR	&o0000400	R for owner
IWUSR	&o0000200	W for owner
IXUSR	&o0000100	X for owner
IRWXG	&o0000070	RWX mask for group
IRGRP	&o0000040	R for group
IWGRP	&o0000020	W for group
IXGRP	&o0000010	X for group
IRWXO	&o0000007	RWX mask for other
IROTH	&o0000004	R for other
IWOTH	&o0000002	W for other
IXOTH	&o0000001	X for other
ISUID	&o0004000	set user id on execution
ISGID	&o0002000	set group id on execution
ISVTX	&o0001000	save swapped text even after use

The ISVTX (the sticky bit) indicates to the system which executable files are shareable (the default) and the system maintains the program text of the files in the swap area. The sticky bit may only be set by the super user on shareable executable files.

If mode ISVTX (the 'sticky bit') is set on a directory, an unprivileged user may not delete or rename files of other users in that directory. The sticky bit may be set by any user on a directory which the user owns or has appropriate permissions. For more details of the properties of the sticky bit, see sticky(8).

Writing or changing the owner of a file turns off the set-user-id and set-group-id bits unless the user is the super-user. This makes the system somewhat more secure by protecting set-user-id (set-group-id) files from remaining set-user-id (set-group-id) if they are modified, at the expense of a degree of compatibility.

You can type "man 2 chmod" on the Mac OS X terminal for more details.

Upon successful completion, a value of 0 is returned. Otherwise, -1 is returned.
Returns -2 on bad parameter or if function is not available.

Chmod() will fail and the file mode will be unchanged if:

ENOTDIR	A component of the path prefix is not a directory.
ENAMETOOLONG	A component of a pathname exceeded { NAME_MAX } characters, or an entire path name exceeded { PATH_MAX } characters.
ENOENT	The named file does not exist.
EACCES	Search permission is denied for a component of the path prefix.
ELOOP	Too many symbolic links were encountered in translating the pathname.
EPERM	The effective user ID does not match the owner of the file and the effective user ID is not the super-user.
EROFS	The named file resides on a read-only file system.
EFAULT	Path points outside the process's allocated address space.
EIO	An I/O error occurred while reading from or writing to the file system.

84.8.5 chown(path as string, uid as Integer, gid as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The owner ID and group ID of the file (or link) named by path is changed as specified by the arguments owner (uid) and group (gid).
Notes: The owner of a file may change the group to a group of which he or she is a member, but the change owner capability is restricted to the superuser.

Chown() clears the set-user-id and set-group-id bits on the file to prevent accidental or mischievous creation of set-user-id and set-group-id programs.

You can type "man 2 chmod" on the Mac OS X terminal for more details.

Upon successful completion, a value of 0 is returned. Otherwise, -1 is returned.
Returns -2 on bad parameter or if function is not available.

Chown() will fail and the file or link will be unchanged if:

84.8.6 error as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

ENOTDIR	A component of the path prefix is not a directory.
ENAMETOOLONG	A component of a pathname exceeded { NAME_MAX } characters, or an entire path name exceeded { PATH_MAX } characters.
ENOENT	The named file does not exist.
EACCES	Search permission is denied for a component of the path prefix.
ELOOP	Too many symbolic links were encountered in translating the pathname.
EPERM	The effective user ID is not the super-user.
EROFS	The named file resides on a read-only file system.
EFAULT	Path points outside the process's allocated addressspace.
EIO	An I/O error occurred while reading from or writing to the file system.

Function: Returns the error code from the last operation.
Notes: This function asks the operating system. It's not a property like in other classes.

Error codes:

Returns -2 if function is not available.

84.8.7 lstat(path as string) as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The stat function obtains information about the file pointed to by path.
Example:

```
// we use truechild to not resolve the symbol link
Var f as FolderItem = SpecialFolder.Desktop.trueChild("test.rtf")

Var c as new DarwinChmodMBS
if c.lstat(f.NativePath) = 0 then
// ok

Break // see values in debugger
else
MessageBox "failed"
end if
```

Notes: See stat for details.

84.8.8 stat(path as string) as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The stat function obtains information about the file pointed to by path.
Example:

```
Var d as DarwinChmodMBS
Var f as FolderItem

f=SpecialFolder.Desktop.Child("test")
d=new DarwinChmodMBS

if d.stat(f.NativePath)=0 then
MessageBox hex(d.mode)
end if
```

Notes: Read, write or execute permission of the named file is not required, but all directories listed in the path name leading to the file must be searchable.

Lstat() is like stat() except in the case where the named file is a symbolic link, in which case lstat() returns information about the link, while stat() returns information about the file the link references. Unlike other filesystem objects, symbolic links do not have an owner, group, access mode, times, etc. Instead, these attributes are taken from the directory that contains the link. The only attributes returned from an lstat() that refer to the symbolic link itself are the file type (S_IFLNK), size, blocks, and link count (always 1).

Information about the file is stored directly into the fields of the class if the function is successful.

You can type "man 2 stat" on the Mac OS X terminal for more details.

Upon successful completion, a value of 0 is returned. Otherwise, -1 is returned.
Returns -2 on bad parameter or if function is not available.

Stat() and lstat() will fail if:

84.8.9 Properties

84.8.10 blocks as Double

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Number of blocks allocated for the file.
Notes: The actual number of blocks allocated for the file in 512-byte units. As short symbolic links are

stored in the inode, this number may be zero.

Set by the stat and lstat function if it was successful.
(Read and Write property)

84.8.11 blocksize as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The optimal I/O block size for the file.
Notes: Set by the stat and lstat function if it was successful.
(Read and Write property)

84.8.12 dev as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The device inode where the file resides on.
Notes: Set by the stat and lstat function if it was successful.
(Read and Write property)

84.8.13 flags as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: User defined flags for the file.
Notes: Set by the stat and lstat function if it was successful.
(Read and Write property)

84.8.14 gen as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The file generation number.
Notes: Set by the stat and lstat function if it was successful.
(Read and Write property)

84.8.15 gid as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The group-id of the owner of the file.
Notes: Set by the stat and lstat function if it was successful.
(Read and Write property)

84.8.16 ino as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The inode's number of the file.
Notes: Set by the stat and lstat function if it was successful.
(Read and Write property)

84.8.17 mode as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The inode protection mode of the file.
Notes: Set by the stat and lstat function if it was successful.

Some Constants:

(Read and Write property)

84.8.18 nlink as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The number or hard links to the file.
Notes: Set by the stat and lstat function if it was successful.
(Read and Write property)

84.8.19 rdev as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The device type, for special file inode.

Notes: Set by the stat and lstat function if it was successful.
(Read and Write property)

84.8.20 size as Double

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The file size, in bytes.
Notes: Set by the stat and lstat function if it was successful.
(Read and Write property)

84.8.21 uid as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The user-id of the owner of the file.
Notes: Set by the stat and lstat function if it was successful.
(Read and Write property)

EPERM	1	Operation not permitted
ENOENT	2	No such file or directory
ESRCH	3	No such process
EINTR	4	Interrupted system call
EIO	5	Input/output error
ENXIO	6	Device not configured
E2BIG	7	Argument list too long
ENOEXEC	8	Exec format error
EBADF	9	Bad file descriptor
ECHILD	10	No child processes
EDEADLK	11	Resource deadlock avoided (11 was EAGAIN)
ENOMEM	12	Cannot allocate memory
EACCES	13	Permission denied
EFAULT	14	Bad address
ENOTBLK	15	Block device required
EBUSY	16	Device busy
EEXIST	17	File exists
EXDEV	18	Cross-device link
ENODEV	19	Operation not supported by device
ENOTDIR	20	Not a directory
EISDIR	21	Is a directory
EINVAL	22	Invalid argument
ENFILE	23	Too many open files in system
EMFILE	24	Too many open files
ENOTTY	25	Inappropriate ioctl for device
ETXTBSY	26	Text file busy
EFBIG	27	File too large
ENOSPC	28	No space left on device
ESPIPE	29	Illegal seek
EROFS	30	Read-only file system
EMLINK	31	Too many links
EPIPE	32	Broken pipe
math software		
EDOM	33	Numerical argument out of domain
ERANGE	34	Result too large
non-blocking and interrupt i/o		
EAGAIN	35	Resource temporarily unavailable
EWOULDBLOCK	EAGAIN	Operation would block
EINPROGRESS	36	Operation now in progress
EALREADY	37	Operation already in progress
ipc/network software – argument errors		
ENOTSOCK	38	Socket operation on non-socket
EDESTADDRREQ	39	Destination address required
EMSGSIZE	40	Message too long
EPROTOTYPE	41	Protocol wrong type for socket
ENOPROTOOPT	42	Protocol not available
EPROTONOSUPPORT	43	Protocol not supported
ESOCKTNOSUPPORT	44	Socket type not supported
ENOTSUP	45	Operation not supported
EOPNOTSUPP	ENOTSUP	Operation not supported
EPFNOSUPPORT	46	Protocol family not supported
EAFNOSUPPORT	47	Address family not supported by protocol family
EADDRINUSE	48	Address already in use
EADDRNOTAVAIL	49	Can't assign requested address
ipc/network software – operational errors		
ENETDOWN	50	Network is down
ENETUNREACH	51	Network is unreachable
ENETRESET	52	Network dropped connection on reset
ECONNABORTED	53	Software caused connection abort
ECONNRESET	54	Connection reset by peer
ENOBUFS	55	No buffer space available
EISCONN	56	Socket is already connected
ENOTCONN	57	Socket is not connected
ESHUTDOWN	58	Can't send after socket shutdown
ETOOMANYREFS	59	Too many references: can't splice
ETIMEDOUT	60	Operation timed out
ECONNREFUSED	61	Connection refused
ELOOP	62	Too many levels of symbolic links
ENAMETOOLONG	63	File name too long
should be rearranged		
EHOSTDOWN	64	Host is down

ENOTDIR	A component of the path prefix is not a directory.
ENAMETOOLONG	A component of a pathname exceeded { NAME_MAX } characters, or an entire path name exceeded { PATH_MAX } characters.
ENOENT	The named file does not exist.
EACCES	Search permission is denied for a component of the path prefix.
ELOOP	Too many symbolic links were encountered in translating the pathname.
EFAULT	Sb or name points to an invalid address.
EIO	An I/O error occurred while reading from or writing to the file system.

ISUID	0004000	set user id on execution
ISGID	0002000	set group id on execution
ISTXT	0001000	sticky bit
IRWXU	0000700	RWX mask for owner
IRUSR	0000400	R for owner
IWUSR	0000200	W for owner
IXUSR	0000100	X for owner
IRWXG	0000070	RWX mask for group
IRGRP	0000040	R for group
IWGRP	0000020	W for group
IXGRP	0000010	X for group
IRWXO	0000007	RWX mask for other
IROTH	0000004	R for other
IWOTH	0000002	W for other
IXOTH	0000001	X for other

84.9 class DarwinIFStatInterfaceMBS

84.9.1 class DarwinIFStatInterfaceMBS

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: A class for the statistics of one interface.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
Var it as DarwinIFStatInterfaceMBS = d.Item(0)
MessageBox it.name
```

Notes: All this integer properties are internally unsigned and they may overflow.
Your application may need to take care for this.
Blog Entries

- MacOSX plugin for iOS

84.9.2 Properties

84.9.3 Baudrate as UInt32

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: The linespeed.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
Var it as DarwinIFStatInterfaceMBS = d.Item(0)
MessageBox str(it.Baudrate)
```

Notes: (Read only property)

84.9.4 Collisions as UInt64

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: The number of collisions on csma interfaces.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
```

```
Var it as DarwinIFStatInterfaceMBS = d.Item(0)
MessageBox str(it.Collisions)
```

Notes: (Read only property)

84.9.5 InputBytes as UInt64

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: Total number of octets received.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
Var it as DarwinIFStatInterfaceMBS = d.Item(0)
MessageBox str(it.InputBytes)
```

Notes: (Read only property)

84.9.6 InputErrors as UInt64

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: The number of input errors on interface.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
Var it as DarwinIFStatInterfaceMBS = d.Item(0)
MessageBox str(it.InputErrors)
```

Notes: (Read only property)

84.9.7 InputMulticasts as UInt64

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: The number of packets received via multicast.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
```

```
Var it as DarwinIFStatInterfaceMBS = d.Item(0)
MessageBox str(it.InputMulticasts)
```

Notes: (Read only property)

84.9.8 InputPackets as UInt64

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: The number of packets received.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
Var it as DarwinIFStatInterfaceMBS = d.Item(0)
MessageBox str(it.InputPackets)
```

Notes: (Read only property)

84.9.9 MTU as UInt32

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: The maximum transmission unit.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
Var it as DarwinIFStatInterfaceMBS = d.Item(0)
MessageBox str(it.MTU)
```

Notes: Maximum size of a packet.
(Read only property)

84.9.10 Name as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: The name of the interface.
Example:

```
Var d as new DarwinIFStatMBS
```

```
call d.Update
Var it as DarwinIFStatInterfaceMBS = d.Item(0)
MessageBox it.Name
```

Notes: e.g. lo0 for localhost, en0 for the first ethernet interface, fw0 for the first firewire interface, etc. (Read and Write property)

84.9.11 OutputBytes as UInt64

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: Total number of octets sent.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
Var it as DarwinIFStatInterfaceMBS = d.Item(0)
MessageBox str(it.OutputBytes)
```

Notes: (Read only property)

84.9.12 OutputErrors as UInt64

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: The number of output errors.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
Var it as DarwinIFStatInterfaceMBS = d.Item(0)
MessageBox str(it.OutputErrors)
```

Notes: (Read only property)

84.9.13 OutputMulticasts as UInt64

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: The number of packets sent via multicast.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
Var it as DarwinIFStatInterfaceMBS = d.Item(0)
MessageBox str(it.OutputMulticasts)
```

Notes: (Read only property)

84.9.14 OutputPackets as UInt64

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: The number of packets sent.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
Var it as DarwinIFStatInterfaceMBS = d.Item(0)
MessageBox str(it.OutputPackets)
```

Notes: (Read only property)

84.9.15 PhysicalType as Integer

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: The physical network type.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
Var it as DarwinIFStatInterfaceMBS = d.Item(0)
MessageBox str(it.PhysicalType)
```

Notes: e.g., AUI, Thinnet, 10base-T, etc

Type is the type of device which includes 1 for ethernet and 6 for Wifi.
(Read and Write property)

84.9.16 Type as Integer

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: The network type.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
Var it as DarwinIFStatInterfaceMBS = d.Item(0)
MessageBox str(it.type)
```

Notes: e.g. ethernet, tokenring, etc

from if_types.h:

Interface types for benefit of parsing media address headers.
This list is derived from the SNMP list of ifTypes, currently documented in RFC1573.

84.10 class DarwinIFStatMBS

84.10.1 class DarwinIFStatMBS

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: A class for network interface throughput statistics.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
MessageBox str(d.Count)
```

Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.2pr1

84.10.2 Methods

84.10.3 Item(index as Integer) as DarwinIFStatInterfaceMBS

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: Returns the statistics for the given interface.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
MessageBox str(d.Item(0).InputBytes)
```

Notes: Index goes from 0 to count-1.

84.10.4 Update as boolean

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: Asks the system for new statistics.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
MessageBox str(d.Count)
```

Notes: Returns true on success.

84.10.5 Properties

84.10.6 Count as Integer

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: The number of interfaces in the item array.
Example:

```
Var d as new DarwinIFStatMBS
call d.Update
MessageBox str(d.Count)
```

Notes: (Read only property)

84.11 class DASessionMBS

84.11.1 class DASessionMBS

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The disk arbitration session class from Mac OS X.
Example:

```
// get notified when disks appear, e.g. a USB stick is plugged in
// MyDiskSession is a subclass of DASessionMBS with the events implemented.
// Session is a property of the window: Session As MyDiskSession
Session = New MyDiskSession

// in MyDiskSession:
Sub Appeared(disk As DADiskMBS) Handles Appeared
Var info As Dictionary = disk.Description
System.DebugLog "Disk appeared: " + disk.BSDName + " " + info.Lookup(DADiskMBS.kDADiskDescriptionVolumeNameKey, "").StringValue
End Sub

Sub Disappeared(disk As DADiskMBS) Handles Disappeared
System.DebugLog "Disk disappeared: " + disk.BSDName
End Sub
```

Notes: The session manages all the events and operations you may do on disks using Apple's Disk Arbitration framework.
Blog Entries

- MBS Xojo Plugins, version 25.6pr3

84.11.2 Methods

84.11.3 Constructor

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.

84.11.4 Eject(disk as DADiskMBS, options as Integer = 0)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Ejects the specified disk object.
Notes: disk: The disk object.
options: The eject options.
Calls Ejected event later with result.

84.11.5 IsClaimed(disk as DADiskMBS) as boolean

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Reports whether or not the disk is claimed.
Notes: disk: The disk object.
Returns true if the disk is claimed, otherwise false.

84.11.6 Mount(disk as DADiskMBS, path as string, options as Integer = 0)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Mounts the volume at the specified disk object.
Notes: disk: The disk object.
path: The mount path. Pass empty string for a "standard" mount path.
options: The mount options.
Calls Mounted event later.

84.11.7 MountWithArguments(disk as DADiskMBS, path as string, arguments() as string, options as Integer = 0)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Mounts the volume at the specified disk object, with the specified mount options.
Notes: disk: The disk object.
path: The mount path. Pass empty string for a "standard" mount path.
options: The mount options.
arguments: The list of mount options to pass to /sbin/mount -o.

84.11.8 Rename(disk as DADiskMBS, name as string, options as Integer = 0)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Renames the volume at the specified disk object.
Notes: disk: The disk object.
options: The rename options.

Calls later the Renamed event with result.

84.11.9 Unclaim(disk as DADiskMBS)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Unclaims the specified disk object.

84.11.10 Unmount(disk as DADiskMBS, options as Integer = 0)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Unmounts the volume at the specified disk object.
Notes: disk: The disk object.
options: The unmount options.
Calles Unmounted event later.

84.11.11 Properties

84.11.12 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

84.11.13 Events

84.11.14 Appeared(disk as DADiskMBS)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called when a disk appears.
Notes: disk: A disk object.

84.11.15 DescriptionChanged(disk as DADiskMBS, keys() as string)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called whenever a disk description has changed.
Notes: disk: A disk object.
keys: A list of changed keys.

84.11.16 Disappeared(disk as DADiskMBS)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called whenever a disk has disappeared.

84.11.17 Ejected(disk as DADiskMBS, dissenter as DADissenterMBS)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Event called after eject operation finished.
Notes: Disk: The disk object.
dissenter A dissenter object on failure or nil on success.

84.11.18 Mounted(disk as DADiskMBS, dissenter as DADissenterMBS)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Event called after mount operation finished.
Notes: disk: The disk object.
dissenter: A dissenter object on failure or nil on success.

84.11.19 Peek(disk as DADiskMBS)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A disk has been peeked.

84.11.20 Renamed(disk as DADiskMBS, dissenter as DADissenterMBS)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Called after the rename operation finished.
Notes: disk: The disk object.
dissenter: A dissenter object on failure or nil on success.

84.11.21 Unmounted(disk as DADiskMBS, dissenter as DADissenterMBS)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Called after unmount operation finished.
Notes: disk: The disk object.
dissenter: A dissenter object on failure or nil on success.

84.11.22 Constants

Claim Options

Constant	Value	Description
kDADiskClaimOptionDefault	0	Default

Eject Options

Constant	Value	Description
kDADiskEjectOptionDefault	0	Default

Mount Options

Constant	Value	Description
kDADiskMountOptionDefault	0	Default
kDADiskMountOptionWhole	1	Mount the volumes tied to the whole disk object.

Disk Options

Constant	Value	Description
kDADiskOptionDefault	0	Default
kDADiskOptionEjectUponLogout	1	Eject the disk upon logout.
kDADiskOptionMountAutomatic	16	Mount the disk upon appearance.
kDADiskOptionMountAutomaticNoDefer	32	Mount the disk upon appearance, even if no login.
kDADiskOptionPrivate	256	Hides the disk from callbacks.

Rename Options

Constant	Value	Description
kDADiskRenameOptionDefault	0	Default

Unmount Options

Constant	Value	Description
kDADiskUnmountOptionDefault	0	Default
kDADiskUnmountOptionForce	&h00080000	Unmount the volume even if files are still active.
kDADiskUnmountOptionWhole	0	Unmount the volumes tied to the whole disk object.

84.12 class DirectorySizeMBS

84.12.1 class DirectorySizeMBS

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for size information about a folder.
Example:

```
// chose a folder
Var f as FolderItem = SelectFolder

// calculate
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)

// display
MessageBox str(d.FilesCount)+" files in "+str(d.FolderCount)+" folder"
```

84.12.2 Methods

84.12.3 Add(d as DirectorySizeMBS)

MBS Util Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the values of the given directory size object to the current one.
Notes: Passing nil is okay and will be ignored.
This method was added to support counting several folders and adding the results to one central object.

84.12.4 close

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

84.12.5 Constructor

MBS Util Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

84.12.6 Update(folder as folderitem, recursive as boolean, ticks as Integer) as boolean

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Updates the class.
Example:

```
// chose a folder
Var f as FolderItem = SpecialFolder.Applications

// calculate
Var d as new DirectorySizeMBS

// update object
call d.Update(f, true, 0)

// display
```

MessageBox str(d.FilesCount)+" files and "+str(d.FolderCount)+" folders"

Notes: The folder specified is searched for files and folders. Normally you'd better use CalculateDirectorySizeMBS.

Ticks is the count of ticks (1/60th second) which must pass till time is given to other threads. (e.g. 10)
Returns true if successful.

If you call this function in a thread you can set the cancel property in a pushbutton event handler to stop this function.

84.12.7 Properties

84.12.8 Cancel as Boolean

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the Update function should stop as soon as possible.
Notes: (Read and Write property)

84.12.9 CompressedSize as UInt64

MBS Util Plugin, Plugin Version: 11.3, Platform: Windows, Targets: All.

Function: The size in bytes of all files.
Notes: If a file is compressed, we add here the compressed size.
If a file is not compressed, we add the normal logical size.
Only used on Windows and only with QueryCompressedSizes = true.
(Read only property)

84.12.10 CountBundlesAsItem as Boolean

MBS Util Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Whether to cound bundles as files.
Example:

```
// chose a folder
Var f as FolderItem = SpecialFolder.Applications

// calculate
```

```
Var d1 as new DirectorySizeMBS
d1.CountBundlesAsItem = true

call d1.Update(f, true, 0)

Var d2 as new DirectorySizeMBS
d2.CountBundlesAsItem = false

call d2.Update(f, true, 0)

// display
MessageBox "Normal count: "+str(D2.FilesCount)+" files and "+str(d2.FolderCount)+" folders"+EndOfLine+_
"With bundles as files: "+str(D1.FilesCount)+" files and "+str(d1.FolderCount)+" folders"
```

Notes: Bundles like applications are counted as a single file if this property is true or as a folder with files inside if this property is false.
Default is false.
(Read and Write property)

84.12.11 Directory as FolderItem

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The folder which was searched.
Notes: (Read and Write property)

84.12.12 FilesCount as UInt64

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of files counted.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox str(d.FilesCount)+" files"
```

Notes: FilesCount=VisibleFilesCount+HiddenFilesCount
(Read only property)

84.12.13 FolderCount as UInt64

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of folders counted.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox str(d.FolderCount)+" folder"
```

Notes: FolderCount=VisibleFolderCount+HiddenFolderCount
(Read only property)

84.12.14 HiddenCompressedSize as UInt64

MBS Util Plugin, Plugin Version: 11.3, Platform: Windows, Targets: All.

Function: The size in bytes of all hidden files.
Notes: If a file is compressed, we add here the compressed size.
If a file is not compressed, we add the normal logical size.
Only used on Windows and only with QueryCompressedSizes = true.
(Read only property)

84.12.15 HiddenFilesCount as Integer

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of hidden files counted.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox str(d.HiddenFilesCount)+" hidden files"
```

Notes: A file is invisible if the Invisible flag is set for this file.
(Read and Write property)

84.12.16 HiddenFolderCount as Integer

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of folders.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox str(d.HiddenFolderCount)+" hidden folders"
```

Notes: A file is invisible if the Invisible flag is set for this file.
(Read and Write property)

84.12.17 HiddenItemCount as UInt64

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of invisible items.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox str(d.HiddenItemCount)+" hidden items"
```

Notes: An item is invisible if the Invisible flag is set for this file.
HiddenItemCount=HiddenFolderCount+HiddenFilesCount
(Read only property)

84.12.18 HiddenLogicalDataForkSize as UInt64

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The logical size of the data forks of all hidden file in Bytes.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Logical data fork size of hidden files: "+Format(d.HiddenLogicalDataForkSize/1000000,"0")+"
MB"
```

Notes: (Read and Write property)

84.12.19 HiddenLogicalResourceForkSize as UInt64

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The logical size of the resource forks of all hidden file in Bytes.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Logical resource fork size of hidden files: "+Format(d.HiddenLogicalResourceForkSize/1000000,"0")+" MB"
```

Notes: (Read and Write property)

84.12.20 HiddenLogicalTotalSize as UInt64

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The logical size of the all forks of all hidden file in Bytes.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Logical total size of hidden files: "+Format(d.HiddenLogicalTotalSize/1000000,"0")+" MB"
```

Notes: (Read only property)

84.12.21 HiddenPhysicalDataForkSize as UInt64

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The physical size of the data forks of all hidden file in Bytes.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Physical data fork size of hidden files: "+Format(d.HiddenPhysicalDataForkSize/1000000,"0")+" MB"
```

Notes: (Read and Write property)

84.12.22 HiddenPhysicalResourceForkSize as UInt64

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The physical size of the resource forks of all hidden file in Bytes.

Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Physical resource fork size of hidden files: "+Format(d.HiddenPhysicalResourceForkSize/1000000,"0")+" MB"
```

Notes: (Read and Write property)

84.12.23 HiddenPhysicalTotalSize as UInt64

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The physical size of the both forks of all hidden file in Bytes.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Physical total size of hidden files: "+Format(d.HiddenPhysicalTotalSize/1000000,"0")+" MB"
```

Notes: (Read only property)

84.12.24 IgnoreHiddenFolderContent as Boolean

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: If this flag is set, the Update method will not count invisible files.
Notes: (Read and Write property)

84.12.25 ItemCount as UInt64

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items counted.
Example:

```
// chose a folder
Var f as FolderItem = SpecialFolder.Music
// calculate size
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(true,0)

// show number of files
```

MessageBox str(d.ItemCount)

Notes: ItemCount=VisibleItemCount+HiddenItemCount
(Read only property)

84.12.26 LogicalDataForkSize as UInt64

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The logical data fork size in Bytes.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Logical data fork size of all files: "+Format(d.LogicalDataForkSize/1000000,"0")+" MB"
```

Notes: (Read only property)

84.12.27 LogicalResourceForkSize as UInt64

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The logical resource fork size in Bytes.
Notes: Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Logical resource fork size of all files: "+Format(d.LogicalResourceForkSize/1000000,"0")+" MB"
(Read only property)

84.12.28 LogicalTotalSize as UInt64

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The logical total size in Bytes.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Logical total size of all files: "+Format(d.LogicalTotalSize/1000000,"0")+" MB"
```

Notes: (ResourceFork+DataFork)
(Read only property)

84.12.29 PhysicalDataForkSize as UInt64

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The physical data fork size in Bytes.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Physical data fork size of all files: "+Format(d.PhysicalDataForkSize/1000000,"0")+" MB"
```

Notes: (Read only property)

84.12.30 PhysicalResourceForkSize as UInt64

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The physical resource fork size in Bytes.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Physical resource fork size of all files: "+Format(d.PhysicalResourceForkSize/1000000,"0")+"
MB"
```

Notes: (Read only property)

84.12.31 PhysicalTotalSize as UInt64

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The physical total file size in Bytes.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Physical total size of all files: "+Format(d.VisiblePhysicalTotalSize/1000000,"0")+" MB"
```

Notes: (ResourceFork+DataFork)
That's what the Finder shows you.
(Read only property)

84.12.32 QueryCompressedSizes as Boolean

MBS Util Plugin, Plugin Version: 11.3, Platform: Windows, Targets: All.

Function: Whether to query compressed file sizes on Windows.
Notes: (Read and Write property)

84.12.33 RecursionLimit as Integer

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The limit for recursion.
Notes: Default is -1 for no limit.
Zero means we do not recurse into subfolders.
Other values define how many recursion levels are allowed.
(Read and Write property)

84.12.34 RecursionMaxLevel as Integer

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum levels of recursions we had for searching this folder.
Notes: (Read and Write property)

84.12.35 VisibleCompressedSize as UInt64

MBS Util Plugin, Plugin Version: 11.3, Platform: Windows, Targets: All.

Function: The size in bytes of all visible files.
Notes: If a file is compressed, we add here the compressed size.
If a file is not compressed, we add the normal logical size.
Only used on Windows and only with QueryCompressedSizes = true.
(Read only property)

84.12.36 VisibleFilesCount as Integer

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of visible files.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox str(d.VisibleFilesCount)+" visible files"
```

Notes: (Read and Write property)

84.12.37 VisibleFolderCount as Integer

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of visible folders.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox str(d.VisibleFolderCount)+" visible folders"
```

Notes: (Read and Write property)

84.12.38 VisibleItemCount as UInt64

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of visible items.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox str(d.VisibleItemCount)+" visible items"
```

Notes: Items are folders or files.
VisibleItemCount=VisibleFolderCount+VisibleFilesCount
(Read only property)

84.12.39 VisibleLogicalDataForkSize as UInt64

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The logical size of the data forks of all visible file in Bytes.

Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Logical data fork size of visible files: "+Format(d.VisibleLogicalDataForkSize/1000000,"0")+" MB"
```

Notes: (Read and Write property)

84.12.40 VisibleLogicalResourceForkSize as UInt64

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The logical size of the resource forks of all visible file in Bytes.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Logical resource fork size of visible files: "+Format(d.VisibleLogicalResourceForkSize/1000000,"0")+" MB"
```

Notes: (Read and Write property)

84.12.41 VisibleLogicalTotalSize as UInt64

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The logical size of the both forks of all visible file in Bytes.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Logical total size of visible files: "+Format(d.VisibleLogicalTotalSize/1000000,"0")+" MB"
```

Notes: (Read only property)

84.12.42 VisiblePhysicalDataForkSize as UInt64

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The physical size of the data forks of all visible file in Bytes.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Physical data fork size of visible files: "+Format(d.VisiblePhysicalDataForkSize/1000000,"0")+"
MB"
```

Notes: (Read and Write property)

84.12.43 VisiblePhysicalResourceForkSize as UInt64

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The physical size of the resource forks of all visible file in Bytes.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Physical resource fork size of visible files: "+Format(d.VisiblePhysicalResourceForkSize/1000000,"0")+"
MB"
```

Notes: (Read and Write property)

84.12.44 VisiblePhysicalTotalSize as UInt64

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The physical size of the both forks of all visible file in Bytes.
Example:

```
Var f as FolderItem = SpecialFolder.desktop
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
MessageBox "Physical total size of visible files: "+Format(d.VisiblePhysicalTotalSize/1000000,"0")+" MB"
```

Notes: (Read only property)

84.12.45 YieldTicks as Integer

MBS Util Plugin, Plugin Version: 7.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: How much time is given back to Xojo for other ticks.
Example:

```
Var d as DirectorySizeMBS // your DirectorySizeMBS object
```

```
d.YieldTicks=6 // only use 1/10th of a second
```

Notes: If value is greater than zero, the application will yield to another Xojo thread after the given number of ticks have passed. 60 ticks are one second. Using a small value can slow down processing a lot while a big value keeps your application not responding to mouse clicks.
If you use this property with e.g. 6 as the value, you may also want to use this method in a thread so you can handle mouse events or let Xojo redraw a progressbar.
(Read and Write property)

84.13 Globals

84.13.1 WindowsEjectVolumeMBS(driveLetter as string, byref status as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Unmounts and ejects the given drive.
Example:

```
// editfield1 has the drive letter

Var status as Integer
Var b as Boolean = WindowsEjectVolumeMBS(EditField1.text, status)

if b then
Select case status
case 1
MessageBox "Media in Drive "+EditField1.text+" has been ejected safely."
case 2
MessageBox "Media in Drive "+EditField1.text+" can be safely removed."
else
MessageBox "Failed?"
end Select
else
MessageBox "Failed."
end if
```

Notes: Status is set to 1 after an eject or 2 after an unmount without eject.
Returns true on success and false on failure.
Blog Entries

- MBS REALbasic Plugins, version 10.6pr4

84.13.2 ExchangeFilesMBS(first as folderitem, second as folderitem) as Integer

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Windows, Targets: All.

Function: Exchanges two files.
Example:

```
Var f1 as FolderItem = SpecialFolder.Desktop.Child("some picture.jpg")
Var f2 as FolderItem = SpecialFolder.Desktop.Child("another picture.jpg")

Var e as Integer = ExchangeFilesMBS(f1,f2)

MessageBox str(e) // show error code (0=no error)
```

Notes: On Mac swaps the contents of two files:

The ExchangeFilesMBS function allows programs to implement a "safe save" operation by creating and writing a complete new file and swapping the contents. An folderitem, alias, FSSpec, or FSRef that refers to the old file will now access the new data. The corresponding information in in-memory data structures are also exchanged.

Either or both files may have open access paths. After the exchange, the access path will refer to the opposite file's data (that is, to the same data it originally referred, which is now part of the other file).

On Windows files are renamed so they exchange their paths.

PS: Xojo does not notice the change, so the folderitems you pass should no longer be used. To access the file, please make new folderitem with parent.truechild(filename).

84.13.3 FolderItemToPathMBS(file as folderitem) as string

MBS MacOSX Plugin, Platform: macOS, Targets: All.

Function: Returns a unix path for the given folderitem.
Example:

```
// get the unix path of a folder, e.g. to pass it to a shell command
Var path As String = FolderItemToPathMBS(SpecialFolder.Desktop)
Var sh As New Shell
sh.Execute "ls -la " + path.ReplaceAll(" ", "\")
MessageBox sh.Result
```

Notes: Works only on Mac OS X.
This function is not very good, as Apple doesn't document for FSRefMakePath what path it returns, which encoding the path uses (maybe UTF8) and when it fails.
(e.g. it currently doesn't work for volumes)
Blog Entries

- MBS Plugins updated for Xojo 2019r2

84.13.4 NewFolderItemMBS(vRefNum as Integer, parID as Integer, name as String) as FolderItem

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Creates a FolderItem from a specified volume, the item's directory ID and its name.
Notes: The vRefNum with value -1 is the boot volume on Mac OS.
Blog Entries

- MBS Plugins updated for Xojo 2019r2
- MBS Xojo / Real Studio Plugins, version 16.4pr3

84.13.5 NewVolumeFolderItemMBS(vRefNum as Integer) as FolderItem

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Creates a FolderItem from a specified volume based on the volume reference number.
Example:

```
Var f as folderItem

f=NewVolumeFolderItemMBS(-1)
MessageBox f.NativePath
```

Notes: The vRefNum with value -1 is the boot volume on Mac OS.

Pass in the vRefNum of any mounted volume and it returns the Volume as a FolderItem.
Returns nil if the vRefNum was invalid.
Blog Entries

- MBS Plugins updated for Xojo 2019r2

84.13.6 PathToFolderItemMBS(path as string) as folderitem

MBS MacOSX Plugin, Platform: macOS, Targets: All.

Function: Returns a folderitem for the given unix path.
Example:

```
// get a folder item for a unix path
Var f As FolderItem = PathToFolderItemMBS("/Applications/Safari.app")
If f <>Nil And f.Exists Then MessageBox f.DisplayName + " found."
```

Notes: Works only on Mac OS X.
This function is not very good, as Apple doesn't document which path is exspected, which encoding the

path should use (maybe UTF8) and when it fails.
(e.g. it currently doesn't work for paths with "
textasciitilde " inside)
Blog Entries

- MBS Plugins updated for Xojo 2019r2

84.13.7 VolResolveIDMBS(volume as FolderItem, id as Integer) as FolderItem

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function:

return a FolderItem for a passed FileID or DirID. If the item can not be resolved, nil is returned instead.
The first parameter specified the volume where you want to resolve the ID on.
Example:

```
Var f,g as folderItem
f=SpecialFolder.Desktop
g=VolResolveIDMBS(f,f.MacDirID)
MessageBox f.NativePath
```

Notes:

This function returns a FolderItem for a passed FileID or DirID. If the item can not be resolved, nil is returned instead.
See also:

- 84.13.8 VolResolveIDMBS(vRefNum as Integer, id as Integer) as FolderItem 14064

84.13.8 VolResolveIDMBS(vRefNum as Integer, id as Integer) as FolderItem

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function:

return a FolderItem for a passed FileID or DirID. If the item can not be resolved, nil is returned instead.
The first parameter specified the volume where you want to resolve the ID on.
Example:

```
Var f,g as folderItem
f=SpecialFolder.Desktop
g=VolResolveIDMBS(f.macVRefNum,f.MacDirID)
MessageBox f.NativePath
```

Notes:

This function returns a FolderItem for a passed FileID or DirID. If the item can not be resolved, nil is returned instead.
The first parameter specified the volume where you want to resolve the ID on.There is a bug in RB which may say "type mistmatch error" in RB. Than use the other variant of that function.

84.13.9 AdminToolsMBS(domain as Integer) as folderitem

MBS Util Plugin, Plugin Version: 13.0, Platform: Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to the admin tools folder on Windows.
Notes: Returns on Windows the common admin tools folder for domain = -32766 and user's admin tools folder if domain = -32763.

84.13.10 CookiesMBS as folderitem

MBS Util Plugin, Plugin Version: 13.0, Platform: Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to the Cookie folder on Windows.

84.13.11 HistoryMBS as folderitem

MBS Util Plugin, Plugin Version: 13.0, Platform: Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to the history folder on Windows.

84.13.12 InternetCacheMBS as folderitem

MBS Util Plugin, Plugin Version: 13.0, Platform: Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to the Internet Cache folder on Windows.

84.13.13 WindowsStartMenuMBS(domain as Integer) as folderitem

MBS Util Plugin, Plugin Version: 13.0, Platform: Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to the start menu folder on Windows.

84.13.14 NewFolderItemFromAbsolutePathMBS(AbsolutePath as string) as FolderItem

MBS MacOSX Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates new folderitem based on absolute path.
Example:

```
// test absolute path
Var f As FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var p As String = f.AbsolutePath

Var g As FolderItem = NewFolderItemFromAbsolutePathMBS(p)
Var n As String = g.NativePath

MessageBox p+EndOfLine+n
```

84.13.15 SetCurrentWorkingDirectoryMBS(path as folderitem) as boolean

MBS Util Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the current working directory for the application.
Example:

```
MessageBox SpecialFolder.CurrentWorkingDirectory.NativePath
call SetCurrentWorkingDirectoryMBS(SpecialFolder.Desktop)
MessageBox SpecialFolder.CurrentWorkingDirectory.NativePath
```

Notes: This is sometimes needed if some library references files relative to this current working directory. Returns true on success and false on failure.
Blog Entries

- MBS Real Studio Plugins, version 11.3fc

84.13.16 SetDllDirectoryMBS(path as folderitem) as boolean

MBS Util Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: Adds a directory to the search path used to locate DLLs for the application.
Notes: The directory to be added to the search path. If this parameter is an empty string (""), the call removes the current directory from the default DLL search order. If this parameter is nil, the function restores the default search order.

If the function succeeds, the return value is true, otherwise false.

The SetDllDirectory function affects all subsequent calls to the LoadLibrary and LoadLibraryEx functions. It also effectively disables safe DLL search mode while the specified directory is in the search path.

After calling SetDllDirectory, the standard DLL search path is:

- The directory from which the application loaded.
- The directory specified by the SetDllDirectory function.
- The system directory. Use the GetSystemDirectory function to get the path of this directory. The name of this directory is System32.
- The Windows directory. Use the GetWindowsDirectory function to get the path of this directory.
- The directories that are listed in the PATH environment variable.

Each time the SetDllDirectory function is called, it replaces the directory specified in the previous SetDllDirectory call.

To revert to the standard search path used by LoadLibrary and LoadLibraryEx, call SetDllDirectory with nil. This also restores safe DLL search mode based on the SafeDllSearchMode registry value.

84.13.17 VolumeFreeSizePathMBS(Path as String) as Int64

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the size of the free space of the volume which the path points to.
Example:

```
// check whether there is enough free space on the disk before saving a big file
Var free As Int64 = VolumeFreeSizePathMBS(SpecialFolder.Documents.NativePath)
Var total As Int64 = VolumeSizePathMBS(SpecialFolder.Documents.NativePath)
MessageBox Format(free / 1e9, "0.0") + " GB of " + Format(total / 1e9, "0.0") + " GB free"
```

Notes: See also folderitem.VolumeFreeSizeMBS function.
Returns -1 on error.
For Windows, the path should point to directory and end with a backslash.
Blog Entries

- MBS Xojo Plugins, version 20.3pr1

84.13.18 VolumeSizePathMBS(Path as String) as Int64

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the size on the volume which the path points to.
Example:

```
// show the total size of the disk the documents folder is on
Var total As Int64 = VolumeSizePathMBS(SpecialFolder.Documents.NativePath)
MessageBox Format(total / 1e9, "0") + " GB"
```

Notes: See also folderitem.VolumeSizeMBS function.
Returns -1 on error.
For Windows, the path should point to directory and end with a backslash.

84.13.19 MountMBS(URL as String, Dest as string = "", Username as String, Password as String, Interactive as boolean = false, Prompt as boolean = false, byref ErrorCode as Integer, Threaded as boolean = false) as String

MBS MacOSX Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Mounts a network share.
Example:

```
// mount a SMB share and get the mount point
Var errorCode As Integer
Var mountPoint As String = MountMBS("smb://server.local/Share", "", "user", "password", False, False, errorCode)
If errorCode = 0 Then
MessageBox "Mounted at " + mountPoint
Else
MessageBox "Error " + errorCode.ToString
End If
```

Notes: Use on Server may require extra work as server runs with a different user account than you being logged in on the server machine. Permissions don't always allow things to be done.

URL: The URL for the network resource.
Dest: The destination path to mount to. If you leave this empty, the system decides. On Mac this can be the path to a folder where to mount new disk inside, e.g. to make a private mount. For Linux destination is required and must exists.
Username: The user name. If none is provided, system can take credentials from keychain, e.g. "test"
Password: The password to use, e.g. "test"
Interactive: Default is false for no dialogs. But you can pass true to have a dialog show up.
Prompt: Pass true on Windows to show dialog always to enter password.

When used on Linux the parameters are a little bit different:
Please pass source (URL), target (Dest), type (Username) and data (Password).
The dest path may need to be created first as new folder.

Returns the new path to the mounted disk.

Examples for URLs:

"afp://Ablage1.local" to mount on Mac via Apple Filesharing Protocol.
"\\myServer\public" to mount a disk on Windows.
"afp://192.168.168.250/Customer%20Data" to mount disk with space in name (URL encoded).
"\\192.168.0.242\ERP" mounts from Windows Server and e.g. pass "SRV2012\bob" as user name.

Threaded: If true and run on a Xojo thread, we yield time to other thread.

84.13.20 MountPathMBS(Path as String) as String

MBS MacOSX Plugin, Plugin Version: 18.3, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Queries mount path for a volume.
Example:

```
MessageBox MountPathMBS("/Volumes/Ablage2")
```

Notes: For a network mounted disk, you can query the original mount point.
May not work on Mac for AFP shares, but for SMB shares.
Returns empty path if no path is known.
See also:

- 84.13.21 MountPathMBS(Volume as FolderItem) as String 14070

84.13.21 MountPathMBS(Volume as FolderItem) as String

MBS MacOSX Plugin, Plugin Version: 18.3, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Queries mount path for a volume.
Example:

```
Var f as FolderItem = Volume(VolumeCount-1)

MessageBox MountPathMBS(f)
```

Notes: For a network mounted disk, you can query the original mount point.
May not work on Mac for AFP shares, but for SMB shares.
Returns empty path if no path is known.

84.13.24 GetDriveTypeMBS(path as string) as Integer

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Determines whether a disk drive is a removable, fixed, CD-ROM, RAM disk, or network drive.
Example:

```
if GetDriveTypeMBS("E:") = 4 then
MessageBox "network drive"
end if
```

Notes: Path: The root directory for the drive.

Possible values:

0	Unknown	The drive type cannot be determined.
1	Error	The root path is invalid; for example, there is no volume mounted at the specified path.
2	Removable	The drive has removable media; for example, a floppy drive, thumb drive, or flash card reader.
3	Fixed	The drive has fixed media; for example, a hard disk drive or flash drive.
4	Remote	The drive is a remote (network) drive.
5	CD-ROM	The drive is a CD-ROM drive.
6	RAM Disk	The drive is a RAM disk.

84.14 module ExtendedAttributesMBS

84.14.1 module ExtendedAttributesMBS

MBS MacOSX Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Targets: All.

Function: The module for working with extended attributes.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")

// keys starting with "com.apple.metadata:" are indexed by Spotlight
call ExtendedAttributesMBS.SetAttribute(f, "com.apple.metadata:test", "testvalue")
```

Notes: Linux support added for plugin version 16.4.
For Windows, please use LargeBinaryStreamMBS class to read/write streams.

84.14.2 Methods

84.14.3 Available as boolean

MBS MacOSX Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Targets: All.

Function: Returns true if extended attribute functions are available.

84.14.4 GetAttribute(path as folderitem, name as string, options as Integer = 0) as Variant

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Get an extended attribute value.
Example:

```
Var f As FolderItem = SpecialFolder.Desktop.Child("test.txt")
// query attribute
Var v As Variant = ExtendedAttributesMBS.GetAttribute(f, "com.apple.metadata:_kMDItemUserTags")

// plugin converts it to Xojo data types with variants
If v <>Nil Then
// tags should be an array of Variant with strings
Var a() As Variant = v

For Each s As String In a
MessageBox s
Next
End If
```

Notes: On Mac the extended attributes are normally formatted property lists, so please use the high level functions SetAttribute/GetAttribute. Raw functions are better for things like resourcefork or FinderInfo.

Extended attributes extend the basic attributes of files and directories in the file system. They are stored as name:data pairs associated with file system objects (files, directories, symlinks, etc).

The GetAttribute function retrieves all bytes of data from the extended attribute identified by name associated with path.

An extended attribute's name is a simple UTF-8 string. position specifies an offset within the extended attribute. In the current implementation, this argument is only used with the resource fork attribute. For all other extended attributes, this parameter is reserved and should be zero.

On success, returns the data associated with name.

Options specify options for retrieving extended attributes:

On success, the value is returned. On failure, nil is returned and lasterror is set.
See also:

- 84.14.5 GetAttribute(path as string, name as string, options as Integer = 0) as Variant 14075

Constant	Description
kNoFollow	Do not follow symbolic links. getxattr() normally returns information from the target of path if it is a symbolic link. With this option, GetAttribute will return extended attribute data from the symbolic link instead.
kShowCompression	GetAttribute will return HFS Plus Compression extended attribute name (if present) for the file referred to by path or fd.

84.14.5 GetAttribute(path as string, name as string, options as Integer = 0) as Variant

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Get an extended attribute value.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var v as Variant = ExtendedAttributesMBS.GetAttribute(f, ExtendedAttributesMBS.kAttributeNameFinderComment)
break // see comment string in debugger
```

Notes: On Mac the extended attributes are normally formatted property lists, so please use the high level functions SetAttribute/GetAttribute. Raw functions are better for things like resourcefork or FinderInfo.

Extended attributes extend the basic attributes of files and directories in the file system. They are stored as name:data pairs associated with file system objects (files, directories, symlinks, etc).

The GetAttribute function retrieves all bytes of data from the extended attribute identified by name associated with path.

Options specify options for retrieving extended attributes:

On success, the value is returned. On failure, nil is returned and lasterror is set.
See also:

- 84.14.4 GetAttribute(path as folderitem, name as string, options as Integer = 0) as Variant 14074

Constant	Description
kNoFollow	Do not follow symbolic links. getxattr() normally returns information from the target of path if it is a symbolic link. With this option, GetAttribute will return extended attribute data from the symbolic link instead.
kShowCompression	GetAttribute will return HFS Plus Compression extended attribute name (if present) for the file referred to by path or fd.

84.14.6 GetRawAttribute(path as folderitem, name as string, options as Integer = 0) as memoryblock

MBS MacOSX Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Targets: All.

Function: Get an extended attribute value.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var value as MemoryBlock = ExtendedAttributesMBS.GetRawAttribute(f, ExtendedAttributesMBS.kAttributeNameFinderInfo)
break // see in debugger
```

Notes: On Mac the extended attributes are normally formatted property lists, so please use the high level functions SetAttribute/GetAttribute. Raw functions are better for things like resourcefork or FinderInfo.

Extended attributes extend the basic attributes of files and directories in the file system. They are stored as name:data pairs associated with file system objects (files, directories, symlinks, etc).

The GetRawAttribute function retrieves all bytes of data from the extended attribute identified by name associated with path.

An extended attribute's name is a simple UTF-8 string. position specifies an offset within the extended attribute. In the current implementation, this argument is only used with the resource fork attribute. For all other extended attributes, this parameter is reserved and should be zero.

On success, returns the data associated with name.

Options specify options for retrieving extended attributes:
kNoFollow: Do not follow symbolic links. getxattr() normally returns information from the target of path if it is a symbolic link. With this option, GetRawAttribute will return extended attribute data from the symbolic link instead.
kShowCompression: GetRawAttribute will return HFS Plus Compression extended attribute name (if present) for the file referred to by path or fd.

On success, the value is returned. On failure, nil is returned and lasterror is set.
See also:

On success, the value is returned. On failure, nil is returned and lasterror is set.
See also:

- 84.14.6 GetRawAttribute(path as folderitem, name as string, options as Integer = 0) as memoryblock 14076

84.14.8 LastError as Integer

MBS MacOSX Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Targets: All.

Function: The last error code.
Notes: Possible error values:

EPERM	1	Attributes cannot be associated with this type of object. For example, attributes are not allowed for resource forks.
EIO	5	An I/O error occurred while reading from or writing to the file system.
E2BIG	7	The data size of the extended attribute is too large.
EACCES	13	Permissions denied
EFAULT	14	path or name points to an invalid address.
EEXIST	17	options contains XATTR_CREATE and the named attribute already exists.
ENOTDIR	20	A component of path's prefix is not a directory.
EISDIR	21	path or fd do not refer to a regular file and the attribute in question is only applicable to files. Similar to EPERM.
EINVAL	22	name or options is invalid. name must be valid UTF-8 and options must make sense.
ENOSPC	28	Not enough space left on the file system.
EROFS	30	The file system is mounted read-only.
ERANGE	34	The data size of the attribute is out of range (some attributes have size restrictions).
ENOTSUP	45	The file system does not support extended attributes or has the feature disabled.
ELOOP	62	Too many symbolic links were encountered resolving path.
ENAMETOOLONG	63	Name exceeded XATTR_MAXNAMELEN UTF-8 bytes, or a component of path exceeded NAME_MAX characters, or the entire path exceeded PATH_MAX characters.
ENOATTR	93	options is set to kReplace and the named attribute does not exist.

84.14.9 LastErrorMessage as string

MBS MacOSX Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Targets: All.

Function: The error message for the last error.

84.14.10 ListAttributes(path as folderitem, Options as Integer = 0) as string()

MBS MacOSX Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Targets: All.

Function: List extended attribute names.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var names() as string = ExtendedAttributesMBS.ListAttributes(f, ExtendedAttributesMBS.kNoFollow+ExtendedAttributesMBS.kShowCompression)
MessageBox Join(names, EndOfLine)
```

Notes: Extended attributes extend the basic attributes associated with files and directories in the file system. They are stored as name:data pairs associated with file system objects (files, directories, symlinks, etc).

ListAttributes retrieves a list of names of extended attributes associated with the given path in the file system. The list will only include names of extended attributes to which the calling process has access.

Options controls how the attribute list is generated:

kNoFollow: Do not follow symbolic links. ListAttributes normally lists attributes of the target of path if it is a symbolic link. With this option, ListAttributes will list attributes of the link itself.
kShowCompression: ListAttributes will list HFS Plus Compression extended attribute(s) (if present) for the file referred to by path.

On success returns array with names. If no accessible extended attributes are associated with the given path, the function returns empty array. Lasterror is set.
See also:

- 84.14.11 ListAttributes(path as string, Options as Integer = 0) as string() 14079

84.14.11 ListAttributes(path as string, Options as Integer = 0) as string()

MBS MacOSX Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Targets: All.

Function: List extended attribute names.
Notes: Extended attributes extend the basic attributes associated with files and directories in the file system. They are stored as name:data pairs associated with file system objects (files, directories, symlinks, etc).

ListAttributes retrieves a list of names of extended attributes associated with the given path in the file system. The list will only include names of extended attributes to which the calling process has access.

Options controls how the attribute list is generated:

kNoFollow: Do not follow symbolic links. ListAttributes normally lists attributes of the target of path if it is a symbolic link. With this option, ListAttributes will list attributes of the link itself.
kShowCompression: ListAttributes will list HFS Plus Compression extended attribute(s) (if present) for the file referred to by path.

On success returns array with names. If no accessible extended attributes are associated with the given path, the function returns empty array. Lasterror is set.
See also:

- 84.14.10 ListAttributes(path as folderitem, Options as Integer = 0) as string() 14078

84.14.12 RemoveAttribute(path as folderitem, name as string, options as Integer = 0) as boolean

MBS MacOSX Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Targets: All.

Function: Remove an extended attribute value.
Notes: Extended attributes extend the basic attributes associated with files and directories in the file system. They are stored as name:data pairs associated with file system objects (files, directories, symlinks, etc).

RemoveAttribute deletes the extended attribute name associated with path.

An extended attribute's name is a simple UTF-8 string. Options is a bit mask specifying various options:

kNoFollow: Do not follow symbolic links. Normally, removexattr() acts on the target of path if it is a symbolic link. With this option, RemoveAttribute will act on the link itself.
kShowCompression: RemoveAttribute will remove HFS Plus Compression extended attribute name (if present) for the file referred to by path or fd.

On success, true is returned. On failure, false is returned and the lasterror value is set.
See also:

- 84.14.13 RemoveAttribute(path as string, name as string, options as Integer = 0) as boolean 14080

84.14.13 RemoveAttribute(path as string, name as string, options as Integer = 0) as boolean

MBS MacOSX Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Targets: All.

Function: Remove an extended attribute value.
Notes: Extended attributes extend the basic attributes associated with files and directories in the file system. They are stored as name:data pairs associated with file system objects (files, directories, symlinks, etc).

RemoveAttribute deletes the extended attribute name associated with path.

An extended attribute's name is a simple UTF-8 string. Options is a bit mask specifying various options:

kNoFollow: Do not follow symbolic links. Normally, removexattr() acts on the target of path if it is a symbolic link. With this option, RemoveAttribute will act on the link itself.
kShowCompression: RemoveAttribute will remove HFS Plus Compression extended attribute name (if present) for the file referred to by path or fd.

On success, true is returned. On failure, false is returned and the lasterror value is set.

See also:

- 84.14.12 RemoveAttribute(path as folderitem, name as string, options as Integer = 0) as boolean 14080

84.14.14 SetAttribute(path as folderitem, name as string, data as Variant, options as Integer = 0) as boolean

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Set an extended attribute value.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
call ExtendedAttributesMBS.SetAttribute(f, ExtendedAttributesMBS.kAttributeNameFinderComment, "Test Comment")
```

Notes: On Mac the extended attributes are normally formatted property lists, so please use the high level functions SetAttribute/GetAttribute. Raw functions are better for things like resourcefork or FinderInfo.

Extended attributes extend the basic attributes associated with files and directories in the file system. They are stored as name:data pairs associated with file system objects (files, directories, symlinks, etc).

SetAttribute associates name and data together as an attribute of path.

An extended attribute's name is a simple UTF-8 string. Data is a memoryblock with the data and contains textual or binary data to be associated with the extended attribute. Position specifies the offset within the extended attribute. In the current implementation, only the resource fork extended attribute makes use of this argument. For all others, position is reserved and should be set to zero.

Options controls how the attribute is set:

kNoFollow	Do not follow symbolic links. SetAttribute normally sets attributes on the target of path if it is a symbolic link. With this option, SetAttribute will act on the link itself.
kCreate	Fail if the named attribute already exists.
kReplace	Fail if the named attribute does not exist. Failure to specify kReplace or kCreate allows creation and replacement.

On some filesystems, such as HFS+, setting the extended attribute com.apple.ResourceFork will update the modification time of the file.

Returns true on success and false on failure. Lasterror is set.
You may need to inform other applications like Finder that file changed and attributes need to be read.
See also:

- 84.14.15 SetAttribute(path as string, name as string, data as Variant, options as Integer = 0) as boolean 14082

84.14.15 SetAttribute(path as string, name as string, data as Variant, options as Integer = 0) as boolean

MBS MacOSX Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Set an extended attribute value.
Notes: On Mac the extended attributes are normally formatted property lists, so please use the high level functions SetAttribute/GetAttribute. Raw functions are better for things like resourcefork or FinderInfo.

84.14.18 Constants

Constants

Constant	Value	Description
kAttributeNameFinderComment	"com.apple.metadata:kMDItemFinderComment"	The attribute name for the Finder
kAttributeNameFinderInfo	"com.apple.FinderInfo"	The attribute name for the Finder
kAttributeNameResourceFork	"com.apple.ResourceFork"	The attribute name for the resourc

Flags

Constant	Value	Description
kCreate	2	Fail if the named attribute already exists.
kNoDefault	16	
kNoFollow	1	Do not follow symbolic links. ListAttributes normally lists attributes of the target of path if it is a symbolic link. With this option, ListAttributes will list attributes of the link itself.
kNoSecurity	8	
kReplace	4	Fail if the named attribute does not exist. Failure to specify kReplace or kCreate allows creation and replacement.
kShowCompression	32	ListAttributes will list HFS Plus Compression extended attribute(s) (if present) for the file referred to by path.

84.15 class FileListMBS

84.15.1 class FileListMBS

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a list of files.
Example:

```
// list the files in the documents folder with their sizes
Var folder As FolderItem = SpecialFolder.Documents
Var list As New FileListMBS(folder, "", FileListMBS.SkipFolders + FileListMBS.SkipHidden)

If Not list.OK Then
MessageBox "Failed to read folder."
Return
End If

list.SortByFileName

Var lines() As String
For i As Integer = 0 To list.Count - 1
lines.Add list.Name(i) + ": " + list.LogicalDataLength(i).ToString + " bytes"
Next

MessageBox list.Count.ToString + " files" + EndOfLine + String.FromArray(lines, EndOfLine)
```

Notes: This class is made to get a list of files in a folder faster than by using a folderitem.

84.15.2 Methods

84.15.3 AttributeModificationDate(index as Integer) as Double

MBS Util Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The attribute modification date of this file or directory.
Notes: On Mac OS the UTC date (+0 time zone)
Raises an exception if index is out of bounds. Index is zero based.
See also:

- 84.15.4 AttributeModificationDate(index as Integer, UTC as boolean) as Date 14087

84.15.4 AttributeModificationDate(index as Integer, UTC as boolean) as Date

MBS Util Plugin, Plugin Version: 13.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The attribute modification date of this file or directory.
Notes: Either in UTC time zone or in local time zone.
Raises an exception if index is out of bounds. Index is zero based.
See also:

- 84.15.3 AttributeModificationDate(index as Integer) as Double 14087

84.15.5 AttributeModificationDateTime(index as integer, UTC as boolean) as DateTime

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The attribute modification date of this file or directory.
Notes: Either in UTC time zone or in local time zone.
Raises an exception if index is out of bounds. Index is zero based.

84.15.6 BackupDate(index as Integer) as Double

MBS Util Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The backup date of this file or directory.
Notes: On Mac OS the UTC date (+0 time zone)
See also:

- 84.15.7 BackupDate(index as Integer, UTC as boolean) as Date 14088

84.15.7 BackupDate(index as Integer, UTC as boolean) as Date

MBS Util Plugin, Plugin Version: 13.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The backup date of this file or directory.
Notes: Either in UTC time zone or in local time zone.
Raises an exception if index is out of bounds. Index is zero based.
See also:

- 84.15.6 BackupDate(index as Integer) as Double 14087

84.15.8 BackupDateTime(index as integer, UTC as boolean) as DateTime

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The backup date of this file or directory.
Notes: Either in UTC time zone or in local time zone.
Raises an exception if index is out of bounds. Index is zero based.

84.15.9 CFURL(index as integer) as Variant

MBS Util Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: Queries CFURLMBS object for an entry.
Notes: Returns nil if no CFURL is kept for this item.
Raises an exception if index is out of bounds. Index is zero based.

84.15.10 Close

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

84.15.11 Constructor

MBS Util Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Targets: All.

Function: A dummy constructor used only for automatic plugin testing.
See also:

- 84.15.12 Constructor(filelist as FileListMBS, index as Integer, WinFilter as string = """, SkipMode as Integer = 0) 14089
- 84.15.13 Constructor(folder as folderitem, WinFilter as string = """, SkipMode as Integer = 0) 14090
- 84.15.14 Constructor(Path as String, WinFilter as string = """, SkipMode as Integer = 0) 14090

84.15.12 Constructor(filelist as FileListMBS, index as Integer, WinFilter as string = """, SkipMode as Integer = 0)

MBS Util Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor which creates a new file list based on item in a given file list.
Example:

```
Var f1 as new FileListMBS(SpecialFolder.UserHome)
'MessageBox f1.path

// search first index of a visible folder
Var IndexOfDirectory as integer = 0
while f1.Directory(IndexOfDirectory) = false or f1.Visible(IndexOfDirectory) = false
IndexOfDirectory = IndexOfDirectory + 1
wend

// list that folder
Var f2 as new FileListMBS(f1, IndexOfDirectory)
'MessageBox f2.path

// show first file and path
MessageBox f2.Name(0)+EndOfLine+f2.ItemPath(0)
```

Notes: If count is 0 after the contrustor the folder is invalid or empty.
On Windows the WinFilter allows you to pass a custom filter like "*.txt" to only find some files there.

SkipMode, added in version 20.1, allows you to skip some files from being part of the file list. Please use BitwiseOr() to combine Skip flags, e.g. BitwiseOr(SkipHidden, SkipFolders) returns only visible files.
See also:

- 84.15.11 Constructor 14089
- 84.15.13 Constructor(folder as folderitem, WinFilter as string = """, SkipMode as Integer = 0) 14090

- 84.15.14 Constructor(Path as String, WinFilter as string = """, SkipMode as Integer = 0) 14090

84.15.13 Constructor(folder as folderitem, WinFilter as string = """, SkipMode as Integer = 0)

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor which creates a new file list based on the folder.
Notes: If count is 0 after the contrustor the folder is invalid or empty.
On Windows the WinFilter allows you to pass a custom filter like "*.txt" to only find some files there.

SkipMode, added in version 20.1, allows you to skip some files from being part of the file list. Please use BitwiseOr() to combine Skip flags, e.g. BitwiseOr(SkipHidden, SkipFolders) returns only visible files.
See also:

- 84.15.11 Constructor 14089
- 84.15.12 Constructor(filelist as FileListMBS, index as Integer, WinFilter as string = """, SkipMode as Integer = 0) 14089
- 84.15.14 Constructor(Path as String, WinFilter as string = """, SkipMode as Integer = 0) 14090

84.15.14 Constructor(Path as String, WinFilter as string = """, SkipMode as Integer = 0)

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor which creates a new file list based on the directory path.
Notes: If count is 0 after the contrustor the directory path is invalid or empty.
On Windows the WinFilter allows you to pass a custom filter like "*.txt" to only find some files there.

SkipMode, added in version 20.1, allows you to skip some files from being part of the file list. Please use BitwiseOr() to combine Skip flags, e.g. BitwiseOr(SkipHidden, SkipFolders) returns only visible files.
See also:

- 84.15.11 Constructor 14089
- 84.15.12 Constructor(filelist as FileListMBS, index as Integer, WinFilter as string = """, SkipMode as Integer = 0) 14089
- 84.15.13 Constructor(folder as folderitem, WinFilter as string = """, SkipMode as Integer = 0) 14090

84.15.15 CreationDate(index as Integer) as Double

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Windows, Targets: All.

Function: The creation date.
Notes: On Mac OS the UTC date (+0 time zone)
On Windows looks like local timezone.
See also:

- 84.15.16 CreationDate(index as Integer, UTC as boolean) as Date 14091

84.15.16 CreationDate(index as Integer, UTC as boolean) as Date

MBS Util Plugin, Plugin Version: 13.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The creation date.
Notes: Either in UTC time zone or in local time zone.
Raises an exception if index is out of bounds. Index is zero based.
See also:

- 84.15.15 CreationDate(index as Integer) as Double 14090

84.15.17 CreationDateTime(index as integer, UTC as boolean) as DateTime

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The creation date.
Notes: Either in UTC time zone or in local time zone.
Raises an exception if index is out of bounds. Index is zero based.

84.15.18 Creator(index as Integer) as string

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The Mac Creator code of the item with the given index.
Notes: Always "" on Windows and Linux.
Raises an exception if index is out of bounds. Index is zero based.

Stopped working on macOS Monterey and newer since Apple deprecated the API long ago.

84.15.19 Directory(index as Integer) as boolean

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the item with the given index is a folder.
Notes: True if it is a folder and false if it is a file.

Raises an exception if index is out of bounds. Index is zero based.

84.15.20 DisplayName(index as Integer) as string

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The display name of the item with the given index.
Notes: Asks the System for the display name of the item. Returns the normal name on any error.

As this call may cost quite some CPU time you may cache the value if you need it more often.

May return a Unicode string, so be carefull with encoding.
Returns "" on any error.

Raises an exception if index is out of bounds. Index is zero based.

84.15.21 FinderFlags(index as Integer) as Integer

MBS Util Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Finder flags from Mac OS.
Notes: On Windows and Linux value is 0.

The flag value is a set of bits with the following meaning:

bit 15	value &H8000	isAlias
bit 14	value &H4000	isInvisible
bit 13	value &H2000	hasBundle (has a BNDL resource)
bit 12	value &H1000	nameLocked
bit 11	value &H0800	isStationary
bit 10	value &H0400	hasCustomIcon
bit 8	value &H0100	hasBeenInited (Finder has seen the file since it has been created)
bit 7	value &H0080	hasNoINITs (there is no INIT rsrc in the Extension file)
bit 6	value &H0040	isShared
bits 1-3	value &H000E	color (as a 3-bit value from 0-7)

84.15.22 FSRef(index as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The FSRef used for this item.
Notes: Returns nil if no FSRef is kept for this item.
On Mac OS there is a FSSpec or (FSRef and HFSUniStr255).
Raises an exception if index is out of bounds. Index is zero based.

84.15.23 HFSUniStr255(index as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The HFSUniStr255 used for this item.
Notes: Returns nil if no HFSUniStr255 is kept for this item.
On Mac OS there is a FSSpec or (FSRef and HFSUniStr255).
Raises an exception if index is out of bounds. Index is zero based.

84.15.24 IsBundle(index as Integer) as Boolean

MBS Util Plugin, Plugin Version: 6.1, Platforms: macOS, Windows, Targets: All.

Function: Queries using LaunchServices whether this item is a folder and the root of a bundle.
Example:

```
Protected Sub Dir(f as FolderItem)
Var l as FileListMBS
Var i,c as Integer

// search subfolders and find bundles

l=new FileListMBS(f)
c=l.Count-1
for i=0 to c
// if bundle, show it in listbox
if l.IsBundle(i) then
ListBox1.AddRow l.Item(i).NativePath
elseif l.Directory(i) then
// if sub folder, browse it
dir l.Item(i)
end if
next
End Sub
```

Notes: On Windows, Linux and Mac OS Classic always false.

84.15.25 IsHardLinked(index as Integer) as boolean

MBS Util Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Targets: All.

Function: Whether the file is a hard link.
Notes: If two directory entries point to the same hard disc space, you have a file which has two directory entries, but only one storage.

This function returns true for files in a Time Machine backup which did not change since the last backup and share their disc space with the other backups.

Raises an exception if index is out of bounds. Index is zero based.

84.15.26 Item(index as Integer) as folderitem

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a folderitem for the item with the given index.
Notes: Returns nil on any error.
The reason why you use this class is to avoid makeing folderitems which is slow, so don't use this function too often.
Raises an exception if index is out of bounds. Index is zero based.

84.15.27 ItemPath(index as Integer) as string

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The native file path for an item.

84.15.28 LastAccessDate(index as Integer) as Double

MBS Util Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last access date of this file or directory.
Notes: On Mac OS the UTC date (+0 time zone)
Raises an exception if index is out of bounds. Index is zero based.

To query Spotlight's Last Open day, please check the FAQ for sampel code.
See also:

- 84.15.29 LastAccessDate(index as Integer, UTC as boolean) as Date

84.15.29 LastAccessDate(index as Integer, UTC as boolean) as Date

MBS Util Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The last access date of this file or directory.
Notes: Either in UTC time zone or in local time zone.
Raises an exception if index is out of bounds. Index is zero based.
To query Spotlight's Last Open day, please check the FAQ for sample code.
See also:

- 84.15.28 LastAccessDate(index as Integer) as Double 14094

84.15.30 LastAccessDateTime(index as integer, UTC as boolean) as DateTime

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last access date of this file or directory.
Notes: Either in UTC time zone or in local time zone.
Raises an exception if index is out of bounds. Index is zero based.
To query Spotlight's Last Open day, please check the FAQ for sample code.

84.15.31 LogicalDataLength(index as Integer) as Int64

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The logical file data length for the item with the given index.
Notes: Same value as folderitem.length, but works with files >2GB.
Raises an exception if index is out of bounds. Index is zero based.

84.15.32 LogicalResourceLength(index as Integer) as Int64

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The logical resource length of the item with the given index.
Notes: Raises an exception if index is out of bounds. Index is zero based.

84.15.33 ModificationDate(index as Integer) as Double

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The modification date.
Notes: On Mac OS the UTC date (+0 time zone)

On Windows looks like local timezone.
Raises an exception if index is out of bounds. Index is zero based.
See also:

- 84.15.34 ModificationDate(index as Integer, UTC as boolean) as Date 14096

84.15.34 ModificationDate(index as Integer, UTC as boolean) as Date

MBS Util Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The modification date.
Notes: Either in UTC time zone or in local time zone.
Raises an exception if index is out of bounds. Index is zero based.
See also:

- 84.15.33 ModificationDate(index as Integer) as Double 14095

84.15.35 ModificationDateTime(index as integer, UTC as boolean) as DateTime

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The modification date.
Notes: Either in UTC time zone or in local time zone.
Raises an exception if index is out of bounds. Index is zero based.

84.15.36 Name(index as Integer) as string

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the item with the given index.
Notes: May return a Unicode string, so be carefull with encoding.
Returns "" on any error.
Raises an exception if index is out of bounds. Index is zero based.

84.15.37 NodeID(index as Integer) as Int64

MBS Util Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Targets: All.

Function: The Mac node ID for the given file or directory.
Notes: The node id is zero on Windows and Linux.

Raises an exception if index is out of bounds. Index is zero based.

84.15.38 ParentDirectoryID(index as Integer) as Int64

MBS Util Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Targets: All.

Function: The Mac ID for the parent directory.
Notes: Parent Directory ID is zero on Windows and Linux.
Raises an exception if index is out of bounds. Index is zero based.

84.15.39 PhysicalDataLength(index as Integer) as Int64

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The physical data length of the item with the given index.
Notes: Returns 0 on any error.
Raises an exception if index is out of bounds. Index is zero based.

84.15.40 PhysicalResourceLength(index as Integer) as Int64

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The physical resource length of the item with the given index.
Notes: Value is always 0 on Windows.
Returns 0 on any error.
Raises an exception if index is out of bounds. Index is zero based.

84.15.41 SortByCreationDate

MBS Util Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sorts items in list by creation date.

84.15.42 SortByFileName

MBS Util Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sorts items in list by file names.

84.15.43 SortByModificationDate

MBS Util Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sorts items in list by modification date.

84.15.44 TrueItem(index as Integer) as folderitem

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a folderitem for the item with the given index.
Notes: Returns nil on any error.
The reason why you use this class is to avoid makeing folderitems which is slow, so don't use this function too often. e.g. good if you just take 5 folderitems for 20000 files by filtering.

TrueItem will use GetTrueFolderItem so the link/alias files are not resolved by Xojo.
Due to bugs in Xojo, you may still get alias resolved.

84.15.45 Type(index as Integer) as string

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The Mac Type code of the item with the given index.
Notes: Always "" on Windows and Linux.
Raises an exception if index is out of bounds. Index is zero based.

Stopped working on macOS Monterey and newer since Apple deprecated the API long ago.

84.15.46 Visible(index as Integer) as boolean

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the item with the given index is visible.
Notes: On Mac OS X, files with name starting with "." are considered to be invisible.
False on any error.
Raises an exception if index is out of bounds. Index is zero based.

84.15.47 WinFileAttributes(index as Integer) as Integer

MBS Util Plugin, Plugin Version: 6.1, Platforms: macOS, Windows, Targets: All.

Function: The file attributes for this file on Windows.
Notes: Value is 0 on other platforms.
Raises an exception if index is out of bounds. Index is zero based.

84.15.48 Properties

84.15.49 Cancel as Boolean

MBS Util Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tells FileListMBS to stop gathering files.
Notes: To be used with threaded flag to stop background threads from working on directory listings soon. You may want to set FileListMBS.cancel to true in app.CancelClose when you let the application has a running thread, so you can quit properly.

The constructors set cancel = false to make sure they work.
(Read and Write property)

84.15.50 Count as Integer

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items found.
Notes: So index goes from 0 to count-1 in all functions.
(Read and Write property)

84.15.51 Folder as FolderItem

MBS Util Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The folderitem used in the constructor.
Notes: (Read and Write property)

84.15.52 OK as Boolean

MBS Util Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the process of reading the directory content in the constructor was successful.
Notes: Should be true on success.
(Read and Write property)

84.15.53 Path as String

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file path for the folder.
Notes: The plugin makes sure it ends with slash or backslash.
(Read and Write property)

84.15.54 Threaded as Boolean

MBS Util Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether you want to run FileListMBS constructors threaded.
Notes: If you run code in a Xojo thread, which uses FileListMBS, you can set this property to true. We then do the work on a preemptive thread to keep the GUI responsive.
(Read and Write property)

84.15.55 TotalLogicalDataLength as Int64

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sum of logical dats length for all items.
Notes: (Read only property)

84.15.56 TotalLogicalResourceLength as Int64

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sum of logical resource length for all items.
Notes: (Read only property)

84.15.57 TotalPhysicalDataLength as Int64

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sum of physical data length for all items.
Notes: (Read only property)

84.15.58 TotalPhysicalResourceLength as Int64

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sum of physical resource length for all items.
Notes: (Read only property)

84.15.59 YieldTicks as Integer

MBS Util Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: How much time is given back to Xojo for other ticks.
Example:

FileListMBS.YieldTicks = 6

Notes: If value is greater than zero, the application will yield to another Xojo thread after the given number of ticks have passed. 60 ticks are one second. Using a small value can slow down processing a lot while a big value keeps your application not responding to mouse clicks.
If you use this property with e.g. 6 as the value, you may also want to use this method in a thread so you can handle mouse events or let Xojo redraw a progressbar.

For threaded FileListMBS, this property has no effect.
(Read and Write property)

84.15.60 Constants

Skip Modes

Constant	Value	Description
SkipFiles	1	Skip files.
SkipFolders	2	Skip folders.
SkipHidden	12	Skip hidden files and folders.
SkipHiddenFiles	4	Skip hidden files.
SkipHiddenFolders	8	Skip hidden folders.
SkipNone	0	Skip no files.

84.16 class FinderSelectionMBS

84.16.1 class FinderSelectionMBS

MBS MacClassic Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: A class to query the Finder for the current selection.
Example:

```
Var f as new FinderSelectionMBS
Var i,n as Integer
Var a(-1) as string
Var g as FolderItem

f.GetSelection
if f.LastError=0 then
n=f.CountItems

for i=1 to n
g=f.Item(i)
if g<>nil then
a.Add g.DisplayName
end if
next
end if

MessageBox Join(a,EndOfLine)
```

Blog Entries

- MBS Plugins updated for Xojo 2019r2
- MonkeyBread Software Releases the MBS Plugins 8.2

84.16.2 Methods

84.16.3 CountItems as Integer

MBS MacClassic Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Returns the number of items in the Finder selection.
Example:

```
Var f as new FinderSelectionMBS

f.GetSelection
```

```
MessageBox str(F.CountItems)
```

Notes: Returns 0 on any error.

84.16.4 GetSelection

MBS MacClassic Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Asks the Finder for the current selection.
Example:

```
Var f as new FinderSelectionMBS

f.GetSelection
```

Notes: Lasterror is set.

84.16.5 Item(index as Integer) as folderitem

MBS MacClassic Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Returns the item with the given index.
Example:

```
Var f as new FinderSelectionMBS

f.GetSelection
MessageBox f.Item(1).DisplayName // display first item's name
```

Notes: Index is from 1 to count.
Lasterror is set.

84.16.6 Properties

84.16.7 LastError as Integer

MBS MacClassic Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: The last error code reported.
Example:

```
Var f as new FinderSelectionMBS
```

```
f.GetSelection
MessageBox str(F.LastError)
```

Notes: A Mac OS error code.
(Read and Write property)

84.17 class FolderItem

84.17.1 class FolderItem

Platforms: macOS, Linux, Windows, Targets: All.

Function: One of Xojo's base classes.
Example:

```
// some of the FolderItem extensions from the plugin
Var folder As FolderItem = SpecialFolder.Documents
Var size As DirectorySizeMBS = folder.CalculateDirectorySizeMBS(True) // recursive

MessageBox "Path: " + folder.DisplayPathMBS + EndOfLine + _
"Created: " + folder.CreationDateTimeMBS.ToString + EndOfLine + _
"Items: " + size.ItemCount.ToString + ", folders: " + size.FolderCount.ToString + EndOfLine + _
"Size: " + Format(size.LogicalTotalSize / 1024 / 1024, "0.0") + " MB"

Var icon As Picture = folder.IconImageMBS(64) // the Finder or Explorer icon
```

Notes: Handles access to files.

84.17.2 Methods

84.17.3 AbsolutePath as string

MBS MacOSX Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the absolute path for the file.
Example:

```
// test absolute path
Var f As FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var p As String = f.AbsolutePath

Var g As FolderItem = NewFolderItemFromAbsolutePathMBS(p)
Var n As String = g.NativePath

MessageBox p+EndOfLine+n
```

Notes: For Xojo we register this function for compatibility to older Xojo and Real Studio versions.
Same as AbsolutePathMBS, but with name AbsolutePath.
On MacOS queries absolute path in MacOS Classic HFS style, but on Windows and Linux just queries native path.

84.17.4 AbsolutePathMBS as string

MBS MacOSX Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the absolute path for the file.
Example:

```
// test absolute path
Var f As FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var p As String = f.AbsolutePathMBS

Var g As FolderItem = NewFolderItemFromAbsolutePathMBS(p)
Var n As String = g.NativePath

MessageBox p+EndOfLine+n
```

Notes: On MacOS queries absolute path in MacOS Classic HFS style, but on Windows and Linux just queries native path.
Version 20.1 or newer makes sure directories return a path ending in double colon.

84.17.5 AliasInfoMBS as AliasInfoMBS

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use CFBookmarkMBS module instead. **Function:** Alias information about the folderitem if it is an alias file.
Example:

```
// select an alias file. use TrueChild so it's not resolved
Var f as FolderItem = SpecialFolder.Desktop.TrueChild("Development")

// get alias info
Var a as AliasInfoMBS = f.AliasInfoMBS

// show info
MessageBox "alias points to "+a.TargetName+" in path "+a.PathString+" of volume "+a.VolumeName
```

Notes: Returns nil on any error.

84.17.6 BackupIsItemExcludedMBS(byref excludeByPath as boolean) as boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Report whether or not an item is being excluded from backup.
Notes: excludeByPath: pass a boolean variable to determine whether or not the given item is excluded as an absolute path or whether it is sticky to the item.

Returns true if the item or any of its ancestors are excluded from backup, false otherwise.

Require Mac OS X 10.5.

84.17.7 BackupSetItemExcludedMBS(exclude as boolean, excludeByPath as boolean) as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Add or remove an item from the list of items excluded from backup.
Notes: When backing up, the backup daemon skips items marked by this call. If a folder is marked for exclusion, it and its contents are excluded from backup. When specifying by path, it is OK to pass a URL of an item/folder that does not exist yet.

Returns the error code. -1 is the error code in case the function is not available.
Require Mac OS X 10.5.

84.17.8 CalculateDirectorySizeMBS(recursive as boolean = false, ticks as Integer = 0, QueryCompressedSizes as boolean = false, RecursionLimit as Integer = -1) as DirectorySizeMBS

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an object with information about the folder size.
Example:

```
// chose a folder
Var f as FolderItem = SelectFolder

// calculate
Var d as DirectorySizeMBS = f.CalculateDirectorySizeMBS(True,0)
```

```
// display
MessageBox str(d.FilesCount)+" files in "+str(d.FolderCount)+" folder"
```

Notes: recursive: Whether to count items in the subfolders.
ticks: Whether to yield time to other threads. (See YieldTicks property)
QueryCompressedSizes: Whether to query compressed file sizes on Windows.
RecursionLimit: If positive, the recursion limit.

Returns nil on any error.

84.17.9 CompressedFileLengthMBS as int64

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the length of the compressed file on disk.
Example:

```
filesize.text=format(file.CompressedFileLengthMBS,"0")
```

Notes: On Windows files can be compressed and this function returns the size of the compressed file. On Mac and for non compressed files on Windows this function returns the uncompressed size.

84.17.10 CountMBS as Integer

MBS MacClassic Plugin, Plugin Version: 3.2, Platforms: macOS, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use folderitem.Count instead.
Function: Returns the number of items in this folder.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop
MessageBox str(F.Count)+" vs. "+str(F.CountMBS)
```

Notes: The count property of the Xojo folderitem class is cached.
So if you create a file, the count property may not update.

If you need a more up to date value, you can use the CountMBS function to return the value the Mac OS system software returns.
On any error (e.g. invalid folderitem) the function returns 0.

Windows support added in 4.2dr2.

- MBS Plugins updated for Xojo 2019r2

84.17.11 CreateLargeBinaryStreamMBS(MacType as string, MacCreator as string) as LargeBinaryStreamMBS

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a file as a LargeBinaryStreamMBS.
Example:

```
Var f as FolderItem // your file
Var l as LargeBinaryStreamMBS

l=f.CreateLargeBinaryStreamMBS("TEXT","ttxt")
```

Notes: If there is already a file, it is deleted.
On Windows the parameters are ignored.
Returns nil on any error.

84.17.12 CreateResStreamMBS(MacType as string, MacCreator as string) as ResStreamMBS

MBS Util Plugin, Platform: macOS, Targets: All.

Function: Creates a new ResStreamMBS.
Notes: If there is already a file, it is deleted.
If the file could not be created it is deleted.
Returns nil on any error.

84.17.13 CreatorAppMBS as FolderItem

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Returns the application that would be launched if you'd call the above Launch method, or NIL if no appropriate app can be located.
Example:

```
Var docfile as folderitem // your document file
Var appfile as folderitem
appfile=docfile.CreatorAppMBS
```

Notes: This function doesn't work with bundles and should be only used on Mac OS 9.
Use Launch service functions on Mac OS X.
See also:

- 84.17.14 CreatorAppMBS(creatorCode as String) as FolderItem 14110

84.17.14 CreatorAppMBS(creatorCode as String) as FolderItem

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Returns a folderitem to the Application which created this file for the given creator code on the volume of the folderitem.
Example:

```
Var myvolume as folderitem // your volume
Var theFile as folderitem // your file
Var appfile as folderitem
Var ok as boolean
Var inFront as Boolean

appfile=myvolume.CreatorAppMBS("iCAB")
' or
ok = theFile.OpenWithAppMBS(myvolume.CreatorAppMBS("RSED"), inFront)
```

Notes: Returns the application that would be launched if you'd call the above Launch method and if the file had the specified creator code. Returns NIL if no appropriate app can be located.

This method allows you to open a document with a creator code that you specify instead of having to locate the application by your own. Here's an example on how to open any file with ResEdit (whose creator code is 'RSED'):

This function doesn't work with bundles and should be only used on Mac OS 9.
Use Launch service functions on Mac OS X.

84.17.15 DarwinMediaClassMBS as string

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Returns the class of the media.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop

MessageBox f.DarwinMediaClassMBS
```

Notes: Returns nil on any problem.

Possible values:

kIOCDMediaClass	"IOCDMedia"
kIODVDMediaClass	"IODVDMedia"
kIOMediaClass	"IOMedia"

See also DarwinMediaInfoMBS function.
Blog Entries

- MBS Plugins updated for Xojo 2019r2

84.17.16 DarwinMediaInfoMBS as CFDictionaryMBS

MBS MacCF Plugin, Plugin Version: 5.1, Platform: macOS, Targets: All.

Function: Returns the info dictionary of the media.
Example:

```
// info for boot volume
Var info as CFDictionaryMBS = volume(0).DarwinMediaInfoMBS

if info = nil then
beep // error
else
CFShowMBS info // show in console

Var RemovableKey as CFStringMBS = NewCFStringMBS("Removable")
Var RemovableCFO as CFObjectMBS = info.Value(RemovableKey)
Var RemovableCFB as CFBooleanMBS = CFBooleanMBS(RemovableCFO)
Var Removable as Boolean = RemovableCFB.Value

MessageBox "Removable: "+str(Removable)
```

```
Var EjectableKey as CFStringMBS = NewCFStringMBS("Ejectable")
Var EjectableCFO as CFObjectMBS = info.Value(EjectableKey)
Var EjectableCFB as CFBooleanMBS = CFBooleanMBS(EjectableCFO)
Var Ejectable as Boolean = EjectableCFB.Value

MessageBox "Ejectable: "+str(Ejectable)

Var SizeKey as CFStringMBS = NewCFStringMBS("Size")
Var SizeCFO as CFObjectMBS = info.Value(SizeKey)
Var SizeCFN as CFNumberMBS = CFNumberMBS(SizeCFO)
Var Size as Double = SizeCFN.doubleValue / 1000000000.0

MessageBox "Size: "+str(Size, "0.0")+" GB"
end if
```

Notes: Returns nil on any problem.

example output for the example code above:
<CFDictionary 0x7d60510 [0xa01900e0] >{ type = fixed-mutable, count = 14, capacity = 14, pairs = (
0 : <CFString 0x7d5ffe0 [0xa01900e0] >{ contents = "Leaf" } = <CFBoolean 0xa0190b98 [0xa01900e0] >{ value = false }

84.17.17 DarwinVolumeNameMBS as string

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Returns the name of the volume from the BSD part of Mac OS X.
Example:

```
MessageBox Volume(0).DarwinVolumeNameMBS // shows here disk1s10
```

Notes: Returns "" on any error.
The returned string is encoded as ASCII.

84.17.18 DeleteDataForkMBS

MBS Util Plugin, Platform: macOS, Targets: All.

Function: Deletes the data fork of a file.
Notes: Equal to open the file using a binarystream and setting the length property to 0.
On Mac OS a file can exist without a datafork, with a resource fork or even without any fork.
Blog Entries

- MBS Plugins 10.3 Release Notes

84.17.19 DeleteResourceForkMBS

MBS Util Plugin, Platform: macOS, Targets: All.

Function: Deletes the resource fork of a file.
Notes: Equal to open the file using a ResStreamMBS and setting the length property to 0.
On Mac OS a file can exist without a datafork, with a resource fork or even without any fork.
Blog Entries

- MBS Plugins 10.3 Release Notes

84.17.20 DisplayPathMBS(delimiter as string = "/") as string

MBS Util Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shows display path.
Example:

```
// Sample values in German:

// SnowLeopard/Programme/Dienstprogramme/Konsole

MessageBox SpecialFolder.Applications.Child("Utilities").Child("Console.app").DisplayPathMBS("/")

// SnowLeopard/Benutzer/cs/Schreibtisch

MessageBox SpecialFolder.Desktop.DisplayPathMBS("/")

// SnowLeopard ,ûú Programme ,ûú Dienstprogramme ,ûú Konsole

MessageBox SpecialFolder.Applications.Child("Utilities").Child("Console.app").DisplayPathMBS(" ,ûú ")

// SnowLeopard ,ûú Benutzer ,ûú cs ,ûú Schreibtisch

MessageBox SpecialFolder.Desktop.DisplayPathMBS(" ,ûú ")
```

Notes: You can pass any string for delimiter. Good looks an arrow or just a slash.
Blog Entries

- MBS Xojo Plugins, version 17.5pr3

84.17.21 EjectVolumeMBS(force as boolean, byref dissenterPID as Integer) as Integer

MBS MacClassic Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: This routine ejects the volume specified by folderitem.
Example:

```
Var disk as FolderItem
```

```
Var c as Integer = VolumeCount-1
for i as Integer = 0 to c
Var v as FolderItem = volume(i)
if v.Name = "testvolume" then
disk = v
exit
end if
next

if disk = nil then
MessageBox "Please change the name in this code."
else
Var pid as Integer
Var e as Integer = disk.EjectVolumeMBS(false, pid)

if e=0 then
MessageBox "Volume unmounted."
else

if pid=0 then
MessageBox "Failed to unmount with error: "+str(e)
else
Var name as string
Var p as new ProcessMBS // from Util plugin
p.GetFirstProcess

do
if p.ProcessID = pid then
name = p.Name
end if
loop until not p.GetNextProcess

if len(name)>0 then
MessageBox "Failed to unmount with error: "+str(e)
else
MessageBox "Failed to unmount."+EndOfLine+EndOfLine+"The application "+name+" is still using this
volume."+EndOfLine+"Error: "+str(e)
end if

end if
end if
end if
```

Notes: If the volume cannot be ejected the pid of the process which denied the unmount will be returned in the dissenter parameter. This routine returns after the eject is complete. Ejecting a volume will result in the unmounting of other volumes on the same device.

force: Specify true if you want the volume forcibly unmounted. Force unmounting a volume will very likely result in data loss since the volume will be ejected even if there are open files on it. This option should be reserved for situations such as the backing store for a volume is gone (so the data is lost regardless).
dissenterPID: Optionally, pid of the process which denied the unmount if the unmount is denied.

Returns a Mac OS error code. 0 means no error and -1 is a plugin error if the function can't be called. -47 is returned if the disc is in use.

PS: Seems like on my tests the pid is not set by Apple.

84.17.22 ExtractIconMBS(width as integer, ID as integer) as picture

MBS Picture Plugin, Plugin Version: 26.4, Platform: Windows, Targets: All.

Function: Extracts an icon from a DLL or EXE file.
Example:

```
Var file As FolderItem = SpecialFolder.System.Child("imageres.dll")

If file.Exists Then
Const id = 3
Me.Backdrop = file.ExtractIconMBS(512, id)
Else
Break // file missing
End If
```

Notes: Returns nil in case of error.
Width is the desired width, so we can prefer to load a bigger icon.

84.17.23 FilesMBS as FolderItem()

MBS Util Plugin, Plugin Version: 12.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array of files in the given folder.
Example:

```
Var folder as FolderItem = SpecialFolder.Desktop
Var files() as FolderItem = folder.FilesMBS
MessageBox str(files.Count)+" files"
```

Notes: Similar to item() function, but returns all files with one call.
Blog Entries

- MBS Real Studio Plugins, version 12.0fc1

84.17.24 FinderUpdateMBS as Integer

MBS Picture Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Updates the file or folder in the Finder.
Notes: Returns 0 for successful and any Mac OS error code on a problem.
Returns -1 on Windows.
This function is called automatically when adding or removing an icon.
If you add a folder icon, use this function to update the Finder to display it.
Blog Entries

84.17.27 FontActivateMBS(OnlyLocal as boolean) as Integer

MBS Util Plugin, Plugin Version: 4.3, Platforms: macOS, Windows, Targets: All.

Function: Activates one font.
Example:

```
Var f as folderitem
Var e as Integer

f=SpecialFolder.Desktop.child("MyWonderfulFont.dfont")
e=f.FontActivateMBS(true)

select case e
case 0
MessageBox "No error"
case -1
MessageBox "Parameter error. (Plugin)"
case 1 // Windows error
MessageBox "Parameter error. (System)"
case -43 // Mac error
MessageBox "File not found."
case -50 // Mac error
MessageBox "Parameter error. (System)"
case -108 // Mac error
MessageBox "File is not a font file."
else
MessageBox "Error: "+str(e)
end Select
```

Notes: The folderitem used here points to a font file.
If you want the Font Manager to make fonts not visible to all applications installed on the system, use the OnlyLocal property.

Requires Mac OS 9.0 or newer.
Returns -1 if this FontManager function was not found. 0 on success.

Some error codes for Mac:

0	No error.
-43	File not found.
-45	File locked.
-108	Out of memory.
-105	Already registered.

Fails in Xojo 2017 on Windows due to changes in Xojo's way to handle fonts. The plugin still activates them, but Xojo doesn't allow you to use fonts which haven't been there earlier. See feedback case 46596.

84.17.28 FontDeactivateMBS(OnlyLocal as boolean) as Integer

MBS Util Plugin, Plugin Version: 4.3, Platforms: macOS, Windows, Targets: All.

Function: Deactivates one font.
Notes: The folderitem used here points to font file.
The OnlyLocal must match the value which was used on registration.

Requires Mac OS 9.0 or newer, Windows 2000/XP.
Returns -1 if this FontManager function was not found. 0 on success.

An user reported that this does not work on Mac OS X 10.4.

Some error codes for Mac:

0	No error.
-43	File not found.
-45	File locked.
-108	Out of memory.

On Windows you may need to call this function several times until all references of the file are freed.

84.17.29 GetFileFlagsMBS as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Get the file flags for a folderitem.
Example:

```
// For example, testing for a file being invisible works like this:
Var fdFlags as Integer
Var fileIsInvisible as boolean
Var f as FolderItem // file

fdFlags = f.GetFileFlagsMBS
if fdFlags <0 then
' ... oops, an error occurred
else
fileIsInvisible = BitwiseAnd (fdFlags, &H4000) <>0
end
```

Notes: Returns the fdFlags of a file. If you pass in a non-existing file or a folder, a negative error code is returned instead.

The fdFlags is a set of bits with the following meaning:

bit 15	value &H8000	isAlias
bit 14	value &H4000	isInvisible
bit 13	value &H2000	hasBundle (has a BNDL resource)
bit 12	value &H1000	nameLocked
bit 11	value &H0800	isStationary
bit 10	value &H0400	hasCustomIcon
bit 8	value &H0100	hasBeenInited (Finder has seen the file since it has been created)
bit 7	value &H0080	hasNoINITs (there is no INIT rsrc in the Extension file)
bit 6	value &H0040	isShared
bits 1-3	value &H000E	color (as a 3-bit value from 0-7)

MBS MacClassic Plugin, Plugin Version: 16.4, Platform: macOS, Targets: All.

Function: Returns the volume reference number.
Notes: Returns zero in case of error.
This can replace FolderItem.MacVRefNum for newer Xojo versions.
Blog Entries

- MBS Plugins updated for Xojo 2019r2

84.17.32 HasUnresolvedConflictsMBS as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the iCloud file properties.
Notes: A boolean that contains true if this item has conflicts outstanding, false otherwise.
Available in Mac OS X v10.7 and later.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr9

84.17.33 IconImageMBS(width as Integer, WindowsFlags as Integer=0) as picture

MBS Picture Plugin, Plugin Version: 3.3, Platforms: macOS, Windows, Targets: All.

Function: Returns an picture with the icon image of a FolderItem.
Example:

Backdrop=SpecialFolder.Desktop.IconImageMBS(512)

Notes: May return a picture which is smaller as requested if the given picture size is not available. (Changed in v5.3 to return the requested size)
On Windows the icon picture is scaled to the requested size. (Actually the plugin can only get 32bit pixels wide icons on Windows as maximum)
Good sizes on Mac OS are 16, 32, 48 and 128 pixels.
Returns nil on low memory.

Version 8.6: Now reads the 32bit image data if possible.

You can pass flags for Windows options:

SHGFI_ADDOVERLAYS	= &h20	Apply the appropriate overlays to the file's icon.
SHGFI_LINKOVERLAY	= &h8000	Adds the link overlay to the file's icon.
SHGFI_OPENICON	= 2	Retrieve the file's open icon
SHGFI_SELECTED	= &h10000	Blend the file's icon with the system highlight color.

This function can fail if the file does not exist.
Added 1024 pixel support in 12.3 plugins.

On Windows, it may be that you get a 256 pixel icon with small icon on top left. This is simply how windows handles the case when no big icon is available.

84.17.34 IconMaskMBS(width as Integer, WindowsFlags as Integer=0) as picture

MBS Picture Plugin, Plugin Version: 3.3, Platforms: macOS, Windows, Targets: All.

Function: Returns an picture with the icon mask of a FolderItem.
Example:

Backdrop=SpecialFolder.Desktop.IconMaskMBS(512)

Notes: May return a picture which is smaller as requested if the given picture size is not available. (Changed in v5.3 to return the requested size)
On Windows the icon picture is scaled to the requested size. (Actually the plugin can only get 32bit pixels wide icons on Windows as maximum)
Good sizes on Mac OS are 16, 32, 48 and 128 pixels.
Returns nil on low memory.

Please use with IconImageMBS and not with IconMBS function.
Version 8.6: Now reads the 8 bit alpha values if possible.

You can pass flags for Windows options:

SHGFI_ADDOVERLAYS	= &h20	Apply the appropriate overlays to the file's icon.
SHGFI_LINKOVERLAY	= &h8000	Adds the link overlay to the file's icon.
SHGFI_OPENICON	= 2	Retrieve the file's open icon
SHGFI_SELECTED	= &h10000	Blend the file's icon with the system highlight color.

This function can fail if the file does not exist.
Added 1024 pixel support in 12.3 plugins.

On Windows, it may be that you get a 256 pixel icon with small icon on top left. This is simply how windows handles the case when no big icon is available.

84.17.35 IconMBS(width as Integer, WindowsFlags as Integer=0) as picture

MBS Picture Plugin, Platforms: macOS, Windows, Targets: All.

Function: Returns an picture with the icon of a FolderItem for the given iconsize.
Example:

```
Backdrop=SpecialFolder.Desktop.IconMBS(512)

// newer way for Mac apps:

// get image
Var n as NSImageMBS = NSWorkspaceMBS.iconForFile(SpecialFolder.desktop)
// set the size we want
n.setSize 512,512
// make a copy as picture
Backdrop = n.CopyPictureWithMask
```

Notes: Changed in plugin version 7.7 to return a picture with mask of the given size.

On Windows the icon picture is scaled to the requested size. (Actually the plugin can only get 32bit pixels wide icons on Windows as maximum)

Version 8.6: Now reads the 32bit image data with 8 bit alpha values if possible.

You can pass flags for Windows options:

SHGFI_ADDOVERLAYS	= &h20	Apply the appropriate overlays to the file's icon.
SHGFI_LINKOVERLAY	= &h8000	Adds the link overlay to the file's icon.
SHGFI_OPENICON	= 2	Retrieve the file's open icon
SHGFI_SELECTED	= &h10000	Blend the file's icon with the system highlight color.

This function can fail if the file does not exist.
Please note that icons on alias files takes much longer to get than normal files.
Added 1024 pixel support in 12.3 plugins.

On Windows, it may be that you get a 256 pixel icon with small icon on top left. This is simply how windows handles the case when no big icon is available.

For Linux, please use LinuxIconMBS module.

84.17.36 isApplicationMBS as boolean

MBS MacOSX Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Whether the folderitem points to an application.
Example:

```
// try an application
Var file1 as FolderItem = SpecialFolder.Applications.Child("iTunes.app")
MessageBox "Bundle: "+str(file1.isBundleMBS)+EndOfLine+"Application: "+str(file1.isApplicationMBS)

// try some other file
Var file2 as FolderItem = SpecialFolder.Preferences.Child("com.apple.itunes.plist")
MessageBox "Bundle: "+str(file2.isBundleMBS)+EndOfLine+"Application: "+str(file2.isApplicationMBS)
```

Notes: Returns true if the folderitem points to an application on Mac.
Upgraded in version 19.5 to use CFURL instead of FSRef APIs.
Blog Entries

- MBS Xojo Plugins, version 19.5pr1
- MBS Real Studio Plugins, version 12.1pr2

84.17.37 isBundleMBS as boolean

MBS MacOSX Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Whether the folderitem points to a bundle.
Example:

```
// try an application
Var file1 as FolderItem = SpecialFolder.Applications.Child("iTunes.app")
MessageBox "Bundle: "+str(file1.isBundleMBS)+EndOfLine+"Application: "+str(file1.isApplicationMBS)

// try some other file
Var file2 as FolderItem = SpecialFolder.Preferences.Child("com.apple.itunes.plist")
MessageBox "Bundle: "+str(file2.isBundleMBS)+EndOfLine+"Application: "+str(file2.isApplicationMBS)
```

Notes: Returns true if the folderitem points to a directory which is a bundle/package.
For example an application package (.app).
Upgraded in version 19.5 to use CFURL instead of FSRef APIs.
Blog Entries

- MBS Xojo Plugins, version 19.5pr1
- MBS Xojo Plugins, version 19.0pr6

84.17.38 IsCompressedFileMBS as Boolean

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Is this file a compressed one?
Notes: On Windows you can compress individual files to double your harddisk, but no application may note, because this compression is transparent.

84.17.39 IsDownloadedMBS as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the iCloud file properties.
Notes: A boolean that contains true if a local copy of this item exists, false otherwise.
Available in Mac OS X v10.7 and later.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr9

84.17.40 IsDownloadingMBS as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the iCloud file properties.
Notes: A boolean that contains true if a local copy of this item is currently being downloaded, false otherwise.
Available in Mac OS X v10.7 and later.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr9

84.17.41 IsEjectableVolumeMBS as Boolean

MBS MacClassic Plugin, Plugin Version: 2.7, Platform: macOS, Targets: All.

Function: Returns true if the file is on a ejectable volume.
Example:

```
Var bool as Boolean
Var f as FolderItem = volume(0)

bool=f.IsEjectableVolumeMBS
```

Notes: If false is returned it may also be possible that the function is not available (on Mac OS X 10.2) or doesn't make sense. So the volume may be ejectable even if false is returned.

For remote volumes, the eject flag is not set from Apple. That makes sense as those volume are not physically ejected, but just unmounted. So check IsOnRemoteVolumeMBS, too.
Blog Entries

- MBS Plugins updated for Xojo 2019r2

84.17.42 IsEncryptedFileMBS as Boolean

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Is this file an encrypted one?
Notes: On Windows you can encrypted individual files to secure your harddisk, but no application may note, because this encryption is transparent to them.

84.17.43 IsFileDataForkOpenReadWriteMBS as boolean

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Test whether a file is currently opened for read and write by an application.
Notes: This method tries to open the file with exclusive access. If this fails for access/permission errors, the function returns true.
Blog Entries

- MBS Plugins updated for Xojo 2019r2

84.17.44 IsFileResourceForkOpenReadWriteMBS as boolean

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Test whether a file is currently opened for read and write by an application.
Notes: This method tries to open the file with exclusive access. If this fails for access/permission errors, the function returns true.
On Windows, the function result is always false.
Blog Entries

- MBS Plugins updated for Xojo 2019r2

84.17.45 IsOnRemoteVolumeMBS as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Returns true if the file is on a remote volume.
Notes: See also GetDriveTypeMBS for macOS.
Blog Entries

- MBS Plugins updated for Xojo 2019r2

84.17.46 IsUbiquitousItemMBS as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the iCloud file properties.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
MessageBox "IsUbiquitousItemMBS: "+str(f.IsUbiquitousItemMBS)
```

Notes: A boolean that contains true if this item is synchronized to cloud-based storage, false otherwise. Available in Mac OS X v10.7 and later.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr9

84.17.47 IsUploadedMBS as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the iCloud file properties.
Notes: A boolean that contains true if a copy of this item exists in cloud-based storage, false otherwise. Available in Mac OS X v10.7 and later.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr9

84.17.48 IsUploadingMBS as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the iCloud file properties.
Notes: A boolean that contains true if a local copy of this item is currently being uploaded, false otherwise. Available in Mac OS X v10.7 and later.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr9

84.17.49 ItemsMBS as FolderItem()

MBS Util Plugin, Plugin Version: 12.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array of items in the given folder.
Example:

```
Var folder as FolderItem = SpecialFolder.Desktop
Var Items() as FolderItem = folder.ItemsMBS
MessageBox str(Items.Count)+" items"
```

Notes: Similar to item() function, but returns all items with one call.
Blog Entries

- MBS Xojo Plugins, version 20.0pr6
- MBS Real Studio Plugins, version 12.0fc1

84.17.50 KindMBS as string

MBS MacClassic Plugin, Platforms: macOS, Windows, Targets: All.

Function: Returns a string about the kind of the document.
Example:

```
Var s as string
Var file as FolderItem = SpecialFolder.Desktop

s=file.KindMBS

MessageBox s
```

Notes: e.g. for a Xojo document on Mac OS X "Xojo Document" or on Mac OS 9 something like "Xojo 4.0.2fc6 Mac OS X Document".

This text may be localized.
Added Windows support in 12.4 plugins.
Blog Entries

- MBS Xojo Plugins, version 19.4pr1
- MBS Real Studio Plugins, version 12.4pr3

84.17.51 LaunchMBS(inFront as Boolean) as Boolean

MBS MacClassic Plugin, Platforms: macOS, Windows, Targets: All.

Function: Launches a file.
Notes: In Xojo 4.5 Realsoftware introduces a new Launch variant: "Launch(inFront)". To be compatible I renamed the old Launch method to MBSLaunch and added a Launch method which is compatible to Xojo's.

The return value is true if no immediate error occurred. It would be false, for instance, if the FolderItem object does not exists, is a folder, or is not allowed to be opened (can happen with files on network volumes, as well as in Mac OS X environments).
Added Windows support in version 3.4.

84.17.52 LaunchServicesApplicationForItemMBS(role as Integer) as folderitem

MBS MacOSX Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Return the application used to open an item.
Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("Test.xojo_binary_project")

Const kLSRolesNone = 1 // no claim Is made about support For this type/scheme
Const kLSRolesViewer = 2 // claim To be able To view this type/scheme
Const kLSRolesEditor = 4 // claim To be able To edit this type/scheme
Const kLSRolesAll = -1 // claim To Do it all

Var appfile As FolderItem = file.LaunchServicesApplicationForItemMBS(kLSRolesEditor)

// shows Xojo
MessageBox appfile.NativePath
```

Notes: Consults the binding tables to return the application that would be used to open the folderitem if it were double-clicked in the Finder. This application will be the user-specified override if appropriate or the default otherwise. If no application is known to LaunchServices suitable for opening this item, nil (kLSApplicationNotFoundErr) will be returned.

Constants you can use for the role parameter:

kLSRolesNone	= 1	no claim is made about support for this type/scheme
kLSRolesViewer	= 2	claim to be able to view this type/scheme
kLSRolesEditor	= 4	claim to be able to edit this type/scheme
kLSRolesAll	= -1	claim to do it all

Upgraded in version 19.5 to use CFURL instead of FSRef APIs.

84.17.53 LaunchServicesApplicationsForItemMBS(role as Integer) as LaunchServicesApplicationListMBS

MBS MacOSX Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: Returns a list of folderitems to applications that offer the requested role(s) for the input item.
Example:

```
Var l as LaunchServicesApplicationListMBS
Var f as FolderItem

f=New FolderItem("text file")
l=f.LaunchServicesApplicationsForItemMBS(4)

if l<>nil then
MessageBox str(l.Count)
MessageBox l.Item(0).NativePath
end if
```

Notes: Requires Mac OS X 10.3.

If the folderitem is a file reference, it is treated as a document, and applications are selected based on the document's type information. Otherwise, applications are selected based on the folderitem's scheme.

Role:
The role(s) which must intersect with the role provided by an application for the specified item in order for the application to be included in the result. Pass kLSRolesAll if any role is acceptable.

Constants you can use for the role parameter:

kLSRolesNone	= 1	no claim is made about support for this type/scheme
kLSRolesViewer	= 2	claim to be able to view this type/scheme
kLSRolesEditor	= 4	claim to be able to edit this type/scheme
kLSRolesAll	= -1	claim to do it all

Upgraded in version 19.5 to use CFURL instead of FSRef APIs.

84.17.54 LaunchServicesCanApplicationAcceptItemMBS(TargetApp as folderitem, role as Integer, flags as Integer) as boolean

MBS MacOSX Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Determine whether an item can accept another item.
Example:

```
Var appl,item as FolderItem

appl=LaunchServicesApplicationForInfoMBS("","","rb",-1)
item=New FolderItem("file.rb")

MessageBox appl.Name

if item.LaunchServicesCanApplicationAcceptItemMBS(appl,-1,1) then
MessageBox "accept"
else
MessageBox "not accepted"
end if
```

Notes: Returns whether TargetApp can accept this folderitem as in a drag and drop operation. If role is other than kLSRolesAll then make sure TargetApp claims to fulfill the requested role.

Constants you can use for the role parameter:

kLSRolesNone	= 1	no claim is made about support for this type/scheme
kLSRolesViewer	= 2	claim to be able to view this type/scheme
kLSRolesEditor	= 4	claim to be able to edit this type/scheme
kLSRolesAll	= -1	claim to do it all

Values for the flags:

kLSAcceptDefault	= 1	
kLSAcceptAllowLoginUI	= 2	show UI to log in if necessary

Upgraded in version 19.5 to use CFURL instead of FSRef APIs.

84.17.55 LaunchServicesDisplayNameMBS as string

MBS MacOSX Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Get the display name for a folderitem.
Example:

```
Var f As FolderItem = SpecialFolder.Desktop.Child("Test.xojo_binary_project")
```

MessageBox f.LaunchServicesKindStringMBS+EndOfLine+f.LaunchServicesDisplayNameMBS#

Notes: Return a copy of the display name for a folderitem. Takes into consideration whether this item has a hidden extension or not.
Upgraded in version 19.5 to use CFURL instead of FSRef APIs.
Blog Entries

- MBS Xojo Plugins, version 19.5pr1

84.17.56 LaunchServicesItemInfoMBS(WhichInfo as Integer) as LaunchServicesItemInfoMBS

MBS MacOSX Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Return information about an item.
Example:

```
Var l as LaunchServicesItemInfoMBS
Var f as FolderItem

f=SpecialFolder.Applications.Child("Mail.app")
l=f.LaunchServicesItemInfoMBS(-1)

if l.IsApplication then // True for mail.app
MessageBox "is Application"
end if

if l.IsContainer then // True for mail.app
MessageBox "is Container"
end if

if l.IsPackage then // True for mail.app
MessageBox "is Package"
end if
```

Notes: Returns as much or as little information as requested about the folderitem. Some information is available in a thread-safe manner, some is not.

Possible values you can combine for the WhichInfo parameter:

84.17.57 LaunchServicesKindStringMBS as string

MBS MacOSX Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

kLSRequestExtension	= &h01	Requests the item's filename extension.
kLSRequestTypeCreator	= &h02	Requests the item's file type and creator signature.
kLSRequestBasicFlagsOnly	= &h04	Requests all item-information flags that are not application-specific: that is, all except IsNativeApp, IsClassicApp, AppPrefersNative, AppPrefersClassic and AppIsScriptable.
kLSRequestAppTypeFlags	= &h08	Requests all application-specific item-information flags: that is, IsNativeApp, IsClassicApp, AppPrefersNative, AppPrefersClassic and AppIsScriptable.
kLSRequestAllFlags	= &h10	Requests all item-information flags.
kLSRequestIconAndKind	= &h20	Not used.
kLSRequestExtensionFlagsOnly	= &h40	Requests only the kLSItemInfoExtensionIsHidden item-information flag.
kLSRequestAllInfo	= -1	

Function: Get the kind string for an item.
Example:

```
Var f As FolderItem = SpecialFolder.Desktop.Child("Test.xojo_binary_project")

MessageBox f.LaunchServicesKindStringMBS+EndOfLine+f.LaunchServicesDisplayNameMBS
```

Notes: Returns the kind string as used in the Finder and elsewhere for the given folderitem.

Upgraded in version 19.5 to use CFURL instead of FSRef APIs.
Blog Entries

- MBS Xojo Plugins, version 19.5pr1

84.17.58 LaunchServicesOpenMBS as folderitem

MBS MacOSX Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Launches the given item.
Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("Test.xojo_binary_project")
Var a As FolderItem = file.LaunchServicesOpenMBS

MessageBox a.NativePath
```

Notes: Returns the file or folder which was launched, e.g. the application for a file.
Upgraded in version 19.5 to use CFURL instead of FSRef APIs.

84.17.59 LaunchServicesRegisterMBS(update as boolean) as Integer

MBS MacOSX Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: If the specified folderitem refers to an application or other bundle claiming to handle documents or URLs, add the bundle's document and URL claims to the Launch Services database.
Notes: Requires Mac OS X 10.3.

Update: When false, LaunchServicesRegisterMBS does not register the item if it has already been registered and the current modification date of the item has not changed from when it was last registered. When true, the item's registered info is updated, even if the modification has not changed.

Returns an error code:
An OSStatus value: noErr (0) - Success kLSNoRegistrationInfoErr (-10824) - The item does not contain info requiring registration kLSDataErr (-10817) - The item's property list info is malformed.
Returns -1 if the function is not available.
Blog Entries

- MBS Plugins updated for Xojo 2019r2

84.17.60 LogicalFileDataLengthMBS as int64

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the length of the logical disk space used for this file's data fork.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")

Var lines(-1) as string

lines.Add "Length: "+str(F.Length)
lines.Add "ResourceForkLength: "+str(F.ResourceForkLength)
lines.Add "LogicalFileDataLengthMBS: "+str(F.LogicalFileDataLengthMBS)
lines.Add "LogicalFileResLengthMBS: "+str(F.LogicalFileResLengthMBS)
lines.Add "LogicalFileTotalLengthMBS: "+str(F.LogicalFileTotalLengthMBS)
lines.Add "PhysicalFileDataLengthMBS: "+str(F.PhysicalFileDataLengthMBS)
lines.Add "PhysicalFileResLengthMBS: "+str(F.PhysicalFileResLengthMBS)
lines.Add "PhysicalFileTotalLengthMBS: "+str(F.PhysicalFileTotalLengthMBS)

MessageBox Join(lines,EndOfLine)
```

Notes: This function works for files bigger than 2 GB which RB's built in functions don't.
On Windows the physical size reported is equal to the logical size, because there is no function for the physical size.

84.17.61 LogicalFileResLengthMBS as int64

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the length of the logical disk space used for this file's resourcefork.
Example:

filesize.text=format(file.LogicalFileResLengthMBS,"0")

Notes: This function works for files bigger than 2 GB which RB's built in functions don't.
On Windows the physical size reported is equal to the logical size, because there is no function for the physical size.

84.17.62 LogicalFileTotalLengthMBS as int64

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the length of the logical disk space used for this file's datafork.
Example:

filesize.text=format(file.LogicalFileTotalLengthMBS,"0")

Notes: This function works for files bigger than 2 GB which RB's built in functions don't.
On Windows the physical size reported is equal to the logical size, because there is no function for the physical size.
Xojo Developer Magazine

- 24.4, page 64: Explore Your Files, Working with files and directories by Stefanie Juchmes-Simonis

84.17.63 LongPathMBS as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the long path for the file.
Example:

```
Var f as folderitem = specialfolder.desktop.child("test.file")
MessageBox f.longpathMBS
```

Notes: Should be the same as f.NativePath
Works with Windows NT 4 or newer.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr8

84.17.64 MacCopyObjectMBS(DestinationFolder as folderitem, DestinationName as string, byref Result as folderitem, Options as Integer) as Integer

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: This routine will copy the source object into the destination directory.
Notes: The source object can be a file or directory.

self: The source object to copy.
DestinationFolder: The destination directory for the copy.
DestinationName: The name for the new object in the destination directory. Pass "" to use the source object name.
result: Upon successful completion a ref to the newly created object. If source is a directory then target will be the corresponding object in the destination directory.
options: One or more FSFileOperation flags

Requires Mac OS X 10.4.

Use this constants:

kFSFileOperationDefaultOptions	0	Use the default options - no overwrite, fail if any source item cannot be read, cross volume moves OK.
kFSFileOperationOverwrite	1	Replace an item in the destDir that has the same name as an item being moved/copied there.
kFSFileOperationSkipSourcePermissionErrors	2	Skip items that cannot be read and continue copying/moving instead of failing the operation.
kFSFileOperationDoNotMoveAcrossVolumes	4	Do not perform a copy/delete to move an item across volume boundries - fail the operation instead.
kFSFileOperationSkipPreflight	8	Skip the preflight for a directory move/copy. This will limit the status information that can be returned since the totals will not be calculated.

Returns a Mac OS error code. Error code -1 is from the plugin for invalid parameters or the function not being availanle.
Blog Entries

- MBS Plugins updated for Xojo 2019r2
- MonkeyBread Software Releases the MBS REALbasic plug-ins 9.2

84.17.65 MacIsHardLinkedMBS as boolean

MBS MacClassic Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Whether the file is a hard link.
Notes: If two directory entries point to the same hard disc space, you have a file which has two directory entries, but only one storage.

This function returns true for files in a Time Machine backup which did not change since the last backup and share their disc space with the other backups.

84.17.66 MacMoveObjectMBS(DestinationFolder as folderitem, DestinationName as string, byref Result as folderitem, Options as Integer) as Integer

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: This routine will move the source object into the destination directory.
Notes: The source object can be a file or directory. If a destName is provided then the object will be renamed as well as moved. By default a move across volumes will result in a copy and deletion of the original source. The kFSFileOperationDoNotMoveAcrossVolumes flag will cause cross volume moves to do nothing and return an error.

self: The source object to copy.
DestinationFolder: The destination directory for the copy.
DestinationName: The name for the new object in the destination directory. Pass "" to use the source object name.
result: Upon successful completion a ref to the newly created object. If source is a directory then target will be the corresponding object in the destination directory.
options: One or more FSFileOperation flags

Requires Mac OS X 10.4.

Use this constants:

kFSFileOperationDefaultOptions	0	Use the default options - no overwrite, fail if any source item cannot be read, cross volume moves OK.
kFSFileOperationOverwrite	1	Replace an item in the destDir that has the same name as an item being moved/copied there.
kFSFileOperationSkipSourcePermissionErrors	2	Skip items that cannot be read and continue copying/moving instead of failing the operation.
kFSFileOperationDoNotMoveAcrossVolumes	4	Do not perform a copy/delete to move an item across volume boundries - fail the operation instead.
kFSFileOperationSkipPreflight	8	Skip the preflight for a directory move/copy. This will limit the status information that can be returned since the totals will not be calculated.

Returns a Mac OS error code. Error code -1 is from the plugin for invalid parameters or the function not being availanle.
Blog Entries

- MonkeyBread Software Releases the MBS REALbasic plug-ins 9.2

84.17.67 MacMoveObjectToTrashMBS(byref Result as folderitem, Options as Integer) as Integer

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: This routine will move the source object into the trash.
Notes: The source object can be a file or directory. If the volume the source object resides on does not support a trash folder then this call will return an error (this is the same circumstance that triggers the delete immediately behavior in the Finder).

self: The source object to move to the trash.
result: Upon successful completion a ref the object in the trash. If source is a directory then target will be the corresponding object in the destination directory.
options: One or more FSFileOperation flags

Requires Mac OS X 10.5.

Use this constants:

kFSFileOperationDefaultOptions	0	Use the default options - no overwrite, fail if any source item cannot be read, cross volume moves OK.
kFSFileOperationOverwrite	1	Replace an item in the destDir that has the same name as an item being moved/copied there.
kFSFileOperationSkipSourcePermissionErrors	2	Skip items that cannot be read and continue copying/moving instead of failing the operation.
kFSFileOperationDoNotMoveAcrossVolumes	4	Do not perform a copy/delete to move an item across volume boundries - fail the operation instead.
kFSFileOperationSkipPreflight	8	Skip the preflight for a directory move/copy. This will limit the status information that can be returned since the totals will not be calculated.

Returns a Mac OS error code. Error code -1 is from the plugin for invalid parameters or the function not being availanle.

- MonkeyBread Software Releases the MBS REALbasic plug-ins 9.2

84.17.68 MacNodeIDMBS as UInt64

MBS MacClassic Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The node ID for this file or folder.
Example:

```
// get some file
Var f as FolderItem = New FolderItem("/Users/cs/Desktop/test.rtf", FolderItem.PathModes.Native)

// get
Var NodeId as UInt64 = f.MacNodeIDMBS
Var ParentId as UInt64 = f.MacParentDirectoryIDMBS
Var p as FolderItem = volume(0).MacResolveNodeIDMBS(NodeId)

MessageBox "Node ID: "+str(NodeId)+EndOfLine+_
"Parent ID: "+str(ParentId)+EndOfLine+_
"Path resolved: "+p.NativePath
```

Notes: Upgraded in plugin version 18.4 to use newer APIs for 64-bit IDs on AFS volumes.
Blog Entries

- MBS Xojo Plugins, version 18.4pr3

84.17.69 MacParentDirectoryIDMBS as UInt64

MBS MacClassic Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The parent directory node ID for this file or folder.
Notes: Upgraded in plugin version 18.4 to use newer APIs for 64-bit IDs on AFS volumes.
Blog Entries

- MBS Xojo Plugins, version 18.4pr3

84.17.70 MacResolveNodeIDMBS(NodeID as UInt64) as folderitem

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Resolves a NodeID by searching for a folderitem on the volume with given NodeID.
Example:

```
// get a volume
Var f as FolderItem = volume(0)

// test with desktop
Var d as FolderItem= SpecialFolder.Desktop
```

```
// query node
Var NodeID as UInt32 = d.MacNodeIDMBS

// and search back
Var dest as FolderItem = f.MacResolveNodeIDMBS(nodeid)

MessageBox dest.NativePath
```

Notes: NodeIDs may not be supported on all volumes.
Returns nil on any error.
Upgraded in plugin version 18.4 to use newer APIs for 64-bit IDs on AFS volumes.

84.17.71 NameExtensionMBS as string

MBS Util Plugin, Plugin Version: 10.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file extension from the file name.
Example:

```
Var f as folderitem = SpecialFolder.desktop

MessageBox "Name: "+f.Name+EndOfLine+"Name extension: "+f.NameExtensionMBS+EndOfLine+"Name without extension: "+f.NameWithoutExtensionMBS

Var g as FolderItem = SpecialFolder.Desktop.Child("test.rbp")

MessageBox "Name: "+g.Name+EndOfLine+"Name extension: "+g.NameExtensionMBS+EndOfLine+"Name without extension: "+g.NameWithoutExtensionMBS
```

Notes: If there is no extension, this string is empty.
The extension does not include the dot.

84.17.72 NameWithoutExtensionMBS as string

MBS Util Plugin, Plugin Version: 10.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file name without file extension.
Example:

```
Var f as folderitem = SpecialFolder.desktop

MessageBox "Name: "+f.Name+EndOfLine+"Name extension: "+f.NameExtensionMBS+EndOfLine+"Name without extension: "+f.NameWithoutExtensionMBS

Var g as FolderItem = SpecialFolder.Desktop.Child("test.rbp")

MessageBox "Name: "+g.Name+EndOfLine+"Name extension: "+g.NameExtensionMBS+EndOfLine+"Name without extension: "+g.NameWithoutExtensionMBS
```

Notes: If there is no extension, the whole name is returned.

84.17.73 NativePath as string

MBS MacOSX Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the native path for the file.
Example:

```
// test absolute path
Var f As FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var p As String = f.AbsolutePath

Var g As FolderItem = NewFolderItemFromAbsolutePathMBS(p)
Var n As String = g.NativePath

MessageBox p+EndOfLine+n
```

Notes: For Real Studio we register this function for compatibility to Xojo.
Same as UnixpathMBS, but with name NativePath.

84.17.74 NewCGPDFDocumentMBS(MediaBox as CGRectMBS, title as string, author as string, creator as string) as CGPDFContextMBS

MBS MacCG Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Creates a PDF document.
Example:

```
// create pdf
Var file as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var r as new CGRectMBS(0,0,500,500)
Var c as CGContextMBS = file.NewCGPDFDocumentMBS(r, "My Title", "My Author", "My Creator")

if c<>Nil then

// create page
c.BeginPage r

// draw something
c.SetRGBFillColor(1.0, 0.0, 0.0, 1.0)
c.FillRect CGMakeRectMBS(100,100,100,100)

// close page
c.EndPage

// flush and show in PDF viewer
c = nil
file.Launch
end if
```

Notes: Title, author and creator are all optional.
RB 4.5 should do this perfectly, but older RB versions may have problems.
(seems like the file must exist before calling this function)
Requires Mac OS X to work.
See also:

- 84.17.75 NewCGPDFDocumentMBS(MediaBox as CGRectMBS, title as string, author as string, creator as string, subject as string, keywords as string, OwnerPassword as string, UserPassword as string, AllowsPrinting as boolean, AllowsCopy as boolean) as CGPDFContextMBS 14144
- 84.17.76 NewCGPDFDocumentMBS(MediaBox as CGRectMBS, title as string, author as string, creator as string, subject as string, keywords as string, OwnerPassword as string, UserPassword as string, AllowsPrinting as boolean, AllowsCopy as boolean, KeyLength as Integer) as CGPDFContextMBS

14145

84.17.75 NewCGPDFDocumentMBS(MediaBox as CGRectMBS, title as string, author as string, creator as string, subject as string, keywords as string, OwnerPassword as string, UserPassword as string, AllowsPrinting as boolean, AllowsCopy as boolean) as CGPDFContextMBS

MBS MacCG Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Creates a PDF document.
Example:

```
// create pdf
Var file as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var r as new CGRectMBS(0,0,500,500)
Var c as CGContextMBS = file.NewCGPDFDocumentMBS(r, "My Title", "My Author", "My Creator",
"My Subject", "test,pdf,mac", "","", true, true)

if c<>Nil then

// create page
c.BeginPage r

// draw something
c.SetRGBFillColor(1.0, 0.0, 0.0, 1.0)
c.FillRect CGMakeRectMBS(100,100,100,100)

// close page
c.EndPage

// flush and show in PDF viewer
c = nil
file.Launch
end if
```

Notes: Title, Author, Creator, Subject and Keywords parameters can be empty.

If OwnerPassword and UserPassword are filled in the PDF is encrypted and AllowsPrinting/AllowsCopy define what the user can do after he entered his password.

Requires Mac OS X to work.
See also:

- 84.17.74 NewCGPDFDocumentMBS(MediaBox as CGRectMBS, title as string, author as string, creator as string) as CGPDFContextMBS 14143

- 84.17.76 NewCGPDFDocumentMBS(MediaBox as CGRectMBS, title as string, author as string, creator as string, subject as string, keywords as string, OwnerPassword as string, UserPassword as string, AllowsPrinting as boolean, AllowsCopy as boolean, KeyLength as Integer) as CGPDFContextMBS 14145

84.17.76 NewCGPDFDocumentMBS(MediaBox as CGRectMBS, title as string, author as string, creator as string, subject as string, keywords as string, OwnerPassword as string, UserPassword as string, AllowsPrinting as boolean, AllowsCopy as boolean, KeyLength as Integer) as CGPDFContextMBS

MBS MacCG Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Creates a PDF document.
Example:

```
// create pdf
Var file as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var r as new CGRectMBS(0,0,500,500)
Var c as CGContextMBS = file.NewCGPDFDocumentMBS(r, "My Title", "My Author", "My Creator",
"My Subject", "test,pdf,mac", "owner","user", false, false, 128)

if c<>Nil then

// create page
c.BeginPage r

// draw something
c.SetRGBFillColor(1.0, 0.0, 0.0, 1.0)
c.FillRect CGMakeRectMBS(100,100,100,100)

// close page
c.EndPage

// flush and show in PDF viewer
c = nil
file.Launch
end if
```

Notes: Title, Author, Creator, Subject and Keywords parameters can be empty.

If OwnerPassword and UserPassword are filled in the PDF is encrypted and AllowsPrinting/AllowsCopy define what the user can do after he entered his password.

Keylength must be a value between 48 bit and 128 bit in 8 bit steps. 0 uses default value.

Requires Mac OS X to work.

- Several ways for picture to PDF in MBS Plugins

See also:

- 84.17.74 NewCGPDFDocumentMBS(MediaBox as CGRectMBS, title as string, author as string, creator as string) as CGPDFContextMBS 14143
- 84.17.75 NewCGPDFDocumentMBS(MediaBox as CGRectMBS, title as string, author as string, creator as string, subject as string, keywords as string, OwnerPassword as string, UserPassword as string, AllowsPrinting as boolean, AllowsCopy as boolean) as CGPDFContextMBS 14144

84.17.77 NewCGPDFDocumentWithInfoMBS(MediaBox as CGRectMBS, info as object) as CGPDFContextMBS

MBS MacCG Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Creates a PDF document.
Example:

```
// create pdf
Var file as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var r as new CGRectMBS(0,0,500,500)

Var d as new CFMutableDictionaryMBS

d.Add NewCFStringMBS("kCGPDFContextTitle"), NewCFStringMBS("My Title")
d.Add NewCFStringMBS("kCGPDFContextAuthor"), NewCFStringMBS("My Author")
d.Add NewCFStringMBS("kCGPDFContextCreator"), NewCFStringMBS("My Creator")
d.Add NewCFStringMBS("kCGPDFContextSubject"), NewCFStringMBS("My Subject")
d.Add NewCFStringMBS("kCGPDFContextKeywords"), NewCFStringMBS("keyword,mac,pdf")

Var c as CGContextMBS = file.NewCGPDFDocumentWithInfoMBS(r, d)

if c<>Nil then

// create page
c.BeginPage r

// draw something
c.SetRGBFillColor(1.0, 0.0, 0.0, 1.0)
c.FillRect CGMakeRectMBS(100,100,100,100)

// close page
```

```
c.EndPage

// flush and show in PDF viewer
c = nil
file.Launch
end if
```

Notes: The optional info parameter is a CFDictionaryMBS object and contains some information about the PDF file.

Keys for auxiliary info dictionary:

NewCFStringMBS("kCGPDFContextTitle")
The document's title. Optional; if present, the value must be a CFString.

NewCFStringMBS("kCGPDFContextAuthor")
The name of the person who created this document. Optional; if present, the value must be a CFString.

NewCFStringMBS("kCGPDFContextCreator")
The name of the application that created the original data used to create this document. Optional; if present, the value must be a CFString.

NewCFStringMBS("kCGPDFContextOutputIntent")
The document's output intent. Optional; if present, the value must be a CFDictionaryMBS. The dictionary is added to the PDF document in the /OutputIntents entry in the PDF file's document catalog. The keys and values contained in the dictionary must match those specified in section 9.10.4 of the PDF 1.4 specification, ISO/DIS 15930-3 document published by ISO/TC 130, and Adobe Technical Note #5413.

The following keys are supported:

"S" - The output intent subtype. This key is required; the value must be a CFString equal to "GTS_PDFX"; otherwise, the dictionary is ignored.

"OutputConditionIdentifier" - A string identifying the intended output device or production condition in a human- or machine-readable form. This key is required; the value must be a CFString. For best results, the string should be representable losslessly in ASCII encoding.

"OutputCondition" - A text string identifying the intended output device or production condition in a human-readable form. This key is optional; if present, the value must be a CFString.

"RegistryName" - A string identifying the registry in which the condition designated by "OutputCondition-

Identifier" is defined. This key is optional; if present, the value must be a CFString. For best results, the string should be representable losslessly in ASCII encoding.

"Info" - A human-readable text string containing additional information or comments about the intended target device or production condition. This key is required if "OutputConditionIdentifier" does not specify a standard production condition; it is optional otherwise. If present, the value must be a CFString.

"DestOutputProfile" - An ICC profile stream defined the transformation from the PDF document's source colors to output device colorants. This key is required if "OutputConditionIdentifier" does not specify a standard production condition; it is optional otherwise. If present, the value must be a ICC-based CGColorSpaceMBS.

NewCFStringMBS("kCGPDFContextOutputIntents")
The document's output intents. Optional; if present, the value must be a CFArrayMBS containing one or more CFDictionaryMBSs. The array is added to the PDF document in the /OutputIntents entry in the PDF file's document catalog. Each dictionary in the array must be of form specified above for the "kCGPDFContextOutputIntent" key, except that only the first dictionary in the array is required to contain the "S" key with a value of "GTS_PDFX". If both the "kCGPDFContextOutputIntent" and "kCGPDFContextOutputIntents" keys are specified, the former will be ignored.

More keys in CGPDFContext.h coming with Xcode.

84.17.78 NodeIDMBS as UInt64

MBS MacClassic Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The node ID for this file or folder.
Example:

```
var f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var n As UInt64 = f.NodeIDMBS

MessageBox "node ID: " + n.ToString
```

Notes: Implemented for macOS, iOS, Windows and Linux.
Blog Entries

- MBS Xojo Plugins, version 26.3pr6

84.17.79 OpenAsCGPDFDocumentMBS as CGPDFDocumentMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: All.

Function: Opens a PDF document.
Notes: RB 4.5 should do this perfectly, but older RB versions may have problems with longer file names.
Requires Mac OS X to work.
Xojo Developer Magazine

- 8.5, pages 20 to 21: Printing PDFs, Easy PDF printing on Mac and Windows
- 6.4, page 30: Creating PDF Files, How to create PDFs using the MBS Plugins by Christian Schmitz

84.17.80 OpenAsGIFMBS as GIFMBS

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a GIF file.
Notes: Returns nil on any error.
QuickTime is not required!
Blog Entries

- Tip of day: Load GIF into WebImageView

84.17.81 OpenAsJPEGMBS as picture

MBS Images Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a picture from a JPEG file.
Notes: A short version of OpenAsJPEG with fileposition=0 and allowdamage=false.
See also:

- 84.17.82 OpenAsJPEGMBS(allowdamaged as Boolean) as picture 14149
- 84.17.83 OpenAsJPEGMBS(allowdamaged as Boolean,fileposition as Integer) as picture 14150

84.17.82 OpenAsJPEGMBS(allowdamaged as Boolean) as picture

MBS Images Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a picture from a JPEG file.
Notes: A short version of OpenAsJPEG with fileposition=0.
See also:

- 84.17.81 OpenAsJPEGMBS as picture 14149
- 84.17.83 OpenAsJPEGMBS(allowdamaged as Boolean,fileposition as Integer) as picture 14150

84.17.83 OpenAsJPEGMBS(allowdamaged as Boolean,fileposition as Integer) as picture

MBS Images Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a picture from a JPEG file.
Example:

```
Var f as folderitem
f=SpecialFolder.Desktop.child("a great jpeg picture.jpg")
Window1.backdrop=f.openasjpegMBS
```

Notes: This methods should read all JPEG files you can get, but I've only tested it for 32 bit color and 8 bit grayscale.

This method is not depending on any library! It works without QuickTime even on System 7, but as it contains everything needed this method is around 120 KB big!

I wrote it mainly because Xojo's built in OpenAsJPEG code crashes badly if your picture is not full downloaded. For example if you have a webbrowser you can now show JPEGs while you download them. Normally you can see a good picture allready with 50% of the data.

Xojo's OpenAsPicture in contrast crashes if the picture is not 100% downloaded or instead of a crash you get a white picture.

See the folder "jpeg load crashtest" in the examples.

The two parameters are both optional. The second is to give a file position to start reading. This way you can load several JPEGs from different file position from one file.
See also:

- 84.17.81 OpenAsJPEGMBS as picture 14149
- 84.17.82 OpenAsJPEGMBS(allowdamaged as Boolean) as picture 14149

84.17.84 OpenAsLargeBinaryStreamMBS(write as Boolean) as LargeBinaryStreamMBS

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a file as a LargeBinaryStreamMBS.
Example:

```
Var l as LargeBinaryStreamMBS
Var f as FolderItem = SpecialFolder.Desktop.Child("testfile")
```

l=f.OpenAsLargeBinaryStreamMBS(true)

Notes: Returns nil on any error.

84.17.85 OpenAsPNGMBS(gamma as single = 0.0, AllowDamaged as Boolean = false) as PNGPictureMBS

MBS Images Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a picture from a PNG file.
Example:

```
Var f as folderitem
f=SpecialFolder.Desktop.child("a great picture.png")
Window1.backdrop=f.OpenAsPNGMBS(0).pict
```

Notes: This methods should read all PNG files you can get.

This method is not depending on any library! It works without QuickTime even on System 7, but as it contains everything needed this method is around 130 KB big!

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma
A bad gamma value can give you a black image.

AllowDamaged: Whether to allow damaged PNG files to return a part of the image as picture.

84.17.86 OpenAsResStreamMBS(write as Boolean) as ResStreamMBS

MBS Util Plugin, Platform: macOS, Targets: All.

Function: Opens a file's resourcefork as a ResStreamMBS.
Notes: Returns nil on any error.

84.17.87 OpenAsTiffMBS(HeaderOnly as boolean=false) as TiffPictureMBS

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a picture from a TIFF file.
Example:

```
Var f as FolderItem
Var t as TiffPictureMBS

f=SpecialFolder.Desktop.Child("008.tiff")
t=f.OpenAsTiffMBS(true)

if t<>Nil then
MessageBox str(t.width)+" x "+str(t.height)
else
MessageBox "Problem?"
end if
```

Notes: This method is not depending on any library! It works without QuickTime even on System 7, but as it contains everything needed this method is around 270 KB big!
The plugin supports even more stuff like zlib compressed picture data or JPEGs embedded into TIFFs.

If the function returns nil, you can use a TiffPictureMBS subclass and use the methods there so you get error messages in the error event.

Setting HeaderOnly to true will ignore the actual picture data and load only the header data.

This function works with most Tiff formats, but has problems with some like 16 bit CMYK.

84.17.88 OpenWithAppMBS(TheApplication as FolderItem, inFront as Boolean) as Boolean

MBS MacClassic Plugin, Platforms: macOS, Windows, Targets: All.

Function: Opens a file using the given application.
Notes: Similar to Launch (see FolderItem.Launch), with the additional option to specify the application that should be used to open the FolderItem object. Passing nil in the app parameter is functionally identical to calling Launch.

Works with Graphicconverter, but not with Preview!?
Added Windows support in version 3.4.
Blog Entries

- MBS Plugins updated for Xojo 2019r2

84.17.89 ParentVolumeMBS as folderitem

MBS Util Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the folderitem for the volume the folderitem is pointing to.
Blog Entries

- MBS Xojo Plugins, version 19.5pr7

84.17.90 PercentDownloadedMBS as Double

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the iCloud file properties.
Notes: An Number in the range 0-100 that tells what percentage of the file has been downloaded.
Available in Mac OS X v10.7 and later.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr9

84.17.91 PercentUploadedMBS as Double

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the iCloud file properties.
Notes: An Number in the range 0-100 that tells what percentage of the file has been uploaded.
Available in Mac OS X v10.7 and later.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr9

84.17.92 PermissionsMBS(OldWay as boolean) as PermissionsMBS

MBS MacOSX Plugin, Platform: macOS, Targets: All.

Function: Returns an object for the Permissions of a file.
Example:

```
Var f as FolderItem
Var p as PermissionsMBS

f=FolderItem.ShowOpenFileDialog("special/any")

if f<>nil then
p=f.PermissionsMBS(true)
```

```
if p<>Nil then // requires Mac OS X
p.Access=&H6

// &h000006 = -rw——-
// &h000600 = —-rw—-
// &h060000 = ——-rw-

if 0=p.SetPermissions(true) then
MessageBox "Permissions set"
else
MessageBox "Permissions could not be set"
end if
else
MessageBox "We require Mac OS X"
end if
else
' nothing selected
end if
```

Notes: You can use old API if you set Oldway=true. Than you set access value like in older version of the plugin.
If you set Oldway = false, you use the newer API which set unix permissions, but not the old ones.
The old way is not supported for 64bit.

84.17.93 PhysicalFileDataLengthMBS as int64

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the length of the physical disk space used for this file's data fork.
Example:

```
filesize.text=format(file.PhysicalFileDataLengthMBS,"0")
```

Notes: This function works for files bigger than 2 GB which RB's built in functions don't.
On Windows the physical size reported is equal to the logical size, because there is no function for the physical size.

84.17.94 PhysicalFileResLengthMBS as int64

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the length of the physical disk space used for this file's resourcefork.
Example:

filesize.text=format(file.PhysicalFileResLengthMBS,"0")

Notes: This function works for files bigger than 2 GB which RB's built in functions don't.
On Windows the physical size reported is equal to the logical size, because there is no function for the physical size.

84.17.95 PhysicalFileTotalLengthMBS as int64

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the length of the physical disk space used for this file.
Example:

filesize.text=format(file.PhysicalFileTotalLengthMBS,"0")

Notes: This function works for files bigger than 2 GB which RB's built in functions don't.
On Windows the physical size reported is equal to the logical size, because there is no function for the physical size.

84.17.96 QuickLookMBS(MaxWidth as Integer = 500, MaxHeight as Integer = 500, IconMode as Boolean = false, ScaleFactor as Double = 1.0) as picture

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Creates a thumbnail for the designated file.
Example:

```
Var f as FolderItem

f=SpecialFolder.Desktop.Child("test.jpg")

// shows the icon in 128x128 scaled by factor 4:
Backdrop=f.QuickLookMBS(128,128,true,4)

// shows the icon in default size:
Backdrop=f.QuickLookMBS(128,128,true,0)
```

```
// shows preview of image in 128x128 pixels.
Backdrop=f.QuickLookMBS(128,128,false,0)

// shows preview of image in 512x512 pixels.
Backdrop=f.QuickLookMBS(128,128,false,4)

// shows preview of image in 512x512 pixels.
Backdrop=f.QuickLookMBS(512,512,false,0)

// use Icon function in case no preview is available:
Backdrop=f.iconmbs(512)
```

Notes: Returns nil if Quick Look does not support this file type. In that case you may use folderitem.Icon() with the given size.

MaxWidth and MacHeight specify the maximum desired size.
If ScaleFactor is bigger than zero, it is used. Else the default value is used.
If IconMode is true, QL will produce an icon (ie a thumbnail and all the icon decor, like shadows, curled corner, etc.).

If you look for a control to show quicklook preview like the finder, please check the QLPreviewPanelMBS window and the QLPreviewViewMBS control.

QuickLook does not provide images for items in special folders like temporary folders.

If you like to use this asynchronously, you can check QLThumbnailGenerationRequestMBS class.

84.17.97 QuickLookMTMBS(MaxWidth as Integer = 500, MaxHeight as Integer = 500, IconMode as Boolean = false, ScaleFactor as Double = 1.0) as picture

MBS MacFrameworks Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a thumbnail for the designated file.
Example:

```
Var f As FolderItem

f=SpecialFolder.Desktop.Child("test.png")

// shows preview of image in 512x512 pixels.
Backdrop=f.QuickLookMTMBS(512,512,False,0)
```

Notes: Same as QuickLookMBS, but thread friendly.

QuickLook does not provide images for items in special folders like temporary folders.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
Blog Entries

- Multithreaded plugin functions can increase speed of Xojo application

- MBS Xojo / Real Studio Plugins, version 13.2pr10

84.17.98 ReadFileMBS(byref data as MemoryBlock, offset As Integer = 0, byteCount As Integer = -1) as boolean

MBS Util Plugin, Plugin Version: 21.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a file to a memory block.
Example:

```
Var f As New FolderItem("/Users/cs/Downloads/Download Archive/Xcode_13_beta_5.xip", FolderItem.PathModes.Native)

Var m As MemoryBlock
'Dim m As New MemoryBlock(f.Length)

If f.ReadFileMBS(m) Then
// okay
Var Len As Integer = m.size
Break
Else
// failed
Var e As Integer = f.LastErrorCode
Break
End If
```

Notes: Reads content of file and returns it in data parameter.
Returns true on success of false on failure.

See also WriteFileMBS function.

If the MemoryBlock is nil, we create one.
If the MemoryBlock is not nil and has right size, we use it, otherwise we create a new one.
Not intended for files >2 GB.

Added offset and length parameters in version 23.1.
If byteCount is negative, we read whole file. If byteCount is bigger than file, we only read the available portion.
See also:

- 84.17.99 ReadFileMBS(byref data as string, offset As Integer = 0, byteCount As Integer = -1) as boolean 14158

84.17.99 ReadFileMBS(byref data as string, offset As Integer = 0, byteCount As Integer = -1) as boolean

MBS Util Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a file.
Notes: Reads content of file and returns it in data parameter.
Returns true on success of false on failure.

See also WriteFileMBS function.

Limited to maximum size of a string (2 GB)
Data must fit in memory, so 32-bit processes may be limited to reading less than 2 GB.

Added offset and length parameters in version 23.1.
If byteCount is negative, we read whole file. If byteCount is bigger than file, we only read the available portion.

84.17.100 SaveAs8BitAlphaPNGMBS(pic as picture, colors() as color, alphas() as Integer, gamma as single = 0.0) as boolean

MBS Images Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves a palette based RGB picture as a PNG file with alpha.
Notes: Pic should have no mask.
Colors must be an array with 256 values defining the palette.
Alphas must be an array with 256 values specifying the alpha value for each palette entry. 255 is opaque and 0 is transparent.

Returns true on success and false on failure.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma
See also:

- 84.17.101 SaveAs8BitAlphaPNGMBS(pic as picture, colors() as color, alphas() as Integer, gamma as single, Interlace as Boolean, FilterType as Integer) as boolean 14160

84.17.101 SaveAs8BitAlphaPNGMBS(pic as picture, colors() as color, alphas() as Integer, gamma as single, Interlace as Boolean, FilterType as Integer) as boolean

MBS Images Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves a palette based RGB picture as a PNG file with alpha.
Notes: Pic should have no mask.
Colors must be an array with 256 values defining the palette.
Alphas must be an array with 256 values specifying the alpha value for each palette entry. 255 is opaque and 0 is transparent.

Returns true on success and false on failure.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma

If Interlace is true the Adam7 interlacing is used.
FilterType specifies the filter:

```
const PNG_NO_FILTERS      = 0
const PNG_FILTER_NONE     = 8
const PNG_FILTER_SUB      = 16
const PNG_FILTER_UP       = 32
const PNG_FILTER_AVG      = 64
const PNG_FILTER_PAETH    = 128
const PNG_FILTER_ALL      = 248
```

84.17.103 SaveAs8BitPNGMBS(pic as picture, colors() as color, gamma as single, Interlace as Boolean, FilterType as Integer) as boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves a palette based RGB picture as a PNG file.
Notes: Pic should have no mask.
Colors must be an array with 256 values defining the palette.

Returns true on success and false on failure.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)

- 84.17.102 SaveAs8BitPNGMBS(pic as picture, colors() as color, gamma as single = 0.0) as boolean 14160

84.17.104 SaveAsGIFMBS(data as GIFMBS) as boolean

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves a gif file.
Notes: Returns true on success and false on any error.
QuickTime is not required!
Please check for the lzw patent in your country before using this function as you may need to pay license fees.

84.17.105 SaveAsJPEGMBS(pic as picture, quality as Integer = 80) as boolean

MBS Images Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves a picture into a file using JPEG compression.
Example:

```
Var pic as Picture = LogoMBS(500)
Var f as folderitem
f=SpecialFolder.Desktop.child("a great jpeg picture.jpg")
if f.SaveAsJPEGMBS(pic,75) then
MessageBox "Picture saved."
end if
```

Notes: This methods saves 32bit pictures to a file using JPEG Compression. Using the parameter you can specify the quality in range between 25 and 100%

See the "SaveJPEG without QuickTime" example.

As JPEG does not support alpha channel or mask, those are ignored.
The second parameter is optional. There you can give a file position where to start writing. This way you can save several JPEGs to different file position inside one file.
Use the JPEGExporterMBS class for more options.

84.17.106 SaveAsPNGMBS(pic as picture, gamma as single = 0.0) as boolean

MBS Images Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves RGB picture as PNG file.
Notes: If pic has a mask, it is written to the file as alpha channel.

Returns true on success and false on failure.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma

- 84.17.109 SaveAsPNGMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as boolean 14165

84.17.107 SaveAsPNGMBS(pic as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as boolean

MBS Images Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves RGB picture as PNG file.
Notes: If pic has a mask, it is written to the file as alpha channel.

Returns true on success and false on failure.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma

If Interlace is true the Adam7 interlacing is used.
FilterType specifies the filter:

```
const PNG_NO_FILTERS      = 0
const PNG_FILTER_NONE     = 8
const PNG_FILTER_SUB      = 16
const PNG_FILTER_UP       = 32
const PNG_FILTER_AVG      = 64
const PNG_FILTER_PAETH    = 128
const PNG_FILTER_ALL      = 248
```

See also:

- 84.17.106 SaveAsPNGMBS(pic as picture, gamma as single = 0.0) as boolean 14163
- 84.17.108 SaveAsPNGMBS(pic as picture, mask as picture, gamma as single = 0.0) as boolean 14165
- 84.17.109 SaveAsPNGMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as boolean 14165

84.17.108 SaveAsPNGMBS(pic as picture, mask as picture, gamma as single = 0.0) as boolean

MBS Images Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves RGB picture as PNG file.
Example:

```
// load
Var f as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var p as PNGPictureMBS = f.OpenAsPNGMBS

// save
Var g as FolderItem = SpecialFolder.Desktop.Child("output.png")
if g.SaveAsPNGMBS(p.Pict, p.Mask) then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: If mask is nil no alpha channel is written to the file.

Returns true on success and false on failure.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma
See also:

- 84.17.106 SaveAsPNGMBS(pic as picture, gamma as single = 0.0) as boolean 14163
- 84.17.107 SaveAsPNGMBS(pic as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as boolean 14164
- 84.17.109 SaveAsPNGMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as boolean 14165

84.17.109 SaveAsPNGMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as boolean

MBS Images Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves RGB picture as PNG file.
Notes: If mask is nil no alpha channel is written to the file.

Returns true on success and false on failure.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma

If Interlace is true the Adam7 interlacing is used.
FilterType specifies the filter:

```
const PNG_NO_FILTERS      = 0
const PNG_FILTER_NONE     = 8
const PNG_FILTER_SUB      = 16
const PNG_FILTER_UP       = 32
const PNG_FILTER_AVG      = 64
const PNG_FILTER_PAETH    = 128
const PNG_FILTER_ALL      = 248
```

See also:

- 84.17.106 SaveAsPNGMBS(pic as picture, gamma as single = 0.0) as boolean 14163
- 84.17.107 SaveAsPNGMBS(pic as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as boolean 14164
- 84.17.108 SaveAsPNGMBS(pic as picture, mask as picture, gamma as single = 0.0) as boolean 14165

84.17.110 SetDesktopPictureMBS as Integer

MBS Picture Plugin, Plugin Version: 3.3, Platforms: macOS, Windows, Targets: All.

Function: Asks the Finder/Explorer to change the desktop picture.
Notes: File must be a valid folderitem for an existing file.
Returns a Mac OS or Windows error code or -1 if the function is not available.

84.17.111 SetFileFlagsMBS(flags as Integer) as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Set the file flags for the folderitem to the given value. Returns 0 if okay.
Example:

```
Var f as FolderItem
Var err, fdFlags as Integer
```

```
// For example, clearing a file's hasCustomIcon flag works like this:
fdFlags = f.GetFileFlagsMBS
if fdFlags >= 0 then
err = f.SetFileFlagsMBS(BitExclMBS(fdFlags, 10))
if err <>0 then
// ... oops, an error occurred
// (for instance, the disk could be write protected)
end
end
```

Notes: Sets the fdFlags of a file. Returns an error code (or zero if no error occurred). Possible error conditions include "disk is write protected" and "file not found".
When changing flags of a file, use GetFileFlags to get the original flags, then clear or set the flags by using BitwiseAnd and BitwiseOr and call SetFileFlags to set the new flags.

- MBS Plugins updated for Xojo 2019r2

84.17.112 SetFolderFlagsMBS(flags as Integer) as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Set the folder flags for the folderitem to the given value. Returns 0 if okay.
Example:

```
Var f As FolderItem = New FolderItem("test") // some folder
If f.SetFolderFlagsMBS(BitwiseOr(f.GetFolderFlagsMBS, 4)) <>0 Then
MessageBox "Can't set label to green."
End If
```

Notes: Sets the frFlags of a folder. Returns an error code (or zero if no error occurred). Possible error conditions include "disk is write protected" and "folder not found".
When changing flags of a folder, use GetFolderFlags to get the original flags, then clear or set the flags by using BitwiseAnd and BitwiseOr and call SetFolderFlags to set the new flags.

with values 2, 4 and 8 in the flags, you control the label color in Finder. Example code above uses 4 which is green by default.

If you need to set bundle bit in newer projects, please use SetResourcePropertyForKey on CFURLMBS class with kCFURLIsPackageKey key.

- MBS Plugins updated for Xojo 2019r2

84.17.113 SetTagNamesMBS(tags() as string) as Integer

MBS MacCF Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Sets file tags.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.xojo_binary_project")

Var Tags() as string = Array("Hello", "World")
Var e as Integer = f.SetTagNamesMBS(tags)

MessageBox "SetTagNamesMBS: "+str(e)
```

Notes: tags() is array with new tag names.
Provides error code as return value and details about error in CFErrorMBS object.
Requires Mac OS X 10.9 or newer.
Please note that some tags may include chr(10) followed by a number to indicate which label color is used for compatibility to older OS X versions.
See also:

- 84.17.114 SetTagNamesMBS(tags() as string, byref e as CFErrorMBS) as Integer 14168

84.17.114 SetTagNamesMBS(tags() as string, byref e as CFErrorMBS) as Integer

MBS MacCF Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Sets file tags.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.xojo_binary_project")

Var Tags() as string = Array("Hello", "World")
Var ce as CFErrorMBS
Var e as Integer = f.SetTagNamesMBS(tags, ce)

if ce <>nil then
MessageBox "SetTagNamesMBS: "+str(e)+EndOfLine+ce.Description
else
MessageBox "SetTagNamesMBS: "+str(e)
end if
```

Notes: tags() is array with new tag names.
Provides error code as return value and details about error in CFErrorMBS object.
Requires Mac OS X 10.9 or newer.
Please note that some tags may include chr(10) followed by a number to indicate which label color is used

for compatibility to older OS X versions.
See also:

- 84.17.113 SetTagNamesMBS(tags() as string) as Integer 14168

84.17.115 ShortPathMBS as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the short path for the file.
Example:

```
Var f as folderitem = specialfolder.desktop.child("test.file")
MessageBox f.ShortPathMBS
```

Notes: In contrast to long path this is the short 8.3 path for Windows.
You need this for the WindowsMCI object.
Works with Windows NT 4 or newer.

84.17.116 SortedFilesMBS(followAlias as Boolean = false, SortByDisplayName as boolean = false, VisibleOnly as boolean = false) as FolderItem()

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array of files in the given folder.
Example:

```
Var folder as FolderItem = SpecialFolder.Desktop
Var Items() as FolderItem = folder.SortedFilesMBS
MessageBox str(Items.Count)+" items"
```

Notes: Checks for whether item is not a directory and returns only those.
We can resolve alias if you like and optionally sort by display name instead of normal name field.
And we can filter to only return visible items.

84.17.117 SortedFoldersMBS(followAlias as Boolean = false, SortByDisplayName as boolean = false, VisibleOnly as boolean = false) as FolderItem()

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array of folders in the given folder.
Example:

```
Var folder as FolderItem = SpecialFolder.Desktop
Var Items() as FolderItem = folder.SortedFoldersMBS
MessageBox str(Items.Count)+" items"
```

Notes: Similar to item() function, but returns all items with one call.
Checks for whether item is directory and returns only those.
We can resolve alias if you like and optionally sort by display name instead of normal name field.
And we can filter to only return visible items.

84.17.119 SpotLightFileInfoMBS(uti as string = "") as dictionary

MBS MacOSX Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Runs the spotlight metadata importer for this file and returns the dictionary with the metadata found in the file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.numbers")
Var d as Dictionary = f.SpotLightFileInfoMBS

MessageBox "Title: "+d.Value("kMDItemTitle")
MessageBox "Text Content: "+d.Value("kMDItemTextContent")
```

Notes: Returns nil on any error.
Works well with PDF, AppleWorks, Pages, Numbers, Word, Excel, Powerpoint and all other files, where you have an importer.
Does currently not find importers inside an application.
Blog Entries

- MBS Plugins updated for Xojo 2019r2
- MBS Xojo Plugins, version 17.5pr2

84.17.120 SpotLightLoadMDImporterMBS as boolean

MBS MacOSX Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Loads another MDImporter.
Example:

```
Var f as FolderItem = New FolderItem("/Developer/Applications/Xcode.app/Contents/Library/Spotlight/SourceCode.mdimporter", FolderItem.PathModes.Shell)

if f.SpotLightLoadMDImporterMBS then
MessageBox "Loaded SourceCode importer."
end if
```

Notes: By default importers are loaded from /Library/Spotlight,
textasciitilde /Library/Spotlight and /System/Library/Spotlight. You can load another importers using this method.
Returns true on success and false on failure.

84.17.121 SpotLightTextContentMBS(uti as string = "") as string

MBS MacOSX Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Runs the spotlight metadata importer for this file and returns the text content string for the file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
MessageBox f.SpotLightTextContentMBS
```

Notes: Returns an empty string on any error.
Works well with PDF, AppleWorks, Pages, Numbers, Word, Excel, Powerpoint and all other files, where you have an importer.
Does currently not find importers inside an application.

84.17.122 TagNamesMBS as string()

MBS MacCF Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Queries tag names for a file or folder.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.xojo_binary_project")
Var Tags() as string = f.TagNamesMBS
MessageBox "Tags: "+Join(tags, EndOfLine)
```

Notes: Requires Mac OS X 10.9 or newer.
Optionally provides error information in CFErrorMBS object.
Please note that some tags may include chr(10) followed by a number to indicate which label color is used for compatibility to older OS X versions.
See also:

- 84.17.123 TagNamesMBS(byref e as CFErrorMBS) as string() 14172

84.17.123 TagNamesMBS(byref e as CFErrorMBS) as string()

MBS MacCF Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Queries tag names for a file or folder.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.xojo_binary_project")
```

```
Var ce as CFErrorMBS
Var Tags() as string = f.TagNamesMBS(ce)

if ce <>nil then
MessageBox "Failed: "+ce.Description
else
MessageBox "Tags: "+Join(tags, EndOfLine)
end if
```

Notes: Requires Mac OS X 10.9 or newer.
Optionally provides error information in CFErrorMBS object.
Please note that some tags may include chr(10) followed by a number to indicate which label color is used for compatibility to older OS X versions.
See also:

84.17.127 UnixpathMBS as string

MBS MacOSX Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the native path for the file.
Example:

```
Var sh as Shell
Var fi as FolderItem
Var s as String
Var t as TextConverter

sh = new Shell
fi = New FolderItem("test ,àö") // or try some other file name

if fi = nil or fi.exists = false then
beep
return
end if

s="ls -al """ + fi.Unixpathmbs + """"

sh.Execute s
MessageBox sh.Result
```

Notes: test on the Desktop could be this:
On Mac OS X: /Users/cs/Desktop/test

On Mac OS 9: Mac OS 9:Desktop folder:test
On Windows: c:\windows\desktop\test

This function will return an empty string if the path can not be encoded in a Xojo String. For my tests ICQ's path which is includes the folder name "ICQ 3.0 í" can not be converted to MacRoman for some reason.

On Mac OS X this function returns the posix path. So if you are looking for POSIXPathMBS or PosixPath this method is it.
This function should do the same as NativePath in Xojo 2013r1.

84.17.128 UnMountVolumeMBS(force as boolean = false) as Integer

MBS MacClassic Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: This routine unmounts the volume specified by the folderitem.
Example:

```
Var disk as FolderItem

Var c as Integer = VolumeCount-1
for i as Integer = 0 to c
Var v as FolderItem = volume(i)
if v.Name = "monikajuchmes" then
disk = v
exit
end if
next

if disk = nil then
MessageBox "Please change the name in this code."
else
Var e as Integer = disk.UnMountVolumeMBS

if e=0 then
MessageBox "Volume unmounted."
else
MessageBox "There was an error!"
end if
end if
```

Notes: If the volume cannot be unmounted the pid of the process which denied the unmount will be returned in the dissenterPID parameter.
This routine returns after the unmount is complete.

force: Specify true if you want the volume forcibly unmounted. Force unmounting a volume will very likely result in data loss since the volume will be ejected even if there are open files on it. This option should be reserved for situations such as the backing store for a volume is gone (so the data is lost regardless).
dissenterPID: Optionally, pid of the process which denied the unmount if the unmount is denied.

Returns a Mac OS error code. 0 means no error and -1 is a plugin error if the function can't be called. -47 is returned if the disc is in use.
See also:

- 84.17.129 UnMountVolumeMBS(force as boolean, byref dissenterPID as Integer) as Integer 14176

84.17.129 UnMountVolumeMBS(force as boolean, byref dissenterPID as Integer) as Integer

MBS MacClassic Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: This routine unmounts the volume specified by the folderitem.
Example:

```
Var disk as FolderItem

Var c as Integer = VolumeCount-1
for i as Integer = 0 to c
Var v as FolderItem = volume(i)
if v.Name = "testvolume" then
disk = v
exit
end if
next

if disk = nil then
MessageBox "Please change the name in this code."
else
Var pid as Integer
Var e as Integer = disk.UnMountVolumeMBS(false, pid)

if e=0 then
MessageBox "Volume unmounted."
else

if pid=0 then
MessageBox "Failed to unmount with error: "+str(e)
else
Var name as string
Var p as new ProcessMBS // from Util plugin
```

```
p.GetFirstProcess

do
if p.ProcessID = pid then
name = p.Name
end if
loop until not p.GetNextProcess

if len(name)>0 then
MessageBox "Failed to unmount with error: "+str(e)
else
MessageBox "Failed to unmount."+EndOfLine+EndOfLine+"The application "+name+" is still using this volume."+EndOfLine+"Error: "+str(e)
end if

end if
end if
end if
```

Notes: If the volume cannot be unmounted the pid of the process which denied the unmount will be returned in the dissenterPID parameter.
This routine returns after the unmount is complete.

force: Specify true if you want the volume forcibly unmounted. Force unmounting a volume will very likely result in data loss since the volume will be ejected even if there are open files on it. This option should be reserved for situations such as the backing store for a volume is gone (so the data is lost regardless).
dissenterPID: Optionally, pid of the process which denied the unmount if the unmount is denied.

Returns a Mac OS error code. 0 means no error and -1 is a plugin error if the function can't be called. -47 is returned if the disc is in use.

PS: Seems like on my tests the pid is not set by Apple.

84.17.130 USBSerialNumberMBS as string

MBS MacCF Plugin, Plugin Version: 25.5, Platform: macOS, Targets: All.

Function: Queries the USB serial number for a volume.
Example:

```
Var f As New FolderItem("/Volumes/USBStick", FolderItem.PathModes.Native)

Var n As String = f.DarwinVolumeNameMBS
Var u As String = f.USBSerialNumberMBS

Break
```

Notes: We lookup the USB device for the volume and then lookup the serial number.
If no serial is available, we report an empty string.

84.17.131 VolGetFolderItemIDMBS(createFileIDs as Boolean = true) as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Returns the unique FileID or DirID of a FolderItem.
Notes: Returns the unique FileID or DirID of a FolderItem. This ID is unique over all items on the same volume. The value 2 always identifies the root directory, all negative values and positive ones above 15 are used for user-created files and folders, while the values 3-15 are used internally by the File System (for the Desktop Database, for example).
If the item does not exists, 0 (zero) is returned instead.

IDs for Folders can always be resolved back to a FolderItem using VolResolveID, while resolving FileIDs only works when they've previously been created explicitly. To create a resolvable FileID, pass true to the createFileIDs parameter. But be aware that if the FileID can not be created (because the disk is locked or because the File System Format does not support it), the call will fail and a zero will be returned!

So, if you are just interested in reading the FileID, pass false to the second parameter. This will not fail even there hasn't been created a resolvable ID for that file yet.

- MBS Plugins updated for Xojo 2019r2

84.17.132 VolSupportsCatSearchMBS as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Returns true if this volume supports Catalog Search which only HFS(+) volumes does for now.
Example:

```
Var v as folderitem
v=volume(0) // boot volume
if v.VolSupportsCatSearchMBS then
MessageBox "CatSearchMBS class will be fast!"
end if
```

Notes: Returns true if the volume is valid and supports the CatSearchMBS functions. Returns false otherwise. From this you can tell whether a search will be fast or slow when using CatSearchOpen with the "allowRecursiveSearch" parameter set to true.

84.17.133 VolumeFreeSizeKBMBS as Int64

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use VolumeFreeSizeMBS instead. **Function:** Returns the size on the free space on volume which the folderitem objects points to.
Example:

```
MessageBox "The volume with your system folder has "+str(specialfolder.system.volumeFreeSizeKBMBS)+"
KBytes free."
```

Notes: This can't work with anything bigger than 2048 Gigabytes (until version 10.0).
Return value changed in version 10.0 from integer to SInt64.

Added Linux support in version 16.0.

84.17.134 VolumeFreeSizeMBS as Int64

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the size of the free space of the volume which the folderitem objects points to.
Example:

```
// 1. a short:
MessageBox "The volume with your system folder has "+str(specialfolder.system.VolumeFreeSizeMBS)+"
Bytes free."
// 2. a nicer:
```

```
Var d as Double
Var s as string

d=specialfolder.system.VolumeFreeSizeMBS

if d>10000.0 then
if d>10000000.0 then
if d>10000000000.0 then
s=format(d/1024.0/1024.0/1024.0,"0")+" GigaBytes"
else
s=format(d/1024.0/1024.0,"0")+" MegaBytes"
end if
else
s=format(d/1024.0,"0")+" KiloBytes"
end if
else
s=format(d,"0")+" Bytes"
end if

MessageBox "On your drive with the system folder you have "+s+" free."
```

Notes: This should be used to handle any volume size.
Return value changed in version 10.0 from double to SInt64.

Added Linux support in version 16.0.
Returns -1 on error.

84.17.135 VolumeInformationMBS as VolumeInformationMBS

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Returns a VolumeInformationMBS object with detailed information about the volume where the folderitem's file is located on.
Notes: May return nil on errors.

84.17.136 VolumeSizeKBMBS as Int64

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use VolumeSizeMBS instead.
Function: Returns the Size on the volume which the folderitem objects points to.
Example:

```
MessageBox "The volume with your system folder is "+str(specialfolder.system.volumeSizeKBMBS)+" KB big."
```

Notes: This can't work with anything bigger than 2048 Gigabytes (until plugin version 10.0).
Return value changed in version 10.0 from integer to SInt64.

Added Linux support in version 16.0.

84.17.137 VolumeSizeMBS as Int64

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the size on the volume which the folderitem objects points to.
Example:

```
// 1. a short:
MessageBox "The volume with your system folder is "+str(specialfolder.system.volumeSizeMBS)+" big."
// 2. a nicer:
Var d as Double
Var s as string

d=SpecialFolder.System.volumesizeMBS

if d>10000.0 then
if d>10000000.0 then
if d>10000000000.0 then
s=format(d/1024.0/1024.0/1024.0,"0")+" GigaBytes"
else
s=format(d/1024.0/1024.0,"0")+" MegaBytes"
end if
else
s=format(d/1024.0,"0")+" KiloBytes"
end if
else
s=format(d,"0")+" Bytes"
end if
```

MessageBox "Your drive with the system folder is "+s+" big."

Notes: This should be used to handle any volume size.
Return value changed in version 10.0 from double to SInt64.

Added Linux support in version 16.0.
Returns -1 on error.

84.17.138 VolumeSupportsHugeFilesMBS as Integer

MBS MacOSX Plugin, Plugin Version: 13.3, Platform: macOS, Targets: All.

Function: Queries whether a volume supports 2 TB file size on Mac OS X.
Notes: Some volumes only support 2 GB or 4 GB file size. Some can handle more than that up to 2 TB.
Returns 0 if not supported, 1 if supported and -1 if unknown.

84.17.140 WinThumbnailMBS(preferredSize as Integer = 512) as picture

MBS Win Plugin, Plugin Version: 14.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries a thumbnail for an item.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Backdrop = f.WinThumbnailMBS
```

Notes: preferredSize is the size you'd like to have. Resulting image can be smaller or bigger.
Returns nil on any error.
If user disabled thumbnails for explorer, the shell also provides none for us, just icons.
Requires Windows Vista or newer.

84.17.144 AccessDateMBS(UTC as boolean = false) as date

MBS Util Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The access date of the file or folder.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var xd as date = f.AccessDateMBS
MessageBox xd.LongDate+" "+xd.LongTime
```

Notes: Setting this value is not supported on Linux currently.

To query Spotlight's Last Open day, please check the FAQ for sample code.
If UTC is true, you get/set date object where time is UTC.
(Read and Write computed property)

84.17.145 AccessDateTimeMBS(UTC as boolean = false) as DateTime

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The access date of the file or folder.
Notes: Setting this value is not supported on Linux currently.

To query Spotlight's Last Open day, please check the FAQ for sample code.
If UTC is true, you get/set date object where time is UTC.
(Read and Write computed property)

84.17.146 AddedToDirectoryDateMBS as date

MBS Util Plugin, Plugin Version: 16.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the date the file was added to the folder.
Notes: Requires OS X 10.10 or newer.
(Read and Write computed property)

84.17.147 AddedToDirectoryDateTimeMBS as DateTime

MBS Util Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Returns the date the file was added to the folder.
Notes: Requires OS X 10.10 or newer.
(Read and Write computed property)

84.17.148 AttributeModificationDateMBS(UTC as boolean = false) as date

MBS Util Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The attribute modification date of the file or folder.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var xd as date = f.AttributeModificationDateMBS
MessageBox xd.LongDate+" "+xd.LongTime
```

Notes: Attribute Motification dates are supported only on Mac OS X currently.
If UTC is true, you get/set date object where time is UTC.
(Read and Write computed property)

84.17.149 AttributeModificationDateTimeMBS(UTC as boolean = false) as DateTime

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The attribute modification date of the file or folder.
Notes: Attribute Motification dates are supported only on Mac OS X currently.
If UTC is true, you get/set date object where time is UTC.
(Read and Write computed property)

84.17.150 BackupDateMBS(UTC as boolean = false) as date

MBS Util Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The backup date of the file or folder.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var xd as date = f.BackupDateMBS
MessageBox xd.LongDate+" "+xd.LongTime
```

Notes: Backup dates are supported only on Mac OS X currently.
If UTC is true, you get/set date object where time is UTC.
(Read and Write computed property)

84.17.151 BackupDateTimeMBS(UTC as boolean = false) as DateTime

MBS Util Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The backup date of the file or folder.
Notes: Backup dates are supported only on Mac OS X currently.
If UTC is true, you get/set date object where time is UTC.
(Read and Write computed property)

84.17.152 BackupItemExcludedMBS as boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether or not an item is being excluded from backup.
Notes: This is the easy method to just query whether a file is marked as being excluded from backup. You

can assign a boolean value to exclude (true) or include (false) the file.

Require Mac OS X 10.5. Returns false on all other operating systems.
(Read and Write computed property)

84.17.153 CommentMBS as string

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: The comment for that file.
Example:

```
Var f as folderitem // your file
f.CommentMBS="Hello world!"
```

Notes: This function sends an AppleEvent to the Finder. It may take some milliseconds.
(on Mac OS X)

Querying comment is not thread safe.
Your application needs to be allowed to control Finder via AppleScripts.

See DeterminePermissionToAutomateTarget method in NSAppleScriptMBS class.

see also
https://developer.apple.com/documentation/bundleresources/entitlements/com_apple_security_automation_apple-events
(Read and Write computed property)

84.17.154 CreationDateMBS(UTC as boolean = false) as date

MBS Util Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The creation date of the file or folder.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var xd as date = f.CreationDateMBS
MessageBox xd.LongDate+" "+xd.LongTime
```

Notes: Setting this value is not supported on Linux currently.
If UTC is true, you get/set date object where time is UTC.

(Read and Write computed property)

84.17.155 CreationDateTimeMBS(UTC as boolean = false) as DateTime

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The creation date of the file or folder.
Notes: Setting this value is not supported on Linux currently.
If UTC is true, you get/set date object where time is UTC.
(Read and Write computed property)

84.17.156 FinderLabelMBS as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Returns the color code for the file.
Example:

file.FinderLabelMBS=2

Notes: The file label is a number between 0 and 7 to give the file a color.
Used in the Classic Finder for labels (and on Mac OS X for Finder replacement or Finder extending utilities)
On reading the value you can get negative values like -43 if the file is not found.

To know labels and colors, please use NSWorkspaceMBS.fileLabelColors and NSWorkspaceMBS.fileLabels methods.

Current list:

0	none
1	gray
2	green
3	violett
4	blue
5	yellow
6	red
7	orange

(Read and Write computed property)

84.17.157 MacQuarantinePropertiesMBS as MacQuarantinePropertiesMBS

MBS MacOSX Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets or sets the quarantine options for a file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.app")

// read value
Var q as MacQuarantinePropertiesMBS = f.MacQuarantinePropertiesMBS
MessageBox q.AgentName

// set value
q = new MacQuarantinePropertiesMBS

q.AgentBundleIdentifier = "test.test"
q.AgentName = "testing app"
q.DataURL="http://www.monkeybreadsoftware.de/test.dmg"
q.OriginURL="http://www.monkeybreadsoftware.de/"
q.Type=q.kTypeWebDownload

f.MacQuarantinePropertiesMBS = q

// clear
f.MacQuarantinePropertiesMBS = nil
```

Notes: Requires Mac OS X 10.5.
(Read and Write computed property)

84.17.158 ModificationDateMBS(UTC as boolean = false) as date

MBS Util Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The modification date of the file or folder.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var xd as date = f.ModificationDateMBS
MessageBox xd.LongDate+" "+xd.LongTime
```

Notes: Setting this value is not supported on Linux currently.

If UTC is true, you get/set date object where time is UTC.
(Read and Write computed property)

84.17.159 ModificationDateTimeMBS(UTC as boolean = false) as DateTime

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The modification date of the file or folder.
Notes: Setting this value is not supported on Linux currently.
If UTC is true, you get/set date object where time is UTC.
(Read and Write computed property)

84.18 class LargeBinaryStreamMBS

84.18.1 class LargeBinaryStreamMBS

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allows you to access files with more than 2GB in size.
Example:

```
// read the last 1 KB of a big file, e.g. a disk image larger than 4 GB
Var file As FolderItem = SpecialFolder.Desktop.Child("backup.dmg")
Var stream As LargeBinaryStreamMBS = LargeBinaryStreamMBS.Open(file, False)
If stream = Nil Then Return

System.DebugLog "File size: " + stream.Length.ToString + " bytes"
stream.Position = Max(0, stream.Length - 1024)
Var tail As MemoryBlock = stream.ReadBlock(1024)
stream.Close
```

Notes: Deprecated in favor of BinaryStream class in Xojo unless you need a feature provided here, so please let us know!

84.18.2 Methods

84.18.3 Allocate(count as int64, flags as Integer) as int64

MBS Util Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Allocates disk space for this file.
Example:

```
Var l as LargeBinaryStreamMBS // your stream
Var d as int64

d=l.Allocate(1024*1024*1024,2) // 1 GB
```

Notes: Only for Mac OS.
The flags can be like this:

AllocDefaultFlags	0	as much as possible, not contiguous
AllocAllOrNothingMask	1	allocate all of the space, or nothing
AllocContiguousMask	2	new space must be one contiguous piece
AllocNoRoundUpMask	4	don't round up allocation to clump size

Note that the length property is not changed because the space is not used.

84.18.4 close

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

84.18.5 Create(file as folderitem, MacType as string, MacCreator as string) as LargeBinaryStreamMBS

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a file as a LargeBinaryStreamMBS.
Example:

```
Var f as FolderItem // your file
Var l as LargeBinaryStreamMBS

l = LargeBinaryStreamMBS.Create(f, "TEXT","ttxt")
```

Notes: If there is already a file, it is deleted.
On Windows the parameters are ignored.
Returns nil on any error.
See also:

- 84.18.6 Create(path as string, MacType as string, MacCreator as string, WinShareMode as Integer = 0) as LargeBinaryStreamMBS 14193

84.18.6 Create(path as string, MacType as string, MacCreator as string, WinShareMode as Integer = 0) as LargeBinaryStreamMBS

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a file as a LargeBinaryStreamMBS.
Example:

```
Var l as LargeBinaryStreamMBS
l = LargeBinaryStreamMBS.Create("C:\test.txt", "", "")
```

Notes: If there is already a file, it is deleted.
On Windows the parameters are ignored.
Returns nil on any error.
See also:

- 84.18.5 Create(file as folderitem, MacType as string, MacCreator as string) as LargeBinaryStreamMBS 14192

84.18.7 CreateResStream(file as folderitem, MacType as string, MacCreator as string) as ResStreamMBS

MBS Util Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Creates a new ResStreamMBS.
Notes: If there is already a file, it is deleted.
If the file could not be created it is deleted.
Returns nil on any error.
See also:

- 84.18.8 CreateResStream(path as string, MacType as string, MacCreator as string) as ResStreamMBS 14193

84.18.8 CreateResStream(path as string, MacType as string, MacCreator as string) as ResStreamMBS

MBS Util Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Creates a new ResStreamMBS.
Notes: If there is already a file, it is deleted.
If the file could not be created it is deleted.

Returns nil on any error.
See also:

- 84.18.7 CreateResStream(file as folderitem, MacType as string, MacCreator as string) as ResStreamMBS 14193

84.18.9 DeleteDataFork(file as folderitem)

MBS Util Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Deletes the data fork of a file.
Notes: Equal to open the file using a binarystream and setting the length property to 0.
On Mac OS a file can exist without a datafork, with a resource fork or even without any fork.

84.18.10 DeleteResourceFork(file as folderitem)

MBS Util Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Deletes the resource fork of a file.
Notes: Equal to open the file using a ResStreamMBS and setting the length property to 0.
On Mac OS a file can exist without a datafork, with a resource fork or even without any fork.

84.18.11 Flush

MBS Util Plugin, Plugin Version: 5.0, Platforms: macOS, Linux, Targets: All.

Function: Makes sure every bit of the stream is written to disc.
Notes: Only for Mac OS X.

84.18.12 LockFileExclusive as boolean

MBS Util Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Locks the file so no other app can access it.
Notes: Returns true on success.
It may be possible that there is still a way around the lock.

84.18.13 Open(file as folderitem, write as Boolean) as LargeBinaryStreamMBS

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a file as a LargeBinaryStreamMBS.
Example:

```
Var l as LargeBinaryStreamMBS
Var f as FolderItem = SpecialFolder.Desktop.Child("testfile")

l = LargeBinaryStreamMBS.Open(f, true)
```

Notes: Returns nil on any error.
See also:

- 84.18.14 Open(path as string, write as Boolean, WinShareMode as Integer = 0) as LargeBinaryStreamMBS 14195

84.18.14 Open(path as string, write as Boolean, WinShareMode as Integer = 0) as LargeBinaryStreamMBS

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a file as a LargeBinaryStreamMBS.
Example:

```
// write to parallel port:
Var b as LargeBinaryStreamMBS = LargeBinaryStreamMBS.Open("LPT1", true, 3)
b.Write "Hello World"
b.Close
```

Notes: Returns nil on any error.
For special cases, you may need to allow Shared Read or Write and for that case, we have WinShareMode parameter.
For WinShareMode, you can pass 1 for shared reading, 2 for shared writing, 4 for shared deletion. Or combine those. Passing zero prevents sharing.
See also:

- 84.18.13 Open(file as folderitem, write as Boolean) as LargeBinaryStreamMBS 14194

84.18.15 OpenAsResStream(file as folderitem, write as Boolean) as ResStreamMBS

MBS Util Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Opens a file's resourcefork as a ResStreamMBS.
Notes: Returns nil on any error.
See also:

- 84.18.16 OpenAsResStream(path as string, write as Boolean) as ResStreamMBS 14196

84.18.16 OpenAsResStream(path as string, write as Boolean) as ResStreamMBS

MBS Util Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Opens a file's resourcefork as a ResStreamMBS.
Notes: Returns nil on any error.
See also:

- 84.18.15 OpenAsResStream(file as folderitem, write as Boolean) as ResStreamMBS 14195

84.18.17 QueryDiskGeometry(byref Cylinders as Int64, byref MediaType as Integer, byref TracksPerCylinder as Integer, byref SectorsPerTrack as Integer, byref BytesPerSector as Integer) as boolean

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries disk size on Windows.
Notes: This function is only useful on Windows and only if you opened a physical disc.
Returns true on success.

84.18.18 Read(count as Integer) as string

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads bytes into a string.
Example:

```
Var b as LargeBinaryStreamMBS // your stream
Var s as string

s=b.read(5)
```

84.18.19 ReadBlock(count as Integer) as memoryblock

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads bytes into a memoryblock.
Example:

```
Var b as LargeBinaryStreamMBS // your stream
Var s as memoryblock

s=b.read(5)
```

84.18.20 Readbyte as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads an 8bit Byte from the stream.
Example:

```
Var b as LargeBinaryStreamMBS // your stream
Var i as Integer

i=B.readbyte
```

84.18.21 ReadLong as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a signed 32bit Integer from the stream.
Example:

```
Var b as LargeBinaryStreamMBS // your stream
Var i as Integer

i=B.readlong
```

Notes: This function is affected by the LittleEndian Setting.

84.18.22 ReadShort as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a signed 16bit Integer from the stream.
Example:

```
Var b as LargeBinaryStreamMBS // your stream
Var i as Integer

i=B.readshort
```

Notes: This function is affected by the LittleEndian Setting.

84.18.23 UnlockFileExclusive as boolean

MBS Util Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unlocks the file so other applications can possibily access it.
Notes: Returns true on success.

84.18.24 WinCreateStream(file as folderitem, StreamName as String, WinShareMode as Integer = 0) as LargeBinaryStreamMBS

MBS Util Plugin, Plugin Version: 16.4, Platform: Windows, Targets: All.

Function: Creates a named stream in a file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var l as LargeBinaryStreamMBS = LargeBinaryStreamMBS.WinCreateStream(f, "test")
if l = nil then
MessageBox "Error"
else
l.Write "Hello"
l.close
end if
```

Notes: Returns nil in case of error.

84.18.25 WinDeleteStream(file as folderitem, StreamName as String) as boolean

MBS Util Plugin, Plugin Version: 16.4, Platform: Windows, Targets: All.

Function: Deletes a named stream in a file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
if LargeBinaryStreamMBS.WinDeleteStream(f) then
MessageBox "OK"
else
MessageBox "Error"
end if
```

Notes: Returns true on success.

84.18.26 WinOpenStream(file as folderitem, StreamName as String, write as Boolean, WinShareMode as Integer = 0) as LargeBinaryStreamMBS

MBS Util Plugin, Plugin Version: 16.4, Platform: Windows, Targets: All.

Function: Opens a named stream in a file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var l as LargeBinaryStreamMBS = LargeBinaryStreamMBS.WinOpenStream(f, "test", false)
if l = nil then
MessageBox "Error"
else
MessageBox l.Read(l.Length)
end if
```

Notes: Returns nil in case of error.

84.18.27 Write(data as string)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes bytes from a string to file.

84.18.28 WriteBlock(data as memoryblock,count as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes count bytes from a memoryblock to file.
Example:

```
Var b as LargeBinaryStreamMBS // your stream
Var m as memoryblock

b.writeblock m,m.size
```

84.18.29 WriteByte(data as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a byte to file.

84.18.30 WriteLong(data as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes an 32bit integer to file.
Notes: This method is affected by the LittleEndian Setting.

84.18.31 WriteShort(data as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes an 16bit integer to file.
Notes: This method is affected by the LittleEndian Setting.

84.18.32 Properties

84.18.33 CanWrite as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if you are allowed to write.
Notes: Even if you open a file for write you may still not be allowed to write if the permissions of the file don't allow you to write.
(Read only property)

84.18.34 EOF as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if you are at the end of the stream.
Notes: You can set this property to truncate the file.
(Read only property)

84.18.35 Lasterror as Integer

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: The values are platform dependent, but zero is no error everywhere.
(Read and Write property)

84.18.36 Length as Int64

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current length of the file.
Notes: You can truncate the stream by setting this property.
Can't be set on Linux currently.
(Read and Write property)

84.18.37 LittleEndian as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies if Integers and Shorts shall be converted in their endienness when read or written.
Notes: See Xojo's binarystream for more details.
For native platform you may set "littleendian=targetwin32".
(Read and Write property)

84.18.38 Position as Int64

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns current position.
Notes: You can set the current file stream position using this property.
(Read and Write property)

84.18.39 Yield as Boolean

MBS Util Plugin, Plugin Version: 9.5, Platform: macOS, Targets: All.

Function: Whether time should be given to other threads.
Notes: If true on Mac OS X CPU time will be given to other threads while read or write operations are pending. To have an effect you need to call read/write methods in a thread.
(Read and Write property)

84.19 class MacFileOperationMBS

84.19.1 class MacFileOperationMBS

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: This class allows you to perform asynchronous file operations on Mac OS X 10.4 like copy and move.
Notes: Available in Mac OS X 10.4.

84.19.2 Methods

84.19.3 Cancel

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Cancels the specified FSFileOperation.
Notes: Lasterror is set.

84.19.4 CopyObject(Item as folderitem, DestinationFolder as folderitem, DestinationName as string, Options as Integer, statusChangeInterval as Double)

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: This routine will start an asynchronous copy of the object specified by Item to the directory specified by DestinationFolder.
Notes: If DestinationName is provided then the new object will be renamed to DestinationName. If DestinationName is empty then the name of the source object will be used.

You will receive StatusChanged events.

Options: One or more FSFileOperation flags
statusChangeInterval: The minimum time between callbacks within a single stage of an operation in seconds.

84.19.5 CopyObjectSync(SourceItem as folderitem, DestinationFolder as folderitem, DestinationName as string, byref Result as folderitem, Options as Integer) as Integer

MBS MacClassic Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: This routine will copy the source object into the destination directory.
Notes: The source object can be a file or directory.

self: The source object to copy.
DestinationFolder: The destination directory for the copy.
DestinationName: The name for the new object in the destination directory. Pass "" to use the source object name.
result: Upon successful completion a ref to the newly created object. If source is a directory then target will be the corresponding object in the destination directory.
options: One or more FSFileOperation flags

Requires Mac OS X 10.4.

Use this constants:

kFSFileOperationDefaultOptions	0	Use the default options - no overwrite, fail if any source item cannot be read, cross volume moves OK.
kFSFileOperationOverwrite	1	Replace an item in the destDir that has the same name as an item being moved/copied there.
kFSFileOperationSkipSourcePermissionErrors	2	Skip items that cannot be read and continue copying/moving instead of failing the operation.
kFSFileOperationDoNotMoveAcrossVolumes	4	Do not perform a copy/delete to move an item across volume boundries - fail the operation instead.
kFSFileOperationSkipPreflight	8	Skip the preflight for a directory move/copy. This will limit the status information that can be returned since the totals will not be calculated.

Returns a Mac OS error code. Error code -1 is from the plugin for invalid parameters or the function not being availanle.

84.19.6 MoveObject(Item as folderitem, DestinationFolder as folderitem, DestinationName as string, Options as Integer, statusChangeInterval as Double)

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: This routine will start an asynchronous move of the object specified by source to the directory specified by DestinationFolder.
Notes: If DestinationName is provided then the new object will be renamed to destName. If Destination-

Name is empty then the name of the source object will be used.

By default a move across volumes will result in a copy and deletion of the original source. The kFSFileOperationDoNotMoveAcrossVolumes flag will cause cross volume moves to do nothing and return an error.

Options: One or more FSFileOperation flags
statusChangeInterval: The minimum time between callbacks within a single stage of an operation in seconds.

84.19.7 MoveObjectSync(SourceItem as folderitem, DestinationFolder as folderitem, DestinationName as string, byref Result as folderitem, Options as Integer) as Integer

MBS MacClassic Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: This routine will move the source object into the destination directory.
Notes: The source object can be a file or directory. If a destName is provided then the object will be renamed as well as moved. By default a move across volumes will result in a copy and deletion of the original source. The kFSFileOperationDoNotMoveAcrossVolumes flag will cause cross volume moves to do nothing and return an error.

self: The source object to copy.
DestinationFolder: The destination directory for the copy.
DestinationName: The name for the new object in the destination directory. Pass "" to use the source object name.
result: Upon successful completion a ref to the newly created object. If source is a directory then target will be the corresponding object in the destination directory.
options: One or more FSFileOperation flags

Requires Mac OS X 10.4.

Use this constants:

kFSFileOperationDefaultOptions	0	Use the default options - no overwrite, fail if any source item cannot be read, cross volume moves OK.
kFSFileOperationOverwrite	1	Replace an item in the destDir that has the same name as an item being moved/copied there.
kFSFileOperationSkipSourcePermissionErrors	2	Skip items that cannot be read and continue copying/moving instead of failing the operation.
kFSFileOperationDoNotMoveAcrossVolumes	4	Do not perform a copy/delete to move an item across volume boundries - fail the operation instead.
kFSFileOperationSkipPreflight	8	Skip the preflight for a directory move/copy. This will limit the status information that can be returned since the totals will not be calculated.

Returns a Mac OS error code. Error code -1 is from the plugin for invalid parameters or the function not being availanle.

84.19.8 MoveObjectToTrash(Item as folderitem, Options as Integer, statusChangeInterval as Double)

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: This routine will start an asynchronous move of the object specified by source to the trash.
Notes: If the volume the source object resides on does not support a trash folder then the operation will return an error (this is the same circumstance that triggers the delete immediately behavior in the Finder).

Options: One or more FSFileOperation flags
statusChangeInterval: The minimum time between callbacks within a single stage of an operation in seconds.

84.19.9 MoveObjectToTrashSync(SourceItem as folderitem, byref Result as folderitem, Options as Integer) as Integer

MBS MacClassic Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: This routine will move the source object into the trash.
Notes: The source object can be a file or directory. If the volume the source object resides on does not support a trash folder then this call will return an error (this is the same circumstance that triggers the delete immediately behavior in the Finder).

self: The source object to move to the trash.
result: Upon successful completion a ref the object in the trash. If source is a directory then target will be the corresponding object in the destination directory.
options: One or more FSFileOperation flags

Requires Mac OS X 10.5.

Use this constants:

Returns a Mac OS error code. Error code -1 is from the plugin for invalid parameters or the function not being availanle. Error -5000 means insufficient access privileges for operation.

See WindowsFileCopyMBS for similar function for Windows.

kFSFileOperationDefaultOptions	0	Use the default options - no overwrite, fail if any source item cannot be read, cross volume moves OK.
kFSFileOperationOverwrite	1	Replace an item in the destDir that has the same name as an item being moved/copied there.
kFSFileOperationSkipSourcePermissionErrors	2	Skip items that cannot be read and continue copying/moving instead of failing the operation.
kFSFileOperationDoNotMoveAcrossVolumes	4	Do not perform a copy/delete to move an item across volume boundries - fail the operation instead.
kFSFileOperationSkipPreflight	8	Skip the preflight for a directory move/copy. This will limit the status information that can be returned since the totals will not be calculated.

84.19.10 Status as MacFileOperationStatusMBS

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: This routine returns the current status of an FileOperation.
Notes: Lasterror is set.
Returns nil on any error.

84.19.11 Properties

84.19.12 Handle as Integer

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal handle.
Notes: (Read and Write property)

84.19.13 LastError as Integer

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Users report that you get error -50 (parameter error) if you reuse a file operation object for a new operation.
So maybe create a new instance for each operation?
(Read and Write property)

84.19.14 Events

84.19.15 StatusChanged(status as MacFileOperationStatusMBS)

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: This event is called whenever the status changed.

84.19.16 Constants

Constants

Constant	Value	Description
kFSFileOperationDefaultOptions	0	One of the file operation flags. Use the default options - no overwrite, fail if any source item ca cross volume moves OK.
kFSFileOperationDoNotMoveAcrossVolumes	4	One of the file operation flags. Do not perform a copy/delete to move an item across volume bo the operation instead.
kFSFileOperationOverwrite	1	One of the file operation flags. Replace an item in the destDir that has the same name as a moved/copied there.
kFSFileOperationSkipPreflight	8	One of the file operation flags. Skip the preflight for a directory move/copy. This will limit the mation that can be returned since the totals will not be calculate
kFSFileOperationSkipSourcePermissionErrors	2	One of the file operation flags. Skip items that cannot be read and continue copying/moving inst the operation.
kFSOperationStageComplete	3	One of the constants for the stage. Operation is done.
kFSOperationStagePreflighting	1	One of the constants for the stage. Operation is calulating sizes and number of items involved in the
kFSOperationStageRunning	2	One of the constants for the stage. Operation is in progress.
kFSOperationStageUndefined	0	One of the constants for the stage. Operation has not started yet.

84.20 class MacFileOperationStatusMBS

84.20.1 class MacFileOperationStatusMBS

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: This class represents the status of a file operation.
Notes: Available in Mac OS X 10.4.
Blog Entries

- MBS Xojo Plugins, version 20.3pr3
- MBS Xojo / Real Studio Plugins, version 16.5pr3
- MonkeyBread Software Releases the MBS REALbasic plug-ins 9.2

84.20.2 Properties

84.20.3 BytesComplete as Int64

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The number of bytes that have been moved/copied by this operation at the time the status call was made.
Notes: During the preflight stage this value represents the currently known number of bytes that will be copied/moved.
Value is -1 if undefined.
(Read only property)

84.20.4 BytesRemaining as Int64

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The number of bytes that remain to be moved/copied by this operation at the time the status call was made.
Notes: Value is -1 if undefined.
This value is not available for a directory operation if kFSFileOperationSkipPreflight was specified.

Seems like newer MacOS versions like 10.13 don't update this value.
(Read only property)

84.20.5 CurrentItem as FolderItem

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A folderitem to item operation is currently processing.
Notes: If the operation is complete then currentItem refers to the target item (the new item corresponding to the source item in the destination directory).
(Read and Write property)

84.20.6 Dictionary as Dictionary

MBS MacClassic Plugin, Plugin Version: 20.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: All details in the status object as a dictionary.
Notes: You get the internal CFDictionary converted to Xojo dictionary to inspect yourself.
(Read only property)

84.20.7 Error as Integer

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The error code.
Notes: Either noErr (0) or an error value which caused the operation to fail.
(Read and Write property)

84.20.8 Handle as Integer

MBS MacClassic Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries internal object reference.
Example:

```
Var status as MacFileOperationStatusMBS // your status object
Var d as CFDictionaryMBS = CFDictionaryMBS.dictionaryWithHandle(status.Handle)
Var dd as Dictionary = d.Dictionary
Break
```

Notes: Value is a CFDictionaryRef reference.
(Read and Write property)

84.20.9 ObjectsComplete as Int64

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The number of objects that have been moved/copied by this operation at the time the status call was made.
Notes: Value is -1 if undefined.
During the preflight stage this value represents the currently known number of objects that will be copied/moved.
(Read only property)

84.20.10 ObjectsRemaining as Int64

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The number of objects that remain to be moved/copied by this operation at the time the status call was made
Notes: Value is -1 if undefined.

This value is not available for a directory operation if kFSFileOperationSkipPreflight was specified.
(Read only property)

84.20.11 Stage as Integer

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current stage of the operation.
Notes: See this constants for possible values:
kFSOperationStageComplete
kFSOperationStagePreflighting
kFSOperationStageRunning
kFSOperationStageUndefined
(Read and Write property)

84.20.12 Throughput as Int64

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current throughput for the operation in bytes per second.
Notes: Value is -1 if undefined.
(Read only property)

84.20.13 TotalBytes as Int64

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The total number of bytes that will be moved/copied by this operation.
Notes: This value is not available for a directory operation if kFSFileOperationSkipPreflight was specified.
Value is -1 if undefined.
(Read only property)

84.20.14 TotalObjects as Int64

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The total number of objects that will be moved/copied by this operation.
Notes: Value is -1 if undefined.
This value is not available for a directory operation if kFSFileOperationSkipPreflight was specified.
(Read only property)

84.20.15 TotalUserVisibleObjects as Int64

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The total number of user visibleobjects that will be moved/copied by this operation.
Notes: Value is -1 if undefined.

This value is not available for a directory operation if kFSFileOperationSkipPreflight was specified. A packaged application is one user visible object even though it is made up of multiple files and directories.
(Read only property)

84.20.16 UserVisibleObjectsComplete as Int64

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The number of user visible objects that have been moved/copied by this operation at the time the status call was made.
Notes: Value is -1 if undefined.

During the preflight stage this value represents the currently known number of objects that will be copied/moved.
A packaged application is one user visible object even though it is made up of multiple files and directories.
(Read only property)

84.20.17 UserVisibleObjectsRemaining as Int64

MBS MacClassic Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The number of user visible objects that remain to be moved/copied by this operation at the time the status call was made
Notes: Value is -1 if undefined.

This value is not available for a directory operation if kFSFileOperationSkipPreflight was specified. A packaged application is one user visible object even though it is made up of multiple files and directories.
(Read only property)

84.21 class MacQuarantinePropertiesMBS

84.21.1 class MacQuarantinePropertiesMBS

MBS MacOSX Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for quarantine options.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.app")

// read value
Var q as MacQuarantinePropertiesMBS = f.MacQuarantinePropertiesMBS
MessageBox q.AgentName

// set value
q = new MacQuarantinePropertiesMBS

q.AgentBundleIdentifier = "test.test"
q.AgentName = "testing app"
q.DataURL="http://www.monkeybreadsoftware.de/test.dmg"
q.OriginURL="http://www.monkeybreadsoftware.de/"
q.Type=q.kTypeWebDownload

f.MacQuarantinePropertiesMBS = q

// clear
f.MacQuarantinePropertiesMBS = nil
```

Notes: Requires Mac OS X 10.5.
Since the LSCopyItemAttribute function got deprecated by Apple, please use NSURLMBS class instead to read various properties.
Blog Entries

- MBS Plugins updated for Xojo 2019r2
- MBS Real Studio Plugins, version 12.4pr3
- Quarantine Properties
- Files in quarantine

84.21.2 Properties

84.21.3 AgentBundleIdentifier as String

MBS MacOSX Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The bundle identifier of the quarantining agent, if available.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.app")
Var q as MacQuarantinePropertiesMBS = f.MacQuarantinePropertiesMBS
MessageBox q.AgentBundleIdentifier
```

Notes: When setting quarantine properties, this value is set automatically if the it is undefined. The automatic value is the main bundle identifier of the current process.
(Read and Write property)

84.21.4 AgentName as String

MBS MacOSX Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the quarantining agent (application or program).
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.app")
Var q as MacQuarantinePropertiesMBS = f.MacQuarantinePropertiesMBS
MessageBox q.AgentName
```

Notes: When setting quarantine properties, this value is set automatically to the current process name if this value is not defined.
(Read and Write property)

84.21.5 DataURL as String

MBS MacOSX Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The URL from which the data for the quarantined item data was actually streamed or downloaded, if available.
Notes: Var f as FolderItem = SpecialFolder.Desktop.Child("test.app")
Var q as MacQuarantinePropertiesMBS = f.MacQuarantinePropertiesMBS
MessageBox q.DataURL
(Read and Write property)

84.21.6 DateTime as DateTime

MBS MacOSX Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time the item was quarantined.
Notes: When setting quarantine properties, this property is set automatically to the current date and time

if this value is not set.
(Read and Write property)

84.21.7 Dic as Variant

MBS MacOSX Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The original dictionary from Mac OS X.
Notes: This is a CFDictionaryMBS object which we provide for debugging.
You can pass it to CFShowMBS to print on console.
(Read and Write property)

84.21.8 OriginURL as String

MBS MacOSX Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The URL of the resource originally hosting the quarantined item, from the user's point of view.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.app")
Var q as MacQuarantinePropertiesMBS = f.MacQuarantinePropertiesMBS
MessageBox q.OriginURL
```

Notes: For web downloads, this property is the URL of the web page on which the user initiated the download. For attachments, this property is the URL of the resource to which the quarantined item was attached (e.g. the email message, calendar event, etc.). The origin URL may be a file URL for local resources, or a custom URL to which the quarantining application will respond when asked to open it. The quarantining application should respond by displaying the resource to the user. Note: The origin URL should not be set to the data URL, or the quarantining application may start downloading the file again if the user choses to view the origin URL while resolving a quarantine warning.
(Read and Write property)

84.21.9 TimeStamp as Date

MBS MacOSX Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time the item was quarantined.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.app")
Var q as MacQuarantinePropertiesMBS = f.MacQuarantinePropertiesMBS
MessageBox q.TimeStamp.LongDate+" "+q.TimeStamp.LongTime
```

Notes: When setting quarantine properties, this property is set automatically to the current date and time if this value is not set.
(Read and Write property)

84.21.10 Type as String

MBS MacOSX Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: A symbolic string identifying the why the item is quarantined, if available.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.app")
Var q as MacQuarantinePropertiesMBS = f.MacQuarantinePropertiesMBS
MessageBox q.Type
```

Notes: (Read and Write property)

84.21.11 Constants

Constants

Constant	Value	Description
kTypeCalendarEventAttachment	"LSQuarantineTypeCalendarEventAttachment"	One of the type constants.
kTypeEmailAttachment	"LSQuarantineTypeEmailAttachment"	One of the type constants.
kTypeInstantMessageAttachment	"LSQuarantineTypeInstantMessageAttachment"	One of the type constants.
kTypeOtherAttachment	"LSQuarantineTypeOtherAttachment"	One of the type constants.
kTypeOtherDownload	"LSQuarantineTypeOtherDownload"	One of the type constants.
kTypeWebDownload	"LSQuarantineTypeWebDownload"	One of the type constants.

84.22 class NetFSMountMBS

84.22.1 class NetFSMountMBS

MBS MacOSX Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Our class for NetFS mounting.
Example:

```
// mount a SMB share without showing a dialog
Var mounter As New NetFSMountMBS
Var mountPoints() As String
Var result As Integer = mounter.MountURLSync("smb://server.local/Documents", "", "user", "password",
Nil, Nil, mountPoints)

If result = 0 And mountPoints.Count >0 Then
MessageBox "Mounted at " + mountPoints(0)
Else
MessageBox "Error " + result.ToString
End If
```

Notes: Based on NetFS framework in MacOS 10.8 or later.

84.22.2 Methods

84.22.3 Cancel

MBS MacOSX Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Cancels asynchronous mounting.
Notes: MountURLAsyncCompleted event will not run.

84.22.4 MountURLAsync(URL as String, MountPath as String = """, User as String = """, Password as String = """, OpenOptions as Dictionary = nil, MountOptions as Dictionary = nil) as Integer

MBS MacOSX Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: MountURLAsync is the same as MountURLSync except it does the mount asynchronously.
Notes: The MountURLAsyncCompleted event is run after the mount with an array of POSIX mountpoint paths.

You can call Cancel method to cancel a pending mount request.

84.22.5 MountURLSync(URL as String, MountPath as String = """, User as String = """, Password as String = """, OpenOptions as Dictionary = nil, MountOptions as Dictionary = nil, byref MountPoints() as String) as Integer

MBS MacOSX Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Given a URL that refers to a file server, connect to that server and mount stuff.
Notes: If the URL just specifies a server and you can't just mount the "root directory" of the server, the user will be prompted with a window to let them select one or more items to mount from that server, otherwise whatever item the URL specifies to mount will be mounted.
If the mountpath is provided it will be used as the mount point. If the mountpath is set to "", a default mount point will be used.
If the user and passwd are set, they will override any user name or password that may be set in the URL. These calls go through the NetAuth agent. If the URL doesn't specify a password, and one is needed, the user will be prompted with a window requesting password.
Options can be provided for the session open and the mount itself. If the mount is successful, the POSIX path to each mountpoint is returned as a string in mountpoints.
If the return value is zero the mount has succeeded.

A positive non-zero return value represents an errno value (see /usr/include/sys/errno.h). For instance, a missing mountpoint error will be returned as ENOENT (2).

A negative non-zero return value represents an OSStatus error. For instance, error -128 is userCanceledErr, returned when a mount operation is canceled by the user.

84.22.6 URLForRemountingVolume(path as String) as String

MBS MacOSX Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Given a localPathURL that refers to a location on a mounted network share, return the URL needed to remount that volume.
Example:

```
Var url as string = NetFSMountMBS.URLForRemountingVolume("/Volumes/Ablage2")

MessageBox url
```

Notes: The return value is an URL of the server, or "" if localPathURL isn't a mounted network share.
See also:

- 84.22.7 URLForRemountingVolume(vol as FolderItem) as String 14219

84.22.7 URLForRemountingVolume(vol as FolderItem) as String

MBS MacOSX Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Given a localPathURL that refers to a location on a mounted network share, return the URL needed to remount that volume.
Example:

```
Var v as FolderItem = volume(VolumeCount-1)
Var url as string = NetFSMountMBS.URLForRemountingVolume(v)

MessageBox url
```

Notes: The return value is an URL of the server, or "" if localPathURL isn't a mounted network share.
See also:

- 84.22.6 URLForRemountingVolume(path as String) as String 14218

84.22.8 URLProbe(hostname as String) as String

MBS MacOSX Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Checks what protocol may be used to mount disk from this server.
Example:

```
Var protocol as string = NetFSMountMBS.URLProbe("Ablage2.local")

MessageBox protocol
```

Notes: The user may enter a hostname in lieu of a full URL. We need to determine an appropriate protocol for this host and return a scheme from which a URL can be derived. For instance, if we determine that it's an SMB server then we return "smb" which the caller can use to build a URL: "smb://hostname".

We start with a list of likely protocols, e.g. ”smb”, ”afp” and initiate a TCP connection to the port for each protocol. These connect attempts run in parallel. Then wait in a select() call to see which connections are successful, or refused, or do not respond. There is a preference order, even if a protocol later in the list responds first, it may lose out if a protocol earlier in the list responds within the timeout.

Returns ”smb” for example.

84.22.9 Properties

84.22.10 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The handle for a pending request.
Notes: (Read and Write property)

84.22.11 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

84.22.12 Events

84.22.13 MountURLAsyncCompleted(status as Integer, URL as String, mountpoints() as String)

MBS MacOSX Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called when mount is done.

84.22.14 Constants

Constants

Constant	Value	Description
kNAUIOptionKey	"UIOption"	One of the keys for open options dictionary. Suppress authentication dialog UI.
kNetFSAllowLoopbackKey	"AllowLoopback"	One of the keys for open options dictionary. Allow a loopback mount.
kNetFSAllowSubMountsKey	"AllowSubMounts"	One of the keys for mount options dictionary. Allow a mount from a dir beneath the share point. Pass boolean value.
kNetFSMountAtMountDirKey	"MountAtMountDir"	One of the keys for mount options dictionary. Mount on the specified mountpath instead of below it. Note that if kNetFSSoftMountKey isn't set, then it's set to true
kNetFSMountFlagsKey	"MountFlags"	One of the keys for mount options dictionary. Mount flags. e.g. integer with value 1 for read only.
kNetFSSoftMountKey	"SoftMount"	One of the keys for mount options dictionary. Mount with "soft" failure semantics. Pass boolean with true.
kNetFSUseGuestKey	"Guest"	One of the keys for open options dictionary. Login as a guest user. The value is a string with login name.

Error Codes

Constant	Value	Description
kErrorAccountRestricted	-5999	Account is restricted.
kErrorMissingMountpoint	2	The mount point is missing.
kErrorNoAuthMethodSupported	-5997	No supported auth method found.
kErrorNoProtocolVersionSupported	-5996	No Protocol Version Supported.
kErrorNoSharesAvailable	-5998	No shares available.
kErrorPasswordNeedsChange	-5045	The password needs change.
kErrorPasswordPolicy	-5046	Error with Password policy.
kErrorUserCanceled	-128	User cancelled.
kNetAuthErrorAlreadyClosed	-6005	Already closed.
kNetAuthErrorGuestNotSupported	-6004	Guest login not supported.
kNetAuthErrorInternal	-6600	Internal error.
kNetAuthErrorMountFailed	-6602	Mount failed.
kNetAuthErrorNoSharesAvailable	-6003	No shared available.

Mount Flags

Constant	Value	Description
kMountFlagsReadOnly	1	Mount read only.

UIOption

Constant	Value	Description
kNAUIOptionAllowUI	"AllowUI"	Allow user interface.
kNAUIOptionForceUI	"ForceUI"	Force user interface.
kNAUIOptionNoUI	"NoUI"	No user interface.

84.23 class PermissionsMBS

84.23.1 class PermissionsMBS

MBS MacOSX Plugin, Platform: macOS, Targets: All.

Function: Gives access to the current Permissions of a file.
Example:

Var p as PermissionsMBS
p=file.PermissionsMBS(false)

Blog Entries

- MBS Xojo Plugins, version 21.5pr1
- MBS Plugins updated for Xojo 2019r2
- MBS Xojo / Real Studio Plugins, version 14.0pr1

84.23.2 Methods

84.23.3 SetPermissions(OldWay as boolean) as Integer

MBS MacOSX Plugin, Platform: macOS, Targets: All.

Function: Sets the Permissions.
Notes: Returns -1 if function is not available.
Any other value is a Mac OS error code including 0 for success. You can use the MacErrorString function to get some details on the error code.
You may not have enough Permissions to set Permissions!

You can use old API if you set Oldway=true. Than you read access value like in older version of the plugin.
If you set Oldway = false, you use the newer API which read unix permissions, but not the old ones.
The old way is not supported for 64bit.

84.23.4 Properties

84.23.5 Access as Integer

MBS MacOSX Plugin, Platform: macOS, Targets: All.

Function: The access mode for this file.
Notes: Only set if you use older API.

Some constants:

AccessOwner	&h80000000	User is owner of directory
AccessBlankAccess	&h10000000	Directory has blank access privileges
AccessUserWrite	&h04000000	User has write privileges
AccessUserRead	&h02000000	User has read privileges
AccessUserSearch	&h01000000	User has search privileges
AccessEveryoneWrite	&h00040000	Everyone has write privileges
AccessEveryoneRead	&h00020000	Everyone has read privileges
AccessEveryoneSearch	&h00010000	Everyone has search privileges
AccessGroupWrite	&h00000400	Group has write privileges
AccessGroupRead	&h00000200	Group has read privileges
AccessGroupSearch	&h00000100	Group has search privileges
AccessOwnerWrite	&h00000004	Owner has write privileges
AccessOwnerRead	&h00000002	Owner has read privileges
AccessOwnerSearch	&h00000001	Owner has search privileges

(Read and Write property)

84.23.6 GroupID as Integer

MBS MacOSX Plugin, Platform: macOS, Targets: All.

Function: The Group ID for this file.
Notes: constants:
knoGroup: 0
(Read and Write property)

84.23.7 Mode as Integer

MBS MacOSX Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The unix file mode.
Notes: Only set if you use newer API.
(Read and Write property)

84.23.8 UserID as Integer

MBS MacOSX Plugin, Platform: macOS, Targets: All.

Function: The User ID for this file.
Example:

```
Var f as FolderItem

f=SpecialFolder.Desktop

MessageBox str(f.PermissionsMBS(true).UserID) // 501
```

Notes: e.g. User 501 is normally the first user.

constants:

knoUser	0,
kadministratorUser	1

(Read and Write property)

84.24 class ResourceForkMBS

84.24.1 class ResourceForkMBS

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: This class is for reading/writing resource forks on Mac.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.Create(f)

r.AddResource "Hello World", "TEXT", 128, "just a test"
```

Notes: It is a replacement for ResourceFork class in Xojo which has been removed for Cocoa and Console targets in Xojo version 2012r2.

Resourcefork methods are deprecated by Apple, but work in 32 and 64-bit applications as of MBS Plugin version 19.5.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

84.24.2 Methods

84.24.3 AddResource(Data as Memoryblock, ResourceType as String, ID as Integer, Name as String)

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds a resource of the Type specified, using the Name and ID specified and fills it with the Data specified.
Notes: We added this method to avoid extra conversion from memoryblock to string when adding data.
See also:

- 84.24.4 AddResource(Data as String, ResourceType as String, ID as Integer, Name as String) 14227

84.24.4 AddResource(Data as String, ResourceType as String, ID as Integer, Name as String)

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds a resource of the Type specified, using the Name and ID specified and fills it with the Data specified.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.Create(f)

r.AddResource "Hello World", "TEXT", 128, "just a test"
```

See also:

- 84.24.3 AddResource(Data as Memoryblock, ResourceType as String, ID as Integer, Name as String) 14226

84.24.5 Close

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Closes the open resource fork.
Notes: The resource fork will be closed automatically when the instance is destroyed.

84.24.6 Constructor

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

84.24.7 Create(file as folderitem, UseDataFork as boolean = false) as ResourceForkMBS

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new ResourceFork.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.Create(f)
```

```
r.AddResource "Hello World", "TEXT", 128, "just a test"
```

Notes: If the file has a resource fork, it is deleted first.
If the file does not exist, it is created.
Returns nil on any error.
If UseDataFork is true, the resources are read/write from data fork.

84.24.8 GetIndResource(ResourceType as String, index as Integer) As String

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the specified resource as a string.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.create(f)

r.AddResource "Hello World", "TEXT", 128, "just a test"

Var s as string = r.GetIndResource("TEXT", 0)
MessageBox s
```

Notes: Index is zero based.

84.24.9 GetNamedResource(ResourceType as String, Name as String) As String

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the specified resource as a string.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.create(f)

r.AddResource "Hello World", "TEXT", 128, "just a test"

Var s as string = r.GetNamedResource("TEXT", "just a test")
MessageBox s
```

84.24.10 GetResource(ResourceType as String, ID as Integer) As String

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the specified resource as a string.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.create(f)

r.AddResource "Hello World", "TEXT", 128, "just a test"

Var s as string = r.GetResource("TEXT", 128)
MessageBox s
```

84.24.11 GetResourceMemory(ResourceType as String, ID as Integer) As Memoryblock

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the specified resource as a Memoryblock.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.create(f)

r.AddResource "Hello World", "TEXT", 128, "just a test"

Var s as MemoryBlock = r.GetResourceMemory("TEXT", 128)
MessageBox s
```

84.24.12 Open(file as folderitem, Write as boolean, UseDataFork as boolean = false) as ResourceForkMBS

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Opens the resource fork of the FolderItem.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.Open(f, false)
MessageBox str(r.TypeCount)+" types in file"
```

Notes: If the FolderItem has no resource fork, OpenResourceFork returns Nil.
Access to the resourcefork is supported only on Macintosh.
If UseDataFork is true, the resources are read/write from data fork.

84.24.13 RemoveResource(ResourceType as String, ID as Integer)

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes the specified resource from the resource fork.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.Create(f)

r.AddResource "Hello World", "TEXT", 128, "just a test"
MessageBox str(r.TypeCount)+" resources"
r.RemoveResource "TEXT", 128
MessageBox str(r.TypeCount)+" resources"
```

84.24.14 ResourceCount(ResourceType as String) as Integer

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of resources of the specified type.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.create(f)

r.AddResource "Hello World", "TEXT", 128, "just a test"

MessageBox str(r.ResourceCount("TEXT")) // shows 1
```

84.24.15 ResourceID(ResourceType as String, index as Integer) as Integer

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the resource ID as an Integer based on the Type and Index passed.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.Create(f)

r.AddResource "Hello World", "TEXT", 128, "just a test"

MessageBox str(r.ResourceID("TEXT", 0)) // shows 128
```

Notes: This list is zero-based.

84.24.16 ResourceName(ResourceType as String, index as Integer) As String

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the resource name as a string based on the Type and the zero-based index to that type.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.Create(f)

r.AddResource "Hello World", "TEXT", 128, "just a test"

MessageBox r.ResourceName("TEXT", 0)
```

84.24.17 ResourceSizeOnDisk(ResourceType as String, ID as Integer) as Integer

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries the size on disk for a given resource.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.Create(f)

r.AddResource "Hello World", "TEXT", 128, "just a test"
MessageBox str(r.ResourceSizeOnDisk("TEXT", 128))+" bytes"
```

84.24.18 ResourceType(index as Integer) As String

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the resource type as a string based on the Index passed.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.create(f)

r.AddResource "Hello World", "TEXT", 128, "just a test"

MessageBox r.ResourceType(0)
```

Notes: This list is zero-based.

84.24.19 UniqueID(ResourceType as String) as Integer

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Finds an unique ID for a given resource type.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.create(f)

MessageBox str(R.UniqueID("TEXT"))
```

84.24.20 Properties

84.24.21 Handle as Integer

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal handle to the resource fork.
Notes: (Read only property)

84.24.22 LastError as Integer

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last error code.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.Open(f, false) // open read only

r.AddResource "Hello World", "TEXT", 128, "just a test"
MessageBox str(R.LastError) // shows -61, write permission error
```

Notes: All methods set this property.
(Read and Write property)

84.24.23 Modified as Boolean

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the resource fork has been modified by you.
Notes: (Read only property)

84.24.24 TypeCount as Integer

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The number of resource types present in the resource fork.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.create(f)

r.AddResource "Hello World", "TEXT", 128, "just a test"

MessageBox str(r.TypeCount) // shows 1
```

Notes: (Read only property)

84.24.25 Writable as Boolean

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the resourcefork was opened writable.
Notes: (Read only property)

84.24.26 ResourceAttributes(ResourceType as String, ID as Integer) as Integer

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get or set all resource attributes together.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rsrc")
Var r as ResourceForkMBS = ResourceForkMBS.Create(f)

r.AddResource "Hello World", "TEXT", 128, "just a test"

MessageBox str(r.ResourceAttributes("TEXT", 128))
// shows 2 which means it has been changed and need to be written to disk soon
```

Notes: (Read and Write computed property)

84.24.27 ResourceLocked(ResourceType as String, ID as Integer) as boolean

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Used to get and set the locked attribute of the resource.
Notes: (Read and Write computed property)

84.24.28 ResourcePreload(ResourceType as String, ID as Integer) as boolean

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Used to get and set the Preload attribute of the resource.
Notes: (Read and Write computed property)

84.24.29 ResourceProtected(ResourceType as String, ID as Integer) as boolean

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Used to get and set the Protected attribute of the resource.
Notes: (Read and Write computed property)

84.24.30 ResourcePurgeable(ResourceType as String, ID as Integer) as boolean

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Used to get and set the Purgeable attribute of the resource.
Notes: (Read and Write computed property)

84.24.31 ResourceSysHeap(ResourceType as String, ID as Integer) as boolean

MBS MacClassic Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Used to get and set the SysHeap attribute of the resource.
Notes: (Read and Write computed property)

84.25 class ResStreamMBS

84.25.1 class ResStreamMBS

MBS Util Plugin, Platform: macOS, Targets: All.

Function: Alows you to access a ressourcefork in its binary representation.
Notes: Useful to copy the resourcefork faster from one file to another.
Subclass of the LargeBinaryStreamMBS class.
Blog Entries

- MBS Plugins updated for Xojo 2019r2

84.26 class StdinMBS

84.26.1 class StdinMBS

MBS Util Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: A class to read from stdin.
Example:

```
Var s as new StdoutMBS
Var r as new StdinMBS
Var v,n as Integer

s.Write "Integer: "
n=r.ReadInteger(v)

print "integer read: "+str(v)
print "integer count: "+str(n)

Var d as Double

s.Write "Double: "
n=r.ReadDouble(d)

print "double read: "+str(d)
print "double count: "+str(n)

Var t as string

s.Write "String: "
n=r.ReadString(t)

print "string read: "+t
print "string count: "+str(n)

do
s.Write "Character (type a and return to end): "
n=r.GetCharacter

print "got character: "+str(n)
loop until n=65 or n=97
```

84.26.2 Methods

84.26.3 AttachConsole(ProcessID as Integer = -1) as Integer

MBS Util Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attaches the calling process to the console of the specified process.
Notes: ProcessId: The identifier of the process whose console is to be used. This parameter can be one of the following values.

Value	Meaning
pid	Use the console of the specified process.
-1	Use the console of the parent of the current process.

Returns Windows error code or zero for success.

A process can be attached to at most one console. If the calling process is already attached to a console, the error code returned is ERROR_ACCESS_DENIED (5). If the specified process does not have a console, the error code returned is ERROR_INVALID_HANDLE (6). If the specified process does not exist, the error code returned is ERROR_GEN_FAILURE (31).

84.26.4 Flush

MBS Util Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Flushes input.

84.26.5 FreeConsole as Integer

MBS Util Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Detaches the calling process from its console.
Notes: Returns Windows error code or zero for success.

A process can be attached to at most one console. If the calling process is not already attached to a console, the error code returned is ERROR_INVALID_PARAMETER (87).
A process can use the FreeConsole function to detach itself from its console. If other processes share the console, the console is not destroyed, but the process that called FreeConsole cannot refer to it. A console is closed when the last process attached to it terminates or calls FreeConsole. After a process calls FreeConsole, it can call the AllocConsole function to create a new console or AttachConsole to attach to another console.

84.26.6 GetCharacter as Integer

MBS Util Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Reads in one character and returns the ASCII code.
Notes: Returns one if a value was read and 0 if not.

84.26.7 Read(count as Integer) as string

MBS Util Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads data from stdin.
Notes: Data is returned in binary encoding.

84.26.8 ReadDouble(byref value as Double) as Integer

MBS Util Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads a double from the console.
Notes: Returns one if a value was read and 0 if not.

84.26.9 ReadInteger(byref value as Integer) as Integer

MBS Util Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads an integer from the console.
Notes: Returns one if a value was read and 0 if not.

84.26.10 ReadString(byref value as string) as Integer

MBS Util Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads a string from the console.
Notes: This string is limited to 4095 characters.
Returns one if a value was read and 0 if not.

84.26.11 Properties

84.26.12 AvailableCharacters as Integer

MBS Util Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries number of characters in the input buffer.
Notes: On Windows check fors input events from keyboard for key down in the console buffer.

For macOS and Linux, we check how many bytes are available in the input buffer. Please note, that in Terminal you have to press the return key to get the text into the input buffer first.
(Read only property)

84.26.13 Echo as Boolean

MBS Util Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables/disables echo for stdin.
Example:

```
// try this on Mac/Linux GUI/Console app with the app launched from Terminal,
// or in console app on Windows launched from command prompt

Var s as new StdoutMBS

s.Write "Hello World"+chr(10)

Var t as string
```

```
Var n as integer = StdinMBS.ReadString(t)
s.Write chr(10)
s.Write "Read with echo: "+t+chr(10)

StdinMBS.Echo = false

n = StdinMBS.ReadString(t)
s.Write chr(10)
s.Write "Read without echo: "+t+chr(10)

StdinMBS.Echo = true
```

Notes: You can disable echo for password input.
By default it is enabled.
(Read and Write property)

84.26.14 IsReady as boolean

MBS Util Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Checks whether there is data waiting in input buffer to be read.
Example:

```
Var d As New date

Do
// print time if second changed
Var e As New date
If e.Second <>d.Second Then
Print e.LongTime
d = e
End If

// if ready, read a key
If StdinMBS.IsReady Then
Var s As String
Var l As Integer = StdinMBS.ReadString(s)
Print "Input "+Str(l)+": "+s
End If
Loop
```

Notes: If IsReady returns false and you would call ReadString method, the app could be blocked until user types something on console.
Added Windows support in version 20.5. We return true, if there is a return in the input buffer, so you can call Read() functions.

(Read only property)

84.27 class StdoutMBS

84.27.1 class StdoutMBS

MBS Util Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: A class to write to stdout.
Example:

```
Var s as new StdoutMBS
Var r as new StdinMBS
Var v,n as Integer

s.Write "Integer: "
n=r.ReadInteger(v)

print "integer read: "+str(v)
print "integer count: "+str(n)

Var d as Double

s.Write "Double: "
n=r.ReadDouble(d)

print "double read: "+str(d)
print "double count: "+str(n)

Var t as string

s.Write "String: "
n=r.ReadString(t)

print "string read: "+t
print "string count: "+str(n)

do
s.Write "Character (type a and return to end): "
n=r.GetCharacter

print "got character: "+str(n)
loop until n=65 or n=97
```

84.27.2 Methods

84.27.3 AttachConsole(ProcessID as Integer = -1) as Integer

MBS Util Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attaches the calling process to the console of the specified process.
Notes: ProcessId: The identifier of the process whose console is to be used. This parameter can be one of the following values.

Value	Meaning
pid	Use the console of the specified process.
-1	Use the console of the parent of the current process.

Returns Windows error code or zero for success.

A process can be attached to at most one console. If the calling process is already attached to a console, the error code returned is ERROR_ACCESS_DENIED (5). If the specified process does not have a console, the error code returned is ERROR_INVALID_HANDLE (6). If the specified process does not exist, the error code returned is ERROR_GEN_FAILURE (31).

84.27.4 Flush

MBS Util Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Makes sure that all data written using Write is already on the console.

84.27.5 FreeConsole as Integer

MBS Util Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Detaches the calling process from its console.
Notes: Returns Windows error code or zero for success.

A process can be attached to at most one console. If the calling process is not already attached to a console, the error code returned is ERROR_INVALID_PARAMETER (87).

A process can use the FreeConsole function to detach itself from its console. If other processes share the console, the console is not destroyed, but the process that called FreeConsole cannot refer to it. A console is closed when the last process attached to it terminates or calls FreeConsole. After a process calls FreeConsole, it can call the AllocConsole function to create a new console or AttachConsole to attach to another console.

84.27.6 Write(data as string)

MBS Util Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes data to stdout.
Notes: You have to make sure your data is in good text encoding.

84.28 class VolumeInformationMBS

84.28.1 class VolumeInformationMBS

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Detailed information on Mac volumes.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Xojo Developer Magazine

- 2.1, page 42: Details about disks, Getting the name, the size, and more information about a disc. by Christian Schmitz

84.28.2 Methods

84.28.3 Constructor

MBS MacClassic Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: The private constructor.

84.28.4 Properties

84.28.5 Blocksize as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: The size of an allocation block, in bytes.
Notes: This field is only appropriate for volume formats (such as HFS and HFS Plus) that allocate space in fixed-size pieces; other volume formats may not have a similar concept, and may set this field to zero.
(Read only property)

84.28.6 DataForkClumpSize as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Default data fork clump size.
Notes: When a fork is automatically grown as it is written, the File Manager attempts to allocate space that is a multiple of the clump size. This field is zero for volume formats that don't support the notion of a clump size.
(Read only property)

84.28.7 DefaultVolume as boolean

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Is this the default volume?
Notes: Not supported if LimitedInformation is false.
(This property requires Mac OS 9 or newer)
(Read only property)

84.28.8 DriveNumber as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: The drive number for the drive (drive queue element) associated with the volume.
Notes: (Read only property)

84.28.9 DriverRefNum as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: The driver reference number for the drive (drive queue element) associated with the volume.
Notes: (Read only property)

84.28.10 FileCount as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: The total number of files on the volume, or 0 if unknown.
Notes: (Read only property)

84.28.11 FilesOpen as boolean

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Are there files open on this volume?
Notes: For the boot volume false!?
Not supported if LimitedInformation is false.
(This property requires Mac OS 9 or newer)
(Read only property)

84.28.12 FileSystemID as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Identifies the filesystem implementation that is handling the volume; this is zero for HFS and HFS Plus volumes.
Notes: (Read only property)

84.28.13 FolderCount as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: The total number of folders on the volume, or 0 if unknown. Note that no root directory counts.
Notes: (Read only property)

84.28.14 freeBlocks as Int64

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: The number of unused allocation blocks on the volume.
Notes: This field is only appropriate for volume formats (such as HFS and HFS Plus) that allocate space in fixed-size pieces; other volume formats may not have a similar concept, and may set this field to zero.
(Read only property)

84.28.15 Freebytes as Int64

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: The number of bytes of free space on the volume.
Notes: On Mac OS versions before 9.0, this returns never a number bigger than 2 GBytes, even if the disc is bigger.
(Read only property)

84.28.16 HardwareLocked as boolean

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: is the volume locked by hardware?
Notes: Not supported if LimitedInformation is false.
(This property requires Mac OS 9 or newer)
(Read only property)

84.28.17 LimitedInformation as boolean

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: True if some properties are not filled.
Notes: Not all values are supported on Mac OS 8.6
(Read only property)

84.28.18 Name as String

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: The name of the volume.
Notes: The name is returned in 16bit Unicode.
RB 4.5 should know how to handle that.
(Read only property)

84.28.19 NextAllocation as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: A hint for where to start searching for free space during an allocation.
Notes: This field is only appropriate for volume formats (such as HFS and HFS Plus) that allocate space in fixed-size pieces; other volume formats may not have a similar concept, and may set this field to zero.
(Read only property)

84.28.20 NextCatalogID as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: The next unused catalog node ID.
Notes: Some volume formats (such as HFS and HFS Plus) use a monotonically increasing number for the catalog node ID (i.e. File ID or Directory ID) of newly created files and directories. For those volume

formats, the nextCatalogID is the next file/directory ID that will be assigned. For other volume formats, this field will be zero.
(Read only property)

84.28.21 ResourceForkClumpSize as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: Default resource fork clump size.
Notes: When a fork is automatically grown as it is written, the File Manager attempts to allocate space that is a multiple of the clump size. This field is zero for volume formats that don't support the notion of a clump size.
(Read only property)

84.28.22 Root as FolderItem

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: A folderitem to the root of this volume.
Notes: Not supported if LimitedInformation is false.
(This property requires Mac OS 9 or newer)
(Read only property)

84.28.23 RootFSRef as memoryblock

MBS MacClassic Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The root folderitem as FSRef packed into a memoryblock.
Notes: (Read only property)

84.28.24 Signature as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: This field is used to distinguish between volume formats supported by a single filesystem implementation.
Notes: Example values:

(Read only property)

HFS	&h4244	"BD"
HFS+	&h482B	"H+"

84.28.25 SoftwareLocked as boolean

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: is the volume locked by software?
Notes: Not supported if LimitedInformation is false.
(This property requires Mac OS 9 or newer)
(Read only property)

84.28.26 Totalblocks as Int64

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: The total number of allocation blocks on the volume.
Notes: This field is only appropriate for volume formats (such as HFS and HFS Plus) that allocate space in fixed-size pieces; other volume formats may not have a similar concept, and may set this field to zero.
(Read only property)

84.28.27 Totalbytes as Int64

MBS MacClassic Plugin, Platform: macOS, Targets: All.

Function: The size of the volume in bytes.
Notes: On Mac OS versions before 9.0, this returns never a number bigger than 2 GBytes, even if the disc is bigger.
(Read only property)

84.29 class WindowsDiskChangeMBS

84.29.1 class WindowsDiskChangeMBS

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class to get events for media or devices being added/inserted or removed.
Blog Entries

- MonkeyBread Software Releases the MBS Real Studio plug-ins in version 13.1
- MBS Real Studio Plugins, version 13.1pr10

84.29.2 Methods

84.29.3 Constructor

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

84.29.4 Properties

84.29.5 Valid as Boolean

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the constructor registered the events successfully.
Notes: (Read and Write property)

84.29.6 Events

84.29.7 DriveAdded(Path as string)

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event to notify you about drive being added.

84.29.8 DriveRemoved(Path as string)

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event to notify you about drive being removed.

84.29.9 MediaInserted(Path as string)

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event to notify you about media being added.

84.29.10 MediaRemoved(Path as string)

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event to notify you about media being removed.
Notes: You may get the event multiple times.

84.30 class WindowsDriveNotificationMBS

84.30.1 class WindowsDriveNotificationMBS

MBS Win Plugin, Plugin Version: 15.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class to detect devices being mounted/unmounted in Windows.
Blog Entries

- MonkeyBread Software Releases the MBS Xojo / Real Studio plug-ins in version 15.0
- MBS Xojo / Real Studio Plugins, version 14.5pr1

84.30.2 Events

84.30.3 DeviceArrival(Path as string)

MBS Win Plugin, Plugin Version: 15.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: A device arrived.
Notes: Path my be path to USB device or path to mount point. For USB sticks you get both.

84.30.4 DeviceRemoved(Path as string)

MBS Win Plugin, Plugin Version: 15.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: A device was removed.
Notes: Path my be path to USB device or path to mount point. For USB sticks you get both.

84.31 module WindowsJunctionMBS

84.31.1 module WindowsJunctionMBS

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: This module implements various functions for links.
Example:

```
// create a junction (directory link) on Windows and read its target
Var target As FolderItem = SpecialFolder.Documents.Child("Projects")
Var link As FolderItem = SpecialFolder.Desktop.Child("Projects Link")

If WindowsJunctionMBS.CreateJunction(link, target) Then
MessageBox "Junction points to " + WindowsJunctionMBS.GetJunctionTarget(link)
Else
MessageBox "Error " + WindowsJunctionMBS.Lasterror.ToString
End If
```

Notes: Symbol links (link files), Hard links (several directory entries for one file on disc) and junctions (show content of one folder inside another folder).

Some operations needs Administrator permissions.
Check lasterror in case of trouble.
Error 1314 for example is permissions problem.

See also WindowsShortCutMBS and WindowsInternetShortCutMBS classes.
For Mac see also CFBookmarkMBS and MacAliasMBS classes.
Blog Entries

- MBS Xojo Plugins, version 19.1pr7
- MBS Real Studio Plugins, version 11.3pr14

84.31.2 Methods

84.31.3 CreateHardLink(NewFile as folderitem, TargetFile as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Establishes a hard link between an existing file and a new file.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("test.exe")
Var nfile as FolderItem = SpecialFolder.Desktop.Child("hello.exe")
```

```
if WindowsJunctionMBS.CreateHardLink(nfile, file) then
MessageBox "OK"
end if
```

Notes: This function is only supported on the NTFS file system, and only for files, not directories.

NewFile: The name of the new file. Function fails if NewFile exists already. This parameter cannot specify the name of a directory.
TargetFile: The name of the existing file. This parameter cannot specify the name of a directory.

Returns true on success. Lasterror is set.

The maximum number of hard links that can be created with this function is 1023 per file. If more than 1023 links are created for a file, an error results.

Any directory entry for a file that is created with CreateFile or CreateHardLink is a hard link to an associated file. An additional hard link that is created with the CreateHardLink function allows you to have multiple directory entries for a file, that is, multiple hard links to the same file, which can be different names in the same directory, or the same or different names in different directories. However, all hard links to a file must be on the same volume.
Because hard links are only directory entries for a file, many changes to that file are instantly visible to applications that access it through the hard links that reference it. However, the directory entry size and attribute information is updated only for the link through which the change was made.
The security descriptor belongs to the file to which a hard link points. The link itself is only a directory entry, and does not have a security descriptor. Therefore, when you change the security descriptor of a hard link, you a change the security descriptor of the underlying file, and all hard links that point to the file allow the newly specified access. You cannot give a file different security descriptors on a per-hard-link basis.

Use DeleteFile to delete hard links (folderitem.delete in Xojo). You can delete them in any order regardless of the order in which they are created.
Flags, attributes, access, and sharing that are specified in CreateFile operate on a per-file basis. That is, if you open a file that does not allow sharing, another application cannot share the file by creating a new hard link to the file.
When you create a hard link on the NTFS file system, the file attribute information in the directory entry is refreshed only when the file is opened, or when GetFileInformationByHandle is called with the handle of a specific file.
Symbolic link behavior—If the path points to a symbolic link, the function creates a hard link to the target.

Lasterror is set. Returns true on success.

84.31.4 CreateJunction(JunctionDir as folderitem, TargetDir as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new junction.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("test")
Var nfile as FolderItem = SpecialFolder.System

if WindowsJunctionMBS.CreateJunction(file, nfile) then
MessageBox "OK"
end if
```

Notes: Lasterror is set. Returns true on success.

84.31.5 CreateSymbolicLink(NewFile as folderitem, TargetFile as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a symbolic link.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("test.lnk")
Var nfile as FolderItem = SpecialFolder.Desktop.Child("test.txt")

if WindowsJunctionMBS.CreateSymbolicLink(file,nfile) then
MessageBox "Ok"
end if
```

Notes: NewFile: The symbolic link to be created.
TargetFile: The name of the target for the symbolic link to be created. If TargetFile has a device name associated with it, the link is treated as an absolute link; otherwise, the link is treated as a relative link.
TargetIsDirectory: Indicates whether the link target, TargetFile, is a directory. (Pass true for a directory).

Returns true on success. False on failure. Lasterror is set.

If the function fails, the return value is zero. To get extended error information, call GetLastError.

Symbolic links can either be absolute or relative links. Absolute links are links that specify each portion of the path name; relative links are determined relative to where relative–link specifiers are in a specified path. Relative links are specified using the following conventions:

- Dot (. and ..) conventions—for example, "..\" resolves the path relative to the parent directory.
- Names with no slashes (\)—for example, "tmp" resolves the path relative to the current directory.
- Root relative—for example, "\Windows\System32" resolves to "current drive:\Windows\System32".
- Current working directory–relative—for example, if the current working directory is C:\Windows\System32, "C:File.txt" resolves to "C:\Windows\System32\File.txt".

If you specify a current working directory–relative link, it is created as an absolute link, due to the way the current working directory is processed based on the user and the thread.

This function can fail due to missing permissions.
See also:

- 84.31.6 CreateSymbolicLink(NewFile as folderitem, TargetFile as string, TargetIsDirectory as Boolean) as boolean 14257

84.31.6 CreateSymbolicLink(NewFile as folderitem, TargetFile as string, TargetIsDirectory as Boolean) as boolean

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a symbolic link.
Notes: NewFile: The symbolic link to be created.
TargetFile: The name of the target for the symbolic link to be created. If TargetFile has a device name associated with it, the link is treated as an absolute link; otherwise, the link is treated as a relative link.
TargetIsDirectory: Indicates whether the link target, TargetFile, is a directory. (Pass true for a directory).

Returns true on success. False on failure. Lasterror is set.

If the function fails, the return value is zero. To get extended error information, call GetLastError.

Symbolic links can either be absolute or relative links. Absolute links are links that specify each portion of the path name; relative links are determined relative to where relative–link specifiers are in a specified path. Relative links are specified using the following conventions:

- Dot (. and ..) conventions—for example, "..\" resolves the path relative to the parent directory.
- Names with no slashes (\)—for example, "tmp" resolves the path relative to the current directory.
- Root relative—for example, "\Windows\System32" resolves to "current drive:\Windows\System32".

- Current working directory–relative—for example, if the current working directory is C:\Windows\System32, "C:File.txt" resolves to "C:\Windows\System32\File.txt".

If you specify a current working directory–relative link, it is created as an absolute link, due to the way the current working directory is processed based on the user and the thread.

This function can fail due to missing permissions.
See also:

- 84.31.5 CreateSymbolicLink(NewFile as folderitem, TargetFile as folderitem) as boolean 14256

84.31.7 DeleteJunction(JunctionDir as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes the junction.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("test")

if WindowsJunctionMBS.DeleteJunction(file) then
MessageBox "Ok"
end if
```

Notes: Folder is not deleted.

84.31.8 GetJunctionTarget(JunctionDir as folderitem) as string

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Checks whether a directory is a directory junction.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("test")

MessageBox WindowsJunctionMBS.GetJunctionTarget(file)
```

Notes: Lasterror is set. Returns path of junction target.

84.31.9 HardLinksForFile(path as string) as string()

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Finds all the hard links to the specified file.
Example:

```
Var path as string = "C:\Users\Christian\Desktop\test.xojo_binary_project"

Var oldfile as FolderItem = New FolderItem(path, FolderItem.PathModes.Native)
Var newfile as FolderItem = New FolderItem(path+".copy", FolderItem.PathModes.Native)

call WindowsJunctionMBS.CreateHardLink(newfile, oldfile)

Var paths() as string = WindowsJunctionMBS.HardLinksForFile(path)

MessageBox Join(paths, EndOfLine)
```

Notes: Path: The name of the file.

Array has only one entry if file has no other hard links.

84.31.10 IsDirectoryJunction(JunctionDir as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Checks whether a directory is a directory junction.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("test")

if WindowsJunctionMBS.IsDirectoryJunction(file) then
MessageBox "Is junction."
else
MessageBox "Is no junction."
end if
```

Notes: Returns true if this file is a junction.
Lasterror is set.

84.31.11 Lasterror as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the last error code.
Notes: Value is 0 for no error
-1 for some parameter error or not implemented inside plugin.

other values are windows error codes.

84.32 class WindowsVolumeInformationMBS

84.32.1 class WindowsVolumeInformationMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Detailed information on Windows volumes.
Example:

```
// show file system details of drive C: on Windows
Var info As New WindowsVolumeInformationMBS("C:\")
If Not info.Valid Then Return

MessageBox "Name: " + info.Name + EndOfLine + _
"File system: " + info.FileSystemName + EndOfLine + _
"Serial: " + Hex(info.Serial) + EndOfLine + _
"Case sensitive: " + info.CaseSensitive.ToString + EndOfLine + _
"Supports encryption: " + info.SupportsFileEncryption.ToString
```

- MBS Xojo / Real Studio Plugins, version 16.2pr1

84.32.2 Methods

84.32.3 Constructor

MBS Win Plugin, Plugin Version: 5.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A dummy constructor used only for automatic plugin testing.
Notes: Uses "C:" as path and does the same as the other constructor.
See also:

- 84.32.4 Constructor(path as string) 14261

84.32.4 Constructor(path as string)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Fills the class with information about the given volume.
Example:

```
Function Window1.ToString(v as Variant) As string
return v
End Function
```

```
Sub Window1.Open
Var w as WindowsVolumeInformationMBS

w=new WindowsVolumeInformationMBS("C:\")

pname.text=w.name
pfsName.text=w.FileSystemName
pmaxLen.text=tostring(w.maxNameLength)
pcasePres.text=tostring(w.CaseIsPreserved)
pcasetiv.text=tostring(w.caseSensitive)
punicode.text=tostring(w.SupportsUnicodeFilenames)
pcompressed.text=tostring(w.IsCompressedVolume)
pfileCompress.text=tostring(w.SupportsFileCompression)
pfileEncrypt.text=tostring(w.SupportsFileEncryption)
pserial.text=hex(w.serial)
End Sub
```

Notes: Path must something like "C:\" or "\\MyServer\MyShare\".
See also:

- 84.32.3 Constructor 14261

84.32.5 Properties

84.32.6 CaseIsPreserved as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file system preserves the case of filenames when it places a name on disk.
Notes: (Read only property)

84.32.7 CaseSensitive as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file system supports case-sensitive filenames.
Notes: (Read only property)

84.32.8 FileSystemName as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the filesystem.
Notes: For example "FAT" or "NTFS".
(Read only property)

84.32.9 IsCompressedVolume as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The specified volume is a compressed volume; for example a DoubleSpace volume.
Notes: A volume is only SupportsFileCompression or IsCompressedVolume, but never both together.
(Read only property)

84.32.10 MaxNameLength as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The maximum length of a file name on this volume.
Notes: Should be 255 on normal Windows disks.
(Read only property)

84.32.11 Name as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The volume name or label if the volume is named.
Notes: (Read only property)

84.32.12 Path as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The path used in the constructor.
Notes: (Read only property)

84.32.13 Serial as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The volume serial number.
Example:

```
Var w as WindowsVolumeInformationMBS

w=new WindowsVolumeInformationMBS("C:\")
MessageBox hex(w.Serial)
```

Notes: This serial is set to a random name on formatting and can be changed later using some special tools.
(Read only property)

84.32.14 SupportsFileCompression as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file system supports file-based compression.
Notes: A volume is only SupportsFileCompression or IsCompressedVolume, but never both together.
(Read only property)

84.32.15 SupportsFileEncryption as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file system supports the Encrypted File System (EPS).
Notes: (Read only property)

84.32.16 SupportsUnicodeFilenames as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file system supports Unicode in filenames as they appear on disk.
Notes: (Read only property)

84.32.17 Valid as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Was the constructor successful?
Notes: May fail on bad file paths.
(Read only property)

Chapter 85

Folder Change Watching

85.1 class FolderChangedNotificationMBS

85.1.1 class FolderChangedNotificationMBS

MBS MacOSX Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use FSEventsMBS instead.
Function: A class to receive notifications
Example:

```
// get notified when files in a folder change on macOS
// MyFolderWatcher is a subclass of FolderChangedNotificationMBS with the DirectoryChanged event implemented.
// Watcher is a property of the window: Watcher As MyFolderWatcher
Watcher = New MyFolderWatcher
Watcher.Subscribe SpecialFolder.Desktop

// in MyFolderWatcher:
Sub DirectoryChanged(message As Integer, flags As Integer) Handles DirectoryChanged
System.DebugLog "Something changed in " + Directory.NativePath
End Sub
```

Notes: It's only for Mac OS X!
And not every application does send notifications around.
Please use FSEventsMBS for getting better results. This class is deprecated.

- MBS Plugins updated for Xojo 2019r2

85.1.2 Methods

85.1.3 Directory as folderitem

MBS MacOSX Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns a folderitem for the directory observed.
Notes: Returns nil on any error.
Lasterror is set.

85.1.4 Notify(dir as folderitem)

MBS MacOSX Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Notifies the system about a modification you made in the given directory.
Notes: Lasterror is set.

85.1.5 NotifyAll

MBS MacOSX Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Notifies the system about a modification you made on several directories.
Notes: Used by installers which may change hundreds of directories.
Lasterror is set.

85.1.6 NotifyByPath(path as string)

MBS MacOSX Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Notifies the system about a modification you made in the given directory.
Notes: Path should be a valid Mac OS X path.
Lasterror is set.

85.1.7 Subscribe(dir as folderitem)

MBS MacOSX Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Subscribes the class to observe a specified directory.
Notes: Lasterror is set.
See also:

• 85.1.8 Subscribe(dir as folderitem, flags as Integer) 14267

85.1.8 Subscribe(dir as folderitem, flags as Integer)

MBS MacOSX Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: Subscribes the class to observe a specified directory.
Notes: Lasterror is set.

Constants for the flags parameter:

kFNNoImplicitAllSubscription	1	Specify this option if you do not want to receive notifications on this subscription when FNNotifyAll is called; by default any subscription is also implicitly a subscription to wildcard notifications.
kFNNotifyInBackground	2	Specify this option if you want to receive notifications on this subscription when your application is in background. By default notifications will be coalesced and and delivered when your application becomes foreground.

See also:

• 85.1.7 Subscribe(dir as folderitem) 14266

85.1.9 SubscribeByPath(path as string)

MBS MacOSX Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Subscribes the class to observe a specified directory.
Notes: Lasterror is set.
Path must be a valid Mac OS X path.
See also:

• 85.1.10 SubscribeByPath(path as string, flags as Integer) 14267

85.1.10 SubscribeByPath(path as string, flags as Integer)

MBS MacOSX Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: Subscribes the class to observe a specified directory.
Notes: Lasterror is set.
Path must be a valid Mac OS X path.

Constants for the flags parameter:

kFNNoImplicitAllSubscription	1	Specify this option if you do not want to receive notifications on this subscription when FNNotifyAll is called; by default any subscription is also implicitly a subscription to wildcard notifications.
kFNNotifyInBackground	2	Specify this option if you want to receive notifications on this subscription when your application is in background. By default notifications will be coalesced and and delivered when your application becomes foreground.

See also:

- 85.1.9 SubscribeByPath(path as string) 14267

85.1.11 Unsubscribe

MBS MacOSX Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Unsubscribes the current directory.
Notes: Lasterror is set.
This method is called for you by the destructor of the class.

85.1.12 Properties

85.1.13 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The handle to the notification object.
Notes: For toolbox development: It's a FNSubscriptionRef.
(Read and Write property)

85.1.14 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The last error code reported.
Notes: 0 if successful, -1 if the function is not available or parameters are bad.
Else a Mac OS error code.
(Read and Write property)

85.1.15 Events

85.1.16 DirectoryChanged(message as Integer, flags as Integer)

MBS MacOSX Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Out directory changed or some directories changed.
Notes: An installer application may send a notification without a specified directory. In this case the event is called and the observed directory may not be changed!

message: An indication of what happened
flags: Options about delivery of the notification (typically 0)

Only one message value is defined:
const kFNDirectoryModifiedMessage = 1

85.2 class FSEventsMBS

85.2.1 class FSEventsMBS

MBS MacFrameworks Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for the Mac OS X 10.5 feature called FSEvents which can be used to monitor a folder hierarchie for changes.
Example:

```
// watch a folder and its subfolders for changed files
// MyFSEvents is a subclass of FSEventsMBS with the Callback event implemented.
// Watcher is a property of the window: Watcher As MyFSEvents
Watcher = New MyFSEvents(SpecialFolder.Documents.NativePath, FSEventsMBS.kFSEventStreamEvent-
tIdSinceNow, 1.0, FSEventsMBS.kFSEventStreamCreateFlagFileEvents)
If Not Watcher.Start Then MessageBox "Can't start watching."

// in MyFSEvents:
Sub Callback(index As Integer, count As Integer, path As String, flags As Integer, eventID As UInt64)
Handles Callback
Var what As String = "changed"
If BitwiseAnd(flags, FSEventsMBS.kFSEventStreamEventFlagItemCreated) <>0 Then what = "created"
If BitwiseAnd(flags, FSEventsMBS.kFSEventStreamEventFlagItemRemoved) <>0 Then what = "removed"
System.DebugLog path + " " + what
End Sub
```

Notes: The text below is from the Apple documentation (With some plugin related modifications). The plugin does currently not support the device related functions, but that can be added later if you need it.

This class provides a mechanism to notify clients about directories they ought to re-scan in order to keep their internal data structures up-to-date with respect to the true state of the file system. (For example, when files or directories are created, modified, or removed.) It sends these notifications "in bulk", possibly notifying the client of changes to several directories in a single callback. By using the API, clients can notice such changes quickly, without needing to resort to recursive polling/scanning of the file system.

Much like kqueues, the FSEvents API allows an application to find near-immediately when the contents of a particular directory has changed. However, unlike kqueues, the FSEvents API allows the application to monitor the whole file system hierarchy rooted at a specified directory (and still get precise per-directory notifications) – to do this with the kqueues API would require the client to monitor each directory individually.

Clients can register interest in a chunk of the filesystem hierarchy and will receive callbacks from their runloop whenever an event occurs that modifies the filesystem therein. The callback will indicate the exact directory in which the event occurred, so the client only has to scan that directory for updated info, not all its children. Clients can supply a "latency" parameter that tells how long to wait after an event occurs before forwarding

it; this reduces the volume of events and reduces the chance that the client will see an ”intermediate” state, like those that arise when doing a ”safe save” of a file, creating a package, or downloading a file via Safari.

The lifecycle of an FSEventStream consists of these stages:

1. new FSEventsMBS(...) ->Creates an FSEventStream.

2. Start() ->Starts receiving events and servicing them from the client’s runloop(s) using the callback supplied by the client when the stream was created. If a value was supplied for the sinceWhen parameter then ”historical” events will be sent via your callback first, then a HistoryDone event, then ”contemporary” events will be sent on an ongoing basis (as though you had supplied kFSEventStreamEventIdSinceNow for sinceWhen).

3. Stop() ->Stops the stream, ensuring the client’s callback will not be called again for this stream. After stopping the stream, it can be restarted seamlessly via Start() without missing any events.

Once the event stream has been started, the following calls can be used:

GetLatestEventId() ->Initially, this returns the sinceWhen value supplied when the stream was created; thereafter, it is updated with the highest-numbered event ID mentioned in the current batch of events just before invoking the client’s callback. Clients can store this value persistently as long as they also store the UUID for the device (obtained via UUIDForDevice()). Clients can then later supply this event ID as the sinceWhen parameter to Constructor(), as long as its UUID matches what you stored. This works because the FSEvents service stores events in a persistent, per-volume database. In this regard,the stream of event IDs acts like a global, system-wide clock, but bears no relation to any particular timebase.

FlushAsync() ->Requests that the fseventsd daemon send any events it has already buffered (via the latency parameter to one of the constructors). This occurs asynchronously; clients will not have received all the callbacks by the time this call returns to them.

FlushSync() ->Requests that the fseventsd daemon send any events it has already buffered (via the latency parameter to one of the constructors). Then runs the runloop in its private mode till all events that have occurred have been reported (via the clients callback). This occurs synchronously; clients will have received all the callbacks by the time this call returns to them.

GetDeviceBeingWatched() ->Gets the dev_t value supplied when the stream was created with Constructor(), otherwise 0.

PathsBeingWatched() ->Gets the paths supplied when the stream was created with one of the constructors.

Calls that can be made without a stream:

UUIDForDevice() ->Gets a UUID that uniquely identifies the FSEvents database for that volume. If the database gets discarded then its replacement will have a different UUID so that clients will be able to detect this situation and avoid trying to use event IDs that they stored as the sinceWhen parameter to the FSEventStreamCreate...() functions.

GetCurrentEventId() ->Gets the most recently generated event ID, system-wide (not just for one stream).

GetLastEventIdForDeviceBeforeTime() ->Gets the last event ID for the given device that was returned before the given time. This is conservative in the sense that if you then use the returned event ID as the sinceWhen parameter of Constructor() that you will not miss any events that happened since that time. On the other hand, you might receive some (harmless) extra events.

PurgeEventsForDeviceUpToEventId() ->Purges old events from the persistent per-volume database maintained by the service. You can combine this with GetLastEventIdForDeviceBeforeTime(). Can only be called by the root user.

For Windows, you can use WindowsDirectoryWatcherMBS class.

85.2.2 Methods

85.2.3 Available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the FSEvent functions are working.
Example:

```
if FSEventsMBS.Available then
MessageBox "available"
```

```
else
MessageBox "not available"
end if
```

Notes: True on Mac OS X 10.5 and false on other versions and operating systems.

85.2.4 Constructor(DeviceToWatch as Integer, path as string, sinceWhen as UInt64, latency as Double, flags as Integer)

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new FS event stream object for a particular device with the given parameters.
Notes: In order to start receiving callbacks you must also call Start().

deviceToWatch:
A dev_t corresponding to the device which you want to receive notifications from. Use GetDeviceID to get such a device ID.

pathsToWatchRelativeToDevice:
A string, specifying a relative path to a directory on the device identified by the dev parameter. The path should be relative to the root of the device. For example, if a volume "MyData" is mounted at "/Volumes/MyData" and you want to watch "/Volumes/MyData/Pictures/July", specify a path string of "Pictures/July". To watch the root of a volume pass a path of "" (the empty string).

sinceWhen:
The service will supply events that have happened after the given event ID. To ask for events "since now" pass the constant kFSEventStreamEventIdSinceNow. Often, clients will supply the highest-numbered FSEventStreamEventId they have received in a callback, which they can obtain via the GetLatestEventId() accessor. Do not pass zero for sinceWhen, unless you want to receive events for every directory modified since "the beginning of time" – an unlikely scenario.

latency:
The number of seconds the service should wait after hearing about an event from the kernel before passing it along to the client via its event. Specifying a larger value may result in more effective temporal coalescing, resulting in fewer callbacks.

flags:
Flags that modify the behavior of the stream being created.

On success the handle property is not 0.

85.2.5 Constructor(DeviceToWatch as Integer, paths() as string, sinceWhen as UInt64, latency as Double, flags as Integer)

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new FS event stream object with the given parameters.
Notes: In order to start receiving callbacks you must also call Start.

paths: The folders you want to watch. (more exactly the root folders of the folder hierarchies you want to watch)
sinceWhen: The service will supply events that have happened after the given event ID. To ask for events "since now" pass the constant kFSEventStreamEventIdSinceNow. Often, clients will supply the highest-numbered FSEventStreamEventId they have received in a callback, which they can obtain via the GetLatestEventId() accessor. Do not pass zero for sinceWhen, unless you want to receive events for every directory modified since "the beginning of time" – an unlikely scenario.
latency: The number of seconds the service should wait after hearing about an event from the kernel before passing it along to the client via its callback. Specifying a larger value may result in more effective temporal coalescing, resulting in fewer callbacks and greater overall efficiency.
flags: Flags that modify the behavior of the stream being created.

85.2.9 Constructor(paths() as string, sinceWhen as UInt64, latency as Double, flags as Integer)

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new FS event stream object for a particular device with the given parameters.
Notes: In order to start receiving callbacks you must also call Start().

deviceToWatch:
A dev_t corresponding to the device which you want to receive notifications from. Use GetDeviceID to get such a device ID.

pathsToWatchRelativeToDevice:
An array of strings, each specifying a relative path to a directory on the device identified by the dev parameter. The paths should be relative to the root of the device. For example, if a volume "MyData" is mounted at "/Volumes/MyData" and you want to watch "/Volumes/MyData/Pictures/July", specify a path string of "Pictures/July". To watch the root of a volume pass a path of "" (the empty string).

sinceWhen:
The service will supply events that have happened after the given event ID. To ask for events "since now" pass the constant kFSEventStreamEventIdSinceNow. Often, clients will supply the highest-numbered FSEventStreamEventId they have received in a callback, which they can obtain via the GetLatestEventId() accessor. Do not pass zero for sinceWhen, unless you want to receive events for every directory modified since "the beginning of time" – an unlikely scenario.

latency:
The number of seconds the service should wait after hearing about an event from the kernel before passing it along to the client via its event. Specifying a larger value may result in more effective temporal coalescing, resulting in fewer callbacks.

flags:
Flags that modify the behavior of the stream being created.

On success the handle property is not 0.

- 85.2.8 Constructor(paths() as folderitem, sinceWhen as UInt64, latency as Double, flags as Integer) 14276

85.2.10 Description as string

MBS MacFrameworks Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a string containing the description of the stream.
Notes: For debugging only.

85.2.11 DeviceBeingWatched as Integer

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Fetches the dev_t supplied when the stream was created using a Device ID.
Notes: Returns 0 if there was an error.

85.2.12 ExclusionPaths as String()

MBS MacFrameworks Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries exclusion paths.

85.2.13 FlushAsync as UInt64

MBS MacFrameworks Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Flushes all events.
Notes: Asks the FS Events service to flush out any events that have occurred but have not yet been delivered, due to the latency parameter that was supplied when the stream was created. This flushing occurs asynchronously – do not expect the events to have already been delivered by the time this call returns. FlushAsync() can only be called after the stream has been started, via Start().

Returns The largest event id of any event ever queued for this stream, otherwise zero if no events have been queued for this stream.

85.2.14 FlushSync

MBS MacFrameworks Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Flushes all events.
Notes: Asks the FS Events service to flush out any events that have occurred but have not yet been delivered, due to the latency parameter that was supplied when the stream was created. This flushing occurs synchronously – by the time this call returns, your callback will have been invoked for every event that had already occurred at the time you made this call. FlushSync() can only be called after the stream has been started, via Start().

85.2.15 GetAbsoluteTime(theDate as date) as Double

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an absolute time value based on the system time zone and the values in the date object.
Example:

```
Var d as new date

MessageBox str(FSEventsMBS.GetAbsoluteTime(d))
```

Notes: Returns 0 if the date parameter is nil or invalid.
See also:

- 85.2.16 GetAbsoluteTime(theDate as DateTime) as double 14279

85.2.16 GetAbsoluteTime(theDate as DateTime) as double

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an absolute time value based on the system time zone and the values in the date object.
Notes: Returns 0 if the date parameter is nil or invalid.
See also:

- 85.2.15 GetAbsoluteTime(theDate as date) as Double 14279

85.2.17 GetCurrentEventId as UInt64

MBS MacFrameworks Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Fetches the most recently generated event ID, system-wide (not just for one stream).
Notes: By thetime it is returned to your application even newer events may have already been generated.

85.2.18 GetDeviceID(volume as folderitem) as Integer

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the device ID for the volume the folderitem points to.
Example:

```
Var v as FolderItem

v=volume(0)

MessageBox str(FSEventsMBS.GetDeviceID(v))
```

Notes: Returns 0 on any error.

85.2.19 GetLastEventIdForDeviceBeforeTime(DeviceID as Integer, theTime as Double) as UInt64

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets the last event ID for the given device that was returned before the given time.
Example:

```
Var d as new date

MessageBox str(FSEventsMBS.GetLastEventIdForDeviceBeforeTime(1,d.TotalSeconds))
```

Notes: This is conservative in the sense that if you then use the returned event ID as the sinceWhen parameter of the constructor that you will not miss any events that happened since that time. On the other hand, you might receive some (harmless) extra events. Beware: there are things that can cause this to fail to be accurate. For example, someone might change the system's clock (either backwards or forwards). Or an external drive might be used on different systems without perfectly synchronized clocks.

85.2.20 GetLatestEventId as UInt64

MBS MacFrameworks Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Fetches the sinceWhen property of the stream.
Notes: Upon receiving an event (and just before invoking the client's callback) this attribute is updated to the highest-numbered event ID mentioned in the event.

85.2.21 kFSEventStreamEventIdSinceNow as UInt64

MBS MacFrameworks Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: A special value to pass in if you mean the event ID for now.

Notes: Returns &hFFFFFFFFFFFFFFFF.

85.2.22 PathsBeingWatched as String()

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array with the paths being watched.
Notes: Works only on the RB Versions which support arry creation in plugins.

85.2.23 PurgeEventsForDeviceUpToEventId(DeviceID as Integer, EventID as UInt64) as boolean

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Purges old events from the persistent per-volume database maintained by the service.
Notes: Can only be called by the root user.

85.2.24 SetExclusionPaths(paths() as String) as boolean

MBS MacFrameworks Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the exclusion paths.
Notes: Sets directories to be filtered from the EventStream.
A maximum of 8 directories maybe specified.

Requires OS X 10.9 or newer.
Returns true on success or false on failure.

85.2.25 Show

MBS MacFrameworks Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Prints a description of the supplied stream to stderr.
Notes: For debugging only.

85.2.26 Start as boolean

MBS MacFrameworks Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to register with the FS Events service to receive events per the parameters in the stream.
Notes: Once started, the stream can be stopped via Stop().

Returns true if it succeeds, otherwise False if it fails. It ought to always succeed, but in the event it does not then your code should fall back to performing recursive scans of the directories of interest as appropriate.

85.2.27 Stop

MBS MacFrameworks Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Unregisters with the FS Events service.
Notes: The client callback will not be called for this stream while it is stopped. Stop() can only be called if the stream has been started, via Start(). Once stopped, the stream can be restarted via Start(), at which point it will resume receiving events from where it left off (”sinceWhen”).

85.2.28 UUIDForDevice(DeviceID as Integer) as memoryblock

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets the UUID associated with a device, or nil if not possible (for example, on read-only device).
Notes: A (non-nil) UUID uniquely identifies a given stream of FSEvents. If this (non-nil) UUID is different than one that you stored from a previous run then the event stream is different (for example, because FSEvents were purged, because the disk was erased, or because the event ID counter wrapped around back to zero). A nil return value indicates that ”historical” events are not available, i.e., you should not supply a ”sinceWhen” value to the constructor other than kFSEventStreamEventIdSinceNow.

85.2.29 Properties

85.2.30 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal stream handle used.
Notes: (Read only property)

85.2.31 Running as Boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether this object has been started.
Notes: This is set to true when you call Start and set to false when you call Stop.
(Read only property)

85.2.32 Events

85.2.33 Callback(index as Integer, count as Integer, path as string, flags as Integer, eventID as UInt64)

MBS MacFrameworks Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The callback received when something changed.
Notes: The plugin receives count events. This event is called count times with index going from 0 to count-1.
Path is the unix file path for the folder. A path might be "/" if either of these flags is set for the event: kFSEventStreamEventFlagUserDropped, kFSEventStreamEventFlagKernelDropped.
Flags: Flags to specify why the event was called. If no flags are set, then there was some change in the directory at the specific path supplied in this event.
eventID: The event ID for this change. Each event ID comes from the most recent event being reported in the corresponding directory named in the path parameter. Event IDs all come from a single global source. They are guaranteed to always be increasing, usually in leaps and bounds, even across system reboots and moving drives from one machine to another. Just before invoking your callback your stream is updated so that calling the accessor GetLatestEventId() will return the largest of the values passed in the eventIds parameter; if you were to stop processing events from this stream after this callback and resume processing them later from a newly-created FSEventStream, this is the value you would pass for the sinceWhen parameter to constructor.

85.2.34 Constants

Creation Flags

Constant	Value	Description
kFSEventStreamCreateFlagFileEvents	16	Request file-level notifications. Your stream will receive events abo files in the hierarchy you're watching instead of only receiving d notifications. Use this flag with care as it will generate significantl than without it. Available in Mac OS X 10.7 or newer.
kFSEventStreamCreateFlagIgnoreSelf	8	Don't send events that were triggered by the current process. Thi reducing the volume of events that are sent. It is only useful if might modify the file system hierarchy beneath the path(s) bein Note: this has no effect on historical events, i.e., those delivere HistoryDone sentinel event. Available in Mac OS X 10.7 or newer.
kFSEventStreamCreateFlagMarkSelf	32	Tag events that were triggered by the current process with the flag. This is only useful if your process might modify the file syst beneath the path(s) being monitored and you wish to know whic triggered by your process. Note: this has no effect on historica those delivered before the HistoryDone sentinel event.
kFSEventStreamCreateFlagNoDefer	2	Affects the meaning of the latency parameter. If you specify this than latency seconds have elapsed since the last event, your app w event immediately. The delivery of the event resets the latency t further events will be delivered after latency seconds have elapsed useful for apps that are interactive and want to react immediate but avoid getting swamped by notifications when changes are occu succession. If you do not specify this flag, then when an event a period of no events, the latency timer is started. Any even during the next latency seconds will be delivered as one group (i first event). The delivery of the group of events resets the laten any further events will be delivered after latency seconds. This behavior and is more appropriate for background, daemon or bat apps.
kFSEventStreamCreateFlagNone	0	
kFSEventStreamCreateFlagUseCFTypes	1	The plugin uses this one internally.
kFSEventStreamCreateFlagUseExtendedData	64	Requires kFSEventStreamCreateFlagUseCFTypes and instructs t to invoke your callback function with CF types but, instead a CFArrayMBS of CFStringMBSs, a CFArrayMBS of CFDic is passed. Each dictionary will contain the event path and p "extended data" about the event. See the kFSEventStreamEv Data*Key definitions for the set of keys that may be set in the d For macOS 10.13 or newer.
kFSEventStreamCreateFlagWatchRoot	4	Request notifications of changes along the path to the path(s) ing. For example, with this flag, if you watch "/foo/bar" and it i "/foo/bar.old", you would receive a RootChanged event. The sa the directory "/foo" were renamed. The event you receive is a the path for the event is the original path you specified, the entStreamEventFlagRootChanged is set and event ID is zero. events are useful to indicate that you should rescan a particular cause it changed completely (as opposed to the things inside of If you want to track the current location of a directory, it is bes directory before creating the stream so that you have a file descrip can issue an F_GETPATH fcntl() to find the current path.

Event flags.

Constant	Value	Description
kFSEventStreamEventFlagEventIdsWrapped	8	If kFSEventStreamEventFlagEventIdsWrapped is set, it means the ID counter wrapped around. As a result, previously-issued event longer valid arguments for the sinceWhen parameter of the constr
kFSEventStreamEventFlagHistoryDone	16	Denotes a sentinel event sent to mark the end of the "historical" as a result of specifying a sinceWhen value in the constructor call this event stream. (It will not be sent if kFSEventStreamEven was passed for sinceWhen.) After invoking the client's callback "historical" events that occurred before now, the client's callbac voked with an event where the kFSEventStreamEventFlagHistory set. The client should ignore the path supplied in this callback.
kFSEventStreamEventFlagKernelDropped	4	The kFSEventStreamEventFlagUserDropped or kFSEventStream ernelDropped flags may be set in addition to the kFSEventStrea MustScanSubDirs flag to indicate that a problem occurred in b events (the particular flag set indicates where the problem occurr the client must do a full scan of any directories (and their subdirec sively) being monitored by this stream. If you asked to monitor m with this stream then you will be notified about all of them. You only check for the kFSEventStreamEventFlagMustScanSubDirs fla (if present) only provide information to help you diagnose the pro
kFSEventStreamEventFlagMount	64	Denotes a special event sent when a volume is mounted. The event is the path to the newly-mounted volume. You will receive notifications for every volume mount event inside the kernel (inc DiskArbitration). Beware that a newly-mounted volume could con trarily large directory hierarchy. Avoid pitfalls like triggering a re of a non-local filesystem, which you can detect by checking for th the MNT_LOCAL flag in the f_flags returned by statfs(). Also the MNT_DONTBROWSE flag that is set for volumes which sh displayed by user interface elements.
kFSEventStreamEventFlagMustScanSubDirs	1	Your application must rescan not just the directory given in the e its children, recursively. This can happen if there was a problem wh were coalesced hierarchically. For example, an event in /Users/js and an event in /Users/jsmith/Pictures might be coalesced into a this flag set and path=/Users/jsmith. If this flag is set you ma get an idea of whether the bottleneck happened in the kernel (less your client (more likely) by checking for the presence of the inform kFSEventStreamEventFlagUserDropped or kFSEventStreamEven Dropped.
kFSEventStreamEventFlagNone	0	
kFSEventStreamEventFlagRootChanged	32	Denotes a special event sent when there is a change to one of th along the path to one of the directories you asked to watch. Whe set, the event ID is zero and the path corresponds to one of the pat to watch (specifically, the one that changed). The path may no because it or one of its parents was deleted or renamed. Events with will only be sent if you passed the flag kFSEventStreamCreateFla to the constructor when you created the stream.
kFSEventStreamEventFlagUnmount	128	Denotes a special event sent when a volume is unmounted. The event is the path to the directory from which the volume was You will receive one of these notifications for every volume un inside the kernel. This is not a substitute for the notifications the DiskArbitration framework; you only get notified after the u occurred. Beware that unmounting a volume could uncover an arb directory hierarchy, although Mac OS X never does that.
kFSEventStreamEventFlagUserDropped	2	The kFSEventStreamEventFlagUserDropped or kFSEventStream ernelDropped flags may be set in addition to the kFSEventStrea MustScanSubDirs flag to indicate that a problem occurred in b events (the particular flag set indicates where the problem occurr the client must do a full scan of any directories (and their subdirec sively) being monitored by this stream. If you asked to monitor m

File Event Flags

Constant	Value	Description
kFSEventStreamEventFlagItemChangeOwner	&h00004000	File changed owner.
kFSEventStreamEventFlagItemCloned	&h00400000	The file system object at the specific path supplied in th was cloned. (This flag is only ever set if you specified the FileEvents fl stream.)
kFSEventStreamEventFlagItemCreated	&h00000100	File created.
kFSEventStreamEventFlagItemFinderInfoMod	&h00002000	File meta data in Finder info have changed.
kFSEventStreamEventFlagItemInodeMetaMod	&h00000400	File meta data in inode have changed.
kFSEventStreamEventFlagItemIsDir	&h00020000	File is a folder.
kFSEventStreamEventFlagItemIsFile	&h00010000	File is a regular file.
kFSEventStreamEventFlagItemIsHardlink	&h00100000	Indicates the object at the specified path supplied in this (This flag is only ever set if you specified the FileEvents fl stream.)
kFSEventStreamEventFlagItemIsLastHardlink	&h00200000	Indicates the object at the specific path supplied in this ev link. (This flag is only ever set if you specified the FileEvents fl stream.)
kFSEventStreamEventFlagItemIsSymlink	&h00040000	File is a symlink.
kFSEventStreamEventFlagItemModified	&h00001000	File modified.
kFSEventStreamEventFlagItemRemoved	&h00000200	File deleted.
kFSEventStreamEventFlagItemRenamed	&h00000800	File renamed.
kFSEventStreamEventFlagItemXattrMod	&h00008000	Extended attributes changed.
kFSEventStreamEventFlagOwnEvent	&h00080000	Indicates the event was triggered by the current process. (This flag is only ever set if you specified the MarkSelf fl stream.)

85.3 class WindowsDirectoryChangeMBS

85.3.1 class WindowsDirectoryChangeMBS

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for directory change information.
Notes: For Mac, you can use FSEventsMBS class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.5pr4

85.3.2 Properties

85.3.3 Action as Integer

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The type of change that has occurred.
Notes: See kAction constants.
(Read and Write property)

85.3.4 Filename as String

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file path.
Notes: For speed reasons we give you string, not folderitem.
(Read and Write property)

85.3.5 Constants

Type Change Constants

Constant	Value	Description
kActionAdded	1	The file was added to the directory.
kActionModified	3	The file was modified. This can be a change in the time stamp or attributes.
kActionRemoved	2	The file was removed from the directory.
kActionRenamedNewName	5	The file was renamed and this is the new name.
kActionRenamedOldName	4	The file was renamed and this is the old name.

85.4 class WindowsDirectoryWatcherMBS

85.4.1 class WindowsDirectoryWatcherMBS

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for watching folders on Windows for changes.
Example:

```
// watch a folder on Windows for new, changed and deleted files
// Watcher is a property of the window: Watcher As WindowsDirectoryWatcherMBS
Watcher = New WindowsDirectoryWatcherMBS
Var flags As Integer = WindowsDirectoryWatcherMBS.kNotifyChangeFilename + WindowsDirectoryWatcherMBS.kNotifyChangeLastWrite
If Not Watcher.AddDirectory(SpecialFolder.Documents, True, flags) Then
MessageBox "Failed to watch folder."
End If

// in a timer, collect the changes
Var change As WindowsDirectoryChangeMBS = Watcher.NextChange
While change <>Nil
Select Case change.Action
Case WindowsDirectoryChangeMBS.kActionAdded
System.DebugLog "Added: " + change.Filename
Case WindowsDirectoryChangeMBS.kActionRemoved
System.DebugLog "Removed: " + change.Filename
Case WindowsDirectoryChangeMBS.kActionModified
System.DebugLog "Modified: " + change.Filename
End Select
change = Watcher.NextChange
Wend
```

Notes: Create an object, add a few directories you want to watch and wait for changes being reported by NextChange method.

85.4.2 Methods

85.4.3 AddDirectory(path as folderitem, Recursive as boolean, Flags as Integer) as Boolean

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Schedules a directory for watching.
Notes: path: Path to folder to watch.
Recursive: Whether to watch subdirectories.
Flags: What to watch for. Please combine kNotifyChange* constants with bitwiseOr.

Returns false on error and true on success.
You can add several directories to a watcher.
See also:

- 85.4.4 AddDirectory(path as string, Recursive as boolean, Flags as Integer) as Boolean 14290

85.4.4 AddDirectory(path as string, Recursive as boolean, Flags as Integer) as Boolean

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Schedules a directory for watching.
Notes: path: Path to folder to watch.
Recursive: Whether to watch subdirectories.
Flags: What to watch for. Please combine kNotifyChange* constants with bitwiseOr.

Returns false on error and true on success.
You can add several directories to a watcher.
See also:

- 85.4.3 AddDirectory(path as folderitem, Recursive as boolean, Flags as Integer) as Boolean 14290

85.4.5 Constructor

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

85.4.6 NextChange as WindowsDirectoryChangeMBS

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries changes.
Notes: Call this method in a loop in a timer until it returns nil.
This way you can get all the changes.

85.4.7 Constants

Flags

Constant	Value	Description
kNotifyChangeAttributes	4	Any attribute change in the watched directory or subtree causes a change notification wait operation to return.
kNotifyChangeCreation	64	Any change to the creation time of files in the watched directory or subtree causes a change notification wait operation to return.
kNotifyChangeDirName	2	Any directory-name change in the watched directory or subtree causes a change notification wait operation to return. Changes include creating or deleting a directory.
kNotifyChangeFilename	1	Any file name change in the watched directory or subtree causes a change notification wait operation to return. Changes include renaming, creating, or deleting a file.
kNotifyChangeLastAccess	32	Any change to the last access time of files in the watched directory or subtree causes a change notification wait operation to return. Be careful: This flag is very performance consuming as you get a lot of events!
kNotifyChangeLastWrite	16	Any change to the last write-time of files in the watched directory or subtree causes a change notification wait operation to return. The operating system detects a change to the last write-time only when the file is written to the disk. For operating systems that use extensive caching, detection occurs only when the cache is sufficiently flushed.
kNotifyChangeSecurity	256	Any security-descriptor change in the watched directory or subtree causes a change notification wait operation to return.
kNotifyChangeSize	8	Any file-size change in the watched directory or subtree causes a change notification wait operation to return. The operating system detects a change in file size only when the file is written to the disk. For operating systems that use extensive caching, detection occurs only when the cache is sufficiently flushed.

85.5 class WindowsFolderChangeMBS

85.5.1 class WindowsFolderChangeMBS

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class to get notifications for folder changes on Windows.
Example:

```
// get notified when files in a folder change on Windows
// MyFolderChange is a subclass of WindowsFolderChangeMBS with the Changed event implemented.
// Watcher is a property of the window: Watcher As MyFolderChange
Var flags As Integer = WindowsFolderChangeMBS.ChangeFile + WindowsFolderChangeMBS.ChangeDir +
WindowsFolderChangeMBS.ChangeWrite
Watcher = New MyFolderChange(SpecialFolder.Documents, True, flags) // True = include subfolders

// in MyFolderChange:
Sub Changed() Handles Changed
System.DebugLog "Something changed in the documents folder (" + Me.ChangeCount.ToString + " changes)"
End Sub
```

Notes: On Mac OS X 10.5 you can use the FSEventsMBS class and on older Mac OS X the class FolderChangedNotificationMBS.

See also newer WindowsDirectoryWatcherMBS class.

85.5.2 Methods

85.5.3 Constructor(path as folderitem, subtree as boolean, FilterFlags as Integer)

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor to start the notification service.
Notes: path: The full path of the directory to be watched.
subtree: If this parameter is true, the function monitors the directory tree rooted at the specified directory; if it is false, it monitors only the specified directory.
FilterFlags: The filter conditions that satisfy a change notification wait. This parameter can be one or more of the constants in this class.

Requires Windows 2000.

85.5.4 Properties

85.5.5 ChangeCount as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of calls to the Changed event.
Notes: (Read and Write property)

85.5.6 Handle as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal handle of the notification.
Notes: (Read and Write property)

85.5.7 Events

85.5.8 Changed

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Something has changed in the given folder.

85.5.9 Constants

Constants

Constant	Value	Description
ChangeAttribute	4	One of the flags for the constructor. Any attribute change in the watched directory or subtree causes a change notification wait operation to return.
ChangeDir	2	One of the flags for the constructor. Any directory-name change in the watched directory or subtree causes a change notification wait operation to return. Changes include creating or deleting a directory.
ChangeFile	1	One of the flags for the constructor. Any file name change in the watched directory or subtree causes a change notification wait operation to return. Changes include renaming, creating, or deleting a file name.
ChangeSecurity	256	One of the flags for the constructor. Any security-descriptor change in the watched directory or subtree causes a change notification wait operation to return.
ChangeSize	8	One of the flags for the constructor. Any file-size change in the watched directory or subtree causes a change notification wait operation to return. The operating system detects a change in file size only when the file is written to the disk. For operating systems that use extensive caching, detection occurs only when the cache is sufficiently flushed.
ChangeWrite	16	One of the flags for the constructor. Any change to the last write-time of files in the watched directory or subtree causes a change notification wait operation to return. The operating system detects a change to the last write-time only when the file is written to the disk. For operating systems that use extensive caching, detection occurs only when the cache is sufficiently flushed.

Chapter 86

Fonts

86.1 class WindowsFontDialogMBS

86.1.1 class WindowsFontDialogMBS

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The class for the standard font dialog for Windows.
Example:

```
// show the Windows font dialog and read the chosen font
Var dialog As New WindowsFontDialogMBS
dialog.Parent = Self
dialog.FontName = "Arial"
dialog.Size = 12

If dialog.ChooseFont Then
MessageBox dialog.FontName + " " + dialog.Size.ToString + " pt" + If(dialog.Bold, " bold", "") + If(dialog.Italic, " italic", "")
End If
```

Notes: Creates a Font dialog box that enables the user to choose attributes for a logical font. These attributes include a font family and associated font style, a point size, effects (underline, strikeout, and text color), and a script (or character set).

86.1.2 Methods

86.1.3 ChooseFont as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Creates a Font dialog box that enables the user to choose attributes for a logical font.
Notes: Returns true if user pressed OK button.
Lasterror is set.
Returns false als sets lasterror to zero for cancel.

86.1.4 CloseDialog

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Close the dialog.
Notes: Can be called from various events to close the dialog programmatically.

86.1.5 Query

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Queries current dialog values into properties.

86.1.6 Update

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Updates dialog with current properties.

86.1.7 Properties

86.1.8 Bold as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The bold value.
Notes: (Read and Write property)

86.1.9 CurrentFont as WindowsFontFamilyMBS

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Returns current font.
Notes: You may need to call Query to get current state from dialog.
This returns a copy, so changes to the font object are not going back.
(Read only property)

86.1.10 DialogHandle as Integer

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Internal window handle for dialog.
Notes: (Read and Write property)

86.1.11 Effects as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether to show text effect controls.
Notes: Causes the dialog box to display the controls that allow the user to specify strikeout, underline, and text color options. If this flag is set, you can use the textColor member to specify the initial text color. You can use the StrikeThrough and Underline members to specify the initial settings of the strikeout and underline check boxes. ChooseFont can use these members to return the user's selections.
(Read and Write property)

86.1.12 FontName as String

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The font name of current font.
Notes: (Read and Write property)

86.1.13 FontType as Integer

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The type of the selected font when ChooseFont returns.
Notes: This member can be one or more of the following values:
FontTypeBold, FontTypeItalic, FontTypePrinter, FontTypeRegular, FontTypeScreen and FontTypeSimulator.
(Read and Write property)

86.1.14 ForceFontExist as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether to only allow existing fonts.
Notes: ChooseFont should indicate an error condition if the user attempts to select a font or style that is not listed in the dialog box.
(Read and Write property)

86.1.15 Height as Integer

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The height, in logical units, of the font's character cell or character.
Notes: The character height value (also known as the em height) is the character cell height value minus the internal-leading value. The font mapper interprets the value specified in lfHeight in the following manner.

Value	Meaning
>0	The font mapper transforms this value into device units and matches it against the cell height of the available fonts.
0	The font mapper uses a default height value when it searches for a match.
<0	The font mapper transforms this value into device units and matches its absolute value against the character height of the available fonts.

For all height comparisons, the font mapper looks for the largest font that does not exceed the requested size.
This mapping occurs when the font is used for the first time.
(Read and Write property)

86.1.16 Italic as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether font is italic.
Notes: (Read and Write property)

86.1.17 LastError as Integer

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The last error code.
Notes: (Read and Write property)

86.1.18 LimitSize as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether to limit font sizes.
Notes: ChooseFont should select only font sizes within the range specified by the MinSize and MaxSize members.
(Read and Write property)

86.1.19 MaxSize as Integer

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The maximum allowed font size.
Notes: Setting this also sets LimitSize to true.
(Read and Write property)

86.1.20 MinSize as Integer

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The minimum allowed font size.
Notes: Setting this also sets LimitSize to true.
(Read and Write property)

86.1.21 NoFontSimulations as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether ChooseFont should not display or allow selection of font simulations.
Notes: (Read and Write property)

86.1.22 NoInitialFaceSelection as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether to show initial font selection.
Notes: When initializing the dialog box controls, use this flag to prevent the dialog box from displaying an initial selection for the font name combo box. This is useful when there is no single font name that applies to the text selection.
(Read and Write property)

86.1.23 NoInitialSizeSelection as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether to show initialize size.
Notes: When initializing the dialog box controls, use this flag to prevent the dialog box from displaying an initial selection for the Font Size combo box. This is useful when there is no single font size that applies to the text selection.
(Read and Write property)

86.1.24 NoInitialStyleSelection as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether to show initial style options.
Notes: When initializing the dialog box controls, use this flag to prevent the dialog box from displaying an initial selection for the Font Style combo box. This is useful when there is no single font style that applies to the text selection.
(Read and Write property)

86.1.25 NoVectorFonts as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether ChooseFont should not allow vector font selections.
Notes: (Read and Write property)

86.1.26 NoVerticalFonts as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether the Font dialog box lists only horizontally oriented fonts.
Notes: (Read and Write property)

86.1.27 OnlyFixedPitchFonts as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether ChooseFont should enumerate and allow selection of only fixed-pitch fonts.
Notes: (Read and Write property)

86.1.28 OnlyTrueTypeFonts as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether ChooseFont should only enumerate and allow the selection of TrueType fonts.
Notes: (Read and Write property)

86.1.29 Parent as Variant

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The parent window.
Notes: The window that owns the dialog box. This member can be any valid window, or it can be nil if the dialog box has no owner.
Can reference a Window or DesktopWindow object.
(Read and Write property)

86.1.30 ScalableFontsOnly as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether to only allow scalable fonts.
Notes: Specifies that ChooseFont should allow only the selection of scalable fonts. Scalable fonts include vector fonts, scalable printer fonts, TrueType fonts, and fonts scaled by other technologies.
(Read and Write property)

86.1.31 ShowApply as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether to show Apply button.
Notes: Causes the dialog box to display the Apply button.
Clicking Apply button does trigger Apply event.
(Read and Write property)

86.1.32 ShowInactiveFonts as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether to display hidden fonts.
Notes: ChooseFont can additionally display fonts that are set to Hide in Fonts Control Panel.
(Read and Write property)

86.1.33 Size as Double

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The size of the font.
Notes: (Read and Write property)

86.1.34 Strikethrough as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether font is stroke through.
Notes: (Read and Write property)

86.1.35 TextColor as Color

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The text color for the font.
Notes: Only used if Effects is true.
(Read and Write property)

86.1.36 Underline as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: Whether font is underlined.
Notes: (Read and Write property)

86.1.37 Weight as Integer

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The weight of the font in the range 0 through 1000.
Notes: For example, 400 is normal and 700 is bold. If this value is zero, a default weight is used.

The following values are defined for convenience.

Value	Weight
FW_DONTCARE	0
FW_THIN	100
FW_EXTRALIGHT	200
FW_ULTRALIGHT	200
FW_LIGHT	300
FW_NORMAL	400
FW_REGULAR	400
FW_MEDIUM	500
FW_SEMIBOLD	600
FW_DEMIBOLD	600
FW_BOLD	700
FW_EXTRABOLD	800
FW_ULTRABOLD	800
FW_HEAVY	900
FW_BLACK	900

(Read and Write property)

86.1.38 Events

86.1.39 Apply

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The user pressed apply.
Notes: Our plugin automatically calls query for you to get current values from dialog into properties.

86.1.40 BoundsChanged

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The bounds changed.

86.1.41 BoundsChanging

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The bounds are changing.

86.1.42 GotFocus

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The window got focus.

86.1.43 Hide

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The window is hidden.

86.1.44 Init

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The dialog initialized.
Notes: You can work with dialog via DialogHandle property.

86.1.45 LostFocus

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The window lost focus.

86.1.46 Show

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop only.

Function: The window is shown.

86.1.47 Constants

Font Types

Constant	Value	Description
FontTypeBold	&h100	The font weight is bold.
FontTypeItalic	&h200	The italic font attribute is set.
FontTypePrinter	&h4000	The font is a printer font.
FontTypeRegular	&h400	The font weight is normal.
FontTypeScreen	&h2000	The font is a screen font.
FontTypeSimulator	&h8000	The font is simulated by the graphics device interface (GDI).

86.2 class WindowsFontFamilyMBS

86.2.1 class WindowsFontFamilyMBS

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for details on Windows fonts.
Example:

```
Var lines(-1) as string

for each f as WindowsFontFamilyMBS in WindowsFontFamilyMBS.AllFonts
lines.Add f.LogFontFullName
next

MessageBox Join(lines,EndOfLine)
```

Notes: The font list is the same as font() function in Xojo as far as we see.
Blog Entries

- MBS REALbasic Plugins 11.0 released
- MBS REALbasic Plugins, version 10.6pr12

86.2.2 Methods

86.2.3 AllFonts as WindowsFontFamilyMBS()

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all fonts on this windows machine.
Example:

```
Var lines(-1) as string

for each f as WindowsFontFamilyMBS in WindowsFontFamilyMBS.AllFonts
lines.Add f.LogFontFullName
next

MessageBox Join(lines,EndOfLine)
```

Notes: Font list is queried from OS and not cached, so this should update if new fonts are activated.

Uses EnumFontFamiliesW function, see
https://docs.microsoft.com/en-us/windows/win32/api/wingdi/nf-wingdi-enumfontfamiliesw
See also:

- 86.2.4 AllFonts(fonts() as WindowsFontFamilyMBS) as Integer 14307

86.2.4 AllFonts(fonts() as WindowsFontFamilyMBS) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all fonts on this windows machine.
Notes: Returns the number of fonts found and sets the font objects in the array.
if the array is too short, you get the first ubound(fonts)+1 fonts set there.

Font list is queried from OS and not cached, so this should update if new fonts are activated.
See also:

- 86.2.3 AllFonts as WindowsFontFamilyMBS() 14306

86.2.5 AllFontsEx as WindowsFontFamilyMBS()

MBS Win Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all fonts on this windows machine.
Example:

```
Var lines(-1) as string

for each f as WindowsFontFamilyMBS in WindowsFontFamilyMBS.AllFontsEx
lines.Add f.LogFontFullName
next

MessageBox Join(lines,EndOfLine)
```

Notes: Font list is queried from OS and not cached, so this should update if new fonts are activated.

Uses EnumFontFamiliesExW function, see
https://docs.microsoft.com/en-us/windows/win32/api/wingdi/nf-wingdi-enumfontfamiliesexw

86.2.6 AxisMaxValue(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The maximum value for this axis.
Notes: Index is from zero to NumberOfAxes-1.
Only available for truetype fonts.

86.2.7 AxisMinValue(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The minimum value for this axis.
Notes: Index is from zero to NumberOfAxes-1.
Only available for truetype fonts.

86.2.8 AxisName(index as Integer) as string

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the axis.
Notes: Index is from zero to NumberOfAxes-1.
Only available for truetype fonts.

86.2.9 DesignVectorValues(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: An array specifying the values of the axes of a multiple master OpenType font.
Notes: This array corresponds to the axes* arrays.

86.2.10 FontsOfFamily(family as string) as WindowsFontFamilyMBS()

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all fonts of the given font family on this windows machine.
See also:

- 86.2.11 FontsOfFamily(family as string, fonts() as WindowsFontFamilyMBS) as Integer 14309

86.2.11 FontsOfFamily(family as string, fonts() as WindowsFontFamilyMBS) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all fonts of the given font family on this windows machine.
Notes: Returns the number of fonts found and sets the font objects in the array.
if the array is too short, you get the first ubound(fonts)+1 fonts set there.
See also:

- 86.2.10 FontsOfFamily(family as string) as WindowsFontFamilyMBS() 14308

86.2.12 Properties

86.2.13 CodepageBitfield as MemoryBlock

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: A 64-bit, code-page bitfield (CPB) that identifies a specific character set or code page. #
Notes: Code pages are in the lower 32 bits of this bitfield. The high 32 are used for non-Windows code pages. For more information, see Code Page Bitfields.
http://msdn.microsoft.com/en-us/library/dd317754(v=vs.85).aspx

Only available for truetype fonts.
(Read only property)

86.2.14 FontType as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The type of the font.
Notes: This parameter can be a combination of these values:

DEVICE_FONTTYPE
RASTER_FONTTYPE
TRUETYPE_FONTTYPE
(Read only property)

86.2.15 LogFontBold as Boolean

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether font is bold.
Notes: Setting to false, will set Weight to 400, setting to true will set Weight to 700.
Returns true if Weight is equal or more than 700.
(Read only property)

86.2.16 LogFontCharSet as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The character set. The following values are predefined.
Notes: The following values are predefined.

ANSI_CHARSET
BALTIC_CHARSET
CHINESEBIG5_CHARSET
DEFAULT_CHARSET
EASTEUROPE_CHARSET
GB2312_CHARSET
GREEK_CHARSET
HANGUL_CHARSET
MAC_CHARSET
OEM_CHARSET
RUSSIAN_CHARSET
SHIFTJIS_CHARSET
SYMBOL_CHARSET
TURKISH_CHARSET
VIETNAMESE_CHARSET

Korean language edition of Windows:

JOHAB_CHARSET

Middle East language edition of Windows:

ARABIC_CHARSET
HEBREW_CHARSET

Thai language edition of Windows:

THAI_CHARSET

The OEM_CHARSET value specifies a character set that is operating-system dependent.

DEFAULT_CHARSET is set to a value based on the current system locale. For example, when the system locale is English (United States), it is set as ANSI_CHARSET.

Fonts with other character sets may exist in the operating system. If an application uses a font with an unknown character set, it should not attempt to translate or interpret strings that are rendered with that font.

This parameter is important in the font mapping process. To ensure consistent results, specify a specific character set. If you specify a typeface name in the lfFaceName member, make sure that the lfCharSet value matches the character set of the typeface specified in lfFaceName.
(Read only property)

86.2.17 LogFontClipPrecision as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The clipping precision.
Notes: The clipping precision defines how to clip characters that are partially outside the clipping region. It can be one or more of the following values.

For more information about the orientation of coordinate systems, see the description of the nOrientation parameter.

Value	Meaning
CLIP_CHARACTER_PRECIS	Not used.
CLIP_DEFAULT_PRECIS	Specifies default clipping behavior.
CLIP_DFA_DISABLE	Windows XP SP1: Turns off font association for the font. Note that this flag is not guaranteed to have any effect on any platform after Windows Server 2003.
CLIP_EMBEDDED	You must specify this flag to use an embedded read-only font.
CLIP_LH_ANGLES	When this value is used, the rotation for all fonts depends on whether the orientation of the coordinate system is left-handed or right-handed. If not used, device fonts always rotate counterclockwise, but the rotation of other fonts is dependent on the orientation of the coordinate system.
CLIP_MASK	Not used.
CLIP_DFA_OVERRIDE	Turns off font association for the font. This is identical to CLIP_DFA_DISABLE, but it can have problems in some situations; the recommended flag to use is CLIP_DFA_DISABLE.
CLIP_STROKE_PRECIS	Not used by the font mapper, but is returned when raster, vector, or TrueType fonts are enumerated. For compatibility, this value is always returned when enumerating fonts.
CLIP_TT_ALWAYS	Not used.

(Read only property)

86.2.18 LogFontEscapement as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The angle, in tenths of degrees, between the escapement vector and the x-axis of the device.
Notes: The escapement vector is parallel to the base line of a row of text.

When the graphics mode is set to GM_ADVANCED, you can specify the escapement angle of the string independently of the orientation angle of the string's characters.

When the graphics mode is set to GM_COMPATIBLE, LogFontEscapement specifies both the escapement and orientation. You should set LogFontEscapement and LogFontOrientation to the same value.
(Read only property)

86.2.19 LogFontFaceName as String

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the typeface name of the font.
Notes: (Read only property)

86.2.20 LogFontFullName as String

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The unique name of the font.
Notes: For example, ABC Font Company TrueType Bold Italic Sans Serif.
(Read only property)

86.2.21 LogFontHeight as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height, in logical units, of the font's character cell or character.
Notes: The character height value (also known as the em height) is the character cell height value minus the internal-leading value. The font mapper interprets the value specified in lfHeight in the following manner.

For all height comparisons, the font mapper looks for the largest font that does not exceed the requested size.

Value	Meaning
>0	The font mapper transforms this value into device units and matches it against the cell height of the available fonts.
0	The font mapper uses a default height value when it searches for a match.
<0	The font mapper transforms this value into device units and matches its absolute value against the character height of the available fonts.

This mapping occurs when the font is used for the first time.
(Read only property)

86.2.22 LogFontItalic as Boolean

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: An italic font if set to true.
Notes: (Read only property)

86.2.23 LogFontOrientation as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The angle, in tenths of degrees, between each character's base line and the x-axis of the device.
Notes: (Read only property)

86.2.24 LogFontOutPrecision as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The output precision.
Notes: The output precision defines how closely the output must match the requested font's height, width, character orientation, escapement, pitch, and font type. It can be one of the following values.

Applications can use the OUT_DEVICE_PRECIS, OUT_RASTER_PRECIS, OUT_TT_PRECIS, and OUT_PS_ONLY_PRECIS values to control how the font mapper chooses a font when the operating system contains more than one font with a specified name. For example, if an operating system contains a font named Symbol in raster and TrueType form, specifying OUT_TT_PRECIS forces the font mapper to choose the TrueType version. Specifying OUT_TT_ONLY_PRECIS forces the font mapper to choose a TrueType font, even if it must substitute a TrueType font of another name.
(Read only property)

Value	Meaning
OUT_CHARACTER_PRECIS	Not used.
OUT_DEFAULT_PRECIS	Specifies the default font mapper behavior.
OUT_DEVICE_PRECIS	Instructs the font mapper to choose a Device font when the system contains multiple fonts with the same name.
OUT_OUTLINE_PRECIS	This value instructs the font mapper to choose from TrueType and other outline-based fonts.
OUT_PS_ONLY_PRECIS	Instructs the font mapper to choose from only PostScript fonts. If there are no PostScript fonts installed in the system, the font mapper returns to default behavior.
OUT_RASTER_PRECIS	Instructs the font mapper to choose a raster font when the system contains multiple fonts with the same name.
OUT_STRING_PRECIS	This value is not used by the font mapper, but it is returned when raster fonts are enumerated.
OUT_STROKE_PRECIS	This value is not used by the font mapper, but it is returned when TrueType, other outline-based fonts, and vector fonts are enumerated.
OUT_TT_ONLY_PRECIS	Instructs the font mapper to choose from only TrueType fonts. If there are no TrueType fonts installed in the system, the font mapper returns to default behavior.
OUT_TT_PRECIS	Instructs the font mapper to choose a TrueType font when the system contains multiple fonts with the same name.

86.2.25 LogFontPitchAndFamily as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The pitch and family of the font.
Notes: The two low-order bits specify the pitch of the font and can be one of the following values.

DEFAULT_PITCH
FIXED_PITCH
VARIABLE_PITCH

Bits 4 through 7 of the member specify the font family and can be one of the following values.

FF_DECORATIVE
FF_DONTCARE
FF_MODERN
FF_ROMAN
FF_SCRIPT
FF_SWISS

The proper value can be obtained by using the Boolean OR operator to join one pitch constant with one

family constant.

Font families describe the look of a font in a general way. They are intended for specifying fonts when the exact typeface desired is not available. The values for font families are as follows.

Value	Meaning
FF_DECORATIVE	Novelty fonts. Old English is an example.
FF_DONTCARE	Use default font.
FF_MODERN	Fonts with constant stroke width (monospace), with or without serifs. Monospace fonts are usually modern. Pica, Elite, and CourierNew are examples.
FF_ROMAN	Fonts with variable stroke width (proportional) and with serifs. MS Serif is an example.
FF_SCRIPT	Fonts designed to look like handwriting. Script and Cursive are examples.
FF_SWISS	Fonts with variable stroke width (proportional) and without serifs. MS Sans Serif is an example.

(Read only property)

86.2.26 LogFontQuality as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The output quality.
Notes: The output quality defines how carefully the graphics device interface (GDI) must attempt to match the logical-font attributes to those of an actual physical font. It can be one of the following values.

(Read only property)

86.2.27 LogFontScript as String

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The script, that is, the character set, of the font. For example, Cyrillic.
Notes: (Read only property)

86.2.28 LogFontStrikeOut as Boolean

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Value	Meaning
ANTIALIASED_QUALITY	Font is always antialiased if the font supports it and the size of the font is not too small or too large.
CLEARTYPE_QUALITY	If set, text is rendered (when possible) using ClearType antialiasing method. See Remarks for more information.
DEFAULT_QUALITY	Appearance of the font does not matter.
DRAFT_QUALITY	Appearance of the font is less important than when PROOF_QUALITY is used. For GDI raster fonts, scaling is enabled, which means that more font sizes are available, but the quality may be lower. Bold, italic, underline, and strikeout fonts are synthesized if necessary.
NONANTIALIASED_QUALITY	Font is never antialiased.
PROOF_QUALITY	Character quality of the font is more important than exact matching of the logical-font attributes. For GDI raster fonts, scaling is disabled and the font closest in size is chosen. Although the chosen font size may not be mapped exactly when PROOF_QUALITY is used, the quality of the font is high and there is no distortion of appearance. Bold, italic, underline, and strikeout fonts are synthesized if necessary.

Function: A strikeout font if set to true.
Notes: (Read only property)

86.2.29 LogFontStyle as String

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The style of the font. For example, Bold Italic.
Notes: (Read only property)

86.2.30 LogFontUnderline as Boolean

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: An underlined font if set to true.
Notes: (Read only property)

86.2.31 LogFontWeight as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The weight of the font in the range 0 through 1000.
Notes: For example, 400 is normal and 700 is bold. If this value is zero, a default weight is used.

The following values are defined for convenience.

Value	Weight
FW_DONTCARE	0
FW_THIN	100
FW_EXTRALIGHT	200
FW_ULTRALIGHT	200
FW_LIGHT	300
FW_NORMAL	400
FW_REGULAR	400
FW_MEDIUM	500
FW_SEMIBOLD	600
FW_DEMIBOLD	600
FW_BOLD	700
FW_EXTRABOLD	800
FW_ULTRABOLD	800
FW_HEAVY	900
FW_BLACK	900

(Read only property)

86.2.32 LogFontWidth as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The average width, in logical units, of characters in the font.
Notes: If LogFontWidth is zero, the aspect ratio of the device is matched against the digitization aspect ratio of the available fonts to find the closest match, determined by the absolute value of the difference.
(Read only property)

86.2.33 NumberOfAxes as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of axes for a specified multiple master font.
Notes: The axes arrays contains information on all the axes of a multiple master font.
Only available for truetype fonts.
(Read only property)

86.2.34 NumberOfDesignVectors as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The design vectors are used by an application to specify values for the axes of a multiple master font.
Notes: (Read only property)

86.2.35 TextMetricAscent as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ascent (units above the base line) of characters.
Notes: (Read only property)

86.2.36 TextMetricAverageCharWidth as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The average width of characters in the font (generally defined as the width of the letter x).
Notes: This value does not include overhang required for bold or italic characters.
(Read only property)

86.2.37 TextMetricAverageWidth as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The average width of characters in the font, in notional units.
Notes: This value should be compared with the value of the TextMetricSizeEM member.
Only available for truetype fonts.
(Read only property)

86.2.38 TextMetricBreakChar as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The value of the character to be used to define word breaks for text justification.
Notes: (Read only property)

86.2.39 TextMetricCellHeight as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height, in notional units, of the font.
Notes: This value should be compared with the value of the TextMetricSizeEM member.
Only available for truetype fonts.
(Read only property)

86.2.40 TextMetricCharSet as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The character set of the font.
Notes: (Read only property)

86.2.41 TextMetricDefaultChar as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The value of the character to be substituted for characters that are not in the font.
Notes: (Read only property)

86.2.42 TextMetricDescent as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The descent (units below the base line) of characters.
Notes: (Read only property)

86.2.43 TextMetricDigitizedAspectX as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The horizontal aspect of the device for which the font was designed.
Notes: (Read only property)

86.2.44 TextMetricDigitizedAspectY as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The vertical aspect of the device for which the font was designed.
Notes: The ratio of the tmDigitizedAspectX and tmDigitizedAspectY members is the aspect ratio of the device for which the font was designed.
(Read only property)

86.2.45 TextMetricExternalLeading as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The amount of extra leading (space) that the application adds between rows.
Notes: Since this area is outside the font, it contains no marks and is not altered by text output calls in either OPAQUE or TRANSPARENT mode. The designer may set this member to zero.
(Read only property)

86.2.46 TextMetricFirstChar as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The value of the first character defined in the font.
Notes: (Read only property)

86.2.47 TextMetricFlags as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies whether the font is italic, underscored, outlined, bold, and so forth.
Notes: May be any reasonable combination of the following values.

Bit	Name	Meaning
0	NTM_ITALIC	italic
5	NTM_BOLD	bold
8	NTM_REGULAR	regular
16	NTM_NONNEGATIVE_AC	no glyph in a font at any size has a negative A or C space.
17	NTM_PS_OPENTYPE	PostScript OpenType font
18	NTM_TT_OPENTYPE	TrueType OpenType font
19	NTM_MULTIPLEMASTER	multiple master font
20	NTM_TYPE1	Type 1 font
21	NTM_DSIG	font with a digital signature. This allows traceability and ensures that the font has been tested and is not corrupted

Only available for truetype fonts.
(Read only property)

86.2.48 TextMetricHeight as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height (ascent + descent) of characters.
Notes: (Read only property)

86.2.49 TextMetricInternalLeading as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The amount of leading (space) inside the bounds set by the tmHeight member.
Notes: Accent marks and other diacritical characters may occur in this area. The designer may set this member to zero.
(Read only property)

86.2.50 TextMetricItalic as Boolean

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: An italic font if set to true.
Notes: (Read only property)

86.2.51 TextMetricLastChar as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The value of the last character defined in the font.
Notes: (Read only property)

86.2.52 TextMetricMaxCharWidth as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the widest character in the font.
Notes: (Read only property)

86.2.53 TextMetricOverhang as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The extra width per string that may be added to some synthesized fonts.
Notes: When synthesizing some attributes, such as bold or italic, graphics device interface (GDI) or a device may have to add width to a string on both a per-character and per-string basis. For example, GDI makes a string bold by expanding the spacing of each character and overstriking by an offset value; it italicizes a font by shearing the string. In either case, there is an overhang past the basic string. For bold strings, the overhang is the distance by which the overstrike is offset. For italic strings, the overhang is the amount the top of the font is sheared past the bottom of the font.

The TextMetricOverhang member enables the application to determine how much of the character width returned by a GetTextExtentPoint32 function call on a single character is the actual character width and how much is the per-string extra width. The actual width is the extent minus the overhang.
(Read only property)

86.2.54 TextMetricPitchAndFamily as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The pitch and family of the selected font.
Notes: The low-order bit (bit 0) specifies the pitch of the font. If it is 1, the font is variable pitch (or proportional). If it is 0, the font is fixed pitch (or monospace). Bits 1 and 2 specify the font type. If both bits are 0, the font is a raster font; if bit 1 is 1 and bit 2 is 0, the font is a vector font; if bit 1 is 0 and bit 2 is set, or if both bits are 1, the font is some other type. Bit 3 is 1 if the font is a device font; otherwise, it is 0.

The four high-order bits designate the font family. The TextMetricPitchAndFamily member can be combined with the hexadecimal value 0xF0 by using the bitwise AND operator and can then be compared with the font family names for an identical match. For more information about the font families, see LogFontPitchAndFamily.
(Read only property)

86.2.55 TextMetricSizeEM as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size of the em square for the font.
Notes: This value is in notional units (that is, the units for which the font was designed).
Only available for truetype fonts.
(Read only property)

86.2.56 TextMetricStruckOut as Boolean

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: An strikeout font if set to true.
Notes: (Read only property)

86.2.57 TextMetricUnderlined as Boolean

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: An underline font if set to true.
Notes: (Read only property)

86.2.58 TextMetricWeight as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The weight of the font.
Notes: (Read only property)

86.2.59 UnicodeSubsetBitfield as MemoryBlock

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: A 128-bit Unicode subset bitfield (USB) identifying up to 126 Unicode subranges.
Notes: Each bit, except the two most significant bits, represents a single subrange. The most significant bit is always 1 and identifies the bitfield as a font signature; the second most significant bit is reserved and must be 0. Unicode subranges are numbered in accordance with the ISO 10646 standard. For more information, see Unicode Subset Bitfields.
http://msdn.microsoft.com/en-us/library/dd374090(v=vs.85).aspx

Only available for truetype fonts.
(Read only property)

86.2.60 Constants

Constants

Constant	Value	Description
ANSI_CHARSET	0	One of the constants for the LogFontCharSet property.
ANTIALIASED_QUALITY	4	One of the constants for the LogFontQuality property. Enables antialiasing for the font. The display driver must suppo text for this setting to work.
ARABIC_CHARSET	178	One of the constants for the LogFontCharSet property.
BALTIC_CHARSET	186	One of the constants for the LogFontCharSet property.
CHINESEBIG5_CHARSET	136	One of the constants for the LogFontCharSet property.
CLIP_CHARACTER_PRECIS	1	One of the constants for the LogFontClipPrecision property. Not used.
CLIP_DEFAULT_PRECIS	0	One of the constants for the LogFontClipPrecision property. Specifies default clipping behavior.
CLIP_EMBEDDED	128	One of the clip constants.
CLIP_LH_ANGLES	16	One of the clip constants.
CLIP_MASK	&h15	One of the clip constants.
CLIP_STROKE_PRECIS	2	One of the constants for the LogFontClipPrecision property. Not used by the font mapper, but is returned when raster, vector, fonts are enumerated.
CLIP_TT_ALWAYS	32	One of the clip constants.
DEFAULT_CHARSET	1	One of the constants for the LogFontCharSet property.
DEFAULT_PITCH	0	One of the pitch constants.
DEFAULT_QUALITY	0	One of the constants for the LogFontQuality property. Appearance of the font does not matter.
DEVICE_FONTTYPE	&h002	One of the constants for the FontType property.
DRAFT_QUALITY	1	One of the constants for the LogFontQuality property. For GDI raster fonts, scaling is enabled, which means that more available, but the quality may be lower. Bold, italic, underline, a fonts are synthesized if necessary.
EASTEUROPE_CHARSET	238	One of the constants for the LogFontCharSet property.
FF_DECORATIVE	80	One of the constants for the LogFontPitchAndFamily property. Novelty fonts, for example, Old English.
FF_DONTCARE	0	One of the constants for the LogFontPitchAndFamily property. Do not care or do not know.
FF_MODERN	48	One of the constants for the LogFontPitchAndFamily property. Fonts with constant stroke width (monospace), with or wi Monospace fonts are usually modern, for example, Pica, Elite, New.
FF_ROMAN	16	One of the constants for the LogFontPitchAndFamily property. Fonts with variable stroke width (proportional) and with serifs, Serif.
FF_SCRIPT	64	One of the constants for the LogFontPitchAndFamily property. Fonts designed to look like handwriting, for example, Script and
FF_SWISS	32	One of the constants for the LogFontPitchAndFamily property. Fonts with variable stroke width (proportional) and without serifs, Sans Serif.
FIXED_PITCH	1	One of the pitch constants.
FW_BLACK	900	One of the constants for the LogFontWeight property.
FW_BOLD	700	One of the constants for the LogFontWeight property.
FW_DEMIBOLD	600	One of the constants for the LogFontWeight property.
FW_DONTCARE	0	One of the constants for the LogFontWeight property.
FW_EXTRABOLD	800	One of the constants for the LogFontWeight property.
FW_EXTRALIGHT	200	One of the constants for the LogFontWeight property.
FW_HEAVY	900	One of the constants for the LogFontWeight property.
FW_LIGHT	300	One of the constants for the LogFontWeight property.
FW_MEDIUM	500	One of the constants for the LogFontWeight property.
FW_NORMAL	400	One of the constants for the LogFontWeight property.
FW_REGULAR	400	One of the constants for the LogFontWeight property.
FW_SEMIBOLD	600	One of the constants for the LogFontWeight property.
FW_THIN	100	One of the constants for the LogFontWeight property.

Chapter 87

Foundation Models

87.1 module FoundationModelsMBS

87.1.1 module FoundationModelsMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The module for global functions for Foundation Models.
Example:

```
// check whether Apple's on-device language model can be used
If FoundationModelsMBS.Available Then
MessageBox "Foundation Models are available, see SystemLanguageModelMBS."
Else
MessageBox "Needs macOS 26 with Apple Intelligence enabled."
End If
```

Notes: Requires macOS 26 or iOS 26.

See SystemLanguageModelsMBS and LanguageModelSessionsMBS classes.
Blog Entries

- MBS Xojo Plugins, version 25.6pr5

- Use Foundation Models in Xojo

87.1.2 Properties

87.1.3 Available as Boolean

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Whether this is available.
Example:

```
if not FoundationModelsMBS.Available then
MessageBox "Please run on macOS 26."
quit
end if
```

Notes: Returns true on macOS 26 or iOS 26.

Does not check whether Apple Intelligence is enabled. For this you need to check with SystemLanguageModelsMBS class.
(Read only property)

87.2 class InstructionsMBS

87.2.1 class InstructionsMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Instructions define the model's intended behavior on prompts.
Example:

```
// give the model fixed instructions for the whole session
Var instructions As New InstructionsMBS("You translate English text to German. Only reply with the translation.")
Var session As New LanguageModelSessionsMBS(Nil, instructions)

// synchronous call, blocks until the answer is there
Var answer As String = session.respond("Good morning, how are you?")
MessageBox answer
```

Notes: Instructions are typically provided by you to define the role and behavior of the model. In the code below, the instructions specify that the model replies with topics rather than, for example, a recipe:

instructions: "Suggest related topics. Keep them concise (three to seven words) and make sure they build naturally from the person's topic."
prompt: "Making homemade bread"

Apple trains the model to obey instructions over any commands it receives in prompts, so don't include untrusted content in instructions.

87.2.2 Methods

87.2.3 Constructor(Value as String)

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates instructions with the a string.
Example:

```
Var instructions As New InstructionsMBS("You are a chatbot in Xojo.")

MessageBox instructions.Value
```

87.2.4 InstructionsBuildArray(Instructions() as InstructionsMBS) as InstructionsMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates instructions with the an array of prompts.

87.2.5 InstructionsBuildEitherFirst(Instructions as InstructionsMBS) as InstructionsMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates instructions with the first component.

87.2.6 InstructionsBuildEitherSecond(Instructions as InstructionsMBS) as InstructionsMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates instructions with the second component.

87.2.7 InstructionsExpression(Instructions as InstructionsMBS) as InstructionsMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates instructions with an expression.

87.2.8 InstructionsFromJSON(JSON as MemoryBlock) as InstructionsMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates instructions from JSON.
Notes: We convert the JSON to instructions:

- string, number or boolean creates an instruction
- array creates an array of instructions
- dictionary may create instructions for optional, expression, either First or either Second.

87.2.9 InstructionsOptional(Instructions as InstructionsMBS) as InstructionsMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates instructions with the optional component.

87.2.10 InstructionsString(Value as String) as InstructionsMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates instructions with the a string.
Example:

```
Var instructions As InstructionsMBS
instructions = InstructionsMBS.InstructionsString("You are a chatbot in Xojo.")

MessageBox instructions.Value
```

87.2.11 Properties

87.2.12 Handle as Integer

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

87.2.13 Value as Variant

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The value used to make the instructions.
Notes: (Read only property)

87.3 class LanguageModelSessionsMBS

87.3.1 class LanguageModelSessionsMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: An object that represents a session that interacts with a language model.
Example:

```
// ask the on-device language model a question without blocking the app
// Session is a property of the window: Session As LanguageModelSessionsMBS
Session = New LanguageModelSessionsMBS(Nil, "You are a helpful assistant. Answer in one short paragraph.")
Session.temperature = 0.5
Session.respond("What is the capital of Germany?", AddressOf GotResponse)

// a method in the window:
Sub GotResponse(Response As ResponseMBS, ErrorString As String, Tag As Variant)
If Response <>Nil Then
MessageBox Response.Content
Else
MessageBox "Error: " + ErrorString
End If
End Sub
```

Notes: A session is a single context that you use to generate content with, and maintains state between requests. You can reuse the existing instance or create a new one each time you call the model. When you create a session you can provide instructions that tells the model what its role is and provides guidance on how to respond.

The framework records each call to the model in a Transcript that includes all prompts and responses. If your session exceeds the available context size, you receive an error.

Requires macOS 26, iOS 26 or newer.

87.3.2 Methods

87.3.3 Constructor(Model as SystemLanguageModelsMBS = nil, Instructions as InstructionsMBS)

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Start a new session in blank slate state with instructions.
Notes: model: The language model to use for this session.
instructions: Instructions that control the model's behavior.
See also:

- 87.3.4 Constructor(Model as SystemLanguageModelsMBS = nil, Instructions as String) 14331
- 87.3.5 Constructor(Model as SystemLanguageModelsMBS = nil, Transcript as TranscriptMBS) 14331

87.3.4 Constructor(Model as SystemLanguageModelsMBS = nil, Instructions as String)

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Start a new session in blank slate state with string-based instructions.
Example:

```
Var session As New LanguageModelSessionsMBS("You are a chatbot in Xojo.")
Var instructions as string = session.Instructions
MessageBox Instructions
```

Notes: model: The language model to use for this session.
instructions: Instructions that control the model's behavior.
See also:

- 87.3.3 Constructor(Model as SystemLanguageModelsMBS = nil, Instructions as InstructionsMBS) 14331
- 87.3.5 Constructor(Model as SystemLanguageModelsMBS = nil, Transcript as TranscriptMBS) 14331

87.3.5 Constructor(Model as SystemLanguageModelsMBS = nil, Transcript as TranscriptMBS)

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Start a session by rehydrating from a transcript.
Notes: model: The language model to use for this session.
transcript: A transcript to resume from.
See also:

- 87.3.3 Constructor(Model as SystemLanguageModelsMBS = nil, Instructions as InstructionsMBS) 14331
- 87.3.4 Constructor(Model as SystemLanguageModelsMBS = nil, Instructions as String) 14331

87.3.6 prewarm(Prompt as PromptMBS = nil)

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Requests that the system eagerly load the resources required for this session into memory and optionally caches a prefix of your prompt.
Notes: This method can be useful in cases where you have a strong signal that the user will interact with session within a few seconds. For example, you might call prewarm when the user begins typing into a text field.

If you know a prefix for the future prompt, passing it to prewarm will allow the system to process the prompt eagerly and reduce latency for the future request.

Important: You should only use prewarm when you have a window of at least 1s before the call to respond.

Note: Calling this method does not guarantee that the system loads your assets immediately, particularly if your app is running in the background or the system is under load.

87.3.7 respond(prompt as PromptMBS) as ResponseMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Produces a response to a prompt.
Notes: prompt: A prompt for the model to respond to.

We wait for the answer and return it.

If temperature >= 0 or maximumResponseTokens >= 0, we pass these as options.
See also:

- 87.3.8 respond(prompt as PromptMBS, theDelegate as ResponseCompletedMBS, tag as Variant = nil) 14333
- 87.3.9 respond(prompt as String) as String 14333
- 87.3.10 respond(prompt as String, theDelegate as ResponseCompletedMBS, tag as Variant = nil) 14334

87.3.8 respond(prompt as PromptMBS, theDelegate as ResponseCompletedMBS, tag as Variant = nil)

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Produces a response to a prompt.
Notes: prompt: A prompt for the model to respond to.

We call the delegate later to report result and pass through tag value.

If temperature >= 0 or maximumResponseTokens >= 0, we pass these as options.
See also:

- 87.3.7 respond(prompt as PromptMBS) as ResponseMBS 14332
- 87.3.9 respond(prompt as String) as String 14333
- 87.3.10 respond(prompt as String, theDelegate as ResponseCompletedMBS, tag as Variant = nil) 14334

87.3.9 respond(prompt as String) as String

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Produces a response to a prompt.
Example:

```
Var session As New LanguageModelSessionsMBS("You are a chatbot in Xojo. Be brief.")
var response as string = session.respond("Can Xojo do web apps?")
MessageBox response

' Yes, Xojo can be used To create web apps. Xojo Web Apps Is a framework
' that allows developers To build web applications Using Xojo's native
' programming language. It provides a set Of tools And libraries To handle
' web development tasks, such As server-side scripting,
' HTML/CSS/JavaScript, And database integration.
```

Notes: prompt: A prompt for the model to respond to.

We wait for the answer and return it.

If temperature >= 0 or maximumResponseTokens >= 0, we pass these as options.
See also:

- 87.3.7 respond(prompt as PromptMBS) as ResponseMBS 14332

- 87.3.8 respond(prompt as PromptMBS, theDelegate as ResponseCompletedMBS, tag as Variant = nil) 14333
- 87.3.10 respond(prompt as String, theDelegate as ResponseCompletedMBS, tag as Variant = nil) 14334

87.3.10 respond(prompt as String, theDelegate as ResponseCompletedMBS, tag as Variant = nil)

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Produces a response to a prompt.
Notes: prompt: A prompt for the model to respond to.

We call the delegate later to report result and pass through tag value.

If temperature >= 0 or maximumResponseTokens >= 0, we pass these as options.
See also:

- 87.3.7 respond(prompt as PromptMBS) as ResponseMBS 14332
- 87.3.8 respond(prompt as PromptMBS, theDelegate as ResponseCompletedMBS, tag as Variant = nil) 14333
- 87.3.9 respond(prompt as String) as String 14333

87.3.11 tokenCount(prompt as PromptMBS) as Integer

MBS Swift Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Returns the token count for the specified instructions.
Notes: New for macOS/iOS 26.4 or newer.
See also:

- 87.3.12 tokenCount(prompt as PromptMBS, theDelegate as TokenCountCompletedMBS, tag as Variant = nil) 14334
- 87.3.13 tokenCount(prompt as String) as Integer 14335
- 87.3.14 tokenCount(prompt as String, theDelegate as TokenCountCompletedMBS, tag as Variant = nil) 14335

87.3.12 tokenCount(prompt as PromptMBS, theDelegate as TokenCountCompletedMBS, tag as Variant = nil)

MBS Swift Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Calculates the token count for the specified instructions.
Notes: New for macOS/iOS 26.4 or newer.
See also:

- 87.3.11 tokenCount(prompt as PromptMBS) as Integer 14334
- 87.3.13 tokenCount(prompt as String) as Integer 14335
- 87.3.14 tokenCount(prompt as String, theDelegate as TokenCountCompletedMBS, tag as Variant = nil) 14335

87.3.13 tokenCount(prompt as String) as Integer

MBS Swift Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Calculates the token count for the specified prompt.
Example:

```
Var session As New LanguageModelSessionsMBS("")
Var count As Integer = session.tokenCount("Hello World")

Break // shows 10
```

Notes: New for macOS/iOS 26.4 or newer.
See also:

- 87.3.11 tokenCount(prompt as PromptMBS) as Integer 14334
- 87.3.12 tokenCount(prompt as PromptMBS, theDelegate as TokenCountCompletedMBS, tag as Variant = nil) 14334
- 87.3.14 tokenCount(prompt as String, theDelegate as TokenCountCompletedMBS, tag as Variant = nil) 14335

87.3.14 tokenCount(prompt as String, theDelegate as TokenCountCompletedMBS, tag as Variant = nil)

MBS Swift Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Returns the token count for the specified instructions.
Notes: Calls TokenCountCompletedMBS event later.

New for macOS/iOS 26.4 or newer.
See also:

- 87.3.11 tokenCount(prompt as PromptMBS) as Integer 14334

- 87.3.12 tokenCount(prompt as PromptMBS, theDelegate as TokenCountCompletedMBS, tag as Variant = nil) 14334
- 87.3.13 tokenCount(prompt as String) as Integer 14335

87.3.15 transcript as TranscriptMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: A full history of interactions, including user inputs and model responses.

87.3.16 Properties

87.3.17 Handle as Integer

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

87.3.18 Instructions as Variant

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The instructions used to create the session.
Notes: (Read only property)

87.3.19 isResponding as Boolean

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: A Boolean value that indicates a response is being generated.
Notes: Important: Attempting to call any of the respond methods while this property is ‘true‘ is a programmer error.
(Read only property)

87.3.20 maximumResponseTokens as Integer

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The maximum number of tokens the model is allowed to produce in its response.
Notes: If the model produce ‘maximumResponseTokens‘ before it naturally completes its response, the response will be terminated early. No error will be thrown. This property can be used to protect against unexpectedly verbose responses and runaway generations.

If no value is specified, then the model is allowed to produce the longest answer its context size supports. If the response exceeds that limit without terminating, an error will be thrown.

Default is -1, so the plugin doesn't pass this value.
(Read and Write property)

87.3.21 SystemLanguageModel as SystemLanguageModelsMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The model used.
Notes: (Read only property)

87.3.22 temperature as Double

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Temperature influences the confidence of the models response.
Notes: The value of this property must be a number between ‘0‘ and ‘1‘ inclusive.

Temperature is an adjustment applied to the probability distribution prior to sampling. A value of ‘1‘ results in no adjustment. Values less than ‘1‘ will make the probability distribution sharper, with already likely tokens becoming even more likely.

The net effect is that low temperatures manifest as more stable and predictable responses, while high temperatures give the model more creative license.

Note: Leaving ‘temperature‘ unset lets the system choose a reasonable default on your behalf.

Default is -1 for not using temperature setting.
(Read and Write property)

87.3.23 Delegates

87.3.24 ResponseCompletedMBS(Response as ResponseMBS, ErrorString as String, Tag as Variant)

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The delegate for the callback when responds is finished.
Notes: We pass through the tag. If an error happens, we pass you the error string.

87.3.25 TokenCountCompletedMBS(TokenCount as Integer, ErrorString as String, Tag as Variant)

MBS Swift Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The event called when the token count method finishes.

87.4 class PromptMBS

87.4.1 class PromptMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: A prompt from a person to the model.
Example:

```
// ask the model about a picture, if the system supports image attachments
Var session As New LanguageModelSessionsMBS(Nil, "Describe pictures in one sentence.")

Var prompt As PromptMBS
If PromptMBS.canAttach Then
prompt = PromptMBS.promptImageFile(SpecialFolder.Desktop.Child("photo.jpg"), "photo")
Else
prompt = PromptMBS.promptString("Describe a sunny beach in one sentence.")
End If

Var response As ResponseMBS = session.respond(prompt)
If response <>Nil Then MessageBox response.Content
```

Notes: Prompts can contain content written by you, an outside source, or input directly from people using your app. You can initialize a Prompt from a string literal.

If your prompt includes input from people, consider wrapping the input in a string template with your own prompt to better steer the model's response.
Blog Entries

- MBS Xojo Plugins, version 26.5pr3
- News from the MBS Xojo Plugins in version 26.2
- Use Foundation Models in Xojo

87.4.2 Methods

87.4.3 canAttach as Boolean

MBS Swift Plugin, Plugin Version: 26.5, Platforms: macOS, iOS, Targets: All.

Function: Whether you can send attachments with prompts.
Notes: Returns true for macOS 27 or iOS 27 or newer.

87.4.4 Constructor(Value as String)

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates a prompt with a string.
Example:

```
Var prompt As New PromptMBS("What is Xojo?")
MessageBox prompt.Value
```

87.4.5 promptBuildArray(prompts() as PromptMBS) as PromptMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates a prompt with the an array of prompts.
Example:

```
Var prompt As PromptMBS
Var prompt1 As PromptMBS = PromptMBS.promptString("Apple")
Var prompt2 As PromptMBS = PromptMBS.promptString("Pear")
Var prompt3 As PromptMBS = PromptMBS.promptBuildEitherFirst(prompt1)
Var prompt4 As PromptMBS = PromptMBS.promptBuildEitherFirst(prompt2)
prompt = PromptMBS.promptBuildArray(array(prompt3, prompt4))
Break // inspect in debugger
```

87.4.6 promptBuildEitherFirst(prompt as PromptMBS) as PromptMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates a prompt with the first component.

87.4.7 promptBuildEitherSecond(prompt as PromptMBS) as PromptMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates a prompt with the second component.

87.4.8 promptCGImage(CGImage as Variant, label as string = "", orientation as Integer = -1) as PromptMBS

MBS Swift Plugin, Plugin Version: 26.5, Platforms: macOS, iOS, Targets: All.

Function: Creates a prompt based on the given CGImageMBS object.
Notes: Label is optional.
Orientation is optional and can be one of the kOrientation* constants.

Requires macOS 27 or iOS 27 or newer.

87.4.9 promptCIImage(CIImage as Variant, label as string = """, orientation as Integer = -1) as PromptMBS

MBS Swift Plugin, Plugin Version: 26.5, Platforms: macOS, iOS, Targets: All.

Function: Creates a prompt based on the given CIImageMBS object.
Notes: Label is optional.
Orientation is optional and can be one of the kOrientation* constants.

Requires macOS 27 or iOS 27 or newer.

87.4.10 promptExpression(prompt as PromptMBS) as PromptMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates a prompt with an expression.

87.4.11 promptFromJSON(JSON as MemoryBlock) as PromptMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates a prompt from JSON.
Notes: We convert the JSON to prompts:

- string, number or boolean creates a prompt
- array creates an array of prompts
- dictionary may create prompts for optional, expression, eitherFirst or eitherSecond.

87.4.12 promptImageFile(file as FolderItem, label as string = """, orientation as Integer = -1) as PromptMBS

MBS Swift Plugin, Plugin Version: 26.5, Platforms: macOS, iOS, Targets: All.

Function: Creates a prompt based on the given FolderItem.
Notes: Label is optional.
Orientation is optional and can be one of the kOrientation* constants.

Requires macOS 27 or iOS 27 or newer.

87.4.13 promptOptional(prompt as PromptMBS) as PromptMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates a prompt with an optional component.
Example:

```
Var p1 As New PromptMBS("Hello")
Var po As PromptMBS = PromptMBS.promptOptional(p1)

Break
```

87.4.14 promptPicture(image as Picture, label as string = "", orientation as Integer = -1) as PromptMBS

MBS Swift Plugin, Plugin Version: 26.5, Platforms: macOS, iOS, Targets: All.

Function: Creates a prompt based on the given picture.
Notes: Label is optional.
Orientation is optional and can be one of the kOrientation* constants.

Requires macOS 27 or iOS 27 or newer.

87.4.15 promptString(Value as String) as PromptMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates a prompt with a string.
Example:

```
Var prompt As PromptMBS
prompt = PromptMBS.promptString("What is Xojo?")
MessageBox prompt.Value
```

87.4.16 Properties

87.4.17 Handle as Integer

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

87.4.18 Value as Variant

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The value used to create the prompt.
Notes: (Read only property)

87.4.19 Constants

Orientations

Constant	Value	Description
kOrientationDown	3	The encoded image data is rotated 180¬∞ from the image's intended display orientation.
kOrientationDownMirrored	4	The encoded image data is vertically flipped from the image's intended display orientation.
kOrientationLeft	8	The encoded image data is rotated 90¬∞ clockwise from the image's intended display orientation.
kOrientationLeftMirrored	5	The encoded image data is horizontally flipped and rotated 90¬∞ counter-clockwise from the image's intended display orientation.
kOrientationRight	6	The encoded image data is rotated 90¬∞ clockwise from the image's intended display orientation.
kOrientationRightMirrored	7	The encoded image data is horizontally flipped and rotated 90¬∞ clockwise from the image's intended display orientation.
kOrientationUp	1	The encoded image data matches the image's intended display orientation.
kOrientationUpMirrored	2	The encoded image data is horizontally flipped from the image's intended display orientation.

87.5 class ResponseMBS

87.5.1 class ResponseMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: A class that stores the output of a response call.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Use Foundation Models in Xojo

87.5.2 Methods

87.5.3 Constructor

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

87.5.4 transcriptEntries as Dictionary()

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The list of transcript entries.

87.5.5 Properties

87.5.6 Content as String

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The response content.
Notes: (Read only property)

87.5.7 Handle as Integer

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

87.6 class SystemLanguageModelsMBS

87.6.1 class SystemLanguageModelsMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: An on-device large language model capable of text generation tasks.
Example:

```
// check whether the on-device Apple Intelligence model can be used
Var model As SystemLanguageModelsMBS = SystemLanguageModelsMBS.default
If model = Nil Then Return

If model.Available Then
MessageBox "Model available with " + model.ContextSize.ToString + " tokens context." + EndOfLine + _
"Languages: " + String.FromArray(model.supportedLanguages, ", ")
ElseIf model.UnavailableReason = SystemLanguageModelsMBS.UnavailableReasonAppleIntelligenceNotEnabled Then
MessageBox "Please enable Apple Intelligence in System Settings."
Else
MessageBox "Model not available, reason " + model.UnavailableReason.ToString
End If
```

Notes: The SystemLanguageModel refers to the on-device text foundation model that powers Apple Intelligence. Use default to access the base version of the model and perform general-purpose text generation tasks. To access a specialized version of the model, initialize the model with UseCase to perform tasks like UseCase contentTagging.

Verify the model availability before you use the model. Model availability depends on device factors like:

- The device must support Apple Intelligence.
- Apple Intelligence must be turned on in Settings.

Requires macOS 26, iOS 26 or newer.
Blog Entries

87.6.2 Methods

87.6.3 Constructor

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The base version of the model.
Notes: The base model is a generic model that is useful for a wide variety of applications, but is not specialized to any particular use case.
See also:

- 87.6.4 Constructor(UseCase as Integer, Guardrails as Integer) 14347

87.6.4 Constructor(UseCase as Integer, Guardrails as Integer)

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates a system language model for a specific use case.
See also:

- 87.6.3 Constructor 14347

87.6.5 default as SystemLanguageModelsMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The base version of the model.

87.6.6 model(UseCase as Integer, Guardrails as Integer) as SystemLanguageModelsMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Creates a system language model for a specific use case.

87.6.7 privateCloudComputeLanguageModel as SystemLanguageModelsMBS

MBS Swift Plugin, Plugin Version: 26.5, Platforms: macOS, iOS, Targets: All.

Function: Creates a new private cloud compute model.
Notes: A variant of Apple Foundation Models that runs on Private Cloud Compute to provide enhanced capabilities while maintaining privacy guarantees.

Before using the model, verify its availability. Model availability depends on whether the device and region supports Apple Intelligence.

Important: To develop with PCC you must meet certain eligibility requirements. To learn more and request access to the managed entitlement, see
https://developer.apple.com/private-cloud-compute/

Your application must have permissions to use PCC.

87.6.8 supportedLanguages as String()

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Queries the languages that the model supports.
Example:

```
var SystemLanguageModels as new SystemLanguageModelsMBS
var languages() as string = SystemLanguageModels.supportedLanguages

break
```

Notes: To check if a given locale is considered supported by the model, use supportsLocale(), which will also take into consideration language fallbacks.

87.6.9 supportsLocale(localeIdentifier as String) as Boolean

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Returns a Boolean indicating whether the given locale is supported by the model.
Example:

```
var SystemLanguageModels as new SystemLanguageModelsMBS

// we can check for supported languages
var supportsLocaleEN as boolean = SystemLanguageModels.supportsLocale("en")
var supportsLocaleDE as boolean = SystemLanguageModels.supportsLocale("de")

break
```

Notes: Use this method over ‘supportedLanguages‘ to check whether the given locale qualifies a user for using this model, as this method will take into consideration language fallbacks.

87.6.10 tokenCount(prompt as PromptMBS) as Integer

MBS Swift Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Calculates the token count for the specified prompt.
Example:

```
Var session As New LanguageModelSessionsMBS("")
var p as new PromptMBS("Hello World")
Var count As Integer = session.tokenCount(p)

Break // shows 10
```

See also:

- 87.6.11 tokenCount(prompt as String) as Integer 14349

87.6.11 tokenCount(prompt as String) as Integer

MBS Swift Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Calculates the token count for the specified prompt.
Example:

```
Var session As New LanguageModelSessionsMBS("")
Var count As Integer = session.tokenCount("Hello World")

Break // shows 10
```

See also:

- 87.6.10 tokenCount(prompt as PromptMBS) as Integer 14349

87.6.12 Properties

87.6.13 Available as Boolean

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: A convenience getter to check if the system is entirely ready.
Notes: (Read only property)

87.6.14 Capabilities as String

MBS Swift Plugin, Plugin Version: 26.5, Platforms: macOS, iOS, Targets: All.

Function: Queries capabilities as JSON.
Notes: Returns details about the capabilities of the current model as JSON.
e.g. { "guidedGeneration":true,"reasoning":false,"toolCalling":true,"vision":true }

Value	Description
vision	The capability to accept image inputs in prompts.
guidedGeneration	The capability to ensure model output conforms to a given generation schema.
reasoning	The capability to reason, structurally separately from producing a response.
toolCalling	The capability to call tools to gather information or trigger side effects.

(Read only property)

87.6.15 ContextSize as Integer

MBS Swift Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The maximum context size (in tokens) supported by the model.
Notes: The context size represents the total number of tokens that can be used in a single session, including both input prompts and generated responses.

This is new in macOS/iOS 26.4.

The context size represents the total number of tokens that can be used in a single session, including both input prompts and generated responses.

Currently 4096.
(Read only property)

87.6.16 Handle as Integer

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

87.6.17 Quota as String

MBS Swift Plugin, Plugin Version: 26.5, Platforms: macOS, iOS, Targets: All.

Function: Queries the quota status for the private cloud compute model.
Notes: The result is JSON with a isLimitReached value, which is true if the limit was reached.
e.g. { "isApproachingLimit":false,"isLimitReached":false,"resetDate":null,"status":"belowLimit" }

The status value is either belowLimit, limitReached or NULL value if unknown.
A resetDate value may indicate the date when the limit resets.

Returns an empty result, if called with a local model.
(Read only property)

87.6.18 UnavailableReason as Integer

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Queries the unavailable reason if not available.
Notes: See UnavailableReason* constants.
(Read only property)

87.6.19 Constants

Guardrails

Constant	Value	Description
GuardrailsDefault	0	Default guardrails. This mode ensures that unsafe¬†content and responses will be blocked with a 'LanguageModelSes tionError.guardrailViolation' error.
GuardrailsPermissiveContentTransformations	1	Guardrails that allow for permissively transforming text input, i tentially unsafe content, to text responses, such as summarizing a In this mode, requests you make to the model that generate a not throw 'LanguageModelSession.GenerationError.guardrailViol However, when the purpose of your instructions and prompts is no ing user input, the model may still refuse to respond to poten prompts by generating an explanation.

Unavailable Reason

Constant	Value	Description
UnavailableReasonAppleIntelligenceNotEnabled	2	Apple Intelligence is not enabled on the system.
UnavailableReasonAvailable	1	The model is available.
UnavailableReasonDeviceNotEligible	4	The device does not support Apple Intelligence.
UnavailableReasonModelNotReady	3	The model(s) aren't available on the user's device. Models a automatically based on factors like network status, battery lev load.
UnavailableReasonSystemNotReady	4	The system is not yet ready to serve PCC requests.

Use Case

Constant	Value	Description
UseCaseContentTagging	1	A use case for content tagging.
UseCaseGeneral	0	A use case for general prompting.

87.7 class TranscriptMBS

87.7.1 class TranscriptMBS

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: A transcript that documents interactions with a language model.
Example:

```
Var session As New LanguageModelSessionsMBS("You are a chatbot in Xojo. Be brief.")
Var response As String = session.respond("What is 1 + 1?")
Var transcript As TranscriptMBS = session.transcript
Var entryCount As Integer = transcript.EntryCount
Var enty0 As Dictionary = transcript.Entry(0)
Var json As String = DefineEncoding(transcript.JSON, encodings.UTF8)

Break // see in debugger
```

Notes: Transcripts contain an ordered list of entries, representing inputs to and outputs from the model. This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

87.7.2 Methods

87.7.3 Constructor

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

87.7.4 Entries as Dictionary()

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Queries all entries as dictionaries.

87.7.5 Entry(Index as Integer) as Dictionary

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Queries one entry as dictionary.

87.7.6 JSON as MemoryBlock

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Converts entries to JSON block.

87.7.7 Properties

87.7.8 EntryCount as Integer

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Queries the number of entries.
Notes: (Read only property)

87.7.9 Handle as Integer

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

Chapter 88

GameKit

88.1 class GameKitMBS

88.1.1 class GameKitMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The central plugin class for GameKit.
Notes: Events from various objects end here, so you can implement them in a central subclass of GameKitMBS.
For most events, we carry a "tag as Variant" parameter, so you can pass a window, some object or whatever value you need.

Also we defined that matchdata is a dictionary. This way you can store various values inside including arrays (e.g. array of variant). As data is serialized over the network, you can't pass Xojo objects.

The plugin makes sure that all events run on the main thread, so please make sure you don't block main thread.
Please create only one instance of your GameKitMBS subclass.

GameKit classes are available in OS X v10.8 and later.
Please review Apple's documentation for more details and a guide.

- 12.4, page 30: Writing OS X Apps for Game Center, Getting started by authenticating the local player with the Game Center Sandbox testing facility by Tom Baumgartner

88.1.2 Methods

88.1.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: True if the class is available.
Notes: Should always be true on Mac OS X 10.8 and newer.

88.1.4 GKErrorDomain as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The Game Kit framework error domain.
Notes: For NSErrorMBS.

88.1.5 showBannerWithTitle(title as string, message as string, duration as Double, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Displays a banner to the player for a specified period of time.
Notes: title: The title of the banner.
message: A secondary message to be displayed.
duration: The amount of time that the banner should be displayed to the player.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.NotificationBannerCompleted event.
See also:

- 88.1.6 showBannerWithTitle(title as string, message as string, tag as Variant) 14356

88.1.6 showBannerWithTitle(title as string, message as string, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Displays a banner to the player.
Notes: title: The title of the banner.
message: A secondary message to be displayed.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.Notification-

BannerCompleted event.
See also:

- 88.1.5 showBannerWithTitle(title as string, message as string, duration as Double, tag as Variant) 14356

88.1.7 Events

88.1.8 acceptInviteCompleted(match as GKTurnBasedMatchMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The event to be called after the match is successfully created.
Notes: match: A newly initialized match object that contains a list of players for the match. If an error occurred, this value is nil.
error: If an error occurred, this error object describes the error. If the operation was completed successfully, the value is nil.

Called by GKTurnBasedMatchMBS.acceptInvite.
Available on Mac OS X 10.8.2 and newer.

88.1.9 achievementViewControllerDidFinish(viewController as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when the user dismisses the achievements screen. (required)
Notes: viewController: The achievement view controller whose interface was dismissed by the player. (GKAchievementViewControllerMBS)

Your should dismiss the view controller. If your game paused any gameplay or other activities, it can restart those services in this method.

88.1.10 addPlayersToMatchCompleted(MatchMaker as GKMatchmakerMBS, match as GKMatchMBS, matchRequest as GKMatchRequestMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKMatchmakerMBS.addPlayersToMatch when matchmaking completes.
Notes: error: If matchmaking was successful, this parameter contains nil. Otherwise, this parameter holds

an error object that describes the error that occurred.

88.1.11 authenticateCompleted(localPlayer as GKLocalPlayerMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKLocalPlayerMBS.authenticate when the player has authenticated or when an error occurs.
Notes: error: This parameter is nil if the player successfully authenticated. Otherwise, it contains an error object that describes the error that occurred.

88.1.12 authenticateHandler(LocalPlayer as GKLocalPlayerMBS, viewController as NSViewControllerMBS, error as NSErrorMBS, tag as Variant, viewControllerHandle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The event called when game center needs authentication.
Notes: viewController: This parameter is nil if the authentication process is complete. Otherwise, it contains a view controller that your game should display to the player.
error: This parameter contains an error object that describes any error that occurred.

Your game should authenticate the player as early as possible after launching, ideally as soon as you can present a user interface to the player. For example, your game may be launched because the player accepted an invitation to join a match or to take a turn in a turn-based match, so you want your game to authenticate the player and process the match invitation as quickly as possible. After you set a handler, authentication begins automatically and is repeated when your game moves to the background and then back to the foreground.

During the authentication process, Game Kit calls your handler one or more times to handle specific authentication events. Your handler must handle three kinds of events:

- If the device does not have an authenticated player, Game Kit passes a view controller to your authenticate handler. When presented, this view controller displays the authentication user interface. Your game should pause other activities that require user interaction (such as your game loop), present this view controller and then return. When the player finishes interacting with it, the view controller is dismissed automatically.
- If the authentication process succeeded, theGKLocalPlayer singleton object's authenticated property is set to true and the object's other properties are set to match those of the connected player.
- If the authentication process failed, the GKLocalPlayer singleton object's authenticated property is set to false and the object's other properties are cleared.

Each time the authentication handler is called, the data stored in the local player singleton object may have changed. A new player may have logged into the device or the player may have simply logged out from Game Center. Because of both of these possibilities, your authentication handler must be prepared to update any other objects that assume that a particular player is logged in. For more information, see "Authenticating the Local Player in a Multitasking Application" in Game Center Programming Guide.

Available on Mac OS X 10.8.2 and newer.

88.1.13 challengesViewControllerDidFinish(viewController as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The challengesViewController did finish.
Notes: Called by GKChallengesViewControllerMBS if needed.
Available on Mac OS X 10.8.2 and newer.

88.1.14 chooseBestHostPlayerCompleted(match as GKMatchMBS, playerID as string, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Called when GKMatchMBS.chooseBestHostPlayer completes.
Notes: playerID: The player identifier for the player with the best estimated network performance, or nil if a player could not currently be determined.

Available on Mac OS X 10.8.2 and newer.

88.1.15 declineInviteCompleted(match as GKTurnBasedMatchMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The event to be called after the match is successfully created.
Notes: error: If an error occurred, this error object describes the error. If the operation was completed successfully, the value is nil.

Called by GKTurnBasedMatchMBS.declineInvite.
Available on Mac OS X 10.8.2 and newer.

88.1.16 didRequestMatchWithOtherPlayers(players() as GKPlayerMBS)

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Initiates a match from Game Center with the requested players. (required)
Notes: player: The GKPlayer object containing the current player,Äôs information.
playersToInvite: An array of GKPlayer objects containing the player identifiers to invite to the match.

When this method is called, you should create a new match using the player identifiers provided and present a GKTurnBasedMatchmakerViewController.

Available in OS X v10.10 and later.

88.1.17 endMatchInTurnWithMatchDataCompleted(match as GKTurnBasedMatchMBS, matchData as Dictionary, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKTurnBasedMatchMBS.endMatchInTurnWithMatchData after the match is successfully ended.
Notes: If an error occurred, this error object describes the error. If the operation was completed successfully, the value is nil.

88.1.18 endTurnWithNextParticipant(match as GKTurnBasedMatchMBS, nextParticipant as GKTurnBasedParticipantMBS, matchData as Dictionary, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKTurnBasedMatchMBS.endTurnWithNextParticipant after the data is uploaded to Game Center.
Notes: If an error occurred, this error object describes the error. If the operation was completed successfully, the value is nil.

88.1.19 endTurnWithNextParticipantsCompleted(match as GKTurnBasedMatchMBS, nextParticipants() as GKTurnBasedParticipantMBS, timeout as Double, matchData as Dictionary, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The event to be called after the data is uploaded to the server.
Notes: Called by GKTurnBasedMatchMBS.participantQuitInTurnWithOutcome.

error: If an error occurred, this error object describes the error. If the operation was completed successfully, the value is nil.

Available on Mac OS X 10.8.2 and newer.

88.1.20 findMatchForRequestCompleted(MatchMaker as GKMatchmakerMBS, request as GKMatchRequestMBS, match as GKMatchMBS, TurnBasedMatch as GKTurnBasedMatchMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when the match has been created.
Notes: This is either called by GKMatchmakerMBS.findMatchForRequest or GKTurnBasedMatchMBS.findMatchForRequest.

match: If matchmaking was successful, this parameter contains the created match. Otherwise, this parameter is nil.
error: If matchmaking was successful, this parameter contains nil. Otherwise, this parameter holds an error object that describes the error that occurred.

88.1.21 findPlayersForHostedMatchRequestCompleted(MatchMaker as GKMatchmakerMBS, request as GKMatchRequestMBS, playerIDs() as string, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKMatchmakerMBS.findPlayersForHostedMatchRequest when the match has been created.
Notes: players: If matchmaking was successful, this parameter contains an array of players to connect into the match. Otherwise, this parameter is nil.
error: If matchmaking was successful, this parameter contains nil. Otherwise, this parameter holds an error object that describes the error that occurred.

88.1.22 friendRequestComposeViewControllerDidFinish(viewController as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The compose view has finished.
Notes: viewController: The GKFriendRequestComposeViewControllerMBS object.

88.1.23 gameCenterViewControllerDidFinish(gameCenterViewController as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Called when gameCenterViewController did finish.
Notes: Available on Mac OS X 10.8.2 and newer.

88.1.24 handleInviteFromGameCenter(playersToInvite() as string)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Sent when the local player receives an invitation to join a new turn-based match.
Notes: playersToInvite: An array of player identifiers for the players to initially invite to the game.

When you receive this message, your game should create a new GKMatchRequestMBS object and assign the playersToInvite parameter to the match request's playersToInvite property. Then, your game can either call the GKTurnBasedMatchMBS class method findMatchForRequest to find a match programmatically or it can use the request to instantiate a new GKTurnBasedMatchmakerViewControllerMBS object to show a user interface to the player.

88.1.25 handleMatchEnded(match as GKTurnBasedMatchMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Sent when a match the local player is participating in has ended.
Notes: match: The match that just ended.

When you receive this message, it should display the match's final results to the player and allow the player the option of saving or removing the match data from Game Center.

88.1.26 handleTurnEventForMatch(match as GKTurnBasedMatchMBS, didBecomeActive as boolean)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Sent when it is the local player's turn to act in a turn-based match.
Notes: match: A match object containing the current state of the match.

When you receive this message, the player has accepted a push notification for a match already in progress. Your game should end whatever task it was performing and switch to the match information provided by the match object. For more information on handling player actions in a turn-based match, see GKTurnBasedMatch Class Reference.

didBecomeActive: New parameter valid on Mac OS X 10.8.2 and newer.

88.1.27 Invited(MatchMaker as GKMatchmakerMBS, acceptedInvite as GKInviteMBS, playersToInvite() as string)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKMatchmakerMBS when an invitation is received from another player.
Notes: acceptedInvite: The invitation accepted by the player.
playersToInvite: A list of player identifiers for additional players to invite into the game.

An game responds to an invitation by allocating and initializing a GKMatchmakerViewControllerMBS object, passing the invitation object and the list of player identifiers as parameters. For more information, see Game Kit Programming Guide.

If your game receives an invitation while your game is running, it should clean up any existing gameplay (including disconnecting from any current matches) and then process the invitation.

88.1.28 inviteeResponseHandler(MatchRequest as GKMatchRequestMBS, PlayerID as string, response as Integer, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The event called when an response from an invited player is returned to your game.
Notes: playerID: The identifier for the player.
response: The nature of the response. See GKInviteeResponse* constants.

Available on Mac OS X 10.8.2 and newer.

88.1.29 leaderboardViewControllerDidFinish(viewController as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The leaderboard view has finished.
Notes: viewController: The GKLeaderboardViewControllerMBS object.

88.1.30 loadAchievementDescriptionsCompleted(achievements() as GKAchievementDescriptionMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKAchievementDescriptionMBS.loadAchievementDescriptions when the download is completed.
Notes: descriptions: An array of description objects for the achievements in your game. If an error occurred, this value may be non-empty. In this case, the array holds whatever descriptions were downloaded by Game Kit before the error occurred.
error: If an error occurred, this error object describes the error. If the operation completed successfully, this value is nil.

88.1.31 loadAchievementsCompleted(achievements() as GKAchievementMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKAchievementMBS.loadAchievements when the download is completed.
Notes: achievements: An array of achievement objects that represents all progress reported to Game Center for the local player. If an error occurred, this parameter may be non-empty, in which case the array holds whatever achievement information Game Kit was able to fetch.
error: If an error occurred, this object describes the error. If the operation completed successfully, this value is nil.

88.1.32 loadCategoriesCompleted(categories() as string, titles() as string, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKLeaderboardMBS.loadCategories when the categories have been retrieved from the server.
Notes: categories: An array of strings that provides the categories to your game. If an error occurred, this

value may be non-empty. In this case, the array holds whatever data Game Kit was able to download before the error occurred.
titles: An array of strings that provides localized titles for each category. If an error occurred, this value may be non-empty. In this case, the array holds whatever data Game Kit was able to download before the error occurred.
error: If an error occurred, this error object describes the error. If the operation completed successfully, the value is nil.

88.1.33 loadDefaultLeaderboardCategoryIDCompleted(LocalPlayer as GKLocalPlayerMBS, categoryID as string, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The loadDefaultLeaderboardCategoryID method completed.
Notes: categoryID: The category ID string for the local player's default leaderboard.
error: If an error occurred, this parameter holds an error object that explains the error. Otherwise, the value of this parameter is nil.

Available on Mac OS X 10.8.2 and newer.

88.1.34 loadFriendPlayersCompleted(localPlayer as GKLocalPlayerMBS, friendPlayers() as GKPlayerMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The event called by GKLocalPlayerMBS.loadFriendPlayers.
Notes: friendPlayers: An array of GKPlayer objects containing the player identifiers for the players that are friends of the local player. If an error occurred, this value can be non-nil. In that case, the array contains the data that Game Kit was able to download before the error occurred.
error: If an error occurred, this parameter holds an error object that explains the error. Otherwise, the value of this parameter is nil.

88.1.35 loadFriendsCompleted(localPlayer as GKLocalPlayerMBS, friends() as string, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKLocalPlayerMBS.loadFriends when the request completes.
Notes: friends: An array of player identifiers for the players that are friends of the local player. If an error occurred, this value can be non-empty. In that case, the array contains the data that Game Kit was able to download before the error occurred.

error: If an error occurred, this parameter holds an error object that explains the error. Otherwise, the value of this parameter is nil.

88.1.36 loadImageCompleted(description as GKAchievementDescriptionMBS, image as NSImageMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKAchievementDescriptionMBS.loadImage when the download is completed.
Notes: image: The downloaded image. If an error occurred, this value is nil.
error: If an error occurred, this error object describes the error. If the operation completed successfully, this value is nil.

88.1.37 loadLeaderboardsCompleted(Leaderboards() as GKLeaderboardMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Leaderboards have been loaded.
Notes: Available on Mac OS X 10.8.2 and newer.

88.1.38 loadMatchDataCompleted(match as GKTurnBasedMatchMBS, matchData as Dictionary, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKTurnBasedMatchMBS.loadMatchData after the match data has been retrieved from the server.
Notes: matchData: The data stored on Game Center that reflects the current state of the match. If an error occurred, this value is nil.
error: If an error occurred, this error object describes the error. If the operation was completed successfully, the value is nil.

88.1.39 loadMatchesCompleted(matches() as GKTurnBasedMatchMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKTurnBasedMatchMBS.loadMatches after the matches are retrieved from the server.
Notes: matches: An array of match objects that hold the requested matches. If an error occurred, this value may be non-empty. In this case, the array holds whatever match data could be retrieved from Game

Center before the error occurred.
error: If an error occurred, this error object describes the error. If the operation was completed successfully, the value is nil.

88.1.40 loadMatchWithIDCompleted(TurnBasedMatch as GKTurnBasedMatchMBS, matchID as string, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The event to be called after the match is retrieved from the server.
Notes: Called when GKTurnBasedMatchMBS.loadMatchWithID finishes.

matchID: The identifier for the turn-based match.
match: If the operation completed successfully, this parameter holds the match. If an error occurred, the value is nil.
error: If an error occurred, this error object describes the error. If the operation was completed successfully, the value is nil.

Available on Mac OS X 10.8.2 and newer.

88.1.41 loadPhotoForSizeCompleted(player as GKPlayerMBS, size as Integer, photo as NSImageMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKPlayerMBS.loadPhotoForSize when the player data is retrieved from Game Center.
Notes: photo: An image for the player. If an error occurred, this may still be non-nil. In this case, the image reflects an image cached by Game Kit on the device.
error: If an error occurred, this error object describes the error. If the operation completed successfully, this is nil.

88.1.42 loadPlayersForIdentifiersCompleted(identifiers() as string, players() as GKPlayerMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKPlayerMBS.loadPlayersForIdentifiers when the player data is retrieved from Game Center.
Notes: players: An array of GKPlayer objects, one per identifier. If an error occurred, this may be non-empty. In that case, the array holds whatever data Game Kit was able to retrieve for the requested players.
error: If an error occurred, this error object describes the error. If the operation completed successfully, this

is nil.

88.1.43 loadReceivedChallengesCompleted(challenges() as GKChallengeMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Called when loadReceivedChallenges finished.
Notes: challenges: An array of challenge objects that represents all challenges made to the local player. If an error occurred, this parameter may be non-nil, in which case the array holds whatever challenge information Game Kit was able to fetch.
error: If an error occurred, this object describes the error. If the operation completed successfully, this value is nil.

Available on Mac OS X 10.8.2 and newer.

88.1.44 loadScoresCompleted(Leaderboard as GKLeaderboardMBS, scores() as GKScoreMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKLeaderboardMBS.loadScores after the scores are retrieved from the server.
Notes: scores: An array of score objects that hold the requested scores. If an error occurred, this value may be non-nil. In this case, the array holds whatever score data could be retrieved from Game Center before the error occurred.
error: If an error occurred, this error object describes the error. If the operation was completed successfully, the value is nil.

88.1.45 localPlayerDidCompleteChallenge(challenge as GKChallengeMBS)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Called when the local player has completed one of their challenges, triggered by a push notification from the server.
Notes: Received only while the game is running.
Available on Mac OS X 10.8.2 and newer.

88.1.46 localPlayerDidReceiveChallenge(challenge as GKChallengeMBS)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Called when the local player has received a challenge, triggered by a push notification from the server.
Notes: Received only while the game is running.
Available on Mac OS X 10.8.2 and newer.

88.1.47 localPlayerDidSelectChallenge(challenge as GKChallengeMBS)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Called when the user clicks a challenge notification banner or the "Play Now" button for a challenge inside Game Center, causing the game to launch.
Notes: Also called when the user clicks a challenge banner inside the game.
Available on Mac OS X 10.8.2 and newer.

88.1.48 matchConnectionWithPlayerFailed(match as GKMatchMBS, playerID as string, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when the match fails to connect to a player.
Notes: match: The match that received the error.
player: The identifier for the player whose connection failed.
error: The error that occurred.

This method is called if the match was unable to send a transmission to another player in the match.

88.1.49 matchDidChangeState(match as GKMatchMBS, playerID as string, state as Integer)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when a player connects to or disconnects from the match.
Notes: match: The match that the player is connected to.
player: The identifier for the player whose state changed.
state: The state the player moved to. (see constants in GKMatchMBS)

Your game implements this method to be notified when players connect to or disconnect from the match.one

88.1.50 matchDidFailWithError(match as GKMatchMBS, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when the match cannot connect to any other players.
Notes: match: The match that received the error.
error: The error that occurred.

This method is called if the match cannot connect to any other players associated with the match. It usually means a serious networking error has occurred.

88.1.51 matchDidReceiveData(match as GKMatchMBS, data as Dictionary, playerID as string)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when data is received from a player. (required)
Notes: match: The match that received the data.
data: The data sent by the player.
player: The string identifier for the player that sent the data.

Important: Data received from other players should be treated as untrusted data. Be sure to validate the data you receive from the match and write your code carefully to avoid security vulnerabilities. See the Secure Coding Guide for more information.

88.1.52 matchEnded(player as GKPlayerMBS, match as GKTurnBasedMatchMBS)

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Called when the match has ended. (required)
Notes: player: The GKPlayer object containing the current player,Äôs information.
match: The GKTurnBasedMatch object containing the current game data.

Available in OS X v10.10 and later.

88.1.53 matchForInviteCompleted(Matchmaker as GKMatchmakerMBS, invite as GKInviteMBS, match as GKMatchMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Called by matchForInvite on completion.
Notes: Match provides the new match object on success.

Possible reasons for error:
1. Communications failure.
2. Invite cancelled.
Available on Mac OS X 10.8.2 and newer.

88.1.54 matchmakerViewControllerDidFailWithError(viewController as Variant, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when the view controller encounters an unrecoverable error. (required)
Notes: viewController: The view controller that received the error. (GKMatchmakerViewControllerMBS)
error: An error object that describes the error.

88.1.55 matchmakerViewControllerDidFindMatch(viewController as Variant, match as GKMatchMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when a peer-to-peer match is found.
Notes: viewController: The view controller that performed the matchmaking. (GKMatchmakerViewControllerMBS)
match: A completed match.

This method is called when the view controller's hosted property is false. Although optional in the protocol, if your game attaches a delegate to the view controller for a peer-to-peer match, the view controller expects your game to provide an implementation of this method.

88.1.56 matchmakerViewControllerDidFindPlayers(viewController as Variant, playerIDs() as string)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when a hosted match is found.
Notes: viewController: The view controller that performed the matchmaking. (GKMatchmakerViewControllerMBS)
players: An array of identifier strings for the matched players.

This method is called when the view controller's hosted property is true. Although optional in the protocol, if your game attaches a delegate to the view controller for a hosted match, the view controller expects your game to provide an implementation of this method.

The view controller returns the list of players to your game by calling this method. Your game is responsible for connecting these players to your own server and then using that server to relay messages between the players.

88.1.57 matchmakerViewControllerDidReceiveAcceptFromHostedPlayer(viewController as Variant, playerID as string)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when a player in a hosted match accepts the invitation.
Notes: viewController: The view controller that accepted the invitation. (GKMatchmakerViewControllerMBS)
playerID: The identifier of the accepting player.

After a player accepts an invitation, that player's device should connect to your server. Once the connection is established, your game should call the view controller's setHostedPlayer method to update the player's connection status.

88.1.58 matchmakerViewControllerWasCancelled(viewController as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when the user cancels the matchmaking request (required)
Notes: viewController: The view controller that received the cancellation. (GKMatchmakerViewControllerMBS)

88.1.59 matchShouldReinvitePlayer(match as GKMatchMBS, playerID as string) as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when a player in a two-player match was disconnected.
Notes: match: The match that lost the player.
playerID: The identifier for the player whose connection failed.

Your game should return true if it wants Game Kit to attempt to reconnect the player, false if it wants to terminate the match.

Occasionally, players may get disconnected from a match. If your game implements this method in the match delegate and the match only contains two players, Game Kit calls this method after a player gets disconnected. If your delegate allows Game Kit to reconnect to the other player, it reconnects the other player. Your matchDidChangeState event is called when the other player is reconnected.

88.1.60 NotificationBannerCompleted(title as string, message as string, duration as Double, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GameKitMBS.showBannerWithTitle after the banner is reported.
Notes: Duration is only passed if it was sent with the newer method on Mac OS X 10.8.2 and newer.

88.1.61 participantQuitInTurnWithOutcomeCompleted(match as GKTurnBasedMatchMBS, matchOutcome as Integer, nextParticipant as GKTurnBasedParticipantMBS, nextParticipants() as GKTurnBasedParticipantMBS, timeout as Double, matchData as Dictionary, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The event to be called after the data is uploaded to the server.
Notes: Called by GKTurnBasedMatchMBS.participantQuitInTurnWithOutcome.

error: If an error occurred, this error object describes the error. If the operation was completed successfully, the value is nil.

Available on Mac OS X 10.8.2 and newer.

88.1.62 participantQuitOutOfTurnWithOutcomeCompleted(match as GKTurnBasedMatchMBS, matchOutcome as Integer, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKTurnBasedMatchMBS.participantQuitOutOfTurnWithOutcome called after the data is uploaded to the server.
Notes: If an error occurred, this error object describes the error. If the operation was completed successfully, the value is nil.

88.1.63 PlayerAuthenticationDidChange(player as GKPlayerMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Player's authentication changed.

88.1.64 playerChanged(player as GKPlayerMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The player changed.

88.1.65 playerStateUpdate(playerID as string, state as Integer, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when the state of any participant in the chat changes (including the local player).
Notes: player: The player identifier for the player whose status changed.
state: The new state of the player.
You need to call enablePlayerStateUpdate to receive events.

88.1.66 queryActivityCompleted(MatchMaker as GKMatchmakerMBS, activity as Integer, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKMatchmakerMBS.queryActivity when query is done.
Notes: activity: The amount of activity in the player group.
error: If the search completed successfully, this parameter is nil; otherwise, this parameter holds an error object that describes the error that occurred.

88.1.67 queryPlayerGroupActivityCompleted(MatchMaker as GKMatchmakerMBS, playerGroup as Integer, activity as Integer, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKMatchmakerMBS.queryPlayerGroupActivity when the search completes.
Notes: activity: The amount of activity in the player group.
error: If the search completed successfully, this parameter is nil; otherwise, this parameter holds an error object that describes the error that occurred.

88.1.68 receivedTurnEventForMatch(player as GKPlayerMBS, match as GKTurnBasedMatchMBS, didBecomeActive as boolean)

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Activates the player,Äôs turn. (required)
Notes: This method is called when the it becomes the player,Äôs turn. It is also called when any of the following events happen:

- The current turn has a time-out associated with it and the turn is about to expire.
- Player accepts an invite from another player.
- Turn was passed to another player. In this case, didBecomeActive is false.
- Match data is saved by another player.
- Player receives a reminder.

Available in OS X v10.10 and later.

88.1.69 recipientResponseHandler(MatchRequest as GKMatchRequestMBS, Player as GKPlayerMBS, response as Integer, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: This event is called whenever you programmatically invite specific players to join a match.
Notes: It is called once for each player invited to the match. Typically, your game uses the responses to update the custom user interface. For example, you want the player to be able to perform any of the following tasks:

- Start the match.
- Invite an additional set of specific players.
- Use matchmaking to fill the remaining match slots.

Available in OS X v10.10 and later.

88.1.70 rematchCompleted(TurnMatch as GKTurnBasedMatchMBS, match as GKMatchMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Called when GKMatchMBS.rematch completes.
Notes: match: The new match. If an error occurred, this parameter's value is nil.
error: If an error occurred, this parameter holds an error object that describes the problem. If the match was successfully recreated, this parameter's value is nil.

Available on Mac OS X 10.8.2 and newer.

88.1.71 remotePlayerDidCompleteChallenge(challenge as GKChallengeMBS)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Called when a non-local player has completed a challenge issued by the local player.
Notes: Triggered by a push notification from the server. Received when a challenge notification banner is clicked, or while the game is running.
Available on Mac OS X 10.8.2 and newer.

88.1.72 removeCompleted(match as GKTurnBasedMatchMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKTurnBasedMatchMBS.remove on completion.
Notes: If an error occurred, this error object describes the error. If the operation was completed successfully, the value is nil.
Tag is the parameter you passed to remove method.

88.1.73 reportAchievementCompleted(score as GKAchievementMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKAchievementMBS.reportAchievement after the operation completes.
Notes: error: If the operation was successful, this value is nil; otherwise, this parameter holds an object that describes the problem that occurred.

88.1.74 reportAchievementsCompleted(achievements() as GKAchievementMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Called when GKAchievementMBS.reportAchievements completes.
Notes: Available on Mac OS X 10.8.2 and newer.

88.1.75 reportScoreCompleted(score as GKScoreMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKScoreMBS.reportScore after the score is reported.
Notes: error: If an error occurred, this parameter holds an error object that describes the problem. If the score was successfully reported, this parameter's value is nil.

88.1.76 reportScoresCompleted(Scores() as GKScoreMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Reporting scores completed.
Notes: scores: An array of score objects to report to Game Center.
error: If an error occurred, this parameter holds an error object that describes the problem. If the score was successfully reported, this parameter's value is nil.

Available on Mac OS X 10.8.2 and newer.

88.1.77 resetAchievementsCompleted(error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKAchievementMBS.resetAchievements when the reset action is completed.
Notes: error: If the operation was successful, this value is nil; otherwise, this parameter holds an object that describes the problem that occurred.

88.1.78 saveCurrentTurnWithMatchDataCompleted(match as GKTurnBasedMatchMBS, matchData as Dictionary, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The event to be called after the data is uploaded to Game Center.
Notes: error: If an error occurred, this error object describes the error. If the operation was completed successfully, the value is nil.
matchData: The game-specific state for the match.

Available on Mac OS X 10.8.2 and newer.

88.1.79 selectChallengeablePlayerIDsCompleted(Achievement as GKAchievementMBS, playerIDs() as string, challengeablePlayerIDs() as string, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Called by GKAchievementMBS.selectChallengeablePlayerIDs on completion
Notes: Available on Mac OS X 10.8.2 and newer.

88.1.80 setDefaultLeaderboardCategoryIDCompleted(LocalPlayer as GKLocalPlayerMBS, categoryID as string, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Called by GKLocalPlayerMBS.setDefaultLeaderboardCategoryID when completed.
Notes: Available on Mac OS X 10.8.2 and newer.

88.1.81 setDefaultLeaderboardCompleted(categoryID as string, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called by GKLeaderboardMBS.setDefaultLeaderboard after the scores are retrieved from the server.
Notes: error: If an error occurred, this error object describes the error. If the operation was completed successfully, the value is nil.

88.1.82 shouldShowBannerForLocallyCompletedChallenge(challenge as GKChallengeMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Whether to show banner for locally completed challenge.
Notes: If the method returns true, a challenge banner (like an achievement or welcome banner – not a notification center banner) is displayed. If false, then no banner is displayed. Default behavior for non-implementing apps is true.
Available on Mac OS X 10.8.2 and newer.

88.1.83 shouldShowBannerForLocallyReceivedChallenge(challenge as GKChallengeMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Whether to show banner for locally received challenge.
Notes: If the method returns true, a challenge banner (like an achievement or welcome banner – not a notification center banner) is displayed when a challenge is received in-game for the local player. If false, then no banner is displayed, and localPlayerDidSelectChallenge will not be called for that challenge. Default behavior for non-implementing apps is true.

Available on Mac OS X 10.8.2 and newer.

88.1.84 shouldShowBannerForRemotelyCompletedChallenge(challenge as GKChallengeMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Whether to show banner for remotely completed challenge.
Notes: If the method returns true, a challenge banner (like an achievement or welcome banner – not a notification center banner) is displayed. If false, then no banner is displayed. Default behavior for non-implementing apps is true.
Available on Mac OS X 10.8.2 and newer.

88.1.85 startBrowsingForNearbyPlayersCompleted(Matchmaker as GKMatchmakerMBS, playerID as string, reachable as boolean, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Called when startBrowsingForNearbyPlayers method found a player.
Notes: Available on Mac OS X 10.8.2 and newer.

88.1.86 turnBasedMatchmakerViewControllerDidFailWithError(viewController as Variant, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when an error occurs. (required)
Notes: viewController: The view controller that received an error. (GKTurnBasedMatchmakerViewControllerMBS)
error: An error object that describes the error.

Your game should dismiss the view controller.

88.1.87 turnBasedMatchmakerViewControllerDidFindMatch(viewController as Variant, match as GKTurnBasedMatchMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when the player selected a match to view. (required)
Notes: viewController: The view controller that found a match. (GKTurnBasedMatchmakerViewControllerMBS)
match: The match that the player selected.

Your game should dismiss the view controller and use the match object to show the current state of the match to the player.

88.1.88 turnBasedMatchmakerViewControllerPlayerQuitForMatch(viewController as Variant, match as GKTurnBasedMatchMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when a player chooses to quit the match. (required)
Notes: viewController: The view controller that the player interacted with. (GKTurnBasedMatchmakerViewControllerMBS)
match: The match the player has chosen to quit.

When this method is called, the player is the current participant in the match, but that player has chosen to resign the match instead of taking a turn. Your game should dismiss the view controller, set an outcome for the player, and then call the match's participantQuitInTurnWithOutcome method.

88.1.89 turnBasedMatchmakerViewControllerWasCancelled(viewController as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Called when the player cancels matchmaking. (required)
Notes: viewController: The view controller that the player canceled. (GKTurnBasedMatchmakerViewControllerMBS)

Your game should dismiss the view controller.

88.1.90 Constants

GameKit Error Constants

Constant	Value	Description
GKErrorAuthenticationInProgress	7	The local player is currently authenticating.
GKErrorCancelled	2	The requested operation was canceled.
GKErrorChallengeInvalid	19	The challenge was invalid. Available on Mac OS X 10.8.2 and newer.
GKErrorCommunicationsFailure	3	An error occurred when communicating with Game Center.
GKErrorGameUnrecognized	15	nGame Center does not recognize the application that made the reques sure the bundle identifier is set properly for the application.one
GKErrorInvalidCredentials	5	The operation failed because the player's user name or password or b incorrect.
GKErrorInvalidParameter	17	One or more of the parameters was incorrect. For example, this error code may be returned if your application atte post a score and provides a category string that does not match a categ configured for your leaderboards on iTunes Connect.
GKErrorInvalidPlayer	8	A player object or identifier is invalid.
GKErrorMatchRequestInvalid	13	The match request's properties are impossible to fulfill. For example, th mum number of players cannot be larger than the maximum number of
GKErrorNotAuthenticated	6	The local player has not been authenticated.
GKErrorNotSupported	16	The device does not support Game Center.
GKErrorOffline	25	The user went offline. In Mac OS X 10.8.2 and newer this constant has value 25. In older ve has value 19.
GKErrorParentalControlsBlocked	10	The feature has been blocked by the user.
GKErrorScoreNotSet	9	A score value was not set before attempting to post the score.
GKErrorTurnBasedInvalidParticipant	22	One of the participant objects you provided was invalid. Available on Mac OS X 10.8.2 and newer.
GKErrorTurnBasedInvalidState	24	The requested operation could not be completed because the session invalid state. Available on Mac OS X 10.8.2 and newer.
GKErrorTurnBasedInvalidTurn	23	The requested operation could not be completed because the specified pant does not have the required turn state. Available on Mac OS X 10.8.2 and newer.
GKErrorTurnBasedMatchDataTooLarge	20	Your game submitted data that exceeded the maximum size that Game permits for a turn-based game. Available on Mac OS X 10.8.2 and newer.
GKErrorTurnBasedTooManySessions	21	The requested operation could not be completed because it would exc maximum number of sessions. Available on Mac OS X 10.8.2 and newer.
GKErrorUnderage	14	The feature is disabled because the local player is underage.
GKErrorUnexpectedConnection	18	An unexpected player has connected to a match.
GKErrorUnknown	1	An unexpected error occurred.
GKErrorUserDenied	4	The operation was denied by the user.

Response Constants

Constant	Value	Description
GKInviteeResponseAccepted	0	The player accepted the invitation. Available on Mac OS X 10.8.2 and newer.
GKInviteeResponseDeclined	1	The player rejected the invitation. Available on Mac OS X 10.8.2 and newer.
GKInviteeResponseFailed	2	The invitation was unable to be delivered. Available on Mac OS X 10.8.2 and newer.
GKInviteeResponseIncompatible	3	The invitee is not running a compatible version of your game. Available on Mac OS X 10.8.2 and newer.
GKInviteeResponseNoAnswer	5	The invitation timed out without an answer. Available on Mac OS X 10.8.2 and newer.
GKInviteeResponseUnableToConnect	4	The invitee could not be contacted. Available on Mac OS X 10.8.2 and newer.

Invite Responses

Constant	Value	Description
GKInviteRecipientResponseAccepted	0	The player accepted the invitation. Available in OS X v10.10 and later.
GKInviteRecipientResponseDeclined	1	The player rejected the invitation. Available in OS X v10.10 and later.
GKInviteRecipientResponseFailed	2	The invitation was unable to be delivered. Available in OS X v10.10 and later.
GKInviteRecipientResponseIncompatible	3	The invitee is not running a compatible version of your game. Available in OS X v10.10 and later.
GKInviteRecipientResponseNoAnswer	5	The invitation timed out without an answer. Available in OS X v10.10 and later.
GKInviteRecipientResponseUnableToConnect	4	The invitee could not be contacted. Available in OS X v10.10 and later.

88.2 class GKAchievementChallengeMBS

88.2.1 class GKAchievementChallengeMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: A GKAchievementChallenge is a challenge to a player to complete a specific achievement.
Notes: Subclass of the GKChallengeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

88.2.2 Methods

88.2.3 achievement as GKAchievementMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The achievement the player must complete.
Notes: (read-only)

88.2.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

88.3 class GKAchievementDescriptionMBS

88.3.1 class GKAchievementDescriptionMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: An GKAchievementDescription object holds text and images used to display an achievement to the player.
Example:

```
// load the achievements defined for your game in App Store Connect
// MyGameKit is a subclass of GameKitMBS with the loadAchievementDescriptionsCompleted event implemented.
// GameKit is a property of the app: GameKit As MyGameKit
GameKit = New MyGameKit
GKAchievementDescriptionMBS.loadAchievementDescriptions

// in MyGameKit:
Sub loadAchievementDescriptionsCompleted(achievements() As GKAchievementDescriptionMBS, error As NSErrorMBS, tag As Variant) Handles loadAchievementDescriptionsCompleted
For Each a As GKAchievementDescriptionMBS In achievements
System.DebugLog a.identifier + ": " + a.title + " (" + a.maximumPoints.ToString + " points) - " + a.achievedDescription
Next
End Sub
```

Notes: During development, you create achievement descriptions by editing them in iTunes Connect. At runtime, your game retrieve these descriptions from Game Center. Usually, your game only needs to download achievement descriptions when it wants to present a custom achievement user interface to the player.

see also
http://developer.apple.com/library/iOS/#documentation/GameKit/Reference/GKAchievementDescription_Ref/Reference/Reference.html
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

88.3.2 Methods

88.3.3 achievedDescription as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A localized description of the completed achievement. (read-only)

88.3.4 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: True if the class is available.
Notes: Should always be true on Mac OS X 10.8 and newer.

88.3.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

88.3.6 groupIdentifier as string

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The group identifier for the achievement, if one exists.
Notes: Available on Mac OS X 10.8.2 and newer.

88.3.7 identifier as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A unique string used to identify the achievement. (read-only)
Notes: The GKAchievementDescription property holds the identifier string you created for the achievement on iTunes Connect.

88.3.8 image as NSImageMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: An image to display for the completed achievement. (read-only)
Notes: The value of this property is undefined until after the image is loaded. See loadImage.

88.3.9 incompleteAchievementImage as NSImageMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A common image for incomplete achievements.

88.3.10 isHidden as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that states whether this achievement should be visible to players. (read-only)
Notes: If the value of this property is false, this achievement is always visible to the user. If true, the achievement is not displayed in any of the standard achievement user interface screens. It remains hidden until the first time your game reports progress towards completing this achievement.

88.3.11 isReplayable as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Whether or not the achievement will be reported by the game when the user earns it again.
Notes: This allows the achievement to be used for challenges when the recipient has previously earned it. Available on Mac OS X 10.8.2 and newer.

88.3.12 loadAchievementDescriptions(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Downloads the achievement descriptions from Game Center.
Notes: When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.loadAchievementDescriptionsCompleted event.

88.3.13 loadImage(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Loads the image property for a completed achievement.
Notes: Your game should call loadImage for each achievement the user has completed. Your game should display the placeholder image until the image is successfully downloaded. After the event is called, the description's image property holds the same image object that is returned to the event.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.loadImageCompleted event.

88.3.14 maximumPoints as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The number of points earned by completing this achievement. (read-only)

88.3.15 placeholderCompletedAchievementImage as NSImageMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A common image for completed achievements.
Notes: When an achievement is completed, your game can display this image until the custom image for an achievement finishes loading.

88.3.16 title as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A localized title for the achievement. (read-only)

88.3.17 unachievedDescription as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A localized description of the achievement, to be used when the achievement has not been completed. (read-only)

88.3.18 Properties

88.3.19 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

88.4 class GKAchievementMBS

88.4.1 class GKAchievementMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Your game uses a GKAchievement object to communicate with Game Center about a local player's progress towards completing an achievement.
Example:

```
// report progress for an achievement to Game Center
// The player must be signed in, see GKLocalPlayerMBS.
// MyGameKit is a subclass of GameKitMBS with the reportAchievementCompleted event implemented.
// Kit is a property of the window: Kit As MyGameKit
Kit = New MyGameKit

Var achievement As New GKAchievementMBS("com.example.mygame.level10")
achievement.percentComplete = 50.0 // half way done
achievement.showsCompletionBanner = True
achievement.reportAchievement

// in MyGameKit:
Sub reportAchievementCompleted(score As GKAchievementMBS, error As NSErrorMBS, tag As Variant)
Handles reportAchievementCompleted
If error <>Nil Then
System.DebugLog error.localizedDescription
Else
System.DebugLog score.identifier + " reported, completed: " + score.isCompleted.ToString
End If
End Sub
```

Notes: see also
http://developer.apple.com/library/iOS/#documentation/GameKit/Reference/GKAchievement_Ref/Reference/Reference.html

88.4.2 Methods

88.4.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: True if the class is available.
Notes: Should always be true on Mac OS X 10.8 and newer.

88.4.4 Constructor(identifier as string)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Initializes a new achievement object.
Notes: identifier: A string that identifies the achievement you want to update.

Your game initializes a new achievement object only when it has not previously reported progress for that achievement. If your game has previously reported progress on an achievement, you should retrieve the achievement object by calling the loadAchievementsWithCompletionHandler class method and update the progress on that object instead.

88.4.5 isCompleted as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that states whether the player has completed the achievement. (read-only)
Notes: The value of this property is true if the percentComplete property is equal to 100.0; otherwise, it is false.

88.4.6 isHidden as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that states whether this achievement is normally kept secret from the player. (read-only)
Notes: On a newly initialized achievement object, the property's value is invalid. If the achievement object was returned to your game by the loadAchievementsWithCompletionHandler class method, the value of this property matches the value you set in iTunes Connect for that achievement. The value in this property is identical to the value found in the hidden property for an GKAchievementDescriptionMBS object that shares the same achievement identifier.

88.4.7 issueChallengeToPlayers(playerIDs() as string, message as string)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Use this method to issue GKScoreChallenges and GKAchievementChallenges to an array of playerIDs.
Notes: Players may not issue challenges to themselves nor to non-friends. Please see the GameKit reference documentation for further details on these methods.
Available on Mac OS X 10.8.2 and newer.

88.4.8 lastReportedDate as date

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The last time that the achievement was successfully reported to Game Center. (read-only)
Notes: On a newly initialized achievement object, this property holds the current date.

88.4.9 loadAchievements(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Retrieves previously submitted achievement progress from Game Center.
Notes: When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.loadAchievementsCompleted event.

88.4.10 reportAchievement(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Reports the player's progress to Game Center.
Notes: When the player makes progress towards completing an achievement, your game should communicate the player's progress to Game Center by calling this method. An achievement object is implicitly tied to the local player that was authenticated when the object was created; your game should only report progress when the same local player is still authenticated on the device.

Note: To avoid using network bandwidth unnecessarily, only report an achievement when the user has actually advanced the progress they have made towards completing it.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.reportAchievementCompleted.

When the progress is successfully reported, the achievement is made visible if it was previously hidden. The percentComplete and lastReportedDate property values stored on Game Center are updated if the new percentComplete value is greater than the value previously stored on Game Center. if the value of the percentComplete property was equal to 100.0, then the achievement is marked as completed and a banner may be shown to the player.

If the error is a network error and your game is running on iOS 4.3 or earlier, your game should periodically attempt to report the progress until the achievement is successfully reported. On iOS 5.0 and later and on OS X, the background reporting task automatically handles network errors on your game's behalf.

88.4.11 reportAchievements(achievements() as GKAchievementMBS, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Report an array of achievements to the server.
Notes: Percent complete is required. Points, completed state are set based on percentComplete. isHidden is set to false anytime this method is invoqued. Date is optional. Error will be nil on success.

Possible reasons for error:
1. Local player not authenticated.
2. Communications failure.
3. Reported Achievement does not exist.

Later calls GameKitMBS.reportAchievementsCompleted event.
Available on Mac OS X 10.8.2 and newer.

88.4.12 resetAchievements(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Resets all achievement progress for the local player.
Notes: Calling this class method deletes all progress towards achievements previously reported for the local player. Hidden achievements that were previously visible are now hidden again.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.resetAchievementsCompleted event.

88.4.13 selectChallengeablePlayerIDs(playerIDs() as string, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Given a list of playerIDs, return a subset of that list containing only playerIDs that are eligible to receive a challenge for the achievement.
Notes: Available on Mac OS X 10.8.2 and newer.
Calls later GameKitMBS.selectChallengeablePlayerIDsCompleted event when completed.

88.4.14 Properties

88.4.15 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

88.4.16 identifier as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A string used to uniquely identify the specific achievement the object refers to.
Notes: The identifier property must match the identifier string for an achievement you created for your game on iTunes Connect.
(Read and Write computed property)

88.4.17 percentComplete as Double

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A percentage value that states how far the player has progressed on this achievement.
Notes: The default value for a newly initialized achievement object is 0.0. The range of legal values is between 0.0 and 100.0, inclusive.
(Read and Write computed property)

88.4.18 showsCompletionBanner as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that states whether a banner is displayed when the achievement is completed.
Notes: When an achievement is completed and the value of this property is true, a notification banner is displayed to the player to inform them of the completed achievement. If the value of this property is false, there is no visual indication that the achievement is completed. Your game should set this property to false only when it wants to provide its own visual indicator that the achievement was earned. The default value is false.
(Read and Write computed property)

88.5 class GKAchievementViewControllerMBS

88.5.1 class GKAchievementViewControllerMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: An GKAchievementViewController object provides a standard user interface to display achievement progress for the local player.
Notes: see also
http://developer.apple.com/library/iOS/#documentation/GameKit/Reference/GKAchievementViewController_Ref/Reference/Reference.html
Subclass of the NSViewControllerMBS class.

88.5.2 Methods

88.5.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.

88.6 class GKChallengeMBS

88.6.1 class GKChallengeMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: A GKChallenge object represents a challenge issued by a player to another player.
Notes: Important: Your game must authenticate a local player before you can use any Game Center classes. If there is no authenticated player, your game receives a GKErrorNotAuthenticated error. For more information on authentication see Game Center Programming Guide.

Players use the Game Center app to issue and view challenges. However, your game can also customize its challenge behaviors in a number of ways:

- You can load the list of challenges issued to the local player by calling the loadReceivedChallenges shared method. For example, you might do this to display the challenges in your game's user interface.
- Your app can issue challenges using a GKScoreMBS or GKAchievementMBS object. Your game should only issue challenges when the local player initiates the action in your user interface.
- Your game can be notified when new challenge events are received. See GameKitMBS events.

You never subclass the GKChallengeMBS class directly. However, subclasses of GKChallengeMBS represent specific kinds of challenges. Two challenge types exist:

A GKScoreChallengeMBS is a challenge to beat a score the local player earned in a leaderboard.
A GKAchievementChallengeMBS is a challenge to complete an achievement that the local player has already completed.

Available on Mac OS X 10.8.2 and newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

88.6.2 Methods

88.6.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.8.2 and newer.

88.6.4 completionDate as date

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The date the challenge was completed. (read-only).
Notes: If the challenge is not complete, this value is nil.
Available on Mac OS X 10.8.2 and newer.

88.6.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The private constructor.
Notes: Available on Mac OS X 10.8.2 and newer.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

88.6.6 decline

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Declines a challenge.
Notes: If your game implements a custom user interface to display challenges, it should include controls that allow a player to decline a challenge. If the player uses your user interface to decline a challenge, call this method.

Available on Mac OS X 10.8.2 and newer.

88.6.7 issueDate as date

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The date the challenge was issued. (read-only).
Notes: Available on Mac OS X 10.8.2 and newer.

88.6.8 issuingPlayerID as string

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The player identifier for the player who issued the challenge. (read-only).
Notes: Available on Mac OS X 10.8.2 and newer.

88.6.9 loadReceivedChallenges(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Loads the list of outstanding challenges.
Notes: Available on Mac OS X 10.8.2 and newer.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKit.loadReceivedChallengesCompleted event.

88.6.10 message as string

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: A text message that describes the challenge. (read-only).
Notes: Available on Mac OS X 10.8.2 and newer.

88.6.11 receivingPlayerID as string

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The player identifier for the player who received the challenge. (read-only).
Notes: Available on Mac OS X 10.8.2 and newer.

88.6.12 state as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The current state of the challenge. (read-only).
Notes: See GKChallengeState* constants.
Available on Mac OS X 10.8.2 and newer.

88.6.13 Properties

88.6.14 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: Available on Mac OS X 10.8.2 and newer.
(Read and Write property)

88.6.15 Constants

State Constants

Constant	Value	Description
GKChallengeStateCompleted	2	The receiving player successfully completed the challenge. Available on Mac OS X 10.8.2 and newer.
GKChallengeStateDeclined	3	The receiving player declined the challenge. Available on Mac OS X 10.8.2 and newer.
GKChallengeStateInvalid	0	An error occurred. The state of this challenge is not valid. Available on Mac OS X 10.8.2 and newer.
GKChallengeStatePending	1	The challenge has been issued, but is not yet completed nor declined. Available on Mac OS X 10.8.2 and newer.

88.7 class GKChallengesViewControllerMBS

88.7.1 class GKChallengesViewControllerMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: View controller that provides the standard user interface for challenges.
Notes: Present modally from the top view controller.
Calls GameKit.challengesViewControllerDidFinish if needed.
Available on Mac OS X 10.8.2 and newer.
Subclass of the NSViewControllerMBS class.

88.7.2 Methods

88.7.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The constructor.

88.8 class GKDialogControllerMBS

88.8.1 class GKDialogControllerMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The GKDialogController class provides the ability to present Game Center view controller classes on OS X.
Example:

```
// present Game Center achievements on this window
// The player must be signed in, see GKLocalPlayerMBS.
Var controller As New GKGameCenterViewControllerMBS
controller.viewState = GKGameCenterViewControllerMBS.StateAchievements

Var dialog As GKDialogControllerMBS = GKDialogControllerMBS.sharedDialogController
dialog.setParentWindow Self.NSWindowMBS
If Not dialog.presentViewController(controller) Then
MessageBox "Can't show Game Center."
End If

// close it later with dialog.dismiss, e.g. in GameKitMBS.gameCenterViewControllerDidFinish
```

Notes: To present a view controller, instantiate a new GKDialogControllerMBS object or use the singleton object provided by the sharedDialogController class method. Set the parentWindow property of the dialog controller to the window that should display the view controller's contents. Then, call the dialog controller's presentViewController* methods, passing in the view controller object to be presented. Later, when the view controller's contents should be hidden, call the dialog controller's dismiss method.

88.8.2 Methods

88.8.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.

88.8.4 dismiss

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Dismisses the currently displayed view controller.

88.8.5 parentWindow as NSWindowMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The window that view controllers presented by the dialog controller are displayed in.
Notes: Your app must set this property before presenting a view controller. The window must be at least 800 x 600.

88.8.6 presentViewController(GKViewController as NSViewControllerMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: Presents a view controller in the dialog controller's window.
Notes: viewController: A Game Center view controller.

Returns true if the view controller was presented, false if an error occurred.
The contents of the window are covered by the view controller's contents until the view controller is dismissed.

88.8.7 setParentWindow(parentWindow as NSWindowMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Sets the parent window.
See also:

- 88.8.8 setParentWindow(parentWindow as Window) 14402

88.8.8 setParentWindow(parentWindow as Window)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Sets the parent window to the given Xojo Window.
Notes: Should work fine in Cocoa, but may fail in Carbon.
See also:

- 88.8.7 setParentWindow(parentWindow as NSWindowMBS) 14401

88.8.9 sharedDialogController as GKDialogControllerMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Retrieves the shared instance of the dialog controller.
Notes: Game Kit provides the shared dialog controller as a convenience. Your game can either use the shared dialog controller provided by this method, or it can instantiate its own GKDialogController object and configure it. You might create multiple GKDialogController objects when each should be presented in its own window.

88.9 class GKFriendRequestComposeViewControllerMBS

88.9.1 class GKFriendRequestComposeViewControllerMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Your game uses the GKFriendRequestComposeViewController class to present a screen that allows the local player to send friend requests to other players.
Notes: see also
https://developer.apple.com/library/prerelease/mac/#documentation/GameKit/Reference/GKFriendRequestComposeViewController_Ref/Reference/Reference.html
Subclass of the NSViewControllerMBS class.

88.9.2 Methods

88.9.3 addRecipientsWithEmailAddresses(playerIDs() as string)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Add recipients to the request.
Notes: If you don't specify at least one recipient before presenting the view, the recipients field will be made firstResponder, to encourage the user to add some.
If you add more than maxNumberOfRecipients recipients, these methods will throw an exception.

88.9.4 addRecipientsWithPlayerIDs(playerIDs() as string)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Add recipients to the request.
Notes: If you don't specify at least one recipient before presenting the view, the recipients field will be made firstResponder, to encourage the user to add some.
If you add more than maxNumberOfRecipients recipients, these methods will throw an exception.

88.9.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.

88.9.6 maxNumberOfRecipients as UInt64

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Get the maximum number of recipients permitted.

88.9.7 setMessage(message as string)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Specify the message sent to the invitee. A default message will be used if you don't specify one.

88.10 class GKGameCenterViewControllerMBS

88.10.1 class GKGameCenterViewControllerMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The GKGameCenterViewControllerMBS class aggregates many common Game Center features into a single user interface.
Example:

```
// show the Game Center leaderboard for today in a sheet on the window
// The player must be signed in, see GKLocalPlayerMBS.
// MyGameKit is a subclass of GameKitMBS with the gameCenterViewControllerDidFinish event implemented.
// Kit is a property of the window: Kit As MyGameKit
Kit = New MyGameKit

Var controller As New GKGameCenterViewControllerMBS
controller.viewState = GKGameCenterViewControllerMBS.StateLeaderboards
controller.leaderboardCategory = "com.example.mygame.highscores"
controller.leaderboardTimeScope = GKLeaderboardMBS.GKLeaderboardTimeScopeToday

Var dialog As GKDialogControllerMBS = GKDialogControllerMBS.sharedDialogController
dialog.setParentWindow Self.NSWindowMBS
Call dialog.presentViewController(controller)

// in MyGameKit:
Sub gameCenterViewControllerDidFinish(gameCenterViewController As Variant) Handles gameCenterViewControllerDidFinish
GKDialogControllerMBS.sharedDialogController.dismiss
End Sub
```

Notes: It replaces GKAchievementViewControllerMBS and GKLeaderboardViewControllerMBS as the preferred way to show Game Center content in your game.

Important: Your application must authenticate a local player before you can use any Game Center classes. If there is no authenticated player, your application receives a GKErrorNotAuthenticated error. For more information on authentication, see Game Center Programming Guide.

To display the Game Center screen, initialize a new GKGameCenterViewController object and set its delegate. Optionally, you can choose to configure the view controller further to specify which content is initially displayed. Then present the view controller. Your delegate is called when the user dismisses the screen.

Your game should pause other activities before presenting the Game Center user interface.

Available on Mac OS X 10.8.2 and newer.
Subclass of the NSViewControllerMBS class.

88.10.2 Methods

88.10.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The constructor.
Notes: Available on Mac OS X 10.8.2 and newer.

88.10.4 Properties

88.10.5 leaderboardCategory as string

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The named leaderboard that is displayed by the view controller.
Notes: The category property must either be empty or it must match a category identifier you defined when you created your leaderboards on iTunes Connect. If empty, the view displays scores for the aggregate leaderboard. Default is empty.

When the leaderboard is presented, the value of this property determines which leaderboard content is displayed to the player. As the player changes which leaderboard content they view, the leaderboardCategory property is automatically updated. For example, to preserve the player's selections, you can read the leaderboardCategory property after the screen is dismissed, and set that value the next time you initialize the view controller.

Available on Mac OS X 10.8.2 and newer.
(Read and Write computed property)

88.10.6 leaderboardTimeScope as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: A time filter used to restrict which scores are displayed to the player.
Notes: This property determines which tab view of the scores screen is displayed to the player. The default value is GKLeaderboardTimeScopeAllTime, which shows the best score each player has earned. For more information on time scopes, see GKLeaderboardMBS Class.

When the leaderboard is presented, the value of this property determines the initial tab that is displayed to the player. As the player changes which tab they view, the leaderboardTimeScope property is automatically updated. For example, to preserve the player's selections, you can read the leaderboardTimeScope property after the screen is dismissed, and set that value the next time you initialize the view controller.

Available on Mac OS X 10.8.2 and newer.
(Read and Write computed property)

88.10.7 viewState as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The content displayed by the Game Center controller.
Notes: See State* constants for possible values. When you first present the Game Center view controller, the content displayed by the view controller is determined by this property. If the player navigates to different content, the view state is automatically updated. For example, to preserve the player's selections, you can read the viewState property after the screen is dismissed, and set that value the next time you initialize the view controller.

Available on Mac OS X 10.8.2 and newer.
(Read and Write computed property)

88.10.8 Constants

State Values

Constant	Value	Description
StateAchievements	1	Indicates that the view controller presents achievements content. Available on Mac OS X 10.8.2 and newer.
StateChallenges	2	Indicates that the view controller presents challenges content. Available on Mac OS X 10.8.2 and newer.
StateDefault	-1	Indicates that the view controller should present the default screen. Available on Mac OS X 10.8.2 and newer.
StateLeaderboards	0	Indicates that the view controller presents leaderboard content. The leaderboardCategory and leaderboardTimeScope properties affect the appearance of this view state. Available on Mac OS X 10.8.2 and newer.

88.11 class GKInviteMBS

88.11.1 class GKInviteMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Your game receives invitations from other players through the GKInvite class.
Notes: Your game never directly creates GKInvite objects. Instead, invitations are created by Game Kit and delivered to your game. To receive invitations from Game Center, your game sets an invitation handler.

The properties of the invitation object describe the match the local player is being invited to join.
Xojo Developer Magazine

- 12.5, page 31: Writing OS X Apps for Game Center, Part 2: Requesting a Match by Tom Baumgartner
- 12.5, page 29: Writing OS X Apps for Game Center, Part 2: Requesting a Match by Tom Baumgartner

88.11.2 Methods

88.11.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: True if the class is available.
Notes: Should always be true on Mac OS X 10.8 and newer.

88.11.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.

88.11.5 inviter as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The identifier for the player who invited the local user to join a match. (read-only)

88.11.6 isHosted as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that states whether the game is hosted. (read-only)
Notes: If the value of the hosted property is true, this is a hosted match. If the value is false, this is a peer-to-peer match. The default is false.

88.11.7 playerAttributes as UInt32

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Player attributes from inviter's match request.
Notes: Available on Mac OS X 10.8.2 and newer.

88.11.8 playerGroup as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Player group from inviter's match request.
Notes: Available on Mac OS X 10.8.2 and newer.

88.11.9 Properties

88.11.10 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

88.12 class GKLeaderboardMBS

88.12.1 class GKLeaderboardMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A GKLeaderboard object represents a programmatic query to retrieve scores from Game Center.
Example:

```
// load the top 10 scores of this week from a leaderboard
// The player must be signed in, see GKLocalPlayerMBS.
// MyGameKit is a subclass of GameKitMBS with the loadScoresCompleted event implemented.
// Kit is a property of the window: Kit As MyGameKit
Kit = New MyGameKit

Var board As New GKLeaderboardMBS
board.category = "com.example.mygame.highscores"
board.timeScope = GKLeaderboardMBS.GKLeaderboardTimeScopeWeek
board.playerScope = GKLeaderboardMBS.GKLeaderboardPlayerScopeGlobal
board.range = New NSRangeMBS(1, 10) // rank 1 to 10
board.loadScores

// in MyGameKit:
Sub loadScoresCompleted(Leaderboard As GKLeaderboardMBS, scores() As GKScoreMBS, error As NSEr-
rorMBS, tag As Variant) Handles loadScoresCompleted
If error <>Nil Then
System.DebugLog error.localizedDescription
Return
End If
For Each s As GKScoreMBS In scores
System.DebugLog s.rank.ToString + ". " + s.playerID + ": " + s.formattedValue
Next
End Sub
```

Notes: Your game uses GKLeaderboard objects when it wants to analyze scoring information or when it wants to create its own custom leaderboard screens.

see also
https://developer.apple.com/library/prerelease/mac/#documentation/GameKit/Reference/GKLeaderboard_Ref/Reference/Reference.html

88.12.2 Methods

88.12.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: True if the class is available.
Notes: Should always be true on Mac OS X 10.8 and newer.

88.12.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Initializes a default leaderboard request.
Notes: A leaderboard object initialized with this method uses the playerScope, timeScope, and range properties to search Game Center for scores.
See also:

- 88.12.5 Constructor(playerIDs() as string) 14411

88.12.5 Constructor(playerIDs() as string)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Initializes a leaderboard request to retrieve the scores of a specific group of players.
Notes: playerIDs: An array of strings that holds the player identifier strings of the players to retrieve.

A leaderboard object initialized with this method ignores the playerScope and range properties. Instead, it retrieves scores for the specific list of players whose IDs are included in the playerIDs parameter.
See also:

- 88.12.4 Constructor 14411

88.12.6 groupIdentifier as string

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Set when leaderboards have been designated a game group; set when loadLeaderboards has been called for leaderboards that support game groups.
Notes: Available on Mac OS X 10.8.2 and newer.

88.12.7 isLoading as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the leaderboard object is retrieving scores. (read-only)
Notes: The value of the loading property is true if the leaderboard object has any pending requests for scores.

88.12.8 loadCategories(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Loads the list of leaderboard categories along with their corresponding localized titles.
Notes: You use this class method to retrieve the category identifiers and titles you configured for your leaderboards on iTunes Connect. To create a leaderboard query that targets a particular category, set the category property to one of the strings returned by this method.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.loadCategoriesCompleted event.

88.12.9 loadLeaderboards(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Loads the leaderboards.
Notes: Calls GameKitMBS.loadLeaderboardsCompleted later when completed.
Available on Mac OS X 10.8.2 and newer.

88.12.10 loadScores(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Retrieves a set of scores from Game Center.
Notes: When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.loadScoresCompleted event.

You can call this method multiple times; each call represents a different query against the scores stored on Game Center. If you post multiple load operations using the same leaderboard object, any properties that are updated by loading scores reflect the last query that completed. The order that achievement queries are processed is arbitrary.

88.12.11 localPlayerScore as GKScoreMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The score earned by the local player. (read-only)
Notes: This property is invalid until a call to loadScores is completed. Afterward, it contains a score object representing the local player's score on the leaderboard.

88.12.12 maxRange as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The size of the leaderboard. (read-only)
Notes: This property is invalid until a call to loadScores is completed. Afterward, it contains the total number of entries available to return to your game given the filters you applied to the query.

88.12.13 scores as GKScoreMBS()

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The list of scores returned by the search. (read-only)
Notes: This property is invalid until a call to loadScores is complete. Afterward, it contains the same score objects that were returned to the completion handler.

88.12.14 setDefaultLeaderboard(categoryID as string, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Sets the default leaderboard for the local player.
Notes: categoryID: The named leaderboard that should be the new default leaderboard for the local player.

The default leaderboard is used whenever your game uses a GKScore object to report a score to Game Center without explicitly setting the score object's category property. The default leaderboard is normally set in iTunes Connect when you configure your game. However, your game can use this class method to override the default leaderboard that appears for the local player.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.setDefaultLeaderboardCompleted event.

If an error occurs and was a network error, your game should periodically resend the request until it completes.

88.12.15 title as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The localized title for the leaderboard. (read-only)
Notes: This property is invalid until a call to loadScores is complete. Afterward, it contains the localized title that matches the category property of the leaderboard object.

88.12.16 Properties

88.12.17 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

88.12.18 category as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The named leaderboard to retrieve information from.
Notes: If non-empty, Game Center only returns scores with a matching category value. If empty, this property is ignored. Default is empty.
(Read and Write computed property)

88.12.19 playerScope as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A filter used to restrict the search to a subset of the players on Game Center.
Notes: The playerScope property is ignored if the leaderboard request was initialized using the Constructor method. Otherwise, the playerScope property determines which players are included in the request for high scores. The default is GKLeaderboardPlayerScopeGlobal. See Leaderboard Player Scope constants for more information.
(Read and Write computed property)

88.12.20 range as NSRangeMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The numerical score rankings to return from the search.
Notes: The range property is ignored if the leaderboard request was initialized using the Constructor method. Otherwise, the range property is used to filter which scores are returned to your game. For example, if you specified a range of [1,10] , after the search is complete, your game receives the top ten scores. The default range is [1,25] .

The minimum index is 1. The maximum length is 100.
(Read and Write computed property)

88.12.21 timeScope as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A filter used to restrict the search to scores that were posted within a specific period of time.
Notes: This property determines how far back in time the search looks for scores. The default value is GKLeaderboardTimeScopeAllTime. See Leaderboard Time Scope for more information.
(Read and Write computed property)

88.12.22 Constants

Leaderboard Player Scope

Constant	Value	Description
GKLeaderboardPlayerScopeFriendsOnly	1	Only friends of the local player should be considered when generating of scores.
GKLeaderboardPlayerScopeGlobal	0	All players on Game Center should be considered when generating th scores.

Leaderboard Time Scope

Constant	Value	Description
GKLeaderboardTimeScopeAllTime	2	Each player's best score is returned.
GKLeaderboardTimeScopeToday	0	Each player is restricted to scores recorded in the past 24 hours.
GKLeaderboardTimeScopeWeek	1	Each player is restricted to scores recorded in the past week.

88.13 class GKLeaderboardViewControllerMBS

88.13.1 class GKLeaderboardViewControllerMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The GKLeaderboardViewController class provides a standard user interface that displays high scores to the player.
Notes: see also
https://developer.apple.com/library/prerelease/mac/#documentation/GameKit/Reference/GKLeaderboardViewController_Ref/Reference/Reference.html
Subclass of the NSViewControllerMBS class.

88.13.2 Methods

88.13.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.

88.13.4 Properties

88.13.5 category as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The category.
Notes: (Read and Write computed property)

88.13.6 timeScope as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The time scope.
Notes: (Read and Write computed property)

88.14 class GKLocalPlayerMBS

88.14.1 class GKLocalPlayerMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The GKLocalPlayer class is a special subclass of GKPlayer that represents the authenticated player running your game on the local device.
Example:

```
// sign in the player to Game Center
// MyGameKit is a subclass of GameKitMBS with the authenticateHandler event implemented.
// Kit is a property of the window: Kit As MyGameKit
Kit = New MyGameKit
GKLocalPlayerMBS.localPlayer.SetAuthenticateHandler

// in MyGameKit:
Sub authenticateHandler(LocalPlayer As GKLocalPlayerMBS, viewController As NSViewControllerMBS,
error As NSErrorMBS, tag As Variant, viewControllerHandle As Integer) Handles authenticateHandler
If LocalPlayer.isAuthenticated Then
System.DebugLog "Signed in to Game Center."
ElseIf error <>Nil Then
System.DebugLog error.localizedDescription
End If
End Sub
```

Notes: At any given time, only one player may be authenticated on the device; this player must log out before another player can log in.

Your game must authenticate the local player before using any Game Center features. Authenticating the player ensures that the player has created an account and is connected to Game Center. To authenticate the local player, retrieve the shared instance of the local player by calling the localPlayer class method, and then call the authenticateWithCompletionHandler: method.

You can see whether the local player is authenticated by reading the local player's authenticated property. If authenticated is true, then the local player's other properties are valid, and you can call other Game Center methods.

Call the loadFriendsWithCompletionHandler: method to retrieve the player identifiers for the local player's friends.
Subclass of the GKPlayerMBS class.
Xojo Developer Magazine

- 12.6, page 27: Writing OS X Apps for Game Center, Part 3: Turn-Based Games by Tom Baumgartner
- 12.4, pages 30 to 31: Writing OS X Apps for Game Center, Getting started by authenticating the local

player with the Game Center Sandbox testing facility by Tom Baumgartner

88.14.2 Methods

88.14.3 authenticate(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use SetAuthenticateHandler instead. **Function:** Prompts the player to confirm their identity.
Notes: When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.authenticateCompleted event.

Your game should authenticate the player as early as possible after launching, ideally as soon as you can present a user interface to the player. For example, your game may be launched because the player accepted an invitation to join a match or to take a turn in a turn-based match, so you want your game to authenticate the player and process the match invitation as quickly as possible.

If there is not an authenticated player on the device when your game calls this method, Game Kit displays a user interface that allows the player to sign in with their credentials (or to create a new account if he or she has never used Game Center). Your game should pause other activities that require user interaction (such as a real time game loop) before attempting to authenticate the local player.

Each time the completion handler is called, the data stored in the GKLocalPlayer singleton object may have changed. A new player may have logged into the device or the player may have simply logged out from Game Center. Because of both of these possibilities, your completion handler must be prepared update any state of the game that assumes that a particular player is logged in if it discovers that the local player has changed. For more information, see "Authenticating the Local Player in a Multitasking Application" in Game Kit Programming Guide.

Deprecated in Mac OS X 10.9.

88.14.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Creates new object pointing to the shared instance of the local player.

88.14.5 friends as string()

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A list of player identifiers for the local player's friends. (read-only)
Notes: This property is invalid until a call to loadFriends succeeds.

88.14.6 GKPlayerAuthenticationDidChangeNotificationName as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The notificartion name fo the notification to inform about an authentication change.
Notes: Posted after the authenticated property of the shared local player object changes.

88.14.7 loadDefaultLeaderboardCategoryID(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Loads the category identifier for the local player's default leaderboard.
Notes: Calls later GameKitMBS.loadDefaultLeaderboardCategoryIDCompleted event.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.loadDefaultLeaderboardCategoryIDCompleted event.

Available on Mac OS X 10.8.2 and newer.

88.14.8 loadFriendPlayers(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Retrieves a list of player identifiers for the local player,Äôs friends.
Notes: When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls your completion handler. The completion handler is always called on the main thread.

Available in OS X v10.10 and later.
Calls later loadFriendPlayersCompleted event in GameKitMBS class.

88.14.9 loadFriends(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Retrieves a list of player identifiers for the local player's friends.
Notes: When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.loadFriendsCompleted.

Once this call is completed, the friends property is set to the same list of players returned in the completion event.

88.14.10 localPlayer as GKLocalPlayerMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Retrieves the shared instance of the local player.
Notes: You never directly create a local player object. Instead, you retrieve the singleton object by calling this method.

88.14.11 SetAuthenticateHandler(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Sets the handler called to process an authentication-related event with GameKitMBS.authenticateHandler.
Notes: Calls later GameKitMBS.authenticateHandler.
Available on Mac OS X 10.8.2 and newer.

88.14.12 setDefaultLeaderboardCategoryID(categoryID as string, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Sets the category identifier for the local player's default leaderboard.
Notes: categoryID: The category ID string for one of your game's leaderboards.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.setDefaultLeaderboardCategoryIDCompleted event.

The default leaderboard is configured in iTunes Connect as part of configuring your game's leaderboards. All players normally start with this leaderboard as the default leaderboard. Calling this method changes the default leaderboard only for the local player.

Available on Mac OS X 10.8.2 and newer.

88.14.13 Properties

88.14.14 isAuthenticated as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether a local player is currently signed in to Game Center. (read-only)
Notes: Before using other Game Center features, your game must authenticate the local player. Your game can read this property elsewhere in your game to confirm that the local player is authenticated.

Important Even after the local player has successfully authenticated their credentials, the value of this property can change. For example, if your game is switched into the background, the player could launch the Game Center game and sign out of Game Center. To be notified when the value of this property changes, your game should register to receive the GKPlayerAuthenticationDidChangeNotificationName notification (or use GameKitMBS.PlayerAuthenticationDidChange event).
(Read only property)

88.14.15 isUnderage as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that declares whether the local player is underage. (read-only)
Notes: Some Game Center features are disabled if the local player is underage. Your game can test this property if it wants to disable some of its own features based on the player's age.
(Read only property)

88.15 class GKMatchmakerMBS

88.15.1 class GKMatchmakerMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The GKMatchmaker class is used to programmatically create matches to other players and to receive match invitations sent by other players.
Example:

```
// find other players automatically, without showing the Game Center user interface
// The player must be signed in, see GKLocalPlayerMBS.
// The result arrives in the findMatchForRequestCompleted event of your GameKitMBS subclass, see GK-
MatchRequestMBS.
Var request As New GKMatchRequestMBS
request.minPlayers = 2
request.maxPlayers = 2

Var matchmaker As GKMatchmakerMBS = GKMatchmakerMBS.sharedMatchmaker
matchmaker.findMatchForRequest request

// to stop searching: matchmaker.cancel
```

Notes: see also
https://developer.apple.com/library/mac/#documentation/GameKit/Reference/GKMatchmaker_Ref/Reference/Reference.html
Xojo Developer Magazine

- 12.5, pages 31 to 32: Writing OS X Apps for Game Center, Part 2: Requesting a Match by Tom Baumgartner
- 12.5, page 29: Writing OS X Apps for Game Center, Part 2: Requesting a Match by Tom Baumgartner

88.15.2 Methods

88.15.3 addPlayersToMatch(match as GKMatchMBS, matchRequest as GK-MatchRequestMBS, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Adds players to an existing match.
Notes: match: A previously created match.
matchRequest: The parameters for the new match request.

This method updates an existing match object by adding additional players.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.addPlayersToMatchCompleted event.

88.15.4 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: True if the class is available.
Notes: Should always be true on Mac OS X 10.8 and newer.

88.15.5 cancel

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Cancels a pending matchmaking request.
Notes: The completion event receives a callback with a GKErrorCancelled error.

88.15.6 cancelInviteToPlayer(playerID as string)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Cancel a pending invitation to a player.
Notes: Available on Mac OS X 10.8.2 and newer.

88.15.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.

88.15.8 Destructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The destructor.

88.15.9 findMatchForRequest(request as GKMatchRequestMBS, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Initiates a request to find players for a peer-to-peer match.
Notes: When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.findMatchForRequestCompleted event.

The match request's playersToInvite property is ignored; to invite a specific set of players to the match, you must display the standard user interface.

88.15.10 findPlayersForHostedMatchRequest(request as GKMatchRequestMBS, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Initiates a request to find players for a hosted match.
Notes: request: The configuration for the desired match.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.findPlayersForHostedMatchRequestCompleted event. When the event is called, your game should connect those players to your own server.

The match request's playersToInvite property is ignored; to invite a specific set of players to the match, you must display the standard user interface.

88.15.11 finishMatchmakingForMatch(match as GKMatchMBS)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Call this when finished with all programmatic P2P invites/matchmaking, for compatability with connected players using GKMatchmakerViewController.
Notes: Available on Mac OS X 10.8.2 and newer.

88.15.12 matchForInvite(invite as GKInviteMBS, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Get a match for an accepted invite.
Notes: Calls later GameKitMBS.matchForInviteCompleted eventg.

Possible reasons for error:
1. Communications failure.
2. Invite cancelled.

Available on Mac OS X 10.8.2 and newer.

88.15.13 maxPlayersAllowedForMatchOfType(type as Integer) as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: To determine the maximum allowed players for each type of match supported.
Notes: Available on Mac OS X 10.8.2 and newer.

88.15.14 queryActivity(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Initiates a search for activity in all player groups.
Notes: A query allows your game to see how many players have recently searched for a match, across all player groups.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.queryActivityCompleted.

88.15.15 queryPlayerGroupActivity(playerGroup as Integer, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Queries Game Center for the activity in a player group.
Notes: playerGroup: A number that uniquely identifies a subset of players of your game.

A query allows your game to see how many players have recently searched for a match. As a result, you can present a user interface that shows the relative activity in each player group. For example, if one group sees less activity than others, you might display a warning so that players are aware that finding a match may take longer.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.queryPlayerGroupActivityCompleted event.

88.15.16 sharedMatchmaker as GKMatchmakerMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Returns the singleton matchmaker instance.
Notes: Games do not create a GKMatchmaker object. Instead, they retrieve the shared singleton by calling this method.

88.15.17 startBrowsingForNearbyPlayers(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Start browsing for nearby players that can be invited to a match.
Notes: The GameKitMBS.startBrowsingForNearbyPlayersCompleted event will be called for each player found with a compatible game. It may be called more than once for the same player if that player ever becomes unreachable (e.g. moves out of range). You should call stopBrowsingForNearbyPlayers when finished browsing.

Available on Mac OS X 10.8.2 and newer.

88.15.18 stopBrowsingForNearbyPlayers

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Stop browsing for nearby players.
Notes: Available on Mac OS X 10.8.2 and newer.

88.15.19 Properties

88.15.20 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

88.15.21 Constants

Match Types

Constant	Value	Description
GKMatchTypeHosted	1	Hosted Match Available on Mac OS X 10.8.2 and newer.
GKMatchTypePeerToPeer	0	Peer to Peer Match. Available on Mac OS X 10.8.2 and newer.
GKMatchTypeTurnBased	2	Turn based match. Available on Mac OS X 10.8.2 and newer.

88.16 class GKMatchmakerViewControllerMBS

88.16.1 class GKMatchmakerViewControllerMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The GKMatchmakerViewController class is used to present a standard user interface to the player.
Example:

```
// show the Game Center user interface to invite friends to a match
// MyGameKit is a subclass of GameKitMBS with the matchmaker events implemented, see GameKitMBS.
Var request As New GKMatchRequestMBS
request.minPlayers = 2
request.maxPlayers = 4

Var controller As New GKMatchmakerViewControllerMBS(request)
Var dialog As GKDialogControllerMBS = GKDialogControllerMBS.sharedDialogController
dialog.setParentWindow Self.NSWindowMBS
Call dialog.presentViewController(controller)
```

Notes: This interface allows them to invite friends to a match or to allow Game Center to fill the remaining players needed for a match.

see also:
https://developer.apple.com/library/mac/#documentation/GameKit/Reference/GKMatchmakerViewController_Ref/Reference/Reference.html
Subclass of the NSViewControllerMBS class.
Xojo Developer Magazine

- 12.5, page 33: Writing OS X Apps for Game Center, Part 2: Requesting a Match by Tom Baumgartner
- 12.5, page 29: Writing OS X Apps for Game Center, Part 2: Requesting a Match by Tom Baumgartner

88.16.2 Methods

88.16.3 addPlayersToMatch(match as GKMatchMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Adds a player to the match.
Notes: match: An existing match that you want to add players to.

Your game calls this method prior to presenting the view controller to the player. Calling this method instructs the view controller to add new players to the provided match rather than creating a new match.

When called, this method sets the delegate on the match to nil and updates the view controller's user interface to display the players already connected to the match.

Important Only one device connected to the match should call this method.

88.16.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The private constructor.
See also:

- 88.16.5 Constructor(invite as GKInviteMBS) 14429
- 88.16.6 Constructor(request as GKMatchRequestMBS) 14429

88.16.5 Constructor(invite as GKInviteMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Initializes a matchmaker view controller to respond to an invitation received from another player.
Notes: invite: The invitation received from the other player.

The user is allowed to join the match that the user was invited to, but is not allowed to invite others to the match.
See also:

- 88.16.4 Constructor 14429
- 88.16.6 Constructor(request as GKMatchRequestMBS) 14429

88.16.6 Constructor(request as GKMatchRequestMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Initializes a matchmaker view controller to create a new match.
Notes: request: A request containing the characteristics for the desired match.
Your game uses this Constructor when it wants the local user to create a new match.
See also:

- 88.16.4 Constructor 14429
- 88.16.5 Constructor(invite as GKInviteMBS) 14429

88.16.7 matchRequest as GKMatchRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The configuration for the desired match. (read-only)

88.16.8 setHostedPlayer(playerID as string, connected as boolean)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Updates a player's status on the view to show that the player has connected or disconnected from your server.
Notes: playerID: The identifier string for a player that connected to the external server.
connected: Optional, a Boolean value that states whether the player is connected to the hosted match.

When setting up a hosted match, each device should instantiate a matchmaker view controller and display it to the player. Then, when a new player connects to your server, your server should notify all participating devices already connected to your server. Each participating device should then call this method to update that player's status in the matchmaking interface. Similarly, if a player disconnects from the server, your server should inform each device so that the devices can update their user interface.

88.16.9 Properties

88.16.10 DefaultInvitationMessage as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The default invitation message used to initialize an invitation.
Notes: Your game sets this property to change the default invitation text displayed when the local player creates a new invitation. The local player may edit the text before sending the invitation.
(Read and Write computed property)

88.16.11 Hosted as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the match is hosted or peer-to-peer.
Notes: The value of the hosted property determines which events of GameKitMBS are called when the match is complete. If true, this is a hosted match, and the delegate's matchmakerViewControllerDidFind-Players method is to provide the list of players to your game. If false, this is a peer-to-peer match, and matchmakerViewControllerDidCreateMatch is called with a GKMatch object. The default value is false.

Hosted matches require you to provide a server that hosts the participants in the match.
(Read and Write computed property)

88.17 class GKMatchMBS

88.17.1 class GKMatchMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A GKMatch object provides a peer-to-peer connection between a group of players that are connected through Game Center.
Example:

```
// send a move to all other players in a Game Center match
// match is the GKMatchMBS from GameKitMBS.findMatchForRequestCompleted, see GKMatchRequestMBS
Var match As GKMatchMBS // your match
If match = Nil Then Return

Var move As New Dictionary
move.Value("x") = 3
move.Value("y") = 5

Var error As NSErrorMBS
If Not match.sendDataToAllPlayers(move, 0, error) Then // 0 = reliable
MessageBox error.localizedDescription
End If
MessageBox "Players: " + String.FromArray(match.playerIDs, ", ")
```

Notes: Matches provide both data and voice services. Your application never directly allocates GKMatch objects. Instead, your application uses the GKMatchmaker class to programmatically find a match with other interested players or a GKMatchmakerViewController object to display a user interface to the player.

After your application receives a match object, you must set a delegate and then wait until the other participants are connected to the match. You can read the expectedPlayerCount property to determine how many players have not connected to the match.

Your application transmits data to other players by calling either the sendDataToAllPlayers method or the sendDataToPlayer method. To transmit and receive voice data, call voiceChatWithName to create one or more voice channels.

When you are finished with the match, call the match's disconnect method.
Xojo Developer Magazine

- 12.5, page 34: Writing OS X Apps for Game Center, Part 2: Requesting a Match by Tom Baumgartner
- 12.5, pages 31 to 32: Writing OS X Apps for Game Center, Part 2: Requesting a Match by Tom Baumgartner

88.17.2 Methods

88.17.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: True if the class is available.
Notes: Should always be true on Mac OS X 10.8 and newer.

88.17.4 chooseBestHostPlayer(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Determines the best player in the game to act as the server for a client-server match.
Notes: Calling this method causes Game Kit to attempt to estimate which player has the best overall network connection using a variety of metrics such as bandwidth, latency and network reliability. Typically, you call this method when your game implements a client-server model on top of the match's peer-to-peer connection. See "Designing Your Network Game" in Game Center Programming Guide.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls your GKMatchMBS.chooseBestHostPlayerCompleted event.

88.17.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.

88.17.6 disconnect

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Disconnects the local player from the match.
Notes: Your application should call disconnect before releasing the match object. Calling disconnect notifies other players that you have left the match.

88.17.7 expectedPlayerCount as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The remaining number of players who have not yet connected to the match. (read-only)
Notes: The value of this property is decremented whenever a player connects to the match. When its value reaches zero, all expected players are connected, and your game can begin the match.

88.17.8 playerIDs as string()

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The player identifiers for the players in the match. (read-only)
Notes: The playerIDs property initially includes the player identifiers for any players already connected to the match; the array may initially be empty. As each player connects to the match, that player's player identifier is added to the array.

88.17.9 rematch(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Create a new match with the list of players from an existing match.
Notes: Calling this method uses auto-matching to recreate a previous match. A new match with the same set of players is created and returned. If your game attempts to recreate matches using this method, each instance of your game on each device should call this method.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GKGameKitMBS.rematchCompleted event.

88.17.10 sendDataToAllPlayers(data as Dictionary, mode as Integer, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Transmits data to all players connected to the match.
Notes: data: The game data to send.
mode: The mechanism used to send the data.
error: If the data could not be queued, on return, this parameter holds an NSError object describing the error.

Return true if the data was successfully queued for transmission; false if the match was unable to queue the data.
The match queues the data and transmits it when the network becomes available.

88.17.11 sendDataToPlayers(players() as string, data as Dictionary, mode as Integer, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Transmits data to a list of connected players.
Notes: data: The game data to be sent.
players: An array containing the identifier strings for the list of players who should receive the data.
mode: The mechanism used to send the data.
error: If the data could not be queued, on return, this parameter holds an NSError object describing the error.

Returns true if the data was successfully queued for transmission; false if the match was unable to queue the data.
The match queues the data and transmits it when the network becomes available.

88.17.12 voiceChatWithName(name as string) as GKVoiceChatMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Joins a voice channel.
Notes: Returns an voice chat object for the voice channel, or nil if an error occurred.

Calling this method joins a voice channel, creating it if necessary. Your application should retain the voice chat object returned by this method. All participants who join a channel with the same name are connected to each other.

A single match can have multiple voice chat channels, and any player in the match can join multiple channels simultaneously. For example, a team-based game might create a channel for each team, and a single channel that includes all of the players.

Voice chat objects are dependent on the network connection provided by the match. When the player disconnects from the match, all voice channels associated with that match stop working. Typically, you should release any voice channels you joined before calling calling disconnect on the match.

Parental controls may prevent a player from joining a voice chat. If the player is not permitted to join the voice channel, a nil object is returned to your application.

88.17.13 Properties

88.17.14 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

88.17.15 Constants

Constants

Constant	Value	Description
GKMatchSendDataReliable	0	One of the mechanism constants used to transmit data to other players. The data is sent continuously until it is successfully received by the intended recipients or the connection times out. Reliable transmissions are delivered in the order they were sent. Use this when you need to guarantee delivery.
GKMatchSendDataUnreliable	1	One of the mechanism constants used to transmit data to other players. The data is sent once and is not sent again if a transmission error occurs. Data transmitted unreliably may be received out of order by recipients. Use this for small packets of data that must arrive quickly to be useful to the recipient.

Match State Constants

Constant	Value	Description
GKPlayerStateConnected	1	Connected to the match.
GKPlayerStateDisconnected	2	Disconnected from the match.
GKPlayerStateUnknown	0	Initial player state.

88.18 class GKMatchRequestMBS

88.18.1 class GKMatchRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A GKMatchRequest object is used to specify the parameters for a new match.
Example:

```
// ask Game Center to find 1 to 3 other players for a match
// The player must be signed in, see GKLocalPlayerMBS.
// MyGameKit is a subclass of GameKitMBS with the findMatchForRequestCompleted event implemented.
// Kit is a property of the window: Kit As MyGameKit
Kit = New MyGameKit

Var request As New GKMatchRequestMBS
request.minPlayers = 2
request.maxPlayers = 4
request.defaultNumberOfPlayers = 2
request.inviteMessage = "Let's play!"

GKMatchmakerMBS.sharedMatchmaker.findMatchForRequest request

// in MyGameKit:
Sub findMatchForRequestCompleted(MatchMaker As GKMatchmakerMBS, request As GKMatchRequestMBS,
match As GKMatchMBS, TurnBasedMatch As GKTurnBasedMatchMBS, error As NSErrorMBS, tag As
Variant) Handles findMatchForRequestCompleted
If error <>Nil Then
System.DebugLog error.localizedDescription
ElseIf match <>Nil Then
System.DebugLog "Match found, waiting for " + match.expectedPlayerCount.ToString + " more players."
End If
End Sub
```

Notes: A GKMatchRequest object is passed to the GKMatchmaker object to programmatically search for other players, or to a GKMatchmakerViewController (GKMatchmakerPanel on OS X) object when your game wants to present the default user interface to the player.
Xojo Developer Magazine

- 12.5, pages 32 to 33: Writing OS X Apps for Game Center, Part 2: Requesting a Match by Tom Baumgartner
- 12.5, page 29: Writing OS X Apps for Game Center, Part 2: Requesting a Match by Tom Baumgartner

88.18.2 Methods

88.18.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: True if the class is available.
Notes: Should always be true on Mac OS X 10.8 and newer.

88.18.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.

88.18.5 playersToInvite as string()

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A list of players to invite to the match.
Notes: If empty (the default), no players are invited. If non-empty, Game Kit populates the match with the provided list of players.

88.18.6 recipients as GKPlayerMBS()

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: A list of player identifiers for players to invite to the match.
Notes: The property holds an array of GKPlayer objects, each of which contains an identifier for a player on Game Center. If the value of the property is non-nil, when you use the request to create a match, Game Center invites those players to the match. No automatching is done and the GKMatchRequestmaxPlayers and minPlayers properties are ignored. If nil (the default), no players are invited. The exact behavior for matchmaking depends on the kind of match being created and the class used to create the match. For more information, see Game Center Programming Guide.

Available in OS X v10.10 and later.

88.18.7 SetInviteeResponseHandler(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Sets the invitee response handler for this match request.
Notes: An invitee response handler is called whenever you programmatically invite specific players to join a match. It is called once for each player invited to the match. Typically, your game uses the responses to update the custom user interface. For example, you want the player to be able to perform any of the following tasks:

- Start the match.
- Invite an additional set of specific players.
- Use matchmaking to fill the remaining match slots.

Available on Mac OS X 10.8.2 and newer.

88.18.8 setPlayersToInvite(playerIDs() as string)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Sets the list of players to invite to the match.
Notes: If empty (the default), no players are invited. If non-empty, Game Kit populates the match with the provided list of players.

88.18.9 SetRecipientResponseHandler(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Sets the event to be called when a response from an invited player is returned to your game.
Notes: Once event is installed, the plugin can call GameKitMBS.recipientResponseHandler event for this match request.

88.18.10 setRecipients(players() as GKPlayerMBS)

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Sets the list of player identifiers for players to invite to the match.
Notes: The property holds an array of GKPlayer objects, each of which contains an identifier for a player on Game Center. If the value of the property is non-nil, when you use the request to create a match, Game Center invites those players to the match. No automatching is done and the GKMatchRequestmaxPlayers and minPlayers properties are ignored. If nil (the default), no players are invited. The exact behavior for matchmaking depends on the kind of match being created and the class used to create the match. For more information, see Game Center Programming Guide.

Available in OS X v10.10 and later.

88.18.11 Properties

88.18.12 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

88.18.13 defaultNumberOfPlayers as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The default number of players for the match.
Notes: If this property is not set, then the default number of players is equal to the value stored in the maxPlayers property. The default number of players determines the number of invitees shown in the standard matchmaking user interface. The player can choose to override this to add or remove slots.

Available on Mac OS X 10.8.2 and newer.
(Read and Write computed property)

88.18.14 inviteMessage as string

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Message sent to invited players, may be modified if using Game Center UI.
Notes: Available on Mac OS X 10.8.2 and newer.
(Read and Write computed property)

88.18.15 maxPlayers as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The maximum number of players to join the match.
Notes: The maximum number of players must be equal or greater than the minimum number of players. The maximum number of players may be no more than 4 for a peer-to-peer match and no more than 16 for a hosted match.
(Read and Write computed property)

88.18.16 minPlayers as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The minimum number of players to join the match.
Notes: The minimum number of players must be at least 2.
(Read and Write computed property)

88.18.17 playerAttributes as UInt32

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A mask that specifies the role that the local player would like to play in the game.
Notes: If this value is 0 (the default), this property is ignored. If the value is nonzero, then automatching uses the value as a mask that restricts the role the player can play in the group. Automatching with player attributes follows two rules:

A new player can only be added to the match if the bitwise AND of that player's mask and the mask of any player already in the match equals &h00000000.
Players are added to the match until the bitwise OR of the masks of all the players in the match equals &hFFFFFFFF.
(Read and Write computed property)

88.18.18 playerGroup as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A number identifying a subset of players allowed to join the match.
Notes: If your game sets the playerGroup property, only players whose requests share the same playerGroup value are automatched by Game Center. You can use any values you want for player groups. For example, you could define different playerGroup values to implement any of the following filters:

- A game could restrict players based on skill level.
- A game that provides multiple games could use it to filter players into the specific game they want to play.
- A game with multiple victory conditions (for example, Capture-The-Flag, Survival) could match players to others interested in the same rules.
- A game that provides bonus content through in-app purchase could match players who own the same content with each other.

(Read and Write computed property)

88.19 class GKPlayerMBS

88.19.1 class GKPlayerMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: GKPlayer objects provide information about a player connected to Game Center.
Example:

```
// show the Game Center name of the local player
Var player As GKLocalPlayerMBS = GKLocalPlayerMBS.localPlayer
If player.isAuthenticated Then
MessageBox "Hello " + player.displayName + " (" + player.alias + ")"
Else
MessageBox "Not signed in to Game Center, see GKLocalPlayerMBS.authenticate."
End If
```

Notes: see also
https://developer.apple.com/library/mac/#documentation/GameKit/Reference/GKPlayer_Ref/Reference/Reference.html
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

88.19.2 Methods

88.19.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: True if the class is available.
Notes: Should always be true on Mac OS X 10.8 and newer.

88.19.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

88.19.5 GKPlayerDidChangeNotificationName as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The name of the notification posted when a player object's data changes.

Notes: Used internally for GameKitMBS.playerChanged event.

88.19.6 loadPhotoForSize(size as Integer, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Loads a photo depicting this player from Game Center.
Notes: size: A constant that determines the size of the photo to load.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.loadPhotoForSizeCompleted.

Important The size of the image returned to your game is dependent on both the constant you provided in the initial request and the user interface idiom of the device your game is running on.

88.19.7 loadPlayersForIdentifiers(identifiers() as string, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Loads information from Game Center about a list of players.
Notes: identifiers: An array of strings, each a unique identifier for a Game Center player.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.loadPlayersForIdentifiersCompleted event.

88.19.8 Properties

88.19.9 alias as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A string chosen by the player to identify themselves to other players. (read-only)
Notes: Your game uses the alias property when it wants to display a user-visible string for a particular player.
(Read only property)

88.19.10 displayName as String

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: A string to display for the player.
Notes: The display name for a player depends on whether the player is a friend of the local player authenticated on the device. If the player is a friend of the local player, then the display name is the actual name of the player. If the player is not a friend, then the display name is the player,Äôs alias.
Available in Mac OS X 10.8 and newer.
(Read only property)

88.19.11 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

88.19.12 isFriend as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the local player has identified this player as a friend. (read-only)
Notes: The Game Center application allows players to declare other players as friends.
(Read only property)

88.19.13 playerID as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A string assigned by Game Center to uniquely identify a player. (read-only)
Notes: The player identifier should not be displayed to the user. Your game should use this string whenever it needs to persistently store information for a specific player.

Do not make assumptions about the contents of the player identifier string. Its format and length are subject to change.
(Read only property)

88.19.14 Constants

Constants

Constant	Value	Description
GKPhotoSizeNormal	1	One of the size constants of a photo loaded by Game Center. Load a normal sized photo.
GKPhotoSizeSmall	0	One of the size constants of a photo loaded by Game Center. Load a small photo.

88.20 class GKScoreChallengeMBS

88.20.1 class GKScoreChallengeMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: A GKScoreChallenge object represents a challenge based on a score in a leaderboard.
Notes: To complete the challenge, the player must score an equal or better score than the score used to create the challenge. When a player beats a score challenge, a new score challenge is automatically issued to the player that issued the challenge unless there is already a pending score challenge that requires a better score.

Available on Mac OS X 10.8.2 and newer.
Subclass of the GKChallengeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

88.20.2 Methods

88.20.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The private constructor.
Notes: Available on Mac OS X 10.8.2 and newer.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

88.20.4 score as GKScoreMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The score to beat. (read-only)
Notes: Available on Mac OS X 10.8.2 and newer.

88.21 class GKScoreMBS

88.21.1 class GKScoreMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A GKScore class holds information for a score that was earned by the player.
Example:

```
// report a new high score to a Game Center leaderboard
// The player must be signed in, see GKLocalPlayerMBS.
// MyGameKit is a subclass of GameKitMBS with the reportScoreCompleted event implemented.
// Kit is a property of the window: Kit As MyGameKit
Kit = New MyGameKit

Var score As New GKScoreMBS("com.example.mygame.highscores")
score.value = 12500
score.context = 3 // e.g. the level, your own value
score.reportScore

// in MyGameKit:
Sub reportScoreCompleted(score As GKScoreMBS, error As NSErrorMBS, tag As Variant) Handles reportScoreCompleted
If error <>Nil Then
System.DebugLog error.localizedDescription
Else
System.DebugLog "Score " + score.formattedValue + " reported."
End If
End Sub
```

Notes: Your game creates GKScore objects to post scores to a leaderboard on Game Center. When your game retrieves score information from a leaderboard those scores are returned as GKScore objects.

see also
https://developer.apple.com/library/mac/#documentation/GameKit/Reference/GKScore_Ref/Reference/Reference.html

88.21.2 Methods

88.21.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: True if the class is available.
Notes: Should always be true on Mac OS X 10.8 and newer.

88.21.4 Constructor(category as string)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Initializes a score object.
Notes: Category: A category identifier for a specific leaderboard you've configured on iTunes Connect. Must not be "".

Your game explicitly allocates and initializes a score object when it needs to report a new score to Game Center.

88.21.5 date as date

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The date and time when the score was earned. (read-only)
Notes: When you initialize the new score object, the date property is automatically set to the current date and time.

88.21.6 formattedValue as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Returns the player's score as a localized string. (read-only)
Notes: This property is invalid on a newly initialized score object. On a score returned from Game Kit, it contains a formatted string based on the player's score. You control the formatting of this string by configuring your leaderboards on iTunes Connect.

Never convert the value property into a string; always configure your leaderboard and call this method to receive the formatted string.

88.21.7 issueChallengeToPlayers(playerIDs() as string, message as string)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Use this method to issue GKScoreChallenges and GKAchievementChallenges to an array of playerIDs.
Notes: Players may not issue challenges to themselves nor to non-friends. Please see the GameKit reference documentation for further details on these methods.

Available on Mac OS X 10.8.2 and newer.

88.21.8 playerID as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The player identifier for the player that earned the score. (read-only)
Notes: When you initialize a new score object, the playerID property is set to the identifier for the local player. If you read the property on a score object retrieved from Game Center, playerID identifies the player who recorded that score.

88.21.9 rank as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The position of the score in the results of a leaderboard search. (read-only)
Notes: The value of this property is undefined on a newly initialized GKScore object. It is only valid on score objects received from Game Center. The rank property represents the position of the score in the returned results, with 1 being the best score, 2 being the second best, and so on.

88.21.10 reportScore(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Reports a score to Game Center.
Notes: The value property must be set before calling this method.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.reportScoreCompleted.

If the score object successfully reports progress to Game Center, your game may release it. Otherwise, your game should inspect the error. If the error is a network error and your game is running on iOS 4.3 or earlier, your game should periodically attempt to report the progress until the score is successfully reported. On iOS 5.0 and later and on OS X, the background reporting task automatically handles network errors on your game's behalf.

88.21.11 reportScores(scores() as GKScoreMBS, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Reports a list of scores to Game Center.
Notes: scores: An array of score objects to report to Game Center.

Calls later GameKitMBS.reportScoresCompleted on completion.

Use this class method whenever you need to submit multiple scores at the same time. Calling this method reports each of the scores, exactly as if you called the reportScore method on each score object in the array. However, the entire operation can typically be processed more efficiently using this method, and the completion handler is only called once.
Available on Mac OS X 10.8.2 and newer.

88.21.12 Properties

88.21.13 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

88.21.14 category as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The leaderboard that this score belongs to.
Notes: The category string must match an identifier you created when you defined your leaderboards on iTunes Connect.
(Read and Write computed property)

88.21.15 context as UInt64

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: An integer value used by your game.
Notes: The context property allows your game to associate an arbitrary 64-bit unsigned integer value with the score data reported to Game Center. You decide how this integer value is interpreted by your game. For example, your game might use the context property to store flags that provide game-specific details about a player's score, or it might use the context as a key to some other data stored on the device or on your own server. In either case, your game typically uses this information when it displays a custom leaderboard to the player.
(Read and Write computed property)

88.21.16 shouldSetDefaultLeaderboard as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether this score should also update the default leaderboard.
Notes: If the value of this property is true, when the score is reported to Game Center, Game Center also updates the default leaderboard to match the value stored in the category property of the score object. This matches the behavior of the GKLeaderboardMBS class's setDefaultLeaderboard class method. If the value of this property is true, the default leaderboard is not changed by reporting the score. The default value of this property is false.
(Read and Write computed property)

88.21.17 value as Int64

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The score earned by the player.
Notes: You can use any algorithm you want to calculate scores in your game. The value provided by a score object must match the formatting string configured for your leaderboard on iTunes Connect. Your game must set the value property before reporting a score, otherwise an error is returned.
(Read and Write computed property)

88.22 class GKTurnBasedMatchmakerViewControllerMBS

88.22.1 class GKTurnBasedMatchmakerViewControllerMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The GKTurnBasedMatchmakerViewController class displays a user interface that allows players to manage the turn-based matches that they are participating in.
Notes: see also
https://developer.apple.com/library/mac/#documentation/GameKit/Reference/GKTurnBasedMatchmakerViewController_Ref/Reference/Reference.html

See also GameKitMBS.turnBasedMatchmakerViewController* events.
Subclass of the NSViewControllerMBS class.

88.22.2 Methods

88.22.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The private constructor.
See also:

- 88.22.4 Constructor(request as GKMatchRequestMBS) 14452

88.22.4 Constructor(request as GKMatchRequestMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Initializes a new matchmaker view controller.
Notes: request: A match request with parameters for the match.
See also:

- 88.22.3 Constructor 14452

88.22.5 Properties

88.22.6 showExistingMatches as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that determines whether the view controller shows existing matches.
Notes: If the value of this property is true, the view controller shows matches that are already in progress.

If the value of this property is false, the view controller only offers the ability to create new matches. The default value is true.
(Read and Write computed property)

88.23 class GKTurnBasedMatchMBS

88.23.1 class GKTurnBasedMatchMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The GKTurnBasedMatch class allows your game to implement turn-based matches between sets of players on Game Center.
Example:

```
// list the turn-based Game Center matches of the player
// MyGameKit is a subclass of GameKitMBS with the loadMatchesCompleted event implemented.
// Kit is a property of the window: Kit As MyGameKit
Kit = New MyGameKit
GKTurnBasedMatchMBS.loadMatches

// in MyGameKit:
Sub loadMatchesCompleted(matches() As GKTurnBasedMatchMBS, error As NSErrorMBS, tag As Variant) Handles loadMatchesCompleted
If error <>Nil Then
System.DebugLog error.localizedDescription
Return
End If
For Each m As GKTurnBasedMatchMBS In matches
System.DebugLog "Match " + m.matchID + ", status " + m.status.ToString + ", " + m.participants.Count.ToString + " participants"
Next
End Sub
```

Notes: A turn-based match uses a store-and-forward approach to share data between the participants. When a player participating in the match performs actions to advance the state of the match, your game uploads data to Game Center that defines the new state of the match and tells Game Center which player act next in the match. Later, when the next player launches your game, it downloads the match data from Game Center and continues the match. Players continue to take turns acting (based on whatever internal logic your game implements) until the match ends. A key advantage of turn-based matches is that a player may participate in multiple matches simultaneously.

88.23.2 Methods

88.23.3 acceptInvite(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Programmatically accept an invitation to a turn-based match.
Notes: When this method is called, it creates a background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls your GameKitMBS.acceptInviteCompleted event.

Available on Mac OS X 10.8.2 and newer.

88.23.4 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: True if the class is available.
Notes: Should always be true on Mac OS X 10.8 and newer.

88.23.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.

88.23.6 creationDate as date

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The date that the match was created. (read-only)

88.23.7 currentParticipant as GKTurnBasedParticipantMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The participant whose turn it is to act next. (read-only)
Notes: After a match starts and until it ends, the current player is the one who needs to take action to

drive the match to completion. Other players are not allowed to change the state of the match.

88.23.8 declineInvite(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Programmatically decline an invitation to a turn-based match.
Notes: When this method is called, it creates a background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls your GameKitMBS.declineInviteCompleted event.

Available on Mac OS X 10.8.2 and newer.

88.23.9 endMatchInTurnWithMatchData(matchData as Dictionary, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Ends the match.
Notes: matchData: The end state for the match.

Calling this method ends the match for all players. This method may only be called by the current participant. Before your game calls this method, the matchOutcome property on each participant object stored in the participants property must have been set to a value other than GKTurnBasedMatchOutcomeNone.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls your GameKitMBS.endMatchInTurnWithMatchDataCompleted event.

88.23.10 endTurnWithNextParticipant(nextParticipant as GKTurnBasedParticipantMBS, matchData as Dictionary, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Updates the data stored on Game Center for the current match.
Notes: nextParticipant: The next player in the match who needs to take an action. It must be one of the object's stored in the match's participants property.
matchData: The game-specific state for the match.
completionHandler

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls the GameKitMBS.endTurnWithNextParticipant event.

88.23.11 endTurnWithNextParticipants(nextParticipants() as GKTurnBasedParticipantMBS, timeout as Double, matchData as Dictionary, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Updates the data stored on Game Center for the current match.
Notes: nextParticipants: An array of participant objects reflecting the order in which the players should act next. Each object in the array must be one of the objects stored in the match's participants property.
timeout: The length of time the next player has to complete their turn.
matchData: The game-specific state for the match.

If the next player to act does not take their turn in the specified interval, the next player in the array receives a notification to act. This process continues until a player takes a turn or the last player in the list is notified.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls your GameKitMBS.endTurnWithNextParticipantsCompleted event.

Available on Mac OS X 10.8.2 and newer.

88.23.12 findMatchForRequest(request as GKMatchRequestMBS, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Programmatically searches for a new match to join.
Notes: request: A match request that specifies the properties that the new match must fulfill.

When this method is called, it creates a background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls your GameKitMBS.findMatchForRequest2Completed event.

This method may either create a new match or it may place the player into an existing match that does not yet have its full complement of players and needs a new player to advance the match further. Regardless of how the player is placed in the match, the local player is always the current participant in the returned match. Your game should immediately display the match in its user interface and allow the player to take

a turn.

88.23.13 loadMatchData(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Loads the game-specific data associated with a match.
Notes: When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.loadMatchDataCompleted event.

88.23.14 loadMatches(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Loads the set of turn-based matches involving the local player and creates a match object for each match.
Notes: When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.loadMatchesCompleted event.

88.23.15 loadMatchWithID(matchID as string, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Loads a specific match.
Notes: matchID: The identifier for the turn-based match.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls your GameKitMBS.loadMatchWithIDCompleted event.

Available on Mac OS X 10.8.2 and newer.

88.23.16 matchData as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Game-specific data that reflects the details of the match. (read-only)
Notes: Although Game Center knows who is participating in the match and who is expected to act next,

it does not know anything about your game's internal logic. Your game provides the match data and all the programming logic required to interpret it. This data should include the current state of the game and provide any necessary details about what actions the current player is expected to take. It can also be helpful for your game to record information about recent moves made by other players. The game can then replay those moves visually for the player to show exactly how the match reached the state it is in now.

Your game never directly updates the match state associated with this property. Instead, when the data is updated to reflect the actions of the current player, your game serializes the updated state into dictionary and calls one of the match's instance methods that transmit the updated state to Game Center.

The value of this property is nil until after your game calls the loadMatchDataWithCompletionHandler: method and the load task is complete. After this task completes, the matchData property holds the data that the last player to act transmitted to Game Center.

88.23.17 matchDataMaximumSize as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Returns the limit the Game Center servers place on the size of the match data. (read-only)
Notes: Game Kit returns an error if your game sends updated data larger than this value.
Available on Mac OS X 10.8.2 and newer.

88.23.18 matchID as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A string that uniquely identifies the match. (read-only)
Notes: This string is not intended to be displayed to players. Your game should use this string whenever it needs to refer to a specific match. For example, if you want your game to store additional information on a device, it might store it in a database using the match ID as a key.

88.23.19 message as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A message displayed to all players in the match.
Notes: The message property is displayed by the standard user interface; this allows your game to use the message to inform players of the current state of the match.

Important This property can be changed only by an instance of your game associated with the current player. If an instance of your game associated with another player in the match attempts to write to this property,

an exception is thrown.

88.23.20 participantQuitInTurnWithOutcome(matchOutcome as Integer, nextParticipant as GKTurnBasedParticipantMBS, matchData as Dictionary, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Resigns the current player from the match without ending the match.
Notes: matchOutcome: The end outcome of the current player in the match.
nextParticipant: The next player in the match who needs to take an action. It must be one of the object's stored in the match's participants property.
matchData: A dictionary the game-specific state for the match.

Your game calls this method on an instance of your game that is processing the current player's turn, but that player has left the match. For example, the player may have willingly resigned from the match or that player may have been eliminated by the other players (based on your game's internal logic).

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.participantQuitInTurnWithOutcome event.
See also:

- 88.23.21 participantQuitInTurnWithOutcome(matchOutcome as Integer, nextParticipants() as GKTurnBasedParticipantMBS, timeout as Double, matchData as Dictionary, tag as Variant = nil) 14460

88.23.21 participantQuitInTurnWithOutcome(matchOutcome as Integer, nextParticipants() as GKTurnBasedParticipantMBS, timeout as Double, matchData as Dictionary, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Resigns the current player from the match without ending the match.
Notes: matchOutcome: The end outcome of the current player in the match.
nextParticipants: An array of participant objects reflecting the order in which the players should act next. Each object in the array must be one of the objects stored in the match's participants property.
timeout: The length of time the next player has to complete their turn.
matchData: The game-specific state for the match.

Your game calls this method on an instance of your game that is processing the current player's turn, but that player has left the match. For example, the player may have willingly resigned from the match or that player may have been eliminated by the other players (based on your game's internal logic).

If the next player to act does not take their turn in the specified interval, the next player in the array receives a notification to act. This process continues until a player takes a turn or the last player in the list is notified.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls your GameKitMBS.participantQuitInTurnWithOutcomeCompleted event.

Available on Mac OS X 10.8.2 and newer.
See also:

- 88.23.20 participantQuitInTurnWithOutcome(matchOutcome as Integer, nextParticipant as GKTurnBasedParticipantMBS, matchData as Dictionary, tag as Variant = nil) 14460

88.23.22 participantQuitOutOfTurnWithOutcome(matchOutcome as Integer, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Resigns the player from the match when that player is not the current player. This action does not end the match.
Notes: matchOutcome: The end outcome of the current player in the match.

If the local player decided they wanted to resign from the match but is not the current participant in the match, your game calls this method.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.participantQuitOutOfTurnWithOutcomeCompleted event.

88.23.23 participants as GKTurnBasedParticipantMBS()

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Information about the players participating in the match. (read-only)
Notes: The elements of this array are GKTurnBasedParticipantMBS objects representing each participant in the match. Your game uses these objects to retrieve more information about the participants in the match. Your game also uses one of the objects in this array as a parameter whenever it calls a method that sets a different participant to act in the match.

The size of the array and the order in which the participants appear in the array are set when the match is first created, and never changes. When a match is first created, some participants may not hold actual players yet. Game Center searches for a player to fill that spot in the match only after your game sets that

participant as the current player.

88.23.24 rematch(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Create a new match with the list of players from an existing match.
Notes: Calling this method uses auto-matching to recreate a previous match. A new match with the same set of players is created and returned. If your game attempts to recreate matches using this method, each instance of your game on each device should call this method.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GKGameKitMBS.rematchCompleted event.

88.23.25 remove(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Programmatically removes a match from Game Center.
Notes: Even after a player's participation in a match ends, the data associated with the match continues to be stored on Game Center. Storing the data on Game Center allows the player to continue to watch the match's progress, or even see the final state of the match when it ends. However, players may also want to delete matches that they have finished playing. If you choose not to use the standard matchmaker user interface, your game should offer the ability to delete a finished match from Game Center. When a player chooses to delete a match from Game Center, call this method. It is a programming error to call this method on a match that has the local player as an active participant.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls GameKitMBS.removeCompleted event passing the tag. Keep in mind that the completion handler may be called on a thread other than the one originally used to invoke the method. This means that the code in your block needs to be thread-safe.

When the task completes, the match is no longer visible to the local player whose device made the call. Other players involved in the match still see the match.

88.23.26 saveCurrentTurnWithMatchData(matchData as Dictionary, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Update the match data without advancing the game to another player.
Notes: Available on Mac OS X 10.8.2 and newer.

matchData: The game-specific state for the match.

This method updates the match data stored on Game Center. Call this method when the current player takes an action that advances the state of the match but does not end the player's turn. For example, if your game has a fog-of-war mechanic, you might call this method when the player revealed new information on the map.

When this method is called, it creates a new background task to handle the request. The method then returns control to your game. Later, when the task is complete, Game Kit calls your GameKitMBS.saveCurrentTurnWithMatchDataCompleted event.

88.23.27 status as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The current state of the match. (read-only)

88.23.28 TimeoutDefault as Double

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Indicates that the player has one week to take a turn.
Example:

MessageBox str(GKTurnBasedMatchMBS.TimeoutDefault)

Notes: One of the common values for turn timeouts.
Available on Mac OS X 10.8.2 and newer.
Currently this function returns 604800 seconds (7 weeks), but this may change in the future.

88.23.29 TimeoutNone as Double

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Indicates that the player's turn never times out.
Example:

MessageBox str(GKTurnBasedMatchMBS.TimeoutNone)

Notes: One of the common values for turn timeouts.
Available on Mac OS X 10.8.2 and newer.
Currently this function returns 0 seconds, but this may change in the future.

88.23.30 Properties

88.23.31 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

88.23.32 Constants

Constants

Constant	Value	Description
GKTurnBasedMatchStatusEnded	2	One of the states a match can enter. The match has been completed.
GKTurnBasedMatchStatusMatching	3	One of the states a match can enter. The match is currently being played.
GKTurnBasedMatchStatusOpen	1	One of the states a match can enter. Game Center is still searching for other players to join the match.
GKTurnBasedMatchStatusUnknown	0	One of the states a match can enter. The match is in an unexpected state.
GKTurnBasedParticipantStatusActive	4	One of the states the participant is in during the match. The participant has joined the match and is an active player in it.
GKTurnBasedParticipantStatusDeclined	2	One of the states the participant is in during the match. The participant declined the invitation to join the match. When ticipant declines an invitation to join a match, the match is auto terminated.
GKTurnBasedParticipantStatusDone	5	One of the states the participant is in during the match. The participant has exited the match. Your game sets the match property to state why the participant left the match.
GKTurnBasedParticipantStatusInvited	1	One of the states the participant is in during the match. The participant was invited to the match, but has not responded to tation.
GKTurnBasedParticipantStatusMatching	3	One of the states the participant is in during the match. The participant is an unfilled position in the match that Game Center to fill when needed. When your game sets this participant as the participant in the match, Game Center fills the position and updates t and playerID properties.
GKTurnBasedParticipantStatusUnknown	0	One of the states the participant is in during the match. The participant is in an unexpected state.

88.24 class GKTurnBasedParticipantMBS

88.24.1 class GKTurnBasedParticipantMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A GKTurnBasedParticipant object stores information for a participant in a turn-based match.
Notes: Your game never creates objects of this class directly; instead it retrieves an array of GKTurnBasedParticipant objects from an GKTurnBasedMatch object.

Most information stored by a GKTurnBasedParticipant object is read-only, and is provided by Game Kit to assist you in implementing your game logic. However, the matchOutcome property is quite important; before your game may end a match, it must set the matchOutcome property in every GKTurnBasedParticipant object associated with the match.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo / Real Studio Plugins, version 14.3pr5

Xojo Developer Magazine

- 12.6, pages 33 to 35: Writing OS X Apps for Game Center, Part 3: Turn-Based Games by Tom Baumgartner
- 12.6, page 29: Writing OS X Apps for Game Center, Part 3: Turn-Based Games by Tom Baumgartner

88.24.2 Methods

88.24.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

88.24.4 Properties

88.24.5 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

88.24.6 lastTurnDate as date

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The date and time that this participant last took a turn in the game. (read-only)
Notes: The value of this property is invalid until the participant first takes a turn in the match.
(Read only property)

88.24.7 lastTurnDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: The date and time that this participant last took a turn in the game. (read-only)
Notes: The value of this property is invalid until the participant first takes a turn in the match.
(Read only property)

88.24.8 matchOutcome as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The end-state of this participant in the match.
Notes: Initially, this property holds GKTurnBasedMatchOutcomeNone. Before your game can end a match, it must set the match outcome to some other value that reflects the outcome of this participant when he or she left the match. Your game must use any of the values provided in the "GKTurnBasedMatchOutcome" enumerated type. Optionally, it may also use an OR operation to include a custom match outcome for your specific game. Game Center does not use the custom value; it exists to allow your game to provide additional information at the end of the match. The custom value must fit in the range provided by the GKTurnBasedMatchOutcomeCustomRange constant.
(Read and Write property)

88.24.9 player as GKPlayerMBS

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The GKPlayer object that identifies this participant. (read-only)
Notes: The value of this property may be nil if this slot in the match has not yet been filled by an actual player.
Available in OS X v10.10 and later.
(Read only property)

88.24.10 playerID as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The player identifier for this participant. (read-only)
Notes: The value of this property may be nil if this slot in the match has not been filled by an actual player.
(Read only property)

88.24.11 status as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The current status of the participant. (read-only)
Notes: This property is updated by Game Kit to reflect the status of the participant.
(Read only property)

88.24.12 timeoutDate as date

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The date and time that the participant's turn times out. (read-only)
Notes: If a timeout was set when the turn state was advanced, this property holds when the player's turn expires. Otherwise, this property is nil.
Available on Mac OS X 10.8.2 and newer.
(Read only property)

88.24.13 timeoutDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: The date and time that the participant's turn times out. (read-only)
Notes: If a timeout was set when the turn state was advanced, this property holds when the player's turn expires. Otherwise, this property is nil.
Available on Mac OS X 10.8.2 and newer.
(Read only property)

88.24.14 Constants

Constants

Constant	Value	Description
GKTurnBasedMatchOutcomeCustomRange	&h00FF0000	One of the states the participant was in when they left the A mask used to allow your game to provide its own custo custom value must fit inside the mask.
GKTurnBasedMatchOutcomeFirst	6	One of the states the participant was in when they left the The participant finished first.
GKTurnBasedMatchOutcomeFourth	9	One of the states the participant was in when they left the The participant finished fourth.
GKTurnBasedMatchOutcomeLost	3	One of the states the participant was in when they left the The participant lost the match.
GKTurnBasedMatchOutcomeNone	0	One of the states the participant was in when they left the The participant's outcome has not been set yet (typically l is still in progress).
GKTurnBasedMatchOutcomeQuit	1	One of the states the participant was in when they left the The participant forfeited the match.
GKTurnBasedMatchOutcomeSecond	7	One of the states the participant was in when they left the The participant finished second.
GKTurnBasedMatchOutcomeThird	8	One of the states the participant was in when they left the The participant finished third.
GKTurnBasedMatchOutcomeTied	4	One of the states the participant was in when they left the The participant tied the match.
GKTurnBasedMatchOutcomeTimeExpired	5	One of the states the participant was in when they left the The participant was ejected from the match because he or s timely fashion.
GKTurnBasedMatchOutcomeWon	2	One of the states the participant was in when they left the The participant won the match.
GKTurnBasedParticipantStatusActive	4	One of the states the participant is in during the match. The participant has joined the match and is an active playe
GKTurnBasedParticipantStatusDeclined	2	One of the states the participant is in during the match. The participant declined the invitation to join the match ticipant declines an invitation to join a match, the matc terminated.
GKTurnBasedParticipantStatusDone	5	One of the states the participant is in during the match. The participant has exited the match. Your game sets t property to state why the participant left the match.
GKTurnBasedParticipantStatusInvited	1	One of the states the participant is in during the match. The participant was invited to the match, but has not resp tation.
GKTurnBasedParticipantStatusMatching	3	One of the states the participant is in during the match. The participant is an unfilled position in the match that Gam to fill when needed. When your game sets this participa participant in the match, Game Center fills the position and and playerID properties.
GKTurnBasedParticipantStatusUnknown	0	One of the states the participant is in during the match. The participant is in an unexpected state.

88.25 class GKVoiceChatMBS

88.25.1 class GKVoiceChatMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A GKVoiceChat object provides a voice channel that allows a set of players in a match to speak with each other.
Notes: see also:
https://developer.apple.com/library/mac/#documentation/GameKit/Reference/GKVoiceChat_Ref/Reference/Reference.html

Available in OS X v10.8 and later.

88.25.2 Methods

88.25.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: True if the class is available.
Notes: Should always be true on Mac OS X 10.8 and newer.

88.25.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new voice chat.

88.25.5 enablePlayerStateUpdate(tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Enables player state update event in GameKitMBS class.
Notes: You enable GameKit.playerStateUpdate event to be called when the state of any participant in the chat changes (including the local player). The event receives the following parameters:

player: The player identifier for the player whose status changed.
state: The new state of the player.

88.25.6 isVoIPAllowed as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Returns whether voice chat is allowed to be used on the device.
Notes: True if voice chat is available to the game.

Some countries or phone carriers may restrict the availability of voice over IP services. Before retrieving a GKVoiceChat object, your game should first check to see whether voice over IP is permitted on the device.

88.25.7 name as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The name of the voice chat (read-only).

88.25.8 playerIDs as string()

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: An array of player identifiers for the players connected to the channel. (read-only)

88.25.9 setMute(mute as boolean, playerID as string)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Mutes a participant in the chat.
Notes: isMuted: Determines whether the player is to be muted or not.
player: The player identifier string for a player in the match.

While a player is muted, the local player does not hear voice data transmitted by that player.

88.25.10 start

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Starts communication with other participants in the voice chat.
Notes: When start is called, the voice chat connects to the channel and notifies other connected players that the local player joined the chat. When the voice chat object is connected, it plays voice data from other

participants in the channel. It sends voice data to other participants when its active property is true.

A device only connects to the channel when the device has a microphone and is connected via wi-fi. However, your game may configure and start a voice chat channel when the device is not currently capable of using voice chat. If conditions change to allow voice chat—for example, the device connects to a wi-fi network—the GKVoiceChat object automatically connects to the channel.

88.25.11 stop

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Ends communication with other participants in the voice chat.
Notes: When stop is called, the voice chat object disconnects from the other players. You should call stop on a channel before releasing it.

88.25.12 Properties

88.25.13 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

88.25.14 active as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that states whether the channel is sampling the microphone.
Notes: When active is true, the voice chat samples the microphone and transmits the voice data to other players connected to the channel. Default value is false.

Only one GKVoiceChat object is allowed to sample the microphone at any given time. When your game sets the active property to true on a voice chat object, the previous voice chat object that owned the microphone (if there was one) sets its active property to false.

Available in OS X v10.8 and later.
(Read and Write computed property)

88.25.15 volume as Double

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The volume level for the voice channel.
Notes: All voice data received from other participants is mixed and then scaled by the volume property. The volume property has a range between 0.0 and 1.0, inclusive. A volume level of 0.0 means the entire channel is muted; a value of 1.0 plays voice samples at full volume. The default value is 1.0.
(Read and Write computed property)

88.25.16 Constants

Constants

Constant	Value	Description
GKVoiceChatPlayerConnected	0	One of the states returned to your game about other players in a voice chat. A new player connected to the chat.
GKVoiceChatPlayerConnecting	4	One of the states returned to your game about other players in a voice chat. A new player is connecting to the chat.
GKVoiceChatPlayerDisconnected	1	One of the states returned to your game about other players in a voice chat. A player left the chat.
GKVoiceChatPlayerSilent	3	One of the states returned to your game about other players in a voice chat. A player stopped speaking.
GKVoiceChatPlayerSpeaking	2	One of the states returned to your game about other players in a voice chat. A player began speaking.

Chapter 89

GIF

89.1 Globals

89.1.1 GifStringToGifMBS(data as string) as GIFMBS

MBS Images Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a Gif GIFPictureMBS from memory.
Example:

```
// count the frames of an animated GIF in memory
Var data As String = BinaryStream.Open(SpecialFolder.Desktop.Child("animation.gif")).Read(100000000)
Var gif As GIFMBS = GifStringToGifMBS(data)
If gif <>Nil Then MessageBox gif.Count.ToString + " blocks, first picture " + gif.MakeFirstPicture.Width.ToString
+ " pixels wide"
```

Notes: Returns nil on any error.
Else it should be identical to the folderitem function.

There is a link bug in RB. So if this function always returns nil, you may need a line like "dim g as new GifMBS" to fix it.

89.1.2 GifStringToPictureMBS(data as string) as Picture

MBS Images Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a Gif picture from memory and returns first picture with mask.
Example:

```
// show a GIF image that was downloaded or stored in a database
Var data As String = BinaryStream.Open(SpecialFolder.Desktop.Child("logo.gif")).Read(10000000)
Var pic As Picture = GifStringToPictureMBS(data)
If pic <>Nil Then MessageBox "GIF has " + pic.Width.ToString + " x " + pic.Height.ToString + " pixels."
```

Notes: Returns nil on any error.
Not always a mask is available.

There is a link bug in RB. So if this function always returns nil, you may need a line like "dim g as new GifMBS" to fix it.

89.2 class GifBlockMBS

89.2.1 class GifBlockMBS

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a gif block.
Notes: May have a GIFPictureMBS or an extension, but not both.
Blog Entries

- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr6

89.2.2 Methods

89.2.3 Clone as GifBlockMBS

MBS Images Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a clone of the object.

89.2.4 Properties

89.2.5 Extension as GifExtensionMBS

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The extension data of this gif block.
Notes: (Read and Write property)

89.2.6 Intro as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The intro value of the gif block.
Notes: The type of data.
(Read and Write property)

89.2.7 Picture as GifPictureMBS

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The GIFPictureMBS data of this gif block.
Notes: Not all blocks have a picture, so this property can be nil.
(Read and Write property)

89.3 class GifDataMBS

89.3.1 class GifDataMBS

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for binary data in a gif image.
Blog Entries

- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr6

89.3.2 Methods

89.3.3 Clone as GifDataMBS

MBS Images Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a clone of the object.

89.3.4 Properties

89.3.5 DataMemory as Memoryblock

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The data as a memoryblock.
Notes: (Read and Write property)

89.3.6 DataString as String

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The data as a string.
Notes: (Read and Write property)

89.3.7 Length as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The length in bytes of this data.
Notes: Returns 0 on any error.
(Read only property)

89.4 class GifExtensionMBS

89.4.1 class GifExtensionMBS

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a gif extension.
Blog Entries

- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr6

89.4.2 Methods

89.4.3 Add(data as GifDataMBS)

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data object to this extension.

89.4.4 Clone as GifExtensionMBS

MBS Images Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a clone of the object.

89.4.5 Data(index as Integer) as GifDataMBS

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The data of this extension.
Notes: Index is 0 based.

89.4.6 Properties

89.4.7 Count as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of data objects attached to this extension.
Notes: Returns 0 on any error.

(Read only property)

89.4.8 FirstData as GifDataMBS

MBS Images Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The first data.
Notes: Same as calling Data(0), but this property is visible in the debugger which makes debugging easier.
(Read only property)

89.4.9 Marker as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The marker field of this extension.
Notes: (Read and Write property)

89.5 class GIFMBS

89.5.1 class GIFMBS

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for reading or writing gif files.
Notes: There are patents on the lzw compression used in this class for writing gif files. This patents may be timeout out for some countries, but please check for your target countries.
Blog Entries

- Tip of day: Load GIF into WebImageView

- MBS REALbasic Plugins, version 10.4pr6

89.5.2 Methods

89.5.3 Add(block as GifBlockMBS)

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a block to this gif object.

89.5.4 Block(index as Integer) as GifBlockMBS

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blocks attached to this gif object.
Notes: Index is 0 based.

89.5.5 Clone as GIFMBS

MBS Images Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a clone of the object.

89.5.6 MakeFirstMask as picture

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches the first picture in this gif object and returns the matching mask.
Notes: Returns nil on any error.

89.5.7 MakeFirstPicture as picture

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches the first picture in this gif object and returns this picture.
Notes: Returns nil on any error.
There is not always a mask available!

89.5.8 MakeFirstPictureWithMask as picture

MBS Images Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches the first picture in this gif object and returns this picture with mask (if exists).
Notes: Returns nil on any error.
There is not always a mask available!

89.5.9 Properties

89.5.10 Count as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of blocks attached to this gif object.
Notes: Not every block has a picture attached, so this is not the picture count.
(Read only property)

89.5.11 FirstBlock as GifBlockMBS

MBS Images Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The first block.
Notes: Same as calling Block(0), but this property is visible in the debugger which makes debugging easier.
(Read only property)

89.5.12 Header as String

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The header string for this gif object.
Notes: e.g. "GIF89a"
(Read and Write property)

89.5.13 Screen as GifScreenMBS

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The screen object attached to this gif object.
Notes: (Read and Write property)

89.6 class GifPaletteMBS

89.6.1 class GifPaletteMBS

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a color palette.
Example:

```
Var p as new GifPaletteMBS

p.Count = 256

p.Value(0)=&cFFEECC

MessageBox hex(p.red(0))+" "+hex(p.Green(0))+" "+hex(p.Blue(0))
```

Notes: Maximum 256 colors.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr9
- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr6

89.6.2 Methods

89.6.3 Clone as GifPaletteMBS

MBS Images Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a clone of the object.

89.6.4 Properties

89.6.5 Count as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of colors in this palette.
Example:

```
Var p as new GifPaletteMBS
```

```
p.Count = 256
```

Notes: Value is 2, 4, 16 or 256.
(Read and Write property)

89.6.6 Blue(index as Integer) as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The array of the blue color components in this color palette.
Example:

```
Var p as new GifPaletteMBS

p.Count = 1
p.Value(0)=&cFFEECC

MessageBox str(p.blue(0))
```

Notes: Index from 0 to count-1. (ignores bad indexes)
Value from 0 to 255.
(Read and Write computed property)

89.6.7 Green(index as Integer) as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The array of the green color components in this color palette.
Example:

```
Var p as new GifPaletteMBS

p.Count = 1
p.Value(0)=&cFFEECC

MessageBox str(p.green(0))
```

Notes: Index from 0 to count-1. (ignores bad indexes)
Value from 0 to 255.
(Read and Write computed property)

89.6.8 Red(index as Integer) as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The array of the red color components in this color palette.
Example:

```
Var p as new GifPaletteMBS

p.Count = 1
p.Value(0)=&cFFEECC

MessageBox str(p.red(0))
```

Notes: Index from 0 to count-1. (ignores bad indexes)
Value from 0 to 255.
(Read and Write computed property)

89.6.9 Value(index as Integer) as color

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The colors in this palette.
Example:

```
Var p as new GifPaletteMBS

p.Count = 1
p.Value(0)=&cFFEECC

MessageBox hex(p.value(0))
```

Notes: Index from 0 to count-1. (ignores bad indexes)
(Read and Write computed property)

89.7 class GIFPictureMBS

89.7.1 class GIFPictureMBS

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a gif GIFPictureMBS.
Blog Entries

- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr6

89.7.2 Methods

89.7.3 Clone as GifPictureMBS

MBS Images Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a clone of the object.

89.7.4 CopyData as memoryblock

MBS Images Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the data of this picture object.
Notes: Returns a new memoryblock with a copy of the data so you can modify it.

89.7.5 MakeMask as picture

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches the matching mask for this picture and returns it as picture.
Notes: May return nil.
See also:

- 89.7.6 MakeMask(TransparentColorIndex as Integer) as picture 14488

89.7.6 MakeMask(TransparentColorIndex as Integer) as picture

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a mask for this picture based on the current transparent color index.
Notes: Returns nil on low memory.
See also:

- 89.7.5 MakeMask as picture 14488

89.7.7 MakePicture as picture

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the picture and returns it.
Notes: Returns nil on any error.

89.7.8 PixelData(row as Integer) as memoryblock

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The raw Pixel data for a given row.
Notes: Row is 0 based.
Returns nil on any error.

89.7.9 Properties

89.7.10 Data as Memoryblock

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The data of this GIFPictureMBS as a big memoryblock.
Notes: (Read and Write property)

89.7.11 HasPalette as Boolean

MBS Images Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether we have a color map (palette).
Notes: This property was named HasCMap in older plugin versions.
(Read and Write property)

89.7.12 Height as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Height in pixels.
Notes: (Read and Write property)

89.7.13 Interlace as Boolean

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the GIFPictureMBS is interlaced.
Notes: Interlacing makes GIFPictureMBS loading faster in a browser, but requires the newer GIF format 89a.
(Read and Write property)

89.7.14 Left as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x position of the GIFPictureMBS.
Notes: On an animation gif each GIFPictureMBS may have it's own position.
(Read and Write property)

89.7.15 Palette as GifPaletteMBS

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The palette for this GIFPictureMBS.
Notes: (Read and Write property)

89.7.16 PaletteDepth as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The depth of the palette of this GIFPictureMBS.
Notes: Value should be 2, 4, 16 or 256.
(Read and Write property)

89.7.17 Sorted as Boolean

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the color palette is sorted.
Notes: (Read and Write property)

89.7.18 Top as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y position of this GIFPictureMBS.
Notes: On an animation gif each GIFPictureMBS may have it's own position.
(Read and Write property)

89.7.19 Width as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the GIFPictureMBS in pixels.
Notes: (Read and Write property)

89.8 class GifScreenMBS

89.8.1 class GifScreenMBS

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for the gif screen information.
Blog Entries

- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr6

89.8.2 Methods

89.8.3 Clone as GifScreenMBS

MBS Images Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a clone of the object.

89.8.4 Properties

89.8.5 Aspect as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The aspect ration of this GIFPictureMBS.
Notes: (Read and Write property)

89.8.6 BackgroundColor as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Index of the background color for this GIFPictureMBS.
Notes: (Read and Write property)

89.8.7 ColorResolution as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color resolution of the screen area.
Notes: (Read and Write property)

89.8.8 HasPalette as Boolean

MBS Images Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this screen defines a palette.
Notes: (Read and Write property)

89.8.9 Height as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the screen area used.
Notes: (Read and Write property)

89.8.10 Palette as GifPaletteMBS

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color palette to use for the screen area used.
Notes: (Read and Write property)

89.8.11 PaletteDepth as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The palette depth of the screen area used.
Notes: (Read and Write property)

89.8.12 Sorted as Boolean

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the color palette is sorted.
Notes: (Read and Write property)

89.8.13 Width as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the screen area used.
Notes: (Read and Write property)

Chapter 90

Graphics & Pictures

90.1 class Graphics

90.1.1 class Graphics

Platforms: macOS, Linux, Windows, Targets: All.

Function: Extends Xojo's Graphics Class.

90.1.2 Methods

90.1.3 DrawCGPDFDocumentMBS(pdf as CGPDFDocumentMBS, r as CGRectMBS, page as Integer)

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Draws a PDF on the graphics object inside the given rectangle.
Notes: Requires Mac OS X to work.

If destination is scaled page size, you need to also scale the rectangle here.

Seems broken in MacOS Mojave for us with drawing in print context.
See also:

- 90.1.4 DrawCGPDFDocumentMBS(pdf as CGPDFDocumentMBS, r as CGRectMBS, page as Integer, InterpolationQuality as Integer, Antialias as boolean, FontSmoothing as Boolean) 14496

90.1.4 DrawCGPDFDocumentMBS(pdf as CGPDFDocumentMBS, r as CGRectMBS, page as Integer, InterpolationQuality as Integer, Antialias as boolean, FontSmoothing as Boolean)

MBS MacCG Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Draws a PDF on the graphics object inside the given rectangle.
Notes: Requires Mac OS X to work.

You can pass for interpolation:

0	Let the context decide.
1	Never interpolate.
2	Low quality, fast interpolation.
4	Medium quality, slower than kCGInterpolationLow.
3	Highest quality, slower than kCGInterpolationMedium.

Set Antialias to true to allow anti aliasing and to false to disallow.
Set FontSmoothing to true to allow font smoothing and false to disallow it.

If destination is scaled page size, you need to also scale the rectangle here.

Seems broken in MacOS Mojave for us with drawing in print context.

See also:

- 90.1.3 DrawCGPDFDocumentMBS(pdf as CGPDFDocumentMBS, r as CGRectMBS, page as Integer) 14495

90.1.5 DrawRotatedTextMBS(Rotation as Double, text as string, x as Integer, y as Integer, Center as Boolean = false, alpha as Double = 1.0, NoSwapY as boolean = false, FontWidth as Integer = 0)

MBS Util Plugin, Plugin Version: 11.2, Platforms: macOS, Windows, Targets: Desktop only.

Function: Draws rotated text.
Example:

```
Sub Paint(g As Graphics)

g.DrawRotatedTextMBS 45, "Hello World", 100, 100

End Sub
```

Notes: Rotation is the angle in degree.
Currently only supported for Mac OS X and Windows in GUI applications.

The plugin does not see the clipping offset for the graphics object. So for graphics objects from printer or canvas, you need to offset the position. Seems like with a Canvas the coordinates are relative to canvas in Cocoa, but relative to Windows in Carbon.

We have the optional parameter Center which tells the plugin to center the rotated text, so the rotation point is in the middle of the text.
The plugin queries Bold, Italic, Underline, ForeColor, TextUnit, TextSize or TextFont.

Alpha gives the alpha value for Mac OS X. Can be 1.0 (Full color) to 0.0 (no color).

On Mac targets the Y coordinate needs to be swapped internally from top down coordinates to bottom up coordinates. As this does not work 100% correct on printers (the plugin doesn't know page margins), you can provide correct Y coordinate yourself and pass NoSwapY = true. (added in plugin version 13.1)
On Windows the OS function used (ExtTextOut) does not support multiple lines.

FontWidth is only for Windows to define the width of the font. Default is 0 to use default width.
The average width, in logical units, of characters in the font. If FontWidth is zero, the aspect ratio of the device is matched against the digitization aspect ratio of the available fonts to find the

On Windows for drawing in a picture, make sure the font size and font name are set. Else it may not draw.
For Windows, we only use HDC for drawing, so if you have a graphics context not using a HDC, this function doesn't draw. The function is not updated for DirectDraw.

90.1.6 DrawWindowsIconMBS(file as folderitem, IconID as Integer, x as Integer, y as Integer, w as Integer, h as Integer) as boolean

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop only.

Function: Draws a windows icon on the given rectangle.
Notes: The folderitem should point to a file with icons (exe, dll, ico or something else). If IconID is zero, the first icon is used. Else IconID is the id of the icon.
If w or h is 0, the default size is used.
Returns true on success and false on failure.

90.1.7 MeasureRotatedTextMBS(text as string, byref Width as Double, byref Height as Double, FontWidth as Integer = 0) as Boolean

MBS Util Plugin, Plugin Version: 17.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Measure size of text.
Notes: This is compatible to text drawing in DrawRotatedTextMBS, so you can use it to calculate the required space.
No rotation is used for measurement.
Returns true on success and false on failure.

90.1.8 PaintdesktopMBS

MBS Picture Plugin, Platform: Windows, Targets: Desktop only.

Function: Draws on Windows the desktop into the current graphics port.
Notes: May not draw a desktop picture.

90.1.9 StretchBltMBS(nXOriginDest as Integer, nYOriginDest as Integer, nWidthDest as Integer, nHeightDest as Integer, source as graphics, nXOriginSrc as Integer, nYOriginSrc as Integer, nWidthSrc as Integer, nHeightSrc as Integer, dwRop as Integer) as boolean

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop only.

Function: The StretchBlt function copies a bitmap from a source rectangle into a destination rectangle, stretching or compressing the bitmap to fit the dimensions of the destination rectangle, if necessary.
Notes: This is just a wrapper to the StretchBlt function from the Windows API.

The system stretches or compresses the bitmap according to the stretching mode currently set in the destination device context.

Parameters:

nXOriginDest	Specifies the x-coordinate, in logical units, of the upper-left corner of the destination rectangle.
nYOriginDest	Specifies the y-coordinate, in logical units, of the upper-left corner of the destination rectangle.
nWidthDest	Specifies the width, in logical units, of the destination rectangle.
nHeightDest	Specifies the height, in logical units, of the destination rectangle.
hdcSrc	The source device context.
nXOriginSrc	Specifies the x-coordinate, in logical units, of the upper-left corner of the source rectangle.
nYOriginSrc	Specifies the y-coordinate, in logical units, of the upper-left corner of the source rectangle.
nWidthSrc	Specifies the width, in logical units, of the source rectangle.
nHeightSrc	Specifies the height, in logical units, of the source rectangle.
dwRop	Specifies the raster operation to be performed. Raster operation codes define how the system combines colors in output operations that involve a brush, a source bitmap, and a destination bitmap. See BitBlt for a list of common raster operation codes (ROPs). Note that the CAPTUREBLT ROP generally cannot be used for printing device contexts.

Return Values

If the function succeeds, the return value is true.
If the function fails, the return value is false.

Possible operation modes:

90.1.10 StretchDIBitsMBS(XDest as Integer, YDest as Integer, DestWidth as Integer, DestHeight as Integer, XSource as Integer, YSource as Integer, SourceWidth as Integer, SourceHeight as Integer, Bits as memoryblock, ImageWidth as Integer, ImageHeight as Integer, ImageBitCount as Integer) as boolean

MBS Picture Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop only.

Function: The StretchDIBits function copies the color data for a rectangle of pixels in a DIB image to the

SRCCOPY	&h00CC0020	dest = source	Copies the source rectangle directly to the destination rectangle.
SRCPAINT	&h00EE0086	dest = source OR dest	Combines the colors of the source and destination rectangles by using the Boolean OR operator.
SRCAND	&h008800C6	dest = source AND dest	Combines the colors of the source and destination rectangles by using the Boolean AND operator.
SRCINVERT	&h00660046	dest = source XOR dest	Combines the colors of the source and destination rectangles by using the Boolean XOR operator.
SRCERASE	&h00440328	dest = source AND (NOT dest)	Combines the inverted colors of the destination rectangle with the colors of the source rectangle by using the Boolean AND operator.
NOTSRCCOPY	&h00330008	dest = (NOT source)	Copies the inverted source rectangle to the destination.
NOTSRCERASE	&h001100A6	dest = (NOT src) AND (NOT dest)	Combines the colors of the source and destination rectangles by using the Boolean OR operator and then inverts the resultant color.
MERGECOPY	&h00C000CA	dest = (source AND pattern)	Merges the colors of the source rectangle with the brush currently selected in hdcDest, by using the Boolean AND operator.
MERGEPAINT	&h00BB0226	dest = (NOT source) OR dest	Merges the colors of the inverted source rectangle with the colors of the destination rectangle by using the Boolean OR operator.
PATCOPY	&h00F00021	dest = pattern	Copies the brush currently selected in hdcDest, into the destination bitmap.
PATPAINT	&h00FB0A09	dest = DPSnoo	Combines the colors of the brush currently selected in hdcDest, with the colors of the inverted source rectangle by using the Boolean OR operator. The result of this operation is combined with the colors of the destination rectangle by using the Boolean OR operator.
PATINVERT	&h005A0049	dest = pattern XOR dest	Combines the colors of the brush currently selected in hdcDest, with the colors of the destination rectangle by using the Boolean XOR operator.
DSTINVERT	&h00550009	dest = (NOT dest)	Inverts the destination rectangle.
BLACKNESS	&h00000042	dest = BLACK	Fills the destination rectangle using the color associated with index 0 in the physical palette. (This color is black for the default physical palette.)
WHITENESS	&h00FF0062	dest = WHITE	Fills the destination rectangle using the color associated with index 1 in the physical palette. (This color is white for the default physical palette.)
NOMIRRORBITMAP	&h80000000	Do not Mirror the bitmap in this call.	Prevents the bitmap from being mirrored.
CAPTUREBLT	&h40000000	Include layered windows.	Includes any windows that are layered on top of your window in the resulting image. By default, the image only contains your window. Note that this generally cannot be used for printing device contexts.

specified destination rectangle.
Example:

```
Var m as MemoryBlock
Var p,q as Picture

p=New Picture(100,100,32)
p.Graphics.ForeColor=rgb(255,128,1)
p.Graphics.FillRect 0,0,100,100

// Make a new MemoryBlock
m=NewMemoryBlock(100*100*3) // 3 bytes per Pixel

// Copy RGB without alpha
if p.CopyBGRtoMemoryblockMBS(m,0) then

Var XDest as Integer = 0
Var YDest as Integer = 0
Var DestWidth as Integer = 100
Var DestHeight as Integer = 100
Var XSource as Integer = 0
Var YSource as Integer = 0
Var SourceWidth as Integer = 100
Var SourceHeight as Integer = 100
Var Bits as memoryblock = m
```

```
Var ImageWidth as Integer = 100
Var ImageHeight as Integer = 100
Var ImageBitCount as Integer = 24

call g.StretchDIBitsMBS(XDest, YDest, DestWidth, DestHeight, XSource, YSource, SourceWidth, SourceHeight, bits, ImageWidth, ImageHeight, ImageBitCount)

end if
```

Notes: If the destination rectangle is larger than the source rectangle, this function stretches the rows and columns of color data to fit the destination rectangle. If the destination rectangle is smaller than the source rectangle, this function compresses the rows and columns by using the specified raster operation.

You specify the dest rectangle in the graphics object, the source rectangle in the picture, the memoryblock with the bits, the size of the image and the bit count of the image (24 or 32).

The origin of a bottom-up DIB is the bottom-left corner; the origin of a top-down DIB is the upper-left corner.

StretchDIBits creates a mirror image of a bitmap if the signs of the nSrcWidth and nDestWidth parameters, or if the nSrcHeight and nDestHeight parameters differ. If nSrcWidth and nDestWidth have different signs, the function creates a mirror image of the bitmap along the x-axis. If nSrcHeight and nDestHeight have different signs, the function creates a mirror image of the bitmap along the y-axis.

Returns true on success and false on failure.

90.1.11 WinApplyDevModeMBS(devmode as WindowsDeviceModeMBS) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Updates the specified printer or plotter device context (graphics) using the specified information.
Notes: Returns true on success.

This function cannot be used to change the driver name, device name, or the output port. When the user changes the port connection or device name, the application must delete the original graphics and create a new graphics object with the new information.

Windows seems not to allow changing graphics object for printer while a page is open, so use WinEndPageMBS to close page before changing settings.

Does not work for Xojo 2016r4 and newer due to switch to DirectDraw for printing.

- More on printing on Windows

90.1.12 WindowsGraphicsInfoMBS as WindowsGraphicsInfoMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Query information about graphics object on Windows.
Notes: Returns nil on any error.

90.1.13 WinEndPageMBS as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The EndPage function notifies the device that the application has finished writing to a page.
Notes: This function is typically used to direct the device driver to advance to a new page.

Returns true on success.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation-factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

Use the WinApplyDevModeMBS function to change the device mode, if necessary, after calling the EndPage function. Note that a call to WinApplyDevModeMBS resets all device context attributes back to default values. Neither EndPage nor StartPage resets the device context attributes. Device context attributes remain constant across subsequent pages. You do not need to re-select objects and set up the mapping mode again before printing the next page; however, doing so will produce the same results and reduce code differences between versions of Windows.

When a page in a spooled file exceeds approximately 350 MB, it may fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

Does not work for Xojo 2016r4 and newer due to switch to DirectDraw for printing.

90.1.14 WinStartPageMBS as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The StartPage function prepares the printer driver to accept data.
Notes: Returns true on success.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation-factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

The system disables the WinApplyDevModeMBS function between calls to the StartPage and EndPage functions. This means that you cannot change the device mode except at page boundaries. After calling EndPage, you can call WinApplyDevModeMBS to change the device mode, if necessary. Note that a call to WinApplyDevModeMBS resets all device context attributes back to default values.

Neither EndPage nor StartPage resets the device context attributes. Device context attributes remain constant across subsequent pages. You do not need to re-select objects and set up the mapping mode again before printing the next page; however, doing so will produce the same results and reduce code differences between versions of Windows.

Does not work for Xojo 2016r4 and newer due to switch to DirectDraw for printing.

90.2.2 Methods

90.2.3 SaveImageAtPathToSavedPhotosAlbum(ImageFile as FolderItem, CompletionDelegate as ImageSaveCompletedMBS)

MBS Picture Plugin, Plugin Version: 21.1, Platform: iOS, Targets: iOS only.

Function: Adds the specified image to the user,Äôs Camera Roll album.
Notes: ImageFile: The image file to write to the Camera Roll album.
CompletionDelegate: Optionally, the delegate which should be called after the image has been written to the Camera Roll album.

The use of the CompletionDelegate parameter is optional and necessary only if you want to be notified asynchronously when the function finishes writing the image to the user,Äôs Camera Roll or Saved Photos album. If you do not want to be notified, pass nil for these parameters.
When used on an iOS device without a camera, this method adds the image to the Saved Photos album rather than to the Camera Roll album.
See also:

- 90.2.4 SaveImageAtPathToSavedPhotosAlbum(ImagePath as String, CompletionDelegate as ImageSaveCompletedMBS) 14506

90.2.4 SaveImageAtPathToSavedPhotosAlbum(ImagePath as String, CompletionDelegate as ImageSaveCompletedMBS)

MBS Picture Plugin, Plugin Version: 21.1, Platform: iOS, Targets: iOS only.

Function: Adds the specified image to the user,Äôs Camera Roll album.
Notes: ImagePath: The image path to write to the Camera Roll album.
CompletionDelegate: Optionally, the delegate which should be called after the image has been written to the Camera Roll album.

The use of the CompletionDelegate parameter is optional and necessary only if you want to be notified asynchronously when the function finishes writing the image to the user,Äôs Camera Roll or Saved Photos album. If you do not want to be notified, pass nil for these parameters.
When used on an iOS device without a camera, this method adds the image to the Saved Photos album rather than to the Camera Roll album.
See also:

- 90.2.3 SaveImageAtPathToSavedPhotosAlbum(ImageFile as FolderItem, CompletionDelegate as ImageSaveCompletedMBS) 14505

90.2.5 SaveVideoAtPathToSavedPhotosAlbum(VideoFile as FolderItem, CompletionDelegate as VideoSaveCompletedMBS)

MBS Picture Plugin, Plugin Version: 21.1, Platform: iOS, Targets: iOS only.

Function: Adds the movie from the specified path to the user,Äôs Camera Roll album.
Notes: videoPath: The filesystem path to the movie file you want to save to the Camera Roll album.
CompletionDelegate: Optionally, the delegate which should be called after the movie has been written to the Camera Roll album.

Before calling this function, call the VideoAtPathIsCompatibleWithSavedPhotosAlbum function to determine if it is possible to save movies to the Camera Roll album. For a code example, refer to Camera Programming Topics for iOS.

The use of the CompletionDelegate parameter is optional and necessary only if you want to be notified asynchronously when the function finishes writing the movie to the user,Äôs Camera Roll or Saved Photos album. If you do not want to be notified, pass nil for these parameters.

When used on an iOS device without a camera, this method adds the movie to the Saved Photos album rather than to the Camera Roll album.
See also:

- 90.2.6 SaveVideoAtPathToSavedPhotosAlbum(VideoPath as String, CompletionDelegate as VideoSaveCompletedMBS) 14507

90.2.6 SaveVideoAtPathToSavedPhotosAlbum(VideoPath as String, CompletionDelegate as VideoSaveCompletedMBS)

MBS Picture Plugin, Plugin Version: 21.1, Platform: iOS, Targets: iOS only.

Function: Adds the movie from the specified path to the user,Äôs Camera Roll album.
Notes: videoPath: The filesystem path to the movie file you want to save to the Camera Roll album.
CompletionDelegate: Optionally, the delegate which should be called after the movie has been written to the Camera Roll album.

Before calling this function, call the VideoAtPathIsCompatibleWithSavedPhotosAlbum function to determine if it is possible to save movies to the Camera Roll album. For a code example, refer to Camera Programming Topics for iOS.

The use of the CompletionDelegate parameter is optional and necessary only if you want to be notified asynchronously when the function finishes writing the movie to the user,Äôs Camera Roll or Saved Photos album. If you do not want to be notified, pass nil for these parameters.

When used on an iOS device without a camera, this method adds the movie to the Saved Photos album rather than to the Camera Roll album.
See also:

- 90.2.5 SaveVideoAtPathToSavedPhotosAlbum(VideoFile as FolderItem, CompletionDelegate as VideoSaveCompletedMBS) 14506

90.2.7 VideoAtPathIsCompatibleWithSavedPhotosAlbum(VideoFile as FolderItem) as Boolean

MBS Picture Plugin, Plugin Version: 21.1, Platform: iOS, Targets: iOS only.

Function: Returns a Boolean value that indicates whether the specified video is compatible to save to the user,Äôs Camera Roll album.
Notes: VideoFile: The folderitem to the movie file you want to save.

Returns true if the video can be saved to the Camera Roll album or false if it cannot.

Not all devices are able to play video files placed in the user,Äôs Camera Roll album. Before attempting to save a video, call this function and check its return value to ensure that saving the video is supported for the current device. For a code example, refer to Camera Programming Topics for iOS.
When used on an iOS device without a camera, this method indicates whether the specified movie can be saved to the Saved Photos album rather than to the Camera Roll album.
See also:

- 90.2.8 VideoAtPathIsCompatibleWithSavedPhotosAlbum(VideoPath as String) as Boolean 14508

90.2.8 VideoAtPathIsCompatibleWithSavedPhotosAlbum(VideoPath as String) as Boolean

MBS Picture Plugin, Plugin Version: 21.1, Platform: iOS, Targets: iOS only.

Function: Returns a Boolean value that indicates whether the specified video is compatible to save to the user,Äôs Camera Roll album.
Notes: videoPath: The filesystem path to the movie file you want to save.

Returns true if the video can be saved to the Camera Roll album or false if it cannot.

Not all devices are able to play video files placed in the user,Äôs Camera Roll album. Before attempting to save a video, call this function and check its return value to ensure that saving the video is supported for the current device. For a code example, refer to Camera Programming Topics for iOS.
When used on an iOS device without a camera, this method indicates whether the specified movie can be saved to the Saved Photos album rather than to the Camera Roll album.
See also:

- 90.2.7 VideoAtPathIsCompatibleWithSavedPhotosAlbum(VideoFile as FolderItem) as Boolean 14507

90.2.9 WriteImageToSavedPhotosAlbum(Pic as Picture, CompletionDelegate as ImageSaveCompletedMBS)

MBS Picture Plugin, Plugin Version: 21.1, Platform: iOS, Targets: iOS only.

Function: Adds the specified image to the user,Äôs Camera Roll album.
Example:

```
Var pic As Picture = LogoMBS(500)

iOSPictureMBS.WriteImageToSavedPhotosAlbum(pic, AddressOf ImageSaved)
```

Notes: Pic: The image to write to the Camera Roll album.
CompletionDelegate: Optionally, the delegate which should be called after the image has been written to the Camera Roll album.

The use of the CompletionDelegate parameter is optional and necessary only if you want to be notified asynchronously when the function finishes writing the image to the user,Äôs Camera Roll or Saved Photos album. If you do not want to be notified, pass nil for these parameters.
When used on an iOS device without a camera, this method adds the image to the Saved Photos album rather than to the Camera Roll album.

90.2.10 Delegates

90.2.11 ImageSaveCompletedMBS(error as NSErrorMBS)

MBS Picture Plugin, Plugin Version: 21.1, Platform: iOS, Targets: iOS only.

Function: The delegate called when image saving is done.
Example:

```
// sample method you could reference via AddressOf
Sub ImageSaved(error as NSErrorMBS)
If error <>Nil Then
MessageBox "Failed to save"+EndOfLine+EndOfLine+error.LocalizedDescription
Else
MessageBox "Saved."
End If
End Sub
```

Notes: If error is nil, the save was successful.

90.2.12 VideoSaveCompletedMBS(videoPath as String, error as NSErrorMBS)

MBS Picture Plugin, Plugin Version: 21.1, Platform: iOS, Targets: iOS only.

Function: The delegate called when video saving is done.
Notes: If error is nil, the save was successful.

90.3 Globals

90.3.1 NewPictureReaderMBS(pic as picture) as PictureReaderMBS

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new picture reader.
Example:

```
Var pic as Picture = LogoMBS(500)
Var p as PictureReaderMBS
Var m as MemoryBlock
Var r,g,b,rRow,gRow,bRow,h1,w1,x,y,bpp as Integer

// Create a new picture reader
p=NewPictureReaderMBS(pic)

h1=p.Height-1
w1=p.Width-1

bpp=p.BytesPerPixel
rRow=p.RedOffset
gRow=p.GreenOffset
bRow=p.BlueOffset
// in each row the red, blue and green channels have different offsets.
// but offsets are platform dependent

Var sum as Double

for y=0 to h1
// Get data in memory. This Memoryblock has a size property of 0!
m=p.Data(y)
r=rRow
g=gRow
b=bRow

for x=0 to w1

sum = sum + m.UInt8Value(r)
sum = sum + m.UInt8Value(g)
sum = sum + m.UInt8Value(b)

r=r+bpp
g=g+bpp
b=b+bpp
next

next
```

```
// show the sum of all pixels:
MessageBox "Sum with plugin is: "+str(sum)

// now try same in RB code:

Var surface as RGBSurface = pic.RGBSurface
Var c as color

sum = 0.0

for y=0 to h1
for x=0 to w1
c = surface.Pixel(x,y)

sum = sum + c.red
sum = sum + c.Green
sum = sum + c.Blue

next

next

surface = nil

MessageBox "Sum with RB Code is: "+str(sum)
quit
```

Notes: Returns nil on failure.
Please report if nil is returned as it should work always (except for low memory).

90.3.2 NewPictureWriterMBS(width as Integer, height as Integer, AlphaChannel as boolean = false) as PictureWriterMBS

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new picture writer.
Example:

```
Var p as PictureWriterMBS
Var m as MemoryBlock
Var r,g,b,rRow,gRow,bRow,h1,w1,x,y,bpp as Integer

// Create a new picture writer
p=NewPictureWriterMBS(512,512)
```

```
h1=p.Height-1
w1=p.Width-1

bpp=p.BytesPerPixel
rRow=p.RedOffset
gRow=p.GreenOffset
bRow=p.BlueOffset
// in each row the red, blue and green channels have different offsets.
// but offsets are platform dependent

for y=0 to h1
// Get data in memory. This Memoryblock has a size property of 0!
m=p.Data(y)
r=rRow
g=gRow
b=bRow

for x=0 to w1

m.UInt8Value(r)=x\2
m.UInt8Value(g)=y\2
m.UInt8Value(b)=x*y\2

r=r+bpp
g=g+bpp
b=b+bpp
next

next

// Use Render to make a picture object
Var pic as Picture = p.Render
Backdrop = pic
```

Notes: Returns nil on failure (low memory).
If alpha is requested, but not possible in the given version of Xojo (or Xojo), we return a picture without.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr12

90.3.3 MemoryblockARGBtoPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer, LittleEndian as boolean) as picture

MBS Picture Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
const kAlphaOffset=0 ' (BigEndian) and 3 (LittleEndian)
Var m as MemoryBlock
Var p,q,k as Picture

p=New Picture(100,100,32)
p.Graphics.ForeColor=rgb(255,128,1)
p.Graphics.FillRect 0,0,100,100
p.mask.Graphics.ForeColor=rgb(127,127,127)
p.mask.Graphics.FillRect 0,0,100,100

// Make a new MemoryBlock
m=NewMemoryBlock(100*100*4) // 4 bytes per Pixel

// copy RGB and leave room for alpha
if p.CopyARGBtoMemoryblockMBS(m,0,false,-1) then
'MessageBox EncodingToHexMBS(m.StringValue(0,99))
end if

// copy green channel from mask image into Memoryblock
if p.mask.CopyGtoMemoryblockMBS(m,kAlphaOffset,4) then
'MessageBox EncodingToHexMBS(m.StringValue(0,99))
end if

// make the picture from this Memoryblock
q=MemoryblockARGBtoPictureMBS(m,0,100,100,false)

// make the mask from this Memoryblock
k=MemoryblockGrayToPictureMBS(m,kAlphaOffset,100,100,4)

// combine picture and mask
q.Mask.Graphics.DrawPicture k,0,0

Backdrop=q
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs width*height*4 bytes in the memoryblock.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.

LittleEndian specifies whether the image is stored in ARGB (BigEndian) or BGRA (LittleEndian) mode.

90.3.4 MemoryblockRGBtoPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
Var m as MemoryBlock
Var p,q as Picture

p=New Picture(100,100,32)
p.Graphics.ForeColor=rgb(255,128,1)
p.Graphics.FillRect 0,0,100,100

// Make a new MemoryBlock
m=NewMemoryBlock(100*100*3) // 3 bytes per Pixel

// Copy RGB without alpha
if p.CopyRGBtoMemoryblockMBS(m,0) then

q=MemoryblockRGBtoPictureMBS(m,0,100,100)

Backdrop=q

end if
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs width*height*3 bytes in the memoryblock.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.

90.3.5 BlendPicturesMBS(source as picture, sourcepercent as Double, dest as picture, destpercent as Double) as picture

MBS Picture Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blends two pictures.
Example:

```
Var a,b,c as picture

a=New Picture(100,100,32)
b=New Picture(100,100,32)
' ... draw something in a and b
c=New Picture(100,100,32)
c=BlendPicturesMBS(a,0.5,b,0.5)
```

Notes: Percent is in range from 0 to 1. Values out of this range may work, but you get strange results.

Reason for returning nil:
- One of the two pictures used is nil.
- One of the pictures is not a 32bit bitmap picture.
- The two parameter pictures have not the same size as the others.

90.3.6 BlendPicturesWithMaskMBS(source as picture, dest as picture, mask as picture) as picture

MBS Picture Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blends two pictures.
Example:

```
Var a,b,c,m as picture

a=New Picture(100,100,32)
b=New Picture(100,100,32)
m=New Picture(100,100,32)
' ... draw something in a and b
c=BlendPicturesWithMaskMBS(a,b,m)
```

Notes: The mask defines how much from one picture is used.

Reason for returning false:
- One of the three pictures used is nil.
- One of the pictures is not a 32bit bitmap picture.
- The three parameter pictures have not the same size as the others.

90.3.7 CombinePicturesMBS(red as picture, blue as picture, green as picture) as picture

MBS Picture Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines the red, green and blue channels of three images into the a new one.
Example:

```
// build one color picture from three grayscale channel pictures
Var red As Picture = Picture.Open(SpecialFolder.Desktop.Child("red.png"))
Var green As Picture = Picture.Open(SpecialFolder.Desktop.Child("green.png"))
Var blue As Picture = Picture.Open(SpecialFolder.Desktop.Child("blue.png"))
Var combined As Picture = CombinePicturesMBS(red, blue, green) // note the order: red, blue, green
```

Notes: Returns nil on any error.

90.3.8 MergePictureMBS(source1 as picture, source2 as picture) as picture

MBS Picture Plugin, Plugin Version: 7.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Merges the two pictures into one.
Example:

```
// in RB this method would work like this:

Var i,j as Integer
Var col2 as color
Var r1,r2,g1,g2,b1,b2 as Integer
Var dest as Picture // destination
Var source1, source2 as Picture // source pictures

col2 = source1.graphics.pixel(i,j)
r1 = col2.red
g1 = col2.green
b1 = col2.blue
col2 = source2.graphics.pixel(i,j)
r2 = col2.red
g2 = col2.green
b2 = col2.blue

dest.graphics.pixel(i,j) = RGB(max(r1,r2), max(g1,g2), max(b1,b2))
```

Notes: Masks are ignored.
Returns nil on low memory.
Both pictures must have the same size and not be nil.

90.3.9 NewPictureWithColorMBS(width as Integer, height as Integer, c as color) as picture

MBS Picture Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new picture and fills it with the given color.
Example:

Window1.backdrop = NewPictureWithColorMBS(200, 200, &c3366CC)

Notes: This function is mostly to check if the picture writer code in our plugins work.

90.3.10 RenderSamplesMBS(Samples as memoryblock, SampleCount as Integer, Smooth as Integer, Width as Integer, Height as Integer, outlinewidth as Integer, BackColor as color=&c88B5C4, ForeColor as color=&c274C5A OutLineColor as color=&c203F4E, Bits as Integer = 8, AutoScale as boolean = false) as Picture

MBS Picture Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Renders audio samples into a picture.
Notes: Samples has one byte for each audio value and 2 bytes for each stereo sample.
SampleCount: Number of Samples. = Samples.size/2
Smooth: How smooth the samples should be made.
Width: Width of picture
Height: Height of picture
outlinewidth: The width of the outline (0=no outline)
BackColor: The back color.
ForeColor: the fore color.
OutLineColor: The color for the outline.
Bits: Pass 7 for signed bytes, 8 for unsigned bytes, 15 for signed shorts and 16 for unsigned short values. Pass -32 for Float32 and -64 for Float64.
AutoScale: Whether to scale automatically depending on highest values.

See SoundFileMBS class to get samples cross platform.

90.3.11 TintPictureMBS(source as picture, GreyBase as color, SepiaBase as color) as picture

MBS Picture Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tints the image.
Example:

```
// The code does the same thing as this Xojo code:

Sub TintPicture(theImg as Picture, pGreyBase as Color, pSepiaBase as Color)
Var theRGBSurface as RGBSurface
Var theWidth, theHeight as Integer
Var pColor as Color
Var x, y as Integer
Var theGrey as Integer

Var SepiaBaseR as Double
Var SepiaBaseG as Double
Var SepiaBaseB as Double

Var GreyBaseR as Double
Var GreyBaseG as Double
Var GreyBaseB as Double

SepiaBaseR=pSepiaBase.Red / 255.0
SepiaBaseG=pSepiaBase.Green / 255.0
SepiaBaseB=pSepiaBase.Blue / 255.0

GreyBaseR=pGreyBase.Red / 255.0
GreyBaseG=pGreyBase.Green / 255.0
GreyBaseB=pGreyBase.Blue / 255.0

theRGBSurface = theImg.RGBSurface

theWidth = theImg.Width-1
theHeight = theImg.Height-1

For x = 0 to theWidth
For y = 0 to theHeight
pColor = theImg.RGBSurface.Pixel( x, y )

theGrey = ( GreyBaseR * pColor.Red ) + ( GreyBaseG * pColor.Green ) + ( GreyBaseB * pColor.Blue )
theImg.RGBSurface.Pixel( x, y ) = RGB( theGrey * SepiaBaseR, theGrey * SepiaBaseG, theGrey * SepiaBaseB )

Next
Next
```

```
End Sub
```

Notes: You can use the code to do something like a Sepia effect.
Returns a new picture on success.

90.3.12 BlendPicturesMBS(result as picture, source as picture, sourcepercent as Double, dest as picture, destpercent as Double, x as Integer, y as Integer, width as Integer, height as Integer) as boolean

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Windows, Targets: All.

Function: Blends two pictures.
Example:

```
Var a,b,c as picture

a=New Picture(100,100,32)
b=New Picture(100,100,32)
' ... draw something in a and b
c=New Picture(100,100,32)
call BlendPicturesMBS(c, a,0.5,b,0.5, 0, 0, 100, 100)
```

Notes: Percent is in range from 0 to 1. Values out of this range may work, but you get strange results.

Reason for returning false:
- One of the pictures used is nil.
- The result picture must be a 24 bit or a 32 bit picture.
- The two parameter pictures have not the same size as the others.

90.3.13 BlendPicturesWithMaskMBS(result as picture, source as picture, dest as picture, mask as picture, x as Integer, y as Integer, width as Integer, height as Integer) as boolean

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Windows, Targets: All.

Function: Blends two pictures.
Example:

```
Var a,b,c,m as picture

a=New Picture(100,100,32)
b=New Picture(100,100,32)
m=New Picture(100,100,32)
```

```
' ... draw something in a and b
call BlendPicturesWithMaskMBS(c,a,b,m,0,0,a.width,a.height)
```

Notes: The mask defines how much from one picture is used.

Reason for returning false:
- One of the pictures used is nil.
- The result picture must be a 24 bit or a 32 bit picture.
- The three parameter pictures have not the same size as the others.

90.3.14 BlendPicturesWithMaskWithBackgroundMBS(SourceImage As Picture, DestImage As Picture, Mask As Picture, Result As Picture, X as Integer, Y as Integer, Width as Integer, Height as Integer) as boolean

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Windows, Targets: All.

Function: Blends a picture with another picture.
Notes: If DestImage is nil, white is used for the background.
If no mask is specified, a full black mask is used.
Result must be valid picture of right size.

Result must be a 24bit or 32bit picture.
See also:

- 90.3.15 BlendPicturesWithMaskWithBackgroundMBS(SourceImage As Picture, DestImage As Picture, Mask As Picture, Result As Picture, X as Integer, Y as Integer, Width as Integer, Height as Integer, BackgroundColour As Color) as boolean 14520

90.3.15 BlendPicturesWithMaskWithBackgroundMBS(SourceImage As Picture, DestImage As Picture, Mask As Picture, Result As Picture, X as Integer, Y as Integer, Width as Integer, Height as Integer, BackgroundColour As Color) as boolean

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Windows, Targets: All.

Function: Blends a picture with another picture.
Notes: If DestImage is nil, BackgroundColour is used for the background.
If no mask is specified, a full black mask is used.
Result must be valid picture of right size.

Result must be a 24bit or 32bit picture.
See also:

- 90.3.14 BlendPicturesWithMaskWithBackgroundMBS(SourceImage As Picture, DestImage As Picture, Mask As Picture, Result As Picture, X as Integer, Y as Integer, Width as Integer, Height as Integer) as boolean 14520

90.3.16 DiffPicturesMBS(source as picture, dest as picture, square as boolean) as picture

MBS Picture Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the difference between two pictures.
Example:

```
// our test Picture
Var p as Picture = LogoMBS(500)

// compress with JPEG and 10%
Var d as string = PictureToJPEGStringMBS(p, 10)

// decompress
Var q as Picture = JPEGStringToPictureMBS(d, true)

// compare them
Window1.Backdrop = DiffPicturesMBS(p, q, true)
```

Notes: Source and dest pictures must have same size. If square, the error is squared, so you see it much better.

Returns nil in case not enough memory is available or pictures do not have same size or are nil.

If both pictures are equal, all pixels in the returned picture are black.
See also Picture.isBlackMBS, and Picture.CompareMBS.

90.3.17 ColorizePictureMBS(Pict As Picture, Mask As Picture, foreR as Double, foreG as Double, foreB as Double, foreA as Double, backR as Double, backG as Double, backB as Double, backA as Double) as boolean

MBS Picture Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Colorizes a picture.
Example:

```
Var p as Picture = SpecialFolder.Pictures.Child("test2.tif").OpenAsPicture

if ColorizePictureMBS(p, p.mask, 1.0, 0.0, 0.0, 1.0, 0.0, 0.0, 1.0, 0.1) then
Backdrop=p
end if
```

Notes: The given pictures are edited. As editing pictures works only on Mac and Windows if the pictures are 24 or 32 bit, this does not work on Linux.
Returns true on success and false on failure.

90.3.18 PictureCombineMBS(DestImage As Picture, Image As Picture, Mask As Picture, DestX as Integer, DestY as Integer, SourceX as Integer, SourceY as Integer, Width as Integer, Height as Integer, UseColours As Boolean) as boolean

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies pixels from one picture into another picture with some options.
Notes: Returns true on success and false on failure.

This function has 4 behaviors depending on the parameters:

1. If mask is nil and no ForeColour and MaskColour values are passed, the pixels a copied to the destination picture.

2. But if there is a mask, the pixels are copied with applying the mask.

3. If the mask color is not defined, the pixels are filled with the fore color applying the mask.

4. As the last variation the pixels are copied and the forecolor, the mask color or black is used with the image as the mask. If UseColours parameter is false black is used for this.

Parameters:
Image: the source picture, must not be nil.
Mask: the mask picture, can be nil.
DestX: destination position
DestY: destination position
SourceX: source position
SourceY: source position
Width: width of the area to copy
Height: height of the area to copy
UseColours: whether to use the mask colour.

ForeColour: the fore colour, optional, can be integer or color
MaskColour: the mask color, optional, can be integer or color

This function is 5 times in the plugin defined to implement having the last two parameters optional and either integer or color. You can pass a negative number for MaskColour or ForeColour to disable this parameter.

The destination image (self) can be either 24 bit or 32 bit.

- 90.3.27 PictureCombineMBS(DestImage As Picture, Image As Picture, PreMultipliedSource as boolean, Mask As Picture, DestX as Integer, DestY as Integer, SourceX as Integer, SourceY as Integer, Width as Integer, Height as Integer, UseColours As Boolean, ForeColour as Integer, MaskColour as Integer) as boolean 14538

90.3.19 PictureCombineMBS(DestImage As Picture, Image As Picture, Mask As Picture, DestX as Integer, DestY as Integer, SourceX as Integer, SourceY as Integer, Width as Integer, Height as Integer, UseColours As Boolean, ForeColour As color) as boolean

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies pixels from one picture into another picture with some options.
Example:

```
Var DestImage As Picture
Var Image As Picture
Var Mask As Picture
Var DestX as Integer=100
Var DestY as Integer=100
Var SourceX as Integer=0
Var SourceY as Integer=0
Var Width as Integer=500
Var Height as Integer=500

image=LogoMBS(500)
Mask=nil
DestImage=New Picture(700,700,32)

if PictureCombineMBS(DestImage, image, Mask, DestX, DestY, SourceX, SourceY, Width, Height, true,&c777777,&c777777)
then
Window1.Backdrop=DestImage
end if
```

Notes: Returns true on success and false on failure.

This function has 4 behaviors depending on the parameters:

1. If mask is nil and no ForeColour and MaskColour values are passed, the pixels a copied to the destination picture.

2. But if there is a mask, the pixels are copied with applying the mask.

3. If the mask color is not defined, the pixels are filled with the fore color applying the mask.

4. As the last variation the pixels are copied and the forecolor, the mask color or black is used with the image as the mask. If UseColours parameter is false black is used for this.

Parameters:

Image: the source picture, must not be nil.
Mask: the mask picture, can be nil.
DestX: destination position
DestY: destination position
SourceX: source position
SourceY: source position
Width: width of the area to copy
Height: height of the area to copy
UseColours: whether to use the mask colour.
ForeColour: the fore colour, optional, can be integer or color
MaskColour: the mask color, optional, can be integer or color

This function is 5 times in the plugin defined to implement having the last two parameters optional and either integer or color. You can pass a negative number for MaskColour or ForeColour to disable this parameter.

The destination image (self) can be either 24 bit or 32 bit.

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies pixels from one picture into another picture with some options.
Example:

```
Var DestImage As Picture
Var Image As Picture
Var Mask As Picture
Var DestX as Integer=100
Var DestY as Integer=100
Var SourceX as Integer=0
Var SourceY as Integer=0
Var Width as Integer=500
Var Height as Integer=500
```

```
image=LogoMBS(500)
Mask=nil
DestImage=New Picture(700,700,32)

if PictureCombineMBS(DestImage,image,Mask,DestX,DestY,SourceX,SourceY,Width,Height,true,&h777777,&h777777)
then
Window1.Backdrop=DestImage
end if
```

Notes: Returns true on success and false on failure.

This function has 4 behaviors depending on the parameters:

1. If mask is nil and no ForeColour and MaskColour values are passed, the pixels a copied to the destination picture.

2. But if there is a mask, the pixels are copied with applying the mask.

3. If the mask color is not defined, the pixels are filled with the fore color applying the mask.

4. As the last variation the pixels are copied and the forecolor, the mask color or black is used with the image as the mask. If UseColours parameter is false black is used for this.

Parameters:
Image: the source picture, must not be nil.
Mask: the mask picture, can be nil.
DestX: destination position
DestY: destination position
SourceX: source position
SourceY: source position
Width: width of the area to copy
Height: height of the area to copy
UseColours: whether to use the mask colour.
ForeColour: the fore colour, optional, can be integer or color
MaskColour: the mask color, optional, can be integer or color

This function is 5 times in the plugin defined to implement having the last two parameters optional and either integer or color. You can pass a negative number for MaskColour or ForeColour to disable this parameter.

The destination image (self) can be either 24 bit or 32 bit.

MBS Picture Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies pixels from one picture into another picture with some options.
Notes: Returns true on success and false on failure.

This function has 4 behaviors depending on the parameters:

1. If mask is nil and no ForeColour and MaskColour values are passed, the pixels a copied to the destination picture.

2. But if there is a mask, the pixels are copied with applying the mask.

3. If the mask color is not defined, the pixels are filled with the fore color applying the mask.

4. As the last variation the pixels are copied and the forecolor, the mask color or black is used with the image as the mask. If UseColours parameter is false black is used for this.

Parameters:
Image: the source picture, must not be nil.
PreMultipliedSource: Optional parameter. If true the image must be premultiplied. Default is false.
Mask: the mask picture, can be nil.
DestX: destination position
DestY: destination position
SourceX: source position
SourceY: source position
Width: width of the area to copy
Height: height of the area to copy
UseColours: whether to use the mask colour.
ForeColour: the fore colour, optional, can be integer or color
MaskColour: the mask color, optional, can be integer or color

This function is 5 times in the plugin defined to implement having the last two parameters optional and either integer or color. You can pass a negative number for MaskColour or ForeColour to disable this parameter.

The destination image (self) can be either 24 bit or 32 bit.

90.3.28 PictureCopyPixelFastMBS(DestImage As Picture, Source As Picture, DestX as Integer, DestY as Integer, SourceX as Integer, SourceY as Integer, Width as Integer, Height as Integer) as boolean

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Windows, Targets: All.

Function: Copies pixels from one picture into another picture with some options.
Example:

```
const x=100 // mouse coordinates for example
const y=100

Var p,logo as picture

logo=LogoMBS(500)

p=New Picture(800,800,32)

p.Graphics.ForeColor=&cFFFFFF
p.Graphics.FillRect 0,0,p.Width,p.Height
```

```
if PictureCopyPixelFastMBS(p, logo, x-logo.Width/2, y-logo.Height/2, 0, 0, logo.Width, logo.Height) then
' ok
else
beep
end if

Window1.Backdrop=p
```

Notes: Returns true on success and false on failure.

Parameters:
Source: the source picture, must not be nil.
DestX: destination position
DestY: destination position
SourceX: source position
SourceY: source position
Width: width of the area to copy
Height: height of the area to copy

The destination image (self) can be either 24 bit or 32 bit.
The source image can have any bit depth and may be converted to 24 or 32 bit.

90.3.29 NewPictureEditorMBS(pic as picture) as PictureEditorMBS

MBS Picture Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new picture editor editing the given picture.
Example:

```
Var l as Picture = LogoMBS(500)
Var p as PictureEditorMBS

p = NewPictureEditorMBS(l)
```

Notes: Returns nil on failure.
Works only for bitmap images.

90.3.30 NewPictureMBS(width as Integer, height as Integer, pixeltype as Integer, buffer as memoryblock, rowbytes as Integer) as picture

MBS Picture Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a picture from a memory block.
Notes: This wraps the REALBuildPictureFromBuffer plugin function and copies the pixels.

rowbytes must be the number of bytes per row. Typical width*3 or width*4.

Pixeltype constants:

kRBPixelRGB24	= 1	3 bytes/pixel: Red, Green, Blue
kRBPixelBGR24	= 2	3 bytes/pixel: Blue, Green, Red
kRBPixelXRGB32	= 3	4 bytes/pixel: Unused, Red, Green, Blue
kRBPixelBGRX32	= 4	4 bytes/pixel: Blue, Green, Red, Unused

90.3.31 NewPictureWriterMBS(pic as picture, width as Integer, height as Integer) as PictureWriterMBS

MBS Picture Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new picture writer.
Notes: Returns nil on failure (low memory).
If you provide an existing picture we reuse it if it has the right size. But you can pass nil to get a new one always.

90.3.32 GetMBfromPictureMBS(pic as picture, mask as picture, mode as string) as memoryblock

MBS Picture Plugin, Plugin Version: 10.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a memoryblock from the picture data with the given format.
Example:

```
Var p as Picture = LogoMBS(500)
Var m as MemoryBlock = GetMBfromPictureMBS(p, p.mask, "RGB32")
```

Notes: Returns nil on any error.
Mode can be a string with the following strings: RGB16, ARGB16, RGB16_565, ARGB32, RGB32, RGB24 or MASK8.

See the example project "Picture To Memoryblock.rbp" for the RB code matching the plugin code.

- 90.3.33 GetMBfromPictureMBS(pic as picture, mode as string) as memoryblock 14543

90.3.33 GetMBfromPictureMBS(pic as picture, mode as string) as memoryblock

MBS Picture Plugin, Plugin Version: 10.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a memoryblock from the picture data with the given format.
Example:

```
Var p as Picture = LogoMBS(500)
Var m as MemoryBlock = GetMBfromPictureMBS(p, "RGB32")
```

Notes: Same as the other GetMBfromPictureMBS function, but takes the mask from the picture.

See also:

- 90.3.32 GetMBfromPictureMBS(pic as picture, mask as picture, mode as string) as memoryblock 14542

90.3.34 MemoryblockABGRtoPictureMBS(dest as picture, source as memoryblock, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
// convert raw ABGR pixels with 4 bytes each from a MemoryBlock into a picture, e.g. data from a camera
or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 4) // ABGR pixels with 4 bytes each
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \4 Mod w) * 255 \w // a simple gradient
Next
Var pic As New Picture(w, h) // existing picture to fill
Var result As Picture = MemoryblockABGRtoPictureMBS(pic, m, 0, w, h)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs width*height*4 bytes in the memoryblock.

In the dest picture parameter you can provide a picture to draw in. If the picture is no big enough or nil, a new one is created.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.

90.3.35 MemoryblockABGRtoPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
// Create a picture with mask:
Var p as Picture = LogoMBS(200)
Var g as Graphics = p.mask.Graphics

g.ForeColor = &cFFFFFF
g.FillRect 0,0,g.Width,g.Height

g.ForeColor = &c000000
g.Filloval 0,0,g.Width,g.Height

// convert to memoryblock
Var m as new MemoryBlock(4 * p.Width * p.Height)

if p.CopyABGRtoMemoryblockMBS(m, 0, p.Mask) then
// convert back
Backdrop = MemoryblockABGRtoPictureMBS(m, 0, p.Width, p.Height)

break // look into memoryblock with debugger
end if
```

Notes: Returns nil on any error.

source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs width*height*4 bytes in the memoryblock.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.

90.3.36 MemoryblockARGBtoPictureMBS(dest as picture, source as memoryblock, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
Var m as MemoryBlock
Var p,q as Picture

p=New Picture(100,100,32)
p.Graphics.ForeColor=rgb(255,128,1)
p.Graphics.FillRect 0,0,100,100

// Make a new MemoryBlock
m=NewMemoryBlock(100*100*4) // 3 bytes per Pixel

// Copy RGB without alpha
if p.CopyARGBtoMemoryblockMBS(m,0,0) then

Var x as Picture = New Picture(100,100,32)

q=MemoryblockARGBtoPictureMBS(x, m,0,100,100)

Backdrop=q

if x=q then
Window1.Title = "reused picture"
else
Window1.Title = "created new picture"
end if
end if
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs width*height*4 bytes in the memoryblock.

In the dest picture parameter you can provide a picture to draw in. If the picture is no big enough or nil, a new one is created.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.

MBS Picture Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
// Create a picture with mask:
Var p as Picture = LogoMBS(200)
Var g as Graphics = p.mask.Graphics

g.ForeColor = &cFFFFFF
g.FillRect 0,0,g.Width,g.Height

g.ForeColor = &c000000
g.Filloval 0,0,g.Width,g.Height

// convert to memoryblock
Var m as new MemoryBlock(4 * p.Width * p.Height)

if p.CopyARGBtoMemoryblockMBS(m, 0, p.Mask) then
// convert back
Backdrop = MemoryblockARGBtoPictureMBS(m, 0, p.Width, p.Height)

break // look into memoryblock with debugger
end if
```

Notes: Returns nil on any error.

source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs width*height*4 bytes in the memoryblock.

Does not access the mask inside the image!

MBS Picture Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
// Create a picture with mask:
Var p as Picture = LogoMBS(200)
Var g as Graphics = p.mask.Graphics

g.ForeColor = &cFFFFFF
g.FillRect 0,0,g.Width,g.Height

g.ForeColor = &c000000
g.Filloval 0,0,g.Width,g.Height

// convert to memoryblock
Var m as new MemoryBlock(4 * p.Width * p.Height)

if p.CopyBGRAtoMemoryblockMBS(m, 0, p.Mask) then
// convert back
Backdrop = MemoryblockBGRAtoPictureMBS(nil, m, 0, p.Width, p.Height)

break // look into memoryblock with debugger
end if
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs width*height*4 bytes in the memoryblock.

In the dest picture parameter you can provide a picture to draw in. If the picture is no big enough or nil, a new one is created.

90.3.39 MemoryblockBGRAtoPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
// Create a picture with mask:
Var p as Picture = LogoMBS(200)
Var g as Graphics = p.mask.Graphics

g.ForeColor = &cFFFFFF
g.FillRect 0,0,g.Width,g.Height

g.ForeColor = &c000000
g.Filloval 0,0,g.Width,g.Height

// convert to memoryblock
Var m as new MemoryBlock(4 * p.Width * p.Height)

if p.CopyBGRAtoMemoryblockMBS(m, 0, p.Mask) then
// convert back
Backdrop = MemoryblockBGRAtoPictureMBS(m, 0, p.Width, p.Height)

break // look into memoryblock with debugger
end if
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs width*height*4 bytes in the memoryblock.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.
See also:

- 90.3.38 MemoryblockBGRAtoPictureMBS(dest as picture, source as memoryblock, offset as Integer, width as Integer, height as Integer) as picture 14547

90.3.40 MemoryblockBGRtoPictureMBS(dest as picture, source as memoryblock, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
Var m as MemoryBlock
Var p,q as Picture

p=New Picture(100,100,32)
p.Graphics.ForeColor=rgb(255,128,1)
p.Graphics.FillRect 0,0,100,100

// Make a new MemoryBlock
m=NewMemoryBlock(100*100*3) // 3 bytes per Pixel

// Copy RGB without alpha
if p.CopyBGRtoMemoryblockMBS(m,0) then

Var x as Picture = New Picture(100,100,32)

q=MemoryblockBGRtoPictureMBS(x, m,0,100,100)

Backdrop=q

if x=q then
Window1.Title = "reused picture"
else
Window1.Title = "created new picture"
end if

end if
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs width*height*3 bytes in the memoryblock.

In the dest picture parameter you can provide a picture to draw in. If the picture is no big enough or nil, a new one is created.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.
See also:

- 90.3.41 MemoryblockBGRtoPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer) as picture 14550

90.3.41 MemoryblockBGRtoPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
// convert raw BGR pixels with 3 bytes each from a MemoryBlock into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 3) // BGR pixels with 3 bytes each
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \3 Mod w) * 255 \w // a simple gradient
Next
Var result As Picture = MemoryblockBGRtoPictureMBS(m, 0, w, h)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs width*height*3 bytes in the memoryblock.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.
See also:

- 90.3.40 MemoryblockBGRtoPictureMBS(dest as picture, source as memoryblock, offset as Integer, width as Integer, height as Integer) as picture 14549

90.3.42 MemoryblockGrayToPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer) as picture

MBS Picture Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
const kAlphaOffset=0 ' (BigEndian) and 3 (LittleEndian)
Var m as MemoryBlock
Var p,q,k as Picture

p=New Picture(100,100,32)
p.Graphics.ForeColor=rgb(255,128,1)
p.Graphics.FillRect 0,0,100,100
p.mask.Graphics.ForeColor=rgb(127,127,127)
p.mask.Graphics.FillRect 0,0,100,100

// Make a new MemoryBlock
m=NewMemoryBlock(100*100*4) // 4 bytes per Pixel

// copy RGB and leave room for alpha
if p.CopyARGBtoMemoryblockMBS(m,0,false,-1) then
'MessageBox EncodingToHexMBS(m.StringValue(0,99))
end if

// copy green channel from mask image into Memoryblock
if p.mask.CopyGtoMemoryblockMBS(m,kAlphaOffset,4) then
'MessageBox EncodingToHexMBS(m.StringValue(0,99))
end if

// make the picture from this Memoryblock
q=MemoryblockARGBtoPictureMBS(m,0,100,100,false)

// make the mask from this Memoryblock
k=MemoryblockGrayToPictureMBS(m,kAlphaOffset,100,100,4)

// combine picture and mask
q.Mask.Graphics.DrawPicture k,0,0

Backdrop=q
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs width*height*PixelByteSize bytes in the memoryblock.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.
See also:

- 90.3.43 MemoryblockGrayToPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer, Red as Integer, Blue as Integer, Green as Integer) as picture 14552

90.3.43 MemoryblockGrayToPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer, Red as Integer, Blue as Integer, Green as Integer) as picture

MBS Picture Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
// convert raw 8 bit gray pixels from a MemoryBlock into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 1) // 8 bit gray pixels
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \1 Mod w) * 255 \w // a simple gradient
Next
Var result As Picture = MemoryblockGrayToPictureMBS(m, 0, w, h, 1, 255, 128, 0)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: This variantion of this method Multiplies the gray value with Red, Blue and Green and divided by 256.

Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs width*height*PixelByteSize bytes in the memoryblock.

Does not access the mask inside the image!

Data is copied from memory block to the new picture, not referenced.
See also:

- 90.3.42 MemoryblockGrayToPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer) as picture 14551
- 90.3.44 MemoryblockGrayToPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer, Red() as Integer, Blue() as Integer, Green() as Integer) as picture 14553

90.3.44 MemoryblockGrayToPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer, Red() as Integer, Blue() as Integer, Green() as Integer) as picture

MBS Picture Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
// convert raw 8 bit gray pixels from a MemoryBlock into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 1) // 8 bit gray pixels
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \1 Mod w) * 255 \w // a simple gradient
Next
Var red(), green(), blue() As Integer
For i As Integer = 0 To 255 // palette: a blue tint
red.Add i \2
green.Add i \2
blue.Add i
Next
Var result As Picture = MemoryblockGrayToPictureMBS(m, 0, w, h, 1, red, blue, green)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: This variantion of this method lookups the Red, Green and Blue values for the next pixel by using the gray value as index.

The arrays should have 256 elements.

Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs width*height*PixelByteSize bytes in the

memoryblock.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.
See also:

- 90.3.42 MemoryblockGrayToPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer) as picture 14551
- 90.3.43 MemoryblockGrayToPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer, Red as Integer, Blue as Integer, Green as Integer) as picture 14552

90.3.45 MemoryblockRGBAtoPictureMBS(dest as picture, source as memoryblock, offset as Integer, width as Integer, height as Integer, FlipVertically as boolean=false) as picture

MBS Picture Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
// Create a picture with mask:
Var p as Picture = LogoMBS(200)
Var g as Graphics = p.mask.Graphics

g.ForeColor = &cFFFFFF
g.FillRect 0,0,g.Width,g.Height

g.ForeColor = &c000000
g.Filloval 0,0,g.Width,g.Height

// convert to memoryblock
Var m as new MemoryBlock(4 * p.Width * p.Height)

if p.CopyRGBAtoMemoryblockMBS(m, 0, p.Mask) then
// convert back
Backdrop = MemoryblockRGBAtoPictureMBS(m, 0, p.Width, p.Height)

break // look into memoryblock with debugger
end if
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs width*height*4 bytes in the memoryblock.

In the dest picture parameter you can provide a picture to draw in. If the picture is no big enough or nil, a new one is created.

If FlipVertically is true the image is flipped. New in version 9.4.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.
See also:

- 90.3.46 MemoryblockRGBAtoPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer, FlipVertically as boolean=false) as picture 14555

90.3.46 MemoryblockRGBAtoPictureMBS(source as memoryblock, offset as Integer, width as Integer, height as Integer, FlipVertically as boolean=false) as picture

MBS Picture Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
// some memory with pixel data
Var m as MemoryBlock = NewMemoryBlock(100*100*32)

for i as Integer = 1 to 1000
// place random pixels
m.Int8Value(rnd*m.size) = rnd*256
next

// and make a picture
Var l as Picture = MemoryBlockRGBAtoPictureMBS(m, 0, 100, 100)

// display in window
Window1.backdrop = l
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs width*height*4 bytes in the memoryblock.

If FlipVertically is true the image is flipped. New in version 9.4.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.
See also:

- 90.3.45 MemoryblockRGBAtoPictureMBS(dest as picture, source as memoryblock, offset as Integer, width as Integer, height as Integer, FlipVertically as boolean=false) as picture 14554

90.3.47 MemoryblockRGBtoPictureMBS(dest as picture, source as memoryblock, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a memoryblock into a picture object.
Example:

```
Var m as MemoryBlock
Var p,q as Picture

p=New Picture(100,100,32)
p.Graphics.ForeColor=rgb(255,128,1)
p.Graphics.FillRect 0,0,100,100

// Make a new MemoryBlock
m=NewMemoryBlock(100*100*3) // 3 bytes per Pixel

// Copy RGB without alpha
if p.CopyRGBtoMemoryblockMBS(m,0) then

Var x as Picture = New Picture(100,100,32)

q=MemoryblockRGBtoPictureMBS(x, m,0,100,100)

Backdrop=q

if x=q then
Window1.Title = "reused picture"
else
Window1.Title = "created new picture"
end if
end if
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

In the dest picture parameter you can provide a picture to draw in. If the picture is no big enough or nil, a new one is created.

The function will crash if the memoryblock is too small. Needs width*height*3 bytes in the memoryblock.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.

90.3.48 PtrABGRtoPictureMBS(dest as picture, source as Ptr, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a pointer into a picture object.
Example:

```
// convert raw ABGR pixels with 4 bytes each from memory into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 4) // ABGR pixels with 4 bytes each
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \4 Mod w) * 255 \w // a simple gradient
Next
Var pic As New Picture(w, h) // existing picture to fill
Var result As Picture = PtrABGRtoPictureMBS(pic, m, 0, w, h)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the data the pointer points to.

The function will crash if the data is too small where the pointer points to. Needs width*height*4 bytes in the memory pointed to by pointer plus offset.

In the dest picture parameter you can provide a picture to draw in. If the picture is no big enough or nil, a new one is created.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.
See also:

as picture 14558

90.3.49 PtrABGRtoPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a pointer into a picture object.
Example:

```
// convert raw ABGR pixels with 4 bytes each from memory into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 4) // ABGR pixels with 4 bytes each
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \4 Mod w) * 255 \w // a simple gradient
Next
Var result As Picture = PtrABGRtoPictureMBS(m, 0, w, h)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the data the pointer points to.

The function will crash if the data is too small where the pointer points to. Needs width*height*4 bytes in the memory pointed to by pointer plus offset.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.

90.3.50 PtrARGBtoPictureMBS(dest as picture, source as Ptr, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a pointer into a picture object.
Example:

```
// convert raw ARGB pixels with 4 bytes each from memory into a picture, e.g. data from a camera or library
```

```
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 4) // ARGB pixels with 4 bytes each
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \4 Mod w) * 255 \w // a simple gradient
Next
Var pic As New Picture(w, h) // existing picture to fill
Var result As Picture = PtrARGBtoPictureMBS(pic, m, 0, w, h)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the data the pointer points to.

The function will crash if the data is too small where the pointer points to. Needs width*height*4 bytes in the memory pointed to by pointer plus offset.

In the dest picture parameter you can provide a picture to draw in. If the picture is no big enough or nil, a new one is created.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.

- 90.3.51 PtrARGBtoPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer) as picture 14559
- 90.3.52 PtrARGBtoPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer, LittleEndian as boolean) as picture 14560

90.3.51 PtrARGBtoPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a pointer into a picture object.
Example:

```
// convert raw ARGB pixels with 4 bytes each from memory into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 4) // ARGB pixels with 4 bytes each
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \4 Mod w) * 255 \w // a simple gradient
```

```
Next
Var result As Picture = PtrARGBtoPictureMBS(m, 0, w, h)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the data the pointer points to.

The function will crash if the data is too small where the pointer points to. Needs width*height*4 bytes in the memory pointed to by pointer plus offset.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.

90.3.52 PtrARGBtoPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer, LittleEndian as boolean) as picture

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a pointer into a picture object.
Example:

```
// convert raw ARGB pixels with 4 bytes each from memory into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 4) // ARGB pixels with 4 bytes each
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \4 Mod w) * 255 \w // a simple gradient
Next
Var result As Picture = PtrARGBtoPictureMBS(m, 0, w, h, True)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the data the pointer points to.

The function will crash if the data is too small where the pointer points to. Needs width*height*4 bytes in

the memory pointed to by pointer plus offset.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.

LittleEndian specifies whether the image is stored in ARGB (BigEndian) or BGRA (LittleEndian) mode.

90.3.53 PtrBGRAtoPictureMBS(dest as picture, source as Ptr, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a pointer into a picture object.
Example:

```
// convert raw BGRA pixels with 4 bytes each from memory into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 4) // BGRA pixels with 4 bytes each
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \4 Mod w) * 255 \w // a simple gradient
Next
Var pic As New Picture(w, h) // existing picture to fill
Var result As Picture = PtrBGRAtoPictureMBS(pic, m, 0, w, h)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the data the pointer points to.

The function will crash if the data is too small where the pointer points to. Needs width*height*4 bytes in the memory pointed to by pointer plus offset.

In the dest picture parameter you can provide a picture to draw in. If the picture is no big enough or nil, a new one is created.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.

90.3.55 PtrBGRtoPictureMBS(dest as picture, source as Ptr, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a pointer into a picture object.
Example:

```
// convert raw BGR pixels with 3 bytes each from memory into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 3) // BGR pixels with 3 bytes each
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \3 Mod w) * 255 \w // a simple gradient
Next
Var pic As New Picture(w, h) // existing picture to fill
Var result As Picture = PtrBGRtoPictureMBS(pic, m, 0, w, h)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the data the pointer points to.

The function will crash if the data is too small where the pointer points to. Needs width*height*3 bytes in the memory pointed to by pointer plus offset.

In the dest picture parameter you can provide a picture to draw in. If the picture is no big enough or nil, a new one is created.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.
See also:

- 90.3.56 PtrBGRtoPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer) as picture 14563

90.3.56 PtrBGRtoPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a pointer into a picture object.
Example:

```
// convert raw BGR pixels with 3 bytes each from memory into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 3) // BGR pixels with 3 bytes each
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \3 Mod w) * 255 \w // a simple gradient
Next
```

```
Var result As Picture = PtrBGRtoPictureMBS(m, 0, w, h)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the data the pointer points to.

The function will crash if the data is too small where the pointer points to. Needs width*height*3 bytes in the memory pointed to by pointer plus offset.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.
See also:

- 90.3.55 PtrBGRtoPictureMBS(dest as picture, source as Ptr, offset as Integer, width as Integer, height as Integer) as picture 14562

90.3.57 PtrGrayToPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer) as picture

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a pointer into a picture object.
Example:

```
// convert raw 8 bit gray pixels from memory into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 1) // 8 bit gray pixels
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \1 Mod w) * 255 \w // a simple gradient
Next
Var result As Picture = PtrGrayToPictureMBS(m, 0, w, h, 1)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the data the pointer points to.

The function will crash if the data is too small where the pointer points to. Needs width*height*PixelByteSize bytes in the memory pointed to by pointer plus offset.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.

See also:

- 90.3.58 PtrGrayToPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer, Red as Integer, Blue as Integer, Green as Integer) as picture 14565
- 90.3.59 PtrGrayToPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer, Red() as Integer, Blue() as Integer, Green() as Integer) as picture 14566

90.3.58 PtrGrayToPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer, Red as Integer, Blue as Integer, Green as Integer) as picture

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a pointer into a picture object.
Example:

```
// convert raw 8 bit gray pixels from memory into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 1) // 8 bit gray pixels
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \1 Mod w) * 255 \w // a simple gradient
Next
Var result As Picture = PtrGrayToPictureMBS(m, 0, w, h, 1, 255, 128, 0)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: This variantion of this method Multiplies the gray value with Red, Blue and Green and divided by 256.

Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the data the pointer points to.

The function will crash if the data is too small where the pointer points to. Needs width*height*PixelByteSize bytes in the memory pointed to by pointer plus offset.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.
See also:

- 90.3.57 PtrGrayToPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer) as picture 14564
- 90.3.59 PtrGrayToPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer, Red() as Integer, Blue() as Integer, Green() as Integer) as picture 14566

90.3.59 PtrGrayToPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer, Red() as Integer, Blue() as Integer, Green() as Integer) as picture

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a pointer into a picture object.
Example:

```
// convert raw 8 bit gray pixels from memory into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 1) // 8 bit gray pixels
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \1 Mod w) * 255 \w // a simple gradient
Next
Var red(), green(), blue() As Integer
For i As Integer = 0 To 255 // palette: a blue tint
red.Add i \2
green.Add i \2
blue.Add i
Next
Var result As Picture = PtrGrayToPictureMBS(m, 0, w, h, 1, red, blue, green)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: This variantion of this method lookups the Red, Green and Blue values for the next pixel by using the gray value as index.

The arrays should have 256 elements.

Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the data the pointer points to.

The function will crash if the data is too small where the pointer points to. Needs width*height*PixelByteSize bytes in the memory pointed to by pointer plus offset.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.
See also:

- 90.3.57 PtrGrayToPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer, PixelByteSize as Integer) as picture 14564

90.3.60 PtrRGBAtoPictureMBS(dest as picture, source as Ptr, offset as Integer, width as Integer, height as Integer, FlipVertically as boolean=false) as picture

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a pointer into a picture object.
Example:

```
// convert raw RGBA pixels with 4 bytes each from memory into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 4) // RGBA pixels with 4 bytes each
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \4 Mod w) * 255 \w // a simple gradient
Next
Var pic As New Picture(w, h) // existing picture to fill
Var result As Picture = PtrRGBAtoPictureMBS(pic, m, 0, w, h, True) // True = flip vertically, e.g. for OpenGL data
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the data the pointer points to.

The function will crash if the data is too small where the pointer points to. Needs width*height*4 bytes in the memory pointed to by pointer plus offset.

In the dest picture parameter you can provide a picture to draw in. If the picture is no big enough or nil, a new one is created.

If FlipVertically is true the image is flipped. New in version 9.4.

Does not access the mask inside the image!
See also:

- 90.3.61 PtrRGBAtoPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer, FlipVertically as boolean=false) as picture 14567

90.3.61 PtrRGBAtoPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer, FlipVertically as boolean=false) as picture

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a pointer into a picture object.
Example:

```
// convert raw RGBA pixels with 4 bytes each from memory into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 4) // RGBA pixels with 4 bytes each
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \4 Mod w) * 255 \w // a simple gradient
Next
Var result As Picture = PtrRGBAtoPictureMBS(m, 0, w, h, True) // True = flip vertically, e.g. for OpenGL data
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the data the pointer points to.

The function will crash if the data is too small where the pointer points to. Needs width*height*4 bytes in the memory pointed to by pointer plus offset.

If FlipVertically is true the image is flipped. New in version 9.4.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.
See also:

- 90.3.60 PtrRGBAtoPictureMBS(dest as picture, source as Ptr, offset as Integer, width as Integer, height as Integer, FlipVertically as boolean=false) as picture 14567

90.3.62 PtrRGBtoPictureMBS(dest as picture, source as Ptr, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a pointer into a picture object.
Example:

```
// convert raw RGB pixels with 3 bytes each from memory into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 3) // RGB pixels with 3 bytes each
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \3 Mod w) * 255 \w // a simple gradient
Next
```

```
Var pic As New Picture(w, h) // existing picture to fill
Var result As Picture = PtrRGBtoPictureMBS(pic, m, 0, w, h)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the data the pointer points to.

In the dest picture parameter you can provide a picture to draw in. If the picture is no big enough or nil, a new one is created.

The function will crash if the data is too small where the pointer points to. Needs width*height*3 bytes in the memory pointed to by pointer plus offset.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.
See also:

90.3.63 PtrRGBtoPictureMBS(source as Ptr, offset as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies image data from a pointer into a picture object.
Example:

```
// convert raw RGB pixels with 3 bytes each from memory into a picture, e.g. data from a camera or library
Var w As Integer = 100
Var h As Integer = 50
Var m As New MemoryBlock(w * h * 3) // RGB pixels with 3 bytes each
For i As Integer = 0 To m.Size - 1
m.Byte(i) = (i \3 Mod w) * 255 \w // a simple gradient
Next
Var result As Picture = PtrRGBtoPictureMBS(m, 0, w, h)
If result <>Nil Then System.DebugLog result.Width.ToString + " x " + result.Height.ToString
```

Notes: Returns nil on any error.
source should not be nil.
offset should be 0 or bigger and is the start position in the data the pointer points to.

The function will crash if the data is too small where the pointer points to. Needs width*height*3 bytes in

the memory pointed to by pointer plus offset.

Does not access the mask inside the image!
Data is copied from memory block to the new picture, not referenced.
See also:

- 90.3.62 PtrRGBtoPictureMBS(dest as picture, source as Ptr, offset as Integer, width as Integer, height as Integer) as picture 14568

90.3.64 MandelbrotSetMBS(Threaded as Integer, width as Integer, height as Integer, fx as Double = 4.0, fy as Double = 4.0, dx as Double = -2.0, dy as Double = -2.0, dest as picture = nil) as picture

MBS Picture Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the mandelbrot picture.
Example:

Backdrop = MandelbrotSetMBS(0,300,300)

Notes: Threaded parameter specifies how many threads you want to use:
A negative value disables threading, zero will use one thread for each CPU core and a positive number specifies the thread count.

Width & Height specifiy the output image size.
fx and fy are the scale values and dx/dy specify the position of the mandelbrot image.

You can pass destination picture. If dest is not nil and size matches, the plugin reuses the picture object which increases performance as no new picture is created.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.
Blog Entries

- Multithreaded plugin functions can increase speed of Xojo application
- Problems with killing Xojo threads with plugin calls.

90.3.65 BinaryStringtoPictureMBS(data as String) as Picture

MBS Picture Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use PNG format instead.
Function: Creates the picture back from the binary data inside the string.
Example:

```
Var pic as Picture = LogoMBS(500)

// encode
Var s as string = PicturetoBinaryStringMBS(pic)

// decode
Backdrop = BinaryStringtoPictureMBS(s)
```

Notes: Deprecated. Please do not use for old projects and convert existing images into a new format, e.g. PNG.

The format of the binary encoded picture data:

+ 0 Kenn, PPIC for Packed Picture
+ 4 Length of whole block
+ 8 Width (BigEndian)
+12 Height (BigEndian)
+16 Depth (BigEndian, 32 for 32bit)
+20 Offset of the binary data. maybe 40.
+24 Reserved for future use. Should be 0.
+40 Pixel Data, packed R, G, B in one byte per Subpixel.

300x300 Pixels will make up 300*300+40 ->270040 Bytes.

This method does not require Quicktime or any other OS Service, but it does no compression.

May be a good way to store pictures crossplatform inside a database. As Valentina can do its own Zip based compression, this may be a wonderfull way to store pictures uncompressed (or lossless compressed) inside the database.
Does not handle mask or alpha channel.

- MBS Xojo / Real Studio Plugins, version 17.0pr1

90.3.66 PicturetoBinaryStringMBS(p as picture) as string

MBS Picture Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use PNG format instead.
Function: Creates a string with the picture content for saving.

Example:

```
Var s as string
Var pic as picture = LogoMBS(100)

s=PicturetoBinaryStringMBS(pic)
```

Notes: Deprecated. Please do not use for old projects and convert existing images into a new format, e.g. PNG.

The format of the binary encoded picture data:

+ 0 Kenn, PPIC for Packed Picture
+ 4 Length of whole block
+ 8 Width (BigEndian)
+12 Height (BigEndian)
+16 Depth (BigEndian, 32 for 32bit)
+20 Offset of the binary data. maybe 40.
+24 Reserved for future use. Should be 0.
+40 Pixel Data, packed R, G, B in one byte per Subpixel.

300x300 Pixels will make up 300*300+40 ->270040 Bytes.

This method does not require Quicktime or any other OS Service, but it does no compression.
Does not handle mask or alpha channel.

May be a good way to store pictures crossplatform inside a database. As Valentina can do its own Zip based compression, this may be a wonderfull way to store pictures uncompressed (or lossless compressed) inside the database.

The returned string has the encoding set to binary (no encoding). If you want to concat the string with another you should check the encoding. If you don't handle that RB may convert the JPEG data to UTF8 (Unicode) which will destroy it.

90.4 class PaletteCalculatorMBS

90.4.1 class PaletteCalculatorMBS

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: This class allows you to calculate an 8 bit image from a RGB image and back.
Example:

```
// reduce a photo to 256 colors with dithering, e.g. for a GIF
Var pic As Picture = Picture.Open(SpecialFolder.Desktop.Child("photo.jpg"))
Var palette As New PaletteCalculatorMBS
Call palette.CreatePicturePalette(pic) // find the best 256 colors

Var indexes As MemoryBlock = palette.TransformBetterDithering(pic) // one byte per pixel
Var reduced As Picture = palette.Transform(indexes, pic.Width, pic.Height)
System.DebugLog palette.Count.ToString + " colors, first is " + palette.Col(0).ToString
```

Notes: You can create the best matching palette for a given image.
If you have several images which should share the same palette, you can draw them first on one big picture before calculating the

90.4.2 Methods

90.4.3 CountColors as Integer

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how many different colors are in the palette.

90.4.4 CreatePicturePalette(Pic as picture) as Integer

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a picture palette based on the picture.
Notes: This function checks which colors are very often used in the image and builds a palette which may be better for this image than the default system palette.

90.4.5 GetIndexOfColor(col as color) as Integer

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches the index in the palette for the given color.
Notes: Returns -1 if the color is not found.

90.4.6 GetIndexOfColor(r as Integer, g as Integer, b as Integer) as Integer

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches the index in the palette for the given color.
Notes: Returns -1 if the color is not found.
See also:

- 90.4.5 GetIndexOfColor(col as color) as Integer 14573

90.4.7 GetNearestIndexOfColor(col as color) as Integer

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches the index in the palette for the best matching color.
Notes: The best color is the color with the lowest value:
value=(r-col(index).red)^2+(g-col(index).green)^2+(b-col(index).blue)^2

Returns -1 if the color is not found (should never happen).
See also:

- 90.4.8 GetNearestIndexOfColor(r as Integer, g as Integer, b as Integer) as Integer 14574

90.4.8 GetNearestIndexOfColor(r as Integer, g as Integer, b as Integer) as Integer

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches the index in the palette for the best matching color.
Notes: The best color is the color with the lowest value:
value=(r-col(index).red)^2+(g-col(index).green)^2+(b-col(index).blue)^2

Returns -1 if the color is not found (should never happen).
See also:

- 90.4.7 GetNearestIndexOfColor(col as color) as Integer 14574

90.4.9 Transform(mem as memoryblock, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transforms a 8 bit picture to a RGB picture.
Notes: The memoryblock must have the 8 bit picture data inside with each row being width bytes big. The memoryblock must have at least width*height bytes.

Returns nil on any error.
See also:

- 90.4.10 Transform(Pic as picture) as memoryblock 14575

90.4.10 Transform(Pic as picture) as memoryblock

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a memoryblock with 8 bit picture data.
Notes: The resulting memoryblock has width*height bytes.
Each RGB color in the picture is looked up in the palette and used to fill the memoryblock.
See also:

- 90.4.9 Transform(mem as memoryblock, width as Integer, height as Integer) as picture 14575

90.4.11 TransformBetterDithering(Pic as picture) as memoryblock

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a memoryblock with 8 bit picture data.
Notes: The resulting memoryblock has width*height bytes.
Each RGB color in the picture is looked up in the palette and used to fill the memoryblock.
This method uses dithering to make the picture looking better than with a better transform using code like Floyd-Steinberg.

90.4.12 TransformFastDithering(Pic as picture) as memoryblock

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a memoryblock with 8 bit picture data.
Notes: The resulting memoryblock has width*height bytes.
Each RGB color in the picture is looked up in the palette and used to fill the memoryblock.
This method uses dithering to make the picture looking better than with a simple transform.

90.4.13 Properties

90.4.14 Count as Integer

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: How many colors are inside this PaletteMBS.
Notes: This property should be 2, 4, 16 or 256.
Default is 256.
(Read and Write property)

90.4.15 Col(i as Integer) as color

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color array.
Notes: Index goes from 0 to count-1.
(Read and Write computed property)

90.5 class Picture

90.5.1 class Picture

Platforms: macOS, Linux, Windows, Targets: All.

Function: Extends Xojo's Picture Class.
Example:

```
// some of the Picture extensions from the plugin
Var pic As Picture = Picture.Open(SpecialFolder.Desktop.Child("photo.jpg"))

Var small As Picture = pic.ScaleMBS(pic.Width \4, pic.Height \4, True) // smooth scaling
Var brighter As Picture = small.ChangeBrightnessLinearMBS(1.2)
Var blurred As Picture = small.BlurMBS(3)
Var rotated As Picture = small.RotateMBS(15)
Var gray As Picture = small.GrayScaleMBS(0)
// show the pictures in a Canvas or ImageViewer
```

90.5.2 Methods

90.5.3 AddSteganographyMBS(flags as Integer, data as Memoryblock) as Picture

MBS Picture Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds steganography to a new picture.
Example:

```
Var p as Picture = LogoMBS(500)
// this example uses chr(0) as end marker
Var s as string = "Hello World. This is just a test." + chr(0)
Var pic as Picture = p.AddSteganographyMBS(1, s)

Var data as MemoryBlock = pic.SteganographyMBS(1)
Var d as string = data.CString(0)

MessageBox d
```

Notes: Flags can be a combination of red (&h100), green (&h010) and blue (&h001).
Returns a new picture or nil. The existing picture is not modified.

If you like to store data, please encrypt them and include some way that you find your data again, detect length of data, verify it's okay via checksum and than decrypt your data.
Please store image in a loss less format like PNG.

Function does not handle mask or alpha channel.

90.5.4 AddSteganographyPictureMBS(flags as Integer, data as Picture) as Picture

MBS Picture Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds steganography to a new picture.
Example:

```
const AllChannels = &h111

Var p as new Picture(500, 500, 32)

Var w as new Window1
w.Title = "white"
w.Backdrop = p

Var l as Picture = LogoMBS(500)

w = new Window1
w.Title = "Logo"
w.Backdrop = l

// adds picture. You will normally not see the modification
Var x as Picture = p.AddSteganographyPictureMBS(AllChannels, l)

w = new Window1
w.Title = "Logo hidden in white picture"
w.Backdrop = x

// as we store in lowest bit, this picture will look strange
Var y as Picture = x.SteganographyPictureMBS(AllChannels)

w = new Window1
w.Title = "Logo extracted"
w.Backdrop = y
```

Notes: Flags can be a combination of red (&h100), green (&h010) and blue (&h001).
Returns a new picture or nil. The existing picture is not modified.

Function does not handle mask or alpha channel.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.2pr2

90.5.5 AutoLevelCopyMBS as picture

MBS Picture Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies auto levels on the picture.
Notes: The histogram is built, white and back points are searched and all pixels adjusted.
Returns nil on any error.
Thanks to Jeff Thoman for his code.

This version of the method makes a copy of the picture so it works on any kind of picture.

Renamed in version 9.2 from AutoLevelMBS to AutoLevelCopyMBS.
Blog Entries

- MBS Real Studio Plugins, version 12.0pr4

90.5.6 AutoLevelMBS as boolean

MBS Picture Plugin, Plugin Version: 9.1, Platforms: macOS, Windows, Targets: All.

Function: Applies auto levels on the picture.
Notes: The histogram is built, white and back points are searched and all pixels adjusted.
Returns true on success and false on any error.
Thanks to Jeff Thoman for his code.

This version of the method modifies the pixels on the picture. Works on 32bit and 24bit pictures.

If you get a type mismatch error on using this function, you may want to use AutoLevelCopyMBS which is the old behavior.
Blog Entries

- Using zbar library with Xojo

90.5.7 BitmapMBS as picture

MBS Picture Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the picture as a bitmap picture.
Example:

```
Var p,r as picture
r=LogoMBS(500)
p=r.BitmapMBS
Canvas1.backdrop=p
```

Notes: A Xojo picture object may contain an icon, a bitmap, a picture handle or something else what Xojo will support as a picture in the future.
The picture editing functions of this plugin can only work with bitmap pictures and this clone function creates such pictures for you.
This function takes a look on the picture and returns it unchanged if it is allready a bitmap, but if not, the picture is Cloned as a bitmap. If you prefer to get a copy of the picture as a bitmap picture, use clone instead.

The Cloned picture does not have a mask.

- MBS REALbasic Plugins, version 10.4pr12

90.5.8 BlueChannelMBS as picture

MBS Picture Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blue channel of the picture copied into a new picture.
Example:

```
Var p as Picture = LogoMBS(500)
Backdrop = p.BlueChannelMBS
```

Blog Entries

- MBS Xojo Plugins, version 26.5pr3
- MBS REALbasic Plugins, version 10.6pr4

90.5.9 BlurMBS(Radius as Double, yield as Integer = 0) as picture

MBS Picture Plugin, Plugin Version: 10.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a blur effect to the image.
Example:

```
Var p as Picture = LogoMBS(500)
Window1.Backdrop = p.BlurMBS(2)
```

Notes: This is not a gaussian blur, but a faster box blur.
Returns nil on any error.

Does ignore mask or alpha channel.
Blog Entries

- MBS REALbasic Plugins, version 10.3pr7

90.5.10 BMPDataMBS(ResolutionValueDPI as Integer=72) as string

MBS Picture Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a String with the BMP File content for the given picture.
Example:

```
// Make a picture
Var p as Picture = LogoMBS(100)

// Encode as BMP
Var s as string = p.BMPDataMBS

// display length in title
Title = str(lenb(s))

// and display picture
Backdrop= BMPStringtoPictureMBS(s)
```

Notes: Does not handle masks.
Returns an empty string on any error.

90.5.11 CalcSteganographyMBS(flags as Integer) as Integer

MBS Picture Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the steganography size.
Example:

```
Var p as Picture = LogoMBS(500)

Var size1 as Integer = p.CalcSteganographyMBS(&h100)
MessageBox "Red only: "+str(size1)

Var size2 as Integer = p.CalcSteganographyMBS(&h111)
MessageBox "RGB only: "+str(size2)
```

Notes: Returns number of bytes that can be stored in an image of the size of this picture.

Flags can be a combination of red (&h100), green (&h010) and blue (&h001).

90.5.12 CGColorSpaceMBS as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Queries the colorspace profile for a picture.
Example:

```
Var p as new Picture(32,32,32)
Var c as CGColorSpaceMBS = p.CGColorSpaceMBS
MessageBox c.Name
```

Notes: Only for Cocoa targets.

In Version 19.3 changed to default to Generic RGB, which Xojo uses if none is set.

90.5.13 ChangeBrightnessAbsoluteMBS(Brightness as Double) as picture

MBS Picture Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the bightness of an image.
Example:

```
// get test picture
Var p as Picture = LogoMBS(500)

Var n as Picture = p.ChangeBrightnessAbsoluteMBS(30)

// show in window
Window1.Backdrop = n
```

Notes: To every pixel component the value is added.
Returns nil if the picture is no bitmap picture.
See also:

- 90.5.14 ChangeBrightnessAbsoluteMBS(BrightnessRed as Double, BrightnessGreen as Double, BrightnessBlue as Double) as picture 14582

90.5.14 ChangeBrightnessAbsoluteMBS(BrightnessRed as Double, BrightnessGreen as Double, BrightnessBlue as Double) as picture

MBS Picture Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the bightness of an image.
Example:

```
// get test picture
Var p as Picture = LogoMBS(500)

Var n as Picture = p.ChangeBrightnessAbsoluteMBS(10,20,30)

// show in window
Window1.Backdrop = n
```

Notes: To every pixel component the value is added.
Returns nil if the picture is no bitmap picture.

PS: This function may be optimized, if someone needs it to be faster.

Basicly Picture.ChangeBrightnessAbsoluteMBS does this:

```
for each pixel in picture
pixel.red = pixel.red + r
pixel.green = pixel.green + g
pixel.blue = pixel.blue + b
next
```

and it limits the pixel values to the range 0 to 255.
See also:

- 90.5.13 ChangeBrightnessAbsoluteMBS(Brightness as Double) as picture 14582

90.5.15 ChangeBrightnessLinearMBS(Brightness as Double) as picture

MBS Picture Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the bightness of an image linear.
Example:

```
// get test picture
Var p as Picture = LogoMBS(500)

Var n as Picture = p.ChangeBrightnessLinearMBS(30)

// show in window
Window1.Backdrop = n
```

Notes: Value is fraction of change. Range -255 to 255. For example 127 would move all colors half the way to white.
Returns nil if the picture is no bitmap picture.
See also:

- 90.5.16 ChangeBrightnessLinearMBS(BrightnessRed as Double, BrightnessGreen as Double, BrightnessBlue as Double) as picture 14584

90.5.16 ChangeBrightnessLinearMBS(BrightnessRed as Double, BrightnessGreen as Double, BrightnessBlue as Double) as picture

MBS Picture Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the bightness of an image linear.
Example:

```
// get test picture
Var p as Picture = LogoMBS(500)

Var n as Picture = p.ChangeBrightnessLinearMBS(10,20,30)

// show in window
Window1.Backdrop = n
```

Notes: Returns nil if the picture is no bitmap picture.
PS: This function may be optimized, if someone needs it to be faster (e.g. using Altivec).

See also:

- 90.5.15 ChangeBrightnessLinearMBS(Brightness as Double) as picture 14583

90.5.17 ChangeContrastBrightnessAbsoluteMBS(Contrast as Double, Brightness as Double) as picture

MBS Picture Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the bightness and contrast of an image.
Example:

```
// get test picture
Var p as Picture = LogoMBS(500)

Var n as Picture = p.ChangeContrastBrightnessAbsoluteMBS(0.5,30)
```

```
// show in window
Window1.Backdrop = n
```

Notes: Returns nil if the picture is no bitmap picture.
See also:

- 90.5.18 ChangeContrastBrightnessAbsoluteMBS(ContrastRed as Double, ContrastGreen as Double, ContrastBlue as Double, BrightnessRed as Double, BrightnessGreen as Double, BrightnessBlue as Double) as picture 14585

90.5.18 ChangeContrastBrightnessAbsoluteMBS(ContrastRed as Double, ContrastGreen as Double, ContrastBlue as Double, BrightnessRed as Double, BrightnessGreen as Double, BrightnessBlue as Double) as picture

MBS Picture Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the bightness and contrast of an image.
Example:

```
// get test picture
Var p as Picture = LogoMBS(500)

Var n as Picture = p.ChangeContrastBrightnessAbsoluteMBS(0.5, 0.5, 0.5, 10, 20, 30)

// show in window
Window1.Backdrop = n
```

Notes: Returns nil if the picture is no bitmap picture.
See also:

- 90.5.17 ChangeContrastBrightnessAbsoluteMBS(Contrast as Double, Brightness as Double) as picture 14584

90.5.19 ChangeContrastBrightnessLinearMBS(Contrast as Double, Brightness as Double) as picture

MBS Picture Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the bightness and contrast of an image linear.
Example:

```
// get test picture
Var p as Picture = LogoMBS(500)
```

```
Var n as Picture = p.ChangeContrastBrightnessLinearMBS(0.5,30)

// show in window
Window1.Backdrop = n
```

Notes: Returns nil if the picture is no bitmap picture.
Contrast range is 0 to 1.0.
Brightness range is -255 to 255.
See also:

- 90.5.20 ChangeContrastBrightnessLinearMBS(ContrastRed as Double, ContrastGreen as Double, ContrastBlue as Double, BrightnessRed as Double, BrightnessGreen as Double, BrightnessBlue as Double) as picture 14586

90.5.20 ChangeContrastBrightnessLinearMBS(ContrastRed as Double, ContrastGreen as Double, ContrastBlue as Double, BrightnessRed as Double, BrightnessGreen as Double, BrightnessBlue as Double) as picture

MBS Picture Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the bightness and contrast of an image linear.
Example:

```
// get test picture
Var p as Picture = LogoMBS(500)

Var n as Picture = p.ChangeContrastBrightnessLinearMBS(0.5, 0.5, 0.5, 10, 20, 30)

// show in window
Window1.Backdrop = n
```

Notes: Returns nil if the picture is no bitmap picture.
Contrast range is 0 to 1.0.
Brightness range is -255 to 255.
See also:

- 90.5.19 ChangeContrastBrightnessLinearMBS(Contrast as Double, Brightness as Double) as picture 14585

90.5.21 ChangeContrastMBS(Contrast as Double) as picture

MBS Picture Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the contrast of the picture.
Example:

```
// get test picture
Var p as Picture = LogoMBS(500)

Var n as Picture = p.ChangeContrastMBS(-0.5)

// show in window
Window1.Backdrop = n
```

Notes: All three color channels are handled with the same contrast change.
Returns a picture on success or nil on any error.
Parameters can have any value.
(values >=0.0 will add contrast, values below 0.0 will reduce contrast till gray picture at -1.0, values below -1.0 will add contrast again and also invert the picture)
See also:

- 90.5.22 ChangeContrastMBS(ContrastRed as Double, ContrastGreen as Double, ContrastBlue as Double) as picture 14587

90.5.22 ChangeContrastMBS(ContrastRed as Double, ContrastGreen as Double, ContrastBlue as Double) as picture

MBS Picture Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the contrast of the picture.
Example:

```
// get test picture
Var p as Picture = LogoMBS(500)

Var n as Picture = p.ChangeContrastMBS(-0.5,0.0,0.5)

// show in window
Window1.Backdrop = n
```

Notes: Three different values, one for each channel.
Returns a picture on success or nil on any error.
(values >=0.0 will add contrast, values below 0.0 will reduce contrast till gray picture at -1.0, values below -1.0 will add contrast again and also invert the picture)
See also:

- 90.5.21 ChangeContrastMBS(Contrast as Double) as picture 14586

90.5.23 ChangeCustomMBS(a as Double, b as Double) as picture

MBS Picture Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the picture with custom values.
Notes: Uses this formular:
NewPixelComponent=OldPixelComponent*a+b
See also:

- 90.5.24 ChangeCustomMBS(Ra as Double, Rb as Double, Ga as Double, Gb as Double, Ba as Double, Bb as Double) as picture 14588

90.5.24 ChangeCustomMBS(Ra as Double, Rb as Double, Ga as Double, Gb as Double, Ba as Double, Bb as Double) as picture

MBS Picture Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the picture with custom values.
Notes: Uses this formular:
NewPixelComponent=OldPixelComponent*a+b
Blog Entries

See also:

- 90.5.23 ChangeCustomMBS(a as Double, b as Double) as picture 14587

90.5.25 ChangeSaturationMBS(Amount as Integer) as picture

MBS Picture Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a copy of the picture with a changed saturation.
Notes: Range of amount is from -255 to 255.

Value 0 does nothing.
Value -255 returns a gray level picture.
Blog Entries

- MBS REALbasic plug-ins version 9.4

90.5.26 cloneMBS as picture

MBS Picture Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones the picture as a bitmap.
Example:

```
Var p,r as picture
r=LogoMBS(500)
p=r.clonembs
Canvas1.backdrop=p
```

Notes: A Xojo picture object may contain an icon, a bitmap, a picture handle or something else what Xojo will support as a picture in the future.
The picture editing functions of this plugin can only work with bitmap pictures and this clone function creates such pictures for you.
If a picture is a bitmap can be easily tested with the graphics property like this:

```
if p.graphics=nil then // if no bitmap
p = p.clonembs // make one
end if
```

The Cloned picture does include the mask, if one exists.
See FAQ entry "How to duplicate a picture with mask or alpha channel?" on how to duplicate with mask.
See also:

- 90.5.28 CloneMBS(NewMask as Picture, width as Integer, height as Integer) as picture 14589
- 90.5.29 CloneMBS(width as Integer, height as Integer) as picture 14590

90.5.27 CloneMBS(NewMask as Picture) as picture

MBS Picture Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones the picture as a bitmap.
Notes: Same as CloneMBS, but adds the mask.
See also:

- 90.5.26 cloneMBS as picture 14588
- 90.5.28 CloneMBS(NewMask as Picture, width as Integer, height as Integer) as picture 14589
- 90.5.29 CloneMBS(width as Integer, height as Integer) as picture 14590

90.5.28 CloneMBS(NewMask as Picture, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones the picture as a bitmap.
Notes: Same as CloneMBS, but adds the mask.
See also:

- 90.5.26 cloneMBS as picture 14588
- 90.5.27 CloneMBS(NewMask as Picture) as picture 14589
- 90.5.29 CloneMBS(width as Integer, height as Integer) as picture 14590

90.5.29 CloneMBS(width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones the picture as a bitmap with given size.
Example:

```
Var p,r as picture
r=LogoMBS(500)
p=r.clonembs(100,100)
Canvas1.backdrop=p
```

Notes: A Xojo picture object may contain an icon, a bitmap, a picture handle or something else what Xojo will support as a picture in the future.
The picture editing functions of this plugin can only work with bitmap pictures and this clone function creates such pictures for you.
If a picture is a bitmap can be easily tested with the graphics property like this:

```
if p.graphics=nil then // if no bitmap
p=p.clonembs // make one
end if
```

The Cloned picture does not have a mask or alpha channel.
See FAQ entry "How to duplicate a picture with mask or alpha channel?" on how to duplicate with mask.

90.5.30 ColorizeMBS(hue as Double, sat as Double, light as Double) as picture

MBS Picture Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colorizes a picture.
Notes: Hue, Sat and Light in range 0.0 to 1.0 please.
Returns new picture.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr8

90.5.31 ColornessMBS(threshold as Integer = 10) as Double

MBS Picture Plugin, Plugin Version: 12.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the color coverage of the picture.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var pic as Picture = Picture.Open(file)

MessageBox str(pic.ColornessMBS)
```

Notes: Counts how many pixels have color and returns percentage depending on a given threshold. Changed in 12.3pr5 to ignore nearly black pictures when counting.

This function loops over all pixels to calculate the difference between green and red channel and green and blue channel. If the differences are greater than the threshold, the pixel counts as colored.

Threshold is between 0 and 255. The value of 10 makes sure almost gray pictures don't count as colored ones.

Finally we calculate the percentage of colored pixels vs total pixels.
Blog Entries

- MBS Real Studio Plugins, version 11.4pr3

90.5.32 CombineMBS(Image As Picture, Mask As Picture, DestX as Integer, DestY as Integer, SourceX as Integer, SourceY as Integer, Width as Integer, Height as Integer, UseColours As Boolean) as boolean

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Windows, Targets: All.

Function: Copies pixels from one picture into another picture with some options.
Notes: Returns true on success and false on failure.

This function has 4 behaviors depending on the parameters:

1. If mask is nil and no ForeColour and MaskColour values are passed, the pixels a copied to the destination picture.

2. But if there is a mask, the pixels are copied with applying the mask.

3. If the mask color is not defined, the pixels are filled with the fore color applying the mask.

4. As the last variation the pixels are copied and the forecolor, the mask color or black is used with the image as the mask. If UseColours parameter is false black is used for this.

Parameters:
Image: the source picture, must not be nil.
Mask: the mask picture, can be nil.
DestX: destination position
DestY: destination position
SourceX: source position
SourceY: source position
Width: width of the area to copy
Height: height of the area to copy
UseColours: whether to use the mask colour.
ForeColour: the fore colour, optional, can be integer or color
MaskColour: the mask color, optional, can be integer or color

This function is 5 times in the plugin defined to implement having the last two parameters optional and either integer or color. You can pass a negative number for MaskColour or ForeColour to disable this parameter.

The destination image (self) can be either 24 bit or 32 bit.
See also:

- 90.5.33 CombineMBS(Image As Picture, Mask As Picture, DestX as Integer, DestY as Integer, SourceX as Integer, SourceY as Integer, Width as Integer, Height as Integer, UseColours As Boolean, ForeColour As color) as boolean 14593
- 90.5.34 CombineMBS(Image As Picture, Mask As Picture, DestX as Integer, DestY as Integer, SourceX as Integer, SourceY as Integer, Width as Integer, Height as Integer, UseColours As Boolean, ForeColour As color, MaskColour As color) as boolean 14595

- 90.5.41 CombineMBS(Image As Picture, PreMultipliedSource as boolean, Mask As Picture, DestX as Integer, DestY as Integer, SourceX as Integer, SourceY as Integer, Width as Integer, Height as Integer, UseColours As Boolean, ForeColour as Integer, MaskColour as Integer) as boolean 14608
- 90.5.42 CombineMBS(Mode as Integer, SecondPicture As Picture, X as Integer = 0, Y as Integer = 0, Width as Integer = 0, Height as Integer = 0) as picture 14609

90.5.33 CombineMBS(Image As Picture, Mask As Picture, DestX as Integer, DestY as Integer, SourceX as Integer, SourceY as Integer, Width as Integer, Height as Integer, UseColours As Boolean, ForeColour As color) as boolean

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Windows, Targets: All.

Function: Copies pixels from one picture into another picture with some options.
Example:

```
Var DestImage As Picture
Var Image As Picture
Var Mask As Picture
Var DestX as Integer=100
Var DestY as Integer=100
Var SourceX as Integer=0
Var SourceY as Integer=0
Var Width as Integer=500
Var Height as Integer=500
Var UseColours as Boolean = true
Var ForeColour as color = &cFF0000

image=LogoMBS(500)
Mask=nil
DestImage=New Picture(700,700,32)

if DestImage.CombineMBS(image,Mask,DestX,DestY,SourceX,SourceY,Width,Height,UseColours,ForeColour)
then
Window1.Backdrop=DestImage
end if
```

Notes: Returns true on success and false on failure.

This function has 4 behaviors depending on the parameters:

1. If mask is nil and no ForeColour and MaskColour values are passed, the pixels a copied to the destination picture.

2. But if there is a mask, the pixels are copied with applying the mask.

3. If the mask color is not defined, the pixels are filled with the fore color applying the mask.

4. As the last variation the pixels are copied and the forecolor, the mask color or black is used with the image as the mask. If UseColours parameter is false black is used for this.

Parameters:
Image: the source picture, must not be nil.
Mask: the mask picture, can be nil.
DestX: destination position
DestY: destination position
SourceX: source position
SourceY: source position
Width: width of the area to copy
Height: height of the area to copy
UseColours: whether to use the mask colour.
ForeColour: the fore colour, optional, can be integer or color
MaskColour: the mask color, optional, can be integer or color

This function is 5 times in the plugin defined to implement having the last two parameters optional and either integer or color. You can pass a negative number for MaskColour or ForeColour to disable this parameter.

The destination image (self) can be either 24 bit or 32 bit.

MBS Picture Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies pixels from one picture into another picture with some options.
Notes: Returns true on success and false on failure.

This function has 4 behaviors depending on the parameters:

1. If mask is nil and no ForeColour and MaskColour values are passed, the pixels a copied to the destination picture.

2. But if there is a mask, the pixels are copied with applying the mask.

3. If the mask color is not defined, the pixels are filled with the fore color applying the mask.

4. As the last variation the pixels are copied and the forecolor, the mask color or black is used with the image as the mask. If UseColours parameter is false black is used for this.

Parameters:
Image: the source picture, must not be nil.
PreMultipliedSource: Optional parameter. If true the image must be premultiplied. Default is false.
Mask: the mask picture, can be nil.
DestX: destination position
DestY: destination position
SourceX: source position
SourceY: source position
Width: width of the area to copy
Height: height of the area to copy
UseColours: whether to use the mask colour.
ForeColour: the fore colour, optional, can be integer or color
MaskColour: the mask color, optional, can be integer or color

This function is 5 times in the plugin defined to implement having the last two parameters optional and either integer or color. You can pass a negative number for MaskColour or ForeColour to disable this parameter.

The destination image (self) can be either 24 bit or 32 bit.

90.5.39 CombineMBS(Image As Picture, PreMultipliedSource as boolean, Mask As Picture, DestX as Integer, DestY as Integer, SourceX as Integer, SourceY as Integer, Width as Integer, Height as Integer, UseColours As Boolean, ForeColour As color, MaskColour As color) as boolean

MBS Picture Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies pixels from one picture into another picture with some options.
Notes: Returns true on success and false on failure.

This function has 4 behaviors depending on the parameters:

1. If mask is nil and no ForeColour and MaskColour values are passed, the pixels a copied to the destination picture.

2. But if there is a mask, the pixels are copied with applying the mask.

3. If the mask color is not defined, the pixels are filled with the fore color applying the mask.

4. As the last variation the pixels are copied and the forecolor, the mask color or black is used with the image as the mask. If UseColours parameter is false black is used for this.

Parameters:
Image: the source picture, must not be nil.
PreMultipliedSource: Optional parameter. If true the image must be premultiplied. Default is false.
Mask: the mask picture, can be nil.
DestX: destination position
DestY: destination position
SourceX: source position
SourceY: source position
Width: width of the area to copy
Height: height of the area to copy
UseColours: whether to use the mask colour.
ForeColour: the fore colour, optional, can be integer or color
MaskColour: the mask color, optional, can be integer or color

This function is 5 times in the plugin defined to implement having the last two parameters optional and either integer or color. You can pass a negative number for MaskColour or ForeColour to disable this parameter.

The destination image (self) can be either 24 bit or 32 bit.

- 90.5.38 CombineMBS(Image As Picture, PreMultipliedSource as boolean, Mask As Picture, DestX as Integer, DestY as Integer, SourceX as Integer, SourceY as Integer, Width as Integer, Height as Integer, UseColours As Boolean, ForeColour As color) as boolean 14602
- 90.5.39 CombineMBS(Image As Picture, PreMultipliedSource as boolean, Mask As Picture, DestX as Integer, DestY as Integer, SourceX as Integer, SourceY as Integer, Width as Integer, Height as Integer, UseColours As Boolean, ForeColour As color, MaskColour As color) as boolean 14604
- 90.5.40 CombineMBS(Image As Picture, PreMultipliedSource as boolean, Mask As Picture, DestX as Integer, DestY as Integer, SourceX as Integer, SourceY as Integer, Width as Integer, Height as Integer, UseColours As Boolean, ForeColour as Integer) as boolean 14606
- 90.5.42 CombineMBS(Mode as Integer, SecondPicture As Picture, X as Integer = 0, Y as Integer = 0, Width as Integer = 0, Height as Integer = 0) as picture 14609

90.5.42 CombineMBS(Mode as Integer, SecondPicture As Picture, X as Integer = 0, Y as Integer = 0, Width as Integer = 0, Height as Integer = 0) as picture

MBS Picture Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines pixels of two images with the given mode.
Example:

```
Var pic as picture // some picture
Var other as picture // some other picture
Var result as picture = pic.CombineMBS(1, other)
```

```
// effects are made like this. If you have a suggestion for a new effect,
// send your suggestion to MBS support:
Function Combine(x as Integer, y as Integer) as Integer
Return BitwiseXor(x,y)
End Function
```

Notes: Each pixel is sent through an operation for each channel.
X, Y, Width and Height can limit effect of a certain portion of the source image.

Modes:

1	Bitwise XOR
2	Bitwise OR
3	Bitwise AND
4	Min
5	Max
6	AddPin (add with limit)
7	AddOver (add with overflow)
8	Difference
9	Difference squared (with limit 255)
10	Sub Pin (sub with limit)

90.5.43 CombinePixelMBS(Mode as Integer, SecondPicture As Picture) as picture

MBS Picture Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines pixels of two images with the given mode.
Example:

```
Var pic as picture // some picture
Var other as picture // some other picture
Var result as picture = pic.CombinePixelMBS(1, other)

// effects are made like this. If you have a suggestion for a new effect,
// send your suggestion to MBS support:
Function Combine(x as color, y as color) As color
Return rgb(x.red+y.red, x.green+y.green, x.blue+y.blue)
End Function
```

Notes: Each pixel is sent through an operation.

Modes:

1	Average (50% first and 50% second picture)
2	Gray
3	LighterPixel
4	DarkerPixel
5	Difference Max
6	Difference Max Squared

90.5.44 CompareBrightnessMBS(other as picture, mode as Integer, threshold as Integer) as Double

MBS Picture Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares two pictures in brightness.
Example:

```
Var p as picture = New Picture(100,100,32)
Var q as Picture = New Picture(100,100,32)

Var diff as Double = p.CompareBrightnessMBS(q, 0, 0)

MessageBox str(Diff) // shows 0 = equal
```

Notes: Returns the percent of difference: Number of pixels where the squared color difference is bigger than the threshold divided by the total number of pixels.
If width and height are not equal, the result is 1.0.
If you need to check the mask also, please call this method a second time for the masks.

Modes:

0	y = 0.33 * R + 0.5 * G + 0.16 * B	Faster version of 3
1	y = 0.375 * R + 0.5 * G + 0.125 * B	Faster version of 3
2	y = 0.2126 * R + 0.7152 * G + 0.0722 * B	Photometric/digital ITU-R
3	y = 0.299 * R + 0.587 * G + 0.114 * B	Digital CCIR601

Mode 2 and 3 uses doubles and mode 0 and 1 use integers so they should be faster.
Still Mode 0 and 1 are just approximation formulas which trade accuracy for perfomance.

Only compares raw pixels without checking mask or alpha channel.

90.5.45 CompareMBS(other as picture, threshold as Integer) as Double

MBS Picture Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares two pictures.
Example:

```
Var p as picture = New Picture(100,100,32)
Var q as Picture = New Picture(100,100,32)

Var diff as Double = p.CompareMBS(q, 0)

MessageBox str(Diff) // shows 0 = equal

p.Graphics.ForeColor = &cFF0000
p.Graphics.FillRect 0, 0, p.Width, p.Height

q.Graphics.ForeColor = &cFF0001
q.Graphics.FillRect 0, 0, q.Width, q.Height

Var diff1 as Double = p.CompareMBS(q, 0)
Var diff2 as Double = p.CompareMBS(q, 2)

MessageBox str(Diff1)+" "+str(Diff2) // shows 1 (all pixels different) and shows 0 (all equal)
```

Notes: Returns the percent of difference: Number of pixels where the squared color difference is bigger than the threshold divided by the total number of pixels.
If width and height are not equal, the result is 1.0.
If you need to check the mask also, please call this method a second time for the masks.

Only compares raw pixels without checking mask or alpha channel.

90.5.46 CopyABGRtoMemoryblockMBS(destination as memoryblock, offset as Integer, AlphaValue as Integer, StartLine as Integer = 0, EndLine as Integer = -1, Yield as Integer = 0, DestRowBytes as Integer = 0) as boolean

MBS Picture Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies raw image data into a memoryblock.
Notes: Returns true on success.
destination should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs picture.width*picture.height*4 bytes in the

memoryblock.

Does not access the mask inside the image!

This method was written for speed, so the creation of the memoryblock is your part. You can of course reuse memoryblocks for batch processing images as long as the memoryblock is big enough.

The X variant of this method does not touch the alpha channel in the memoryblock and the A variant changes the alpha value to the given value.

StartLine and Endline define the range of source lines from picture. Range is from 0 to picture.height-1. if Endline is -1, we use picture.height-1 internally. Yield specifies how much CPU time is given to other threads. If yield = 0, we give no CPU time away. If yield is >0, we yield every yield/60th second to other threads. If DestRowBytes is not zero, it specifies the bytes per row in the target memoryblock for each line. See also:

- 90.5.47 CopyABGRtoMemoryblockMBS(destination as memoryblock, offset as Integer, MaskForAlpha as picture, StartLine as Integer = 0, EndLine as Integer = -1, Yield as Integer = 0, DestRowBytes as Integer = 0) as boolean 14614

90.5.47 CopyABGRtoMemoryblockMBS(destination as memoryblock, offset as Integer, MaskForAlpha as picture, StartLine as Integer = 0, EndLine as Integer = -1, Yield as Integer = 0, DestRowBytes as Integer = 0) as boolean

MBS Picture Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies raw image data into a memoryblock.
Example:

```
// Create a picture with mask:
Var p as Picture = LogoMBS(200)
Var g as Graphics = p.mask.Graphics

g.ForeColor = &cFFFFFF
g.FillRect 0,0,g.Width,g.Height

g.ForeColor = &c000000
g.Filloval 0,0,g.Width,g.Height

// convert to memoryblock
Var m as new MemoryBlock(4 * p.Width * p.Height)

if p.CopyABGRtoMemoryblockMBS(m, 0, p.Mask) then
// convert back
```

Backdrop = MemoryblockABGRtoPictureMBS(m, 0, p.Width, p.Height)

```
break // look into memoryblock with debugger
end if
```

Notes: Returns true on success.
destination should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.
MaskForAlpha should not be nil and be the mask for this image.

The function will crash if the memoryblock is too small. Needs picture.width*picture.height*4 bytes in the memoryblock. Mask and Picture must have equal size.
The mask is used to fill alpha channel.

This method was written for speed, so the creation of the memoryblock is your part. You can of course reuse memoryblocks for batch processing images as long as the memoryblock is big enough.

StartLine and Endline define the range of source lines from picture. Range is from 0 to picture.height-1. if Endline is -1, we use picture.height-1 internally. Yield specifies how much CPU time is given to other threads. If yield = 0, we give no CPU time away. If yield is >0, we yield every yield/60th second to other threads. If DestRowBytes is not zero, it specifies the bytes per row in the target memoryblock for each line.

Function: Copies raw image data into a memoryblock.
Example:

```
Var m as MemoryBlock
Var p,q as Picture
```

```
p=New Picture(100,100,32)
p.Graphics.ForeColor=rgb(255,128,1)
p.Graphics.FillRect 0,0,100,100

// Make a new MemoryBlock
m=NewMemoryBlock(100*100*4) // 3 bytes per Pixel

// Copy RGB without alpha
if p.CopyARGBtoMemoryblockMBS(m,0,0) then

Var x as Picture = New Picture(100,100,32)

q=MemoryblockARGBtoPictureMBS(x, m,0,100,100)

Backdrop=q

if x=q then
Window1.Title = "reused picture"
else
Window1.Title = "created new picture"
end if
end if
```

Notes: Returns true on success.
destination should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs picture.width*picture.height*4 bytes in the memoryblock.

90.5.49 CopyARGBtoMemoryblockMBS(destination as memoryblock, offset as Integer, LittleEndian as boolean, AlphaValue as Integer, StartLine as Integer = 0, EndLine as Integer = -1, Yield as Integer = 0, DestRowBytes as Integer = 0) as boolean

MBS Picture Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies raw image data into a memoryblock.
Example:

```
Var m as MemoryBlock
Var p as Picture

p=New Picture(100,100,32)
p.Graphics.ForeColor=rgb(255,128,1)
p.Graphics.FillRect 0,0,100,100

// Make a new MemoryBlock
m=NewMemoryBlock(100*100*4) // 4 bytes per Pixel

// copy RGB and leave room for alpha
if p.CopyARGBtoMemoryblockMBS(m,0,false,-1) then
MessageBox EncodingToHexMBS(m.StringValue(0,99))
end if
```

Notes: Returns true on success.
destination should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs picture.width*picture.height*4 bytes in the memoryblock.

Does not access the mask inside the image!

LittleEndian specifies whether the image is stored in ARGB (BigEndian) or BGRA (LittleEndian) mode.

If Alphavalue is in range of 0 to 255 the alpha value of all pixel is set to this value. If the AlphaValue is

outside this range the alpha value is not touched for all pixels.

This method was written for speed, so the creation of the memoryblock is your part. You can of course reuse memoryblocks for batch processing images as long as the memoryblock is big enough.

StartLine and Endline define the range of source lines from picture. Range is from 0 to picture.height-1. if Endline is -1, we use picture.height-1 internally. Yield specifies how much CPU time is given to other threads. If yield = 0, we give no CPU time away. If yield is >0, we yield every yield/60th second to other threads. If DestRowBytes is not zero, it specifies the bytes per row in the target memoryblock for each line. See also:

- 90.5.48 CopyARGBtoMemoryblockMBS(destination as memoryblock, offset as Integer, AlphaValue as Integer, StartLine as Integer = 0, EndLine as Integer = -1, Yield as Integer = 0, DestRowBytes as Integer = 0) as boolean 14615
- 90.5.50 CopyARGBtoMemoryblockMBS(destination as memoryblock, offset as Integer, MaskForAlpha as picture, StartLine as Integer = 0, EndLine as Integer = -1, Yield as Integer = 0, DestRowBytes as Integer = 0) as boolean 14618

90.5.50 CopyARGBtoMemoryblockMBS(destination as memoryblock, offset as Integer, MaskForAlpha as picture, StartLine as Integer = 0, EndLine as Integer = -1, Yield as Integer = 0, DestRowBytes as Integer = 0) as boolean

MBS Picture Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies raw image data into a memoryblock.
Example:

```
// Create a picture with mask:
Var p as Picture = LogoMBS(200)
Var g as Graphics = p.mask.Graphics

g.ForeColor = &cFFFFFF
g.FillRect 0,0,g.Width,g.Height

g.ForeColor = &c000000
g.Filloval 0,0,g.Width,g.Height

// convert to memoryblock
Var m as new MemoryBlock(4 * p.Width * p.Height)

if p.CopyARGBtoMemoryblockMBS(m, 0, p.Mask) then
// convert back
Backdrop = MemoryblockARGBtoPictureMBS(m, 0, p.Width, p.Height)
```

```
break // look into memoryblock with debugger
end if
```

Notes: Returns true on success.
destination should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.
MaskForAlpha should not be nil and be the mask for this image.

The function will crash if the memoryblock is too small. Needs picture.width*picture.height*4 bytes in the memoryblock. Mask and Picture must have equal size.
The mask is used to fill alpha channel.

This method was written for speed, so the creation of the memoryblock is your part. You can of course reuse memoryblocks for batch processing images as long as the memoryblock is big enough.

StartLine and Endline define the range of source lines from picture. Range is from 0 to picture.height-1. if Endline is -1, we use picture.height-1 internally. Yield specifies how much CPU time is given to other threads. If yield = 0, we give no CPU time away. If yield is >0, we yield every yield/60th second to other threads. If DestRowBytes is not zero, it specifies the bytes per row in the target memoryblock for each line.

90.5.55 CopyBtoMemoryblockMBS(destination as memoryblock, offset as Integer, PixelByteSize as Integer, StartLine as Integer = 0, EndLine as Integer = -1, Yield as Integer = 0, DestRowBytes as Integer = 0) as boolean

MBS Picture Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies raw image data into a memoryblock.
Example:

```
const kAlphaOffset=0 ' (BigEndian) and 3 (LittleEndian)
Var m as MemoryBlock
Var p as Picture

p=New Picture(100,100,32)
p.Graphics.ForeColor=rgb(255,128,1)
p.Graphics.FillRect 0,0,100,100
p.mask.Graphics.ForeColor=rgb(127,127,127)
p.mask.Graphics.FillRect 0,0,100,100

// Make a new MemoryBlock
m=NewMemoryBlock(100*100*4) // 4 bytes per Pixel

// copy RGB and leave room for alpha
if p.CopyARGBtoMemoryblockMBS(m,0,false,-1) then
MessageBox EncodingToHexMBS(m.StringValue(0,99))
end if

// copy Blue channel from mask image into Memoryblock
if p.mask.CopyBtoMemoryblockMBS(m,kAlphaOffset,4) then
MessageBox EncodingToHexMBS(m.StringValue(0,99))
end if
```

Notes: Returns true on success.
destination should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.
PixelByteSize is normally 4 for 32bit per Pixel.
By using a different offset you can have this function working correctly on non BigEndian platforms.
The function will crash if the memoryblock is too small. Needs picture.width*picture.height*PixelByteSize bytes in the memoryblock.
Mask images in RB are all gray so it does not matter which channel you copy to get the alpha channel. This function takes the blue channel from the source image.

This method was written for speed, so the creation of the memoryblock is your part. You can of course reuse memoryblocks for batch processing images as long as the memoryblock is big enough.

StartLine and Endline define the range of source lines from picture. Range is from 0 to picture.height-1. if Endline is -1, we use picture.height-1 internally. If DestRowBytes is not zero, it specifies the bytes per row in the target memoryblock for each line.

90.5.56 CopyGtoMemoryblockMBS(destination as memoryblock, offset as Integer, PixelByteSize as Integer, StartLine as Integer = 0, EndLine as Integer = -1, Yield as Integer = 0, DestRowBytes as Integer = 0) as boolean

MBS Picture Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies raw image data into a memoryblock.
Example:

```
const kAlphaOffset=0 ' (BigEndian) and 3 (LittleEndian)
Var m as MemoryBlock
Var p as Picture

p=New Picture(100,100,32)
p.Graphics.ForeColor=rgb(255,128,1)
p.Graphics.FillRect 0,0,100,100
p.mask.Graphics.ForeColor=rgb(127,127,127)
p.mask.Graphics.FillRect 0,0,100,100

// Make a new MemoryBlock
m=NewMemoryBlock(100*100*4) // 4 bytes per Pixel

// copy RGB and leave room for alpha
if p.CopyARGBtoMemoryblockMBS(m,0,false,-1) then
MessageBox EncodingToHexMBS(m.StringValue(0,99))
end if

// copy green channel from mask image into Memoryblock
if p.mask.CopyGtoMemoryblockMBS(m,kAlphaOffset,4) then
MessageBox EncodingToHexMBS(m.StringValue(0,99))
end if
```

Notes: Returns true on success.
destination should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.
PixelByteSize is normally 4 for 32bit per Pixel.
By using a different offset you can have this function working correctly on non BigEndian platforms.
The function will crash if the memoryblock is too small. Needs picture.width*picture.height*PixelByteSize bytes in the memoryblock.
Mask images in RB are all gray so it does not matter which channel you copy to get the alpha channel. This

function takes the green channel from the source image.

90.5.57 CopyMaskMBS as picture

MBS Picture Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the mask of the picture into a new and independent picture object.
Example:

```
Var p as Picture

p=New Picture(300,300,32)

p.Graphics.ForeColor=&cFF0000
p.Graphics.FillRect 0,0,300,300

p.mask.Graphics.ForeColor=&cFFFFFF
p.mask.Graphics.Fillrect 0,0,300,300

p.mask.Graphics.ForeColor=&c000000
p.mask.Graphics.Filloval 0,0,300,300

Backdrop=p.CopyMaskMBS
```

Notes: Returns nil on low memory.

90.5.61 CopyPixelFastMBS(Source As Picture, DestX as Integer, DestY as Integer, SourceX as Integer, SourceY as Integer, Width as Integer, Height as Integer) as boolean

MBS Picture Plugin, Plugin Version: 8.7, Platforms: macOS, Windows, Targets: All.

Function: Copies pixels from one picture into another picture with some options.
Example:

```
const x=100 // mouse coordinates for example
const y=100

Var p,logo as picture

logo=LogoMBS(500)

p=New Picture(800,800,32)

p.Graphics.ForeColor=&cFFFFFF
p.Graphics.FillRect 0,0,p.Width,p.Height

if p.CopyPixelFastMBS(logo, x-logo.Width/2, y-logo.Height/2, 0, 0, logo.Width, logo.Height) then
' ok
else
beep
end if

Window1.Backdrop=p
```

Notes: Returns true on success and false on failure.

Parameters:
Source: the source picture, must not be nil.
DestX: destination position
DestY: destination position
SourceX: source position
SourceY: source position

Width: width of the area to copy
Height: height of the area to copy

The destination image (self) can be either 24 bit or 32 bit.
The source image can have any bit depth and may be converted to 24 or 32 bit.

90.5.62 CopyRGBAtoMemoryblockMBS(destination as memoryblock, offset as Integer, AlphaValue as Integer, StartLine as Integer = 0, EndLine as Integer = -1, Yield as Integer = 0, DestRowBytes as Integer = 0) as boolean

MBS Picture Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies raw image data into a memoryblock.
Example:

```
// get some picture
Var pic as Picture = LogoMBS(500)
// and a memoryblock of 1000 by 1000 pixels with 4 bytes per pixel
Var m as new MemoryBlock(1000* 1000 *4)

// calculate some offset for the image with 50 rows from top and 60 pixels from left
Var Offset50Lines as Integer = 1000*4 *50 +60*4

// copy picture to memoryblock
if pic.CopyRGBAtoMemoryblockMBS(m, Offset50Lines, 127, 0, pic.Height-1, 0, 4*1000) then

// show MemoryBlock content
Backdrop = MemoryblockRGBAtoPictureMBS(nil, m, 0, 1000, 1000)
end if
```

Notes: Returns true on success.
destination should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs picture.width*picture.height*4 bytes in the memoryblock.

Does not access the mask inside the image!

This method was written for speed, so the creation of the memoryblock is your part. You can of course reuse memoryblocks for batch processing images as long as the memoryblock is big enough.

The X variant of this method does not touch the alpha channel in the memoryblock and the A variant changes the alpha value to the given value.

StartLine and Endline define the range of source lines from picture. Range is from 0 to picture.height-1. if Endline is -1, we use picture.height-1 internally. Yield specifies how much CPU time is given to other threads. If yield = 0, we give no CPU time away. If yield is >0, we yield every yield/60th second to other threads. MBS Picture Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies raw image data into a memoryblock.
Example:

```
// Create a picture with mask:
Var p as Picture = LogoMBS(200)
Var g as Graphics = p.mask.Graphics

g.ForeColor = &cFFFFFF
g.FillRect 0,0,g.Width,g.Height

g.ForeColor = &c000000
g.Filloval 0,0,g.Width,g.Height

// convert to memoryblock
Var m as new MemoryBlock(4 * p.Width * p.Height)

if p.CopyRGBAtoMemoryblockMBS(m, 0, p.Mask) then
// convert back
Backdrop = MemoryblockRGBAtoPictureMBS(m, 0, p.Width, p.Height)

break // look into memoryblock with debugger
end if
```

Notes: Returns true on success.
destination should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

MaskForAlpha should not be nil and be the mask for this image.

This method was written for speed, so the creation of the memoryblock is your part. You can of course reuse memoryblocks for batch processing images as long as the memoryblock is big enough.

StartLine and Endline define the range of source lines from picture. Range is from 0 to picture.height-1. if Endline is -1, we use picture.height-1 internally. Yield specifies how much CPU time is given to other threads. If yield = 0, we give no CPU time away. If yield is >0, we yield every yield/60th second to other threads. If DestRowBytes is not zero, it specifies the bytes per row in the target memoryblock for each line.

90.5.67 CopyXBGRtoMemoryblockMBS(destination as memoryblock, offset as Integer, StartLine as Integer = 0, EndLine as Integer = -1, Yield as Integer = 0, DestRowBytes as Integer = 0) as boolean

MBS Picture Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies raw image data into a memoryblock.
Notes: Returns true on success.
destination should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs picture.width*picture.height*4 bytes in the memoryblock.

Does not access the mask inside the image!

This method was written for speed, so the creation of the memoryblock is your part. You can of course reuse memoryblocks for batch processing images as long as the memoryblock is big enough.

The X variant of this method does not touch the alpha channel in the memoryblock and the A variant changes the alpha value to the given value.

StartLine and Endline define the range of source lines from picture. Range is from 0 to picture.height-1. if Endline is -1, we use picture.height-1 internally. Yield specifies how much CPU time is given to other threads. If yield = 0, we give no CPU time away. If yield is >0, we yield every yield/60th second to other threads. If DestRowBytes is not zero, it specifies the bytes per row in the target memoryblock for each line.

90.5.68 CopyXRGBtoMemoryblockMBS(destination as memoryblock, offset as Integer, StartLine as Integer = 0, EndLine as Integer = -1, Yield as Integer = 0, DestRowBytes as Integer = 0) as boolean

MBS Picture Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies raw image data into a memoryblock.
Notes: Returns true on success.
destination should not be nil.
offset should be 0 or bigger and is the start position in the memoryblock.

The function will crash if the memoryblock is too small. Needs picture.width*picture.height*4 bytes in the memoryblock.

Does not access the mask inside the image!

This method was written for speed, so the creation of the memoryblock is your part. You can of course reuse memoryblocks for batch processing images as long as the memoryblock is big enough.

The X variant of this method does not touch the alpha channel in the memoryblock and the A variant changes the alpha value to the given value.

StartLine and Endline define the range of source lines from picture. Range is from 0 to picture.height-1. if Endline is -1, we use picture.height-1 internally. Yield specifies how much CPU time is given to other threads. If yield = 0, we give no CPU time away. If yield is >0, we yield every yield/60th second to other threads. If DestRowBytes is not zero, it specifies the bytes per row in the target memoryblock for each line.

90.5.69 CountColorMBS(col as color) as Integer

MBS Picture Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts the pixels with the given colors.
Example:

```
Var p as Picture
Var n1,n2 as Integer

p=New Picture(300,300,32)

p.Graphics.ForeColor=&cFF0000
p.Graphics.FillRect 0,0,100,100

n1=p.CountColorMBS(&cFF0000)
n2=p.CountColorMBS(&cFFFFFF)
```

```
if n1=100*100 then
if n2=300*300-100*100 then
MessageBox "OK"
else
MessageBox "white failed"
end if
else
MessageBox "red failed"
end if
```

Notes: Returns the number of pixels found.

- Tipp of the day: Blank HTMLViewer

90.5.70 CountColorsMBS(byref red as memoryblock, byref blue as memoryblock, byref green as memoryblock, byref count as Integer)

MBS Picture Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts the color parts of each pixel.
Notes: red, blue and green are filled with 1024 bytes big memoryblocks. One 4 byte integer for each color value possible.
Count is filled with the number of pixels processed.

90.5.71 DrawPictureFMBS(pic as picture, x as Double, y as Double, alpha as Double = 1.0, yield as Integer = 0) as boolean

MBS Picture Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws picture with floating point coordinates.
Notes: Supports a mask on the picture.
Returns true on success.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.5pr3

90.5.72 ExtractColorMBS(SearchColor as color, ReplaceWithColor as color, BackGroundColor as color) as picture

MBS Picture Plugin, Plugin Version: 7.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches the first color and writes matching pixels with the second color.
Example:

```
Var p as Picture

p=New Picture(300,300,32)

p.Graphics.ForeColor=&cFF0000
p.Graphics.FillRect 000,100,100,100

p.Graphics.ForeColor=&c00FF00
p.Graphics.FillRect 100,100,100,100

p.Graphics.ForeColor=&c0000FF
p.Graphics.FillRect 200,100,100,100

p.Graphics.ForeColor=&c777700
p.Graphics.FillRect 100,200,100,100

// shows just a violet box on the left
backdrop=p.ExtractColorMBS(&cFF0000,&cFF00FF,&c000000)
```

Notes: All pixels which do not match the search color are written to the new picture using the given background color.
Returns nil on any error.

90.5.73 ExtractColorRectangleMaskMBS as picture

MBS Picture Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a mask picture with all the rectangles marked visible which contain color.
Example:

```
Var invertedpic as picture
Var pic as Picture

pic=New Picture(300,300,32)
pic.graphics.drawpicture LogoMBS(100), 150,50

Backdrop=pic.ExtractColorRectangleMaskMBS
// marks black where the logo is drawn
```

Notes: If you have a picture which is mostly gray and you need to find a color picture inside, this method can be helpful.

In the returned picture all pixels are black which belong to a rectangle which contains color pixels in the original picture.
See also:

- 90.5.74 ExtractColorRectangleMaskMBS(left as Integer,top as Integer,width as Integer,height as Integer) as picture 14637

90.5.74 ExtractColorRectangleMaskMBS(left as Integer,top as Integer,width as Integer,height as Integer) as picture

MBS Picture Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a mask picture with all the rectangles marked visible which contain color.
Notes: If you have a picture which is mostly gray and you need to find a color picture inside, this method can be helpful.

In the returned picture all pixels are black which belong to a rectangle which contains color pixels in the original picture.

All pixel outside the rectangle specified will be white.
See also:

- 90.5.73 ExtractColorRectangleMaskMBS as picture 14636

90.5.75 FindPictureMBS(pic as picture, byref x as Integer, byref y as Integer, StartX as Integer = 0, StartY as Integer = 0, Tolerance as Integer = 3) as boolean

MBS Picture Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the given picture inside the picture.
Example:

```
// this is search image
Var p as new Picture(20,20,32)
p.Graphics.ForeColor = &c0000FF
p.Graphics.FillRect 0, 0, 20, 20

// this is target image
Var q as new Picture(500, 500, 32)

// with some color at Random position
q.Graphics.ForeColor = &c0000FF
q.Graphics.FillRect rnd*480, rnd*480, 30, 30
```

```
// do a search
Var x, y as Integer

if q.FindPictureMBS(p, x,y) then
// found image, so draw rectangle there

q.Graphics.ForeColor = &cFF0000
q.Graphics.DrawRect x, y, p.Width, p.Height
end if

Window1.Backdrop = q
```

Notes: Returns true on success and fills x/y variables.
Pixels are compared exactly, so a little bit color correction and make the picture being not found.

StartX/StartY can give start position. Tolerance defines how much two pixel component values can differ and still be considered the same. This helps with color matching and other drawings which may alter pixels a little bit.
If function returns true, you can use x+1, y as the new start position and search again.

90.5.76 GetMaskMBS(create as boolean = true) as picture

MBS Picture Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the mask for that picture.
Notes: Same as Picture.Mask in Xojo, but over the Plugin API.
We added it to test for leaks in plugin API.
Blog Entries

- MBS Plugins 11.1 Release notes
- MBS REALbasic Plugins, version 11.1pr3

90.5.77 GrayScale2MBS(mode as Integer) as boolean

MBS Picture Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Turns picture into grayscale.
Example:

```
Var l as Picture = LogoMBS(500)
if l.GrayScale2MBS(0) then
```

```
Backdrop = l
end if
```

Notes: Returns true on success and false on failure.

Modes:

0	y = 0.33 * R + 0.5 * G + 0.16 * B	Faster version of 3
1	y = 0.375 * R + 0.5 * G + 0.125 * B	Faster version of 3
2	y = 0.2126 * R + 0.7152 * G + 0.0722 * B	Photometric/digital ITU-R
3	y = 0.299 * R + 0.587 * G + 0.114 * B	Digital CCIR601

Mode 2 and 3 uses doubles and mode 0 and 1 use integers so they should be faster.
Still Mode 0 and 1 are just approximation formulas which trade accuracy for perfomance.

GrayScaleMBS makes a copy of the picture while GrayScale2MBS edits in-place.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.1pr3

90.5.78 GrayScaleMBS(mode as Integer) as picture

MBS Picture Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a grayscale copy of the picture.
Example:

```
Var l as Picture = LogoMBS(500)
Backdrop = l.GrayScaleMBS(0)
```

Notes: If you have a mask on the picture, you need to draw that mask in the new picture's mask if you want to keep it.

Modes:

0	y = 0.33 * R + 0.5 * G + 0.16 * B	Faster version of 3
1	y = 0.375 * R + 0.5 * G + 0.125 * B	Faster version of 3
2	y = 0.2126 * R + 0.7152 * G + 0.0722 * B	Photometric/digital ITU-R
3	y = 0.299 * R + 0.587 * G + 0.114 * B	Digital CCIR601

Mode 2 and 3 uses doubles and mode 0 and 1 use integers so they should be faster.
Still Mode 0 and 1 are just approximation formulas which trade accuracy for perfomance.

GrayScaleMBS makes a copy of the picture while GrayScale2MBS edits in-place.

90.5.79 GreenChannelMBS as picture

MBS Picture Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green channel of the picture copied into a new picture.
Example:

```
Var p as Picture = LogoMBS(500)
Backdrop = p.GreenChannelMBS
```

Blog Entries

- MBS REALbasic Plugins, version 10.6pr4

90.5.80 HashMBS as UInt32

MBS Picture Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates CRC 32 over all pixels.
Example:

```
Var p as new Picture(100, 100, 32)

Var hash1 as UInt32 = p.HashMBS

// one black pixel
p.Graphics.Pixel(50, 50) = &c000000

Var hash2 as UInt32 = p.HashMBS

MessageBox hex(hash1)+" "+hex(hash2)
```

Notes: You can use hash to see if two pictures have 100% identical pixel values. Changing just one pixel should give different number.
Does not include alpha channel or mask for the hash, but only RGB channels.
Blog Entries

- MBS Real Studio Plugins, version 12.1pr4

90.5.81 HasMaskMBS as boolean

MBS Picture Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this picture has a mask or not.
Notes: Returns true if yes or false if not.

90.5.82 HMirrorMBS as picture

MBS Picture Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mirrors the picture horizontally (flip).
Example:

```
// load picture
Var f as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var p as PNGPictureMBS = f.OpenAsPNGMBS

// get parts
Var pic as Picture = p.Pict.HMirrorMBS
Var mask as Picture = p.mask.HMirrorMBS

// save as png
Var g as FolderItem = SpecialFolder.Desktop.Child("output.png")
call g.SaveAsPNGMBS(pic, mask, 0)

// now apply mask to show it
pic.Mask = mask
Backdrop = pic
```

Notes: This method returns a copy of the picture mirrored.
Returns nil on low memory.

90.5.83 HMirrorPictureMBS as boolean

MBS Picture Plugin, Plugin Version: 7.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mirrors the picture horizontally (flip).
Example:

```
if pic.HMirrorPictureMBS then // mirror picture
Canvas1.backdrop=pic
else
Canvas1.backdrop=pic.HMirrorMBS // mirror a copy
end if
```

Notes: This methods mirrors the picture data itself. Returns true on success and false on failure. Only bitmap pictures can be mirrored this way.

90.5.84 InvertGrayMBS as picture

MBS Picture Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inverts the gray pixels inside the picture.
Example:

```
Var invertedpic as picture
Var pic as picture

pic=LogoMBS(500)
invertedpic=pic.InvertGrayMBS

Backdrop=invertedpic
```

Notes: Returns nil on any error.
See also:

- 90.5.85 InvertGrayMBS(left as Integer,top as Integer,width as Integer,height as Integer) as picture

90.5.85 InvertGrayMBS(left as Integer,top as Integer,width as Integer,height as Integer) as picture

MBS Picture Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inverts the gray pixels inside the picture.
Example:

```
Var invertedpic as picture
Var pic as picture

pic=LogoMBS(500)
invertedpic=pic.InvertGrayMBS(0,0,250,250)

Backdrop=invertedpic
```

Notes: Returns nil on any error.
The part of the picture which is not inverted will be all black.
See also:

- 90.5.84 InvertGrayMBS as picture 14642

90.5.86 InvertMBS as picture

MBS Picture Plugin, Plugin Version: 7.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inverts the whole picture.
Example:

```
Var invertedpic as picture
Var pic as picture

pic=LogoMBS(500)
invertedpic=pic.InvertMBS

Backdrop=invertedpic
```

Notes: Supports RGB and RGBA pictures, but does not look into a mask as that is not needed.
Alpha stays untouched as only RGB is inverted.
Returns nil on any error.
See also:

- 90.5.87 InvertMBS(left as Integer,top as Integer,width as Integer,height as Integer) as picture 14643

90.5.87 InvertMBS(left as Integer,top as Integer,width as Integer,height as Integer) as picture

MBS Picture Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inverts the picture.
Example:

```
Var invertedpic as picture
Var pic as picture

pic=LogoMBS(500)
invertedpic=pic.InvertMBS(0,0,250,250)

Backdrop=invertedpic
```

Notes: Returns nil on any error.
The part of the picture which is not inverted will be all black.

- 90.5.86 InvertMBS as picture 14643

90.5.88 isBlackMBS as boolean

MBS Picture Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the picture has only black pixels.
Example:

```
Var p as Picture

// test white
p=New Picture(100,100,32)

MessageBox "isBlackMBS: "+str(p.isBlackMBS)+EndOfLine+"isWhiteMBS: "+str(p.isWhiteMBS)

// test black
p.Graphics.ForeColor=&c000000
p.Graphics.FillRect 0,0,100,100
MessageBox "isBlackMBS: "+str(p.isBlackMBS)+EndOfLine+"isWhiteMBS: "+str(p.isWhiteMBS)

// test red
p.Graphics.ForeColor=&cFF0000
p.Graphics.FillRect 0,0,100,100
MessageBox "isBlackMBS: "+str(p.isBlackMBS)+EndOfLine+"isWhiteMBS: "+str(p.isWhiteMBS)
```

See also:

- 90.5.89 isBlackMBS(left as Integer,top as Integer,width as Integer,height as Integer) as boolean 14644

90.5.89 isBlackMBS(left as Integer,top as Integer,width as Integer,height as Integer) as boolean

MBS Picture Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the picture has only black pixels in the given rectangle.
See also:

- 90.5.88 isBlackMBS as boolean 14644

90.5.90 isGrayMBS(tolerance as Integer = 0) as boolean

MBS Picture Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if a picture has only shades of gray in all pixels.
Example:

```
Var p as new Picture(100,100,32)

// 1. test white picture

if p.isGrayMBS then
MessageBox "white picture is gray."
end if

// 2. test gray picture
Var g as Graphics = p.Graphics
g.ForeColor = &c777777
g.FillRect 0, 0, 100, 100

if p.isGrayMBS then
MessageBox "gray picture is gray."
end if

// 3. test gray picture with tolerance
g.ForeColor = &c777778
g.FillRect 0, 0, 100, 100

if p.isGrayMBS(0) then
MessageBox "gray (not correct)"
else
MessageBox "not gray (correct)"
end if

if p.isGrayMBS(1) then
MessageBox "gray (correct)"
else
MessageBox "not gray (not correct)"
end if

// 4. test gray picture with over tolerance
g.ForeColor = &c777779
g.FillRect 0, 0, 100, 100

if p.isGrayMBS(0) then
MessageBox "gray (not correct)"
else
MessageBox "not gray (correct)"
end if

if p.isGrayMBS(1) then
MessageBox "gray (not correct)"
```

```
else
MessageBox "not gray (correct)"
end if
```

Notes: Tolerance defines how big the difference between two channels can be. Typically a value smaller than 5. Pass 0 if you need exact gray scales.
Like the difference between &c000000 and &c000001 is not visible to most people, it can be ignored often.
See also:

- 90.5.91 isGrayMBS(tolerance as Integer, left as Integer,top as Integer,width as Integer,height as Integer) as boolean 14646

90.5.91 isGrayMBS(tolerance as Integer, left as Integer,top as Integer,width as Integer,height as Integer) as boolean

MBS Picture Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if a picture has only shades of gray in all pixels.
Notes: Tolerance defines how big the difference between two channels can be. Typically a value smaller than 5. Pass 0 if you need exact gray scales.
Like the difference between &c000000 and &c000001 is not visible to most people, it can be ignored often.

90.5.95 MirrorMBS as picture

MBS Picture Plugin, Plugin Version: 7.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mirrors the picture vertically and horizontally.
Example:

```
Canvas1.backdrop=pic.MirrorMBS
```

Notes: Same as rotation by 180 degree.
This method returns a copy of the picture mirrored.
Returns nil on low memory.

90.5.96 MirrorPictureMBS as boolean

MBS Picture Plugin, Plugin Version: 7.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mirrors the picture vertically and horizontally.
Example:

```
if pic.MirrorPictureMBS then // mirror picture
Canvas1.backdrop=pic
else
Canvas1.backdrop=pic.MirrorMBS // mirror a copy
end if
```

Notes: Same as rotation by 180 degree.

- MBS REALbasic Plugins, version 11.1pr1

90.5.104 Rotate90MBS as picture

MBS Picture Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rotates the picture by 90¬∞ counter clockwise.
Example:

```
Var p,r as picture
r=LogoMBS(500)
p=r.cloneMBS
Canvas1.backdrop=p.Rotate90MBS
```

Notes: You may use the function picture.bitmap to make sure that the picture is a bitmap, because this function works only for bitmap pictures.

90.5.105 RotateImageAndMaskMBS(angle as Double, cut as boolean = False) as picture

MBS Picture Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rotates the picture by angle¬∞ counter clockwise.
Notes: Internally uses RotateMBS.
Works with masked and alpha channel pictures, but is faster with masked pictures.
Returns nil on any error.
if cut is true, the image is cut to the original size.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.4pr5

90.5.106 RotateMBS(angle as Double, background as color = &cFFFFFFFF) as picture

MBS Picture Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rotates the picture by angle¬∞ counter clockwise.
Example:

```
Var p,r as picture
r=LogoMBS(500)
p=r.cloneMBS
Canvas1.backdrop=p.RotateMBS(42.3,rgb(255,255,255))
```

Notes: The area around the picture is filled using the backcolor.

You may use the function picture.bitmap to make sure that the picture is a bitmap, because this function works only for bitmap pictures.

Alpha channel support is half done. If it's working for you, please enjoy it. If not, please report.

90.5.107 RotateMemoryMBS(angle as Double) as Int64

MBS Picture Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the memory needed to rotate the picture with the given angle.
Notes: RotateMBS needs temporary buffers and fails if somewhere between memory is low.
Blog Entries

- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr2

90.5.108 ScaleImageAndMaskMBS(width as Integer, height as Integer, AntiAlias as boolean=false, YieldTicks as Integer=0) as picture

MBS Picture Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales the picture to the new size including mask (in case one exists).
Notes: This is a self made algorithm which produces nice pictures on all platforms.
It is slower than QuickDraw on Mac OS, but nicer than drawpicture on Windows.
Returns nil on low memory or invalid width and height values.

AntiAlias is set to false if width<=self.width or height<=self.height.

If YieldTicks is 0, no time is given to other threads in your application. If it is a value >0, this time is waited before a thread switch is done. Setting it to 1 will give away control to another thread after 1/60th of a second. We recommend a value of 3 to 5 for a good reponsibility of your application.

Version 19.4 or newer of our plugin includes scaling for pictures with alpha channel.
Blog Entries

- MBS Xojo Plugins, version 19.4pr7
- MBS Real Studio Plugins, version 12.0pr4

90.5.109 ScaleMBS(width as Integer, height as Integer, AntiAlias as boolean=false, YieldTicks as Integer=0) as picture

MBS Picture Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales the picture to the new size.
Example:

```
Var pic as new Picture(100,100,32)

pic.Graphics.ForeColor=&cFF0000
pic.Graphics.FillOval 0,0,100,100

Var scaledPic as picture = pic.ScaleMBS(200,200)

// show scaledPic
Window1.backdrop = scaledPic
```

Notes: This is a self made algorithm which produces nice pictures on all platforms.
It is slower than QuickDraw on Mac OS, but nicer than drawpicture on Windows.
Returns nil on low memory or invalid width and height values.

AntiAlias is set to false if width<=self.width or height<=self.height.

If YieldTicks is 0, no time is given to other threads in your application. If it is a value >0, this time is waited before a thread switch is done. Setting it to 1 will give away control to another thread after 1/60th of a second. We recommend a value of 3 to 5 for a good reponsibility of your application.

Scaling down does not use antialias. If you need full antialias, please use ScalingMBS function.

If input and output size is equal, you get your picture back unchanged.
This function does not handle masks. Please use pictures with mask and scale image and mask separately.

Version 19.4 or newer of our plugin includes scaling for pictures with alpha channel.

90.5.110 ScalingMBS(mode as Integer, width as Integer, height as Integer, yield as Integer = 0) as picture

MBS Picture Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales the picture to the given size.
Example:

```
Var p as Picture

p=LogoMBS(1000)

p=p.ScalingMBS(2, 4000, 4000)
```

backdrop=p

Notes: On low memory this function can return nil or the image may look bad. (e.g. all black)
The memory used for the temporary storage is original height * new width * 12 bytes plus some extra.
For scaling with the same size as the picture already has, the scaling is still performed.

Returns nil ony error. (e.g. destwidth=0)

Modes:

1 triangle
2 box, nereast neighbor
3 lanczos 3
4 lanczos 8
5 mitchell
6 poly 3
7 cubic

This function does not handle mask. Please use pictures with mask and scale image and mask separately.

Version 19.4 or newer of our plugin includes scaling for pictures with alpha channel.

- MonkeyBread Software Releases the MBS REALbasic plug-ins 9.2

90.5.111 ScrollHorizontalMBS(delta as Integer, wrap as boolean, scrollmask as boolean) as boolean

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Windows, Targets: All.

Function: Scrolls the image data horizontally.
Example:

```
Var p as Picture
```

```
p=LogoMBS(500) // any bitmap image

if p.ScrollHorizontalMBS(100,true,false) then
Title="ok"
end if

Backdrop=p
```

Notes: Returns true on success and false on failure.
Works only on Mac OS and Windows with 32bit bitmap images.
scrollmask defines whether a mask (if one exists) is also scrolled.
Wrap will define whether the image will wrap on the edges. If wrap is enabled on Mac, the whole thing speeds up.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.1pr1

90.5.112 ScrollMBS(deltaX as Integer, deltaY as Integer, wrap as boolean, scrollmask as boolean) as boolean

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Windows, Targets: All.

Function: Combines calls to ScrollHorizontalMBS and ScrollVerticalMBS.
Notes: Returns true on success and false on failure.
Works only on Mac OS and Windows with 32bit bitmap images.
scrollmask defines whether a mask (if one exists) is also scrolled.
Wrap will define whether the image will wrap on the edges. If wrap is enabled on Mac, the whole thing speeds up.

90.5.113 ScrollVerticalMBS(delta as Integer, wrap as boolean, scrollmask as boolean) as boolean

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Windows, Targets: All.

Function: Scrolls the image data vertically.
Example:

```
Var p as Picture

p=LogoMBS(500) // any bitmap image

if p.ScrollVerticalMBS(100,true,false) then
Title="ok"
end if
```

Backdrop=p

Notes: Returns true on success and false on failure.
Works only on Mac OS and Windows with 32bit bitmap images.
scrollmask defines whether a mask (if one exists) is also scrolled.
Wrap will define whether the image will wrap on the edges. If wrap is enabled on Mac, the whole thing speeds up.

90.5.114 SetSteganographyMBS(flags as Integer, data as Memoryblock) as boolean

MBS Picture Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds steganography to an existing picture.
Example:

```
Var p as Picture = LogoMBS(500)

// this example uses chr(0) as end marker
Var s as string = "Hello World. This is just a test." + chr(0)
if p.SetSteganographyMBS(1, s) then

Var data as MemoryBlock = p.SteganographyMBS(1)
Var d as string = data.CString(0)

Backdrop = p
Break
end if
```

Notes: Flags can be a combination of red (&h100), green (&h010) and blue (&h001).
Returns true on success or false on failure.
If memoryblock provided is nil, this function fails.

If you like to store data, please encrypt them and include some way that you find your data again, detect length of data, verify it's okay via checksum and than decrypt your data.
Please store image in a loss less format like PNG.
Function does not handle mask or alpha channel.

90.5.115 SetSteganographyPictureMBS(flags as Integer, data as Picture) as boolean

MBS Picture Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds steganography to an existing picture.
Example:

```
const AllChannels = &h111

Var p as new Picture(500, 500, 32)
Var l as Picture = LogoMBS(500)

Var w as new Window1
w.Title = "Logo"
w.Backdrop = l

// adds picture. You will normally not see the modification
if p.SetSteganographyPictureMBS(AllChannels, l) then

w = new Window1
w.Title = "Logo hidden in white picture"
w.Backdrop = p

// as we store in lowest bit, this picture will look strange
Var y as Picture = p.SteganographyPictureMBS(AllChannels)

w = new Window1
w.Title = "Logo extracted"
w.Backdrop = y
end if
```

Notes: Flags can be a combination of red (&h100), green (&h010) and blue (&h001).
Returns true on success or false on failure.

Function does not handle mask or alpha channel.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.2pr2

90.5.116 SobelChannelsMBS(Red as boolean, Green as Boolean, Blue as boolean, direction1 as Integer = 1, direction2 as Integer = 3, swap as boolean = false) as picture

MBS Picture Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the sobel operator.
Example:

```
Var m as Picture = LogoMBS(500)

// only green
```

Backdrop = m.SobelChannelsMBS(false, true, false)

Notes: Useful for edge detection.
See also SobelMBS function which takes similar operators.
You can set Red/Blue/Green parameters to define which channel is modified and which channel is just copied.
Pictures look quite funny. The channel who got the edge detection has bigger areas black or white so other colors in other channels have much more visible effect.
Blog Entries

- MBS Plugins 11.1 Release notes

90.5.117 SobelMBS(direction1 as Integer = 1, direction2 as Integer = 3, swap as boolean = false, gray as boolean = true) as picture

MBS Picture Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the sobel operator.
Example:

Var m as Picture = LogoMBS(500)

Backdrop = m.SobelMBS

Notes: Useful for edge detection.

direction1: The direction for first matrix.
direction2: The direction for first matrix.
swap: If false, you get white on black. If true you get black on white.
gray: whether to output gray image instead of RGB image.

Possible Matrix values:
-1: negative identity:
0: identity
1: west
2: east
3: north
4: south
5: south east
6: north west
7: north east
8: south west

You can add 10 to the 8 direction matrixes to get more weight.

90.5.118 SteganographyMBS(flags as Integer) as Memoryblock

MBS Picture Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries steganography information inside the picture.
Example:

```
Var p as Picture = LogoMBS(500)

Var s as string = "Hello World. This is just a test." + chr(0)
if p.SetSteganographyMBS(1, s) then

Var data as MemoryBlock = p.SteganographyMBS(1)
Var d as string = data.CString(0)

Backdrop = p
Break
end if
```

Notes: Flags can be a combination of red (&h100), green (&h010) and blue (&h001).
Blog Entries

- MBS Xojo / Real Studio Plugins, version 17.1pr1

90.5.119 SteganographyPictureMBS(flags as Integer) as Picture

MBS Picture Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries steganography information inside the picture.
Example:

```
const AllChannels = &h111

Var p as new Picture(500, 500, 32)

Var w as new Window1
w.Title = "white"
w.Backdrop = p

Var l as Picture = LogoMBS(500)

w = new Window1
w.Title = "Logo"
```

```
w.Backdrop = l

// adds picture. You will normally not see the modification
Var x as Picture = p.AddSteganographyPictureMBS(AllChannels, l)

w = new Window1
w.Title = "Logo hidden in white picture"
w.Backdrop = x

// as we store in lowest bit, this picture will look strange
Var y as Picture = x.SteganographyPictureMBS(AllChannels)

w = new Window1
w.Title = "Logo extracted"
w.Backdrop = y
```

Notes: Flags can be a combination of red (&h100), green (&h010) and blue (&h001).

- MBS Xojo / Real Studio Plugins, version 16.2pr2

90.5.120 ThreadedTransformMBS(Threaded as Integer, Map() as color, dest as picture = nil) as picture

MBS Picture Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a transformation to the picture.
Example:

```
Var p as Picture = LogoMBS(500)

Var map(-1) as color

for r as Integer = 0 to 255
for g as Integer = 0 to 255
for b as Integer = 0 to 255
// index is r*65536+g*256+b

// we swap colors: r gives g, g gives b, b gives r
map.Add rgb(g,b,r)
next
next
next

Backdrop=p.ThreadedTransformMBS(0, map)
```

Notes: Threaded parameter specifies how many threads you want to use:
A negative value disables threading, zero will use one thread for each CPU core and a positive number specifies the thread count.

For each color in the source picture the red, blue and green values are used as index (blue+green*256+blue*65536) in the arrays to get the new color value.

The arrays should have 2^24 entries.

You can pass destination picture. If dest is not nil and size matches, the plugin reuses the picture object which increases performance as no new picture is created.
See also:

- 90.5.121 ThreadedTransformMBS(Threaded as Integer, Map() as Integer, dest as picture = nil) as picture 14662
- 90.5.122 ThreadedTransformMBS(Threaded as Integer, RedMap as memoryblock, GreenMap as memoryblock, BlueMap as memoryblock, dest as picture = nil) as picture 14663
- 90.5.123 ThreadedTransformMBS(Threaded as Integer, RedMap() as Integer, GreenMap() as Integer, BlueMap() as Integer, dest as picture = nil) as picture 14664

90.5.121 ThreadedTransformMBS(Threaded as Integer, Map() as Integer, dest as picture = nil) as picture

MBS Picture Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a transformation to the picture.
Example:

```
Var p as Picture = LogoMBS(500)

Var map(-1) as Integer

for r as Integer = 0 to 255
for g as Integer = 0 to 255
for b as Integer = 0 to 255
// index is r*65536+g*256+b

// we swap colors: r gives g, g gives b, b gives r
map.Add g*65536+b*256+r
next
next
next

Backdrop=p.ThreadedTransformMBS(0, map)
```

Notes: Threaded parameter specifies how many threads you want to use:
A negative value disables threading, zero will use one thread for each CPU core and a positive number specifies the thread count.

For each color in the source picture the red, blue and green values are used as index (blue+green*256+blue*65536) in the arrays to get the new color value.

The arrays should have 2^24 entries.

You can pass destination picture. If dest is not nil and size matches, the plugin reuses the picture object which increases performance as no new picture is created.
See also:

- 90.5.120 ThreadedTransformMBS(Threaded as Integer, Map() as color, dest as picture = nil) as picture 14661
- 90.5.122 ThreadedTransformMBS(Threaded as Integer, RedMap as memoryblock, GreenMap as memoryblock, BlueMap as memoryblock, dest as picture = nil) as picture 14663
- 90.5.123 ThreadedTransformMBS(Threaded as Integer, RedMap() as Integer, GreenMap() as Integer, BlueMap() as Integer, dest as picture = nil) as picture 14664

90.5.122 ThreadedTransformMBS(Threaded as Integer, RedMap as memoryblock, GreenMap as memoryblock, BlueMap as memoryblock, dest as picture = nil) as picture

MBS Picture Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a transformation to the picture.
Example:

```
Var p as Picture = LogoMBS(500)

Var red as MemoryBlock = NewMemoryBlock(256)
Var green as MemoryBlock = NewMemoryBlock(256)
Var blue as MemoryBlock = NewMemoryBlock(256)

for i as Integer=0 to 255
red.Byte(i)=i/2
green.Byte(i)=i/2
blue.Byte(i)=i/2
next

Backdrop=p.ThreadedTransformMBS(0, red, green, blue)
```

Notes: Threaded parameter specifies how many threads you want to use:
A negative value disables threading, zero will use one thread for each CPU core and a positive number specifies the thread count.

For each color in the source picture the red, blue and green values are used as index in the memoryblocks to get the new color value.

The memoryblocks must have a size of 256 Bytes.

You can pass destination picture. If dest is not nil and size matches, the plugin reuses the picture object which increases performance as no new picture is created.
See also:

- 90.5.120 ThreadedTransformMBS(Threaded as Integer, Map() as color, dest as picture = nil) as picture 14661
- 90.5.121 ThreadedTransformMBS(Threaded as Integer, Map() as Integer, dest as picture = nil) as picture 14662
- 90.5.123 ThreadedTransformMBS(Threaded as Integer, RedMap() as Integer, GreenMap() as Integer, BlueMap() as Integer, dest as picture = nil) as picture 14664

90.5.123 ThreadedTransformMBS(Threaded as Integer, RedMap() as Integer, GreenMap() as Integer, BlueMap() as Integer, dest as picture = nil) as picture

MBS Picture Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a transformation to the picture.
Example:

```
Var p as Picture = LogoMBS(500)

Var red(-1) as Integer
Var green(-1) as Integer
Var blue(-1) as Integer

for i as Integer=0 to 255
red.Add i/2
green.Add i/2
blue.Add i/2
next

Backdrop=p.ThreadedTransformMBS(0, red, green, blue)
```

Notes: Threaded parameter specifies how many threads you want to use:
A negative value disables threading, zero will use one thread for each CPU core and a positive number specifies the thread count.

For each color in the source picture the red, blue and green values are used as index in the arrays to get the new color value.

The arrays should have 256 entries.

You can pass destination picture. If dest is not nil and size matches, the plugin reuses the picture object which increases performance as no new picture is created.

90.5.124 ThresholdMBS(Threshold as integer) as picture

MBS Picture Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates black and white picture.
Notes: With threshold value you define threshold in range from 0 to 255.
Normally you use 127 for turning picture to black & white.

Xojo Developer Magazine

- 16.1, page 10: News

90.5.125 TransformColorsMBS(red as memoryblock, blue as memoryblock, green as memoryblock, dest as picture = nil) as picture

MBS Picture Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a transform table to the pixels.
Notes: Red, blue and green are 256 byte big memoryblocks with one byte for each value.

In RB the function does this:
color=rgb(red.byte [color.red] , green.byte [color.green] , blue.byte [color.blue])

If you pass a destination picture and it has right size, the plugin will recycle that instead of creating a new one to increase performance.

- MBS Real Studio Plugins, version 13.0pr1

90.5.126 TrimMBS(left as Integer, top as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Trims the picture to the given rectangle.
Example:

```
Var p as Picture = LogoMBS(500)

Backdrop = p.TrimMBS(100,100,300,300)
```

Notes: This method does not handle the mask.
So p.Trim(0,0,p.width,p.height) will give you a copy of the image pixels without mask.
left and top are zero based.

Use TrimWithMaskMBS if you need the mask to be trimmed.
Returns nil on low memory or bad parameters.

90.5.127 TrimWithMaskMBS(left as Integer, top as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Trims the picture to the given rectangle.
Example:

```
Var p as picture
Var someimage as Picture = LogoMBS(100)

p=someimage.TrimWithMaskMBS(100,200,300,400)
```

Notes: left and top are zero based.
Returns nil on low memory or bad parameters.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.2pr2

90.5.128 VMirrorMBS as picture

MBS Picture Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mirrors the picture vertically.
Example:

```
Canvas1.backdrop=pic.VMirrorMBS
```

Notes: This method returns a copy of the picture mirrored.
Returns nil on low memory.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.2pr10

90.5.129 VMirrorPictureMBS as boolean

MBS Picture Plugin, Plugin Version: 7.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mirrors the picture vertically.
Example:

```
if pic.VMirrorPictureMBS then // mirror picture
Canvas1.backdrop=pic
else
Canvas1.backdrop=pic.VMirrorMBS // mirror a copy
end if
```

Notes: This methods mirrors the picture data itself. Returns true on success and false on failure. Only bitmap pictures can be mirrored this way.
Blog Entries

- MBS Real Studio Plugins, version 11.4pr1

90.5.130 Properties

90.5.131 EmbeddedMaskMBS(swap as boolean) as picture

MBS Picture Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Targets: All.

Function: Read or write a picture mask.
Example:

```
// Export a mask picture:

Var f as FolderItem
Var t as TiffPictureMBS
Var m,p as Picture
Var q as QTGraphicsExporterMBS

p=New Picture(100,100,32)
p.Graphics.ForeColor=rgb(100,100,100)
p.Graphics.fillrect 0,0,100,100
p.Graphics.ForeColor=rgb(255,0,0)
p.Graphics.fillrect 20,20,80,30

m=New Picture(100,100,32)
m.Graphics.ForeColor=rgb(255,255,255)
m.Graphics.FillRect 0,0,30,100
m.Graphics.ForeColor=rgb(200,200,200)
m.Graphics.FillRect 30,0,30,100
m.Graphics.ForeColor=rgb(100,100,100)
m.Graphics.FillRect 60,0,30,100

p.EmbeddedMaskMBS(true)=m
p.Mask.Graphics.DrawPicture m,0,0 // just for showing as a backdrop

q=new QTGraphicsExporterMBS

q.OpenExporter("TIFF")
q.Depth=32
q.InputPicture=p
q.CompressionQuality=1024
q.OutputFile=SpecialFolder.Desktop.Child("Hello.tif")
title=str(q.Export)

Backdrop=p
```

Notes: Only useful on 32bit images.
Xojo takes white for transparent, so you may need to swap this to black using the swap parameter.

Windows support removed somewhere in version 10.4 with internal changes. If you need this, please tell us. (Read and Write computed property)

90.6 class PictureConvolutionMBS

90.6.1 class PictureConvolutionMBS

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a Picture Convolution.
Example:

```
// blur

Var l as Picture = LogoMBS(500)
Var p as new PictureConvolutionMBS

p.hor(0) = 0.2
p.hor(1) = 0.2
p.hor(2) = 0.2
p.hor(3) = 0.2
p.hor(4) = 0.2

p.ver(0) = 0.2
p.ver(1) = 0.2
p.ver(2) = 0.2
p.ver(3) = 0.2
p.ver(4) = 0.2

p.ValueCount=5

p.SourcePicture=l

Var t as Integer=ticks
call p.run(7)
t=ticks-t

Title=str(t)

Backdrop=p.DestinationPicture
```

90.6.2 Methods

90.6.3 close

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

90.6.4 Run(channels as Integer) as boolean

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the picture effect.
Notes: Fails if the pictures are not bitmap pictures. Source and Destination can be equal. If you provide a destination picture, the dimenstions of source and destination must be equal.

Channels is a combination of 1, 2 and 4. 1 for Red, 2 for Green and 4 for Blue.
The border (one pixel thick) is not filled in the destination picture.

This method does the following for each pixel:

```
// first horizontal fill the temporary picture
r=0
g=0
b=0

if RedChannel then
r = r + sourcepicture.pixel(x-1,y).red * Hor(0)
r = r + sourcepicture.pixel(x ,y).red * Hor(1)
r = r + sourcepicture.pixel(x+1,y).red * Hor(2)
else
r = sourcepicture.pixel(x,y)
end if

if GreenChannel then
g = g + sourcepicture.pixel(x-1,y).green * Hor(0)
g = g + sourcepicture.pixel(x ,y).green * Hor(1)
g = g + sourcepicture.pixel(x+1,y).green * Hor(2)
else
g = sourcepicture.pixel(x,y)
end if
```

```
if BlueChannel then
b = b + sourcepicture.pixel(x-1,y).blue * Hor(0)
b = b + sourcepicture.pixel(x ,y).blue * Hor(1)
b = b + sourcepicture.pixel(x+1,y).blue * Hor(2)
else
b = sourcepicture.pixel(x,y)
end if

temppicture.pixel(x,y)=rgb(r,g,b)

// now back from temporary picture to the destination picture

r=0
g=0
b=0

if RedChannel then
r = r + temppicture.pixel(x,y-1).red * Ver(0)
r = r + temppicture.pixel(x,y ).red * Ver(1)
r = r + temppicture.pixel(x,y+1).red * Ver(2)
else
r = temppicture.pixel(x,y)
end if

if GreenChannel then
g = g + temppicture.pixel(x,y-1).green * Ver(0)
g = g + temppicture.pixel(x,y ).green * Ver(1)
g = g + temppicture.pixel(x,y+1).green * Ver(2)
else
g = temppicture.pixel(x,y)
end if

if BlueChannel then
b = b + temppicture.pixel(x,y-1).blue * Ver(0)
b = b + temppicture.pixel(x,y ).blue * Ver(1)
b = b + temppicture.pixel(x,y+1).blue * Ver(2)
else
b = temppicture.pixel(x,y)
end if

destinationpicture.pixel(x,y)=rgb(r,g,b)
```

90.6.5 Properties

90.6.6 DestinationPicture as Picture

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destination picture.
Notes: If you set this property, use a bitmap picture equal in size to the source picture.
If this property is nil, the Run method will create a picture.
(Read and Write property)

90.6.7 SourcePicture as Picture

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The source picture.
Notes: Must be a bitmap picture.
(you can use the picture.BitmapMBS function for this)
(Read and Write property)

90.6.8 ValueCount as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of values set in the Hor and Ver array.
Example:

```
Var p as new PictureConvolutionMBS

p.Hor(0)=0.25
p.Hor(1)=0.5
p.Hor(2)=0.25
p.ValueCount=3
```

Notes: The index in the arrays goes from 0 to ValueCount-1.
Default is 3.
Use values like 1, 3, 5, 7, 9, 11, 13, 15, 17 or 19.
(Read and Write property)

90.6.9 Hor(index as UInt32) as Double

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The horizontal factors.
Notes: Index from 0 to 19.
(Read and Write computed property)

90.6.10 Ver(index as UInt32) as Double

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The vertical factors.
Notes: Index from 0 to 19.
(Read and Write computed property)

90.7 class PictureEditorMBS

90.7.1 class PictureEditorMBS

MBS Picture Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: class to edit picture data as a memoryblock in place.
Notes: This is the same code the plugin uses to edit pictures.

- MBS Xojo / Real Studio Plugins, version 14.2pr12
- MBS REALbasic plug-in 9.6

90.7.2 Methods

90.7.3 Data(Row as Integer) as MemoryBlock

MBS Picture Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The memoryblock with the original image data of the given row.
Notes: Changes here will be visible in the picture.
This memoryblock has a size property with value 0!
No bound checking can be done by Xojo on this memoryblock.

90.7.4 Properties

90.7.5 AllData as Memoryblock

MBS Picture Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The memoryblock with the original image data.
Notes: Changes here will be visible in the picture.
This memoryblock has a size property with value 0!
No bound checking can be done by Xojo on this memoryblock.

Returns nil for console pictures.
(Read only property)

90.7.6 AllDataCopy as Memoryblock

MBS Picture Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the data for the current picture into a new memoryblock.
Notes: Changes to this memoryblock will not be visible in the original picture.
(Read only property)

90.7.7 BlueOffset as Integer

MBS Picture Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The platform dependent offset of the blue channel in the RGB data.
Notes: A value between 0 and 3.
(Read only property)

90.7.8 BytesPerPixel as Integer

MBS Picture Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of bytes per pixel.
Notes: Most times 4, but for some platforms 3.
(Read only property)

90.7.9 DataPtr as Integer

MBS Picture Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The memory address where the data is stored.
Notes: Maybe useful for declares.
Returns nil for console pictures.
(Read only property)

90.7.10 GreenOffset as Integer

MBS Picture Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The platform dependent offset of the green channel in the RGB data.
Notes: A value between 0 and 3.
(Read only property)

90.7.11 HasAlphaChannel as Boolean

MBS Picture Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether an alpha channel exists.
Notes: (Read only property)

90.7.12 Height as Integer

MBS Picture Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the image in pixels.
Notes: (Read only property)

90.7.13 Picture as Picture

MBS Picture Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The original picture reference.
Notes: (Read only property)

90.7.14 RedOffset as Integer

MBS Picture Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The platform dependent offset of the red channel in the RGB data.
Notes: A value between 0 and 3.
(Read only property)

90.7.15 RowBytes as Integer

MBS Picture Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of an image row in bytes.
Notes: RowBytes can be width*bytesPerPixel, but often it is not.
(Read only property)

90.7.16 Width as Integer

MBS Picture Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the image in pixels.
Notes: (Read only property)

90.8 class PictureLut3DMBS

90.8.1 class PictureLut3DMBS

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for doing a LUT 3D on a picture.

90.8.2 Methods

90.8.3 close

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

90.8.4 Run as boolean

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the picture effect.
Notes: Fails if the pictures are not bitmap pictures. Source and Destination can be equal. If you provide a destination picture, the dimenstions of source and destination must be equal.

90.8.5 Properties

90.8.6 DestinationPicture as Picture

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destination picture.
Notes: If you set this property, use a bitmap picture equal in size to the source picture.
If this property is nil, the Run method will create a picture.
(Read and Write property)

90.8.7 MaxX as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximal x coordinate to use.
Notes: If 0 the width of the source picture defines this value.
(Read and Write property)

90.8.8 MaxY as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximal y coordinate to use.
Notes: If 0 the height of the source picture defines this value.
(Read and Write property)

90.8.9 MinX as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minimal x coordinate to use.
Notes: Default is 0.
(Read and Write property)

90.8.10 MinY as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minimal y coordinate to use.
Notes: Default is 0.
(Read and Write property)

90.8.11 SourcePicture as Picture

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The source picture.
Notes: Must be a bitmap picture.
(you can use the picture.BitmapMBS function for this)
(Read and Write property)

90.8.12 Table(r as UInt32, g as UInt32, b as UInt32, x as UInt32) as Double

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The lut table.
Notes: Indexes r, g and b go from 0 to 16 while x goes from 0 to 2.
(Read and Write computed property)

90.9 class PictureMatrix3DMBS

90.9.1 class PictureMatrix3DMBS

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for doing a 3D picture matrix.

90.9.2 Methods

90.9.3 close

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

90.9.4 Run as boolean

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the picture effect.
Notes: Fails if the pictures are not bitmap pictures. Source and Destination can be equal. If you provide a destination picture, the dimenstions of source and destination must be equal.

90.9.5 Properties

90.9.6 DestinationPicture as Picture

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destination picture.
Notes: If you set this property, use a bitmap picture equal in size to the source picture.
If this property is nil, the Run method will create a picture.
(Read and Write property)

90.9.7 MaxX as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximal x coordinate to use.
Notes: If 0 the width of the source picture defines this value.
(Read and Write property)

90.9.8 MaxY as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximal y coordinate to use.
Notes: If 0 the height of the source picture defines this value.
(Read and Write property)

90.9.9 MinX as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minimal x coordinate to use.
Notes: Default is 0.
(Read and Write property)

90.9.10 MinY as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minimal y coordinate to use.
Notes: Default is 0.
(Read and Write property)

90.9.11 SourcePicture as Picture

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The source picture.
Notes: Must be a bitmap picture.
(you can use the picture.BitmapMBS function for this)
(Read and Write property)

90.9.12 Matrix(x as UInt32, y as UInt32) as Double

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The matrix to use.
Notes: The indexes x and y are 0 based.
(Read and Write computed property)

90.10 class PictureMatrixMBS

90.10.1 class PictureMatrixMBS

MBS Picture Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for matrix operations on a picture.
Example:

```
// sharpen a picture with a 3x3 convolution matrix
Var m As New PictureMatrixMBS
m.SourcePicture = Picture.Open(SpecialFolder.Desktop.Child("photo.jpg"))
m.DestinationPicture = New Picture(m.SourcePicture.Width, m.SourcePicture.Height, 32)

// 0 -1 0
// -1 5 -1
// 0 -1 0
m.Matrix(1, 0) = -1
m.Matrix(0, 1) = -1
m.Matrix(1, 1) = 5
m.Matrix(2, 1) = -1
m.Matrix(1, 2) = -1
m.ScaleFactor = 1

If m.Run Then
Var sharp As Picture = m.DestinationPicture
End If
```

Notes: Can be used e.g. to sharpen a picture.
Blog Entries

- Better OutOfBoundsException

90.10.2 Methods

90.10.3 close

MBS Picture Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

90.10.4 Run as boolean

MBS Picture Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the process.
Notes: Returns true on success.

90.10.5 RunRGB(red as boolean, green as boolean, blue as boolean) as boolean

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the process for the given channels.
Notes: Returns true on success.
A few combinations are optimized for faster processing.
Still more optimization is possible.

90.10.6 Properties

90.10.7 DestinationPicture as Picture

MBS Picture Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destination picture.
Notes: If this property is nil, a new picture will be placed here inside the Run method.
If you place a picture here, please use one created with New Picture with a 32bit depth.
(Read and Write property)

90.10.8 Displacement as Integer

MBS Picture Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The displacement value.
Notes: See the example project for details.
(Read and Write property)

90.10.9 MaxX as Integer

MBS Picture Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum x coordinate to use.
Notes: Just for limiting the working area to a part of the picture.

(Read and Write property)

90.10.10 MaxY as Integer

MBS Picture Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum y coordinate to use.
Notes: Just for limiting the working area to a part of the picture.
(Read and Write property)

90.10.11 MinX as Integer

MBS Picture Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minimum x coordinate to use.
Notes: Just for limiting the working area to a part of the picture.
(Read and Write property)

90.10.12 MinY as Integer

MBS Picture Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minimum y coordinate to use.
Notes: Just for limiting the working area to a part of the picture.
(Read and Write property)

90.10.13 ScaleFactor as Double

MBS Picture Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A scaling factor.
Notes: See the example project for details.
(Read and Write property)

90.10.14 SourcePicture as Picture

MBS Picture Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The source picture.
Notes: The run method will fail if this picture is not a 32bit deep picture created with New Picture.

(Read and Write property)

90.10.15 Matrix(x as UInt32, y as UInt32) as Integer

MBS Picture Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The matrix used.
Notes: X and Y are in range from 0 to 4.
Values >255 are used for empty cells.
(Read and Write computed property)

90.11 class PictureMinMaxMBS

90.11.1 class PictureMinMaxMBS

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to find the minimum/maximum pixel values.
Example:

```
Var pic as Picture = LogoMBS(500)
Var m as new PictureMinMaxMBS

if m.FindAll(pic) then
break // check values in debugger
end if
```

Notes: This class offers several Find functions.
Please choose carefully which one you use as it's faster to use e.g. FindRed instead of FindMinRed and FindMaxRed together.

90.11.2 Methods

90.11.3 FindAll(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for the minimum and maximum pixels.
Notes: Sets all fields.

90.11.4 FindBlue(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for the minimum and maximum blue pixels.
Notes: Sets BlueMaxX, BlueMax, BlueMinX, BlueMinY, BlueMin and BlueMaxY.

90.11.5 FindGreen(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for the minimum and maximum green pixels.
Notes: Sets GreenMaxX, GreenMax, GreenMinX, GreenMinY, GreenMin and GreenMaxY.

90.11.6 FindMaxAll(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for the maximum pixels.
Notes: Sets RedMaxX, RedMax, RedMaxY, GreenMaxX, GreenMax, GreenMaxY, BlueMaxX, BlueMax and BlueMaxY.

90.11.7 FindMaxBlue(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for the maximum blue pixel.
Notes: Sets BlueMaxX, BlueMax and BlueMaxY.

90.11.8 FindMaxGreen(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for the maximum green pixel.
Notes: Sets GreenMaxX, GreenMax and GreenMaxY.

90.11.9 FindMaxRed(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for the maximum red pixel.
Notes: Sets RedMaxX, RedMax and RedMaxY.

90.11.10 FindMaxSum(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for the maximum sum pixel.
Notes: The sum of a pixel is the sum of all color channels of this pixel (red+Sum+blue).
Sets SumMaxX, SumMax and SumMaxY.

90.11.11 FindMinAll(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for the minimum pixels.
Notes: Sets RedMinX, RedMin, RedMinY, GreenMinX, GreenMin, GreenMinY, BlueMinX, BlueMin and BlueMinY.

90.11.12 FindMinBlue(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for the minimum blue pixel.
Notes: Sets BlueMinX, BlueMin and BlueMinY.

90.11.13 FindMinGreen(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for the minimum green pixel.
Notes: Sets GreenMinX, GreenMin and GreenMinY.

90.11.14 FindMinRed(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for the minimum red pixel.
Notes: Sets RedMinX, RedMin and RedMinY.

90.11.15 FindMinSum(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for the minimum sum pixel.
Notes: The sum of a pixel is the sum of all color channels of this pixel (red+green+blue).
Sets SumMinX, SumMin and SumMinY.

90.11.16 FindRed(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for the minimum and maximum red pixels.
Notes: Sets RedMaxX, RedMax, RedMinX, RedMinY, RedMin and RedMaxY.

90.11.17 FindSum(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for the minimum and maximum sum pixels.
Notes: The sum of a pixel is the sum of all color channels of this pixel (red+Sum+blue).
Sets SumMaxX, SumMax, SumMinX, SumMinY, SumMin and SumMaxY.

90.11.18 Properties

90.11.19 BlueMax as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum blue color value.
Notes: Range: 0 to 255.
(Read and Write property)

90.11.20 BlueMaxX as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the maximum blue value.
Notes: Range: 0 to Picture.Width-1. Set to -1 on any error.
(Read and Write property)

90.11.21 BlueMaxY as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the maximum blue value.
Notes: Range: 0 to Picture.Height-1. Set to -1 on any error.
(Read and Write property)

90.11.22 BlueMin as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minimum blue color value.
Notes: Range: 0 to 255.
(Read and Write property)

90.11.23 BlueMinX as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the minimum blue value.
Notes: Range: 0 to Picture.Width-1. Set to -1 on any error.
(Read and Write property)

90.11.24 BlueMinY as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the minimum blue value.
Notes: Range: 0 to Picture.Height-1. Set to -1 on any error.
(Read and Write property)

90.11.25 GreenMax as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum green color value.
Notes: Range: 0 to 255
(Read and Write property)

90.11.26 GreenMaxX as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the maximum green value.
Notes: Range: 0 to Picture.Width-1. Set to -1 on any error.
(Read and Write property)

90.11.27 GreenMaxY as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the maximum green value.
Notes: Range: 0 to Picture.Height-1. Set to -1 on any error.
(Read and Write property)

90.11.28 GreenMin as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minimum green color value.
Notes: Range: 0 to 255
(Read and Write property)

90.11.29 GreenMinX as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the minimum green value.
Notes: Range: 0 to Picture.Width-1. Set to -1 on any error.
(Read and Write property)

90.11.30 GreenMinY as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the minimum green value.
Notes: Range: 0 to Picture.Height-1. Set to -1 on any error.
(Read and Write property)

90.11.31 RedMax as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum red color value.
Notes: Range: 0 to 255
(Read and Write property)

90.11.32 RedMaxX as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the maximum red value.
Notes: Range: 0 to Picture.Width-1. Set to -1 on any error.
(Read and Write property)

90.11.33 RedMaxY as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the maximum red value.
Notes: Range: 0 to Picture.Height-1. Set to -1 on any error.
(Read and Write property)

90.11.34 RedMin as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minimum red color value.
Notes: Range: 0 to 255
(Read and Write property)

90.11.35 RedMinX as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the minimum red value.
Notes: Range: 0 to Picture.Width-1. Set to -1 on any error.
(Read and Write property)

90.11.36 RedMinY as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the minimum red value.
Notes: Range: 0 to Picture.Height-1. Set to -1 on any error.
(Read and Write property)

90.11.37 SumMax as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum sum color value.
Notes: sum=red+blue+green
Range: 0 to 765
(Read and Write property)

90.11.38 SumMaxX as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the maximum sum value.
Notes: Range: 0 to Picture.Width-1. Set to -1 on any error.
(Read and Write property)

90.11.39 SumMaxY as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the maximum sum value.
Notes: Range: 0 to Picture.Height-1. Set to -1 on any error.
(Read and Write property)

90.11.40 SumMin as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minimum sum color value.
Notes: sum=red+blue+green
Range: 0 to 765
(Read and Write property)

90.11.41 SumMinX as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the minimum sum value.
Notes: Range: 0 to Picture.Width-1. Set to -1 on any error.
(Read and Write property)

90.11.42 SumMinY as Integer

MBS Picture Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the pixel with the minimum sum value.
Notes: Range: 0 to Picture.Height-1. Set to -1 on any error.
(Read and Write property)

90.12 class PictureReaderMBS

90.12.1 class PictureReaderMBS

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to read picture data as a memoryblock.
Example:

```
Var pic as Picture = LogoMBS(500)
Var p as PictureReaderMBS
Var m as MemoryBlock
Var r,g,b,rRow,gRow,bRow,h1,w1,x,y,bpp as Integer

// Create a new picture reader
p=NewPictureReaderMBS(pic)

h1=p.Height-1
w1=p.Width-1

bpp=p.BytesPerPixel
rRow=p.RedOffset
gRow=p.GreenOffset
bRow=p.BlueOffset
// in each row the red, blue and green channels have different offsets.
// but offsets are platform dependent

Var sum as Double

for y=0 to h1
// Get data in memory. This Memoryblock has a size property of 0!
m=p.Data(y)
r=rRow
g=gRow
b=bRow

for x=0 to w1

sum = sum + m.UInt8Value(r)
sum = sum + m.UInt8Value(g)
sum = sum + m.UInt8Value(b)

r=r+bpp
g=g+bpp
b=b+bpp
next

next
```

```
// show the sum of all pixels:
MessageBox "Sum with plugin is: "+str(sum)

// now try same in RB code:

Var surface as RGBSurface = pic.RGBSurface
Var c as color

sum = 0.0

for y=0 to h1
for x=0 to w1
c = surface.Pixel(x,y)

sum = sum + c.red
sum = sum + c.Green
sum = sum + c.Blue

next

next

surface = nil

MessageBox "Sum with RB Code is: "+str(sum)
quit
```

Notes: This is the same code the plugin uses to read pictures.

90.12.2 Methods

90.12.3 Data(Row as Integer) as MemoryBlock

MBS Picture Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The memoryblock with the original image data for this row.
Notes: Changes here will be visible in the picture. (except for platforms where a copy is made of the data)
This memoryblock has a size property with value 0!
No bound checking can be done by Xojo on this memoryblock.
See also:

- 90.12.7 Data as Memoryblock 14700

90.12.4 Properties

90.12.5 BlueOffset as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The platform dependent offset of the blue channel in the RGB data.
Notes: A value between 0 and 3.
(Read only property)

90.12.6 BytesPerPixel as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of bytes per pixel.
Notes: Most times 4, but for some platforms 3.
(Read only property)

90.12.7 Data as Memoryblock

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The memoryblock with the original image data.
Notes: Changes here will be visible in the picture. (except for platforms where a copy is made of the data)
This memoryblock has a size property with value 0!
No bound checking can be done by Xojo on this memoryblock.
Returns nil for console pictures.
(Read only property)
See also:

• 90.12.3 Data(Row as Integer) as MemoryBlock 14700

90.12.8 DataCopy as Memoryblock

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the data for the current picture into a new memoryblock.
Notes: (Read only property)

90.12.9 DataPtr as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The memory address where the data is stored.
Notes: Maybe useful for declares.
Returns nil for console pictures.
(Read only property)

90.12.10 GreenOffset as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The platform dependent offset of the green channel in the RGB data.
Notes: A value between 0 and 3.
(Read only property)

90.12.11 HasAlphaChannel as Boolean

MBS Picture Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether an alpha channel exists.
Notes: (Read only property)

90.12.12 Height as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the image in pixels.
Notes: (Read only property)

90.12.13 Picture as Picture

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The original picture reference.
Notes: (Read only property)

90.12.14 RedOffset as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The platform dependent offset of the red channel in the RGB data.
Notes: A value between 0 and 3.
(Read only property)

90.12.15 RowBytes as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of an image row in bytes.
Notes: RowBytes can be width*bytesPerPixel, but often it is not.
(Read only property)

90.12.16 Width as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the image in pixels.
Notes: (Read only property)

90.13 class PictureSepiaMBS

90.13.1 class PictureSepiaMBS

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for doing a sepia effect.
Example:

```
// give a photo an old fashioned sepia look
Var sepia As New PictureSepiaMBS
sepia.SourcePicture = Picture.Open(SpecialFolder.Desktop.Child("photo.jpg"))
sepia.DestinationPicture = New Picture(sepia.SourcePicture.Width, sepia.SourcePicture.Height, 32)
If sepia.Run Then
Var result As Picture = sepia.DestinationPicture
// show result in a Canvas or save it
End If
```

90.13.2 Methods

90.13.3 close

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

90.13.4 Run as boolean

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the picture effect.
Notes: Fails if the pictures are not bitmap pictures. Source and Destination can be equal. If you provide a destination picture, the dimenstions of source and destination must be equal.

For each pixel this method does:

```
sourcepixel=sourcepicture.pixel(x,y)
r=sourcepixel.red
g=sourcepixel.green
b=sourcepixel.blue
```

sum = r * RedFactor + g * GreenFactor + b * BlueFactor

r = sum + SepiaColor.red
g = sum + SepiaColor.green
b = sum + SepiaColor.blue

destinationpicture.pixel(x,y) = rgb(r,g,b)

90.13.5 Properties

90.13.6 DestinationPicture as Picture

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destination picture.
Notes: If you set this property, use a bitmap picture equal in size to the source picture.
If this property is nil, the Run method will create a picture.
(Read and Write property)

90.13.7 FactorBlue as Double

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blue factor.
Notes: (Read and Write property)

90.13.8 FactorGreen as Double

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green factor.
Notes: (Read and Write property)

90.13.9 FactorRed as Double

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The red factor.
Notes: (Read and Write property)

90.13.10 MaxX as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximal x coordinate to use.
Notes: If 0 the width of the source picture defines this value.
(Read and Write property)

90.13.11 MaxY as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximal y coordinate to use.
Notes: If 0 the height of the source picture defines this value.
(Read and Write property)

90.13.12 MinX as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minimal x coordinate to use.
Notes: Default is 0.
(Read and Write property)

90.13.13 MinY as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minimal y coordinate to use.
Notes: Default is 0.
(Read and Write property)

90.13.14 SepiaBlue as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sepia color to use.
Notes: Default is 0.
(Read and Write property)

90.13.15 SepiaGreen as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sepia color to use.
Notes: Default is 0.
(Read and Write property)

90.13.16 SepiaRed as Integer

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sepia color to use.
Notes: Default is 0.
(Read and Write property)

90.13.17 SourcePicture as Picture

MBS Picture Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The source picture.
Notes: Must be a bitmap picture.
(you can use the picture.BitmapMBS function for this)
(Read and Write property)

90.14 class PictureWriterMBS

90.14.1 class PictureWriterMBS

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to build a picture by filling a memoryblock.
Example:

```
Var p as PictureWriterMBS
Var m as MemoryBlock
Var r,g,b,rRow,gRow,bRow,h1,w1,x,y,bpp as Integer

// Create a new picture writer
p=NewPictureWriterMBS(512,512)

h1=p.Height-1
w1=p.Width-1

bpp=p.BytesPerPixel
rRow=p.RedOffset
gRow=p.GreenOffset
bRow=p.BlueOffset
// in each row the red, blue and green channels have different offsets.
// but offsets are platform dependent

for y=0 to h1
// Get data in memory. This Memoryblock has a size property of 0!
m=p.Data(y)
r=rRow
g=gRow
b=bRow

for x=0 to w1

m.UInt8Value(r)=x\2
m.UInt8Value(g)=y\2
m.UInt8Value(b)=x*y\2

r=r+bpp
g=g+bpp
b=b+bpp
next

next

// Use Render to make a picture object
Var pic as Picture = p.Render
```

Backdrop = pic

Notes: This is the same code the plugin uses to create pictures.

90.14.2 Methods

90.14.3 Data(Row as Integer) as MemoryBlock

MBS Picture Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The memoryblock with the original image data for the given row.
Notes: Changes here will be visible in the picture.
This memoryblock has a size property with value 0!
No bound checking can be done by Xojo on this memoryblock.
See also:

- 90.14.8 Data as Memoryblock 14709

90.14.4 Render as picture

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates and returns a picture for this writer.
Notes: The writer is destroyed with this call, so do not use it any more.
(one picture can be created with one writer currently)

90.14.5 Properties

90.14.6 BlueOffset as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The platform dependent offset of the blue channel in the RGB data.
Notes: A value between 0 and 3.

(Read only property)

90.14.7 BytesPerPixel as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Number of bytes per pixel.
Notes: Most times 4, but for some platforms 3.
(Read only property)

90.14.8 Data as Memoryblock

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The memoryblock with the original image data.
Notes: Changes here will be visible in the picture.
This memoryblock has a size property with value 0!
No bound checking can be done by Xojo on this memoryblock.
Returns nil for console pictures.
(Read only property)
See also:

- 90.14.3 Data(Row as Integer) as MemoryBlock 14708

90.14.9 DataCopy as Memoryblock

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Copies the data for the current picture into a new memoryblock.
Notes: Changes to this memoryblock will not be visible in the rendered picture.
(Read only property)

90.14.10 DataPtr as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The memory address where the data is stored.
Notes: Maybe useful for declares.
Returns nil for console pictures.
(Read only property)

90.14.11 GreenOffset as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The platform dependent offset of the green channel in the RGB data.
Notes: A value between 0 and 3.
(Read only property)

90.14.12 HasAlphaChannel as Boolean

MBS Picture Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether an alpha channel exists.
Example:

```
Var p as PictureWriterMBS = NewPictureWriterMBS(200, 200, true)

MessageBox "Alpha: "+str(p.HasAlphaChannel)

// get pointer to bytes
Var m as MemoryBlock = p.Data

// fill all with 127
m.FillBytesMBS 0, p.RowBytes * p.Height, 127

Var x as Picture = p.Render
Break
```

Notes: (Read only property)

90.14.13 Height as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The height of the image in pixels.
Notes: (Read only property)

90.14.14 Picture as Picture

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The buffer picture reference.
Notes: If the writer uses a RB picture as buffer it is available here.

(depends on the actual implementation for a given platform whether this property is used)
(Read only property)

90.14.15 RedOffset as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The platform dependent offset of the red channel in the RGB data.
Notes: A value between 0 and 3.
(Read only property)

90.14.16 RowBytes as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The width of an image row in bytes.
Notes: RowBytes can be width*bytesPerPixel, but often it is not.
(Read only property)

90.14.17 Width as Integer

MBS Picture Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The width of the image in pixels.
Notes: (Read only property)

Chapter 91

GraphicsMagick

91.1 class GM16BlobMBS

91.1.1 class GM16BlobMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for binary large objects.
Example:

```
// get some image data (e.g. from blob in database)
Var logo as Picture = LogoMBS(500)
Var jpegData as string = PictureToJPEGStringMBS(logo, 80)

// new image
Var mp as new GM16ImageMBS
Var blob as new GM16BlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
'mp.type = mp.TrueColorMatteType
Backdrop=mp.CombinePictureWithMask
```

Notes: Blob provides the means to contain any opaque data. It is named after the term "Binary Large OBject" commonly used to describe unstructured data (such as encoded images) which is stored in a database. While the function of Blob is very simple (store a pointer and and size associated with allocated data), the Blob class provides some very useful capabilities. In particular, it is fully reference counted just like the Image class.

The Blob class supports value assignment while preserving any outstanding earlier versions of the object. Since assignment is via a pointer internally, Blob is efficient enough to be stored directly in an STL container or any other data structure which requires assignment. In particular, by storing a Blob in an associative container (such as STL's 'map') it is possible to create simple indexed in-memory "database" of Blobs.

Magick++ currently uses Blob to contain encoded images (e.g. JPEG) as well as ICC and IPTC profiles. Since Blob is a general-purpose class, it may be used for other purposes as well.

91.1.2 Methods

91.1.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor creating an empty blob object.
See also:

- 91.1.4 Constructor(data as memoryblock, offset as Integer, size as Integer) 14714
- 91.1.5 Constructor(data as string) 14714
- 91.1.6 Constructor(other as GM16BlobMBS) 14715

91.1.4 Constructor(data as memoryblock, offset as Integer, size as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct object with data, making a copy of the supplied data.
See also:

- 91.1.3 Constructor 14714
- 91.1.5 Constructor(data as string) 14714
- 91.1.6 Constructor(other as GM16BlobMBS) 14715

91.1.5 Constructor(data as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct object with data, making a copy of the supplied data.
Example:

```
// get some image data (e.g. from blob in database)
Var logo as Picture = LogoMBS(500)
```

```
Var jpegData as string = PictureToJPEGStringMBS(logo, 80)

// new image
Var mp as new GM16ImageMBS
Var blob as new GM16BlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
'mp.type = mp.TrueColorMatteType
Backdrop=mp.CombinePictureWithMask
```

See also:

- 91.1.3 Constructor 14714
- 91.1.4 Constructor(data as memoryblock, offset as Integer, size as Integer) 14714
- 91.1.6 Constructor(other as GM16BlobMBS) 14715

91.1.6 Constructor(other as GM16BlobMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copy constructor (reference counted).
See also:

- 91.1.3 Constructor 14714
- 91.1.4 Constructor(data as memoryblock, offset as Integer, size as Integer) 14714
- 91.1.5 Constructor(data as string) 14714

91.1.7 CopyMemory as memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a copy of the data as a memoryblock.
Notes: Returns nil on any error like low memory.

91.1.8 CopyString as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a copy of the data as a string.

91.1.9 Data as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A memoryblock with the data from this blob.
Example:

```
Var b as new GM16BlobMBS("Hello")

Var m as memoryblock = b.Data
MessageBox m.StringValue(0,5) // shows "Hello"
```

Notes: This is a memoryblock referencing the data of the blob. It has no size set. The memoryblock can only be used as long as the blob object exists. if you use it after you destroyed the blob object, you can crash you application.

91.1.10 Update(data as memoryblock, offset as Integer, size as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces the content of this blob with a copy of the bytes in the memoryblock.
See also:

- 91.1.11 Update(data as string) 14716

91.1.11 Update(data as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces the content of this blob with a copy of the bytes in the string.
Notes: Offset is zero based.
See also:

- 91.1.10 Update(data as memoryblock, offset as Integer, size as Integer) 14716

91.1.12 Properties

91.1.13 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal handle of the blob object.
Notes: (Read and Write property)

91.1.14 length as UInt64

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain data length in bytes.
Example:

```
Var b as new GM16BlobMBS("Hello")

MessageBox str(B.length) // shows 5
```

Notes: (Read only property)

91.1.15 base64 as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blob content as a string in Base64 format.
Example:

```
Var b as new GM16BlobMBS("Hello")

MessageBox b.base64 // shows "SGVsbG8="
```

Notes: (Read and Write computed property)

91.2 class GM16CoderInfoMBS

91.2.1 class GM16CoderInfoMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class used to get information about all registered coders.
Example:

```
Var coders(-1) as GM16CoderInfoMBS = GM16CoderInfoMBS.CoderInfoList
Var names(-1) as string

for each coder as GM16CoderInfoMBS in coders
names.Add coder.name
next

MessageBox Join(names,EndOfLine)
```

Notes: The CoderInfo class provides the means to provide information regarding GraphicsMagick support for an image format (designated by a magick string). It may be used to provide support for a specific named format (provided as an argument to the constructor), or as an element of a container when format support is queried using the coderInfoList() templated function.

91.2.2 Methods

91.2.3 CoderInfoList as GM16CoderInfoMBS()

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a list of all coders.
Example:

```
Var coders(-1) as GM16CoderInfoMBS = GM16CoderInfoMBS.CoderInfoList
```

91.2.4 Properties

91.2.5 description as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Format description (e.g. "CompuServe graphics interchange format").
Example:

```
Var coders(-1) as GM16CoderInfoMBS = GM16CoderInfoMBS.CoderInfoList
```

```
Var names(-1) as string

for each coder as GM16CoderInfoMBS in coders
names.Add coder.name+" "+coder.description
next

MessageBox Join(names,EndOfLine)
```

Notes: (Read and Write property)

91.2.6 isMultiFrame as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Format supports multiple frames.
Example:

```
Var coders(-1) as GM16CoderInfoMBS = GM16CoderInfoMBS.CoderInfoList
Var names(-1) as string

for each coder as GM16CoderInfoMBS in coders
names.Add coder.name+" "+str(coder.isMultiFrame)
next

MessageBox Join(names,EndOfLine)
```

Notes: (Read and Write property)

91.2.7 isReadable as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Format is readable.
Example:

```
Var coders(-1) as GM16CoderInfoMBS = GM16CoderInfoMBS.CoderInfoList
Var names(-1) as string

for each coder as GM16CoderInfoMBS in coders
names.Add coder.name+" "+str(coder.isReadable)
next

MessageBox Join(names,EndOfLine)
```

Notes: (Read and Write property)

91.2.8 isWritable as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Format is writeable.
Example:

```
Var coders(-1) as GM16CoderInfoMBS = GM16CoderInfoMBS.CoderInfoList
Var names(-1) as string

for each coder as GM16CoderInfoMBS in coders
names.Add coder.name+" "+str(coder.isWritable)
next

MessageBox Join(names,EndOfLine)
```

Notes: (Read and Write property)

91.2.9 ModuleName as String

MBS GraphicsMagick Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Name of loadable module.
Notes: (Read and Write property)

91.2.10 name as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Format name (e.g. "GIF").
Example:

```
Var coders(-1) as GM16CoderInfoMBS = GM16CoderInfoMBS.CoderInfoList
Var coder as GM16CoderInfoMBS = coders(0) // pick first one

MessageBox coder.name
```

Notes: (Read and Write property)

91.2.11 Note as String

MBS GraphicsMagick Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Usage note for user.
Notes: (Read and Write property)

91.2.12 Version as String

MBS GraphicsMagick Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Support library version.
Notes: (Read and Write property)

91.3 class GM16ColorGrayMBS

91.3.1 class GM16ColorGrayMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color subclass for a grayscale color.
Example:

```
Var g as new GM16ColorGrayMBS(0.5)
MessageBox str(g.shade)
```

Notes: Representation of grayscale RGB color.
Equal parts red, green, and blue specified as a ratio (0 to 1).
Subclass of the GM16ColorMBS class.

91.3.2 Methods

91.3.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with transparent black.
Example:

```
Var c as new GM16ColorGrayMBS
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.3.4 Constructor(other as GM16ColorMBS) 14722
- 91.3.5 Constructor(shade as Double) 14723

91.3.4 Constructor(other as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color copying the existing color.
Example:

```
Var g as new GM16ColorGrayMBS(0.5)
Var o as new GM16ColorGrayMBS(g)
MessageBox str(o.shade)
```

See also:

- 91.3.3 Constructor 14722
- 91.3.5 Constructor(shade as Double) 14723

91.3.5 Constructor(shade as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given value.
Example:

```
Var g as new GM16ColorGrayMBS(1.0)
MessageBox str(g.colorValue)
```

Notes: Range is 0.0 to 1.0.
See also:

- 91.3.3 Constructor 14722
- 91.3.4 Constructor(other as GM16ColorMBS) 14722

91.3.6 Properties

91.3.7 shade as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The gray value for this color.
Example:

```
Var g as new GM16ColorGrayMBS(1.0)
MessageBox str(g.shade)
```

Notes: Range is 0.0 to 1.0
(Read and Write property)

91.4 class GM16ColorHSLMBS

91.4.1 class GM16ColorHSLMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a HSL color.
Example:

```
Var g as new GM16ColorHSLMBS(0.1,0.2,0.3)
MessageBox str(g.colorValue)
```

Notes: Subclass of the GM16ColorMBS class.

91.4.2 Methods

91.4.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with transparent black.
Example:

```
Var c as new GM16ColorHSLMBS
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.4.4 Constructor(hue as Double, saturation as Double, luminosity as Double) 14724
- 91.4.5 Constructor(other as GM16ColorMBS) 14725

91.4.4 Constructor(hue as Double, saturation as Double, luminosity as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

```
Var g as new GM16ColorHSLMBS(0.1,0.2,0.3)
MessageBox str(g.hue)+" "+str(g.saturation)+" "+str(g.luminosity)
```

See also:

- 91.4.3 Constructor 14724

• 91.4.5 Constructor(other as GM16ColorMBS) 14725

91.4.5 Constructor(other as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color copying the existing color.
Example:

```
Var g as new GM16ColorHSLMBS(0.1,0.2,0.3)
Var o as new GM16ColorHSLMBS(g)

MessageBox str(o.colorValue)
```

See also:

• 91.4.3 Constructor 14724

• 91.4.4 Constructor(hue as Double, saturation as Double, luminosity as Double) 14724

91.4.6 Properties

91.4.7 hue as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The hue value.
Example:

```
Var g as new GM16ColorHSLMBS(0.1,0.2,0.3)
MessageBox str(g.hue)
```

Notes: (Read and Write property)

91.4.8 luminosity as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The luminosity value.
Example:

```
Var g as new GM16ColorHSLMBS(0.1,0.2,0.3)
MessageBox str(g.luminosity)
```

Notes: (Read and Write property)

91.4.9 saturation as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The saturation value.
Example:

```
Var g as new GM16ColorHSLMBS(0.1,0.2,0.3)
MessageBox str(g.saturation)
```

Notes: (Read and Write property)

91.5 class GM16ColorMBS

91.5.1 class GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Color is the base color class.
Example:

```
Var c as new GM16ColorMBS(127,255,127) // light green
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

Notes: It is a simple container class for the pixel red, green, blue, and alpha values scaled to fit GraphicsMagick's Quantum size. Normally users will instantiate a class derived from Color which supports the color model that fits the needs of the application. The Color class may be constructed directly from an X11-style color string. As a perhaps odd design decision, the value transparent black is considered to represent an unset value (invalid color) in many cases. This choice was made since it avoided using more memory. The default Color constructor constructs an invalid color (i.e. transparent black) and may be used as a parameter in order to remove a color setting.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.0pr7

91.5.2 Methods

91.5.3 Black as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a black color.
Example:

```
Var black as GM16ColorMBS = GM16ColorMBS.Black

MessageBox str(black.colorValue)
```

91.5.4 Color(ColorValue as Color) as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts color from Xojo to GM16ColorMBS.
Example:

```
Var c as GM16ColorMBS = GM16ColorMBS.Color(&cFF0000)
```

MessageBox str(c.colorValue)

See also:

- 91.5.5 Color(ColorValue as Color, alpha as Integer) as GM16ColorMBS 14728
- 91.5.6 Color(red as integer, green as integer, blue as integer) as GM16ColorMBS 14728
- 91.5.7 Color(red as integer, green as integer, blue as integer, alpha as Integer) as GM16ColorMBS 14729

91.5.5 Color(ColorValue as Color, alpha as Integer) as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts color from Xojo to GM16ColorMBS with separate alpha value.
Example:

```
Var c as GM16ColorMBS = GM16ColorMBS.Color(&cFF0000, 128)

MessageBox str(c.colorValue)+" "+str(c.alpha)
```

Notes: Alpha in range from 0 to 255.
See also:

- 91.5.4 Color(ColorValue as Color) as GM16ColorMBS 14727
- 91.5.6 Color(red as integer, green as integer, blue as integer) as GM16ColorMBS 14728
- 91.5.7 Color(red as integer, green as integer, blue as integer, alpha as Integer) as GM16ColorMBS 14729

91.5.6 Color(red as integer, green as integer, blue as integer) as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates color with RGB values.
Example:

```
Var c as GM16ColorMBS = GM16ColorMBS.Color(127, 191, 255)

MessageBox str(c.colorValue)
```

Notes: Range in 0 to 255 for 8bit and 0 to 65535 for 16bit class.
See also:

- 91.5.4 Color(ColorValue as Color) as GM16ColorMBS 14727
- 91.5.5 Color(ColorValue as Color, alpha as Integer) as GM16ColorMBS 14728
- 91.5.7 Color(red as integer, green as integer, blue as integer, alpha as Integer) as GM16ColorMBS 14729

91.5.7 Color(red as integer, green as integer, blue as integer, alpha as Integer) as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates color with RGB values.
Example:

```
Var c as GM16ColorMBS = GM16ColorMBS.Color(127, 191, 255, 127)

MessageBox str(c.colorValue)+" "+str(c.alphaQuantum)
```

Notes: Range in 0 to 255 for 8bit and 0 to 65535 for 16bit class.
See also:

- 91.5.4 Color(ColorValue as Color) as GM16ColorMBS 14727
- 91.5.5 Color(ColorValue as Color, alpha as Integer) as GM16ColorMBS 14728
- 91.5.6 Color(red as integer, green as integer, blue as integer) as GM16ColorMBS 14728

91.5.8 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with transparent black.
Example:

```
Var c as new GM16ColorMBS
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.5.9 Constructor(ColorName as string) 14730
- 91.5.10 Constructor(ColorValue as color) 14730
- 91.5.11 Constructor(ColorValue as color, alpha as Integer) 14731
- 91.5.12 Constructor(other as GM16ColorMBS) 14731
- 91.5.13 Constructor(red as Integer, green as Integer, blue as Integer) 14732
- 91.5.14 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer) 14732

91.5.9 Constructor(ColorName as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color based on the X11 color name.
Example:

```
Var c as new GM16ColorMBS("red")

MessageBox str(c.redQuantum)+"-"+str(c.greenQuantum)+"-"+str(c.blueQuantum) // shows "255-0-0"

Var d as new GM16ColorMBS("#77FF00")

MessageBox str(d.redQuantum)+"-"+str(d.greenQuantum)+"-"+str(d.blueQuantum) // shows "119-255-0"
```

Notes: An alternate way to construct the class is via an X11-compatible color specification string (e.g. Color("red") or Color ("#FF0000")). Since the class may be constructed from a string, convenient strings may be passed in place of an explicit Color object in methods which accept a reference to Color. Color may also be converted to a std::string for convenience in user interfaces, and for saving settings to a text file.

- 91.5.12 Constructor(other as GM16ColorMBS) 14731
- 91.5.13 Constructor(red as Integer, green as Integer, blue as Integer) 14732
- 91.5.14 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer) 14732

91.5.10 Constructor(ColorValue as color)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

```
Var c as new GM16ColorMBS(&cFF0000)
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.5.8 Constructor 14729

- 91.5.11 Constructor(ColorValue as color, alpha as Integer) 14731
- 91.5.12 Constructor(other as GM16ColorMBS) 14731
- 91.5.13 Constructor(red as Integer, green as Integer, blue as Integer) 14732
- 91.5.14 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer) 14732

91.5.11 Constructor(ColorValue as color, alpha as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

```
Var c as new GM16ColorMBS(&cFF0102, 127)
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)+" "+str(c.alpha)
```

- 91.5.12 Constructor(other as GM16ColorMBS) 14731
- 91.5.13 Constructor(red as Integer, green as Integer, blue as Integer) 14732
- 91.5.14 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer) 14732

91.5.12 Constructor(other as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color copying the existing color.
Example:

```
Var r as new GM16ColorMBS(1,2,3)
Var c as new GM16ColorMBS(r)
MessageBox str(C.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.5.9 Constructor(ColorName as string) 14730

- 91.5.10 Constructor(ColorValue as color) 14730
- 91.5.11 Constructor(ColorValue as color, alpha as Integer) 14731
- 91.5.13 Constructor(red as Integer, green as Integer, blue as Integer) 14732
- 91.5.14 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer) 14732

91.5.13 Constructor(red as Integer, green as Integer, blue as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

```
Var c as new GM16ColorMBS(1,2,3)
MessageBox str(C.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

Notes: For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
See also:

- 91.5.8 Constructor 14729
- 91.5.9 Constructor(ColorName as string) 14730
- 91.5.10 Constructor(ColorValue as color) 14730
- 91.5.11 Constructor(ColorValue as color, alpha as Integer) 14731
- 91.5.12 Constructor(other as GM16ColorMBS) 14731
- 91.5.14 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer) 14732

91.5.14 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

```
Var c as new GM16ColorMBS(1,2,3,4)

// display color, alpha is double...
MessageBox str(C.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)+" "+str(c.alpha)
```

Notes: For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
See also:

- 91.5.8 Constructor 14729
- 91.5.9 Constructor(ColorName as string) 14730
- 91.5.10 Constructor(ColorValue as color) 14730
- 91.5.11 Constructor(ColorValue as color, alpha as Integer) 14731
- 91.5.12 Constructor(other as GM16ColorMBS) 14731
- 91.5.13 Constructor(red as Integer, green as Integer, blue as Integer) 14732

91.5.15 QuantumByteSize as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The quantum byte size.
Example:

```
MessageBox str(GM16ColorMBS.QuantumByteSize)
```

Notes: As the plugin uses 8 bit this value should be 1.

91.5.16 scaleDoubleToQuantum(value as Double) as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales a double value to a value in the range of a quantum.
Example:

```
Var d as Double = 1.0
Var v as Integer = GM16ColorMBS.scaleDoubleToQuantum(d)
MessageBox str(v)
```

Notes: As the plugin uses 8 bit quantums, this is basicly a multiplication by 255.0

91.5.17 scaleQuantumToDouble(value as Integer) as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales a quantum to a double value.
Example:

```
Var v as Integer = 255
Var d as Double = GM16ColorMBS.scaleQuantumToDouble(v)
```

MessageBox str(d)

Notes: The plugin uses 8bit quantums, so this is basicly the division of value by 255.0

91.5.18 White as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a white color.
Example:

Var White as GM16ColorMBS = GM16ColorMBS.White

MessageBox str(White.colorValue)

91.5.19 Properties

91.5.20 alpha as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The alpha value of this color.
Example:

Var c as new GM16ColorMBS(1,2,3,1.0)
MessageBox str(c.alpha)

Notes: Range is 0.0 to 1.0. If you pass values higher, they are divided by 255.
(Read and Write property)

91.5.21 alphaQuantum as Integer

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The alpha color value.
Notes: For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)

91.5.22 blueQuantum as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blue color value.
Example:

```
Var c as new GM16ColorMBS(1,2,3)
MessageBox str(c.redQuantum) // 3
```

Notes: For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)

91.5.23 colorValue as color

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Xojo color for the GraphicsMagick color.
Example:

```
Var c as new GM16ColorMBS(&cFF0102)
MessageBox str(c.ColorValue)
```

Notes: (Read and Write property)

91.5.24 greenQuantum as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green color value.
Example:

```
Var r as new GM16ColorMBS(1,2,3)
MessageBox str(r.greenQuantum) // shows 2
```

Notes: For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)

91.5.25 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal color reference.
Example:

```
Var r as new GM16ColorMBS(1,2,3)
MessageBox str(r.handle)
```

Notes: (Read and Write property)

91.5.26 intensity as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The intensity of this color.
Example:

```
Var c as new GM16ColorMBS(1,2,3)
MessageBox str(c.intensity)
```

Notes: (Read only property)

91.5.27 isValid as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Does object contain valid color?
Example:

```
Var c as new GM16ColorMBS(1,2,3)
MessageBox str(c.isValid)
```

Notes: (Read and Write property)

91.5.28 redQuantum as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The red color value.
Example:

```
Var c as new GM16ColorMBS(1,2,3)
MessageBox str(c.redQuantum) // 1
```

Notes: For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)

91.6 class GM16ColorMonoMBS

91.6.1 class GM16ColorMonoMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Representation of a black/white color (true/false)
Example:

```
Var g as new GM16ColorMonoMBS(false)
MessageBox str(g.colorValue)
```

Notes: Subclass of the GM16ColorMBS class.

91.6.2 Methods

91.6.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with transparent black.
Example:

```
Var c as new GM16ColorMonoMBS
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.6.4 Constructor(mono as boolean) 14738
- 91.6.5 Constructor(other as GM16ColorMBS) 14739

91.6.4 Constructor(mono as boolean)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

```
Var g as new GM16ColorMonoMBS(false)
MessageBox str(g.mono)
```

See also:

- 91.6.3 Constructor 14738

• 91.6.5 Constructor(other as GM16ColorMBS) 14739

91.6.5 Constructor(other as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color copying the existing color.
Example:

```
Var g as new GM16ColorMonoMBS(false)
Var o as new GM16ColorMonoMBS(g)
MessageBox str(o.mono)
```

• 91.6.3 Constructor 14738

• 91.6.4 Constructor(mono as boolean) 14738

91.6.6 Properties

91.6.7 mono as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color value.
Example:

```
Var g as new GM16ColorMonoMBS(true)
MessageBox str(g.mono)
```

Notes: (Read and Write property)

91.7 class GM16ColorRGBMBS

91.7.1 class GM16ColorRGBMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color class for RGB colors.
Example:

```
Var c as new GM16ColorRGBMBS(1.0,0.0,0.0) // red
MessageBox str(C.red)+" "+str(c.green)+" "+str(c.blue)
MessageBox str(C.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

Notes: Representation of RGB color with red, green, and blue specified as ratios (0 to 1)
Subclass of the GM16ColorMBS class.

91.7.2 Methods

91.7.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with transparent black.
Example:

```
Var c as new GM16ColorRGBMBS
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.7.4 Constructor(other as GM16ColorMBS) 14740
- 91.7.5 Constructor(red as Double, green as Double, blue as Double) 14741

91.7.4 Constructor(other as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color copying the existing color.
Example:

```
Var g as new GM16ColorRGBMBS(1,2,3)
Var o as new GM16ColorRGBMBS(g)
MessageBox str(o.colorValue)
```

See also:

- 91.7.3 Constructor 14740
- 91.7.5 Constructor(red as Double, green as Double, blue as Double) 14741

91.7.5 Constructor(red as Double, green as Double, blue as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

```
Var c as new GM16ColorRGBMBS(0.1,0.2,0.3)
```

Notes: Range is 0.0 to 1.0.
See also:

- 91.7.3 Constructor 14740
- 91.7.4 Constructor(other as GM16ColorMBS) 14740

91.7.6 Properties

91.7.7 blue as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blue color component.
Example:

```
Var c as new GM16ColorRGBMBS(0.0,0.0,1.0)
MessageBox str(c.blue)
```

Notes: Range is 0.0 to 1.0.
(Read and Write property)

91.7.8 green as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green color component.
Example:

```
Var c as new GM16ColorRGBMBS(0.0,1.0,0.0)
MessageBox str(c.green)
```

Notes: Range is 0.0 to 1.0.
(Read and Write property)

91.7.9 red as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The red color component.
Example:

```
Var c as new GM16ColorRGBMBS(1.0,0.0,0.0) // red
MessageBox str(C.red)
```

Notes: Range is 0.0 to 1.0.
(Read and Write property)

91.8 class GM16ColorYUVMBS

91.8.1 class GM16ColorYUVMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Representation of a color in the YUV colorspace
Example:

```
Var g as new GM16ColorYUVMBS(0.1, 0.2, 0.3)
MessageBox str(g.y)+" "+str(g.u)+" "+str(g.v)
```

Notes: Subclass of the GM16ColorMBS class.

91.8.2 Methods

91.8.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with transparent black.
Example:

```
Var c as new GM16ColorYUVMBS
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.8.4 Constructor(other as GM16ColorMBS) 14743
- 91.8.5 Constructor(y as Double, u as Double, v as Double) 14744

91.8.4 Constructor(other as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color copying the existing color.
Example:

```
Var g as new GM16ColorYUVMBS(0.1, 0.2, 0.3)
Var o as new GM16ColorYUVMBS(g)
MessageBox str(o.colorValue)
```

See also:

- 91.8.3 Constructor 14743
- 91.8.5 Constructor(y as Double, u as Double, v as Double) 14744

91.8.5 Constructor(y as Double, u as Double, v as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

```
Var g as new GM16ColorYUVMBS(0.1, 0.2, 0.3)
```

See also:

- 91.8.3 Constructor 14743
- 91.8.4 Constructor(other as GM16ColorMBS) 14743

91.8.6 Properties

91.8.7 u as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The u color component.
Example:

```
Var g as new GM16ColorYUVMBS(0.1, 0.2, 0.3)
MessageBox str(g.u)
```

Notes: Range is -0.5 to +0.5.
(Read and Write property)

91.8.8 v as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The v color component.
Example:

```
Var g as new GM16ColorYUVMBS(0.1, 0.2, 0.3)
MessageBox str(g.v)
```

Notes: Range is -0.5 to +0.5.
(Read and Write property)

91.8.9 y as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y color component.
Example:

```
Var g as new GM16ColorYUVMBS(0.1, 0.2, 0.3)
MessageBox str(g.y)
```

Notes: Range is 0.0 to 1.0.
(Read and Write property)

91.9 class GM16ConvertMBS

91.9.1 class GM16ConvertMBS

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to convert images thread friendly.
Example:

```
// scale a photo to 800 pixels width and save it as JPEG, without blocking other threads
// Call this from a Thread to keep the app responsive.
Var c As New GM16ConvertMBS
c.InputFile = SpecialFolder.Desktop.Child("photo.png")
c.OutputFile = SpecialFolder.Desktop.Child("photo small.jpg")
c.ScaleGeometry = New GM16GeometryMBS(800, 0) // height follows the aspect ratio
c.Quality = 85
c.AutoOrient = True // rotate as the camera recorded it
c.Strip = True // remove metadata
c.Run
```

Notes: This class is intended to process lots of images in several instances in several threads.
If you for example use 8 Xojo threads, to process thousands of images to scale them down for thumbnails, you can easily keep 8 CPU cores busy.

Please make a new instance, set options and call run method. When run is done, please read output properties.
Do not modify properties while thread is running.
Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 19.1
- MBS Xojo Plugins, version 19.1pr2

91.9.2 Methods

91.9.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

91.9.4 Run

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Starts converter.
Notes: The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

91.9.5 Properties

91.9.6 AutoOrient as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to call autoOrient method to change orientation of image data to 0¬∞.
Notes: (Read and Write property)

91.9.7 Enhance as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to run enhance command.
Notes: If true, we call enhance on the image to minimize noise.
(Read and Write property)

91.9.8 Equalize as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to run equalize command.
Notes: If set to true, we call equalize command on image (histogram equalization).
(Read and Write property)

91.9.9 ImageType as Integer

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the image type.
Notes: If value is >0, the image type is change to the given type.
(Read and Write property)

91.9.10 InputData as String

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The input data string.
Notes: If set, we read image from this data.
(Read and Write property)

91.9.11 InputFile as FolderItem

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The input folderitem.
Notes: If set input file to read.
(Read and Write property)

91.9.12 InputGeometry as GM16GeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The input geometry.
Notes: Some formats can be loaded with different scales, so this geometry is passed to read method to define the format requested.
(Read and Write property)

91.9.13 InputImage as GM16ImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The input image.
Notes: (Read and Write property)

91.9.14 InputMagick as String

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The image magick type.
Notes: If empty, the type of file is automatically determined.
(Read and Write property)

91.9.15 InputMemory as MemoryBlock

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The input data memoryblock.
Notes: If set, we read image from this data.
(Read and Write property)

91.9.16 InputPath as String

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The input file path.
Notes: If set input file to read.
(Read and Write property)

91.9.17 OutputData as String

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Output data as string.
Notes: (Read and Write property)

91.9.18 OutputFile as FolderItem

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The folderitem where to write file.
Notes: If set, the image will be written to this file.
(Read and Write property)

91.9.19 OutputImage as GM16ImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Output image object.
Notes: (Read and Write property)

91.9.20 OutputMagick as String

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Output magick.
Notes: You can set this to a magick codec type to define output format, e.g. "jpeg".
(Read and Write property)

91.9.21 OutputMemory as MemoryBlock

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Output data as memory block.
Notes: (Read and Write property)

91.9.22 OutputPath as String

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The native file path for output.
Notes: If set, the image will be written to this path.
(Read and Write property)

91.9.23 Quality as Integer

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Quality of images in range 1 to 100.
Notes: If value is >0, we assign it to the image for setting image quality.
(Read and Write property)

91.9.24 Running as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this converter is running.
Notes: Set to true while Run method runs.
(Read only property)

91.9.25 ScaleGeometry as GM16GeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The geometry for call to scale method.
Notes: scale method is called with this geometry (if set) to reduce image size.
(Read and Write property)

91.9.26 Strip as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to remove all profiles and text attributes from the image.
Notes: (Read and Write property)

91.9.27 ThumbnailGeometry as GM16GeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The geometry for call to thumbnail method.
Notes: thumbnail method is called with this geometry (if set) to reduce image size.
(Read and Write property)

91.9.28 Trim as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether trim command is called on image to remove extra blank space around image.
Notes: (Read and Write property)

91.9.29 WantOutputData as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether you want image compressed and stored in OutputData property.
Notes: (Read and Write property)

91.9.30 WantOutputMemory as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether you want image compressed and stored in OutputMemory property.
Notes: (Read and Write property)

91.10 class GM16CoordinateMBS

91.10.1 class GM16CoordinateMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Graphics Magick class for a coordinate.
Example:

```
Var c as new GM16CoordinateMBS(5,6)
MessageBox str(c.x)+" "+str(c.y)
```

91.10.2 Methods

91.10.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create a new coordinate.
See also:

- 91.10.4 Constructor(x as Double, y as Double) 14753

91.10.4 Constructor(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create a new coordinate.
Example:

```
Var c as new GM16CoordinateMBS(5,6)
MessageBox str(c.x)+" "+str(c.y)
```

See also:

- 91.10.3 Constructor 14753

91.10.5 Properties

91.10.6 x as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x value.
Example:

```
Var c as new GM16CoordinateMBS
c.x = 5
MessageBox str(c.x)
```

Notes: (Read and Write property)

91.10.7 y as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y value.
Example:

```
Var c as new GM16CoordinateMBS
c.y = 5
MessageBox str(c.y)
```

Notes: (Read and Write property)

91.11 class GM16ErrorExceptionMBS

91.11.1 class GM16ErrorExceptionMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception to report errors in the GraphicMagick plugin.
Notes: Check the message property for details.
Subclass of the RuntimeException class.

91.12 class GM16GeometryMBS

91.12.1 class GM16GeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Geometry provides a convenient means to specify a geometry argument.
Example:

```
Var g as new GM16GeometryMBS(300,400)
MessageBox str(G.width)+" "+str(G.height)
```

Notes: The object may be initialized from a string containing a geometry specification. It may also be initialized by more efficient parameterized constructors.
Xojo Developer Magazine

- 20.2, page 83: Wifi QR Code, Embedding your Wifi password in a QR code by Stefanie Juchmes

91.12.2 Methods

91.12.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates empty geometry.
Example:

```
Var g as new GM16GeometryMBS
MessageBox str(G.width)+" "+str(G.height)
```

See also:

- 91.12.4 Constructor(geometry as string) 14756
- 91.12.5 Constructor(other as GM16GeometryMBS) 14757
- 91.12.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false) 14757

91.12.4 Constructor(geometry as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct geometry from string.
Example:

```
Var g as new GM16GeometryMBS("600x600")

MessageBox str(G.width)+" "+str(G.height)
```

Notes: See the GraphicsMagick website for details.
http://www.graphicsmagick.org/Magick++/Geometry.html
See also:

- 91.12.3 Constructor 14756
- 91.12.5 Constructor(other as GM16GeometryMBS) 14757
- 91.12.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false) 14757

91.12.5 Constructor(other as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new geometry object by copying an existing one.
Example:

```
Var g as new GM16GeometryMBS(600,600)
Var h as new GM16GeometryMBS(g)
MessageBox str(h.width)
```

See also:

- 91.12.3 Constructor 14756
- 91.12.4 Constructor(geometry as string) 14756
- 91.12.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false) 14757

91.12.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates geometry with the given values.
Example:

```
Var g as new GM16GeometryMBS(600,600)
MessageBox str(g.width)
```

See also:

- 91.12.3 Constructor 14756
- 91.12.4 Constructor(geometry as string) 14756
- 91.12.5 Constructor(other as GM16GeometryMBS) 14757

91.12.7 Make(geometry as string) as GM16GeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct geometry from string.
Example:

```
Var g as GM16GeometryMBS = GM16GeometryMBS.Make("600x600")

MessageBox str(G.width)+" "+str(G.height)
```

Notes: See the GraphicsMagick website for more details:
http://www.graphicsmagick.org/Magick++/Geometry.html
See also:

- 91.12.8 Make(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false) as GM16GeometryMBS 14758

91.12.8 Make(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false) as GM16GeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates geometry with the given values.
Example:

```
Var g as GM16GeometryMBS = GM16GeometryMBS.Make(600,600)
MessageBox str(g.width)
```

See also:

- 91.12.7 Make(geometry as string) as GM16GeometryMBS 14758

91.12.9 Properties

91.12.10 aspect as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize without preserving aspect ratio (!).
Example:

```
Var g as new GM16GeometryMBS(600,600)
MessageBox str(g.aspect)
```

Notes: (Read and Write property)

91.12.11 fillArea as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image to fit total pixel area specified by dimensions.
Notes: Same as @ in the geometry specification.
(Read and Write property)

91.12.12 greater as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize if image is greater than size (>).
Example:

```
Var g as new GM16GeometryMBS(600,600)
MessageBox str(g.greater)
```

Notes: (Read and Write property)

91.12.13 height as Uint32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height value.
Example:

```
Var g as new GM16GeometryMBS(600,600)
MessageBox str(g.height)
```

Notes: (Read and Write property)

91.12.14 isValid as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Does object contain a valid geometry?
Example:

```
Var g as new GM16GeometryMBS(100,200)
MessageBox str(G.isValid)
```

Notes: May be set to false in order to invalidate an existing geometry object.
(Read and Write property)

91.12.15 less as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize if image is less than size (<).
Example:

```
Var g as new GM16GeometryMBS(600,600)
MessageBox str(g.less)
```

Notes: (Read and Write property)

91.12.16 limitPixels as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Dimensions are treated as minimum rather than maximum values.
Notes: Same as ^in the geometry specification.
(Read and Write property)

91.12.17 percent as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Width and height are expressed as percentages.
Example:

```
Var g as new GM16GeometryMBS(600,600)
MessageBox str(g.percent)
```

Notes: (Read and Write property)

91.12.18 StringValue as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The string representation of the geometry object.
Example:

```
Var g as new GM16GeometryMBS(600,600)
MessageBox str(g.StringValue)
```

Notes: (Read and Write property)

91.12.19 width as Uint32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width value.
Example:

```
Var g as new GM16GeometryMBS(600,600)
MessageBox str(g.width)
```

Notes: (Read and Write property)

91.12.20 xNegative as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sign of X offset negative? (X origin at right)
Example:

```
Var g as new GM16GeometryMBS(100,200,30,40,true,false)
MessageBox str(G.xNegative)
```

Notes: (Read and Write property)

91.12.21 xOff as Uint32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: X offset from origin.
Example:

```
Var g as new GM16GeometryMBS(100,200,30,40,true,true)
MessageBox str(G.xOff)+" "+str(G.yOff)
```

Notes: (Read and Write property)

91.12.22 yNegative as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sign of Y offset negative? (Y origin at bottom)
Example:

```
Var g as new GM16GeometryMBS(100,200,30,40,false,true)
MessageBox str(G.yNegative)
```

Notes: (Read and Write property)

91.12.23 yOff as Uint32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Y offset from origin
Example:

```
Var g as new GM16GeometryMBS(100,200,30,40,true,true)
MessageBox str(G.xOff)+" "+str(G.yOff)
```

Notes: (Read and Write property)

91.13 class GM16GraphicsMBS

91.13.1 class GM16GraphicsMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for drawing commands targeting a GM16ImageMBS.
Notes: Please remember that all commands are collected till you call the Draw method.

91.13.2 Methods

91.13.3 Arc(startX as Double, startY as Double, endX as Double, endY as Double, startDegrees as Double, endDegrees as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw an arc using the stroke color and based on the circle starting at coordinates startX,startY, and ending with coordinates endX,endY, and bounded by the rotational arc startDegrees,endDegrees.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.type = image.TrueColorType
image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

draw.arc(250, 250, 100, 100,50,300)
draw.Draw

Backdrop=image.CopyPicture
```

91.13.4 Bezier(values() as GM16CoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a bezier curve using the stroke color and based on the coordinates specified by the coordinates array.

91.13.5 Circle(originX as Double, originY as Double, perimX as Double, perimY as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a circle using the stroke color and thickness using specified origin and perimeter coordinates.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.type = image.TrueColorType
image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)
draw.Draw

Backdrop=image.CopyPicture
```

Notes: If a fill color is specified, then the object is filled.

91.13.6 ClipPath(id as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Select a drawing clip path matching id.

91.13.7 ColorPixel(x as Double, y as Double, paintMethod as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Color image according to paintMethod.
Notes: The point method recolors the target pixel. The replace method recolors any pixel that matches the color of the target pixel. Floodfill recolors any pixel that matches the color of the target pixel and is a neighbor, whereas filltoborder recolors any neighbor pixel that is not the border color. Finally, reset recolors all pixels.

Paint methods:

PointMethod	0	Replace pixel color at point.
ReplaceMethod	1	Replace color for all image pixels matching color at point.
FloodfillMethod	2	Replace color for pixels surrounding point until encountering pixel that fails to match color at point.
FillToBorderMethod	3	Replace color for pixels surrounding point until encountering pixels matching border color.
ResetMethod	4	Replace colors for all pixels in image with pen color.

91.13.8 CompositeImage(x as Double, y as Double, file as folderitem)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composite current image with contents of specified image, at specified coordinates.
Notes: If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through.

- 91.13.10 CompositeImage(x as Double, y as Double, path as string) 14766
- 91.13.11 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem) 14767
- 91.13.12 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem, CompositeOperator as Integer) 14767
- 91.13.13 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GM16ImageMBS) 14768
- 91.13.14 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GM16ImageMBS, CompositeOperator as Integer) 14769
- 91.13.15 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string) 14769
- 91.13.16 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string, CompositeOperator as Integer) 14770

91.13.9 CompositeImage(x as Double, y as Double, image as GM16ImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composite current image with contents of specified image, at specified coordinates.
Notes: If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through.
See also:

- 91.13.10 CompositeImage(x as Double, y as Double, path as string) 14766
- 91.13.11 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem) 14767
- 91.13.12 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem, CompositeOperator as Integer) 14767
- 91.13.13 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GM16ImageMBS) 14768
- 91.13.14 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GM16ImageMBS, CompositeOperator as Integer) 14769
- 91.13.15 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string) 14769
- 91.13.16 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string, CompositeOperator as Integer) 14770

91.13.10 CompositeImage(x as Double, y as Double, path as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composite current image with contents of specified image, at specified coordinates.
Notes: If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through.
See also:

- 91.13.8 CompositeImage(x as Double, y as Double, file as folderitem) 14765
- 91.13.9 CompositeImage(x as Double, y as Double, image as GM16ImageMBS) 14765
- 91.13.11 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem) 14767
- 91.13.12 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem, CompositeOperator as Integer) 14767
- 91.13.13 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GM16ImageMBS) 14768
- 91.13.14 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GM16ImageMBS, CompositeOperator as Integer) 14769

- 91.13.16 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string, CompositeOperator as Integer) 14770

91.13.11 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composite current image with contents of specified image, rendered with specified width and height, at specified coordinates.
Notes: If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through. If the specified width or height is zero, then the image is composited at its natural size, without enlargement or reduction.
See also:

91.13.12 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem, CompositeOperator as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composite current image with contents of specified image, rendered with specified width and height, using specified composition algorithm, at specified coordinates.
Notes: If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through. If the specified width or height is zero, then the image is composited at its natural size, without enlargement or reduction.

91.13.13 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GM16ImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composite current image with contents of specified image, rendered with specified width and height, at specified coordinates.
Notes: If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through. If the specified width or height is zero, then the image is composited at its natural size, without enlargement or reduction.

- 91.13.10 CompositeImage(x as Double, y as Double, path as string) 14766
- 91.13.11 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem) 14767
- 91.13.12 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem, CompositeOperator as Integer) 14767
- 91.13.13 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GM16ImageMBS) 14768
- 91.13.14 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GM16ImageMBS, CompositeOperator as Integer) 14769
- 91.13.15 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string) 14769

91.13.17 Constructor(image as GM16ImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new object referencing the given image.

91.13.18 DashArray(values() as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify the pattern of dashes and gaps used to stroke paths.
Notes: The strokeDashArray represents a zero-terminated array of numbers that specify the lengths of alternating dashes and gaps in pixels. If an odd number of values is provided, then the list of values is repeated to yield an even number of values. A typical strokeDashArray array might contain the members 5 3 2 0, where the zero value indicates the end of the pattern array.

91.13.19 DashOffset(offset as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify the distance into the dash pattern to start the dash.
Notes: See documentation on SVG's stroke-dashoffset property for usage details.

91.13.20 Draw

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws all draw commands collected.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.type = image.TrueColorType
image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

draw.StrokeColor new GM16ColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

91.13.21 DrawPath

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw on image using vector path.
Example:

```
// new picture, 500x500 and filled with white
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

Var draw as GM16GraphicsMBS = image.Graphics

// Draw path

Var cr as new GM16ColorRGBMBS("red")
Var gr as new GM16ColorRGBMBS("green")
draw.StrokeColor cr
draw.FillColor gr
draw.PathMovetoAbs(30,10)
draw.PathLinetoAbs(20,55)
draw.PathLinetoAbs(70,50)
draw.PathLinetoAbs(80,5)
draw.DrawPath

draw.Draw

// show picture
image.type = image.TrueColorType // make sure it's a bitmap
Backdrop=image.CopyPicture
```

91.13.22 Ellipse(originX as Double, originY as Double, perimX as Double, perimY as Double, arcStart as Double, arcEnd as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw an ellipse using the stroke color and thickness, specified origin, x & y radius, as well as specified start and end of arc in degrees.
Notes: If a fill color is specified, then the object is filled.

91.13.23 FillColor(c as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify drawing object fill color.

91.13.24 FillOpacity(opacity as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify opacity to use when drawing using fill color.

91.13.25 FillRule(fillRule as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify the algorithm which is to be used to determine what parts of the canvas are included inside the shape.
Notes: See documentation on SVG's fill-rule property for usage details.

91.13.26 Font(fontname as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify font name to use when drawing text.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

Var draw as GM16GraphicsMBS = image.Graphics

// draw red text
draw.strokeColor(new GM16ColorRGBMBS("red")) // Outline color
draw.strokeWidth(1)
draw.Font("/Library/Fonts/Verdana.ttf")
draw.Text(50, 50, "Hello", "")
draw.Draw

Backdrop=image.CopyPicture
```

See also:

- 91.13.27 Font(fontname as string, StyleType as Integer, weight as Integer, StretchType as Integer) 14774

91.13.27 Font(fontname as string, StyleType as Integer, weight as Integer, StretchType as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the font.
Notes: Specify font family, style, weight (one of the set { 100 | 200 | 300 | 400 | 500 | 600 | 700 | 800 | 900 } with 400 being the normal size), and stretch to be used to select the font used when drawing text. Wildcard matches may be applied to style via the AnyStyle enumeration, applied to weight if weight is zero, and applied to stretch via the AnyStretch enumeration.
See also:

- 91.13.26 Font(fontname as string) 14773

91.13.28 Gravity(GravityType as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify text positioning gravity.

91.13.29 Line(startX as Double, startY as Double, endX as Double, endY as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a line using stroke color and thickness using starting and ending coordinates
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

// Draw a line
draw.Line(100,100,400,400)
draw.Draw

image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

91.13.30 Matte(x as Double, y as Double, paintMethod as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Change the pixel matte value to transparent.
Notes: The point method changes the matte value of the target pixel. The replace method changes the matte value of any pixel that matches the color of the target pixel. Floodfill changes the matte value of any pixel that matches the color of the target pixel and is a neighbor, whereas filltoborder changes the matte value of any neighbor pixel that is not the border color, Finally reset changes the matte value of all pixels.

Paint methods:

PointMethod	0	Replace pixel color at point.
ReplaceMethod	1	Replace color for all image pixels matching color at point.
FloodfillMethod	2	Replace color for pixels surrounding point until encountering pixel that fails to match color at point.
FillToBorderMethod	3	Replace color for pixels surrounding point until encountering pixels matching border color.
ResetMethod	4	Replace colors for all pixels in image with pen color.

91.13.31 MiterLimit(miterlimit as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify miter limit.
Notes: When two line segments meet at a sharp angle and miter joins have been specified for 'lineJoin', it is possible for the miter to extend far beyond the thickness of the line stroking the path. The miterLimit' imposes a limit on the ratio of the miter length to the 'lineWidth'. The default value of this parameter is 4.

91.13.32 PathArcAbs(c as GM16PathArgsMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws an elliptical arc from the current point to (x, y).
Notes: The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

In the GM16PathArgsMBS, set the following properties: radiusX, radiusY, xAxisRotation, bool largeArcFlag, sweepFlag, x and y.

See also:

- 91.13.33 PathArcAbs(c() as GM16PathArgsMBS) 14776
- 91.13.34 PathArcAbs(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 14776

91.13.33 PathArcAbs(c() as GM16PathArgsMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws an elliptical arc from the current point to (x, y).
Notes: The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

In the GM16PathArgsMBS, set the following properties: radiusX, radiusY, xAxisRotation, bool largeArcFlag, sweepFlag, x and y.

- 91.13.32 PathArcAbs(c as GM16PathArgsMBS) 14775
- 91.13.34 PathArcAbs(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 14776

91.13.34 PathArcAbs(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws an elliptical arc from the current point to (x, y).
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics
```

```
// Draw an arc

draw.PathMovetoAbs 100,100
draw.PathArcAbs(100,100, 0, false, false, 200,200)
draw.DrawPath
draw.Draw

Backdrop=image.CopyPicture
```

Notes: The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

- 91.13.36 PathArcRel(c() as GM16PathArgsMBS) 14777

91.13.38 PathClosePath

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Close the current subpath by drawing a straight line from the current point to current subpath's most recent starting point (usually, the most recent moveto point).

91.13.39 PathCurvetoAbs(c as GM16PathArgsMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
Notes: PathCurvetoAbs indicates that absolutecoordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.
See also:

- 91.13.40 PathCurvetoAbs(c() as GM16PathArgsMBS) 14779
- 91.13.41 PathCurvetoAbs(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 14779

91.13.40 PathCurvetoAbs(c() as GM16PathArgsMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
Notes: PathCurvetoAbs indicates that absolutecoordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.
See also:

- 91.13.41 PathCurvetoAbs(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 14779

91.13.41 PathCurvetoAbs(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
Notes: PathCurvetoAbs indicates that absolutecoordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end

of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.
See also:

- 91.13.39 PathCurvetoAbs(c as GM16PathArgsMBS) 14779
- 91.13.40 PathCurvetoAbs(c() as GM16PathArgsMBS) 14779

91.13.42 PathCurvetoRel(c as GM16PathArgsMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
Notes: PathCurvetoAbs indicates that absolutecoordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.
See also:

- 91.13.43 PathCurvetoRel(c() as GM16PathArgsMBS) 14780
- 91.13.44 PathCurvetoRel(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 14781

91.13.43 PathCurvetoRel(c() as GM16PathArgsMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
Notes: PathCurvetoAbs indicates that absolutecoordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.
See also:

- 91.13.42 PathCurvetoRel(c as GM16PathArgsMBS) 14780

91.13.44 PathCurvetoRel(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
Notes: PathCurvetoAbs indicates that absolutecoordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

91.13.45 PathLinetoAbs(c as GM16CoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.
See also:

- 91.13.46 PathLinetoAbs(c() as GM16CoordinateMBS) 14781
- 91.13.47 PathLinetoAbs(x as Double, y as Double) 14782

91.13.46 PathLinetoAbs(c() as GM16CoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.
See also:

- 91.13.45 PathLinetoAbs(c as GM16CoordinateMBS) 14781
- 91.13.47 PathLinetoAbs(x as Double, y as Double) 14782

91.13.47 PathLinetoAbs(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.
See also:

- 91.13.45 PathLinetoAbs(c as GM16CoordinateMBS) 14781
- 91.13.46 PathLinetoAbs(c() as GM16CoordinateMBS) 14781

91.13.48 PathLinetoHorizontalAbs(v as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draws a horizontal line from the current point (cpx, cpy) to (x, cpy). PathLinetoHorizontalAbs indicates that absolute coordinates are supplied; PathLinetoHorizontalRel indicates that relative coordinates are supplied. At the end of the command, the new current point becomes (x, cpy) for the final value of x.

91.13.49 PathLinetoHorizontalRel(v as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draws a horizontal line from the current point (cpx, cpy) to (x, cpy). PathLinetoHorizontalAbs indicates that absolute coordinates are supplied; PathLinetoHorizontalRel indicates that relative coordinates are supplied. At the end of the command, the new current point becomes (x, cpy) for the final value of x.

91.13.50 PathLinetoRel(c as GM16CoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.

• 91.13.52 PathLinetoRel(x as Double, y as Double) 14783

91.13.51 PathLinetoRel(c() as GM16CoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.
See also:

• 91.13.50 PathLinetoRel(c as GM16CoordinateMBS) 14782

• 91.13.52 PathLinetoRel(x as Double, y as Double) 14783

91.13.52 PathLinetoRel(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Example:

```
// new picture, 500x500 and filled with white
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

Var draw as GM16GraphicsMBS = image.Graphics

// Draw path

Var cr as new GM16ColorRGBMBS("red")
Var gr as new GM16ColorRGBMBS("green")
draw.StrokeColor cr
draw.FillColor gr
draw.PathMovetoAbs(30,10)
draw.PathLinetoAbs(20,55)
draw.PathLinetoAbs(70,50)
draw.PathLinetoAbs(80,5)
draw.DrawPath

draw.Draw

// show picture
```

```
image.type = image.TrueColorType // make sure it's a bitmap
Backdrop=image.CopyPicture
```

Notes: Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.
See also:

- 91.13.50 PathLinetoRel(c as GM16CoordinateMBS) 14782
- 91.13.51 PathLinetoRel(c() as GM16CoordinateMBS) 14783

91.13.53 PathLinetoVerticalAbs(v as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draws a vertical line from the current point (cpx, cpy) to (cpx, y). PathLinetoVerticalAbs indicates that absolute coordinates are supplied; PathLinetoVerticalRel indicates that relative coordinates are supplied. At the end of the command, the new current point becomes (cpx, y) for the final value of y.

91.13.54 PathLinetoVerticalRel(v as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draws a vertical line from the current point (cpx, cpy) to (cpx, y). PathLinetoVerticalAbs indicates that absolute coordinates are supplied; PathLinetoVerticalRel indicates that relative coordinates are supplied. At the end of the command, the new current point becomes (cpx, y) for the final value of y.

91.13.55 PathMovetoAbs(c as GM16CoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The "moveto" commands establish a new current point.
Notes: The effect is as if the "pen" were lifted and moved to a new location. A path data segment must begin with either one of the "moveto" commands or one of the "arc" commands. Subsequent "moveto" commands (i.e., when the "moveto" is not the first command) represent the start of a new subpath.

Start a new sub-path at the given coordinate. PathMovetoAbs indicates that absolute coordinates will follow; PathMovetoRel indicates that relative coordinates will follow. If a relative moveto appears as the first element of the path, then it is treated as a pair of absolute coordinates. If a moveto is followed by

multiple pairs of coordinates, the subsequent pairs are treated as implicit lineto commands.
See also:

- 91.13.56 PathMovetoAbs(x as Double, y as Double) 14785

91.13.56 PathMovetoAbs(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The "moveto" commands establish a new current point.
Notes: The effect is as if the "pen" were lifted and moved to a new location. A path data segment must begin with either one of the "moveto" commands or one of the "arc" commands. Subsequent "moveto" commands (i.e., when the "moveto" is not the first command) represent the start of a new subpath.

Start a new sub-path at the given coordinate. PathMovetoAbs indicates that absolute coordinates will follow; PathMovetoRel indicates that relative coordinates will follow. If a relative moveto appears as the first element of the path, then it is treated as a pair of absolute coordinates. If a moveto is followed by multiple pairs of coordinates, the subsequent pairs are treated as implicit lineto commands.

91.13.63 PathQuadraticCurvetoRel(c() as GM16PathArgsMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point.
Notes: PathQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathQuadraticCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x and y.

- 91.13.64 PathQuadraticCurvetoRel(x1 as Double, y1 as Double, x as Double, y as Double) 14788

91.13.64 PathQuadraticCurvetoRel(x1 as Double, y1 as Double, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point.
Notes: PathQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathQuadraticCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

- 91.13.63 PathQuadraticCurvetoRel(c() as GM16PathArgsMBS) 14787

91.13.65 PathSmoothCurvetoAbs(c as GM16CoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y).
Notes: The first control point is assumed to be the reflection of the second control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not an PathCurvetoAbs, PathCurvetoRel, PathSmoothCurvetoAbs or PathSmoothCurvetoRel, assume the first control point is coincident with the current point.) (x2,y2) is the second control point (i.e., the control point at the end of the curve). PathSmoothCurvetoAbs indicates that absolute coordinates will follow; PathSmoothCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.

- 91.13.67 PathSmoothCurvetoAbs(x as Double, y as Double) 14789

91.13.66 PathSmoothCurvetoAbs(c() as GM16CoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y).
Notes: The first control point is assumed to be the reflection of the second control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not an PathCurvetoAbs, PathCurvetoRel, PathSmoothCurvetoAbs or PathSmoothCurvetoRel, assume the first control point is coincident with the current point.) (x2,y2) is the second control point (i.e., the control point at the end of the curve). PathSmoothCurvetoAbs indicates that absolute coordinates will follow; PathSmoothCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.

- 91.13.69 PathSmoothCurvetoRel(c() as GM16CoordinateMBS) 14790

91.13.71 PathSmoothQuadraticCurvetoAbs(c as GM16CoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y).
Notes: The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x and y.
See also:

- 91.13.73 PathSmoothQuadraticCurvetoAbs(x as Double, y as Double) 14792

91.13.72 PathSmoothQuadraticCurvetoAbs(c() as GM16CoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y).
Notes: The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x and y.
See also:

- 91.13.71 PathSmoothQuadraticCurvetoAbs(c as GM16CoordinateMBS) 14791
- 91.13.73 PathSmoothQuadraticCurvetoAbs(x as Double, y as Double) 14792

91.13.73 PathSmoothQuadraticCurvetoAbs(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y).
Notes: The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.
See also:

- 91.13.71 PathSmoothQuadraticCurvetoAbs(c as GM16CoordinateMBS) 14791
- 91.13.72 PathSmoothQuadraticCurvetoAbs(c() as GM16CoordinateMBS) 14791

91.13.74 PathSmoothQuadraticCurvetoRel(c as GM16CoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y).
Notes: The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x and y.
See also:

- 91.13.75 PathSmoothQuadraticCurvetoRel(c() as GM16CoordinateMBS) 14792
- 91.13.76 PathSmoothQuadraticCurvetoRel(x as Double, y as Double) 14793

91.13.75 PathSmoothQuadraticCurvetoRel(c() as GM16CoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y).
Notes: The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not

a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x and y.
See also:

- 91.13.74 PathSmoothQuadraticCurvetoRel(c as GM16CoordinateMBS) 14792
- 91.13.76 PathSmoothQuadraticCurvetoRel(x as Double, y as Double) 14793

91.13.76 PathSmoothQuadraticCurvetoRel(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y).
Notes: The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.
See also:

- 91.13.74 PathSmoothQuadraticCurvetoRel(c as GM16CoordinateMBS) 14792
- 91.13.75 PathSmoothQuadraticCurvetoRel(c() as GM16CoordinateMBS) 14792

91.13.77 Point(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a point using stroke color and thickness at coordinate.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.fillColor = new GM16ColorRGBMBS("red") // set color

Var draw as GM16GraphicsMBS = image.Graphics

// draw cross with pixels
```

```
for x as Integer = 240 to 260
draw.Point(x, 250)
next
for y as Integer = 240 to 260
draw.Point(250,y)
next
draw.Draw

Backdrop=image.CopyPicture
```

91.13.78 PointSize(pointSize as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set font point size.

91.13.79 Polygon(values() as GM16CoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw an arbitrary polygon using stroke color and thickness consisting of three or more coordinates contained in an array.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.fillColor = new GM16ColorRGBMBS("red") // set color
image.strokeColor = new GM16ColorRGBMBS("green") // set color

Var draw as GM16GraphicsMBS = image.Graphics
Var coordinates(-1) as GM16CoordinateMBS

coordinates.Add new GM16CoordinateMBS(70,70)
coordinates.Add new GM16CoordinateMBS(100,340)
coordinates.Add new GM16CoordinateMBS(380,200)
coordinates.Add new GM16CoordinateMBS(70,70)

draw.Polygon coordinates
draw.Draw

Backdrop=image.CopyPicture
```

Notes: If a fill color is specified, then the object is filled.

91.13.80 Polyline(values() as GM16CoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw an arbitrary polyline using stroke color and thickness consisting of three or more coordinates contained in an array.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("green") // set color

Var draw as GM16GraphicsMBS = image.Graphics
Var coordinates(-1) as GM16CoordinateMBS

coordinates.Add new GM16CoordinateMBS(70,70)
coordinates.Add new GM16CoordinateMBS(100,340)
coordinates.Add new GM16CoordinateMBS(380,200)

draw.Polyline coordinates
draw.Draw

Backdrop=image.CopyPicture
```

Notes: If a fill color is specified, then the object is filled.

91.13.81 PopClipPath

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pop (terminate) clip path definition started by PushClipPath.

91.13.82 PopGraphicContext

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pop Graphic Context.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorMBS() // transparent fillcolor
image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

// Draw a Rectangle
draw.PushGraphicContext
draw.Translation(250,250)
draw.Rotation(50)
draw.Rectangle(0, 0, 100, 100) // rotated
draw.PopGraphicContext
draw.Rectangle(0, 0, 100, 100) // not rotated
draw.Draw

Backdrop=image.CopyPicture
```

Notes: Removing the current graphic context from the graphic context stack restores the options to the values they had prior to the preceding PushGraphicContext operation.

91.13.83 PopPattern

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Terminate a pattern definition started via PushPattern.

91.13.84 PushClipPath(id as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Push (create) clip path definition with id.
Notes: Clip patch definition consists of subsequent drawing commands, terminated by PopClipPath.

91.13.85 PushGraphicContext

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Push Graphic Context.

Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorMBS() // transparent fillcolor
image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

// Draw a Rectangle
draw.PushGraphicContext
draw.Translation(250,250)
draw.Rotation(50)
draw.Rectangle(0, 0, 100, 100) // rotated
draw.PopGraphicContext
draw.Rectangle(0, 0, 100, 100) // not rotated
draw.Draw

Backdrop=image.CopyPicture
```

Notes: When a graphic context is pushed, options set after the context is pushed (such as coordinate transformations, color settings, etc.) are saved to a new graphic context. This allows related options to be saved on a graphic context "stack" in order to support heirarchical nesting of options. When PopGraphicContext is used to pop the current graphic context, the options in effect during the last PushGraphicContext operation are restored.

91.13.86 PushPattern(id as string, x as Integer, y as Integer, width as Integer, height as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Start a pattern definition with arbitrary pattern name specified by id, pattern offset specified by x and y, and pattern size specified by width and height.
Notes: The pattern is defined within the coordinate system defined by the specified offset and size. Arbitrary drawing objects (including DrawableCompositeImage) may be specified between PushPattern and PopPattern in order to draw the pattern. Normally the pair PushGraphicContext & PopGraphicContext are used to enclose a pattern definition. Pattern definitions are terminated by a PopPattern object.

91.13.87 Rectangle(upperLeftX as Double, upperLeftY as Double, lowerRightX as Double, lowerRightY as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a rectangle using stroke color and thickness from upper-left coordinates to lower-right coordinates.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

// Draw a rectangle
draw.Rectangle(250, 250, 100, 100)
draw.Draw

Backdrop=image.CopyPicture
```

Notes: If a fill color is specified, then the object is filled.

91.13.88 Rotation(angle as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set rotation to use when drawing (coordinate transformation).
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

draw.StrokeColor new GM16ColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.Rotation 5
draw.StrokeColor new GM16ColorRGBMBS("blue")
draw.Line(100,100,400,400)
```

```
draw.Draw

Backdrop=image.CopyPicture
```

91.13.89 RoundRectangle(centerX as Double, centerY as Double, width as Double, height as Double, cornerWidth as Double, cornerHeight as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a rounded rectangle using stroke color and thickness, with specified center coordinate, specified width and height, and specified corner width and height.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

// Draw a round rectangle
draw.RoundRectangle(250, 250, 100, 100,20,20)
draw.Draw

Backdrop=image.CopyPicture
```

Notes: If a fill color is specified, then the object is filled.

91.13.90 Scaling(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply scaling in x and y direction while drawing objects (coordinate transformation).
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeWidth = 5
```

```
Var draw as GM16GraphicsMBS = image.Graphics
draw.FillColor new GM16ColorRGBMBS("red")

draw.StrokeColor new GM16ColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.StrokeColor new GM16ColorRGBMBS("blue")
draw.Scaling 1.2,1.1
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

91.13.91 SkewX(angle as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply Skew in X direction (coordinate transformation)
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

draw.StrokeColor new GM16ColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.SkewX 5
draw.StrokeColor new GM16ColorRGBMBS("blue")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

91.13.92 SkewY(angle as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply Skew in Y direction.
Example:

```
Var g as new GM16GeometryMBS(500,500)
```

```
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

draw.StrokeColor new GM16ColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.SkewY 5
draw.StrokeColor new GM16ColorRGBMBS("blue")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

91.13.93 StrokeAntialias(flag as boolean)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Antialias while drawing lines or object outlines.

91.13.94 StrokeColor(c as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set color to use when drawing lines or object outlines.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

draw.StrokeColor new GM16ColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

91.13.95 StrokeLineCap(LineCap as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify the shape to be used at the end of open subpaths when they are stroked.
Notes: Values of LineCap are UndefinedCap, ButtCap, RoundCap, and SquareCap.

91.13.96 StrokeLineJoin(LineJoin as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify the shape to be used at the corners of paths (or other vector shapes) when they are stroked.
Notes: Values of LineJoin are UndefinedJoin, MiterJoin, RoundJoin, and BevelJoin.

91.13.97 StrokeOpacity(opacity as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opacity to use when drawing lines or object outlines.

91.13.98 StrokeWidth(opacity as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set width to use when drawing lines or object outlines.

91.13.99 Text(x as Double, y as Double, text as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Annotate image with text using stroke color, font, font pointsize, and box color (text background color), at specified coordinates.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

Var draw as GM16GraphicsMBS = image.Graphics

// draw red text
```

```
draw.strokeColor(new GM16ColorRGBMBS("red")) // Outline color
draw.strokeWidth(1)
draw.Font("/Library/Fonts/Verdana.ttf")
draw.Text(50, 50, "Hello")
draw.Draw

Backdrop=image.CopyPicture
```

Notes: If text contains special format characters the image filename, type, width, height, or other image attributes may be incorporated in the text (see label).
See also:

- 91.13.100 Text(x as Double, y as Double, text as string, encoding as string) 14803

91.13.100 Text(x as Double, y as Double, text as string, encoding as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Annotate image with text represented with text encoding, using current stroke color, font, font pointsize, and box color (text background color), at specified coordinates.
Notes: If text contains special format characters the image filename, type, width, height, or other image attributes may be incorporated in the text (see label()).

The text encoding specifies the code set to use for text annotations. The only character encoding which may be specified at this time is "UTF-8" for representing Unicode as a sequence of bytes. Specify an empty string to set text encoding to the system's default. Successful text annotation using Unicode may require fonts designed to support Unicode.

Seems like you need ghostscript or the DPS library for text handling, so it may no be available for you.
See also:

- 91.13.99 Text(x as Double, y as Double, text as string) 14802

91.13.101 TextAntialias(flag as boolean)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Antialias while drawing text (default true).
Notes: The main reason to disable text antialiasing is to avoid adding new colors to the image.

91.13.102 TextDecoration(DecorationType as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify decoration (e.g. UnderlineDecoration) to apply to text.

91.13.103 TextUnderColor(c as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a box under rendered text using the specified color.

91.13.104 Translation(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply coordinate translation (set new coordinate origin).
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

draw.StrokeColor new GM16ColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.Translation 5,5
draw.StrokeColor new GM16ColorRGBMBS("blue")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

91.13.105 Viewbox(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Dimensions of the output viewbox.
Notes: If the image is to be written to a vector format (e.g. MVG or SVG), then a PushGraphicContext() object should be pushed to the head of the list, followed by a Viewbox() statement to establish the output canvas size. A matching PopGraphicContext() object should be pushed to the tail of the list.

91.13.106 Properties

91.13.107 Image as GM16ImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The image this graphics object belongs to.
Notes: (Read only property)

91.14 class GM16ImageArrayMBS

91.14.1 class GM16ImageArrayMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an array of images in GraphicsMagick.
Example:

```
// extract all layers of photoshop file
Var file as FolderItem = SpecialFolder.Desktop.Child("test.psd")
Var images as new GM16ImageArrayMBS

images.readImages(file.NativePath)

Var c as Integer = images.size
for i as Integer = 0 to c-1
Var image as GM16ImageMBS = images.Image(i)
file = SpecialFolder.Desktop.Child(image.FileName+"."+str(i)+".png")
image.write(file)
next
```

Notes: Can be used to assemble/disassemble gif images.

91.14.2 Methods

91.14.3 animateImages

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Animate a sequence of image frames.
Notes: Image frames are displayed in succession, creating an animated effect. The animation options are taken from the first image frame. This feature is only supported under X11 at the moment.

91.14.4 append(image as GM16ImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an image to the end of the array.
Example:

```
// read gif
Var g as new GM16ImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
```

```
g.readImages(file.NativePath)

// put copy of first image on the back
Var n as GM16ImageMBS = g.FirstImage
g.append n

// write to file

Var output as FolderItem = SpecialFolder.Desktop.Child("output.gif")

g.writeImages(output.NativePath)
```

Notes: Instead of gif, you can also use tif files.

91.14.5 appendImages(stack as boolean = false) as GM16ImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Append a sequence of image frames, writing the result to new image.
Notes: All the input image frames must have the same width or height. Image frames of the same width are stacked top-to-bottom. Image frames of the same height are stacked left-to-right. If the stack parameter is false, rectangular image frames are stacked left-to-right otherwise top-to-bottom.

91.14.6 averageImages as GM16ImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Average a sequence of image frames, writing the result to averagedImage.
Example:

```
// read gif
Var g as new GM16ImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// averageImages
Var n as GM16ImageMBS = g.averageImages
Backdrop = n.CopyPicture
```

Notes: All the input image frames must be the same size in pixels.

91.14.7 coalesceImages as GM16ImageArrayMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a coalesced image sequence obtained by "playing" the image sequence (observing page offsets and disposal methods) to create a new image sequence in which all frames are full size and completely rendered.
Example:

```
// read gif
Var g as new GM16ImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// deconstruct
g = g.coalesceImages

// write gif
Var output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages output.NativePath
```

Notes: Note that if the original image sequence relied on page offsets and disposal methods that the resulting sequence will be larger (perhaps much larger) then the original. This is useful for GIF animation sequences that have page offsets and disposal methods. The resuting image sequence is returned.

91.14.8 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an empty image array.

91.14.9 deconstructImages as GM16ImageArrayMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Break down an image sequence into constituent parts.
Example:

```
// read gif
Var g as new GM16ImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// deconstruct
g = g.deconstructImages
```

```
// write gif
Var output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages output.NativePath
```

Notes: This is useful for creating GIF or MNG animation sequences.

91.14.10 displayImages

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Display a sequence of image frames.
Notes: Through use of a pop-up menu, image frames may be selected in succession. This feature is fully supported under X11 but may have only limited support in other environments.
Caution: if an image format is not compatable with the display visual (e.g. JPEG on a colormapped display) then the original image will be altered. Use a copy of the original if this is a problem.

display methods are not supported currently.

91.14.11 FirstImage as GM16ImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns first image in array.
Example:

```
// read gif
Var g as new GM16ImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// show first image
Var img as GM16ImageMBS = g.FirstImage

// convert to true color for CopyPicture to work
const TrueColorType=6
img.type=TrueColorType

Backdrop = img.CopyPicture
```

91.14.12 flattenImages as GM16ImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Merge a sequence of image frames which represent image layers into a single composited representation.
Example:

```
// read gif
Var g as new GM16ImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// put copy of first image on the back
Var n as GM16ImageMBS = g.flattenImages

Backdrop = n.CopyPicture
```

Notes: Returns the flattened image. This function is useful for combining Photoshop layers into a single image.

91.14.13 Image(index as Integer) as GM16ImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries image with given index.

91.14.14 insert(image as GM16ImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts an image on the front.
Example:

```
// read gif
Var g as new GM16ImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// put copy of first image on the front
Var n as GM16ImageMBS = g.FirstImage
g.insert n

// write to file
```

```
Var output as FolderItem = SpecialFolder.Desktop.Child("output.gif")

g.writeImages(output.NativePath)
```

91.14.15 LastImage as GM16ImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns last image in array.

91.14.16 mapImages(map as GM16ImageMBS, dither as boolean = true, measureError as boolean = false)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replace the colors of a sequence of images with the closest color from a reference image.
Notes: Set dither to true to enable dithering. Set measureError to true in order to evaluate quantization error.

91.14.17 montageImages(options as GM16MontageMBS) as GM16ImageArrayMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a composite image by combining several separate image frames.
Example:

```
// build montage
Var StackingMontage as New GM16MontageMBS
StackingMontage.backgroundColor = New GM16ColorMBS(&cE7E7E7)
StackingMontage.fillColor = New GM16ColorMBS(&c000000)
StackingMontage.tile = New GM16GeometryMBS("1x20")
StackingMontage.geometry = New GM16GeometryMBS("160x120+5+5")
StackingMontage.font = "Helvetica"
StackingMontage.pointSize = 12
StackingMontage.title = "Title goes here"

// make picture
Var logo as Picture = LogoMBS(500)
Var image as New GM16ImageMBS(logo)

image.label("Sample label")

// Put the current image into the array
```

```
Var StackingFrames As new GM16ImageArrayMBS
StackingFrames.insert(image)

// show result
Var resultImages as GM16ImageArrayMBS = StackingFrames.montageImages(StackingMontage)
Backdrop = resultImages.Image(0).CopyPicture
```

Notes: Multiple frames may be generated in the output array depending on the tile setting and the number of image frames montaged. Montage options are provided via the parameter options. Options set in the first image frame (backgroundColor, borderColor, matteColor, fillColor, strokeColor, font and fontPointsize) are also used as options by montageImages().

91.14.18 morphImages(frames as Integer) as GM16ImageArrayMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Morph a seqence of image frames.
Example:

```
// read gif
Var g as new GM16ImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// coalesce to make sure we have full images
g = g.coalesceImages
// morph to 10 pictures
g = g.morphImages(10)

// write gif
Var output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages output.NativePath
```

Notes: This algorithm expands the number of image frames (output to the new image array) by adding the number of intervening frames specified by frames such that the original frames morph (blend) into each other when played as an animation.

91.14.19 mosaicImages as GM16ImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inlay a number of images to form a single coherent picture.
Notes: The result image argument is updated with a mosaic constructed from the image sequence.

91.14.20 quantizeImages(measureError as boolean = false)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Quantize colors in images using current quantization settings.
Notes: Set measureError to true in order to measure quantization error.

91.14.21 readImages(blob as GM16BlobMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read a sequence of image frames into existing container (appending to array) from blob.
See also:

- 91.14.22 readImages(imageSpec as string) 14814

91.14.22 readImages(imageSpec as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read a sequence of image frames into existing container (appending to array) with image names specified in the string imageSpec.
See also:

- 91.14.21 readImages(blob as GM16BlobMBS) 14814

91.14.23 remove(index as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the image with the given index.
Example:

```
// read gif
Var g as new GM16ImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// remove first
g.remove 0

// write to file

Var output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
```

```
g.writeImages(output.NativePath)
```

Notes: Index should be between 0 and size-1.

91.14.24 reverse

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reverses the order of images in the array.

91.14.25 writeImages(blob as GM16BlobMBS, adjoin as boolean = true)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes images to the given blob object.
Notes: Write images in container to in-memory BLOB specified by Blob blob. Set adjoin to false to write a set of image frames via a wildcard imageSpec (e.g. image%02d.miff).
Caution: if an image format is selected which is capable of supporting fewer colors than the original image or quantization has been requested, the original image will be quantized to fewer colors. Use a copy of the original if this is a problem.
See also:

- 91.14.26 writeImages(imageSpec as string, adjoin as boolean = true) 14815

91.14.26 writeImages(imageSpec as string, adjoin as boolean = true)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes images to the given path.
Example:

```
// read gif
Var g as new GM16ImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// write to file

Var output as FolderItem = SpecialFolder.Desktop.Child("output.gif")

g.writeImages(output.NativePath)
```

Notes: Write images in container to file specified by string imageSpec. Set adjoin_ to false to write a set

of image frames via a wildcard imageSpec (e.g. image%02d.miff).
The wildcard must be one of %0Nd, %0No, or %0Nx.
Caution: if an image format is selected which is capable of supporting fewer colors than the original image or quantization has been requested, the original image will be quantized to fewer colors. Use a copy of the original if this is a problem.
See also:

- 91.14.25 writeImages(blob as GM16BlobMBS, adjoin as boolean = true) 14815

91.14.27 Properties

91.14.28 empty as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether image array is empty.
Notes: Returns true if array is empty or false if not.
(Read only property)

91.14.29 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal handle of the image array.
Notes: Should always be non zero.
(Read and Write property)

91.14.30 size as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns number of images in this array.
Example:

```
// read gif
Var g as new GM16ImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// display number of images
MessageBox str(g.size)
```

Notes: (Read only property)

91.15 class GM16ImageChannelStatisticsMBS

91.15.1 class GM16ImageChannelStatisticsMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The statistics for image channel.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GM16ImageMBS(f)
Var stat as GM16ImageStatisticsMBS = g.statistics
Var gs as GM16ImageChannelStatisticsMBS = stat.blue

MessageBox "blue channel: "+str(gs.minimum)+"-"+str(Gs.maximum)+", mean "+str(gs.mean)
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

91.15.2 Methods

91.15.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

91.15.4 Properties

91.15.5 maximum as Double

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum value observed.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GM16ImageMBS(f)
Var stat as GM16ImageStatisticsMBS = g.statistics
Var gs as GM16ImageChannelStatisticsMBS = stat.green

MessageBox "maximum green color: "+str(gs.maximum)
```

Notes: (Read only property)

91.15.6 mean as Double

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Average (mean) value observed.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GM16ImageMBS(f)
Var stat as GM16ImageStatisticsMBS = g.statistics
Var r as GM16ImageChannelStatisticsMBS = stat.red

MessageBox "mean red color: "+str(R.mean)
```

Notes: (Read only property)

91.15.7 minimum as Double

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Minimum value observed.
Notes: (Read only property)

91.15.8 standardDeviation as Double

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Standard deviation, sqrt(variance).
Notes: (Read only property)

91.15.9 variance as Double

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Variance.
Notes: (Read only property)

91.16 class GM16ImageMBS

91.16.1 class GM16ImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image is the primary object in Magick++ and represents a single image frame (see image design).
Example:

```
Var c as new GM16ColorMBS("white")
Var g as new GM16GeometryMBS(100,100)
Var image as new GM16ImageMBS(g, c)
```

Notes: With MBS Plugin 14.0 we offer this classes in 8bit (GM prefix) or 16bit (GM16 prefix).

The GM16ImageArrayMBS class must be used to operate on image sequences or images (e.g. of format GIF, TIFF, MIFF, Postscript, & MNG) which are comprized of multiple image frames. Individual frames of a multi-frame image may be requested by adding array-style notation to the end of the file name (e.g. "animation.gif [3] " retrieves the fourth frame of a GIF animation. Various image manipulation operations may be applied to the image. Attributes may be set on the image to influence the operation of the manipulation operations. The GM16PixelsMBS class provides low-level access to image pixels.

91.16.2 Methods

91.16.3 adaptiveThreshold(width as UInt32, height as UInt32, offset as double = 0)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply adaptive thresholding to the image.
Notes: see:
http://www.dai.ed.ac.uk/HIPR2/adpthrsh.htm

Adaptive thresholding is useful if the ideal threshold level is not known in advance, or if the illumination gradient is not constant across the image. Adaptive thresholding works by evaulating the mean (average) of a pixel region (size specified by width and height) and using the mean as the thresholding value. In order to remove residual noise from the background, the threshold may be adjusted by subtracting a constant offset (default zero) from the mean to compute the threshold.

91.16.4 addNoise(noise as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add noise to image with the specified noise type.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.addNoise(image.GaussianNoise)

Backdrop=image.CopyPicture
```

Notes: Use one of this constants: GaussianNoise, ImpulseNoise, LaplacianNoise, MultiplicativeGaussianNoise, PoissonNoise, UniformNoise.

91.16.5 addNoiseChannel(channel as Integer, noise as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add noise to an image channel with the specified noise type. The channel parameter specifies the channel to add noise to.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)
```

image.addNoiseChannel(image.BlueChannel, image.ImpulseNoise)

Backdrop=image.CopyPicture

Notes: The noiseType parameter specifies the type of noise.
Use one of this constants: GaussianNoise, ImpulseNoise, LaplacianNoise, MultiplicativeGaussianNoise, PoissonNoise, UniformNoise.

91.16.6 affineTransform(sx as Double, sy as Double, rx as Double, ry as Double, tx as Double, ty as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies an affine transformation to the drawing matrix.
Notes: Specify a transformation matrix to adjust scaling, rotation, and translation (coordinate transformation) for subsequently drawn objects in the same or decendent drawing context. The sx & sy parameters represent the x & y scale factors, the rx & ry parameters represent the x & y rotation, and the tx & ty parameters represent the x & y translation.

91.16.7 annotate(text as string, boundingArea as GM16GeometryMBS, gravity as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Annotate using specified text, bounding area, and placement gravity.
Notes: Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

NorthWestGravity	text bottom-left corner placed at top-left
NorthGravity	text bottom-center placed at top-center
NorthEastGravity	text bottom-right corner placed at top-right
WestGravity	text left-center placed at left-center
CenterGravity	text center placed at center
EastGravity	text right-center placed at right-center
SouthWestGravity	text top-left placed at bottom-left
SouthGravity	text top-center placed at bottom-center
SouthEastGravity	text top-right placed at bottom-right

Annotate annotates an image with text. Optionally you can include any of the following bits of information

about the image by embedding the appropriate special characters:

%b file size in bytes. %c comment. %d directory in which the image resides. %e extension of the image file. %f original filename of the image. %h height of image. %i filename of the image. %k number of unique colors. %l image label. %m image file format. %n number of images in a image sequence. %o output image filename. %p page number of the image. %q image depth (8 or 16). %p page number of the image. %q image depth (8 or 16). %s image scene number. %t image filename without any extension. %u a unique temporary filename. %w image width. %x x resolution of the image. %y y resolution of the image.

Set a font with full path and @ in front. e.g. "@/Library/Fonts/Arial.ttf". This way the plugin loads it directly.

- 91.16.9 annotate(text as string, gravity as Integer) 14823
- 91.16.10 annotate(text as string, location as GM16GeometryMBS) 14824

91.16.8 annotate(text as string, boundingArea as GM16GeometryMBS, gravity as Integer, degrees as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Annotate with text using specified text, bounding area, placement gravity, and rotation.
Notes: Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

NorthWestGravity	text bottom-left corner placed at top-left
NorthGravity	text bottom-center placed at top-center
NorthEastGravity	text bottom-right corner placed at top-right
WestGravity	text left-center placed at left-center
CenterGravity	text center placed at center
EastGravity	text right-center placed at right-center
SouthWestGravity	text top-left placed at bottom-left
SouthGravity	text top-center placed at bottom-center
SouthEastGravity	text top-right placed at bottom-right

Annotate annotates an image with text. Optionally you can include any of the following bits of information about the image by embedding the appropriate special characters:

%b file size in bytes. %c comment. %d directory in which the image resides. %e extension of the image file. %f original filename of the image. %h height of image. %i filename of the image. %k number of unique colors. %l image label. %m image file format. %n number of images in a image sequence. %o output image filename. %p page number of the image. %q image depth (8 or 16). %p page number of the image. %q image depth (8 or 16). %s image scene number. %t image filename without any extension. %u a unique temporary filename. %w image width. %x x resolution of the image. %y y resolution of the image.

Set a font with full path and @ in front. e.g. "@/Library/Fonts/Arial.ttf". This way the plugin loads it directly.

- 91.16.10 annotate(text as string, location as GM16GeometryMBS) 14824

91.16.9 annotate(text as string, gravity as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Annotate with text (bounding area is entire image) and placement gravity.
Example:

```
Var White as new GM16ColorGrayMBS(1)
Var Black as new GM16ColorGrayMBS(0)
Var geo as new GM16GeometryMBS("300x200")

Var g as new GM16ImageMBS(geo, White)

g.antiAlias = False
g.fillColor = Black
g.lineWidth = 1
g.strokeColor = Black
g.font = "@/Library/Fonts/Tahoma.ttf"
g.fontPointsize = 15

g.annotate("Hello World", g.SouthGravity)

Backdrop = g.CopyPicture
```

Notes: Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

Annotate annotates an image with text. Optionally you can include any of the following bits of information

NorthWestGravity	text bottom-left corner placed at top-left
NorthGravity	text bottom-center placed at top-center
NorthEastGravity	text bottom-right corner placed at top-right
WestGravity	text left-center placed at left-center
CenterGravity	text center placed at center
EastGravity	text right-center placed at right-center
SouthWestGravity	text top-left placed at bottom-left
SouthGravity	text top-center placed at bottom-center
SouthEastGravity	text top-right placed at bottom-right

about the image by embedding the appropriate special characters:

%b file size in bytes. %c comment. %d directory in which the image resides. %e extension of the image file. %f original filename of the image. %h height of image. %i filename of the image. %k number of unique colors. %l image label. %m image file format. %n number of images in a image sequence. %o output image filename. %p page number of the image. %q image depth (8 or 16). %p page number of the image. %q image depth (8 or 16). %s image scene number. %t image filename without any extension. %u a unique temporary filename. %w image width. %x x resolution of the image. %y y resolution of the image.

Set a font with full path and @ in front. e.g. "@/Library/Fonts/Arial.ttf". This way the plugin loads it directly.

- 91.16.10 annotate(text as string, location as GM16GeometryMBS) 14824

91.16.10 annotate(text as string, location as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Annotate using specified text, and placement location.
Notes: Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

Annotate annotates an image with text. Optionally you can include any of the following bits of information about the image by embedding the appropriate special characters:

%b file size in bytes. %c comment. %d directory in which the image resides. %e extension of the image

NorthWestGravity	text bottom-left corner placed at top-left

- 91.16.9 annotate(text as string, gravity as Integer) 14823

91.16.11 attributeValues as dictionary

MBS GraphicsMagick Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A dictionary with all attributes.
Notes: As attributes are created on demand, this will only return all so far generated attributes.

91.16.12 autoOrient

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Orient image to be right-side up based on its current orientation attribute.
Notes: This allows the image to be viewed correctly when the orientation attribute is not available, or is not respected.

91.16.13 blur(radius as Double=0.0, sigma as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blur an image with the specified blur factor.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.blur(30,10)

Backdrop=image.CopyPicture
```

Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

91.16.14 blurChannel(channel as Integer, radius as Double=0.0, sigma as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blur an image channel with the specified blur factor.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.blurChannel(image.BlueChannel, 30,10)

Backdrop=image.CopyPicture
```

Notes: The channel parameter specifies the channel to modify. The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

91.16.15 border

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Border image (add border to image).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)
```

image.border

Backdrop=image.CopyPicture

Notes: The color of the border is specified by the borderColor attribute.
See also:

- 91.16.16 border(geometry as GM16GeometryMBS) 14827

91.16.16 border(geometry as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Border image (add border to image).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.border GM16GeometryMBS.Make(10,10)

Backdrop=image.CopyPicture
```

Notes: The color of the border is specified by the borderColor attribute.
See also:

- 91.16.15 border 14826

91.16.17 borderGeometryDefault as String

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default geometry description for border.

91.16.18 cacheThreshold(threshold as UInt32)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pixel cache threshold in megabytes.
Notes: Once this memory threshold is exceeded, all subsequent pixels cache operations are to/from disk. This setting is shared by all Image objects.

91.16.19 cdl(cdl as string)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Bake in the ASC-CDL.
Notes: Bake in the ASC-CDL, which is a convention for the for the exchange of basic primary color grading information between for the exchange of basic primary color grading information between equipment and software from different manufacturers. It is a useful transform for other purposes as well.

91.16.20 channel(channel as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extract channel from image.
Notes: Use this option to extract a particular channel from the image. MatteChannel for example, is useful for extracting the opacity values from an image.

91.16.21 charcoal(radius as Double=0.0, sigma as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Charcoal effect image (looks like charcoal sketch).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.charcoal

Backdrop=image.CopyPicture
```

Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

91.16.22 chop(geometry as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chop image (remove vertical or horizontal subregion of image).

91.16.23 colorHistogram as dictionary

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates histogram.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GM16ImageMBS(f)
Var d as Dictionary = g.colorHistogram

MessageBox str(d.Count)+" color"

// check first color
Var c as GM16ColorMBS = d.key(0)

MessageBox "Color "+str(c.colorValue)+": "+str(d.Value(c))
```

Notes: The dictionary has a GM16ColorMBS/GMColor16MBS object as key for each color and an unsigned integer as value.

91.16.24 colorize(opacity as UInt32, penColor as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colorize image with pen color, using specified percent opacity.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.colorize(10, new GM16ColorMBS("red"))

Backdrop=image.CopyPicture
```

See also:

- 91.16.25 colorize(opacityRed as UInt32, opacityGreen as UInt32, opacityBlue as UInt32, penColor as GM16ColorMBS) 14829

91.16.25 colorize(opacityRed as UInt32, opacityGreen as UInt32, opacityBlue as UInt32, penColor as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colorize image with pen color, using specified percent opacity for red, green, and blue quantums.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.colorize(10, 0, 5, new GM16ColorMBS("red"))

Backdrop=image.CopyPicture
```

See also:

- 91.16.24 colorize(opacity as UInt32, penColor as GM16ColorMBS) 14829

91.16.26 colorMap as GM16ColorMBS()

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries array with all colors in color map.
See also:

- 91.16.311 colorMap(index as UInt32) as GM16ColorMBS 14930

91.16.27 colorMatrix(order as Integer, ColorMatrix() as Double)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply a color matrix to the image channels.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GM16ImageMBS(f)

Var m(8) as Double

m(0) = 0.25
m(1) = 0
m(2) = 0.25

m(3) = 0
m(4) = 0
m(5) = 0

m(6) = 0.25
m(7) = 0
m(8) = 0.25
```

g.colorMatrix 3, m

Backdrop = g.CopyPicture

Notes: The user supplied matrix may be of order 1 to 5 (1x1 through 5x5).

91.16.28 CombinePictureWithMask as picture

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the image with mask.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

Var c as new GM16ColorMBS("white")
image.transparent(c)

Backdrop=image.CombinePictureWithMask
```

Notes: Internally this calls Width and Height, CopyPicture and CopyMask.

91.16.29 compare(image as GM16ImageMBS) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compare current image with another image.
Notes: Sets meanErrorPerPixel, normalizedMaxError, and normalizedMeanError in the current image. False is returned if the images are identical. An ErrorOption exception is thrown if the reference image columns, rows, colorspace, or matte differ from the current image:

91.16.30 composite(compositeImage as GM16ImageMBS, gravity as Integer, CompositeOperator as Integer = 2)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose an image onto another at specified x and y offset and using a specified algorithm.

91.16.31 compositeAt(compositeImage as GM16ImageMBS, offset as GM16GeometryMBS, CompositeOperator as Integer = 2)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose an image onto another at specified x and y offset and using a specified algorithm.

91.16.32 compositeXY(compositeImage as GM16ImageMBS, xOffset as Integer, yOffset as Integer, CompositeOperator as Integer = 2)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose an image onto another at specified x and y offset and using a specified algorithm.

91.16.33 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor.
Example:

```
// get some image data (e.g. from blob in database)
Var logo as Picture = LogoMBS(500)
Var jpegData as string = PictureToJPEGStringMBS(logo, 80)

// new image
Var mp as new GM16ImageMBS
Var blob as new GM16BlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
'mp.type = mp.TrueColorMatteType
Backdrop=mp.CombinePictureWithMask
```

- 91.16.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 14840

91.16.34 Constructor(blob as GM16BlobMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct Image from in-memory Blob.
See also:

- 91.16.33 Constructor 14832
- 91.16.35 Constructor(blob as GM16BlobMBS, geometry as GM16GeometryMBS) 14834

- 91.16.42 Constructor(pic as picture) 14838
- 91.16.43 Constructor(size as GM16GeometryMBS, ColorValue as GM16ColorMBS) 14839
- 91.16.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 14840

91.16.36 Constructor(blob as GM16BlobMBS, geometry as GM16GeometryMBS, depth as UInt32)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct Image of specified size and depth from in-memory Blob.
See also:

- 91.16.34 Constructor(blob as GM16BlobMBS) 14833

- 91.16.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 14840

91.16.37 Constructor(blob as GM16BlobMBS, geometry as GM16GeometryMBS, depth as UInt32, Magick as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct Image of specified size, depth, and format from in-memory Blob.
See also:

- 91.16.33 Constructor 14832
- 91.16.34 Constructor(blob as GM16BlobMBS) 14833
- 91.16.35 Constructor(blob as GM16BlobMBS, geometry as GM16GeometryMBS) 14834
- 91.16.36 Constructor(blob as GM16BlobMBS, geometry as GM16GeometryMBS, depth as UInt32) 14834
- 91.16.38 Constructor(blob as GM16BlobMBS, geometry as GM16GeometryMBS, Magick as string) 14835
- 91.16.39 Constructor(file as folderitem) 14836
- 91.16.40 Constructor(other as GM16ImageMBS) 14837
- 91.16.41 Constructor(Path as string) 14838
- 91.16.42 Constructor(pic as picture) 14838
- 91.16.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 14840

91.16.38 Constructor(blob as GM16BlobMBS, geometry as GM16GeometryMBS, Magick as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct Image of specified size, depth, and format from in-memory Blob.
Example:

```
// first open file and read data in blob
SVG_File = FolderItem.ShowOpenFileDialog("")
If SVG_File = Nil Then Return
```

```
Var stream as BinaryStream = BinaryStream.Open(SVG_File)
Var data as string = stream.Read(stream.Length)
Var blob as new GM16BlobMBS(data)

// 400 width and 400 height
Var geo As New GM16GeometryMBS(400, 400, 0, 0)

// pass type here to have GraphicsMagick know it since there is no file name in blob:
Var g as New GM16ImageMBS(blob, geo, "svg")
```

91.16.40 Constructor(other as GM16ImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an image by making a copy of the existing one.

91.16.41 Constructor(Path as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct from image file or image specification.

91.16.42 Constructor(pic as picture)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new GMImage with the given picture.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)
Backdrop=image.CopyPicture
```

Notes: Pixels from both the picture and picture's mask.

91.16.43 Constructor(size as GM16GeometryMBS, ColorValue as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct a blank image canvas of specified size and color.
Example:

```
Var g as new GM16GeometryMBS(600,600)
Var c as new GM16ColorRGBMBS(1.0,0.0,0.0) // red
Var image as new GM16ImageMBS(g, c)

const TrueColorType=6

// Ensure that there are no other references to this image.
image.modifyImage
// Set the image type to TrueColor DirectClass representation.
image.type=TrueColorType

Backdrop=image.CopyPicture(0,0,600,600)
```

- 91.16.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 14840

91.16.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes single image frame from an array of raw pixels, with specified storage type (ConstituteImage).
Example:

```
Var data as new memoryblock(2048*2048) // your data
Var image as new GM16ImageMBS(2048, 2048, "I", GM16ImageMBS.StorageTypeCharPixel, data)
```

Notes: Returns an Image corresponding to an image stored in a raw memory array format. The pixel data must be in scanline order top-to-bottom. The data can be unsigned char, unsigned short int, unsigned int, unsigned long, float, or double. Float and double require the pixels to be normalized to the range [0..1] , otherwise the range is [0..MaxVal] where MaxVal is the maximum possible value for that type.

Note that for most 32-bit architectures the size of an unsigned long is the same as unsigned int, but for 64-bit architectures observing the LP64 standard, an unsigned long is 64 bits, while an unsigned int remains 32 bits. This should be considered when deciding if the data should be described as "Integer" or "Long".

For example, to create a 640x480 image from unsigned red-green-blue character data, use

image = new GM16ImageMBS(640, 480, "RGB", GM16ImageMBS.StorageTypeCharPixel, pixels);

width: width in pixels of the image.
height: height in pixels of the image.
map: This string reflects the expected ordering of the pixel array. It can be any combination or order of R = red, G = green, B = blue, A = alpha (same as Transparency), O = Opacity, T = Transparency, C = cyan, Y = yellow, M = magenta, K = black, or I = intensity (for grayscale). Specify "P" = pad, to skip over a quantum which is intentionally ignored. Creation of an alpha channel for CMYK images is currently not supported.

type: Define the data type of the pixels. Float and double types are expected to be normalized [0..1] otherwise [0..MaxRGB] . Choose from these types: StorageTypeCharPixel, StorageTypeShortPixel, StorageTypeIntegerPixel, StorageTypeLongPixel, StorageTypeFloatPixel, or StorageTypeDoublePixel.
pixels: This array of values contain the pixel components as defined by map and type. You must preallocate this array where the expected length varies depending on the values of width, height, map, and type.

- 91.16.43 Constructor(size as GM16GeometryMBS, ColorValue as GM16ColorMBS) 14839

91.16.45 contrast(sharpen as UInt32)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Contrast image (enhance intensity differences in image).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.contrast(10)

Backdrop=image.CopyPicture
```

91.16.46 convolve(order as Integer, ColorMatrix() as Double)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convolve image.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GM16ImageMBS(f)

Var m(8) as Double

m(0) = 0.25
m(1) = 0
m(2) = 0.25

m(3) = 0
m(4) = 0
m(5) = 0

m(6) = 0.25
m(7) = 0
m(8) = 0.25

g.convolve 3, m

Backdrop = g.CopyPicture
```

Notes: Applies a user-specified convolution to the image.
order represents the number of columns and rows in the filter kernel.
kernel is an array of doubles representing the convolution kernel.

91.16.47 CopyPicture as picture

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the image and returns it as a new picture.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

// Draw a circle
draw.Rectangle(250, 250, 100, 100)

Backdrop=image.CopyPicture
```

Notes: You may need to set image type to RGB to get it working.
See also:

- 91.16.48 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture 14843

91.16.48 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the image and returns it as a new picture.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.threshold 127

// convert to RGB so CopyPicture works
image.type = image.TrueColorType
Backdrop=image.CopyPicture(0,0,250,250)
```

Notes: You may need to set image type to RGB to get it working.
See also:

- 91.16.47 CopyPicture as picture 14842

91.16.49 CopyPictureMask as picture

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the image's mask and returns it as a new picture.
Example:

```
Var f As FolderItem = SpecialFolder.Desktop.Child("test.png")
Var g As New GM16ImageMBS(f)

// get image with mask
Var p As picture = g.CopyPicture
p.mask = g.CopyPictureMask

Window1.Backdrop = p
```

See also:

- 91.16.50 CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture 14844

91.16.50 CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the image's mask and returns it as a new picture.
See also:

- 91.16.49 CopyPictureMask as picture 14843

91.16.51 CopyPixelsMemory as Memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copy the pixels as they are into a memoryblock.
Notes: Optional specify rectangle.
Returns nil on low memory or bad parameter. Image must be of type class direct (not palette picture).
Order of pixel data is normally Red, Green, Blue, Opacity. Or Cyan, Magenta, Yellow, Black for CMYK images.
For GM16ImageMBS, the data is 8bit per channel. For GMImage16MBS, the data is 16bit per channel.
See also:

- 91.16.52 CopyPixelsMemory(x as Integer, y as Integer, width as Integer, height as Integer) as Memoryblock 14844

91.16.52 CopyPixelsMemory(x as Integer, y as Integer, width as Integer, height as Integer) as Memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copy the pixels as they are into a memoryblock.
Notes: Optional specify rectangle.
Returns nil on low memory or bad parameter. Image must be of type class direct (not palette picture).
Order of pixel data is normally Red, Green, Blue, Opacity. Or Cyan, Magenta, Yellow, Black for CMYK images.
For GM16ImageMBS, the data is 8bit per channel. For GMImage16MBS, the data is 16bit per channel.
See also:

- 91.16.51 CopyPixelsMemory as Memoryblock 14844

91.16.53 CreateHBITMAP as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Creates a HBITMAP for the image for use with Windows Declares.
Example:

```
// get test image
Var logo as Picture = LogoMBS(500)

// create GraphicsMagick image
Var g as new GM16ImageMBS(logo)

// make a HBitmap
Var hBitmap as ptr = g.CreateHBITMAP

// convert back to Xojo picture
Var pic as Picture = WindowsBitmapMBS.HBitmapToPicture(hBitmap, true)

// show in window
Backdrop = pic

// and cleanup memory
WindowsBitmapMBS.DeleteBitmap(hBitmap)
```

Notes: The HBITMAP returned needs to be freed when you are done with it or you risk having a memory leak.

91.16.54 crop(geometry as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Crop image (return subregion of original image).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.crop GM16GeometryMBS.Make(100,200)

Backdrop=image.CopyPicture
```

91.16.55 cycleColormap(amount as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Cycle (rotate) image colormap.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.cycleColormap(5)

image.type = image.TrueColorType

Backdrop=image.CopyPicture
```

91.16.56 Describe(verbose as Integer = 1) as String

MBS GraphicsMagick Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Describes an image by printing its attributes.
Example:

```
Var f As FolderItem = FindFile("test.jpg")

Var g As New GM16ImageMBS(f)
Var s As String = g.Describe(2)
Break
```

Notes: Attributes include the image width, height, size, and others.

verbose: Whether output should be verbose.
Default is 1. Pass 0 to get a shorted output.
Pass 2 to count the number of colors in the image.

91.16.57 despeckle

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Despeckle image (reduce speckle noise).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.despeckle

Backdrop=image.CopyPicture
```

91.16.58 display

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Display image on screen.
Notes: Caution: if an image format is not compatible with the display visual (e.g. JPEG on a colormapped display) then the original image will be altered. Use a copy of the original if this is a problem.

The plugin is not compiled with X11 so this call may not be useful.

91.16.59 edge(radius as Double=0.0)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Edge image (hilight edges in image).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.edge

Backdrop=image.CopyPicture
```

Notes: The radius is the radius of the pixel neighborhood. Specify a radius of zero for automatic radius selection.

91.16.60 emboss(radius as Double=0.0, sigma as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Emboss image (hilight edges with 3D effect).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.emboss

Backdrop=image.CopyPicture
```

Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

91.16.61 enhance

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enhance image (minimize noise).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.enhance

Backdrop=image.CopyPicture
```

91.16.62 erase

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set all image pixels to the current background color.

91.16.63 extent(geo as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an image canvas using background color sized according to geometry and composite existing image on it, with image placement controlled by gravity.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GM16ImageMBS(f)

// extend image to fit
Var geo as new GM16GeometryMBS(500,500)
image.extent geo

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

Notes: Parameters are obtained from existing image properties if they are not specified via a method parameter. Parameters which are supported by image properties (gravity and backgroundColor) update those image properties as a side-effect.
See also:

- 91.16.64 extent(geo as GM16GeometryMBS, backgroundColor as GM16ColorMBS)

- 91.16.65 extent(geo as GM16GeometryMBS, backgroundColor as GM16ColorMBS, gravity as Integer) 14849
- 91.16.66 extent(geo as GM16GeometryMBS, gravity as Integer) 14850

91.16.64 extent(geo as GM16GeometryMBS, backgroundColor as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an image canvas using background color sized according to geometry and composite existing image on it, with image placement controlled by gravity.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GM16ImageMBS(f)

// extend image to fit
Var geo as new GM16GeometryMBS(500,500)
Var col as GM16ColorMBS = GM16ColorMBS.Black
image.extent geo, col

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

Notes: Parameters are obtained from existing image properties if they are not specified via a method parameter. Parameters which are supported by image properties (gravity and backgroundColor) update those image properties as a side-effect.
See also:

- 91.16.63 extent(geo as GM16GeometryMBS) 14848
- 91.16.65 extent(geo as GM16GeometryMBS, backgroundColor as GM16ColorMBS, gravity as Integer) 14849
- 91.16.66 extent(geo as GM16GeometryMBS, gravity as Integer) 14850

91.16.65 extent(geo as GM16GeometryMBS, backgroundColor as GM16ColorMBS, gravity as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an image canvas using background color sized according to geometry and composite existing image on it, with image placement controlled by gravity.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GM16ImageMBS(f)
```

```
// extend image to fit
Var geo as new GM16GeometryMBS(500,500)
Var col as GM16ColorMBS = GM16ColorMBS.Black
image.extent geo, col

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

Notes: Parameters are obtained from existing image properties if they are not specified via a method parameter. Parameters which are supported by image properties (gravity and backgroundColor) update those image properties as a side-effect.
See also:

- 91.16.63 extent(geo as GM16GeometryMBS) 14848
- 91.16.64 extent(geo as GM16GeometryMBS, backgroundColor as GM16ColorMBS) 14849
- 91.16.66 extent(geo as GM16GeometryMBS, gravity as Integer) 14850

91.16.66 extent(geo as GM16GeometryMBS, gravity as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an image canvas using background color sized according to geometry and composite existing image on it, with image placement controlled by gravity.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GM16ImageMBS(f)

// resize proportionally to fit
Var geo as new GM16GeometryMBS(500,500)
image.extent geo, image.CenterGravity

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

Notes: Parameters are obtained from existing image properties if they are not specified via a method parameter. Parameters which are supported by image properties (gravity and backgroundColor) update those image properties as a side-effect.
See also:

- 91.16.63 extent(geo as GM16GeometryMBS) 14848
- 91.16.64 extent(geo as GM16GeometryMBS, backgroundColor as GM16ColorMBS) 14849
- 91.16.65 extent(geo as GM16GeometryMBS, backgroundColor as GM16ColorMBS, gravity as Integer) 14849

91.16.67 Flatten

MBS GraphicsMagick Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flatten the alpha channel.
Notes: Please set background color to define what color goes into the transparent areas.

91.16.68 flip

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flip image (reflect each scanline in the vertical direction).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.flip

Backdrop=image.CopyPicture
```

91.16.69 floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill color across pixels that match the color of the target pixel and are neighbors of the target pixel.
Notes: Uses current fuzz setting when determining color match.
See also:

- 91.16.70 floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 14851
- 91.16.71 floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS) 14852
- 91.16.72 floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 14852

91.16.70 floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill color across pixels starting at target-pixel and stopping at pixels matching specified border color.
Notes: Uses current fuzz setting when determining color match:
See also:

- 91.16.69 floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS) 14851
- 91.16.71 floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS) 14852
- 91.16.72 floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 14852

91.16.71 floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill color across pixels that match the color of the target pixel and are neighbors of the target pixel.
Notes: Uses current fuzz setting when determining color match.
See also:

- 91.16.69 floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS) 14851
- 91.16.70 floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 14851
- 91.16.72 floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 14852

91.16.72 floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill color across pixels starting at target-pixel and stopping at pixels matching specified border color.
Notes: Uses current fuzz setting when determining color match:
See also:

- 91.16.69 floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS) 14851
- 91.16.70 floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 14851
- 91.16.71 floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS) 14852

91.16.73 floodFillOpacity(x as UInt32, y as UInt32, opacity as UInt32, PaintMethod as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill pixels matching color (within fuzz factor) of target pixel(x,y) with replacement opacity value using method.
Example:

```
Var image as new GM16ImageMBS(pic)
// fills opacity channel with 100
image.floodFillOpacity(250,250, 100, 2)
```

Notes: Paint methods:

PointMethod	0	Replace pixel color at point.
ReplaceMethod	1	Replace color for all image pixels matching color at point.
FloodfillMethod	2	Replace color for pixels surrounding point until encountering pixel that fails to match color at point.
FillToBorderMethod	3	Replace color for pixels surrounding point until encountering pixels matching border color.
ResetMethod	4	Replace colors for all pixels in image with pen color.

91.16.74 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill texture across pixels that match the color of the target pixel and are neighbors of the target pixel.
Notes: Uses current fuzz setting when determining color match.
See also:

- 91.16.75 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 14853
- 91.16.76 floodFillTexture(x as UInt32, y as UInt32, fillColor as GM16ColorMBS) 14854
- 91.16.77 floodFillTexture(x as UInt32, y as UInt32, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 14854

91.16.75 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill texture across pixels starting at target-pixel and stopping at pixels matching specified border color.
Notes: Uses current fuzz setting when determining color match.
See also:

- 91.16.74 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS) 14853
- 91.16.76 floodFillTexture(x as UInt32, y as UInt32, fillColor as GM16ColorMBS) 14854
- 91.16.77 floodFillTexture(x as UInt32, y as UInt32, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 14854

91.16.76 floodFillTexture(x as UInt32, y as UInt32, fillColor as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill texture across pixels that match the color of the target pixel and are neighbors of the target pixel.
Notes: Uses current fuzz setting when determining color match.
See also:

- 91.16.74 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS) 14853
- 91.16.75 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 14853
- 91.16.77 floodFillTexture(x as UInt32, y as UInt32, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 14854

91.16.77 floodFillTexture(x as UInt32, y as UInt32, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill texture across pixels starting at target-pixel and stopping at pixels matching specified border color.
Notes: Uses current fuzz setting when determining color match.
See also:

- 91.16.74 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS) 14853
- 91.16.75 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 14853
- 91.16.76 floodFillTexture(x as UInt32, y as UInt32, fillColor as GM16ColorMBS) 14854

91.16.78 flop

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flop image (reflect each scanline in the horizontal direction).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.flop

Backdrop=image.CopyPicture
```

91.16.79 FontMap as string

MBS GraphicsMagick Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current font map in use.
Notes: The MBS Plugin provides to GraphicsMagick the font map to use.
This is a XML defining which fonts are available.
Use this function to learn what fonts may be available or debug to see why a font doesn't load.

91.16.80 fontTypeMetrics(name as string) as GM16TypeMetricMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain font metrics for text string given current font, pointsize, and density settings.

91.16.81 formatExpression(expression as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Format the specified expression similar to command line '-format'.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GM16ImageMBS(f)

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

Notes: For example "%wx%h" is converted to a string containing image WIDTHxHEIGHT like "640x480".

91.16.82 frame

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a decorative frame around the image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.frame

Backdrop=image.CopyPicture
```

See also:

- 91.16.83 frame(geometry as GM16GeometryMBS) 14856
- 91.16.84 frame(width as UInt32, height as UInt32, innerBevel as Integer=6, outerBevel as Integer=6) 14857

91.16.83 frame(geometry as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a decorative frame around the image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.frame(GM16GeometryMBS.Make("10x10"))

Backdrop=image.CopyPicture
```

See also:

- 91.16.82 frame 14856
- 91.16.84 frame(width as UInt32, height as UInt32, innerBevel as Integer=6, outerBevel as Integer=6) 14857

91.16.84 frame(width as UInt32, height as UInt32, innerBevel as Integer=6, outerBevel as Integer=6)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a decorative frame around the image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.frame(15,15)

Backdrop=image.CopyPicture
```

See also:

- 91.16.82 frame 14856
- 91.16.83 frame(geometry as GM16GeometryMBS) 14856

91.16.85 frameGeometryDefault as String

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default geometry description for frame.

91.16.86 gamma(gammaRed as Double, gammaGreen as Double, gammaBlue as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gamma correct the image or individual image channels.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.gamma(1,2,3)

Backdrop=image.CopyPicture
```

See also:

- 91.16.254 gamma as Double 14913

91.16.87 gaussianBlur(width as Double, sigma as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gaussian blur image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.gaussianBlur(30, 10)

Backdrop=image.CopyPicture
```

Notes: The number of neighbor pixels to be included in the convolution mask is specified by width. The standard deviation of the gaussian bell curve is specified by sigma

91.16.88 gaussianBlurChannel(channel as Integer, width as Double, sigma as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gaussian blur image channel.
Notes: The number of neighbor pixels to be included in the convolution mask is specified by width. The standard deviation of the gaussian bell curve is specified by sigma.

91.16.89 getChromaBluePrimary(byref x as Double, byref y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity blue primary point.

91.16.90 getchromaGreenPrimary(byref x as Double, byref y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity green primary point.
Notes: e.g. x=0.3, y=0.6

91.16.91 getchromaRedPrimary(byref x as Double, byref y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity red primary point
Notes: e.g. x=0.64, y=0.33

91.16.92 getchromaWhitePoint(byref x as Double, byref y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity white point
Notes: e.g. x=0.3127, y=0.329

91.16.93 getConstPixels(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transfers read-only pixels from the image to the pixel cache as defined by the specified region

91.16.94 GetEXIFOrientation(byref orientation as integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries orientation from EXIF.
Notes: Orientation is set to number from 0 to 8 depending on rotation. -1 if unknown.
This function can only read orientation, if there is an EXIF block in image.
Returns true for success and false for failure.

For new development, please use ExifTagsMBS class instead.

91.16.95 getPixels(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transfers pixels from the image to the pixel cache as defined by the specified region.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GM16ImageMBS(f)

// get pointer to some pixels to write
Var x as ptr = g.getPixels(0, 0, 100, 100)

// draw a red line to the pixel buffer
Var o as Integer
for i as Integer = 0 to 99
o = 100 * i + i
x.UInt32(o * 4) = &hFFFF0000
next

// write back
g.syncPixels

// show
me.Backdrop = g.CopyPicture
```

Notes: Modified pixels may be subsequently transferred back to the image via syncPixels. This method is valid for DirectClass images.

91.16.96 Graphics as GM16GraphicsMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a graphics object for this image.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)

Backdrop=image.CopyPicture
```

Notes: Using the graphics object you can draw on the image.

91.16.97 haldClut(image as GM16ImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply a color lookup table (Hald CLUT) to the image.

91.16.98 Hash(Size as Integer = 8) as String

MBS GraphicsMagick Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a hash of the image.
Example:

```
Var p As Picture = LogoMBS(500)
Var g As New GM16ImageMBS(p)
MessageBox g.Hash
```

Notes: Hash is returned as 64 characters being 1 or 0.
We convert image to 8x8, turn grayscale and check if pixels are above or below mean value.
This hash is quite immune against resizing, compression artifacts and hue changes.
You can use LevenshteinDistanceMBS or JaroWinklerDistanceMBS to compare two hashes.

Added size parameter for version 22.4:
The size of the bitmap. Value from 8 to 1024. Default is 8.

91.16.99 implode(factor as Double=0.0)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Implode image (special effect).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.implode(0.3)

Backdrop=image.CopyPicture
```

91.16.100 IsLoggingEnabled as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether logging is enabled.
Notes: Returns true if we log GraphicsMagick usage.

91.16.101 JasperLibVersion as string

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries version string for jasper library.

91.16.102 label(text as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assign a label to an image.
Notes: Use this option to assign a specific label to the image. Optionally you can include the image filename, type, width, height, or scene number in the label by embedding special format characters. If the first character of string is @, the image label is read from a file titled by the remaining characters in the string. When converting to Postscript, use this option to specify a header string to print above the image.
See also:

- 91.16.265 label as string 14917

91.16.103 level(black_point as Double, white_point as Double, mid_point as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Level image to increase image contrast, and/or adjust image gamma.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.level(0, 127.0)

Backdrop=image.CopyPicture
```

Notes: Adjust the levels of the image by scaling the colors falling between specified white and black points to the full available quantum range. The parameters provided represent the black, mid (gamma), and white points. The black point specifies the darkest color in the image. Colors darker than the black point are set to zero. Mid point (gamma) specifies a gamma correction to apply to the image. White point specifies the lightest color in the image. Colors brighter than the white point are set to the maximum quantum value. The black and white point have the valid range 0 to MaxRGB while mid (gamma) has a useful range of 0 to ten:

91.16.104 levelChannel(channel as Integer, black_point as Double, white_point as Double, mid_point as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Level image channel to increase image contrast, and/or adjust image gamma.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.levelChannel(image.BlueChannel, 0, 127.0)

Backdrop=image.CopyPicture
```

Notes: Adjust the levels of the image channel by scaling the colors falling between specified white and black points to the full available quantum range. The parameters provided represent the black, mid (gamma), and white points. The black point specifies the darkest color in the image. Colors darker than the black point are set to zero. Mid point (gamma) specifies a gamma correction to apply to the image. White point specifies the lightest color in the image. Colors brighter than the white point are set to the maximum quantum value. The black and white point have the valid range 0 to MaxRGB while mid (gamma) has a useful range of 0 to ten.

91.16.105 LibVersion as String

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the version string of the GraphicsMagick library.

91.16.106 LoadIconvLibrary(path as String, byref Error as String) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the iconv library.
Notes: The GraphicsMagick classes may use libiconv for text encoding conversion.
If you explicitly need, you can load the library on start of solution.

MBS Plugin may try to load iconv.dll/dylib/so automatically when first iconv function is called.

91.16.107 MagickVersion as string

MBS GraphicsMagick Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the version text of the GraphicsMagick library.

91.16.108 magnify

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Magnify image by integral size (double the dimensions)
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.magnify

Backdrop=image.CopyPicture
```

91.16.109 map(mapImage as GM16ImageMBS, dither as boolean=false)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remap image colors with closest color from a reference image.
Example:

```
// some picture we want to map colors
Var pic as Picture = LogoMBS(500)

// build a picture with palette
Var backgroundColor as new GM16ColorMBS(255,255,255) // white
Var size as new GM16GeometryMBS(10,10)

Var i as new GM16ImageMBS(pic)
Var x as new GM16ImageMBS(size, backgroundColor)

x.pixelColor(0,0) = new GM16ColorMBS(0 ,0 ,0 ) // black
x.pixelColor(0,1) = new GM16ColorMBS(255,0 ,0 ) // red
x.pixelColor(0,2) = new GM16ColorMBS(0 ,255,0 ) // green
x.pixelColor(0,3) = new GM16ColorMBS(0 ,0 ,255) // blue
x.pixelColor(0,4) = new GM16ColorMBS(255,255,0 ) // yellow
x.pixelColor(0,5) = new GM16ColorMBS(0 ,255,255) // cyan
x.pixelColor(0,6) = new GM16ColorMBS(255,0 ,255) // magenta

// do the map
i.map(x, false)

// convert result from palette picture to bitmap picture
i.type = i.TrueColorType

// and copy picture to backdrop
Backdrop = i.CopyPicture
```

Notes: Set dither to true in to apply Floyd/Steinberg error diffusion to the image. By default, color reduction chooses an optimal set of colors that best represent the original image. Alternatively, you can choose a particular set of colors from an image file with this option.

91.16.110 matteFloodfill(target as GM16ColorMBS, opacity as UInt32, x as Integer, y as Integer, PaintMethod as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Floodfill designated area with a replacement opacity value.
Notes: Paint methods:

PointMethod	0	Replace pixel color at point.
ReplaceMethod	1	Replace color for all image pixels matching color at point.
FloodfillMethod	2	Replace color for pixels surrounding point until encountering pixel that fails to match color at point.
FillToBorderMethod	3	Replace color for pixels surrounding point until encountering pixels matching border color.
ResetMethod	4	Replace colors for all pixels in image with pen color.

91.16.111 medianFilter(radius as Double=0.0)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Filter image by replacing each pixel component with the median color in a circular neighborhood.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.medianFilter(10)

Backdrop=image.CopyPicture
```

91.16.112 minify

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reduce image by integral (half) size.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.minify

Backdrop=image.CopyPicture
```

91.16.113 modequalizeifyImage

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Not documented.

91.16.114 modifyImage

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prepare to update image (copy if reference >1).
Notes: Normally Magick++'s implicit reference counting takes care of all instance management. In the rare case that the automatic instance management does not work, use this method to assure that there is only one reference to the image to be modified. It should be used in the cases where a GraphicsMagick C function is used directly on an image which may have multiple references:

91.16.115 modulate(brightness as Double, saturation as Double, hue as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Modulate percent hue, saturation, and brightness of an image.
Example:

```
Var logo as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(logo)

image.type = image.TrueColorType

// brightness 150%
image.modulate(150,100,100)
backdrop = image.CopyPicture
```

Notes: Modulation of saturation and brightness is as a ratio of the current value (100 for no change). Modulation of hue is an absolute rotation of -180 degrees to +180 degrees from the current position corresponding to an argument range of 0 to 200 (100 for no change).

91.16.116 montageGeometry as GM16GeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tile size and offset within an image montage.
Notes: Only valid for montage images.

91.16.117 motionBlur(radius as Double, sigma as Double, angle as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Motion blur image with specified blur factor.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.motionBlur(30,10,90)

Backdrop=image.CopyPicture
```

Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels. The angle parameter specifies the angle the object appears to be comming from (zero degrees is from the right).

91.16.118 negate(grayscale as boolean=false)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negate colors in image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.negate

Backdrop=image.CopyPicture
```

Notes: Set grayscale to only negate grayscale values in image.

91.16.119 normalize

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Normalize image (increase contrast by normalizing the pixel values to span the full range of color values).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.normalize

Backdrop=image.CopyPicture
```

91.16.120 oilPaint(radius as Double=3.0)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Oilpaint image (image looks like an oil painting).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.oilPaint

Backdrop=image.CopyPicture
```

91.16.121 opacity(opacity as UInt32)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set or attenuate the opacity channel in the image.
Notes: If the image pixels are opaque then they are set to the specified opacity value, otherwise they are blended with the supplied opacity value. The value of opacity ranges from 0 (completely opaque) to MaxRGB. The defines OpaqueOpacity and TransparentOpacity are available to specify completely opaque or completely transparent, respectively.

91.16.122 opaque(opaqueColor as GM16ColorMBS, penColor as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Change color of specified opaque pixel to specified pen color.

91.16.123 ping(data as GM16BlobMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads information for an image from the blob.
Notes: Ping is similar to read except only enough of the image is read to determine the image columns, rows, and filesize. Access the columns, rows, and fileSize attributes after invoking ping. The image pixels are not valid after calling ping.
See also:

- 91.16.124 ping(file as folderitem) 14870
- 91.16.125 ping(Path as string) 14870

91.16.124 ping(file as folderitem)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads information for an image from the file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")

// try with Constructor (same as read)
Var t1 as Double = Microseconds
Var g1 as new GM16ImageMBS(f)

// now just ping
Var t2 as Double = Microseconds
Var g2 as new GM16ImageMBS
g2.ping(f)

// or read
Var t3 as Double = Microseconds
Var g3 as new GM16ImageMBS
g3.read(f)

Var t4 as Double = Microseconds

// show speeds
MessageBox str(T4-t3)+" ¬µs for read"+EndOfLine+_
str(T3-t2)+" ¬µs for ping"+EndOfLine+_
str(T2-t1)+" ¬µs for Constructor"
```

Notes: Ping is similar to read except only enough of the image is read to determine the image columns, rows, and filesize. Access the columns, rows, and fileSize attributes after invoking ping. The image pixels are not valid after calling ping.
See also:

- 91.16.123 ping(data as GM16BlobMBS) 14869
- 91.16.125 ping(Path as string) 14870

91.16.125 ping(Path as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads information for an image from the image specification.
Notes: Ping is similar to read except only enough of the image is read to determine the image columns, rows, and filesize. Access the columns, rows, and fileSize attributes after invoking ping. The image pixels are not valid after calling ping.
See also:

- 91.16.123 ping(data as GM16BlobMBS) 14869
- 91.16.124 ping(file as folderitem) 14870

91.16.126 PNGLibVersion as string

MBS GraphicsMagick Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries PNG library version string.

91.16.127 Profiles as String()

MBS GraphicsMagick Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the list of available profiles.
Notes: Profile identifiers include usually "8BIM", EXIF, "ICM", "IPTC" or "XMP".

91.16.128 quantize(measureError as boolean=false)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Quantize image (reduce number of colors).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.quantize

image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

Notes: Set measureError to true in order to calculate error attributes.

91.16.129 QuantumDepth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the quantum depth.

91.16.130 quantumOperator(channel as Integer, Operator as Integer, rvalue as Double)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply an arithmetic or bitwise operator to the image pixel quantums.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GM16ImageMBS(f)

const AddQuantumOp = 1
const ThresholdQuantumOp = 10

g.quantumOperator( g.AllChannels, AddQuantumOp, 100)

// show
me.Backdrop = g.CopyPicture
```

See also:

- 91.16.131 quantumOperator(x as Integer, y as Integer, columns as Integer, rows as Integer, channel as Integer, Operator as Integer, rvalue as Double) 14872

91.16.131 quantumOperator(x as Integer, y as Integer, columns as Integer, rows as Integer, channel as Integer, Operator as Integer, rvalue as Double)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply an arithmetic or bitwise operator to the image pixel quantums.
See also:

- 91.16.130 quantumOperator(channel as Integer, Operator as Integer, rvalue as Double) 14872

91.16.132 raiseGeometryDefault as String

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default geometry description for raise.

91.16.133 raiseImage

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Raise image (lighten or darken the edges of an image to give a 3-D raised or lowered effect).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.raiseImage

Backdrop=image.CopyPicture
```

See also:

- 91.16.134 raiseImage(geometry as GM16GeometryMBS, raisedFlag as boolean=false) 14873

91.16.134 raiseImage(geometry as GM16GeometryMBS, raisedFlag as boolean=false)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Raise image (lighten or darken the edges of an image to give a 3-D raised or lowered effect).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.raiseImage(GM16GeometryMBS.Make(5,8))

Backdrop=image.CopyPicture
```

See also:

- 91.16.133 raiseImage 14872

91.16.135 randomThreshold(thresholds as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Random threshold image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.randomThreshold(GM16GeometryMBS.make("50x200"))

image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

Notes: Changes the value of individual pixels based on the intensity of each pixel compared to a random threshold. The result is a low-contrast, two color image. The thresholds argument is a geometry containing LOWxHIGH thresholds. If the string contains 2x2, 3x3, or 4x4, then an ordered dither of order 2, 3, or 4 will be performed instead. If a channel argument is specified then only the specified channel is altered. This is a very fast alternative to 'quantize' based dithering.

91.16.136 randomThresholdChannel(thresholds as GM16GeometryMBS, channel as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Random threshold image channel.
Notes: Changes the value of individual pixels based on the intensity of each pixel compared to a random threshold. The result is a low-contrast, two color image. The thresholds argument is a geometry containing LOWxHIGH thresholds. If the string contains 2x2, 3x3, or 4x4, then an ordered dither of order 2, 3, or 4 will be performed instead. If a channel argument is specified then only the specified channel is altered. This is a very fast alternative to 'quantize' based dithering.

91.16.137 read(blob as GM16BlobMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read single image frame from in-memory Blob.
Example:

```
// get some image data (e.g. from blob in database)
Var logo as Picture = LogoMBS(500)
Var jpegData as string = PictureToJPEGStringMBS(logo, 80)

// new image
Var mp as new GM16ImageMBS
Var blob as new GM16BlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
'mp.type = mp.TrueColorMatteType
Backdrop=mp.CombinePictureWithMask
```

See also:

- 91.16.138 read(blob as GM16BlobMBS, size as GM16GeometryMBS) 14875
- 91.16.139 read(blob as GM16BlobMBS, size as GM16GeometryMBS, depth as Integer) 14875

- 91.16.140 read(blob as GM16BlobMBS, size as GM16GeometryMBS, depth as Integer, magick as string) 14876
- 91.16.141 read(blob as GM16BlobMBS, size as GM16GeometryMBS, magick as string) 14877
- 91.16.142 read(file as folderitem) 14877
- 91.16.143 read(path as string) 14878
- 91.16.144 read(size as GM16GeometryMBS, file as folderitem) 14878
- 91.16.145 read(size as GM16GeometryMBS, Path as string) 14879
- 91.16.146 read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 14879

91.16.138 read(blob as GM16BlobMBS, size as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read single image frame of specified size from in-memory Blob.
See also:

- 91.16.137 read(blob as GM16BlobMBS) 14874
- 91.16.139 read(blob as GM16BlobMBS, size as GM16GeometryMBS, depth as Integer) 14875
- 91.16.140 read(blob as GM16BlobMBS, size as GM16GeometryMBS, depth as Integer, magick as string) 14876

- 91.16.142 read(file as folderitem) 14877
- 91.16.143 read(path as string) 14878
- 91.16.144 read(size as GM16GeometryMBS, file as folderitem) 14878
- 91.16.145 read(size as GM16GeometryMBS, Path as string) 14879
- 91.16.146 read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 14879

91.16.139 read(blob as GM16BlobMBS, size as GM16GeometryMBS, depth as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read single image frame of specified size and depth from in-memory Blob.
See also:

- 91.16.137 read(blob as GM16BlobMBS) 14874
- 91.16.138 read(blob as GM16BlobMBS, size as GM16GeometryMBS) 14875
- 91.16.140 read(blob as GM16BlobMBS, size as GM16GeometryMBS, depth as Integer, magick as string) 14876
- 91.16.141 read(blob as GM16BlobMBS, size as GM16GeometryMBS, magick as string) 14877
- 91.16.142 read(file as folderitem) 14877
- 91.16.143 read(path as string) 14878
- 91.16.144 read(size as GM16GeometryMBS, file as folderitem) 14878
- 91.16.145 read(size as GM16GeometryMBS, Path as string) 14879
- 91.16.146 read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 14879

91.16.140 read(blob as GM16BlobMBS, size as GM16GeometryMBS, depth as Integer, magick as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read single image frame of specified size, depth, and format from in-memory Blob.
See also:

- 91.16.137 read(blob as GM16BlobMBS) 14874
- 91.16.138 read(blob as GM16BlobMBS, size as GM16GeometryMBS) 14875
- 91.16.139 read(blob as GM16BlobMBS, size as GM16GeometryMBS, depth as Integer) 14875
- 91.16.141 read(blob as GM16BlobMBS, size as GM16GeometryMBS, magick as string) 14877
- 91.16.142 read(file as folderitem) 14877
- 91.16.143 read(path as string) 14878

- 91.16.140 read(blob as GM16BlobMBS, size as GM16GeometryMBS, depth as Integer, magick as string) 14876
- 91.16.141 read(blob as GM16BlobMBS, size as GM16GeometryMBS, magick as string) 14877
- 91.16.142 read(file as folderitem) 14877
- 91.16.143 read(path as string) 14878
- 91.16.144 read(size as GM16GeometryMBS, file as folderitem) 14878
- 91.16.146 read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 14879

91.16.146 read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read single image frame from an array of raw pixels, with specified storage type (ConstituteImage).
Notes: Returns an Image corresponding to an image stored in a raw memory array format. The pixel data must be in scanline order top-to-bottom. The data can be unsigned char, unsigned short int, unsigned int, unsigned long, float, or double. Float and double require the pixels to be normalized to the range [0..1] , otherwise the range is [0..MaxVal] where MaxVal is the maximum possible value for that type.

Note that for most 32-bit architectures the size of an unsigned long is the same as unsigned int, but for 64-bit architectures observing the LP64 standard, an unsigned long is 64 bits, while an unsigned int remains 32 bits. This should be considered when deciding if the data should be described as "Integer" or "Long".

For example, to create a 640x480 image from unsigned red-green-blue character data, use

image = new GM16ImageMBS(640, 480, "RGB", GM16ImageMBS.StorageTypeCharPixel, pixels);

width: width in pixels of the image.
height: height in pixels of the image.
map: This string reflects the expected ordering of the pixel array. It can be any combination or order of R = red, G = green, B = blue, A = alpha (same as Transparency), O = Opacity, T = Transparency, C = cyan, Y = yellow, M = magenta, K = black, or I = intensity (for grayscale). Specify "P" = pad, to skip over a quantum which is intentionally ignored. Creation of an alpha channel for CMYK images is currently not supported.
type: Define the data type of the pixels. Float and double types are expected to be normalized [0..1] otherwise [0..MaxRGB] . Choose from these types: StorageTypeCharPixel, StorageTypeShortPixel, StorageTypeIntegerPixel, StorageTypeLongPixel, StorageTypeFloatPixel, or StorageTypeDoublePixel.
pixels: This array of values contain the pixel components as defined by map and type. You must preallocate this array where the expected length varies depending on the values of width, height, map, and type.

91.16.147 reduceNoise

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reduce noise in image using a noise peak elimination filter.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.reduceNoise

Backdrop=image.CopyPicture
```

See also:

- 91.16.148 reduceNoise(order as Double) 14881

91.16.148 reduceNoise(order as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reduce noise in image using a noise peak elimination filter.
See also:

- 91.16.147 reduceNoise 14880

91.16.149 ReleaseDate as String

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the release date of the used graphics magick library.
Notes: We update the library only when someone needs an update, so if you need, please contact us.

91.16.150 repage

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resets the image page canvas and position.

91.16.151 resize(geo as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image, specifying only geometry, with filter and blur obtained from Image default.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GM16ImageMBS(f)

// resize proportionally to fit
Var geo as new GM16GeometryMBS(500,500)
image.resize geo

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

Notes: Same result as 'zoom' method.
See also:

- 91.16.152 resize(geo as GM16GeometryMBS, filterType as Integer) 14882
- 91.16.153 resize(geo as GM16GeometryMBS, filterType as Integer, blur as double) 14882

91.16.152 resize(geo as GM16GeometryMBS, filterType as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image, specifying geometry and filter, with blur using Image default.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GM16ImageMBS(f)

// resize proportionally to fit
Var geo as new GM16GeometryMBS(500,500)
image.resize geo, image.CubicFilter

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

See also:

- 91.16.151 resize(geo as GM16GeometryMBS) 14881
- 91.16.153 resize(geo as GM16GeometryMBS, filterType as Integer, blur as double) 14882

91.16.153 resize(geo as GM16GeometryMBS, filterType as Integer, blur as double)

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image, specifying geometry, filter, and blur.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GM16ImageMBS(f)

// resize proportionally to fit
Var geo as new GM16GeometryMBS(500,500)
image.resize geo, image.CubicFilter, 3

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

See also:

- 91.16.151 resize(geo as GM16GeometryMBS) 14881
- 91.16.152 resize(geo as GM16GeometryMBS, filterType as Integer) 14882

91.16.154 roll(columns as UInt32, rows as UInt32)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Roll image (rolls image vertically and horizontally) by specified number of columnms and rows).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.roll(30,30)

Backdrop=image.CopyPicture
```

See also:

- 91.16.155 roll(roll as GM16GeometryMBS) 14883

91.16.155 roll(roll as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Roll image (rolls image vertically and horizontally) by specified number of columnms and rows).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.roll(GM16GeometryMBS.Make(0,0,30,30))

Backdrop=image.CopyPicture
```

See also:

- 91.16.154 roll(columns as UInt32, rows as UInt32) 14883

91.16.156 rotate(degree as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rotate image counter-clockwise by specified number of degrees.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.rotate(30)
```

Backdrop=image.CopyPicture

91.16.157 sample(geometry as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image by using pixel sampling algorithm.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.sample GM16GeometryMBS.make(100,100)

Backdrop=image.CopyPicture
```

91.16.158 scale(geometry as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image by using simple ratio algorithm which provides good quality.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.scale new GM16GeometryMBS(100,100)

Backdrop=image.CopyPicture
```

91.16.159 segment(clusterThreshold as Double=1.0, smoothingThreshold as Double=1.5)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Segment (coalesce similar image components) by analyzing the histograms of the color components and identifying units that are homogeneous with the fuzzy c-means technique.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.segment
```

image.type = image.TrueColorType

Backdrop=image.CopyPicture

Notes: A histogram is built for the image. This histogram is filtered to reduce noise and a second derivative of the histogram plot is built and used to identify potential cluster colors (peaks in the histogram). The cluster colors are then validated by scanning through all of the pixels to see how many pixels fall within each cluster. Some candidate cluster colors may not match any of the image pixels at all and should be discarded. Specify clusterThreshold, as the number of pixels matching a cluster color in order for the cluster to be considered valid. SmoothingThreshold eliminates noise in the second derivative of the histogram. As the value is increased, you can expect a smoother second derivative. The default is 1.5.

91.16.160 setChromaBluePrimary(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity blue primary point.
Notes: e.g. x=0.15, y=0.06

91.16.161 setchromaGreenPrimary(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity green primary point.
Notes: e.g. x=0.3, y=0.6

91.16.162 setchromaRedPrimary(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity red primary point
Notes: e.g. x=0.64, y=0.33

91.16.163 setchromaWhitePoint(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity white point
Notes: e.g. x=0.3127, y=0.329

91.16.164 SetEXIFOrientation(orientation as integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets orientation for EXIF.
Notes: Changing orientation may need to set orientation via SetOrientation and SetEXIFOrientation. With a JPEG you have orientation both in JPEG header and in EXIF metadata.
Returns true for success and false for failure.

For new development, please use ExifTagsMBS class instead.

91.16.165 SetLogEventMask(events as String)

MBS GraphicsMagick Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set log event mask.
Example:

```
GM16ImageMBS.SetLogEventMask("coder,annotate")
```

Notes: Defines which events are logged.
By default logging goes to stderr, so on macOS you may need to run your app via Terminal to see logs there.

List of events includes: none, Configure, Annotate, Render, Transform, Locale, Coder, X11, Cache, Blob, Deprecate, User, Resource, TemporaryFile, Exception, Option, Information, Warning, Error, FatalError and All.

91.16.166 SetPicture(pic as picture, x as Integer, y as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the picture into the Image at the given position.

91.16.167 SetPictureMask(maskpic as picture, x as Integer, y as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the picture into the Image's mask at the given position.
Example:

```
// this converts 32 bit PNG with alpha channel to BMP
```

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var p as Picture = Picture.Open(f)

Var g as new GM16ImageMBS( new GM16GeometryMBS(p.Width, p.Height), new GM16ColorGrayMBS(1.0))

g.type = g.TrueColorMatteType
g.matte = True
g.magick = "BMP"

g.SetPicture(p, 0, 0)
g.SetPictureMask(p.mask.invertMBS, 0, 0)

f = SpecialFolder.Desktop.Child("test.bmp")
g.write(f)
```

91.16.168 setPixels(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allocates a pixel cache region to store image pixels as defined by the region rectangle.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GM16ImageMBS(f)

// get pointer to some pixels to write
Var x as ptr = g.setPixels(0, 0, 100, 100)

// draw a red line to the pixel buffer
Var o as Integer
for i as Integer = 0 to 99
o = 100 * i + i
x.UInt32(o * 4) = &hFFFF0000
next

// write back
g.syncPixels

// show
me.Backdrop = g.CopyPicture
```

Notes: This area is subsequently transferred from the pixel cache to the image via syncPixels.

91.16.169 setStrokeDashArray(values() as Double)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets stroke dash pattern.
Notes: Specify the pattern of dashes and gaps used to stroke paths. The strokeDashArray represents a zero-terminated array of numbers that specify the lengths of alternating dashes and gaps in pixels. If an odd number of values is provided, then the list of values is repeated to yield an even number of values. A typical strokeDashArray array might contain the members 5 3 2 0, where the zero value indicates the end of the pattern array.

91.16.170 shade(azimuth as Double=30.0, elevation as Double=30.0, colorShading as boolean=false)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shade image using distant light source.
Notes: Specify azimuth and elevation as the position of the light source. By default, the shading results as a grayscale image.. Set colorShading to true to shade the red, green, and blue components of the image.

91.16.171 sharpen(radius as Double=0.0, sigma as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sharpen pixels in image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.sharpen

Backdrop=image.CopyPicture
```

Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

91.16.172 sharpenChannel(channel as Integer, radius as Double=0.0, sigma as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sharpen pixels in image channel.

Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

91.16.173 shave(geometry as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shave pixels from image edges.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.shave(new GM16GeometryMBS(200,200))

Backdrop=image.CopyPicture
```

91.16.174 shear(xShearAngle as Double, yShearAngle as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shear image (create parallelogram by sliding image by X or Y axis).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.shear(10,20)

Backdrop=image.CopyPicture
```

Notes: Shearing slides one edge of an image along the X or Y axis, creating a parallelogram. An X direction shear slides an edge along the X axis, while a Y direction shear slides an edge along the Y axis. The amount of the shear is controlled by a shear angle. For X direction shears, x degrees is measured relative to the Y axis, and similarly, for Y direction shears y degrees is measured relative to the X axis. Empty triangles left over from shearing the image are filled with the color defined as borderColor.

91.16.175 signature(force as boolean=false) as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image textual signature.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

MessageBox image.signature

Backdrop=image.CopyPicture
```

Notes: Set force to true in order to re-calculate the signature regardless of whether the image data has been modified.

91.16.176 solarize(factor as Double=50.0)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Solarize image (similar to effect seen when exposing a photographic film to light during the development process)
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.solarize

Backdrop=image.CopyPicture
```

91.16.177 spread(amount as UInt32=3)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Spread pixels randomly within image by specified ammount
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.spread 5

Backdrop=image.CopyPicture
```

91.16.178 statistics as GM16ImageStatisticsMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain image statistics.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GM16ImageMBS(f)
Var stat as GM16ImageStatisticsMBS = g.statistics
Var gs as GM16ImageChannelStatisticsMBS = stat.blue

MessageBox "blue channel: "+str(gs.minimum)+"-"+str(Gs.maximum)+", mean "+str(gs.mean)
```

Notes: Statistics are normalized to the range of 0.0 to 1.0 and are output to the specified ImageStatistics structure.

91.16.179 stegano(watermark as GM16ImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add a digital watermark to the image (based on second image).
Example:

```
Var p as Picture = LogoMBS(500)
Var p1 as Picture = New Picture(550,500,32)
Var p2 as Picture = New Picture(550,500,32)

p1.Graphics.DrawPicture p, 0,0
p2.Graphics.DrawPicture p,50,0

Var image1 as new GM16ImageMBS(p1)
Var image2 as new GM16ImageMBS(p2)

image2.zoom(new GM16GeometryMBS(100,100)) // scale down

// add watermark
image1.stegano(image2)

// now make a threshold so you see the difference
image1.threshold 254

image1.type = image1.TrueColorType
Backdrop=image1.CopyPicture
```

91.16.180 stereo(rightImage as GM16ImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an image which appears in stereo when viewed with red-blue glasses (Red image on left, blue on right)
Example:

```
Var p as Picture = LogoMBS(500)
Var p1 as Picture = New Picture(550,500,32)
Var p2 as Picture = New Picture(550,500,32)

p1.Graphics.DrawPicture p, 0,0
p2.Graphics.DrawPicture p,50,0

Var image1 as new GM16ImageMBS(p1)
Var image2 as new GM16ImageMBS(p2)

image1.stereo(IMAGE2)

Backdrop=image1.CopyPicture
```

91.16.181 strip

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove all profiles and text attributes from the image.

91.16.182 strokeDashArray as Double()

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries stroke dash pattern.
Notes: Specify the pattern of dashes and gaps used to stroke paths. The strokeDashArray represents a zero-terminated array of numbers that specify the lengths of alternating dashes and gaps in pixels. If an odd number of values is provided, then the list of values is repeated to yield an even number of values. A typical strokeDashArray array might contain the members 5 3 2 0, where the zero value indicates the end of the pattern array.

91.16.183 swirl(degree as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Swirl image (image pixels are rotated by degrees).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)
```

```
image.swirl 200

Backdrop=image.CopyPicture
```

91.16.184 syncPixels

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transfers the image cache pixels to the image.

91.16.185 texture(texture as GM16ImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Channel a texture on pixels matching image background color.

91.16.186 threshold(degree as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Threshold image channels (below threshold becomes black, above threshold becomes white).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.threshold 127

// convert to RGB so CopyPicture works
image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

Notes: The range of the threshold parameter is 0 to MaxRGB.

91.16.187 thumbnail(geometry as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image using several algorithms to make smaller images very quickly.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GM16ImageMBS(f)

// make thumbnail
Var geo as new GM16GeometryMBS(100, 100)
g.thumbnail(geo)

// show
me.Backdrop = g.CopyPicture
```

91.16.188 TIFFLibVersion as string

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries version string for tiff library.

91.16.189 transform(imageGeometry as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transform image based on image and crop geometries.
Notes: Crop geometry is optional.
See also:

- 91.16.190 transform(imageGeometry as GM16GeometryMBS, cropGeometry as GM16GeometryMBS) 14894

91.16.190 transform(imageGeometry as GM16GeometryMBS, cropGeometry as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transform image based on image and crop geometries.
Notes: Crop geometry is optional.
See also:

- 91.16.189 transform(imageGeometry as GM16GeometryMBS) 14894

91.16.191 transformOrigin(tx as Double, ty as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Origin of coordinate system to use when annotating with text or drawing.

91.16.192 transformReset

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reset transformation parameters to default.

91.16.193 transformRotation(angle as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rotation to use when annotating with text or drawing.

91.16.194 transformScale(tx as Double, ty as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scale to use when annotating with text or drawing.

91.16.195 transformSkewX(x as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Skew to use in X axis when annotating with text or drawing.

91.16.196 transformSkewY(y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Skew to use in Y axis when annotating with text or drawing.

91.16.197 transparent(color as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add matte channel to image, setting pixels matching color to transparent.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

Var c as new GM16ColorMBS("white")
image.transparent(c)

Backdrop=image.CombinePictureWithMask
```

91.16.198 trim

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Trim edges that are the background color from the image.
Example:

```
Var p as Picture = LogoMBS(500)
// make the logo picture bigger
Var q as Picture = New Picture(700,700,32)

q.Graphics.DrawPicture p,100,100

Var image as new GM16ImageMBS(q)

// now trim the white border away
image.trim

Backdrop=image.CopyPicture
```

Notes: See ColorFuzz property for how far the pixel value can differentiate.

91.16.199 unregisterId

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Not documented.

91.16.200 unsharpmask(radius as Double, sigma as Double, amount as Double, threshold as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replace image with a sharpened version of the original image using the unsharp mask algorithm.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.unsharpmask(10,1,0.5,50)

Backdrop=image.CopyPicture
```

Notes: radius: the radius of the Gaussian, in pixels, not counting the center pixel.
sigma: the standard deviation of the Gaussian, in pixels.
amount: the percentage of the difference between the original and the blur image that is added back into the original.
threshold: the threshold in pixels needed to apply the diffence amount.

91.16.201 unsharpmaskChannel(channel as Integer, radius as Double, sigma as Double, amount as Double, threshold as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replace image channel with a sharpened version of the original image using the unsharp mask algorithm.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.unsharpmaskChannel(Image.RedChannel, 10,1,0.5,50)

Backdrop=image.CopyPicture
```

Notes:

91.16.202 wave(amplitude as Double=25.0, wavelength as Double=150.0)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Map image pixels to a sine wave.
Example:

channel:	image channel to modify.
radius:	the radius of the Gaussian, in pixels, not counting the center pixel.
sigma:	the standard deviation of the Gaussian, in pixels.
amount:	the percentage of the difference between the original and the blur image that is added back into the original.
threshold:	the threshold in pixels needed to apply the diffence amount.

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.wave

Backdrop=image.CopyPicture
```

91.16.203 WebPVersion as String

MBS GraphicsMagick Plugin, Plugin Version: 23.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns version of WebP library.
Notes: Should be a version string like "1.3.0".

91.16.204 write(blob as GM16BlobMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write single image frame to in-memory Blob, with optional format and adjoin parameters.
See also:

- 91.16.205 write(blob as GM16BlobMBS, magick as string) 14899
- 91.16.206 write(blob as GM16BlobMBS, magick as string, depth as UInt32) 14899
- 91.16.207 write(file as folderitem) 14900
- 91.16.208 write(Path as string) 14901
- 91.16.209 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr) 14901

91.16.205 write(blob as GM16BlobMBS, magick as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write single image frame to in-memory Blob, with optional format and adjoin parameters.
See also:

- 91.16.204 write(blob as GM16BlobMBS) 14899
- 91.16.206 write(blob as GM16BlobMBS, magick as string, depth as UInt32) 14899
- 91.16.207 write(file as folderitem) 14900
- 91.16.208 write(Path as string) 14901
- 91.16.209 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr) 14901

91.16.206 write(blob as GM16BlobMBS, magick as string, depth as UInt32)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write single image frame to in-memory Blob, with optional format and adjoin parameters.
See also:

- 91.16.204 write(blob as GM16BlobMBS) 14899
- 91.16.205 write(blob as GM16BlobMBS, magick as string) 14899
- 91.16.207 write(file as folderitem) 14900
- 91.16.208 write(Path as string) 14901
- 91.16.209 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr) 14901

91.16.207 write(file as folderitem)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write single image frame to a file.
Example:

```
// this converts 32 bit PNG with alpha channel to BMP

Var f as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var p as Picture = Picture.Open(f)

Var g as new GM16ImageMBS( new GM16GeometryMBS(p.Width, p.Height), new GM16ColorGrayMBS(1.0))

g.type = g.TrueColorMatteType
g.matte = True
g.magick = "BMP"

g.SetPicture(p, 0, 0)
g.SetPictureMask(p.mask.invertMBS, 0, 0)

f = SpecialFolder.Desktop.Child("test.bmp")
g.write(f)
```

See also:

- 91.16.204 write(blob as GM16BlobMBS) 14899
- 91.16.205 write(blob as GM16BlobMBS, magick as string) 14899
- 91.16.206 write(blob as GM16BlobMBS, magick as string, depth as UInt32) 14899
- 91.16.208 write(Path as string) 14901
- 91.16.209 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr) 14901

91.16.208 write(Path as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write single image frame to a file.
Example:

```
// export a picture as PCL
Var l As Picture = LogoMBS(500)
Var p As New GM16ImageMBS(l)

p.type = p.BilevelType
p.write("/tmp/print.pcl")
```

See also:

- 91.16.204 write(blob as GM16BlobMBS) 14899
- 91.16.205 write(blob as GM16BlobMBS, magick as string) 14899
- 91.16.206 write(blob as GM16BlobMBS, magick as string, depth as UInt32) 14899
- 91.16.207 write(file as folderitem) 14900
- 91.16.209 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr) 14901

91.16.209 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write single image frame to an array of pixels with storage type specified by user (DispatchImage).
Notes: e.g. image.write(0, 0, 640, 1, "RGB", 0, pixels)
See also:

- 91.16.204 write(blob as GM16BlobMBS) 14899
- 91.16.205 write(blob as GM16BlobMBS, magick as string) 14899
- 91.16.206 write(blob as GM16BlobMBS, magick as string, depth as UInt32) 14899
- 91.16.207 write(file as folderitem) 14900
- 91.16.208 write(Path as string) 14901

91.16.210 ZLibVersion as string

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries version string for zlib library.

91.16.211 zoom(geometry as GM16GeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Zoom (resize) image to specified size.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.zoom(new GM16GeometryMBS(200,200))

Backdrop=image.CopyPicture
```

91.16.212 ZPL(Header as boolean = true) as String

MBS GraphicsMagick Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries image as ZPL hex image.
Notes: This is for sending data to a receipt printer. The picture is taken as black & white image and we build the hex string, you can send to the printer.
Picture needs to have a width dividable by 8.

Set Header to false for skipping header and footer.

91.16.213 Properties

91.16.214 adjoin as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Join images into a single multi-image file.
Notes: (Read and Write property)

91.16.215 animationDelay as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Time in 1/100ths of a second (0 to 65535) which must expire before displaying the next image in an animated sequence.
Notes: This option is useful for regulating the animation of a sequence of GIF images within Netscape.
(Read and Write property)

91.16.216 animationIterations as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of iterations to loop an animation (e.g. Netscape loop extension) for.
Notes: (Read and Write property)

91.16.217 antiAlias as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Control antialiasing of rendered Postscript and Postscript or TrueType fonts.
Notes: Enabled by default.
(Read and Write property)

91.16.218 backgroundColor as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image background color.
Example:

```
// make a red and turn it to 100% transparent
Var red As New GM16ColorRGBMBS("red")
red.alpha = 1

// now make image and make it RGBA with the transparent background
Var RastoredVectorImage as New GM16ImageMBS
RastoredVectorImage.type = GM16ImageMBS.TrueColorMatteType
RastoredVectorImage.backgroundColor = red

// now read SVG, so we get a transparent background
Var SVG_File as FolderItem = SpecialFolders.desktop.Child("test.svg")
RastoredVectorImage.read(SVG_File)
```

Notes: (Read and Write property)

91.16.219 backgroundTexture as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image file name to use as the background texture.
Notes: Does not modify image pixels.
(Read and Write property)

91.16.220 baseColumns as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Base image width (before transformations)
Notes: (Read only property)

91.16.221 baseFilename as String

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Base image filename (before transformations)
Notes: (Read only property)

91.16.222 baseRows as Uint32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Base image height (before transformations).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

Title = str(image.baseRows)+" x "+str(image.baseColumns)
```

Notes: (Read only property)

91.16.223 borderColor as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image border color.
Notes: (Read and Write property)

91.16.224 boundingBox as GM16GeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return smallest bounding box enclosing non-border pixels.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.fillColor = new GM16ColorRGBMBS("red") // set color
image.strokeColor = new GM16ColorRGBMBS("green") // set color

image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

// Draw a circle

draw.Circle(250, 250, 120, 150)
draw.Draw

draw = nil
image.type = image.TrueColorType

Backdrop = image.CopyPicture

MessageBox image.boundingBox.StringValue
```

Notes: The current fuzz value is used when discriminating between pixels. This is the crop bounding box used by crop(Geometry(0,0)).
(Read only property)

91.16.225 boxColor as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Base color that annotation text is rendered on (default none).
Notes: (Read and Write property)

91.16.226 classType as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image class (DirectClass or PseudoClass).
Notes: NOTE: setting a DirectClass image to PseudoClass will result in the loss of color information if the number of colors in the image is greater than the maximum palette size (either 256 or 65536 entries depending on the value of QuantumDepth when ImageMagick was built):
(Read and Write property)

91.16.227 clipMask as GM16ImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Associate a clip mask image with the current image.
Notes: The clip mask image must have the same dimensions as the current image or an exception is thrown. Clipping occurs wherever pixels are transparent in the clip mask image. Clipping Pass an invalid image to unset an existing clip mask.
(Read and Write property)

91.16.228 colorFuzz as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colors within this distance are considered equal.
Notes: A number of algorithms search for a target color. By default the color must be exact. Use this option to match colors that are close to the target color in RGB space.

e.g. set to 50 for 8 bit class and 50 * 257 for the 16 bit class to allow 20% divagation in pixel values.
(Read and Write property)

91.16.229 colorMapSize as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of entries in the colormap.
Notes: Setting the colormap size may extend or truncate the colormap. The maximum number of supported entries is specified by the MaxColormapSize constant, and is dependent on the value of QuantumDepth when

GraphicsMagick is compiled. An exception is thrown if more entries are requested than may be supported. Care should be taken when truncating the colormap to ensure that the image colormap indexes reference valid colormap entries.
(Read and Write property)

91.16.230 colorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The colorspace (e.g. CMYK) used to represent the image pixel colors.
Notes:

UndefinedColorspace	= 0
RGBColorspace	= 1 (Plain old RGB colorspace)
GRAYColorspace	= 2 (Plain old full-range grayscale)
TransparentColorspace	= 3 (RGB but preserve matte channel during quantize)
OHTAColorspace	= 4
XYZColorspace	= 5 (CIE XYZ)
YCCColorspace	= 6 (Kodak PhotoCD PhotoYCC)
YIQColorspace	= 7
YPbPrColorspace	= 8
YUVColorspace	= 9
CMYKColorspace	= 10 (Cyan, magenta, yellow, black, alpha)
sRGBColorspace	= 11 (Kodak PhotoCD sRGB)
HSLColorspace	= 12 (Hue, saturation, luminosity)
HWBColorspace	= 13 (Hue, whiteness, blackness)
LABColorspace	= 14 (LAB colorspace not supported yet other than via lcms)
CineonLogRGBColorspace	= 15 (RGB data with Cineon Log scaling, 2.048 density range)
Rec601LumaColorspace	= 16 (Luma (Y) according to ITU-R 601)
Rec601YCbCrColorspace	= 17 (YCbCr according to ITU-R 601)
Rec709LumaColorspace	= 18 (Luma (Y) according to ITU-R 709)
Rec709YCbCrColorspace	= 19 (YCbCr according to ITU-R 709)

(Read and Write property)

91.16.231 columns as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image width.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)
```

Title = str(image.columns)+" x "+str(image.rows)
Backdrop=image.CopyPicture

Notes: (Read only property)

91.16.232 comment as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image comment.
Notes: When you set this property, you add comment string to image.
By default, each image is commented with its file name. Use this method to assign a specific comment to the image. Optionally you can include the image filename, type, width, height, or other image attributes by embedding special format characters:
(Read and Write property)

91.16.233 compose as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composition operator to be used when composition is implicitly used (such as for image flattening).
Notes: (Read and Write property)

91.16.234 compressType as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image compresion type.
Notes: The default is the compression type of the input image file.
(Read and Write property)

91.16.235 debug as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable printing of debug messages from GraphicsMagick as it executes.
Notes: (Read and Write property)

91.16.236 density as GM16GeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Vertical and horizontal resolution in pixels of the image.
Example:

```
Var p as new GM16ImageMBS

Var item as FolderItem = SpecialFolder.Desktop.Child("input.png")
p.read(item)
p.scale new GM16GeometryMBS(3750,3750)
p.quality = 95
p.resolutionUnits = p.PixelsPerInchResolution
p.density = new GM16GeometryMBS(300, 300)
Var out as FolderItem = SpecialFolder.Desktop.Child("output.png")
p.write out
```

Notes: This option specifies an image density when decoding a Postscript or Portable Document page. Often used with psPageSize.
(Read and Write property)

91.16.237 depth as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image depth (bits allocated to red/green/blue components).
Notes: Used to specify the bit depth when reading or writing raw images or when the output format supports multiple depths. Defaults to the quantum depth that GraphicsMagick is compiled with.
(Read and Write property)

91.16.238 directory as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tile names from within an image montage.
Notes: (Read only property)

91.16.239 endian as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The endian mode.

Notes: Endianness (LSBEndian like Intel, MSBEndian like SPARC, or NativeEndian for what this computer uses) for image formats which support endian-specific options.
(Read and Write property)

91.16.240 ExifThumbnail as String

MBS GraphicsMagick Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts an embedded thumbnail in EXIF data.
Example:

```
Var g As New GM16ImageMBS

// not load, but just read header & metadata
g.ping("/Users/cs/Desktop/test.JPG")

// get thumbnail
Var Thumbnail As String = g.ExifThumbnail

// show it
Window1.Backdrop = picture.FromData(Thumbnail)
```

Notes: Returns string containing JPEG compressed image data.

For new development, please use ExifTagsMBS class instead.
(Read only property)

91.16.241 fileName as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image file name.
Notes: (Read and Write property)

91.16.242 fileSize as Int64

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of bytes of the image on disk.
Notes: (Read only property)

91.16.243 fillColor as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Color to use when filling drawn objects.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)

Backdrop=image.CopyPicture
```

Notes: (Read and Write property)

91.16.244 fillPattern as GM16ImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pattern to use while filling drawn objects.
Notes: (Read and Write property)

91.16.245 fillRule as Integer

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rule to use when filling drawn objects
Notes: (Read and Write property)

91.16.246 filterType as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The reduction filter employed has a sigificant effect on the time required to resize an image and

the resulting quality. The default filter is Lanczos which has been shown to produce high quality results when reducing most images.
Notes: Filter to use when resizing image.
(Read and Write property)

91.16.247 font as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Text rendering font.
Notes: If the font is a fully qualified X server font name, the font is obtained from an X server. To use a TrueType font, precede the TrueType filename with an @. Otherwise, specify a Postscript font name (e.g. "helvetica").
(Read and Write property)

91.16.248 FontFamily as String

MBS GraphicsMagick Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font family to use.
Notes: The plugin will look through the list to find best match for combination of family, style, stretch and weight.
You can use either FontFamily or Font property, but not both.
Setting font family clears font.
(Read and Write property)

91.16.249 fontPointsize as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Text rendering font point size.
Notes: (Read and Write property)

91.16.250 FontStretch as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font stretch.
Notes: Can be Normal, UltraCondensed, ExtraCondensed, Condensed, SemiCondensed, SemiExpanded, Expanded, ExtraExpanded, UltraExpanded or Any.
See stretch constants.

(Read and Write property)

91.16.251 FontStyle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font style to use.
Notes: Can be Normal, Italic, Oblique or Any.
See font style constants.
(Read and Write property)

91.16.252 FontWeight as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font weight.
Notes: The font weight in range from 0 to 1000.
400 is normal and 800 bold.
(Read and Write property)

91.16.253 format as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Long image format description.
Notes: (Read only property)

91.16.254 gamma as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gamma correct the image or individual image channels.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.gamma = 3.0

Backdrop=image.CopyPicture
```

Notes: If you get the value, it is the gamma level of the image. Gamma is a pow() function which converts between the linear light representation and the representation for the computer display. Most computer images are gamma corrected to 2.2 (1/0.4545) so that each step results in a visually linear step on a computer or video display:
(Read and Write property)
See also:

- 91.16.86 gamma(gammaRed as Double, gammaGreen as Double, gammaBlue as Double) 14857

91.16.255 geometry as GM16GeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Preferred size of the image when encoding.
Notes: (Read only property)

91.16.256 getConstIndexes as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain immutable image pixel indexes (valid for PseudoClass images)
Notes: (Read only property)

91.16.257 getIndexes as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain mutable image pixel indexes (valid for PseudoClass images)
Notes: (Read only property)

91.16.258 gifDisposeMethod as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: GIF disposal method.
Notes: This option (specific to the GIF file format) is used to control how successive frames are rendered (how the preceding frame is disposed of) when creating a GIF animation.

(Read and Write property)

Constant	Disposal	Description
UndefinedDispose	0	No disposal specified.
NoneDispose	1	Do not dispose between frames.
BackgroundDispose	2	Overwrite frame with background color from header.
PreviousDispose	3	Overwrite with previous frame.

91.16.259 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Example:

```
Var c as new GM16ColorMBS("white")
Var g as new GM16GeometryMBS(100,100)
Var image as new GM16ImageMBS(g, c)
MessageBox hex(Image.handle) // valid if not zero
```

Notes: (Read and Write property)

91.16.260 height as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the image.
Example:

```
Var c as new GM16ColorRGBMBS(1.0,0.0,0.0)
Var size as new GM16GeometryMBS(100,100)
Var g as new GM16ImageMBS(size, c)

MessageBox str(g.width)+" "+str(g.height)
```

Notes: This is a convenience function for you which calls size.height.
(Read only property)

91.16.261 iccColorProfile as GM16BlobMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: ICC color profile.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("IMG_0793.tif")
```

```
Var Image as new GM16ImageMBS(f)
Var ProfileBlob as GM16BlobMBS = Image.iccColorProfile
Var ProfileData as string = ProfileBlob.CopyString
Var cm as LCMS2ProfileMBS = LCMS2ProfileMBS.OpenProfileFromString(ProfileData)
Var name as string = cm.Name

Break // check data in debugger
```

Notes: Supplied via a Blob since Magick++/ and GraphicsMagick do not currently support formating this data structure directly. Specifications are available from the International Color Consortium for the format of ICC color profiles.
(Read and Write property)

91.16.262 interlaceType as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of interlacing scheme (default NoInterlace).
Notes: This option is used to specify the type of interlacing scheme for raw image formats such as RGB or YUV. NoInterlace means do not interlace, LineInterlace uses scanline interlacing, and PlaneInterlace uses plane interlacing. PartitionInterlace is like PlaneInterlace except the different planes are saved to individual files (e.g. image.R, image.G, and image.B). Use LineInterlace or PlaneInterlace to create an interlaced GIF or progressive JPEG image.
(Read and Write property)

91.16.263 iptcProfile as GM16BlobMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: IPTC profile.
Notes: Supplied via a Blob since Magick++ and GraphicsMagick do not currently support formating this data structure directly. Specifications are available from the International Press Telecommunications Council for IPTC profiles.
(Read and Write property)

91.16.264 isValid as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Does object contain valid image?
Notes: Set to false in order to invalidate the image. Images constructed via the default constructor are invalid images and isValid() will return false.

(Read and Write property)

91.16.265 label as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image label.
Notes: (Read only property)
See also:

- 91.16.102 label(text as string) 14862

91.16.266 lineWidth as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Stroke width for drawing vector objects (default one)
Notes: This method is now deprecated. Please use strokeWidth instead.
(Read and Write property)

91.16.267 magick as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the codec to use for compression.
Example:

```
// this converts 32 bit PNG with alpha channel to BMP

Var f as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var p as Picture = Picture.Open(f)

Var g as new GM16ImageMBS( new GM16GeometryMBS(p.Width, p.Height), new GM16ColorGrayMBS(1.0))

g.type = g.TrueColorMatteType
g.matte = True
g.magick = "BMP"

g.SetPicture(p, 0, 0)
g.SetPictureMask(p.mask.invertMBS, 0, 0)

f = SpecialFolder.Desktop.Child("test.bmp")
g.write(f)
```

Notes: (Read and Write property)

91.16.268 matte as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image supports transparency (matte channel)
Notes: (Read and Write property)

91.16.269 matteColor as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image matte (frame) color.
Notes: (Read and Write property)

91.16.270 meanErrorPerPixel as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mean error per pixel computed when an image is color reduced.
Notes: This parameter is only valid if verbose is set to true and the image has just been quantized.
(Read only property)

91.16.271 modulusDepth as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image modulus depth (minimum number of bits required to support red/green/blue components without loss of accuracy).
Notes: The pixel modulus depth may be decreased by supplying a value which is less than the current value, updating the pixels (reducing accuracy) to the new depth. The pixel modulus depth can not be increased over the current value using this method.
(Read and Write property)

91.16.272 monochrome as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transform image to black and white while color reducing (quantizing).
Notes: (Read and Write property)

91.16.273 normalizedMaxError as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The normalized max error per pixel computed when an image is color reduced.
Notes: This parameter is only valid if verbose is set to true and the image has just been quantized.
(Read only property)

91.16.274 normalizedMeanError as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The normalized mean error per pixel computed when an image is color reduced.
Notes: This parameter is only valid if verbose is set to true and the image has just been quantized.
(Read only property)

91.16.275 orientation as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image orientation. Supported by some file formats such as DPX and TIFF. Useful for turning the right way up.
Notes: (Read and Write property)

91.16.276 page as GM16GeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Preferred size and location of an image canvas.
Notes: Use this option to specify the dimensions and position of the Postscript page in dots per inch or a TEXT page in pixels. This option is typically used in concert with density .

Page may also be used to position a GIF image (such as for a scene in an animation).
(Read and Write property)

91.16.277 penColor as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The pen color.
Notes: (Read and Write property)

91.16.278 quality as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: JPEG/MIFF/PNG compression level (default 75).
Notes: (Read and Write property)

91.16.279 quantizeColors as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum number of colors to quantize to.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.quantizeColors = 10
image.quantize

image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

Notes: (Read and Write property)

91.16.280 quantizeColorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colorspace to quantize in (default RGB).
Example:

```
// load a picture
Var f as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var pic as Picture = Picture.Open(f)
```

```
const GrayColorSpace = 2

Var Converter As New GM16ImageMBS(Pic)

// quantize with dither
Converter.type = GM16ImageMBS.BilevelType
Converter.quantizeColorSpace = GrayColorSpace
Converter.quantizeColors = 2
Converter.quantizeDither = True
Converter.quantize

// convert back to Xojo
Converter.type = GM16ImageMBS.TrueColorType
Backdrop = Converter.CopyPicture
```

Notes: Empirical evidence suggests that distances in color spaces such as YUV or YIQ correspond to perceptual color differences more closely than do distances in RGB space. These color spaces may give better results when color reducing an image.
(Read and Write property)

91.16.281 quantizeDither as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply Floyd/Steinberg error diffusion to the image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.quantizeColors = 10
image.quantizeDither = true
image.quantize

image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

Notes: The basic strategy of dithering is to trade intensity resolution for spatial resolution by averaging the intensities of several neighboring pixels. Images which suffer from severe contouring when reducing colors can be improved with this option. The quantizeColors or monochrome option must be set for this option to take effect.
(Read and Write property)

91.16.282 quantizeTreeDepth as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Depth of the quantization color classification tree.
Notes: Values of 0 or 1 allow selection of the optimal tree depth for the color reduction algorithm. Values between 2 and 8 may be used to manually adjust the tree depth.
(Read and Write property)

91.16.283 Quiet as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Suppress all warning messages.
Notes: Error messages are still reported.
(Read and Write property)

91.16.284 renderingIntent as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of rendering intent (used when applying an ICC color profile).
Notes: (Read and Write property)

91.16.285 resolutionUnits as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Units of image resolution.
Example:

```
Var item As FolderItem = SpecialFolder.Desktop.Child("test.jpeg")
Var p As New GM16ImageMBS(item)

// scale image
p.quality = 95
p.scale New GM16GeometryMBS(1000,1000)

// change resolution
p.density = New GM16GeometryMBS(300, 300)
p.resolutionUnits = p.PixelsPerInchResolution

// remove metadata
Var empty As New GM16BlobMBS
```

```
p.profile("EXIF") = empty
p.profile("IPTC") = empty
p.profile("XMP") = empty

Var out As FolderItem = SpecialFolder.Desktop.Child("output.jpeg")
p.write out
```

Notes: (Read and Write property)

91.16.286 rows as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of pixel rows in the image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

Title = str(image.columns)+" x "+str(image.rows)
Backdrop=image.CopyPicture
```

Notes: (Read only property)

91.16.287 scene as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image scene number.
Notes: (Read and Write property)

91.16.288 size as GM16GeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Width and height of a raw image (an image which does not support width and height information).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

MessageBox image.size.StringValue
```

```
image.size = new GM16GeometryMBS(200,200)

Backdrop=image.CopyPicture
```

Notes: Size may also be used to affect the image size read from a multi-resolution format (e.g. Photo CD, JBIG, or JPEG.
(Read and Write property)

91.16.289 strokeAntiAlias as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable/disable stroke anti-aliasing.
Notes: (Read and Write property)

91.16.290 strokeColor as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Color to use when drawing object outlines.
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)

Backdrop=image.CopyPicture
```

Notes: (Read and Write property)

91.16.291 strokeDashOffset as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: While drawing using a dash pattern, specify distance into the dash pattern to start the dash (default 0).
Notes: (Read and Write property)

91.16.292 strokeLineCap as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify the shape to be used at the end of open subpaths when they are stroked. #
Notes: Values of LineCap are UndefinedCap, ButtCap, RoundCap, and SquareCap.
(Read and Write property)

91.16.293 strokeLineJoin as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify the shape to be used at the corners of paths (or other vector shapes) when they are stroked. Values of LineJoin are UndefinedJoin, MiterJoin, RoundJoin, and BevelJoin.
Notes: (Read and Write property)

91.16.294 strokeMiterLimit as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify miter limit.
Notes: When two line segments meet at a sharp angle and miter joins have been specified for 'lineJoin', it is possible for the miter to extend far beyond the thickness of the line stroking the path. The miterLimit' imposes a limit on the ratio of the miter length to the 'lineWidth'. The default value of this parameter is 4.
(Read and Write property)

91.16.295 strokePattern as GM16ImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pattern image to use while stroking object outlines.
Notes: (Read and Write property)

91.16.296 strokeWidth as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Stroke width for drawing vector objects (default one).
Example:

```
Var g as new GM16GeometryMBS(500,500)
Var c as new GM16ColorRGBMBS("white") // white
Var image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GM16GraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)

Backdrop=image.CopyPicture
```

Notes: (Read and Write property)

91.16.297 subImage as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subimage of an image sequence.
Notes: (Read and Write property)

91.16.298 subRange as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of images relative to the base image.
Notes: (Read and Write property)

91.16.299 textEncoding as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Annotation text encoding (e.g. "UTF-16").

Notes: (Read and Write property)

91.16.300 tileName as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tile name.
Notes: (Read and Write property)

91.16.301 totalColors as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of colors in the image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

Title = str(image.totalColors) // shows 5284
Backdrop=image.CombinePictureWithMask
```

Notes: (Read only property)

91.16.302 type as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of this image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)

image.type = image.GrayscaleType

Backdrop=image.CopyPicture
```

Notes: You can set this value to convert the image to the type.

Convert the image representation to the specified type or retrieve the current image type. If the image is reduced to an inferior type, then image information may be lost (e.g. color changed to grayscale).

Available enumerations for the type parameter:

BilevelType	1	black/white
GrayscaleType	2	grayscale
GrayscaleMatteType	3	grayscale with alpha (opacity) channel
PaletteType	4	colormapped
PaletteMatteType	5	colormapped with transparency
TrueColorType	6	true (full) color
TrueColorMatteType	7	true (full) color with alpha (opacity) channel
ColorSeparationType	8	Cyan, magenta, yellow, and black
ColorSeparationMatteType	9	Cyan, magenta, yellow, and black with alpha (opacity) channel
OptimizeType	10	Optimize the image type to best represent the existing pixels

(Read and Write property)

91.16.303 verbose as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Print detailed information about the image.
Notes: (Read and Write property)

91.16.304 view as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: FlashPix viewing parameters.
Notes: (Read and Write property)

91.16.305 width as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the image.
Example:

```
Var c as new GM16ColorRGBMBS(1.0,0.0,0.0)
Var size as new GM16GeometryMBS(100,100)
Var g as new GM16ImageMBS(size, c)

MessageBox str(g.width)+" "+str(g.height)
```

Notes: This is a convenience function for you which calls size.width.
(Read only property)

91.16.306 x11Display as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: X11 display to display to, obtain fonts from, or to capture image from.
Notes: (Read and Write property)

91.16.307 XResolution as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: x resolution of the image.
Notes: See also density functions.
Settable with version 19.0.
(Read and Write property)

91.16.308 YResolution as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: y resolution of the image.
Notes: Settable with version 19.0.
(Read and Write property)

91.16.309 attributeValue(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Access an arbitrary named image attribute.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("IMG_4048.jpg")
Var g as new GM16ImageMBS(f)
Var a as string = g.attributeValue("EXIF:DateTime")
MessageBox a
```

Notes: Any number of named attributes may be attached to the image. For example, the image comment is a named image attribute with the name "comment". EXIF tags are attached to the image as named attributes. Use the syntax "EXIF:<tag>" to request an EXIF tag similar to "EXIF:DateTime":
(Read and Write computed property)

91.16.310 channelDepth(channel as Integer) as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set or obtain modulus channel depth.
Notes: (Read and Write computed property)

91.16.311 colorMap(index as UInt32) as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Color at colormap position index.
Notes: (Read and Write computed property)
See also:

- 91.16.26 colorMap as GM16ColorMBS() 14830

91.16.312 defineSet(magick as string, key as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set or obtain a definition flag to applied when encoding or decoding the specified format.
Notes: Similar to the defineValue() method except that passing the flag value 'true' creates a value-less define with that format and key. Passing the flag value 'false' removes any existing matching definition. The method returns 'true' if a matching key exists, and 'false' if no matching key exists.
(Read and Write computed property)

91.16.313 defineValue(magick as string, key as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set or obtain a definition string to applied when encoding or decoding the specified format.
Notes: The meanings of the definitions are format specific. The format is designated by the magick argument, the format-specific key is designated by key, and the associated value is specified by value. See the defineSet() method if the key must be removed entirely.
(Read and Write computed property)

91.16.314 pixelColor(x as UInt32, y as UInt32) as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/set pixel color at location x & y.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GM16ImageMBS(p)
Var c as new GM16ColorMBS("red")

for x as Integer = 240 to 260
image.pixelColor(x,250)=c
next

for y as Integer = 240 to 260
image.pixelColor(250,y)=c
next

Backdrop=image.CopyPicture
```

Notes: (Read and Write computed property)

91.16.315 profile(name as string) as GM16BlobMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set a named profile.
Example:

```
Var item As FolderItem = SpecialFolder.Desktop.Child("test.jpeg")
Var p As New GM16ImageMBS(item)

// scale image
p.quality = 95
p.scale New GM16GeometryMBS(1000,1000)

// change resolution
p.density = New GM16GeometryMBS(300, 300)
p.resolutionUnits = p.PixelsPerInchResolution

// remove metadata
Var empty As New GM16BlobMBS
p.profile("EXIF") = empty
p.profile("IPTC") = empty
p.profile("XMP") = empty

Var out As FolderItem = SpecialFolder.Desktop.Child("output.jpeg")
p.write out
```

Notes: Add or remove a named profile to/from the image. Remove the profile by passing an empty Blob (e.g. Blob()). Valid names are "*", "8BIM", "ICM", "IPTC", or a user/format-defined profile name.

Retrieve a named profile from the image. Valid names are: "8BIM", "8BIMTEXT", "APP1", "APP1JPEG", "ICC", "ICM", & "IPTC" or an existing user/format-defined profile name
(Read and Write computed property)

91.16.316 Constants

Constants

Constant	Value	Description
AbsoluteIntent	3	One of the intent type constants.
AddCompositeOp	8	One of the composite type constants.
AllChannels	10	One of the possible channel constants.
AllCompliance	&hffff	One of the Compliance type constants.
AssociatedAlpha	1	One of the possible alpha type constants.
AtopCompositeOp	4	One of the composite type constants.
BackgroundDispose	2	One of the gif dispose type constants.
BesselFilter	14	One of the filter type constants.
BilevelType	1	One of the image type constants.
BlackChannel	8	One of the possible channel constants.
BlackmanFilter	7	One of the filter type constants.
BlueChannel	5	One of the possible channel constants.
BottomLeftOrientation	4	One of the orientation type constants. Line direction: Left to right Frame Direction: Bottom to top
BottomRightOrientation	3	One of the orientation type constants. Line direction: Right to left Frame Direction: Bottom to top
BoxFilter	2	One of the filter type constants.
BumpmapCompositeOp	12	One of the composite type constants.
BZipCompression	2	One of the compression type constants.
CatromFilter	11	One of the filter type constants.
CenterGravity	5	One of the possible gravity constants.
ClearCompositeOp	18	One of the composite type constants.
ColorizeCompositeOp	28	One of the composite type constants.
ColorSeparationMatteType	9	One of the image type constants.
ColorSeparationType	8	One of the image type constants.
ConcatenateMode	3	One of the image type constants.
CopyBlackCompositeOp	35	One of the composite type constants.
CopyBlueCompositeOp	16	One of the composite type constants.
CopyCompositeOp	13	One of the composite type constants.
CopyCyanCompositeOp	32	One of the composite type constants.
CopyGreenCompositeOp	15	One of the composite type constants.
CopyMagentaCompositeOp	33	One of the composite type constants.
CopyOpacityCompositeOp	17	One of the composite type constants.
CopyRedCompositeOp	14	One of the composite type constants.
CopyYellowCompositeOp	34	One of the composite type constants.
CubicFilter	10	One of the filter type constants.
CyanChannel	2	One of the possible channel constants.
DarkenCompositeOp	24	One of the composite type constants.
DifferenceCompositeOp	10	One of the composite type constants.
DirectClass	1	One of the class type constants.
DisplaceCompositeOp	20	One of the composite type constants.
DissolveCompositeOp	19	One of the composite type constants.
DivideCompositeOp	36	One of the composite type constants.
EastGravity	6	One of the possible gravity constants.
FaxCompression	3	One of the compression type constants.
ForgetGravity	0	One of the possible gravity constants.
FrameMode	1	One of the mode type constants.
GaussianFilter	8	One of the filter type constants.
GaussianNoise	1	One of the possible noise constants.
GrayChannel	11	One of the possible channel constants.
GrayscaleMatteType	3	One of the image type constants.
GrayscaleType	2	One of the image type constants.
GreenChannel	3	One of the possible channel constants.
Group4Compression	4	One of the compression type constants.
HammingFilter	6	One of the filter type constants.
HanningFilter	5	One of the filter type constants.

Font Stretch

Constant	Value	Description
AnyStretch	9	Don't care.
CondensedStretch	3	Condensed
ExpandedStretch	6	Expanded
ExtraCondensedStretch	2	Extra Condensed
ExtraExpandedStretch	7	Extra Expanded
NormalStretch	0	Normal (Default)
SemiCondensedStretch	4	Semi Condensed
SemiExpandedStretch	5	Semi Expanded
UltraCondensedStretch	1	Ultra Condensed
UltraExpandedStretch	8	Ultra Expanded

Font Style

Constant	Value	Description
AnyStyle	3	Don't care.
ItalicStyle	1	Italic font.
NormalStyle	0	Normal (Default)
ObliqueStyle	2	Oblique font.

Storage Types

Constant	Value	Description
StorageTypeCharPixel	0	8bit numbers.
StorageTypeDoublePixel	5	64bit floating numbers.
StorageTypeFloatPixel	4	32bit floating numbers.
StorageTypeIntegerPixel	2	32bit numbers.
StorageTypeLongPixel	3	64bit numbers.
StorageTypeShortPixel	1	16bit numbers.

91.17 class GM16ImageStatisticsMBS

91.17.1 class GM16ImageStatisticsMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for image statistics.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

91.17.2 Methods

91.17.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

91.17.4 Properties

91.17.5 blue as GM16ImageChannelStatisticsMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blue channel statistics.
Notes: (Read only property)

91.17.6 green as GM16ImageChannelStatisticsMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green channel statistics.
Notes: (Read only property)

91.17.7 opacity as GM16ImageChannelStatisticsMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The opacity channel statistics.
Notes: (Read only property)

91.17.8 red as GM16ImageChannelStatisticsMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The red channel statistics.
Notes: (Read only property)

91.18 class GM16LockMBS

91.18.1 class GM16LockMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for locking a certain resource.
Notes: The idea is to pass the constructor a mutexlock and keep the only reference to this new lock object on the stack. On the end of the method, the destructor is called by Xojo and releases the mutexlock automatically.

91.18.2 Methods

91.18.3 Constructor(mutexlock as GM16MutexLockMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new Lock based on the given mutexlock.

91.18.4 Properties

91.18.5 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

91.18.6 target as GM16MutexLockMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mutexlock this lock is referencing to.
Notes: (Read and Write property)

91.19 class GM16MontageFramedMBS

91.19.1 class GM16MontageFramedMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: MontageFramed provides the means to specify montage options when it is desired to have decorative frames around the image thumbnails.
Notes: MontageFramed inherits from Montage and therefore provides all the methods of Montage as well as those shown in the table "MontageFramed Methods".

Framed thumbnails consist of four components: the thumbnail image, the thumbnail frame, the thumbnail border, an optional thumbnail shadow, and an optional thumbnail label area.
Subclass of the GM16MontageMBS class.

91.19.2 Methods

91.19.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

91.19.4 Properties

91.19.5 borderColor as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the background color within the thumbnail frame.
Notes: (Read and Write computed property)

91.19.6 borderWidth as Uint32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the border (in pixels) to place between a thumbnail and its surrounding frame.
Notes: This option only takes effect if thumbnail frames are enabled (via frameGeometry) and the thumbnail geometry specification doesn't also specify the thumbnail border width.
(Read and Write computed property)

91.19.7 frameGeometry as GM16GeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the geometry specification for frame to place around thumbnail.
Notes: If this parameter is not specified, then the montage is unframed.
(Read and Write computed property)

91.19.8 matteColor as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the thumbnail frame color.
Notes: (Read and Write computed property)

91.20 class GM16MontageMBS

91.20.1 class GM16MontageMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Montage is the base class to provide montage options and provides methods to set all options required to render simple (unframed) montages.
Example:

```
// build montage
Var StackingMontage as New GM16MontageMBS
StackingMontage.backgroundColor = New GM16ColorMBS(&cE7E7E7)
StackingMontage.fillColor = New GM16ColorMBS(&c000000)
StackingMontage.tile = New GM16GeometryMBS("1x20")
StackingMontage.geometry = New GM16GeometryMBS("160x120+5+5")
StackingMontage.font = "Helvetica"
StackingMontage.pointSize = 12
StackingMontage.title = "Title goes here"

// make picture
Var logo as Picture = LogoMBS(500)
Var image as New GM16ImageMBS(logo)

image.label("Sample label")

// Put the current image into the array
Var StackingFrames As new GM16ImageArrayMBS
StackingFrames.insert(image)

// show result
Var resultImages as GM16ImageArrayMBS = StackingFrames.montageImages(StackingMontage)
Backdrop = resultImages.Image(0).CopyPicture
```

Notes: See GM16MontageFramedMBS if you would like to create a framed montage.

Unframed thumbnails consist of four components: the thumbnail image, the thumbnail border, an optional thumbnail shadow, and an optional thumbnail label area.

91.20.2 Methods

91.20.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

91.20.4 Properties

91.20.5 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

91.20.6 backgroundColor as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the background color that thumbnails are imaged upon.
Notes: (Read and Write computed property)

91.20.7 compose as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the image composition algorithm for thumbnails.
Notes: This controls the algorithm by which the thumbnail image is placed on the background. Use of OverCompositeOp is recommended for use with images that have transparency. This option may have negative side-effects for images without transparency.
(Read and Write computed property)

91.20.8 fileName as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the image filename to be used for the generated montage images.
Notes: To handle the case were multiple montage images are generated, a printf-style format may be embedded within the filename. For example, a filename specification of image%02d.miff names the montage images as image00.miff, image01.miff, etc.
(Read and Write computed property)

91.20.9 fillColor as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the fill color to use for the label text.
Notes: (Read and Write computed property)

91.20.10 font as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the thumbnail label font.
Notes: (Read and Write computed property)

91.20.11 geometry as GM16GeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the size of the generated thumbnail.
Notes: (Read and Write computed property)

91.20.12 gravity as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the thumbnail positioning within the specified geometry area.
Notes: If the thumbnail is smaller in any dimension than the geometry, then it is placed according to this specification.
See Gravity constants in GM16ImageMBS class.
(Read and Write computed property)

91.20.13 label as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the format used for the image label.
Notes: Special format characters may be embedded in the format string to include information about the image.
(Read and Write computed property)

91.20.14 penColor as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the pen color to use for the label text (same as fill).
Notes: (Read and Write computed property)

91.20.15 pointSize as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the thumbnail label font size.
Notes: (Read and Write computed property)

91.20.16 shadow as boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable/disable drop-shadow on thumbnails.
Notes: (Read and Write computed property)

91.20.17 strokeColor as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the stroke color to use for the label text.
Notes: (Read and Write computed property)

91.20.18 texture as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies a texture image to use as montage background.
Notes: The built-in textures "granite:" and "plasma:" are available. A texture is the same as a background image.
(Read and Write computed property)

91.20.19 tile as GM16GeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the maximum number of montage columns and rows in the montage.
Notes: The montage is built by filling out all cells in a row before advancing to the next row. Once the montage has reached the maximum number of columns and rows, a new montage image is started.
(Read and Write computed property)

91.20.20 title as string

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the montage title.
Notes: (Read and Write computed property)

91.20.21 transparentColor as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies a montage color to set transparent.
Notes: This option can be set the same as the background color in order for the thumbnails to appear without a background when rendered on an HTML page. For best effect, ensure that the transparent color selected does not occur in the rendered thumbnail colors.
(Read and Write computed property)

91.21 class GM16MutexLockMBS

91.21.1 class GM16MutexLockMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mutex class for GraphicsMagick.

91.21.2 Methods

91.21.3 lock

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Locks the lock.
Notes: Only one thread at a time can get the lock. The other threads will wait when lock is called.

91.21.4 unlock

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unlocks the lock.

91.21.5 Properties

91.21.6 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

91.22 class GM16NotInitializedExceptionMBS

91.22.1 class GM16NotInitializedExceptionMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception raised if you access a method/property in an object and the object was not initialized propertly.
Notes: Check the message property for details.
Subclass of the GM16ErrorExceptionMBS class.

91.23 class GM16PathArgsMBS

91.23.1 class GM16PathArgsMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: This is a class for arguments to the path arc/curve methods in GM16GraphicsMBS.
Example:

```
Var g as new GM16PathArgsMBS(1,2,3,4) // for a QuadraticCurveto

MessageBox str(g.x1)+EndOfLine+str(g.y1)+EndOfLine+str(g.x)+EndOfLine+str(g.y)
```

Notes: Due we use this class for three different ways, we have three constructors to fill in the value you need for the calls.

91.23.2 Methods

91.23.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor for creating an empty object.
See also:

- 91.23.4 Constructor(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 14947
- 91.23.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double) 14948
- 91.23.6 Constructor(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 14948

91.23.4 Constructor(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create the arguments object for the PathArc methods in GM16GraphicsMBS.
See also:

- 91.23.3 Constructor 14947
- 91.23.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double) 14948

- 91.23.6 Constructor(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 14948

91.23.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create the arguments object for the QuadraticCurveto methods in GM16GraphicsMBS.
Example:

Var g as new GM16PathArgsMBS(1,2,3,4)

MessageBox str(g.x1)+EndOfLine+str(g.y1)+EndOfLine+str(g.x)+EndOfLine+str(g.y)

See also:

- 91.23.3 Constructor 14947
- 91.23.4 Constructor(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 14947
- 91.23.6 Constructor(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 14948

91.23.6 Constructor(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create the arguments object for the Curveto methods in GM16GraphicsMBS.
Example:

Var g as new GM16PathArgsMBS(1,2,3,4,5,6)

MessageBox str(g.x1)+EndOfLine+str(g.y1)+EndOfLine+str(g.x2)+EndOfLine+str(g.y2)+EndOfLine+str(g.x)+EndOfLine+str(g.y)

See also:

- 91.23.3 Constructor 14947
- 91.23.4 Constructor(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 14947
- 91.23.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double) 14948

91.23.7 Properties

91.23.8 largeArcFlag as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The large arc flag.
Notes: Draw longer of the two matching arcs
(Read and Write property)

91.23.9 radiusX as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The radius x value.
Notes: (Read and Write property)

91.23.10 radiusY as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The radius y value.
Notes: (Read and Write property)

91.23.11 sweepFlag as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sweep flag value.
Notes: Draw arc matching clock-wise rotation.
(Read and Write property)

91.23.12 x as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x value.
Notes: For an arc: End-point X
(Read and Write property)

91.23.13 x1 as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x1 value.
Notes: (Read and Write property)

91.23.14 x2 as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x2 value.
Notes: (Read and Write property)

91.23.15 xAxisRotation as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x Axis Rotation value.
Notes: Rotation relative to X axis.
(Read and Write property)

91.23.16 y as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y value.
Notes: for an arc: End-point Y
(Read and Write property)

91.23.17 y1 as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y1 value.
Notes: (Read and Write property)

91.23.18 y2 as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y2 value.
Notes: (Read and Write property)

91.24 class GM16PixelsMBS

91.24.1 class GM16PixelsMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an empty pixels object.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GM16ImageMBS(f)
Var p as new GM16PixelsMBS(g)

// get pointer to some pixels to read/write
Var x as ptr = p.get(0, 0, 100, 100)

// draw a red line to the pixel buffer
Var o as Integer
for i as Integer = 0 to 99
o = 100 * i + i
x.UInt32(o * 4) = &hFFFF0000
next

// write back
p.sync

// show
Window1.Backdrop = g.CopyPicture
```

91.24.2 Methods

91.24.3 Constructor(Image as GM16ImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new Pixels object with the pixels from an image.

91.24.4 get(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transfer pixels from the image to the pixel view as defined by the specified region.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GM16ImageMBS(f)
Var p as new GM16PixelsMBS(g)

// get pointer to some pixels
Var x as ptr = p.get(0, 0, 100, 100)

// draw a red line to the pixel buffer
Var o as Integer
for i as Integer = 0 to 99
o = 100 * i + i
x.UInt32(o * 4) = &hFFFF0000
next

// write back
p.sync

// show
Window1.Backdrop = g.CopyPicture
```

Notes: Modified pixels may be subsequently transferred back to the image via sync.

91.24.5 getConst(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transfer read-only pixels from the image to the pixel view as defined by the specified region.

91.24.6 indexes as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return pixel colormap index array.

91.24.7 set(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allocate a pixel view region to store image pixels as defined by the region rectangle.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GM16ImageMBS(f)
Var p as new GM16PixelsMBS(g)

// get pointer to some pixels to write
Var x as ptr = p.set(0, 0, 100, 100)

// draw a red line to the pixel buffer
Var o as Integer
for i as Integer = 0 to 99
o = 100 * i + i
x.UInt32(o * 4) = &hFFFF0000
next

// write back
p.sync

// show
Window1.Backdrop = g.CopyPicture
```

Notes: This area is subsequently transferred from the pixel view to the image via sync.

91.24.8 sync

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transfers the image cache pixels to the image.

91.24.9 Properties

91.24.10 columns as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Width of view.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GM16ImageMBS(f)
Var p as new GM16PixelsMBS(g)

// get pointer to some pixels
Var x as ptr = p.get(0, 0, 100, 100)
```

```
// and show size
MessageBox str(p.columns)+" x "+str(p.rows)
```

Notes: (Read only property)

91.24.11 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

91.24.12 rows as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Height of view.
Notes: (Read only property)

91.24.13 x as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Left ordinate of view.
Notes: (Read only property)

91.24.14 y as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Top ordinate of view.
Notes: (Read only property)

91.25 class GM16TypeMetricMBS

91.25.1 class GM16TypeMetricMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The TypeMetric class provides the means to pass data from the Image class's TypeMetric method to the user.
Example:

```
// measure how much space a text needs before drawing it into an image
Var image As New GM16ImageMBS(New GM16GeometryMBS(400, 100), New GM16ColorMBS("white"))
image.font = "Helvetica"
image.fontPointsize = 24

Var metric As GM16TypeMetricMBS = image.fontTypeMetrics("Hello World")
MessageBox "Width: " + Format(metric.textWidth, "0") + EndOfLine + _
"Height: " + Format(metric.textHeight, "0") + EndOfLine + _
"Ascent: " + Format(metric.ascent, "0.0") + ", descent: " + Format(metric.descent, "0.0")
```

Notes: It provides information regarding font metrics such as ascent, descent, text width, text height, and maximum horizontal advance. The units of these font metrics are in pixels, and that the metrics are dependent on the current Image font (default Ghostscript's "Helvetica"), pointsize (default 12 points), and x/y resolution (default 72 DPI) settings.

The pixel units may be converted to points (the standard resolution-independent measure used by the typesetting industry) via the following equation:

size_points = (size_pixels * 72)/resolution
where resolution is in dots-per-inch (DPI). This means that at the default image resolution, there is one pixel per point.

Note that a font's pointsize is only a first-order approximation of the font height (ascender + descender) in points. The relationship between the specified pointsize and the rendered font height is determined by the font designer.

See FreeType Glyph Conventions for a detailed description of font metrics related issues.

91.25.2 Methods

91.25.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

91.25.4 Properties

91.25.5 ascent as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the distance in pixels from the text baseline to the highest/upper grid coordinate used to place an outline point.
Notes: Always a positive value.
(Read only property)

91.25.6 descent as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the distance in pixels from the baseline to the lowest grid coordinate used to place an outline point.
Notes: Always a negative value.
(Read only property)

91.25.7 maxHorizontalAdvance as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the maximum horizontal advance (advance from the beginning of a character to the beginning of the next character) in pixels.
Notes: (Read only property)

91.25.8 textHeight as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns text height in pixels.
Notes: (Read only property)

91.25.9 textWidth as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns text width in pixels.
Notes: (Read only property)

91.26 class GM16UnsupportedExceptionMBS

91.26.1 class GM16UnsupportedExceptionMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: An exception raised if you call the GM functions on an unsupported platform.
Notes: Check the message property for details.
This exception is currently only used on Windows.
(Windows support may come later)
Subclass of the GM16ErrorExceptionMBS class.

91.27 class GMBlobMBS

91.27.1 class GMBlobMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for binary large objects.
Example:

```
// get some image data (e.g. from blob in database)
Var logo as Picture = LogoMBS(500)
Var jpegData as string = PictureToJPEGStringMBS(logo, 80)

// new image
Var mp as new GMImageMBS
Var blob as new GMBlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
'mp.type = mp.TrueColorMatteType
Backdrop=mp.CombinePictureWithMask
```

Notes: Blob provides the means to contain any opaque data. It is named after the term "Binary Large OBject" commonly used to describe unstructured data (such as encoded images) which is stored in a database. While the function of Blob is very simple (store a pointer and and size associated with allocated data), the Blob class provides some very useful capabilities. In particular, it is fully reference counted just like the Image class.

The Blob class supports value assignment while preserving any outstanding earlier versions of the object. Since assignment is via a pointer internally, Blob is efficient enough to be stored directly in an STL container or any other data structure which requires assignment. In particular, by storing a Blob in an associative container (such as STL's 'map') it is possible to create simple indexed in-memory "database" of Blobs.

Magick++ currently uses Blob to contain encoded images (e.g. JPEG) as well as ICC and IPTC profiles. Since Blob is a general-purpose class, it may be used for other purposes as well.

- Tip of the day: Render SVG with GraphicsMagick Plugin

91.27.2 Methods

91.27.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor creating an empty blob object.
See also:

- 91.27.4 Constructor(data as memoryblock, offset as Integer, size as Integer) 14961
- 91.27.5 Constructor(data as string) 14961
- 91.27.6 Constructor(other as GMBlobMBS) 14962

91.27.4 Constructor(data as memoryblock, offset as Integer, size as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct object with data, making a copy of the supplied data.
See also:

- 91.27.3 Constructor 14961
- 91.27.5 Constructor(data as string) 14961
- 91.27.6 Constructor(other as GMBlobMBS) 14962

91.27.5 Constructor(data as string)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct object with data, making a copy of the supplied data.
Example:

```
// get some image data (e.g. from blob in database)
Var logo as Picture = LogoMBS(500)
Var jpegData as string = PictureToJPEGStringMBS(logo, 80)

// new image
Var mp as new GMImageMBS
Var blob as new GMBlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
'mp.type = mp.TrueColorMatteType
```

Backdrop=mp.CombinePictureWithMask

See also:

- 91.27.3 Constructor 14961
- 91.27.4 Constructor(data as memoryblock, offset as Integer, size as Integer) 14961
- 91.27.6 Constructor(other as GMBlobMBS) 14962

91.27.6 Constructor(other as GMBlobMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copy constructor (reference counted).
See also:

- 91.27.3 Constructor 14961
- 91.27.4 Constructor(data as memoryblock, offset as Integer, size as Integer) 14961
- 91.27.5 Constructor(data as string) 14961

91.27.7 CopyMemory as memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a copy of the data as a memoryblock.
Notes: Returns nil on any error like low memory.

91.27.8 CopyString as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a copy of the data as a string.

91.27.9 Data as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A memoryblock with the data from this blob.
Example:

```
Var b as new GMBlobMBS("Hello")
```

```
Var m as memoryblock = b.Data
MessageBox m.StringValue(0,5) // shows "Hello"
```

Notes: This is a memoryblock referencing the data of the blob. It has no size set. The memoryblock can only be used as long as the blob object exists. if you use it after you destroyed the blob object, you can crash you application.

91.27.10 Update(data as memoryblock, offset as Integer, size as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces the content of this blob with a copy of the bytes in the memoryblock.
See also:

- 91.27.11 Update(data as string) 14963

91.27.11 Update(data as string)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces the content of this blob with a copy of the bytes in the string.
Notes: Offset is zero based.
See also:

- 91.27.10 Update(data as memoryblock, offset as Integer, size as Integer) 14963

91.27.12 Properties

91.27.13 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal handle of the blob object.
Notes: (Read and Write property)

91.27.14 length as UInt64

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain data length in bytes.
Example:

```
Var b as new GMBlobMBS("Hello")

MessageBox str(B.length) // shows 5
```

Notes: (Read only property)

91.27.15 base64 as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blob content as a string in Base64 format.
Example:

```
Var b as new GMBlobMBS("Hello")

MessageBox b.base64 // shows "SGVsbG8="
```

Notes: (Read and Write computed property)

91.28 class GMCoderInfoMBS

91.28.1 class GMCoderInfoMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class used to get information about all registered coders.
Example:

```
Var coders(-1) as GMCoderInfoMBS = GMCoderInfoMBS.CoderInfoList
Var names(-1) as string

for each coder as GMCoderInfoMBS in coders
names.Add coder.name
next

MessageBox Join(names,EndOfLine)
```

Notes: The CoderInfo class provides the means to provide information regarding GraphicsMagick support for an image format (designated by a magick string). It may be used to provide support for a specific named format (provided as an argument to the constructor), or as an element of a container when format support is queried using the coderInfoList() templated function.
Blog Entries

- MBS Xojo Plugins, version 18.4pr1

91.28.2 Methods

91.28.3 CoderInfoList as GMCoderInfoMBS()

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a list of all coders.
Example:

```
Var coders(-1) as GMCoderInfoMBS = GMCoderInfoMBS.CoderInfoList
```

91.28.4 Properties

91.28.5 description as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Format description (e.g. "CompuServe graphics interchange format").
Example:

```
Var coders(-1) as GMCoderInfoMBS = GMCoderInfoMBS.CoderInfoList
Var names(-1) as string

for each coder as GMCoderInfoMBS in coders
names.Add coder.name+" "+coder.description
next

MessageBox Join(names,EndOfLine)
```

Notes: (Read and Write property)

91.28.6 isMultiFrame as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Format supports multiple frames.
Example:

```
Var coders(-1) as GMCoderInfoMBS = GMCoderInfoMBS.CoderInfoList
Var names(-1) as string

for each coder as GMCoderInfoMBS in coders
names.Add coder.name+" "+str(coder.isMultiFrame)
next

MessageBox Join(names,EndOfLine)
```

Notes: (Read and Write property)

91.28.7 isReadable as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Format is readable.
Example:

```
Var coders(-1) as GMCoderInfoMBS = GMCoderInfoMBS.CoderInfoList
Var names(-1) as string

for each coder as GMCoderInfoMBS in coders
names.Add coder.name+" "+str(coder.isReadable)
next

MessageBox Join(names,EndOfLine)
```

Notes: (Read and Write property)

91.28.8 isWritable as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Format is writeable.
Example:

```
Var coders(-1) as GMCoderInfoMBS = GMCoderInfoMBS.CoderInfoList
Var names(-1) as string

for each coder as GMCoderInfoMBS in coders
names.Add coder.name+" "+str(coder.isWritable)
next

MessageBox Join(names,EndOfLine)
```

Notes: (Read and Write property)

91.28.9 ModuleName as String

MBS GraphicsMagick Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Name of loadable module.
Notes: (Read and Write property)

91.28.10 name as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Format name (e.g. "GIF").
Example:

```
Var coders(-1) as GMCoderInfoMBS = GMCoderInfoMBS.CoderInfoList
Var coder as GMCoderInfoMBS = coders(0) // pick first one

MessageBox coder.name
```

Notes: (Read and Write property)

91.28.11 Note as String

MBS GraphicsMagick Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Usage note for user.
Notes: (Read and Write property)

91.28.12 Version as String

MBS GraphicsMagick Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Support library version.
Notes: (Read and Write property)

91.29 class GMColorGrayMBS

91.29.1 class GMColorGrayMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color subclass for a grayscale color.
Example:

```
Var g as new GMColorGrayMBS(0.5)
MessageBox str(g.shade)
```

Notes: Representation of grayscale RGB color.
Equal parts red, green, and blue specified as a ratio (0 to 1).
Subclass of the GMColorMBS class.

91.29.2 Methods

91.29.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with transparent black.
Example:

```
Var c as new GMColorGrayMBS
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.29.4 Constructor(other as GMColorMBS) 14969
- 91.29.5 Constructor(shade as Double) 14970

91.29.4 Constructor(other as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color copying the existing color.
Example:

```
Var g as new GMColorGrayMBS(0.5)
Var o as new GMColorGrayMBS(g)
MessageBox str(o.shade)
```

See also:

- 91.29.3 Constructor 14969
- 91.29.5 Constructor(shade as Double) 14970

91.29.5 Constructor(shade as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given value.
Example:

```
Var g as new GMColorGrayMBS(1.0)
MessageBox str(g.colorValue)
```

Notes: Range is 0.0 to 1.0.
See also:

- 91.29.3 Constructor 14969
- 91.29.4 Constructor(other as GMColorMBS) 14969

91.29.6 Properties

91.29.7 shade as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The gray value for this color.
Example:

```
Var g as new GMColorGrayMBS(1.0)
MessageBox str(g.shade)
```

Notes: Range is 0.0 to 1.0
(Read and Write property)

91.30 class GMColorHSLMBS

91.30.1 class GMColorHSLMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a HSL color.
Example:

```
Var g as new GMColorHSLMBS(0.1,0.2,0.3)
MessageBox str(g.colorValue)
```

Notes: Subclass of the GMColorMBS class.

91.30.2 Methods

91.30.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with transparent black.
Example:

```
Var c as new GMColorHSLMBS
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.30.4 Constructor(hue as Double, saturation as Double, luminosity as Double) 14971
- 91.30.5 Constructor(other as GMColorMBS) 14972

91.30.4 Constructor(hue as Double, saturation as Double, luminosity as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

```
Var g as new GMColorHSLMBS(0.1,0.2,0.3)
MessageBox str(g.hue)+" "+str(g.saturation)+" "+str(g.luminosity)
```

See also:

- 91.30.3 Constructor 14971
- 91.30.5 Constructor(other as GMColorMBS) 14972

91.30.5 Constructor(other as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color copying the existing color.
Example:

```
Var g as new GMColorHSLMBS(0.1,0.2,0.3)
Var o as new GMColorHSLMBS(g)

MessageBox str(o.colorValue)
```

See also:

- 91.30.3 Constructor 14971
- 91.30.4 Constructor(hue as Double, saturation as Double, luminosity as Double) 14971

91.30.6 Properties

91.30.7 hue as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The hue value.
Example:

```
Var g as new GMColorHSLMBS(0.1,0.2,0.3)
MessageBox str(g.hue)
```

Notes: (Read and Write property)

91.30.8 luminosity as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The luminosity value.
Example:

```
Var g as new GMColorHSLMBS(0.1,0.2,0.3)
MessageBox str(g.luminosity)
```

Notes: (Read and Write property)

91.30.9 saturation as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The saturation value.
Example:

```
Var g as new GMColorHSLMBS(0.1,0.2,0.3)
MessageBox str(g.saturation)
```

Notes: (Read and Write property)

91.31 class GMColorMBS

91.31.1 class GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Color is the base color class.
Example:

```
Var c as new GMColorMBS(127,255,127) // light green
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

Notes: It is a simple container class for the pixel red, green, blue, and alpha values scaled to fit GraphicsMagick's Quantum size. Normally users will instantiate a class derived from Color which supports the color model that fits the needs of the application. The Color class may be constructed directly from an X11-style color string. As a perhaps odd design decision, the value transparent black is considered to represent an unset value (invalid color) in many cases. This choice was made since it avoided using more memory. The default Color constructor constructs an invalid color (i.e. transparent black) and may be used as a parameter in order to remove a color setting.

- MBS Xojo Plugins, version 18.3pr1
- Gradients in GraphicsMagick

91.31.2 Methods

91.31.3 Black as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a black color.
Example:

```
Var black as GMColorMBS = GMColorMBS.Black

MessageBox str(black.colorValue)
```

91.31.4 Color(ColorValue as Color) as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts color from Xojo to GMColorMBS.
Example:

```
Var c as GMColorMBS = GMColorMBS.Color(&cFF0000)

MessageBox str(c.colorValue)
```

See also:

- 91.31.5 Color(ColorValue as Color, alpha as Integer) as GMColorMBS 14975
- 91.31.6 Color(red as integer, green as integer, blue as integer) as GMColorMBS 14975
- 91.31.7 Color(red as integer, green as integer, blue as integer, alpha as Integer) as GMColorMBS 14976

91.31.5 Color(ColorValue as Color, alpha as Integer) as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts color from Xojo to GMColorMBS with separate alpha value.
Example:

```
Var c as GMColorMBS = GMColorMBS.Color(&cFF0000, 128)

MessageBox str(c.colorValue)+" "+str(c.alpha)
```

Notes: Alpha in range from 0 to 255.
See also:

- 91.31.4 Color(ColorValue as Color) as GMColorMBS 14974
- 91.31.6 Color(red as integer, green as integer, blue as integer) as GMColorMBS 14975
- 91.31.7 Color(red as integer, green as integer, blue as integer, alpha as Integer) as GMColorMBS 14976

91.31.6 Color(red as integer, green as integer, blue as integer) as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates color with RGB values.
Example:

```
Var c as GMColorMBS = GMColorMBS.Color(127, 191, 255)

MessageBox str(c.colorValue)
```

Notes: Range in 0 to 255 for 8bit and 0 to 65535 for 16bit class.
See also:

- 91.31.4 Color(ColorValue as Color) as GMColorMBS 14974

- 91.31.5 Color(ColorValue as Color, alpha as Integer) as GMColorMBS 14975
- 91.31.7 Color(red as integer, green as integer, blue as integer, alpha as Integer) as GMColorMBS 14976

91.31.7 Color(red as integer, green as integer, blue as integer, alpha as Integer) as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates color with RGB values.
Example:

```
Var c as GMColorMBS = GMColorMBS.Color(127, 191, 255, 127)

MessageBox str(c.colorValue)+" "+str(c.alphaQuantum)
```

Notes: Range in 0 to 255 for 8bit and 0 to 65535 for 16bit class.
See also:

- 91.31.4 Color(ColorValue as Color) as GMColorMBS 14974
- 91.31.5 Color(ColorValue as Color, alpha as Integer) as GMColorMBS 14975
- 91.31.6 Color(red as integer, green as integer, blue as integer) as GMColorMBS 14975

91.31.8 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with transparent black.
Example:

```
Var c as new GMColorMBS
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.31.9 Constructor(ColorName as string) 14977
- 91.31.10 Constructor(ColorValue as color) 14977
- 91.31.11 Constructor(ColorValue as color, alpha as Integer) 14978
- 91.31.12 Constructor(other as GMColorMBS) 14978
- 91.31.13 Constructor(red as Integer, green as Integer, blue as Integer) 14979
- 91.31.14 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer) 14979

91.31.9 Constructor(ColorName as string)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color based on the X11 color name.
Example:

```
Var c as new GMColorMBS("red")

MessageBox str(c.redQuantum)+"-"+str(c.greenQuantum)+"-"+str(c.blueQuantum) // shows "255-0-0"

Var d as new GMColorMBS("#77FF00")

MessageBox str(d.redQuantum)+"-"+str(d.greenQuantum)+"-"+str(d.blueQuantum) // shows "119-255-0"
```

Notes: An alternate way to construct the class is via an X11-compatible color specification string (e.g. Color("red") or Color ("#FF0000")). Since the class may be constructed from a string, convenient strings may be passed in place of an explicit Color object in methods which accept a reference to Color. Color may also be converted to a std::string for convenience in user interfaces, and for saving settings to a text file.

- 91.31.12 Constructor(other as GMColorMBS) 14978
- 91.31.13 Constructor(red as Integer, green as Integer, blue as Integer) 14979
- 91.31.14 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer) 14979

91.31.10 Constructor(ColorValue as color)

MBS GraphicsMagick Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

```
Var c as new GMColorMBS(&cFF0000)
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.31.8 Constructor 14976

- 91.31.11 Constructor(ColorValue as color, alpha as Integer) 14978
- 91.31.12 Constructor(other as GMColorMBS) 14978
- 91.31.13 Constructor(red as Integer, green as Integer, blue as Integer) 14979
- 91.31.14 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer) 14979

91.31.11 Constructor(ColorValue as color, alpha as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

```
Var c as new GMColorMBS(&cFF0102, 127)
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)+" "+str(c.alpha)
```

See also:

- 91.31.8 Constructor 14976
- 91.31.9 Constructor(ColorName as string) 14977
- 91.31.10 Constructor(ColorValue as color) 14977
- 91.31.12 Constructor(other as GMColorMBS) 14978
- 91.31.13 Constructor(red as Integer, green as Integer, blue as Integer) 14979
- 91.31.14 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer) 14979

91.31.12 Constructor(other as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color copying the existing color.
Example:

```
Var r as new GMColorMBS(1,2,3)
Var c as new GMColorMBS(r)
MessageBox str(C.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.31.8 Constructor 14976
- 91.31.9 Constructor(ColorName as string) 14977

- 91.31.10 Constructor(ColorValue as color) 14977
- 91.31.11 Constructor(ColorValue as color, alpha as Integer) 14978
- 91.31.13 Constructor(red as Integer, green as Integer, blue as Integer) 14979
- 91.31.14 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer) 14979

91.31.13 Constructor(red as Integer, green as Integer, blue as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

```
Var c as new GMColorMBS(1,2,3)
MessageBox str(C.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

Notes: For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
See also:

- 91.31.8 Constructor 14976
- 91.31.9 Constructor(ColorName as string) 14977
- 91.31.10 Constructor(ColorValue as color) 14977
- 91.31.11 Constructor(ColorValue as color, alpha as Integer) 14978
- 91.31.12 Constructor(other as GMColorMBS) 14978
- 91.31.14 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer) 14979

91.31.14 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

```
Var c as new GMColorMBS(1,2,3,4)

// display color, alpha is double...
MessageBox str(C.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)+" "+str(c.alpha)
```

Notes: For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
See also:

- 91.31.8 Constructor 14976
- 91.31.9 Constructor(ColorName as string) 14977
- 91.31.10 Constructor(ColorValue as color) 14977
- 91.31.11 Constructor(ColorValue as color, alpha as Integer) 14978
- 91.31.12 Constructor(other as GMColorMBS) 14978
- 91.31.13 Constructor(red as Integer, green as Integer, blue as Integer) 14979

91.31.15 QuantumByteSize as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The quantum byte size.
Example:

```
MessageBox str(GMColorMBS.QuantumByteSize)
```

Notes: As the plugin uses 8 bit this value should be 1.

91.31.16 scaleDoubleToQuantum(value as Double) as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales a double value to a value in the range of a quantum.
Example:

```
Var d as Double = 1.0
Var v as Integer = GMColorMBS.scaleDoubleToQuantum(d)
MessageBox str(v)
```

Notes: As the plugin uses 8 bit quantums, this is basicly a multiplication by 255.0

91.31.17 scaleQuantumToDouble(value as Integer) as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales a quantum to a double value.
Example:

```
Var v as Integer = 255
Var d as Double = GMColorMBS.scaleQuantumToDouble(v)
```

MessageBox str(d)

Notes: The plugin uses 8bit quantums, so this is basicly the division of value by 255.0

91.31.18 White as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a white color.
Example:

Var White as GMColorMBS = GMColorMBS.White

MessageBox str(White.colorValue)

91.31.19 Properties

91.31.20 alpha as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The alpha value of this color.
Example:

Var c as new GMColorMBS(1,2,3,1.0)
MessageBox str(c.alpha)

Notes: Range is 0.0 to 1.0. If you pass values higher, they are divided by 255.
(Read and Write property)

91.31.21 alphaQuantum as Integer

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The alpha color value.
Notes: For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)

91.31.22 blueQuantum as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blue color value.
Example:

```
Var c as new GMColorMBS(1,2,3)
MessageBox str(c.redQuantum) // 3
```

Notes: For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)

91.31.23 colorValue as color

MBS GraphicsMagick Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Xojo color for the GraphicsMagick color.
Example:

```
Var c as new GMColorMBS(&cFF0102)
MessageBox str(c.ColorValue)
```

Notes: (Read and Write property)

91.31.24 greenQuantum as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green color value.
Example:

```
Var r as new GMColorMBS(1,2,3)
MessageBox str(r.greenQuantum) // shows 2
```

Notes: For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)

91.31.25 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal color reference.
Example:

```
Var r as new GMColorMBS(1,2,3)
MessageBox str(r.handle)
```

Notes: (Read and Write property)

91.31.26 intensity as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The intensity of this color.
Example:

```
Var c as new GMColorMBS(1,2,3)
MessageBox str(c.intensity)
```

Notes: (Read only property)

91.31.27 isValid as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Does object contain valid color?
Example:

```
Var c as new GMColorMBS(1,2,3)
MessageBox str(c.isValid)
```

Notes: (Read and Write property)

91.31.28 redQuantum as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The red color value.
Example:

```
Var c as new GMColorMBS(1,2,3)
MessageBox str(c.redQuantum) // 1
```

Notes: For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)

91.32 class GMColorMonoMBS

91.32.1 class GMColorMonoMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Representation of a black/white color (true/false)
Example:

```
Var g as new GMColorMonoMBS(false)
MessageBox str(g.colorValue)
```

Notes: Subclass of the GMColorMBS class.

91.32.2 Methods

91.32.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with transparent black.
Example:

```
Var c as new GMColorMonoMBS
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.32.4 Constructor(mono as boolean) 14985
- 91.32.5 Constructor(other as GMColorMBS) 14986

91.32.4 Constructor(mono as boolean)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

```
Var g as new GMColorMonoMBS(false)
MessageBox str(g.mono)
```

See also:

- 91.32.3 Constructor 14985

• 91.32.5 Constructor(other as GMColorMBS) 14986

91.32.5 Constructor(other as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color copying the existing color.
Example:

```
Var g as new GMColorMonoMBS(false)
Var o as new GMColorMonoMBS(g)
MessageBox str(o.mono)
```

See also:

• 91.32.3 Constructor 14985

• 91.32.4 Constructor(mono as boolean) 14985

91.32.6 Properties

91.32.7 mono as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color value.
Example:

```
Var g as new GMColorMonoMBS(true)
MessageBox str(g.mono)
```

Notes: (Read and Write property)

91.33 class GMColorRGBMBS

91.33.1 class GMColorRGBMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color class for RGB colors.
Example:

```
Var c as new GMColorRGBMBS(1.0,0.0,0.0) // red
MessageBox str(C.red)+" "+str(c.green)+" "+str(c.blue)
MessageBox str(C.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

Notes: Representation of RGB color with red, green, and blue specified as ratios (0 to 1)
Subclass of the GMColorMBS class.
Blog Entries

- Crop a two side page document to a single page document

91.33.2 Methods

91.33.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with transparent black.
Example:

```
Var c as new GMColorRGBMBS
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.33.4 Constructor(other as GMColorMBS) 14987
- 91.33.5 Constructor(red as Double, green as Double, blue as Double) 14988

91.33.4 Constructor(other as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color copying the existing color.
Example:

```
Var g as new GMColorRGBMBS(1,2,3)
Var o as new GMColorRGBMBS(g)
```

MessageBox str(o.colorValue)

See also:

- 91.33.3 Constructor 14987
- 91.33.5 Constructor(red as Double, green as Double, blue as Double) 14988

91.33.5 Constructor(red as Double, green as Double, blue as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

Var c as new GMColorRGBMBS(0.1,0.2,0.3)

Notes: Range is 0.0 to 1.0.
See also:

- 91.33.3 Constructor 14987
- 91.33.4 Constructor(other as GMColorMBS) 14987

91.33.6 Properties

91.33.7 blue as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blue color component.
Example:

Var c as new GMColorRGBMBS(0.0,0.0,1.0)
MessageBox str(c.blue)

Notes: Range is 0.0 to 1.0.
(Read and Write property)

91.33.8 green as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green color component.
Example:

```
Var c as new GMColorRGBMBS(0.0,1.0,0.0)
MessageBox str(c.green)
```

Notes: Range is 0.0 to 1.0.
(Read and Write property)

91.33.9 red as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The red color component.
Example:

```
Var c as new GMColorRGBMBS(1.0,0.0,0.0) // red
MessageBox str(C.red)
```

Notes: Range is 0.0 to 1.0.
(Read and Write property)

91.34 class GMColorYUVMBS

91.34.1 class GMColorYUVMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Representation of a color in the YUV colorspace
Example:

```
Var g as new GMColorYUVMBS(0.1, 0.2, 0.3)
MessageBox str(g.y)+" "+str(g.u)+" "+str(g.v)
```

Notes: Subclass of the GMColorMBS class.

91.34.2 Methods

91.34.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with transparent black.
Example:

```
Var c as new GMColorYUVMBS
MessageBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 91.34.4 Constructor(other as GMColorMBS) 14990
- 91.34.5 Constructor(y as Double, u as Double, v as Double) 14991

91.34.4 Constructor(other as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color copying the existing color.
Example:

```
Var g as new GMColorYUVMBS(0.1, 0.2, 0.3)
Var o as new GMColorYUVMBS(g)
MessageBox str(o.colorValue)
```

See also:

- 91.34.3 Constructor 14990
- 91.34.5 Constructor(y as Double, u as Double, v as Double) 14991

91.34.5 Constructor(y as Double, u as Double, v as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color with the given values.
Example:

```
Var g as new GMColorYUVMBS(0.1, 0.2, 0.3)
```

See also:

- 91.34.3 Constructor 14990
- 91.34.4 Constructor(other as GMColorMBS) 14990

91.34.6 Properties

91.34.7 u as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The u color component.
Example:

```
Var g as new GMColorYUVMBS(0.1, 0.2, 0.3)
MessageBox str(g.u)
```

Notes: Range is -0.5 to +0.5.
(Read and Write property)

91.34.8 v as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The v color component.
Example:

```
Var g as new GMColorYUVMBS(0.1, 0.2, 0.3)
MessageBox str(g.v)
```

Notes: Range is -0.5 to +0.5.
(Read and Write property)

91.34.9 y as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y color component.
Example:

```
Var g as new GMColorYUVMBS(0.1, 0.2, 0.3)
MessageBox str(g.y)
```

Notes: Range is 0.0 to 1.0.
(Read and Write property)

91.35 class GMConvertMBS

91.35.1 class GMConvertMBS

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to convert images thread friendly.
Example:

```
// scale a photo to 800 pixels width and save it as JPEG, without blocking other threads
// Call this from a Thread to keep the app responsive.
Var c As New GMConvertMBS
c.InputFile = SpecialFolder.Desktop.Child("photo.png")
c.OutputFile = SpecialFolder.Desktop.Child("photo small.jpg")
c.ScaleGeometry = New GMGeometryMBS(800, 0) // height follows the aspect ratio
c.Quality = 85
c.AutoOrient = True // rotate as the camera recorded it
c.Strip = True // remove metadata
c.Run
```

Notes: This class is intended to process lots of images in several instances in several threads.
If you for example use 8 Xojo threads, to process thousands of images to scale them down for thumbnails, you can easily keep 8 CPU cores busy.

Please make a new instance, set options and call run method. When run is done, please read output properties.
Do not modify properties while thread is running.

- 17.3, page 11: News

91.35.2 Methods

91.35.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

91.35.4 Run

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Starts converter.
Notes: The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

91.35.5 Properties

91.35.6 AutoOrient as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to call autoOrient method to change orientation of image data to 0¬∞.
Notes: (Read and Write property)

91.35.7 Enhance as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to run enhance command.
Notes: If true, we call enhance on the image to minimize noise.
(Read and Write property)

91.35.8 Equalize as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to run equalize command.
Notes: If set to true, we call equalize command on image (histogram equalization).
(Read and Write property)

91.35.9 ImageType as Integer

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the image type.
Notes: If value is >0, the image type is change to the given type.
(Read and Write property)

91.35.10 InputData as String

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The input data string.
Notes: If set, we read image from this data.
(Read and Write property)

91.35.11 InputFile as FolderItem

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The input folderitem.
Notes: If set input file to read.
(Read and Write property)

91.35.12 InputGeometry as GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The input geometry.
Notes: Some formats can be loaded with different scales, so this geometry is passed to read method to define the format requested.
(Read and Write property)

91.35.13 InputImage as GMImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The input image.
Notes: (Read and Write property)

91.35.14 InputMagick as String

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The image magick type.
Notes: If empty, the type of file is automatically determined.
(Read and Write property)

91.35.15 InputMemory as MemoryBlock

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The input data memoryblock.
Notes: If set, we read image from this data.
(Read and Write property)

91.35.16 InputPath as String

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The input file path.
Notes: If set input file to read.
(Read and Write property)

91.35.17 OutputData as String

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Output data as string.
Notes: (Read and Write property)

91.35.18 OutputFile as FolderItem

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The folderitem where to write file.
Notes: If set, the image will be written to this file.
(Read and Write property)

91.35.19 OutputImage as GMImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Output image object.
Notes: (Read and Write property)

91.35.20 OutputMagick as String

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Output magick.
Notes: You can set this to a magick codec type to define output format, e.g. "jpeg".
(Read and Write property)

91.35.21 OutputMemory as MemoryBlock

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Output data as memory block.
Notes: (Read and Write property)

91.35.22 OutputPath as String

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The native file path for output.
Notes: If set, the image will be written to this path.
(Read and Write property)

91.35.23 Quality as Integer

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Quality of images in range 1 to 100.
Notes: If value is >0, we assign it to the image for setting image quality.
(Read and Write property)

91.35.24 Running as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this converter is running.
Notes: Set to true while Run method runs.
(Read only property)

91.35.25 ScaleGeometry as GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The geometry for call to scale method.
Notes: scale method is called with this geometry (if set) to reduce image size.
(Read and Write property)

91.35.26 Strip as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to remove all profiles and text attributes from the image.
Notes: (Read and Write property)

91.35.27 ThumbnailGeometry as GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The geometry for call to thumbnail method.
Notes: thumbnail method is called with this geometry (if set) to reduce image size.
(Read and Write property)

91.35.28 Trim as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether trim command is called on image to remove extra blank space around image.
Notes: (Read and Write property)

91.35.29 WantOutputData as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether you want image compressed and stored in OutputData property.
Notes: (Read and Write property)

91.35.30 WantOutputMemory as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether you want image compressed and stored in OutputMemory property.
Notes: (Read and Write property)

91.36 class GMCoordinateMBS

91.36.1 class GMCoordinateMBS

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Graphics Magick class for a coordinate.
Example:

```
Var c as new GMCoordinateMBS(5,6)
MessageBox str(c.x)+" "+str(c.y)
```

91.36.2 Methods

91.36.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create a new coordinate.
See also:

- 91.36.4 Constructor(x as Double, y as Double) 15000

91.36.4 Constructor(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create a new coordinate.
Example:

```
Var c as new GMCoordinateMBS(5,6)
MessageBox str(c.x)+" "+str(c.y)
```

See also:

- 91.36.3 Constructor 15000

91.36.5 Properties

91.36.6 x as Double

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x value.
Example:

```
Var c as new GMCoordinateMBS
c.x = 5
MessageBox str(c.x)
```

Notes: (Read and Write property)

91.36.7 y as Double

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y value.
Example:

```
Var c as new GMCoordinateMBS
c.y = 5
MessageBox str(c.y)
```

Notes: (Read and Write property)

91.37 class GMErrorExceptionMBS

91.37.1 class GMErrorExceptionMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception to report errors in the GraphicMagick plugin.
Notes: Check the message property for details.
Subclass of the RuntimeException class.

91.38 class GMGeometryMBS

91.38.1 class GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Geometry provides a convenient means to specify a geometry argument.
Example:

```
Var g as new GMGeometryMBS(300,400)
MessageBox str(G.width)+" "+str(G.height)
```

Notes: The object may be initialized from a string containing a geometry specification. It may also be initialized by more efficient parameterized constructors.

Xojo Developer Magazine

- 19.6, page 74: Fun with GraphicsMagick, Cool methods from the GMImageMBS class by Stefanie Juchmes

91.38.2 Methods

91.38.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates empty geometry.
Example:

```
Var g as new GMGeometryMBS
MessageBox str(G.width)+" "+str(G.height)
```

See also:

- 91.38.4 Constructor(geometry as string) 15004

- 91.38.5 Constructor(other as GMGeometryMBS) 15004
- 91.38.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false) 15005

91.38.4 Constructor(geometry as string)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct geometry from string.
Example:

```
Var g as new GMGeometryMBS("600x600")

MessageBox str(G.width)+" "+str(G.height)
```

Notes: See the GraphicsMagick website for details.
http://www.graphicsmagick.org/Magick++/Geometry.html
See also:

- 91.38.3 Constructor 15003
- 91.38.5 Constructor(other as GMGeometryMBS) 15004
- 91.38.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false) 15005

91.38.5 Constructor(other as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new geometry object by copying an existing one.
Example:

```
Var g as new GMGeometryMBS(600,600)
Var h as new GMGeometryMBS(g)
MessageBox str(h.width)
```

See also:

- 91.38.3 Constructor 15003
- 91.38.4 Constructor(geometry as string) 15004
- 91.38.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false) 15005

91.38.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates geometry with the given values.
Example:

```
Var g as new GMGeometryMBS(600,600)
MessageBox str(g.width)
```

See also:

- 91.38.3 Constructor 15003
- 91.38.4 Constructor(geometry as string) 15004
- 91.38.5 Constructor(other as GMGeometryMBS) 15004

91.38.7 Make(geometry as string) as GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct geometry from string.
Example:

```
Var g as GMGeometryMBS = GMGeometryMBS.Make("600x600")

MessageBox str(G.width)+" "+str(G.height)
```

Notes: See the GraphicsMagick website for more details:
http://www.graphicsmagick.org/Magick++/Geometry.html
See also:

- 91.38.8 Make(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false) as GMGeometryMBS 15005

91.38.8 Make(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false) as GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates geometry with the given values.
Example:

```
Var g as GMGeometryMBS = GMGeometryMBS.Make(600,600)
MessageBox str(g.width)
```

See also:

- 91.38.7 Make(geometry as string) as GMGeometryMBS 15005

91.38.9 Properties

91.38.10 aspect as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize without preserving aspect ratio (!).
Example:

```
Var g as new GMGeometryMBS(600,600)
MessageBox str(g.aspect)
```

Notes: (Read and Write property)

91.38.11 fillArea as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image to fit total pixel area specified by dimensions.
Notes: Same as @ in the geometry specification.
(Read and Write property)

91.38.12 greater as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize if image is greater than size (>).
Example:

```
Var g as new GMGeometryMBS(600,600)
MessageBox str(g.greater)
```

Notes: (Read and Write property)

91.38.13 height as Uint32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height value.
Example:

```
Var g as new GMGeometryMBS(600,600)
MessageBox str(g.height)
```

Notes: (Read and Write property)

91.38.14 isValid as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Does object contain a valid geometry?
Example:

```
Var g as new GMGeometryMBS(100,200)
MessageBox str(G.isValid)
```

Notes: May be set to false in order to invalidate an existing geometry object.
(Read and Write property)

91.38.15 less as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize if image is less than size (<).
Example:

```
Var g as new GMGeometryMBS(600,600)
MessageBox str(g.less)
```

Notes: (Read and Write property)

91.38.16 limitPixels as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Dimensions are treated as minimum rather than maximum values.
Notes: Same as ^in the geometry specification.

(Read and Write property)

91.38.17 percent as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Width and height are expressed as percentages.
Example:

```
Var g as new GMGeometryMBS(600,600)
MessageBox str(g.percent)
```

Notes: (Read and Write property)

91.38.18 StringValue as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The string representation of the geometry object.
Example:

```
Var g as new GMGeometryMBS(600,600)
MessageBox str(g.StringValue)
```

Notes: (Read and Write property)

91.38.19 width as Uint32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width value.
Example:

```
Var g as new GMGeometryMBS(600,600)
MessageBox str(g.width)
```

Notes: (Read and Write property)

91.38.20 xNegative as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sign of X offset negative? (X origin at right)
Example:

```
Var g as new GMGeometryMBS(100,200,30,40,true,false)
MessageBox str(G.xNegative)
```

Notes: (Read and Write property)

91.38.21 xOff as Uint32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: X offset from origin.
Example:

```
Var g as new GMGeometryMBS(100,200,30,40,true,true)
MessageBox str(G.xOff)+" "+str(G.yOff)
```

Notes: (Read and Write property)

91.38.22 yNegative as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sign of Y offset negative? (Y origin at bottom)
Example:

```
Var g as new GMGeometryMBS(100,200,30,40,false,true)
MessageBox str(G.yNegative)
```

Notes: (Read and Write property)

91.38.23 yOff as Uint32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Y offset from origin
Example:

```
Var g as new GMGeometryMBS(100,200,30,40,true,true)
MessageBox str(G.xOff)+" "+str(G.yOff)
```

Notes: (Read and Write property)

91.39 class GMGraphicsMBS

91.39.1 class GMGraphicsMBS

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for drawing commands targeting a GMImageMBS.
Notes: Please remember that all commands are collected till you call the Draw method.

91.39.2 Methods

91.39.3 Arc(startX as Double, startY as Double, endX as Double, endY as Double, startDegrees as Double, endDegrees as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw an arc using the stroke color and based on the circle starting at coordinates startX,startY, and ending with coordinates endX,endY, and bounded by the rotational arc startDegrees,endDegrees.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.type = image.TrueColorType
image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

draw.arc(250, 250, 100, 100,50,300)
draw.Draw

Backdrop=image.CopyPicture
```

91.39.4 Bezier(values() as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a bezier curve using the stroke color and based on the coordinates specified by the coordinates array.

91.39.5 Circle(originX as Double, originY as Double, perimX as Double, perimY as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a circle using the stroke color and thickness using specified origin and perimeter coordinates.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.type = image.TrueColorType
image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)
draw.Draw

Backdrop=image.CopyPicture
```

Notes: If a fill color is specified, then the object is filled.

91.39.6 ClipPath(id as string)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Select a drawing clip path matching id.

91.39.7 ColorPixel(x as Double, y as Double, paintMethod as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Color image according to paintMethod.
Notes: The point method recolors the target pixel. The replace method recolors any pixel that matches the color of the target pixel. Floodfill recolors any pixel that matches the color of the target pixel and is a

neighbor, whereas filltoborder recolors any neighbor pixel that is not the border color. Finally, reset recolors all pixels.

Paint methods:

PointMethod	0	Replace pixel color at point.
ReplaceMethod	1	Replace color for all image pixels matching color at point.
FloodfillMethod	2	Replace color for pixels surrounding point until encountering pixel that fails to match color at point.
FillToBorderMethod	3	Replace color for pixels surrounding point until encountering pixels matching border color.
ResetMethod	4	Replace colors for all pixels in image with pen color.

91.39.8 CompositeImage(x as Double, y as Double, file as folderitem)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composite current image with contents of specified image, at specified coordinates.
Notes: If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through.

- 91.39.16 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string, CompositeOperator as Integer) 15018

91.39.9 CompositeImage(x as Double, y as Double, image as GMImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composite current image with contents of specified image, at specified coordinates.
Notes: If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through.

- 91.39.13 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GMImageMBS) 15016
- 91.39.14 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GMImageMBS, CompositeOperator as Integer) 15017
- 91.39.15 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string) 15017
- 91.39.16 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string, CompositeOperator as Integer) 15018

91.39.10 CompositeImage(x as Double, y as Double, path as string)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composite current image with contents of specified image, at specified coordinates.
Notes: If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through.

- 91.39.16 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string, CompositeOperator as Integer) 15018

91.39.11 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composite current image with contents of specified image, rendered with specified width and height, at specified coordinates.
Notes: If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through. If the specified width or height is zero, then the image is composited at its natural size, without enlargement or reduction.

91.39.12 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem, CompositeOperator as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composite current image with contents of specified image, rendered with specified width and height, using specified composition algorithm, at specified coordinates.
Notes: If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through. If the specified width or height is zero, then the image is composited at its natural size, without enlargement or reduction.

91.39.13 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GMImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composite current image with contents of specified image, rendered with specified width and height, at specified coordinates.
Notes: If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through. If the specified width or height is zero, then the image is composited at its natural size, without enlargement or reduction.

- 91.39.14 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GMImageMBS, CompositeOperator as Integer) 15017
- 91.39.15 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string) 15017

91.39.17 Constructor(image as GMImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new object referencing the given image.

91.39.18 DashArray(values() as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify the pattern of dashes and gaps used to stroke paths.
Notes: The strokeDashArray represents a zero-terminated array of numbers that specify the lengths of alternating dashes and gaps in pixels. If an odd number of values is provided, then the list of values is repeated to yield an even number of values. A typical strokeDashArray array might contain the members 5 3 2 0, where the zero value indicates the end of the pattern array.

91.39.19 DashOffset(offset as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify the distance into the dash pattern to start the dash.
Notes: See documentation on SVG's stroke-dashoffset property for usage details.

91.39.20 Draw

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws all draw commands collected.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.type = image.TrueColorType
image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

draw.StrokeColor new GMColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

91.39.21 DrawPath

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw on image using vector path.
Example:

```
// new picture, 500x500 and filled with white
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

Var draw as GMGraphicsMBS = image.Graphics

// Draw path

Var cr as new GMColorRGBMBS("red")
Var gr as new GMColorRGBMBS("green")
draw.StrokeColor cr
draw.FillColor gr
draw.PathMovetoAbs(30,10)
draw.PathLinetoAbs(20,55)
draw.PathLinetoAbs(70,50)
draw.PathLinetoAbs(80,5)
draw.DrawPath

draw.Draw

// show picture
image.type = image.TrueColorType // make sure it's a bitmap
Backdrop=image.CopyPicture
```

91.39.22 Ellipse(originX as Double, originY as Double, perimX as Double, perimY as Double, arcStart as Double, arcEnd as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw an ellipse using the stroke color and thickness, specified origin, x & y radius, as well as specified start and end of arc in degrees.
Notes: If a fill color is specified, then the object is filled.

91.39.23 FillColor(c as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify drawing object fill color.

91.39.24 FillOpacity(opacity as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify opacity to use when drawing using fill color.

91.39.25 FillRule(fillRule as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify the algorithm which is to be used to determine what parts of the canvas are included inside the shape.
Notes: See documentation on SVG's fill-rule property for usage details.

91.39.26 Font(fontname as string)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify font name to use when drawing text.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

Var draw as GMGraphicsMBS = image.Graphics

// draw red text
draw.strokeColor(new GMColorRGBMBS("red")) // Outline color
draw.strokeWidth(1)
draw.Font("/Library/Fonts/Verdana.ttf")
draw.Text(50, 50, "Hello", "")
draw.Draw

Backdrop=image.CopyPicture
```

See also:

- 91.39.27 Font(fontname as string, StyleType as Integer, weight as Integer, StretchType as Integer) 15022

91.39.27 Font(fontname as string, StyleType as Integer, weight as Integer, StretchType as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the font.
Notes: Specify font family, style, weight (one of the set { 100 | 200 | 300 | 400 | 500 | 600 | 700 | 800 | 900 } with 400 being the normal size), and stretch to be used to select the font used when drawing text. Wildcard matches may be applied to style via the AnyStyle enumeration, applied to weight if weight is zero, and applied to stretch via the AnyStretch enumeration.
See also:

- 91.39.26 Font(fontname as string) 15021

91.39.28 Gravity(GravityType as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify text positioning gravity.

91.39.29 Line(startX as Double, startY as Double, endX as Double, endY as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a line using stroke color and thickness using starting and ending coordinates
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

// Draw a line
draw.Line(100,100,400,400)
draw.Draw

image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

91.39.30 Matte(x as Double, y as Double, paintMethod as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Change the pixel matte value to transparent.
Notes: The point method changes the matte value of the target pixel. The replace method changes the matte value of any pixel that matches the color of the target pixel. Floodfill changes the matte value of any pixel that matches the color of the target pixel and is a neighbor, whereas filltoborder changes the matte value of any neighbor pixel that is not the border color, Finally reset changes the matte value of all pixels.

Paint methods:

PointMethod	0	Replace pixel color at point.
ReplaceMethod	1	Replace color for all image pixels matching color at point.
FloodfillMethod	2	Replace color for pixels surrounding point until encountering pixel that fails to match color at point.
FillToBorderMethod	3	Replace color for pixels surrounding point until encountering pixels matching border color.
ResetMethod	4	Replace colors for all pixels in image with pen color.

91.39.31 MiterLimit(miterlimit as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify miter limit.
Notes: When two line segments meet at a sharp angle and miter joins have been specified for 'lineJoin', it is possible for the miter to extend far beyond the thickness of the line stroking the path. The miterLimit' imposes a limit on the ratio of the miter length to the 'lineWidth'. The default value of this parameter is 4.

91.39.32 PathArcAbs(c as GMPathArgsMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws an elliptical arc from the current point to (x, y).
Notes: The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

In the GMPathArgsMBS, set the following properties: radiusX, radiusY, xAxisRotation, bool largeArcFlag, sweepFlag, x and y.

See also:

- 91.39.33 PathArcAbs(c() as GMPathArgsMBS) 15024
- 91.39.34 PathArcAbs(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 15024

91.39.33 PathArcAbs(c() as GMPathArgsMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws an elliptical arc from the current point to (x, y).
Notes: The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

In the GMPathArgsMBS, set the following properties: radiusX, radiusY, xAxisRotation, bool largeArcFlag, sweepFlag, x and y.
See also:

- 91.39.32 PathArcAbs(c as GMPathArgsMBS) 15023
- 91.39.34 PathArcAbs(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 15024

91.39.34 PathArcAbs(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws an elliptical arc from the current point to (x, y).
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics
```

```
// Draw an arc

draw.PathMovetoAbs 100,100
draw.PathArcAbs(100,100, 0, false, false, 200,200)
draw.DrawPath
draw.Draw

Backdrop=image.CopyPicture
```

Notes: The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

91.39.36 PathArcRel(c() as GMPathArgsMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws an elliptical arc from the current point to (x, y).
Notes: The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

In the GMPathArgsMBS, set the following properties: radiusX, radiusY, xAxisRotation, bool largeArcFlag, sweepFlag, x and y.

- 91.39.36 PathArcRel(c() as GMPathArgsMBS) 15025

91.39.38 PathClosePath

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Close the current subpath by drawing a straight line from the current point to current subpath's most recent starting point (usually, the most recent moveto point).

91.39.39 PathCurvetoAbs(c as GMPathArgsMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
Notes: PathCurvetoAbs indicates that absolutecoordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.
See also:

- 91.39.40 PathCurvetoAbs(c() as GMPathArgsMBS) 15027
- 91.39.41 PathCurvetoAbs(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 15027

91.39.40 PathCurvetoAbs(c() as GMPathArgsMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
Notes: PathCurvetoAbs indicates that absolutecoordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.
See also:

- 91.39.39 PathCurvetoAbs(c as GMPathArgsMBS) 15027
- 91.39.41 PathCurvetoAbs(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 15027

91.39.41 PathCurvetoAbs(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
Notes: PathCurvetoAbs indicates that absolutecoordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end

of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.
See also:

- 91.39.39 PathCurvetoAbs(c as GMPathArgsMBS) 15027
- 91.39.40 PathCurvetoAbs(c() as GMPathArgsMBS) 15027

91.39.42 PathCurvetoRel(c as GMPathArgsMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
Notes: PathCurvetoAbs indicates that absolutecoordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.
See also:

- 91.39.43 PathCurvetoRel(c() as GMPathArgsMBS) 15028
- 91.39.44 PathCurvetoRel(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 15029

91.39.43 PathCurvetoRel(c() as GMPathArgsMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
Notes: PathCurvetoAbs indicates that absolutecoordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.
See also:

- 91.39.42 PathCurvetoRel(c as GMPathArgsMBS) 15028
- 91.39.44 PathCurvetoRel(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 15029

91.39.44 PathCurvetoRel(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
Notes: PathCurvetoAbs indicates that absolutecoordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.
See also:

- 91.39.42 PathCurvetoRel(c as GMPathArgsMBS) 15028
- 91.39.43 PathCurvetoRel(c() as GMPathArgsMBS) 15028

91.39.45 PathLinetoAbs(c as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.
See also:

- 91.39.46 PathLinetoAbs(c() as GMCoordinateMBS) 15029
- 91.39.47 PathLinetoAbs(x as Double, y as Double) 15030

91.39.46 PathLinetoAbs(c() as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.
See also:

- 91.39.45 PathLinetoAbs(c as GMCoordinateMBS) 15029
- 91.39.47 PathLinetoAbs(x as Double, y as Double) 15030

91.39.47 PathLinetoAbs(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.
See also:

- 91.39.45 PathLinetoAbs(c as GMCoordinateMBS) 15029
- 91.39.46 PathLinetoAbs(c() as GMCoordinateMBS) 15029

91.39.48 PathLinetoHorizontalAbs(v as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draws a horizontal line from the current point (cpx, cpy) to (x, cpy). PathLinetoHorizontalAbs indicates that absolute coordinates are supplied; PathLinetoHorizontalRel indicates that relative coordinates are supplied. At the end of the command, the new current point becomes (x, cpy) for the final value of x.

91.39.49 PathLinetoHorizontalRel(v as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draws a horizontal line from the current point (cpx, cpy) to (x, cpy). PathLinetoHorizontalAbs indicates that absolute coordinates are supplied; PathLinetoHorizontalRel indicates that relative coordinates are supplied. At the end of the command, the new current point becomes (x, cpy) for the final value of x.

91.39.50 PathLinetoRel(c as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.
See also:

• 91.39.52 PathLinetoRel(x as Double, y as Double) 15031

91.39.51 PathLinetoRel(c() as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.
See also:

• 91.39.50 PathLinetoRel(c as GMCoordinateMBS) 15030

• 91.39.52 PathLinetoRel(x as Double, y as Double) 15031

91.39.52 PathLinetoRel(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Example:

```
// new picture, 500x500 and filled with white
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

Var draw as GMGraphicsMBS = image.Graphics

// Draw path

Var cr as new GMColorRGBMBS("red")
Var gr as new GMColorRGBMBS("green")
draw.StrokeColor cr
draw.FillColor gr
draw.PathMovetoAbs(30,10)
draw.PathLinetoAbs(20,55)
draw.PathLinetoAbs(70,50)
draw.PathLinetoAbs(80,5)
draw.DrawPath

draw.Draw

// show picture
```

```
image.type = image.TrueColorType // make sure it's a bitmap
Backdrop=image.CopyPicture
```

Notes: Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.
See also:

- 91.39.50 PathLinetoRel(c as GMCoordinateMBS) 15030
- 91.39.51 PathLinetoRel(c() as GMCoordinateMBS) 15031

91.39.53 PathLinetoVerticalAbs(v as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draws a vertical line from the current point (cpx, cpy) to (cpx, y). PathLinetoVerticalAbs indicates that absolute coordinates are supplied; PathLinetoVerticalRel indicates that relative coordinates are supplied. At the end of the command, the new current point becomes (cpx, y) for the final value of y.

91.39.54 PathLinetoVerticalRel(v as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draws a vertical line from the current point (cpx, cpy) to (cpx, y). PathLinetoVerticalAbs indicates that absolute coordinates are supplied; PathLinetoVerticalRel indicates that relative coordinates are supplied. At the end of the command, the new current point becomes (cpx, y) for the final value of y.

91.39.55 PathMovetoAbs(c as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The "moveto" commands establish a new current point.
Notes: The effect is as if the "pen" were lifted and moved to a new location. A path data segment must begin with either one of the "moveto" commands or one of the "arc" commands. Subsequent "moveto" commands (i.e., when the "moveto" is not the first command) represent the start of a new subpath.

Start a new sub-path at the given coordinate. PathMovetoAbs indicates that absolute coordinates will follow; PathMovetoRel indicates that relative coordinates will follow. If a relative moveto appears as the first element of the path, then it is treated as a pair of absolute coordinates. If a moveto is followed by

multiple pairs of coordinates, the subsequent pairs are treated as implicit lineto commands.
See also:

- 91.39.56 PathMovetoAbs(x as Double, y as Double) 15033

91.39.56 PathMovetoAbs(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The "moveto" commands establish a new current point.
Notes: The effect is as if the "pen" were lifted and moved to a new location. A path data segment must begin with either one of the "moveto" commands or one of the "arc" commands. Subsequent "moveto" commands (i.e., when the "moveto" is not the first command) represent the start of a new subpath.

Start a new sub-path at the given coordinate. PathMovetoAbs indicates that absolute coordinates will follow; PathMovetoRel indicates that relative coordinates will follow. If a relative moveto appears as the first element of the path, then it is treated as a pair of absolute coordinates. If a moveto is followed by multiple pairs of coordinates, the subsequent pairs are treated as implicit lineto commands.

91.39.63 PathQuadraticCurvetoRel(c() as GMPathArgsMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point.
Notes: PathQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathQuadraticCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x and y.

- 91.39.62 PathQuadraticCurvetoRel(c as GMPathArgsMBS) 15035
- 91.39.64 PathQuadraticCurvetoRel(x1 as Double, y1 as Double, x as Double, y as Double) 15036

91.39.64 PathQuadraticCurvetoRel(x1 as Double, y1 as Double, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y) using (x1,y1) as the control point.
Notes: PathQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathQuadraticCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

- 91.39.63 PathQuadraticCurvetoRel(c() as GMPathArgsMBS) 15035

91.39.65 PathSmoothCurvetoAbs(c as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y).
Notes: The first control point is assumed to be the reflection of the second control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not an PathCurvetoAbs, PathCurvetoRel, PathSmoothCurvetoAbs or PathSmoothCurvetoRel, assume the first control point is coincident with the current point.) (x2,y2) is the second control point (i.e., the control point at the end of the curve). PathSmoothCurvetoAbs indicates that absolute coordinates will follow; PathSmoothCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.

- 91.39.67 PathSmoothCurvetoAbs(x as Double, y as Double) 15037

91.39.66 PathSmoothCurvetoAbs(c() as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cubic B√©zier curve from the current point to (x,y).
Notes: The first control point is assumed to be the reflection of the second control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not an PathCurvetoAbs, PathCurvetoRel, PathSmoothCurvetoAbs or PathSmoothCurvetoRel, assume the first control point is coincident with the current point.) (x2,y2) is the second control point (i.e., the control point at the end of the curve). PathSmoothCurvetoAbs indicates that absolute coordinates will follow; PathSmoothCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.

91.39.71 PathSmoothQuadraticCurvetoAbs(c as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y).
Notes: The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x and y.
See also:

- 91.39.73 PathSmoothQuadraticCurvetoAbs(x as Double, y as Double) 15040

91.39.72 PathSmoothQuadraticCurvetoAbs(c() as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y).
Notes: The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x and y.
See also:

- 91.39.71 PathSmoothQuadraticCurvetoAbs(c as GMCoordinateMBS) 15039
- 91.39.73 PathSmoothQuadraticCurvetoAbs(x as Double, y as Double) 15040

91.39.73 PathSmoothQuadraticCurvetoAbs(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y).
Notes: The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.
See also:

- 91.39.71 PathSmoothQuadraticCurvetoAbs(c as GMCoordinateMBS) 15039
- 91.39.72 PathSmoothQuadraticCurvetoAbs(c() as GMCoordinateMBS) 15039

91.39.74 PathSmoothQuadraticCurvetoRel(c as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y).
Notes: The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x and y.
See also:

- 91.39.75 PathSmoothQuadraticCurvetoRel(c() as GMCoordinateMBS) 15040
- 91.39.76 PathSmoothQuadraticCurvetoRel(x as Double, y as Double) 15041

91.39.75 PathSmoothQuadraticCurvetoRel(c() as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y).
Notes: The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not

a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x and y.
See also:

- 91.39.74 PathSmoothQuadraticCurvetoRel(c as GMCoordinateMBS) 15040
- 91.39.76 PathSmoothQuadraticCurvetoRel(x as Double, y as Double) 15041

91.39.76 PathSmoothQuadraticCurvetoRel(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a quadratic B√©zier curve from the current point to (x,y).
Notes: The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.
See also:

- 91.39.74 PathSmoothQuadraticCurvetoRel(c as GMCoordinateMBS) 15040
- 91.39.75 PathSmoothQuadraticCurvetoRel(c() as GMCoordinateMBS) 15040

91.39.77 Point(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a point using stroke color and thickness at coordinate.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.fillColor = new GMColorRGBMBS("red") // set color

Var draw as GMGraphicsMBS = image.Graphics

// draw cross with pixels
```

```
for x as Integer = 240 to 260
draw.Point(x, 250)
next
for y as Integer = 240 to 260
draw.Point(250,y)
next
draw.Draw

Backdrop=image.CopyPicture
```

91.39.78 PointSize(pointSize as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set font point size.

91.39.79 Polygon(values() as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw an arbitrary polygon using stroke color and thickness consisting of three or more coordinates contained in an array.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.fillColor = new GMColorRGBMBS("red") // set color
image.strokeColor = new GMColorRGBMBS("green") // set color

Var draw as GMGraphicsMBS = image.Graphics
Var coordinates(-1) as GMCoordinateMBS

coordinates.Add new GMCoordinateMBS(70,70)
coordinates.Add new GMCoordinateMBS(100,340)
coordinates.Add new GMCoordinateMBS(380,200)
coordinates.Add new GMCoordinateMBS(70,70)

draw.Polygon coordinates
draw.Draw

Backdrop=image.CopyPicture
```

Notes: If a fill color is specified, then the object is filled.

91.39.80 Polyline(values() as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw an arbitrary polyline using stroke color and thickness consisting of three or more coordinates contained in an array.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("green") // set color

Var draw as GMGraphicsMBS = image.Graphics
Var coordinates(-1) as GMCoordinateMBS

coordinates.Add new GMCoordinateMBS(70,70)
coordinates.Add new GMCoordinateMBS(100,340)
coordinates.Add new GMCoordinateMBS(380,200)

draw.Polyline coordinates
draw.Draw

Backdrop=image.CopyPicture
```

Notes: If a fill color is specified, then the object is filled.

91.39.81 PopClipPath

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pop (terminate) clip path definition started by PushClipPath.

91.39.82 PopGraphicContext

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pop Graphic Context.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorMBS() // transparent fillcolor
image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

// Draw a Rectangle
draw.PushGraphicContext
draw.Translation(250,250)
draw.Rotation(50)
draw.Rectangle(0, 0, 100, 100) // rotated
draw.PopGraphicContext
draw.Rectangle(0, 0, 100, 100) // not rotated
draw.Draw

Backdrop=image.CopyPicture
```

Notes: Removing the current graphic context from the graphic context stack restores the options to the values they had prior to the preceding PushGraphicContext operation.

91.39.83 PopPattern

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Terminate a pattern definition started via PushPattern.

91.39.84 PushClipPath(id as string)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Push (create) clip path definition with id.
Notes: Clip patch definition consists of subsequent drawing commands, terminated by PopClipPath.

91.39.85 PushGraphicContext

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Push Graphic Context.

Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorMBS() // transparent fillcolor
image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

// Draw a Rectangle
draw.PushGraphicContext
draw.Translation(250,250)
draw.Rotation(50)
draw.Rectangle(0, 0, 100, 100) // rotated
draw.PopGraphicContext
draw.Rectangle(0, 0, 100, 100) // not rotated
draw.Draw

Backdrop=image.CopyPicture
```

Notes: When a graphic context is pushed, options set after the context is pushed (such as coordinate transformations, color settings, etc.) are saved to a new graphic context. This allows related options to be saved on a graphic context "stack" in order to support heirarchical nesting of options. When PopGraphicContext is used to pop the current graphic context, the options in effect during the last PushGraphicContext operation are restored.

91.39.86 PushPattern(id as string, x as Integer, y as Integer, width as Integer, height as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Start a pattern definition with arbitrary pattern name specified by id, pattern offset specified by x and y, and pattern size specified by width and height.
Notes: The pattern is defined within the coordinate system defined by the specified offset and size. Arbitrary drawing objects (including DrawableCompositeImage) may be specified between PushPattern and PopPattern in order to draw the pattern. Normally the pair PushGraphicContext & PopGraphicContext are used to enclose a pattern definition. Pattern definitions are terminated by a PopPattern object.

91.39.87 Rectangle(upperLeftX as Double, upperLeftY as Double, lowerRightX as Double, lowerRightY as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a rectangle using stroke color and thickness from upper-left coordinates to lower-right coordinates.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

// Draw a rectangle
draw.Rectangle(250, 250, 100, 100)
draw.Draw

Backdrop=image.CopyPicture
```

Notes: If a fill color is specified, then the object is filled.

91.39.88 Rotation(angle as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set rotation to use when drawing (coordinate transformation).
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

draw.StrokeColor new GMColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.Rotation 5
draw.StrokeColor new GMColorRGBMBS("blue")
draw.Line(100,100,400,400)
```

```
draw.Draw

Backdrop=image.CopyPicture
```

91.39.89 RoundRectangle(centerX as Double, centerY as Double, width as Double, height as Double, cornerWidth as Double, cornerHeight as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a rounded rectangle using stroke color and thickness, with specified center coordinate, specified width and height, and specified corner width and height.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

// Draw a round rectangle
draw.RoundRectangle(250, 250, 100, 100,20,20)
draw.Draw

Backdrop=image.CopyPicture
```

Notes: If a fill color is specified, then the object is filled.

91.39.90 Scaling(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply scaling in x and y direction while drawing objects (coordinate transformation).
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeWidth = 5
```

```
Var draw as GMGraphicsMBS = image.Graphics
draw.FillColor new GMColorRGBMBS("red")

draw.StrokeColor new GMColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.StrokeColor new GMColorRGBMBS("blue")
draw.Scaling 1.2,1.1
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

91.39.91 SkewX(angle as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply Skew in X direction (coordinate transformation)
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

draw.StrokeColor new GMColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.SkewX 5
draw.StrokeColor new GMColorRGBMBS("blue")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

91.39.92 SkewY(angle as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply Skew in Y direction.
Example:

```
Var g as new GMGeometryMBS(500,500)
```

```
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

draw.StrokeColor new GMColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.SkewY 5
draw.StrokeColor new GMColorRGBMBS("blue")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

91.39.93 StrokeAntialias(flag as boolean)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Antialias while drawing lines or object outlines.

91.39.94 StrokeColor(c as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set color to use when drawing lines or object outlines.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

draw.StrokeColor new GMColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

91.39.95 StrokeLineCap(LineCap as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify the shape to be used at the end of open subpaths when they are stroked.
Notes: Values of LineCap are UndefinedCap, ButtCap, RoundCap, and SquareCap.

91.39.96 StrokeLineJoin(LineJoin as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify the shape to be used at the corners of paths (or other vector shapes) when they are stroked.
Notes: Values of LineJoin are UndefinedJoin, MiterJoin, RoundJoin, and BevelJoin.

91.39.97 StrokeOpacity(opacity as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opacity to use when drawing lines or object outlines.

91.39.98 StrokeWidth(opacity as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set width to use when drawing lines or object outlines.

91.39.99 Text(x as Double, y as Double, text as string)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Annotate image with text using stroke color, font, font pointsize, and box color (text background color), at specified coordinates.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

Var draw as GMGraphicsMBS = image.Graphics

// draw red text
```

```
draw.strokeColor(new GMColorRGBMBS("red")) // Outline color
draw.strokeWidth(1)
draw.Font("/Library/Fonts/Verdana.ttf")
draw.Text(50, 50, "Hello")
draw.Draw

Backdrop=image.CopyPicture
```

Notes: If text contains special format characters the image filename, type, width, height, or other image attributes may be incorporated in the text (see label).
See also:

- 91.39.100 Text(x as Double, y as Double, text as string, encoding as string) 15051

91.39.100 Text(x as Double, y as Double, text as string, encoding as string)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Annotate image with text represented with text encoding, using current stroke color, font, font pointsize, and box color (text background color), at specified coordinates.
Notes: If text contains special format characters the image filename, type, width, height, or other image attributes may be incorporated in the text (see label()).

The text encoding specifies the code set to use for text annotations. The only character encoding which may be specified at this time is "UTF-8" for representing Unicode as a sequence of bytes. Specify an empty string to set text encoding to the system's default. Successful text annotation using Unicode may require fonts designed to support Unicode.

Seems like you need ghostscript or the DPS library for text handling, so it may no be available for you.
See also:

- 91.39.99 Text(x as Double, y as Double, text as string) 15050

91.39.101 TextAntialias(flag as boolean)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Antialias while drawing text (default true).
Notes: The main reason to disable text antialiasing is to avoid adding new colors to the image.

91.39.102 TextDecoration(DecorationType as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify decoration (e.g. UnderlineDecoration) to apply to text.

91.39.103 TextUnderColor(c as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a box under rendered text using the specified color.

91.39.104 Translation(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply coordinate translation (set new coordinate origin).
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

draw.StrokeColor new GMColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.Translation 5,5
draw.StrokeColor new GMColorRGBMBS("blue")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

91.39.105 Viewbox(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Dimensions of the output viewbox.
Notes: If the image is to be written to a vector format (e.g. MVG or SVG), then a PushGraphicContext() object should be pushed to the head of the list, followed by a Viewbox() statement to establish the output canvas size. A matching PopGraphicContext() object should be pushed to the tail of the list.

91.39.106 Properties

91.39.107 Image as GMImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The image this graphics object belongs to.
Notes: (Read only property)

91.40 class GMImageArrayMBS

91.40.1 class GMImageArrayMBS

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an array of images in GraphicsMagick.
Example:

```
// extract all layers of photoshop file
Var file as FolderItem = SpecialFolder.Desktop.Child("test.psd")
Var images as new GMImageArrayMBS

images.readImages(file.NativePath)

Var c as Integer = images.size
for i as Integer = 0 to c-1
Var image as GMImageMBS = images.Image(i)
file = SpecialFolder.Desktop.Child(image.FileName+"."+str(i)+".png")
image.write(file)
next
```

Notes: Can be used to assemble/disassemble gif images.
Blog Entries

- MBS Real Studio Plugins, version 12.3pr4

91.40.2 Methods

91.40.3 animateImages

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Animate a sequence of image frames.
Notes: Image frames are displayed in succession, creating an animated effect. The animation options are taken from the first image frame. This feature is only supported under X11 at the moment.

91.40.4 append(image as GMImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an image to the end of the array.
Example:

```
// read gif
```

```
Var g as new GMImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// put copy of first image on the back
Var n as GMImageMBS = g.FirstImage
g.append n

// write to file

Var output as FolderItem = SpecialFolder.Desktop.Child("output.gif")

g.writeImages(output.NativePath)
```

Notes: Instead of gif, you can also use tif files.

91.40.5 appendImages(stack as boolean = false) as GMImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Append a sequence of image frames, writing the result to new image.
Notes: All the input image frames must have the same width or height. Image frames of the same width are stacked top-to-bottom. Image frames of the same height are stacked left-to-right. If the stack parameter is false, rectangular image frames are stacked left-to-right otherwise top-to-bottom.

91.40.6 averageImages as GMImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Average a sequence of image frames, writing the result to averagedImage.
Example:

```
// read gif
Var g as new GMImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// averageImages
Var n as GMImageMBS = g.averageImages
Backdrop = n.CopyPicture
```

Notes: All the input image frames must be the same size in pixels.

91.40.7 coalesceImages as GMImageArrayMBS

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a coalesced image sequence obtained by "playing" the image sequence (observing page offsets and disposal methods) to create a new image sequence in which all frames are full size and completely rendered.
Example:

```
// read gif
Var g as new GMImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// deconstruct
g = g.coalesceImages

// write gif
Var output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages output.NativePath
```

Notes: Note that if the original image sequence relied on page offsets and disposal methods that the resulting sequence will be larger (perhaps much larger) then the original. This is useful for GIF animation sequences that have page offsets and disposal methods. The resuting image sequence is returned.

91.40.8 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an empty image array.

91.40.9 deconstructImages as GMImageArrayMBS

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Break down an image sequence into constituent parts.
Example:

```
// read gif
Var g as new GMImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// deconstruct
g = g.deconstructImages
```

```
// write gif
Var output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages output.NativePath
```

Notes: This is useful for creating GIF or MNG animation sequences.

91.40.10 displayImages

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Display a sequence of image frames.
Notes: Through use of a pop-up menu, image frames may be selected in succession. This feature is fully supported under X11 but may have only limited support in other environments.
Caution: if an image format is not compatable with the display visual (e.g. JPEG on a colormapped display) then the original image will be altered. Use a copy of the original if this is a problem.

display methods are not supported currently.

91.40.11 FirstImage as GMImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns first image in array.
Example:

```
// read gif
Var g as new GMImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// show first image
Var img as GMImageMBS = g.FirstImage

// convert to true color for CopyPicture to work
const TrueColorType=6
img.type=TrueColorType

Backdrop = img.CopyPicture
```

91.40.12 flattenImages as GMImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Merge a sequence of image frames which represent image layers into a single composited representation.
Example:

```
// read gif
Var g as new GMImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// put copy of first image on the back
Var n as GMImageMBS = g.flattenImages

Backdrop = n.CopyPicture
```

Notes: Returns the flattened image. This function is useful for combining Photoshop layers into a single image.

91.40.13 Image(index as Integer) as GMImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries image with given index.

91.40.14 insert(image as GMImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts an image on the front.
Example:

```
// read gif
Var g as new GMImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// put copy of first image on the front
Var n as GMImageMBS = g.FirstImage
g.insert n

// write to file
```

```
Var output as FolderItem = SpecialFolder.Desktop.Child("output.gif")

g.writeImages(output.NativePath)
```

91.40.15 LastImage as GMImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns last image in array.

91.40.16 mapImages(map as GMImageMBS, dither as boolean = true, measureError as boolean = false)

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replace the colors of a sequence of images with the closest color from a reference image.
Notes: Set dither to true to enable dithering. Set measureError to true in order to evaluate quantization error.

91.40.17 montageImages(options as GMMontageMBS) as GMImageArrayMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a composite image by combining several separate image frames.
Example:

```
// build montage
Var StackingMontage as New GM16MontageMBS
StackingMontage.backgroundColor = New GM16ColorMBS(&cE7E7E7)
StackingMontage.fillColor = New GM16ColorMBS(&c000000)
StackingMontage.tile = New GM16GeometryMBS("1x20")
StackingMontage.geometry = New GM16GeometryMBS("160x120+5+5")
StackingMontage.font = "Helvetica"
StackingMontage.pointSize = 12
StackingMontage.title = "Title goes here"

// make picture
Var logo as Picture = LogoMBS(500)
Var image as New GM16ImageMBS(logo)

image.label("Sample label")

// Put the current image into the array
```

```
Var StackingFrames As new GM16ImageArrayMBS
StackingFrames.insert(image)

// show result
Var resultImages as GM16ImageArrayMBS = StackingFrames.montageImages(StackingMontage)
Backdrop = resultImages.Image(0).CopyPicture
```

Notes: Multiple frames may be generated in the output array depending on the tile setting and the number of image frames montaged. Montage options are provided via the parameter options. Options set in the first image frame (backgroundColor, borderColor, matteColor, fillColor, strokeColor, font and fontPointsize) are also used as options by montageImages().

91.40.18 morphImages(frames as Integer) as GMImageArrayMBS

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Morph a seqence of image frames.
Example:

```
// read gif
Var g as new GMImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// coalesce to make sure we have full images
g = g.coalesceImages
// morph to 10 pictures
g = g.morphImages(10)

// write gif
Var output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages output.NativePath
```

Notes: This algorithm expands the number of image frames (output to the new image array) by adding the number of intervening frames specified by frames such that the original frames morph (blend) into each other when played as an animation.

91.40.19 mosaicImages as GMImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inlay a number of images to form a single coherent picture.
Notes: The result image argument is updated with a mosaic constructed from the image sequence.

91.40.20 quantizeImages(measureError as boolean = false)

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Quantize colors in images using current quantization settings.
Notes: Set measureError to true in order to measure quantization error.

91.40.21 readImages(blob as GMBlobMBS)

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read a sequence of image frames into existing container (appending to array) from blob.
See also:

- 91.40.22 readImages(imageSpec as string) 15062

91.40.22 readImages(imageSpec as string)

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read a sequence of image frames into existing container (appending to array) with image names specified in the string imageSpec.
See also:

- 91.40.21 readImages(blob as GMBlobMBS) 15062

91.40.23 remove(index as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the image with the given index.
Example:

```
// read gif
Var g as new GMImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// remove first
g.remove 0

// write to file

Var output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
```

```
g.writeImages(output.NativePath)
```

Notes: Index should be between 0 and size-1.

91.40.24 reverse

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reverses the order of images in the array.

91.40.25 writeImages(blob as GMBlobMBS, adjoin as boolean = true)

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes images to the given blob object.
Notes: Write images in container to in-memory BLOB specified by Blob blob. Set adjoin to false to write a set of image frames via a wildcard imageSpec (e.g. image%02d.miff).
Caution: if an image format is selected which is capable of supporting fewer colors than the original image or quantization has been requested, the original image will be quantized to fewer colors. Use a copy of the original if this is a problem.
See also:

- 91.40.26 writeImages(imageSpec as string, adjoin as boolean = true) 15063

91.40.26 writeImages(imageSpec as string, adjoin as boolean = true)

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes images to the given path.
Example:

```
// read gif
Var g as new GMImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// write to file

Var output as FolderItem = SpecialFolder.Desktop.Child("output.gif")

g.writeImages(output.NativePath)
```

Notes: Write images in container to file specified by string imageSpec. Set adjoin_ to false to write a set

of image frames via a wildcard imageSpec (e.g. image%02d.miff).
The wildcard must be one of %0Nd, %0No, or %0Nx.
Caution: if an image format is selected which is capable of supporting fewer colors than the original image or quantization has been requested, the original image will be quantized to fewer colors. Use a copy of the original if this is a problem.
See also:

- 91.40.25 writeImages(blob as GMBlobMBS, adjoin as boolean = true) 15063

91.40.27 Properties

91.40.28 empty as boolean

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether image array is empty.
Notes: Returns true if array is empty or false if not.
(Read only property)

91.40.29 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal handle of the image array.
Notes: Should always be non zero.
(Read and Write property)

91.40.30 size as Integer

MBS GraphicsMagick Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns number of images in this array.
Example:

```
// read gif
Var g as new GMImageArrayMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.NativePath)

// display number of images
MessageBox str(g.size)
```

Notes: (Read only property)

91.41 class GMImageChannelStatisticsMBS

91.41.1 class GMImageChannelStatisticsMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The statistics for image channel.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GMImageMBS(f)
Var stat as GMImageStatisticsMBS = g.statistics
Var gs as GMImageChannelStatisticsMBS = stat.blue

MessageBox "blue channel: "+str(gs.minimum)+"-"+str(Gs.maximum)+", mean "+str(gs.mean)
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

91.41.2 Methods

91.41.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

91.41.4 Properties

91.41.5 maximum as Double

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum value observed.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GMImageMBS(f)
Var stat as GMImageStatisticsMBS = g.statistics
Var gs as GMImageChannelStatisticsMBS = stat.green

MessageBox "maximum green color: "+str(gs.maximum)
```

Notes: (Read only property)

91.41.6 mean as Double

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Average (mean) value observed.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GMImageMBS(f)
Var stat as GMImageStatisticsMBS = g.statistics
Var r as GMImageChannelStatisticsMBS = stat.red

MessageBox "mean red color: "+str(R.mean)
```

Notes: (Read only property)

91.41.7 minimum as Double

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Minimum value observed.
Notes: (Read only property)

91.41.8 standardDeviation as Double

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Standard deviation, sqrt(variance).
Notes: (Read only property)

91.41.9 variance as Double

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Variance.
Notes: (Read only property)

91.42 class GMImageMBS

91.42.1 class GMImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image is the primary object in Magick++ and represents a single image frame (see image design).
Example:

```
Var c as new GMColorMBS("white")
Var g as new GMGeometryMBS(100,100)
Var image as new GMImageMBS(g, c)
```

Notes: With MBS Plugin 14.0 we offer this classes in 8bit (GM prefix) or 16bit (GM16 prefix).

The GMImageArrayMBS class must be used to operate on image sequences or images (e.g. of format GIF, TIFF, MIFF, Postscript, & MNG) which are comprized of multiple image frames. Individual frames of a multi-frame image may be requested by adding array-style notation to the end of the file name (e.g. "animation.gif [3] " retrieves the fourth frame of a GIF animation. Various image manipulation operations may be applied to the image. Attributes may be set on the image to influence the operation of the manipulation operations. The GMPixelsMBS class provides low-level access to image pixels.

91.42.2 Methods

91.42.3 adaptiveThreshold(width as UInt32, height as UInt32, offset as double = 0)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply adaptive thresholding to the image.
Notes: see:
http://www.dai.ed.ac.uk/HIPR2/adpthrsh.htm

Adaptive thresholding is useful if the ideal threshold level is not known in advance, or if the illumination gradient is not constant across the image. Adaptive thresholding works by evaulating the mean (average) of a pixel region (size specified by width and height) and using the mean as the thresholding value. In order to remove residual noise from the background, the threshold may be adjusted by subtracting a constant offset (default zero) from the mean to compute the threshold.

91.42.4 addNoise(noise as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add noise to image with the specified noise type.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)
```

image.addNoise(image.GaussianNoise)

Backdrop=image.CopyPicture

Notes: Use one of this constants: GaussianNoise, ImpulseNoise, LaplacianNoise, MultiplicativeGaussianNoise, PoissonNoise, UniformNoise.

91.42.5 addNoiseChannel(channel as Integer, noise as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add noise to an image channel with the specified noise type. The channel parameter specifies the channel to add noise to.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.addNoiseChannel(image.BlueChannel, image.ImpulseNoise)

Backdrop=image.CopyPicture
```

Notes: The noiseType parameter specifies the type of noise.
Use one of this constants: GaussianNoise, ImpulseNoise, LaplacianNoise, MultiplicativeGaussianNoise, PoissonNoise, UniformNoise.

91.42.6 affineTransform(sx as Double, sy as Double, rx as Double, ry as Double, tx as Double, ty as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies an affine transformation to the drawing matrix.
Notes: Specify a transformation matrix to adjust scaling, rotation, and translation (coordinate transformation) for subsequently drawn objects in the same or decendent drawing context. The sx & sy parameters represent the x & y scale factors, the rx & ry parameters represent the x & y rotation, and the tx & ty parameters represent the x & y translation.

91.42.7 annotate(text as string, boundingArea as GMGeometryMBS, gravity as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Annotate using specified text, bounding area, and placement gravity.
Notes: Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

NorthWestGravity	text bottom-left corner placed at top-left
NorthGravity	text bottom-center placed at top-center
NorthEastGravity	text bottom-right corner placed at top-right
WestGravity	text left-center placed at left-center
CenterGravity	text center placed at center
EastGravity	text right-center placed at right-center
SouthWestGravity	text top-left placed at bottom-left
SouthGravity	text top-center placed at bottom-center
SouthEastGravity	text top-right placed at bottom-right

Annotate annotates an image with text. Optionally you can include any of the following bits of information about the image by embedding the appropriate special characters:

%b file size in bytes. %c comment. %d directory in which the image resides. %e extension of the image file. %f original filename of the image. %h height of image. %i filename of the image. %k number of unique colors. %l image label. %m image file format. %n number of images in a image sequence. %o output image filename. %p page number of the image. %q image depth (8 or 16). %p page number of the image. %q image depth (8 or 16). %s image scene number. %t image filename without any extension. %u a unique temporary filename. %w image width. %x x resolution of the image. %y y resolution of the image.

Set a font with full path and @ in front. e.g. "@/Library/Fonts/Arial.ttf". This way the plugin loads it directly.

- 91.42.9 annotate(text as string, gravity as Integer) 15071
- 91.42.10 annotate(text as string, location as GMGeometryMBS) 15073

91.42.8 annotate(text as string, boundingArea as GMGeometryMBS, gravity as Integer, degrees as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Annotate with text using specified text, bounding area, placement gravity, and rotation.
Notes: Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

NorthWestGravity	text bottom-left corner placed at top-left
NorthGravity	text bottom-center placed at top-center
NorthEastGravity	text bottom-right corner placed at top-right
WestGravity	text left-center placed at left-center
CenterGravity	text center placed at center
EastGravity	text right-center placed at right-center
SouthWestGravity	text top-left placed at bottom-left
SouthGravity	text top-center placed at bottom-center
SouthEastGravity	text top-right placed at bottom-right

Annotate annotates an image with text. Optionally you can include any of the following bits of information about the image by embedding the appropriate special characters:

%b file size in bytes. %c comment. %d directory in which the image resides. %e extension of the image file. %f original filename of the image. %h height of image. %i filename of the image. %k number of unique colors. %l image label. %m image file format. %n number of images in a image sequence. %o output image filename. %p page number of the image. %q image depth (8 or 16). %p page number of the image. %q image depth (8 or 16). %s image scene number. %t image filename without any extension. %u a unique temporary filename. %w image width. %x x resolution of the image. %y y resolution of the image.

Set a font with full path and @ in front. e.g. "@/Library/Fonts/Arial.ttf". This way the plugin loads it directly.

- 91.42.10 annotate(text as string, location as GMGeometryMBS) 15073

91.42.9 annotate(text as string, gravity as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Annotate with text (bounding area is entire image) and placement gravity.
Example:

```
Var White as new GMColorGrayMBS(1)
Var Black as new GMColorGrayMBS(0)
Var geo as new GMGeometryMBS("300x200")

Var g as new GMImageMBS(geo, White)

g.antiAlias = False
g.fillColor = Black
g.lineWidth = 1
g.strokeColor = Black
g.font = "@/Library/Fonts/Tahoma.ttf"
g.fontPointsize = 15

g.annotate("Hello World", g.SouthGravity)

Backdrop = g.CopyPicture
```

Notes: Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

NorthWestGravity	text bottom-left corner placed at top-left
NorthGravity	text bottom-center placed at top-center
NorthEastGravity	text bottom-right corner placed at top-right
WestGravity	text left-center placed at left-center
CenterGravity	text center placed at center
EastGravity	text right-center placed at right-center
SouthWestGravity	text top-left placed at bottom-left
SouthGravity	text top-center placed at bottom-center
SouthEastGravity	text top-right placed at bottom-right

Annotate annotates an image with text. Optionally you can include any of the following bits of information about the image by embedding the appropriate special characters:

%b file size in bytes. %c comment. %d directory in which the image resides. %e extension of the image file. %f original filename of the image. %h height of image. %i filename of the image. %k number of unique colors. %l image label. %m image file format. %n number of images in a image sequence. %o output image filename. %p page number of the image. %q image depth (8 or 16). %p page number of the image. %q image depth (8 or 16). %s image scene number. %t image filename without any extension. %u a unique temporary filename. %w image width. %x x resolution of the image. %y y resolution of the image.

Set a font with full path and @ in front. e.g. "@/Library/Fonts/Arial.ttf". This way the plugin loads it directly.

- 91.42.10 annotate(text as string, location as GMGeometryMBS) 15073

91.42.10 annotate(text as string, location as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Annotate using specified text, and placement location.
Notes: Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

NorthWestGravity	text bottom-left corner placed at top-left
NorthGravity	text bottom-center placed at top-center
NorthEastGravity	text bottom-right corner placed at top-right
WestGravity	text left-center placed at left-center
CenterGravity	text center placed at center
EastGravity	text right-center placed at right-center
SouthWestGravity	text top-left placed at bottom-left
SouthGravity	text top-center placed at bottom-center
SouthEastGravity	text top-right placed at bottom-right

Annotate annotates an image with text. Optionally you can include any of the following bits of information about the image by embedding the appropriate special characters:

%b file size in bytes. %c comment. %d directory in which the image resides. %e extension of the image file. %f original filename of the image. %h height of image. %i filename of the image. %k number of unique colors. %l image label. %m image file format. %n number of images in a image sequence. %o output image filename. %p page number of the image. %q image depth (8 or 16). %p page number of the image. %q image depth (8 or 16). %s image scene number. %t image filename without any extension. %u a unique temporary filename. %w image width. %x x resolution of the image. %y y resolution of the image.

- 91.42.9 annotate(text as string, gravity as Integer) 15071

91.42.11 attributeValues as dictionary

MBS GraphicsMagick Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A dictionary with all attributes.
Notes: As attributes are created on demand, this will only return all so far generated attributes.

91.42.12 autoOrient

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Orient image to be right-side up based on its current orientation attribute.
Notes: This allows the image to be viewed correctly when the orientation attribute is not available, or is not respected.

91.42.13 blur(radius as Double=0.0, sigma as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blur an image with the specified blur factor.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.blur(30,10)

Backdrop=image.CopyPicture
```

Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

91.42.14 blurChannel(channel as Integer, radius as Double=0.0, sigma as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blur an image channel with the specified blur factor.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.blurChannel(image.BlueChannel, 30,10)

Backdrop=image.CopyPicture
```

Notes: The channel parameter specifies the channel to modify. The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

91.42.15 border

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Border image (add border to image).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.border

Backdrop=image.CopyPicture
```

Notes: The color of the border is specified by the borderColor attribute.
See also:

- 91.42.16 border(geometry as GMGeometryMBS) 15075

91.42.16 border(geometry as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Border image (add border to image).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.border GMGeometryMBS.Make(10,10)
```

Backdrop=image.CopyPicture

Notes: The color of the border is specified by the borderColor attribute.
See also:

- 91.42.15 border 15075

91.42.17 borderGeometryDefault as String

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default geometry description for border.

91.42.18 cacheThreshold(threshold as UInt32)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pixel cache threshold in megabytes.
Notes: Once this memory threshold is exceeded, all subsequent pixels cache operations are to/from disk. This setting is shared by all Image objects.

91.42.19 cdl(cdl as string)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Bake in the ASC-CDL.
Notes: Bake in the ASC-CDL, which is a convention for the for the exchange of basic primary color grading information between for the exchange of basic primary color grading information between equipment and software from different manufacturers. It is a useful transform for other purposes as well.

91.42.20 channel(channel as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extract channel from image.
Notes: Use this option to extract a particular channel from the image. MatteChannel for example, is useful for extracting the opacity values from an image.

91.42.21 charcoal(radius as Double=0.0, sigma as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Charcoal effect image (looks like charcoal sketch).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.charcoal

Backdrop=image.CopyPicture
```

Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

91.42.22 chop(geometry as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chop image (remove vertical or horizontal subregion of image).

91.42.23 colorHistogram as dictionary

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates histogram.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GMImageMBS(f)
Var d as Dictionary = g.colorHistogram

MessageBox str(d.Count)+" color"

// check first color
Var c as GMColorMBS = d.key(0)

MessageBox "Color "+str(c.colorValue)+": "+str(d.Value(c))
```

Notes: The dictionary has a GMColorMBS/GMColor16MBS object as key for each color and an unsigned integer as value.

91.42.24 colorize(opacity as UInt32, penColor as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colorize image with pen color, using specified percent opacity.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.colorize(10, new GMColorMBS("red"))

Backdrop=image.CopyPicture
```

See also:

- 91.42.25 colorize(opacityRed as UInt32, opacityGreen as UInt32, opacityBlue as UInt32, penColor as GMColorMBS) 15078

91.42.25 colorize(opacityRed as UInt32, opacityGreen as UInt32, opacityBlue as UInt32, penColor as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colorize image with pen color, using specified percent opacity for red, green, and blue quantums.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.colorize(10, 0, 5, new GMColorMBS("red"))

Backdrop=image.CopyPicture
```

See also:

- 91.42.24 colorize(opacity as UInt32, penColor as GMColorMBS) 15078

91.42.26 colorMap as GMColorMBS()

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries array with all colors in color map.
See also:

- 91.42.311 colorMap(index as UInt32) as GMColorMBS 15178

91.42.27 colorMatrix(order as Integer, ColorMatrix() as Double)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply a color matrix to the image channels.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GMImageMBS(f)

Var m(8) as Double

m(0) = 0.25
m(1) = 0
m(2) = 0.25

m(3) = 0
m(4) = 0
m(5) = 0

m(6) = 0.25
m(7) = 0
m(8) = 0.25

g.colorMatrix 3, m

Backdrop = g.CopyPicture
```

Notes: The user supplied matrix may be of order 1 to 5 (1x1 through 5x5).

91.42.28 CombinePictureWithMask as picture

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the image with mask.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

Var c as new GMColorMBS("white")
image.transparent(c)

Backdrop=image.CombinePictureWithMask
```

Notes: Internally this calls Width and Height, CopyPicture and CopyMask.

91.42.29 compare(image as GMImageMBS) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compare current image with another image.
Notes: Sets meanErrorPerPixel, normalizedMaxError, and normalizedMeanError in the current image. False is returned if the images are identical. An ErrorOption exception is thrown if the reference image columns, rows, colorspace, or matte differ from the current image:

91.42.30 composite(compositeImage as GMImageMBS, gravity as Integer, CompositeOperator as Integer = 2)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose an image onto another at specified x and y offset and using a specified algorithm.

91.42.31 compositeAt(compositeImage as GMImageMBS, offset as GMGeometryMBS, CompositeOperator as Integer = 2)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose an image onto another at specified x and y offset and using a specified algorithm.

91.42.32 compositeXY(compositeImage as GMImageMBS, xOffset as Integer, yOffset as Integer, CompositeOperator as Integer = 2)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose an image onto another at specified x and y offset and using a specified algorithm.

91.42.33 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor.
Example:

```
// get some image data (e.g. from blob in database)
Var logo as Picture = LogoMBS(500)
```

```
Var jpegData as string = PictureToJPEGStringMBS(logo, 80)

// new image
Var mp as new GMImageMBS
Var blob as new GMBlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
'mp.type = mp.TrueColorMatteType
Backdrop=mp.CombinePictureWithMask
```

- 91.42.43 Constructor(size as GMGeometryMBS, ColorValue as GMColorMBS) 15087
- 91.42.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 15088

91.42.38 Constructor(blob as GMBlobMBS, geometry as GMGeometryMBS, Magick as string)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct Image of specified size, depth, and format from in-memory Blob.
Example:

```
// first open file and read data in blob
SVG_File = FolderItem.ShowOpenFileDialog("")
If SVG_File = Nil Then Return

Var stream as BinaryStream = BinaryStream.Open(SVG_File)
Var data as string = stream.Read(stream.Length)
Var blob as new GMBlobMBS(data)

// 400 width and 400 height
Var geo As New GMGeometryMBS(400, 400, 0, 0)

// pass type here to have GraphicsMagick know it since there is no file name in blob:
Var g as New GMImageMBS(blob, geo, "svg")
```

- 91.42.37 Constructor(blob as GMBlobMBS, geometry as GMGeometryMBS, depth as UInt32, Magick as string) 15083
- 91.42.39 Constructor(file as folderitem) 15084
- 91.42.41 Constructor(Path as string) 15086
- 91.42.42 Constructor(pic as picture) 15086
- 91.42.43 Constructor(size as GMGeometryMBS, ColorValue as GMColorMBS) 15087
- 91.42.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 15088

91.42.39 Constructor(file as folderitem)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct from image file.
See also:

- 91.42.33 Constructor 15080
- 91.42.35 Constructor(blob as GMBlobMBS, geometry as GMGeometryMBS) 15082

- 91.42.43 Constructor(size as GMGeometryMBS, ColorValue as GMColorMBS) 15087
- 91.42.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 15088

91.42.40 Constructor(other as GMImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an image by making a copy of the existing one.

- 91.42.43 Constructor(size as GMGeometryMBS, ColorValue as GMColorMBS) 15087

91.42.41 Constructor(Path as string)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct from image file or image specification.
See also:

- 91.42.33 Constructor 15080
- 91.42.34 Constructor(blob as GMBlobMBS) 15081
- 91.42.36 Constructor(blob as GMBlobMBS, geometry as GMGeometryMBS, depth as UInt32) 15082

- 91.42.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 15088

91.42.42 Constructor(pic as picture)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new GMImage with the given picture.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)
Backdrop=image.CopyPicture
```

Notes: Pixels from both the picture and picture's mask.

91.42.43 Constructor(size as GMGeometryMBS, ColorValue as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct a blank image canvas of specified size and color.
Example:

```
Var g as new GMGeometryMBS(600,600)
Var c as new GMColorRGBMBS(1.0,0.0,0.0) // red
Var image as new GMImageMBS(g, c)

const TrueColorType=6

// Ensure that there are no other references to this image.
image.modifyImage
// Set the image type to TrueColor DirectClass representation.
image.type=TrueColorType

Backdrop=image.CopyPicture(0,0,600,600)
```

- 91.42.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 15088

91.42.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes single image frame from an array of raw pixels, with specified storage type (ConstituteImage).
Example:

```
Var data as new memoryblock(2048*2048) // your data
Var image as new GMImageMBS(2048, 2048, "I", GMImageMBS.StorageTypeCharPixel, data)
```

Notes: Returns an Image corresponding to an image stored in a raw memory array format. The pixel data must be in scanline order top-to-bottom. The data can be unsigned char, unsigned short int, unsigned int, unsigned long, float, or double. Float and double require the pixels to be normalized to the range [0..1] , otherwise the range is [0..MaxVal] where MaxVal is the maximum possible value for that type.

Note that for most 32-bit architectures the size of an unsigned long is the same as unsigned int, but for 64-bit architectures observing the LP64 standard, an unsigned long is 64 bits, while an unsigned int remains 32 bits. This should be considered when deciding if the data should be described as "Integer" or "Long".

For example, to create a 640x480 image from unsigned red-green-blue character data, use

image = new GMImageMBS(640, 480, "RGB", GMImageMBS.StorageTypeCharPixel, pixels);

width: width in pixels of the image.
height: height in pixels of the image.
map: This string reflects the expected ordering of the pixel array. It can be any combination or order of R = red, G = green, B = blue, A = alpha (same as Transparency), O = Opacity, T = Transparency, C = cyan, Y = yellow, M = magenta, K = black, or I = intensity (for grayscale). Specify "P" = pad, to skip over a quantum which is intentionally ignored. Creation of an alpha channel for CMYK images is currently not supported.
type: Define the data type of the pixels. Float and double types are expected to be normalized [0..1] otherwise [0..MaxRGB] . Choose from these types: StorageTypeCharPixel, StorageTypeShortPixel, StorageTypeIntegerPixel, StorageTypeLongPixel, StorageTypeFloatPixel, or StorageTypeDoublePixel.
pixels: This array of values contain the pixel components as defined by map and type. You must preallocate this array where the expected length varies depending on the values of width, height, map, and type.

- 91.42.43 Constructor(size as GMGeometryMBS, ColorValue as GMColorMBS) 15087

91.42.45 contrast(sharpen as UInt32)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Contrast image (enhance intensity differences in image).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.contrast(10)

Backdrop=image.CopyPicture
```

91.42.46 convolve(order as Integer, ColorMatrix() as Double)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convolve image.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GMImageMBS(f)

Var m(8) as Double

m(0) = 0.25
m(1) = 0
m(2) = 0.25
```

```
m(3) = 0
m(4) = 0
m(5) = 0

m(6) = 0.25
m(7) = 0
m(8) = 0.25

g.convolve 3, m

Backdrop = g.CopyPicture
```

Notes: Applies a user-specified convolution to the image.
order represents the number of columns and rows in the filter kernel.
kernel is an array of doubles representing the convolution kernel.

91.42.47 CopyPicture as picture

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the image and returns it as a new picture.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

// Draw a circle
draw.Rectangle(250, 250, 100, 100)

Backdrop=image.CopyPicture
```

Notes: You may need to set image type to RGB to get it working.
See also:

- 91.42.48 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture

91.42.48 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the image and returns it as a new picture.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.threshold 127

// convert to RGB so CopyPicture works
image.type = image.TrueColorType
Backdrop=image.CopyPicture(0,0,250,250)
```

Notes: You may need to set image type to RGB to get it working.
See also:

- 91.42.47 CopyPicture as picture 15090

91.42.49 CopyPictureMask as picture

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the image's mask and returns it as a new picture.
Example:

```
Var f As FolderItem = SpecialFolder.Desktop.Child("test.png")
Var g As New GMImageMBS(f)

// get image with mask
Var p As picture = g.CopyPicture
p.mask = g.CopyPictureMask

Window1.Backdrop = p
```

See also:

- 91.42.50 CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture 15092

91.42.50 CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the image's mask and returns it as a new picture.
See also:

- 91.42.49 CopyPictureMask as picture 15091

91.42.51 CopyPixelsMemory as Memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copy the pixels as they are into a memoryblock.
Notes: Optional specify rectangle.
Returns nil on low memory or bad parameter. Image must be of type class direct (not palette picture).
Order of pixel data is normally Red, Green, Blue, Opacity. Or Cyan, Magenta, Yellow, Black for CMYK images.
For GMImageMBS, the data is 8bit per channel. For GMImage16MBS, the data is 16bit per channel.
See also:

- 91.42.52 CopyPixelsMemory(x as Integer, y as Integer, width as Integer, height as Integer) as Memoryblock 15092

91.42.52 CopyPixelsMemory(x as Integer, y as Integer, width as Integer, height as Integer) as Memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copy the pixels as they are into a memoryblock.
Notes: Optional specify rectangle.
Returns nil on low memory or bad parameter. Image must be of type class direct (not palette picture).
Order of pixel data is normally Red, Green, Blue, Opacity. Or Cyan, Magenta, Yellow, Black for CMYK images.
For GMImageMBS, the data is 8bit per channel. For GMImage16MBS, the data is 16bit per channel.
See also:

- 91.42.51 CopyPixelsMemory as Memoryblock 15092

91.42.53 CreateHBITMAP as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Creates a HBITMAP for the image for use with Windows Declares.
Example:

```
// get test image
Var logo as Picture = LogoMBS(500)

// create GraphicsMagick image
Var g as new GMImageMBS(logo)

// make a HBitmap
Var hBitmap as ptr = g.CreateHBITMAP

// convert back to Xojo picture
Var pic as Picture = WindowsBitmapMBS.HBitmapToPicture(hBitmap, true)

// show in window
Backdrop = pic

// and cleanup memory
WindowsBitmapMBS.DeleteBitmap(hBitmap)
```

Notes: The HBITMAP returned needs to be freed when you are done with it or you risk having a memory leak.

91.42.54 crop(geometry as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Crop image (return subregion of original image).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.crop GMGeometryMBS.Make(100,200)

Backdrop=image.CopyPicture
```

91.42.55 cycleColormap(amount as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Cycle (rotate) image colormap.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)
```

```
image.cycleColormap(5)

image.type = image.TrueColorType

Backdrop=image.CopyPicture
```

91.42.56 Describe(verbose as Integer = 1) as String

MBS GraphicsMagick Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Describes an image by printing its attributes.
Example:

```
Var f As FolderItem = FindFile("test.jpg")

Var g As New GMImageMBS(f)
Var s As String = g.Describe(2)
Break
```

Notes: Attributes include the image width, height, size, and others.

verbose: Whether output should be verbose.
Default is 1. Pass 0 to get a shorted output.
Pass 2 to count the number of colors in the image.

91.42.57 despeckle

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Despeckle image (reduce speckle noise).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.despeckle

Backdrop=image.CopyPicture
```

91.42.58 display

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Display image on screen.
Notes: Caution: if an image format is not compatible with the display visual (e.g. JPEG on a colormapped display) then the original image will be altered. Use a copy of the original if this is a problem.

The plugin is not compiled with X11 so this call may not be useful.

91.42.59 edge(radius as Double=0.0)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Edge image (hilight edges in image).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.edge

Backdrop=image.CopyPicture
```

Notes: The radius is the radius of the pixel neighborhood. Specify a radius of zero for automatic radius selection.

91.42.60 emboss(radius as Double=0.0, sigma as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Emboss image (hilight edges with 3D effect).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.emboss

Backdrop=image.CopyPicture
```

Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

91.42.61 enhance

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enhance image (minimize noise).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.enhance

Backdrop=image.CopyPicture
```

91.42.62 erase

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set all image pixels to the current background color.

91.42.63 extent(geo as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an image canvas using background color sized according to geometry and composite existing image on it, with image placement controlled by gravity.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GMImageMBS(f)

// extend image to fit
Var geo as new GMGeometryMBS(500,500)
image.extent geo

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

Notes: Parameters are obtained from existing image properties if they are not specified via a method parameter. Parameters which are supported by image properties (gravity and backgroundColor) update those image properties as a side-effect.
See also:

- 91.42.64 extent(geo as GMGeometryMBS, backgroundColor as GMColorMBS)

- 91.42.65 extent(geo as GMGeometryMBS, backgroundColor as GMColorMBS, gravity as Integer) 15097
- 91.42.66 extent(geo as GMGeometryMBS, gravity as Integer) 15098

91.42.64 extent(geo as GMGeometryMBS, backgroundColor as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an image canvas using background color sized according to geometry and composite existing image on it, with image placement controlled by gravity.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GMImageMBS(f)

// extend image to fit
Var geo as new GMGeometryMBS(500,500)
Var col as GMColorMBS = GMColorMBS.Black
image.extent geo, col

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

Notes: Parameters are obtained from existing image properties if they are not specified via a method parameter. Parameters which are supported by image properties (gravity and backgroundColor) update those image properties as a side-effect.
See also:

- 91.42.63 extent(geo as GMGeometryMBS) 15096
- 91.42.65 extent(geo as GMGeometryMBS, backgroundColor as GMColorMBS, gravity as Integer) 15097
- 91.42.66 extent(geo as GMGeometryMBS, gravity as Integer) 15098

91.42.65 extent(geo as GMGeometryMBS, backgroundColor as GMColorMBS, gravity as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an image canvas using background color sized according to geometry and composite existing image on it, with image placement controlled by gravity.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GMImageMBS(f)
```

```
// extend image to fit
Var geo as new GMGeometryMBS(500,500)
Var col as GMColorMBS = GMColorMBS.Black
image.extent geo, col

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

Notes: Parameters are obtained from existing image properties if they are not specified via a method parameter. Parameters which are supported by image properties (gravity and backgroundColor) update those image properties as a side-effect.
See also:

- 91.42.63 extent(geo as GMGeometryMBS) 15096
- 91.42.64 extent(geo as GMGeometryMBS, backgroundColor as GMColorMBS) 15097
- 91.42.66 extent(geo as GMGeometryMBS, gravity as Integer) 15098

91.42.66 extent(geo as GMGeometryMBS, gravity as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an image canvas using background color sized according to geometry and composite existing image on it, with image placement controlled by gravity.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GMImageMBS(f)

// resize proportionally to fit
Var geo as new GMGeometryMBS(500,500)
image.extent geo, image.CenterGravity

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

Notes: Parameters are obtained from existing image properties if they are not specified via a method parameter. Parameters which are supported by image properties (gravity and backgroundColor) update those image properties as a side-effect.
See also:

- 91.42.63 extent(geo as GMGeometryMBS) 15096
- 91.42.64 extent(geo as GMGeometryMBS, backgroundColor as GMColorMBS) 15097
- 91.42.65 extent(geo as GMGeometryMBS, backgroundColor as GMColorMBS, gravity as Integer) 15097

91.42.67 Flatten

MBS GraphicsMagick Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flatten the alpha channel.
Notes: Please set background color to define what color goes into the transparent areas.

91.42.68 flip

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flip image (reflect each scanline in the vertical direction).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.flip

Backdrop=image.CopyPicture
```

91.42.69 floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill color across pixels that match the color of the target pixel and are neighbors of the target pixel.
Notes: Uses current fuzz setting when determining color match.
See also:

- 91.42.70 floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS) 15099
- 91.42.71 floodFillColor(x as UInt32, y as UInt32, fillColor as GMColorMBS) 15100
- 91.42.72 floodFillColor(x as UInt32, y as UInt32, fillColor as GMColorMBS, borderColor as GMColorMBS) 15100

91.42.70 floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill color across pixels starting at target-pixel and stopping at pixels matching specified border color.

Notes: Uses current fuzz setting when determining color match:
See also:

- 91.42.69 floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS) 15099
- 91.42.71 floodFillColor(x as UInt32, y as UInt32, fillColor as GMColorMBS) 15100
- 91.42.72 floodFillColor(x as UInt32, y as UInt32, fillColor as GMColorMBS, borderColor as GMColorMBS) 15100

91.42.71 floodFillColor(x as UInt32, y as UInt32, fillColor as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill color across pixels that match the color of the target pixel and are neighbors of the target pixel.
Notes: Uses current fuzz setting when determining color match.
See also:

- 91.42.69 floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS) 15099
- 91.42.70 floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS) 15099
- 91.42.72 floodFillColor(x as UInt32, y as UInt32, fillColor as GMColorMBS, borderColor as GMColorMBS) 15100

91.42.72 floodFillColor(x as UInt32, y as UInt32, fillColor as GMColorMBS, borderColor as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill color across pixels starting at target-pixel and stopping at pixels matching specified border color.
Notes: Uses current fuzz setting when determining color match:
See also:

- 91.42.69 floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS) 15099
- 91.42.70 floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS) 15099
- 91.42.71 floodFillColor(x as UInt32, y as UInt32, fillColor as GMColorMBS) 15100

91.42.73 floodFillOpacity(x as UInt32, y as UInt32, opacity as UInt32, PaintMethod as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill pixels matching color (within fuzz factor) of target pixel(x,y) with replacement opacity value using method.
Example:

```
Var image as new GMImageMBS(pic)
// fills opacity channel with 100
image.floodFillOpacity(250,250, 100, 2)
```

Notes: Paint methods:

PointMethod	0	Replace pixel color at point.
ReplaceMethod	1	Replace color for all image pixels matching color at point.
FloodfillMethod	2	Replace color for pixels surrounding point until encountering pixel that fails to match color at point.
FillToBorderMethod	3	Replace color for pixels surrounding point until encountering pixels matching border color.
ResetMethod	4	Replace colors for all pixels in image with pen color.

91.42.74 floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill texture across pixels that match the color of the target pixel and are neighbors of the target pixel.
Notes: Uses current fuzz setting when determining color match.

- 91.42.75 floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS) 15101
- 91.42.76 floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS) 15102
- 91.42.77 floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS, borderColor as GMColorMBS) 15102

91.42.75 floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill texture across pixels starting at target-pixel and stopping at pixels matching specified border color.
Notes: Uses current fuzz setting when determining color match.
See also:

- 91.42.74 floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS) 15101
- 91.42.76 floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS) 15102
- 91.42.77 floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS, borderColor as GMColorMBS) 15102

91.42.76 floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill texture across pixels that match the color of the target pixel and are neighbors of the target pixel.
Notes: Uses current fuzz setting when determining color match.
See also:

- 91.42.74 floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS) 15101
- 91.42.75 floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS) 15101
- 91.42.77 floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS, borderColor as GMColorMBS) 15102

91.42.77 floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS, borderColor as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood-fill texture across pixels starting at target-pixel and stopping at pixels matching specified border color.
Notes: Uses current fuzz setting when determining color match.
See also:

- 91.42.74 floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS) 15101
- 91.42.75 floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS) 15101
- 91.42.76 floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS) 15102

91.42.78 flop

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flop image (reflect each scanline in the horizontal direction).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.flop

Backdrop=image.CopyPicture
```

91.42.79 FontMap as string

MBS GraphicsMagick Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current font map in use.
Notes: The MBS Plugin provides to GraphicsMagick the font map to use.
This is a XML defining which fonts are available.
Use this function to learn what fonts may be available or debug to see why a font doesn't load.

91.42.80 fontTypeMetrics(name as string) as GMTypeMetricMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain font metrics for text string given current font, pointsize, and density settings.

91.42.81 formatExpression(expression as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Format the specified expression similar to command line '-format'.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GMImageMBS(f)

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

Notes: For example "%wx%h" is converted to a string containing image WIDTHxHEIGHT like "640x480".

91.42.82 frame

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a decorative frame around the image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.frame

Backdrop=image.CopyPicture
```

See also:

- 91.42.83 frame(geometry as GMGeometryMBS) 15104
- 91.42.84 frame(width as UInt32, height as UInt32, innerBevel as Integer=6, outerBevel as Integer=6) 15104

91.42.83 frame(geometry as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a decorative frame around the image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.frame(GMGeometryMBS.Make("10x10"))

Backdrop=image.CopyPicture
```

See also:

- 91.42.82 frame 15103
- 91.42.84 frame(width as UInt32, height as UInt32, innerBevel as Integer=6, outerBevel as Integer=6) 15104

91.42.84 frame(width as UInt32, height as UInt32, innerBevel as Integer=6, outerBevel as Integer=6)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a decorative frame around the image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.frame(15,15)

Backdrop=image.CopyPicture
```

See also:

- 91.42.82 frame 15103
- 91.42.83 frame(geometry as GMGeometryMBS) 15104

91.42.85 frameGeometryDefault as String

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default geometry description for frame.

91.42.86 gamma(gammaRed as Double, gammaGreen as Double, gammaBlue as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gamma correct the image or individual image channels.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.gamma(1,2,3)

Backdrop=image.CopyPicture
```

See also:

- 91.42.254 gamma as Double 15161

91.42.87 gaussianBlur(width as Double, sigma as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gaussian blur image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.gaussianBlur(30, 10)

Backdrop=image.CopyPicture
```

Notes: The number of neighbor pixels to be included in the convolution mask is specified by width. The standard deviation of the gaussian bell curve is specified by sigma

91.42.88 gaussianBlurChannel(channel as Integer, width as Double, sigma as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gaussian blur image channel.
Notes: The number of neighbor pixels to be included in the convolution mask is specified by width. The standard deviation of the gaussian bell curve is specified by sigma.

91.42.89 getChromaBluePrimary(byref x as Double, byref y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity blue primary point.

91.42.90 getchromaGreenPrimary(byref x as Double, byref y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity green primary point.
Notes: e.g. x=0.3, y=0.6

91.42.91 getchromaRedPrimary(byref x as Double, byref y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity red primary point
Notes: e.g. x=0.64, y=0.33

91.42.92 getchromaWhitePoint(byref x as Double, byref y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity white point
Notes: e.g. x=0.3127, y=0.329

91.42.93 getConstPixels(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transfers read-only pixels from the image to the pixel cache as defined by the specified region

91.42.94 GetEXIFOrientation(byref orientation as integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries orientation from EXIF.
Notes: Orientation is set to number from 0 to 8 depending on rotation. -1 if unknown.
This function can only read orientation, if there is an EXIF block in image.
Returns true for success and false for failure.

For new development, please use ExifTagsMBS class instead.

91.42.95 getPixels(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transfers pixels from the image to the pixel cache as defined by the specified region.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GMImageMBS(f)

// get pointer to some pixels to write
Var x as ptr = g.getPixels(0, 0, 100, 100)

// draw a red line to the pixel buffer
Var o as Integer
for i as Integer = 0 to 99
o = 100 * i + i
```

```
x.UInt32(o * 4) = &hFFFF0000
next

// write back
g.syncPixels

// show
me.Backdrop = g.CopyPicture
```

Notes: Modified pixels may be subsequently transferred back to the image via syncPixels. This method is valid for DirectClass images.

91.42.96 Graphics as GMGraphicsMBS

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a graphics object for this image.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)

Backdrop=image.CopyPicture
```

Notes: Using the graphics object you can draw on the image.

91.42.97 haldClut(image as GMImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply a color lookup table (Hald CLUT) to the image.

91.42.98 Hash(Size as Integer = 8) as String

MBS GraphicsMagick Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a hash of the image.
Example:

```
Var p As Picture = LogoMBS(500)
Var g As New GMImageMBS(p)
MessageBox g.Hash
```

Notes: Hash is returned as 64 characters being 1 or 0.
We convert image to 8x8, turn grayscale and check if pixels are above or below mean value.
This hash is quite immune against resizing, compression artifacts and hue changes.
You can use LevenshteinDistanceMBS or JaroWinklerDistanceMBS to compare two hashes.

Added size parameter for version 22.4:
The size of the bitmap. Value from 8 to 1024. Default is 8.

91.42.99 implode(factor as Double=0.0)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Implode image (special effect).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.implode(0.3)

Backdrop=image.CopyPicture
```

91.42.100 IsLoggingEnabled as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether logging is enabled.
Notes: Returns true if we log GraphicsMagick usage.

91.42.101 JasperLibVersion as string

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries version string for jasper library.

91.42.102 label(text as string)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assign a label to an image.
Notes: Use this option to assign a specific label to the image. Optionally you can include the image filename, type, width, height, or scene number in the label by embedding special format characters. If the first character of string is @, the image label is read from a file titled by the remaining characters in the string. When converting to Postscript, use this option to specify a header string to print above the image.
See also:

- 91.42.265 label as string 15165

91.42.103 level(black_point as Double, white_point as Double, mid_point as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Level image to increase image contrast, and/or adjust image gamma.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.level(0, 127.0)

Backdrop=image.CopyPicture
```

Notes: Adjust the levels of the image by scaling the colors falling between specified white and black points to the full available quantum range. The parameters provided represent the black, mid (gamma), and white points. The black point specifies the darkest color in the image. Colors darker than the black point are set to zero. Mid point (gamma) specifies a gamma correction to apply to the image. White point specifies the lightest color in the image. Colors brighter than the white point are set to the maximum quantum value. The black and white point have the valid range 0 to MaxRGB while mid (gamma) has a useful range of 0 to ten:

91.42.104 levelChannel(channel as Integer, black_point as Double, white_point as Double, mid_point as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Level image channel to increase image contrast, and/or adjust image gamma.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.levelChannel(image.BlueChannel, 0, 127.0)

Backdrop=image.CopyPicture
```

Notes: Adjust the levels of the image channel by scaling the colors falling between specified white and black points to the full available quantum range. The parameters provided represent the black, mid (gamma), and white points. The black point specifies the darkest color in the image. Colors darker than the black point are set to zero. Mid point (gamma) specifies a gamma correction to apply to the image. White point specifies the lightest color in the image. Colors brighter than the white point are set to the maximum quantum value. The black and white point have the valid range 0 to MaxRGB while mid (gamma) has a useful range of 0 to ten.

91.42.105 LibVersion as String

MBS GraphicsMagick Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the version string of the GraphicsMagick library.

91.42.106 LoadIconvLibrary(path as String, byref Error as String) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the iconv library.
Notes: The GraphicsMagick classes may use libiconv for text encoding conversion.
If you explicitly need, you can load the library on start of solution.

MBS Plugin may try to load iconv.dll/dylib/so automatically when first iconv function is called.

91.42.107 MagickVersion as string

MBS GraphicsMagick Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the version text of the GraphicsMagick library.

91.42.108 magnify

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Magnify image by integral size (double the dimensions)
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.magnify

Backdrop=image.CopyPicture
```

91.42.109 map(mapImage as GMImageMBS, dither as boolean=false)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remap image colors with closest color from a reference image.
Example:

```
// some picture we want to map colors
Var pic as Picture = LogoMBS(500)

// build a picture with palette
Var backgroundColor as new GMColorMBS(255,255,255) // white
Var size as new GMGeometryMBS(10,10)

Var i as new GMImageMBS(pic)
Var x as new GMImageMBS(size, backgroundColor)

x.pixelColor(0,0) = new GMColorMBS(0 ,0 ,0 ) // black
x.pixelColor(0,1) = new GMColorMBS(255,0 ,0 ) // red
x.pixelColor(0,2) = new GMColorMBS(0 ,255,0 ) // green
x.pixelColor(0,3) = new GMColorMBS(0 ,0 ,255) // blue
x.pixelColor(0,4) = new GMColorMBS(255,255,0 ) // yellow
x.pixelColor(0,5) = new GMColorMBS(0 ,255,255) // cyan
x.pixelColor(0,6) = new GMColorMBS(255,0 ,255) // magenta

// do the map
i.map(x, false)

// convert result from palette picture to bitmap picture
i.type = i.TrueColorType

// and copy picture to backdrop
Backdrop = i.CopyPicture
```

Notes: Set dither to true in to apply Floyd/Steinberg error diffusion to the image. By default, color reduction chooses an optimal set of colors that best represent the original image. Alternatively, you can choose a particular set of colors from an image file with this option.

91.42.110 matteFloodfill(target as GMColorMBS, opacity as UInt32, x as Integer, y as Integer, PaintMethod as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Floodfill designated area with a replacement opacity value.
Notes: Paint methods:

PointMethod	0	Replace pixel color at point.
ReplaceMethod	1	Replace color for all image pixels matching color at point.
FloodfillMethod	2	Replace color for pixels surrounding point until encountering pixel that fails to match color at point.
FillToBorderMethod	3	Replace color for pixels surrounding point until encountering pixels matching border color.
ResetMethod	4	Replace colors for all pixels in image with pen color.

91.42.111 medianFilter(radius as Double=0.0)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Filter image by replacing each pixel component with the median color in a circular neighborhood.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.medianFilter(10)

Backdrop=image.CopyPicture
```

91.42.112 minify

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reduce image by integral (half) size.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.minify

Backdrop=image.CopyPicture
```

91.42.113 modequalizeifyImage

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Not documented.

91.42.114 modifyImage

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prepare to update image (copy if reference >1).
Notes: Normally Magick++'s implicit reference counting takes care of all instance management. In the rare case that the automatic instance management does not work, use this method to assure that there is only one reference to the image to be modified. It should be used in the cases where a GraphicsMagick C function is used directly on an image which may have multiple references:

91.42.115 modulate(brightness as Double, saturation as Double, hue as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Modulate percent hue, saturation, and brightness of an image.
Example:

```
Var logo as Picture = LogoMBS(500)
Var image as new GMImageMBS(logo)

image.type = image.TrueColorType

// brightness 150%
image.modulate(150,100,100)
backdrop = image.CopyPicture
```

Notes: Modulation of saturation and brightness is as a ratio of the current value (100 for no change). Modulation of hue is an absolute rotation of -180 degrees to +180 degrees from the current position corresponding to an argument range of 0 to 200 (100 for no change).

91.42.116 montageGeometry as GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tile size and offset within an image montage.
Notes: Only valid for montage images.

91.42.117 motionBlur(radius as Double, sigma as Double, angle as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Motion blur image with specified blur factor.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.motionBlur(30,10,90)

Backdrop=image.CopyPicture
```

Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels. The angle parameter specifies the angle the object appears to be comming from (zero degrees is from the right).

91.42.118 negate(grayscale as boolean=false)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negate colors in image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.negate

Backdrop=image.CopyPicture
```

Notes: Set grayscale to only negate grayscale values in image.

91.42.119 normalize

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Normalize image (increase contrast by normalizing the pixel values to span the full range of color values).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.normalize

Backdrop=image.CopyPicture
```

91.42.120 oilPaint(radius as Double=3.0)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Oilpaint image (image looks like an oil painting).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.oilPaint

Backdrop=image.CopyPicture
```

91.42.121 opacity(opacity as UInt32)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set or attenuate the opacity channel in the image.
Notes: If the image pixels are opaque then they are set to the specified opacity value, otherwise they are blended with the supplied opacity value. The value of opacity ranges from 0 (completely opaque) to MaxRGB. The defines OpaqueOpacity and TransparentOpacity are available to specify completely opaque or completely transparent, respectively.

91.42.122 opaque(opaqueColor as GMColorMBS, penColor as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Change color of specified opaque pixel to specified pen color.

91.42.123 ping(data as GMBlobMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads information for an image from the blob.
Notes: Ping is similar to read except only enough of the image is read to determine the image columns, rows, and filesize. Access the columns, rows, and fileSize attributes after invoking ping. The image pixels are not valid after calling ping.
See also:

- 91.42.124 ping(file as folderitem) 15118
- 91.42.125 ping(Path as string) 15118

91.42.124 ping(file as folderitem)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads information for an image from the file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")

// try with Constructor (same as read)
Var t1 as Double = Microseconds
Var g1 as new GMImageMBS(f)

// now just ping
Var t2 as Double = Microseconds
Var g2 as new GMImageMBS
g2.ping(f)

// or read
Var t3 as Double = Microseconds
Var g3 as new GMImageMBS
g3.read(f)

Var t4 as Double = Microseconds

// show speeds
MessageBox str(T4-t3)+" ¬µs for read"+EndOfLine+_
str(T3-t2)+" ¬µs for ping"+EndOfLine+_
str(T2-t1)+" ¬µs for Constructor"
```

Notes: Ping is similar to read except only enough of the image is read to determine the image columns, rows, and filesize. Access the columns, rows, and fileSize attributes after invoking ping. The image pixels are not valid after calling ping.
See also:

- 91.42.123 ping(data as GMBlobMBS) 15117
- 91.42.125 ping(Path as string) 15118

91.42.125 ping(Path as string)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads information for an image from the image specification.
Notes: Ping is similar to read except only enough of the image is read to determine the image columns, rows, and filesize. Access the columns, rows, and fileSize attributes after invoking ping. The image pixels are not valid after calling ping.
See also:

- 91.42.123 ping(data as GMBlobMBS) 15117
- 91.42.124 ping(file as folderitem) 15118

91.42.126 PNGLibVersion as string

MBS GraphicsMagick Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries PNG library version string.

91.42.127 Profiles as String()

MBS GraphicsMagick Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the list of available profiles.
Notes: Profile identifiers include usually "8BIM", EXIF, "ICM", "IPTC" or "XMP".

91.42.128 quantize(measureError as boolean=false)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Quantize image (reduce number of colors).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.quantize

image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

Notes: Set measureError to true in order to calculate error attributes.

91.42.129 QuantumDepth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the quantum depth.

91.42.130 quantumOperator(channel as Integer, Operator as Integer, rvalue as Double)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply an arithmetic or bitwise operator to the image pixel quantums.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GMImageMBS(f)

const AddQuantumOp = 1
const ThresholdQuantumOp = 10

g.quantumOperator( g.AllChannels, AddQuantumOp, 100)

// show
me.Backdrop = g.CopyPicture
```

See also:

- 91.42.131 quantumOperator(x as Integer, y as Integer, columns as Integer, rows as Integer, channel as Integer, Operator as Integer, rvalue as Double) 15120

91.42.131 quantumOperator(x as Integer, y as Integer, columns as Integer, rows as Integer, channel as Integer, Operator as Integer, rvalue as Double)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply an arithmetic or bitwise operator to the image pixel quantums.
See also:

- 91.42.130 quantumOperator(channel as Integer, Operator as Integer, rvalue as Double) 15120

91.42.132 raiseGeometryDefault as String

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default geometry description for raise.

91.42.133 raiseImage

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Raise image (lighten or darken the edges of an image to give a 3-D raised or lowered effect).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.raiseImage

Backdrop=image.CopyPicture
```

See also:

- 91.42.134 raiseImage(geometry as GMGeometryMBS, raisedFlag as boolean=false) 15121

91.42.134 raiseImage(geometry as GMGeometryMBS, raisedFlag as boolean=false)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Raise image (lighten or darken the edges of an image to give a 3-D raised or lowered effect).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.raiseImage(GMGeometryMBS.Make(5,8))

Backdrop=image.CopyPicture
```

See also:

- 91.42.133 raiseImage 15120

91.42.135 randomThreshold(thresholds as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Random threshold image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.randomThreshold(GMGeometryMBS.make("50x200"))

image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

Notes: Changes the value of individual pixels based on the intensity of each pixel compared to a random threshold. The result is a low-contrast, two color image. The thresholds argument is a geometry containing LOWxHIGH thresholds. If the string contains 2x2, 3x3, or 4x4, then an ordered dither of order 2, 3, or 4 will be performed instead. If a channel argument is specified then only the specified channel is altered. This is a very fast alternative to 'quantize' based dithering.

91.42.136 randomThresholdChannel(thresholds as GMGeometryMBS, channel as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Random threshold image channel.
Notes: Changes the value of individual pixels based on the intensity of each pixel compared to a random threshold. The result is a low-contrast, two color image. The thresholds argument is a geometry containing LOWxHIGH thresholds. If the string contains 2x2, 3x3, or 4x4, then an ordered dither of order 2, 3, or 4 will be performed instead. If a channel argument is specified then only the specified channel is altered. This is a very fast alternative to 'quantize' based dithering.

91.42.137 read(blob as GMBlobMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read single image frame from in-memory Blob.
Example:

```
// get some image data (e.g. from blob in database)
Var logo as Picture = LogoMBS(500)
Var jpegData as string = PictureToJPEGStringMBS(logo, 80)

// new image
Var mp as new GMImageMBS
Var blob as new GMBlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
'mp.type = mp.TrueColorMatteType
Backdrop=mp.CombinePictureWithMask
```

- 91.42.145 read(size as GMGeometryMBS, Path as string) 15127
- 91.42.146 read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 15127

91.42.138 read(blob as GMBlobMBS, size as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read single image frame of specified size from in-memory Blob.
See also:

- 91.42.137 read(blob as GMBlobMBS) 15122
- 91.42.139 read(blob as GMBlobMBS, size as GMGeometryMBS, depth as Integer) 15123
- 91.42.140 read(blob as GMBlobMBS, size as GMGeometryMBS, depth as Integer, magick as string) 15124
- 91.42.141 read(blob as GMBlobMBS, size as GMGeometryMBS, magick as string) 15125
- 91.42.142 read(file as folderitem) 15125
- 91.42.143 read(path as string) 15126

- 91.42.144 read(size as GMGeometryMBS, file as folderitem) 15126
- 91.42.145 read(size as GMGeometryMBS, Path as string) 15127
- 91.42.146 read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 15127

91.42.140 read(blob as GMBlobMBS, size as GMGeometryMBS, depth as Integer, magick as string)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read single image frame of specified size, depth, and format from in-memory Blob.
See also:

- 91.42.137 read(blob as GMBlobMBS) 15122
- 91.42.138 read(blob as GMBlobMBS, size as GMGeometryMBS) 15123

- 91.42.144 read(size as GMGeometryMBS, file as folderitem) 15126
- 91.42.145 read(size as GMGeometryMBS, Path as string) 15127
- 91.42.146 read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 15127

91.42.143 read(path as string)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read single image frame into current object.
See also:

- 91.42.137 read(blob as GMBlobMBS) 15122
- 91.42.138 read(blob as GMBlobMBS, size as GMGeometryMBS) 15123
- 91.42.139 read(blob as GMBlobMBS, size as GMGeometryMBS, depth as Integer) 15123
- 91.42.140 read(blob as GMBlobMBS, size as GMGeometryMBS, depth as Integer, magick as string) 15124
- 91.42.141 read(blob as GMBlobMBS, size as GMGeometryMBS, magick as string) 15125
- 91.42.142 read(file as folderitem) 15125
- 91.42.144 read(size as GMGeometryMBS, file as folderitem) 15126

- 91.42.140 read(blob as GMBlobMBS, size as GMGeometryMBS, depth as Integer, magick as string) 15124
- 91.42.141 read(blob as GMBlobMBS, size as GMGeometryMBS, magick as string) 15125
- 91.42.142 read(file as folderitem) 15125
- 91.42.143 read(path as string) 15126
- 91.42.145 read(size as GMGeometryMBS, Path as string) 15127
- 91.42.146 read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 15127

91.42.145 read(size as GMGeometryMBS, Path as string)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read single image frame of specified size into current object.
See also:

- 91.42.137 read(blob as GMBlobMBS) 15122
- 91.42.138 read(blob as GMBlobMBS, size as GMGeometryMBS) 15123
- 91.42.139 read(blob as GMBlobMBS, size as GMGeometryMBS, depth as Integer) 15123
- 91.42.140 read(blob as GMBlobMBS, size as GMGeometryMBS, depth as Integer, magick as string) 15124
- 91.42.141 read(blob as GMBlobMBS, size as GMGeometryMBS, magick as string) 15125
- 91.42.142 read(file as folderitem) 15125
- 91.42.143 read(path as string) 15126
- 91.42.144 read(size as GMGeometryMBS, file as folderitem) 15126
- 91.42.146 read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 15127

91.42.146 read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read single image frame from an array of raw pixels, with specified storage type (ConstituteImage).
Notes: Returns an Image corresponding to an image stored in a raw memory array format. The pixel data must be in scanline order top-to-bottom. The data can be unsigned char, unsigned short int, unsigned int, unsigned long, float, or double. Float and double require the pixels to be normalized to the range [0..1] , otherwise the range is [0..MaxVal] where MaxVal is the maximum possible value for that type.

Note that for most 32-bit architectures the size of an unsigned long is the same as unsigned int, but for 64-bit architectures observing the LP64 standard, an unsigned long is 64 bits, while an unsigned int remains 32 bits. This should be considered when deciding if the data should be described as "Integer" or "Long".

For example, to create a 640x480 image from unsigned red-green-blue character data, use

image = new GMImageMBS(640, 480, "RGB", GMImageMBS.StorageTypeCharPixel, pixels);

width: width in pixels of the image.
height: height in pixels of the image.
map: This string reflects the expected ordering of the pixel array. It can be any combination or order of R = red, G = green, B = blue, A = alpha (same as Transparency), O = Opacity, T = Transparency, C = cyan, Y = yellow, M = magenta, K = black, or I = intensity (for grayscale). Specify "P" = pad, to skip over a quantum which is intentionally ignored. Creation of an alpha channel for CMYK images is currently not supported.
type: Define the data type of the pixels. Float and double types are expected to be normalized [0..1] otherwise [0..MaxRGB] . Choose from these types: StorageTypeCharPixel, StorageTypeShortPixel, StorageTypeIntegerPixel, StorageTypeLongPixel, StorageTypeFloatPixel, or StorageTypeDoublePixel.
pixels: This array of values contain the pixel components as defined by map and type. You must preallocate this array where the expected length varies depending on the values of width, height, map, and type.

91.42.147 reduceNoise

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reduce noise in image using a noise peak elimination filter.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.reduceNoise

Backdrop=image.CopyPicture
```

See also:

- 91.42.148 reduceNoise(order as Double) 15129

91.42.148 reduceNoise(order as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reduce noise in image using a noise peak elimination filter.
See also:

- 91.42.147 reduceNoise 15128

91.42.149 ReleaseDate as String

MBS GraphicsMagick Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the release date of the used graphics magick library.
Notes: We update the library only when someone needs an update, so if you need, please contact us.

91.42.150 repage

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resets the image page canvas and position.

91.42.151 resize(geo as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image, specifying only geometry, with filter and blur obtained from Image default.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GMImageMBS(f)

// resize proportionally to fit
Var geo as new GMGeometryMBS(500,500)
image.resize geo

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

Notes: Same result as 'zoom' method.
See also:

- 91.42.152 resize(geo as GMGeometryMBS, filterType as Integer) 15130
- 91.42.153 resize(geo as GMGeometryMBS, filterType as Integer, blur as double) 15130

91.42.152 resize(geo as GMGeometryMBS, filterType as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image, specifying geometry and filter, with blur using Image default.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GMImageMBS(f)

// resize proportionally to fit
Var geo as new GMGeometryMBS(500,500)
image.resize geo, image.CubicFilter

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

See also:

- 91.42.151 resize(geo as GMGeometryMBS) 15129
- 91.42.153 resize(geo as GMGeometryMBS, filterType as Integer, blur as double) 15130

91.42.153 resize(geo as GMGeometryMBS, filterType as Integer, blur as double)

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image, specifying geometry, filter, and blur.
Example:

```
Var f as folderitem = SpecialFolder.Desktop.Child("test.jpg")
Var image as new GMImageMBS(f)

// resize proportionally to fit
Var geo as new GMGeometryMBS(500,500)
image.resize geo, image.CubicFilter, 3

Window1.Title = image.formatExpression("%wx%h")
Window1.Backdrop = image.CopyPicture
```

See also:

- 91.42.151 resize(geo as GMGeometryMBS) 15129
- 91.42.152 resize(geo as GMGeometryMBS, filterType as Integer) 15130

91.42.154 roll(columns as UInt32, rows as UInt32)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Roll image (rolls image vertically and horizontally) by specified number of columnms and rows).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.roll(30,30)

Backdrop=image.CopyPicture
```

See also:

- 91.42.155 roll(roll as GMGeometryMBS) 15131

91.42.155 roll(roll as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Roll image (rolls image vertically and horizontally) by specified number of columnms and rows).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.roll(GMGeometryMBS.Make(0,0,30,30))

Backdrop=image.CopyPicture
```

See also:

- 91.42.154 roll(columns as UInt32, rows as UInt32) 15131

91.42.156 rotate(degree as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rotate image counter-clockwise by specified number of degrees.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.rotate(30)
```

Backdrop=image.CopyPicture

91.42.157 sample(geometry as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image by using pixel sampling algorithm.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.sample GMGeometryMBS.make(100,100)

Backdrop=image.CopyPicture
```

91.42.158 scale(geometry as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image by using simple ratio algorithm which provides good quality.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.scale new GMGeometryMBS(100,100)

Backdrop=image.CopyPicture
```

91.42.159 segment(clusterThreshold as Double=1.0, smoothingThreshold as Double=1.5)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Segment (coalesce similar image components) by analyzing the histograms of the color components and identifying units that are homogeneous with the fuzzy c-means technique.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.segment
```

image.type = image.TrueColorType

Backdrop=image.CopyPicture

Notes: A histogram is built for the image. This histogram is filtered to reduce noise and a second derivative of the histogram plot is built and used to identify potential cluster colors (peaks in the histogram). The cluster colors are then validated by scanning through all of the pixels to see how many pixels fall within each cluster. Some candidate cluster colors may not match any of the image pixels at all and should be discarded. Specify clusterThreshold, as the number of pixels matching a cluster color in order for the cluster to be considered valid. SmoothingThreshold eliminates noise in the second derivative of the histogram. As the value is increased, you can expect a smoother second derivative. The default is 1.5.

91.42.160 setChromaBluePrimary(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity blue primary point.
Notes: e.g. x=0.15, y=0.06

91.42.161 setchromaGreenPrimary(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity green primary point.
Notes: e.g. x=0.3, y=0.6

91.42.162 setchromaRedPrimary(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity red primary point
Notes: e.g. x=0.64, y=0.33

91.42.163 setchromaWhitePoint(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chromaticity white point
Notes: e.g. x=0.3127, y=0.329

91.42.164 SetEXIFOrientation(orientation as integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets orientation for EXIF.
Notes: Changing orientation may need to set orientation via SetOrientation and SetEXIFOrientation. With a JPEG you have orientation both in JPEG header and in EXIF metadata.
Returns true for success and false for failure.

For new development, please use ExifTagsMBS class instead.

91.42.165 SetLogEventMask(events as String)

MBS GraphicsMagick Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set log event mask.
Example:

```
GMImageMBS.SetLogEventMask("coder,annotate")
```

Notes: Defines which events are logged.
By default logging goes to stderr, so on macOS you may need to run your app via Terminal to see logs there.

List of events includes: none, Configure, Annotate, Render, Transform, Locale, Coder, X11, Cache, Blob, Deprecate, User, Resource, TemporaryFile, Exception, Option, Information, Warning, Error, FatalError and All.

91.42.166 SetPicture(pic as picture, x as Integer, y as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the picture into the Image at the given position.

91.42.167 SetPictureMask(maskpic as picture, x as Integer, y as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the picture into the Image's mask at the given position.
Example:

```
// this converts 32 bit PNG with alpha channel to BMP
```

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var p as Picture = Picture.Open(f)

Var g as new GMImageMBS( new GMGeometryMBS(p.Width, p.Height), new GMColorGrayMBS(1.0))

g.type = g.TrueColorMatteType
g.matte = True
g.magick = "BMP"

g.SetPicture(p, 0, 0)
g.SetPictureMask(p.mask.invertMBS, 0, 0)

f = SpecialFolder.Desktop.Child("test.bmp")
g.write(f)
```

91.42.168 setPixels(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allocates a pixel cache region to store image pixels as defined by the region rectangle.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GMImageMBS(f)

// get pointer to some pixels to write
Var x as ptr = g.setPixels(0, 0, 100, 100)

// draw a red line to the pixel buffer
Var o as Integer
for i as Integer = 0 to 99
o = 100 * i + i
x.UInt32(o * 4) = &hFFFF0000
next

// write back
g.syncPixels

// show
me.Backdrop = g.CopyPicture
```

Notes: This area is subsequently transferred from the pixel cache to the image via syncPixels.

91.42.169 setStrokeDashArray(values() as Double)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets stroke dash pattern.
Notes: Specify the pattern of dashes and gaps used to stroke paths. The strokeDashArray represents a zero-terminated array of numbers that specify the lengths of alternating dashes and gaps in pixels. If an odd number of values is provided, then the list of values is repeated to yield an even number of values. A typical strokeDashArray array might contain the members 5 3 2 0, where the zero value indicates the end of the pattern array.

91.42.170 shade(azimuth as Double=30.0, elevation as Double=30.0, colorShading as boolean=false)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shade image using distant light source.
Notes: Specify azimuth and elevation as the position of the light source. By default, the shading results as a grayscale image.. Set colorShading to true to shade the red, green, and blue components of the image.

91.42.171 sharpen(radius as Double=0.0, sigma as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sharpen pixels in image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.sharpen

Backdrop=image.CopyPicture
```

Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

91.42.172 sharpenChannel(channel as Integer, radius as Double=0.0, sigma as Double=1.0)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sharpen pixels in image channel.

Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

91.42.173 shave(geometry as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shave pixels from image edges.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.shave(new GMGeometryMBS(200,200))

Backdrop=image.CopyPicture
```

91.42.174 shear(xShearAngle as Double, yShearAngle as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shear image (create parallelogram by sliding image by X or Y axis).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.shear(10,20)

Backdrop=image.CopyPicture
```

Notes: Shearing slides one edge of an image along the X or Y axis, creating a parallelogram. An X direction shear slides an edge along the X axis, while a Y direction shear slides an edge along the Y axis. The amount of the shear is controlled by a shear angle. For X direction shears, x degrees is measured relative to the Y axis, and similarly, for Y direction shears y degrees is measured relative to the X axis. Empty triangles left over from shearing the image are filled with the color defined as borderColor.

91.42.175 signature(force as boolean=false) as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image textual signature.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

MessageBox image.signature

Backdrop=image.CopyPicture
```

Notes: Set force to true in order to re-calculate the signature regardless of whether the image data has been modified.

91.42.176 solarize(factor as Double=50.0)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Solarize image (similar to effect seen when exposing a photographic film to light during the development process)
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.solarize

Backdrop=image.CopyPicture
```

91.42.177 spread(amount as UInt32=3)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Spread pixels randomly within image by specified ammount
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.spread 5

Backdrop=image.CopyPicture
```

91.42.178 statistics as GMImageStatisticsMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain image statistics.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GMImageMBS(f)
Var stat as GMImageStatisticsMBS = g.statistics
Var gs as GMImageChannelStatisticsMBS = stat.blue

MessageBox "blue channel: "+str(gs.minimum)+"-"+str(Gs.maximum)+", mean "+str(gs.mean)
```

Notes: Statistics are normalized to the range of 0.0 to 1.0 and are output to the specified ImageStatistics structure.

91.42.179 stegano(watermark as GMImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add a digital watermark to the image (based on second image).
Example:

```
Var p as Picture = LogoMBS(500)
Var p1 as Picture = New Picture(550,500,32)
Var p2 as Picture = New Picture(550,500,32)

p1.Graphics.DrawPicture p, 0,0
p2.Graphics.DrawPicture p,50,0

Var image1 as new GMImageMBS(p1)
Var image2 as new GMImageMBS(p2)

image2.zoom(new GMGeometryMBS(100,100)) // scale down

// add watermark
image1.stegano(image2)

// now make a threshold so you see the difference
image1.threshold 254

image1.type = image1.TrueColorType
Backdrop=image1.CopyPicture
```

91.42.180 stereo(rightImage as GMImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an image which appears in stereo when viewed with red-blue glasses (Red image on left, blue on right)
Example:

```
Var p as Picture = LogoMBS(500)
Var p1 as Picture = New Picture(550,500,32)
Var p2 as Picture = New Picture(550,500,32)

p1.Graphics.DrawPicture p, 0,0
p2.Graphics.DrawPicture p,50,0

Var image1 as new GMImageMBS(p1)
Var image2 as new GMImageMBS(p2)

image1.stereo(IMAGE2)

Backdrop=image1.CopyPicture
```

91.42.181 strip

MBS GraphicsMagick Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove all profiles and text attributes from the image.

91.42.182 strokeDashArray as Double()

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries stroke dash pattern.
Notes: Specify the pattern of dashes and gaps used to stroke paths. The strokeDashArray represents a zero-terminated array of numbers that specify the lengths of alternating dashes and gaps in pixels. If an odd number of values is provided, then the list of values is repeated to yield an even number of values. A typical strokeDashArray array might contain the members 5 3 2 0, where the zero value indicates the end of the pattern array.

91.42.183 swirl(degree as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Swirl image (image pixels are rotated by degrees).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)
```

```
image.swirl 200

Backdrop=image.CopyPicture
```

91.42.184 syncPixels

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transfers the image cache pixels to the image.

91.42.185 texture(texture as GMImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Channel a texture on pixels matching image background color.

91.42.186 threshold(degree as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Threshold image channels (below threshold becomes black, above threshold becomes white).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.threshold 127

// convert to RGB so CopyPicture works
image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

Notes: The range of the threshold parameter is 0 to MaxRGB.

91.42.187 thumbnail(geometry as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image using several algorithms to make smaller images very quickly.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GMImageMBS(f)

// make thumbnail
Var geo as new GMGeometryMBS(100, 100)
g.thumbnail(geo)

// show
me.Backdrop = g.CopyPicture
```

91.42.188 TIFFLibVersion as string

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries version string for tiff library.

91.42.189 transform(imageGeometry as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transform image based on image and crop geometries.
Notes: Crop geometry is optional.
See also:

- 91.42.190 transform(imageGeometry as GMGeometryMBS, cropGeometry as GMGeometryMBS) 15142

91.42.190 transform(imageGeometry as GMGeometryMBS, cropGeometry as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transform image based on image and crop geometries.
Notes: Crop geometry is optional.
See also:

- 91.42.189 transform(imageGeometry as GMGeometryMBS) 15142

91.42.191 transformOrigin(tx as Double, ty as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Origin of coordinate system to use when annotating with text or drawing.

91.42.192 transformReset

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reset transformation parameters to default.

91.42.193 transformRotation(angle as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rotation to use when annotating with text or drawing.

91.42.194 transformScale(tx as Double, ty as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scale to use when annotating with text or drawing.

91.42.195 transformSkewX(x as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Skew to use in X axis when annotating with text or drawing.

91.42.196 transformSkewY(y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Skew to use in Y axis when annotating with text or drawing.

91.42.197 transparent(color as GMColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add matte channel to image, setting pixels matching color to transparent.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

Var c as new GMColorMBS("white")
image.transparent(c)

Backdrop=image.CombinePictureWithMask
```

91.42.198 trim

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Trim edges that are the background color from the image.
Example:

```
Var p as Picture = LogoMBS(500)
// make the logo picture bigger
Var q as Picture = New Picture(700,700,32)

q.Graphics.DrawPicture p,100,100

Var image as new GMImageMBS(q)

// now trim the white border away
image.trim

Backdrop=image.CopyPicture
```

Notes: See ColorFuzz property for how far the pixel value can differentiate.

91.42.199 unregisterId

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Not documented.

91.42.200 unsharpmask(radius as Double, sigma as Double, amount as Double, threshold as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replace image with a sharpened version of the original image using the unsharp mask algorithm.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.unsharpmask(10,1,0.5,50)

Backdrop=image.CopyPicture
```

Notes: radius: the radius of the Gaussian, in pixels, not counting the center pixel.
sigma: the standard deviation of the Gaussian, in pixels.
amount: the percentage of the difference between the original and the blur image that is added back into the original.
threshold: the threshold in pixels needed to apply the diffence amount.

91.42.201 unsharpmaskChannel(channel as Integer, radius as Double, sigma as Double, amount as Double, threshold as Double)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replace image channel with a sharpened version of the original image using the unsharp mask algorithm.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.unsharpmaskChannel(Image.RedChannel, 10,1,0.5,50)

Backdrop=image.CopyPicture
```

Notes:

channel:	image channel to modify.
radius:	the radius of the Gaussian, in pixels, not counting the center pixel.
sigma:	the standard deviation of the Gaussian, in pixels.
amount:	the percentage of the difference between the original and the blur image that is added back into the original.
threshold:	the threshold in pixels needed to apply the diffence amount.

91.42.202 wave(amplitude as Double=25.0, wavelength as Double=150.0)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Map image pixels to a sine wave.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.wave

Backdrop=image.CopyPicture
```

91.42.203 WebPVersion as String

MBS GraphicsMagick Plugin, Plugin Version: 23.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns version of WebP library.
Notes: Should be a version string like "1.3.0".

91.42.204 write(blob as GMBlobMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write single image frame to in-memory Blob, with optional format and adjoin parameters.
See also:

- 91.42.205 write(blob as GMBlobMBS, magick as string) 15147
- 91.42.206 write(blob as GMBlobMBS, magick as string, depth as UInt32) 15147
- 91.42.207 write(file as folderitem) 15148
- 91.42.208 write(Path as string) 15149
- 91.42.209 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr) 15149

91.42.205 write(blob as GMBlobMBS, magick as string)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write single image frame to in-memory Blob, with optional format and adjoin parameters.
See also:

- 91.42.204 write(blob as GMBlobMBS) 15147
- 91.42.206 write(blob as GMBlobMBS, magick as string, depth as UInt32) 15147
- 91.42.207 write(file as folderitem) 15148
- 91.42.208 write(Path as string) 15149
- 91.42.209 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr) 15149

91.42.206 write(blob as GMBlobMBS, magick as string, depth as UInt32)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write single image frame to in-memory Blob, with optional format and adjoin parameters.
See also:

- 91.42.204 write(blob as GMBlobMBS) 15147
- 91.42.205 write(blob as GMBlobMBS, magick as string) 15147
- 91.42.207 write(file as folderitem) 15148
- 91.42.208 write(Path as string) 15149
- 91.42.209 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr) 15149

91.42.207 write(file as folderitem)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write single image frame to a file.
Example:

```
// this converts 32 bit PNG with alpha channel to BMP

Var f as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var p as Picture = Picture.Open(f)

Var g as new GMImageMBS( new GMGeometryMBS(p.Width, p.Height), new GMColorGrayMBS(1.0))

g.type = g.TrueColorMatteType
g.matte = True
g.magick = "BMP"

g.SetPicture(p, 0, 0)
g.SetPictureMask(p.mask.invertMBS, 0, 0)

f = SpecialFolder.Desktop.Child("test.bmp")
g.write(f)
```

See also:

- 91.42.204 write(blob as GMBlobMBS) 15147
- 91.42.205 write(blob as GMBlobMBS, magick as string) 15147
- 91.42.206 write(blob as GMBlobMBS, magick as string, depth as UInt32) 15147
- 91.42.208 write(Path as string) 15149
- 91.42.209 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr) 15149

91.42.208 write(Path as string)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write single image frame to a file.
Example:

```
// export a picture as PCL
Var l As Picture = LogoMBS(500)
Var p As New GMImageMBS(l)

p.type = p.BilevelType
p.write("/tmp/print.pcl")
```

See also:

- 91.42.204 write(blob as GMBlobMBS) 15147
- 91.42.205 write(blob as GMBlobMBS, magick as string) 15147
- 91.42.206 write(blob as GMBlobMBS, magick as string, depth as UInt32) 15147
- 91.42.207 write(file as folderitem) 15148
- 91.42.209 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr) 15149

91.42.209 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr)

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write single image frame to an array of pixels with storage type specified by user (DispatchImage).
Notes: e.g. image.write(0, 0, 640, 1, "RGB", 0, pixels)
See also:

- 91.42.204 write(blob as GMBlobMBS) 15147
- 91.42.205 write(blob as GMBlobMBS, magick as string) 15147
- 91.42.206 write(blob as GMBlobMBS, magick as string, depth as UInt32) 15147
- 91.42.207 write(file as folderitem) 15148
- 91.42.208 write(Path as string) 15149

91.42.210 ZLibVersion as string

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries version string for zlib library.

91.42.211 zoom(geometry as GMGeometryMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Zoom (resize) image to specified size.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.zoom(new GMGeometryMBS(200,200))

Backdrop=image.CopyPicture
```

91.42.212 ZPL(Header as boolean = true) as String

MBS GraphicsMagick Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries image as ZPL hex image.
Notes: This is for sending data to a receipt printer. The picture is taken as black & white image and we build the hex string, you can send to the printer.
Picture needs to have a width dividable by 8.

Set Header to false for skipping header and footer.

91.42.213 Properties

91.42.214 adjoin as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Join images into a single multi-image file.
Notes: (Read and Write property)

91.42.215 animationDelay as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Time in 1/100ths of a second (0 to 65535) which must expire before displaying the next image in an animated sequence.
Notes: This option is useful for regulating the animation of a sequence of GIF images within Netscape.
(Read and Write property)

91.42.216 animationIterations as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of iterations to loop an animation (e.g. Netscape loop extension) for.
Notes: (Read and Write property)

91.42.217 antiAlias as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Control antialiasing of rendered Postscript and Postscript or TrueType fonts.
Notes: Enabled by default.
(Read and Write property)

91.42.218 backgroundColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image background color.
Example:

```
// make a red and turn it to 100% transparent
Var red As New GMColorRGBMBS("red")
red.alpha = 1

// now make image and make it RGBA with the transparent background
Var RastoredVectorImage as New GMImageMBS
RastoredVectorImage.type = GMImageMBS.TrueColorMatteType
RastoredVectorImage.backgroundColor = red

// now read SVG, so we get a transparent background
Var SVG_File as FolderItem = SpecialFolders.desktop.Child("test.svg")
RastoredVectorImage.read(SVG_File)
```

Notes: (Read and Write property)

91.42.219 backgroundTexture as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image file name to use as the background texture.
Notes: Does not modify image pixels.
(Read and Write property)

91.42.220 baseColumns as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Base image width (before transformations)
Notes: (Read only property)

91.42.221 baseFilename as String

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Base image filename (before transformations)
Notes: (Read only property)

91.42.222 baseRows as Uint32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Base image height (before transformations).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

Title = str(image.baseRows)+" x "+str(image.baseColumns)
```

Notes: (Read only property)

91.42.223 borderColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image border color.
Notes: (Read and Write property)

91.42.224 boundingBox as GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return smallest bounding box enclosing non-border pixels.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.fillColor = new GMColorRGBMBS("red") // set color
image.strokeColor = new GMColorRGBMBS("green") // set color

image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

// Draw a circle

draw.Circle(250, 250, 120, 150)
draw.Draw

draw = nil
image.type = image.TrueColorType

Backdrop = image.CopyPicture

MessageBox image.boundingBox.StringValue
```

Notes: The current fuzz value is used when discriminating between pixels. This is the crop bounding box used by crop(Geometry(0,0)).
(Read only property)

91.42.225 boxColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Base color that annotation text is rendered on (default none).
Notes: (Read and Write property)

91.42.226 classType as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image class (DirectClass or PseudoClass).
Notes: NOTE: setting a DirectClass image to PseudoClass will result in the loss of color information if the number of colors in the image is greater than the maximum palette size (either 256 or 65536 entries depending on the value of QuantumDepth when ImageMagick was built):
(Read and Write property)

91.42.227 clipMask as GMImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Associate a clip mask image with the current image.
Notes: The clip mask image must have the same dimensions as the current image or an exception is thrown. Clipping occurs wherever pixels are transparent in the clip mask image. Clipping Pass an invalid image to unset an existing clip mask.
(Read and Write property)

91.42.228 colorFuzz as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colors within this distance are considered equal.
Notes: A number of algorithms search for a target color. By default the color must be exact. Use this option to match colors that are close to the target color in RGB space.

e.g. set to 50 for 8 bit class and 50 * 257 for the 16 bit class to allow 20% divagation in pixel values.
(Read and Write property)

91.42.229 colorMapSize as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of entries in the colormap.
Notes: Setting the colormap size may extend or truncate the colormap. The maximum number of supported entries is specified by the MaxColormapSize constant, and is dependent on the value of QuantumDepth when

GraphicsMagick is compiled. An exception is thrown if more entries are requested than may be supported. Care should be taken when truncating the colormap to ensure that the image colormap indexes reference valid colormap entries.
(Read and Write property)

91.42.230 colorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The colorspace (e.g. CMYK) used to represent the image pixel colors.
Notes:

UndefinedColorspace	= 0
RGBColorspace	= 1 (Plain old RGB colorspace)
GRAYColorspace	= 2 (Plain old full-range grayscale)
TransparentColorspace	= 3 (RGB but preserve matte channel during quantize)
OHTAColorspace	= 4
XYZColorspace	= 5 (CIE XYZ)
YCCColorspace	= 6 (Kodak PhotoCD PhotoYCC)
YIQColorspace	= 7
YPbPrColorspace	= 8
YUVColorspace	= 9
CMYKColorspace	= 10 (Cyan, magenta, yellow, black, alpha)
sRGBColorspace	= 11 (Kodak PhotoCD sRGB)
HSLColorspace	= 12 (Hue, saturation, luminosity)
HWBColorspace	= 13 (Hue, whiteness, blackness)
LABColorspace	= 14 (LAB colorspace not supported yet other than via lcms)
CineonLogRGBColorspace	= 15 (RGB data with Cineon Log scaling, 2.048 density range)
Rec601LumaColorspace	= 16 (Luma (Y) according to ITU-R 601)
Rec601YCbCrColorspace	= 17 (YCbCr according to ITU-R 601)
Rec709LumaColorspace	= 18 (Luma (Y) according to ITU-R 709)
Rec709YCbCrColorspace	= 19 (YCbCr according to ITU-R 709)

(Read and Write property)

91.42.231 columns as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image width.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)
```

Title = str(image.columns)+" x "+str(image.rows)
Backdrop=image.CopyPicture

Notes: (Read only property)

91.42.232 comment as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image comment.
Notes: When you set this property, you add comment string to image.
By default, each image is commented with its file name. Use this method to assign a specific comment to the image. Optionally you can include the image filename, type, width, height, or other image attributes by embedding special format characters:
(Read and Write property)

91.42.233 compose as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composition operator to be used when composition is implicitly used (such as for image flattening).
Notes: (Read and Write property)

91.42.234 compressType as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image compresion type.
Notes: The default is the compression type of the input image file.
(Read and Write property)

91.42.235 debug as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable printing of debug messages from GraphicsMagick as it executes.
Notes: (Read and Write property)

91.42.236 density as GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Vertical and horizontal resolution in pixels of the image.
Example:

```
Var p as new GMImageMBS

Var item as FolderItem = SpecialFolder.Desktop.Child("input.png")
p.read(item)
p.scale new GMGeometryMBS(3750,3750)
p.quality = 95
p.resolutionUnits = p.PixelsPerInchResolution
p.density = new GMGeometryMBS(300, 300)
Var out as FolderItem = SpecialFolder.Desktop.Child("output.png")
p.write out
```

Notes: This option specifies an image density when decoding a Postscript or Portable Document page. Often used with psPageSize.
(Read and Write property)

91.42.237 depth as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image depth (bits allocated to red/green/blue components).
Notes: Used to specify the bit depth when reading or writing raw images or when the output format supports multiple depths. Defaults to the quantum depth that GraphicsMagick is compiled with.
(Read and Write property)

91.42.238 directory as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tile names from within an image montage.
Notes: (Read only property)

91.42.239 endian as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The endian mode.

Notes: Endianness (LSBEndian like Intel, MSBEndian like SPARC, or NativeEndian for what this computer uses) for image formats which support endian-specific options.
(Read and Write property)

91.42.240 ExifThumbnail as String

MBS GraphicsMagick Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts an embedded thumbnail in EXIF data.
Example:

```
Var g As New GMImageMBS

// not load, but just read header & metadata
g.ping("/Users/cs/Desktop/test.JPG")

// get thumbnail
Var Thumbnail As String = g.ExifThumbnail

// show it
Window1.Backdrop = picture.FromData(Thumbnail)
```

Notes: Returns string containing JPEG compressed image data.

For new development, please use ExifTagsMBS class instead.
(Read only property)

91.42.241 fileName as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image file name.
Notes: (Read and Write property)

91.42.242 fileSize as Int64

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of bytes of the image on disk.
Notes: (Read only property)

91.42.243 fillColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Color to use when filling drawn objects.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)

Backdrop=image.CopyPicture
```

Notes: (Read and Write property)

91.42.244 fillPattern as GMImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pattern to use while filling drawn objects.
Notes: (Read and Write property)

91.42.245 fillRule as Integer

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rule to use when filling drawn objects
Notes: (Read and Write property)

91.42.246 filterType as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The reduction filter employed has a sigificant effect on the time required to resize an image and

the resulting quality. The default filter is Lanczos which has been shown to produce high quality results when reducing most images.
Notes: Filter to use when resizing image.
(Read and Write property)

91.42.247 font as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Text rendering font.
Notes: If the font is a fully qualified X server font name, the font is obtained from an X server. To use a TrueType font, precede the TrueType filename with an @. Otherwise, specify a Postscript font name (e.g. "helvetica").
(Read and Write property)

91.42.248 FontFamily as String

MBS GraphicsMagick Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font family to use.
Notes: The plugin will look through the list to find best match for combination of family, style, stretch and weight.
You can use either FontFamily or Font property, but not both.
Setting font family clears font.
(Read and Write property)

91.42.249 fontPointsize as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Text rendering font point size.
Notes: (Read and Write property)

91.42.250 FontStretch as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font stretch.
Notes: Can be Normal, UltraCondensed, ExtraCondensed, Condensed, SemiCondensed, SemiExpanded, Expanded, ExtraExpanded, UltraExpanded or Any.
See stretch constants.

(Read and Write property)

91.42.251 FontStyle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font style to use.
Notes: Can be Normal, Italic, Oblique or Any.
See font style constants.
(Read and Write property)

91.42.252 FontWeight as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font weight.
Notes: The font weight in range from 0 to 1000.
400 is normal and 800 bold.
(Read and Write property)

91.42.253 format as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Long image format description.
Notes: (Read only property)

91.42.254 gamma as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gamma correct the image or individual image channels.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.gamma = 3.0

Backdrop=image.CopyPicture
```

Notes: If you get the value, it is the gamma level of the image. Gamma is a pow() function which converts between the linear light representation and the representation for the computer display. Most computer images are gamma corrected to 2.2 (1/0.4545) so that each step results in a visually linear step on a computer or video display:
(Read and Write property)
See also:

- 91.42.86 gamma(gammaRed as Double, gammaGreen as Double, gammaBlue as Double) 15105

91.42.255 geometry as GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Preferred size of the image when encoding.
Notes: (Read only property)

91.42.256 getConstIndexes as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain immutable image pixel indexes (valid for PseudoClass images)
Notes: (Read only property)

91.42.257 getIndexes as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain mutable image pixel indexes (valid for PseudoClass images)
Notes: (Read only property)

91.42.258 gifDisposeMethod as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: GIF disposal method.
Notes: This option (specific to the GIF file format) is used to control how successive frames are rendered (how the preceding frame is disposed of) when creating a GIF animation.

(Read and Write property)

Constant	Disposal	Description
UndefinedDispose	0	No disposal specified.
NoneDispose	1	Do not dispose between frames.
BackgroundDispose	2	Overwrite frame with background color from header.
PreviousDispose	3	Overwrite with previous frame.

91.42.259 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Example:

```
Var c as new GMColorMBS("white")
Var g as new GMGeometryMBS(100,100)
Var image as new GMImageMBS(g, c)
MessageBox hex(Image.handle) // valid if not zero
```

Notes: (Read and Write property)

91.42.260 height as Integer

MBS GraphicsMagick Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the image.
Example:

```
Var c as new GMColorRGBMBS(1.0,0.0,0.0)
Var size as new GMGeometryMBS(100,100)
Var g as new GMImageMBS(size, c)

MessageBox str(g.width)+" "+str(g.height)
```

Notes: This is a convenience function for you which calls size.height.
(Read only property)

91.42.261 iccColorProfile as GMBlobMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: ICC color profile.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("IMG_0793.tif")
```

```
Var Image as new GMImageMBS(f)
Var ProfileBlob as GMBlobMBS = Image.iccColorProfile
Var ProfileData as string = ProfileBlob.CopyString
Var cm as LCMS2ProfileMBS = LCMS2ProfileMBS.OpenProfileFromString(ProfileData)
Var name as string = cm.Name

Break // check data in debugger
```

Notes: Supplied via a Blob since Magick++/ and GraphicsMagick do not currently support formating this data structure directly. Specifications are available from the International Color Consortium for the format of ICC color profiles.
(Read and Write property)

91.42.262 interlaceType as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of interlacing scheme (default NoInterlace).
Notes: This option is used to specify the type of interlacing scheme for raw image formats such as RGB or YUV. NoInterlace means do not interlace, LineInterlace uses scanline interlacing, and PlaneInterlace uses plane interlacing. PartitionInterlace is like PlaneInterlace except the different planes are saved to individual files (e.g. image.R, image.G, and image.B). Use LineInterlace or PlaneInterlace to create an interlaced GIF or progressive JPEG image.
(Read and Write property)

91.42.263 iptcProfile as GMBlobMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: IPTC profile.
Notes: Supplied via a Blob since Magick++ and GraphicsMagick do not currently support formating this data structure directly. Specifications are available from the International Press Telecommunications Council for IPTC profiles.
(Read and Write property)

91.42.264 isValid as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Does object contain valid image?
Notes: Set to false in order to invalidate the image. Images constructed via the default constructor are invalid images and isValid() will return false.

(Read and Write property)

91.42.265 label as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image label.
Notes: (Read only property)
See also:

- 91.42.102 label(text as string) 15110

91.42.266 lineWidth as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Stroke width for drawing vector objects (default one)
Notes: This method is now deprecated. Please use strokeWidth instead.
(Read and Write property)

91.42.267 magick as string

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the codec to use for compression.
Example:

```
// this converts 32 bit PNG with alpha channel to BMP

Var f as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var p as Picture = Picture.Open(f)

Var g as new GMImageMBS( new GMGeometryMBS(p.Width, p.Height), new GMColorGrayMBS(1.0))

g.type = g.TrueColorMatteType
g.matte = True
g.magick = "BMP"

g.SetPicture(p, 0, 0)
g.SetPictureMask(p.mask.invertMBS, 0, 0)

f = SpecialFolder.Desktop.Child("test.bmp")
g.write(f)
```

Notes: (Read and Write property)

91.42.268 matte as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image supports transparency (matte channel)
Notes: (Read and Write property)

91.42.269 matteColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image matte (frame) color.
Notes: (Read and Write property)

91.42.270 meanErrorPerPixel as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mean error per pixel computed when an image is color reduced.
Notes: This parameter is only valid if verbose is set to true and the image has just been quantized.
(Read only property)

91.42.271 modulusDepth as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image modulus depth (minimum number of bits required to support red/green/blue components without loss of accuracy).
Notes: The pixel modulus depth may be decreased by supplying a value which is less than the current value, updating the pixels (reducing accuracy) to the new depth. The pixel modulus depth can not be increased over the current value using this method.
(Read and Write property)

91.42.272 monochrome as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transform image to black and white while color reducing (quantizing).
Notes: (Read and Write property)

91.42.273 normalizedMaxError as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The normalized max error per pixel computed when an image is color reduced.
Notes: This parameter is only valid if verbose is set to true and the image has just been quantized.
(Read only property)

91.42.274 normalizedMeanError as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The normalized mean error per pixel computed when an image is color reduced.
Notes: This parameter is only valid if verbose is set to true and the image has just been quantized.
(Read only property)

91.42.275 orientation as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image orientation. Supported by some file formats such as DPX and TIFF. Useful for turning the right way up.
Notes: (Read and Write property)

91.42.276 page as GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Preferred size and location of an image canvas.
Notes: Use this option to specify the dimensions and position of the Postscript page in dots per inch or a TEXT page in pixels. This option is typically used in concert with density .

Page may also be used to position a GIF image (such as for a scene in an animation).
(Read and Write property)

91.42.277 penColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The pen color.
Notes: (Read and Write property)

91.42.278 quality as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: JPEG/MIFF/PNG compression level (default 75).
Notes: (Read and Write property)

91.42.279 quantizeColors as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum number of colors to quantize to.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.quantizeColors = 10
image.quantize

image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

Notes: (Read and Write property)

91.42.280 quantizeColorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colorspace to quantize in (default RGB).
Example:

```
// load a picture
Var f as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var pic as Picture = Picture.Open(f)
```

```
const GrayColorSpace = 2

Var Converter As New GMImageMBS(Pic)

// quantize with dither
Converter.type = GMImageMBS.BilevelType
Converter.quantizeColorSpace = GrayColorSpace
Converter.quantizeColors = 2
Converter.quantizeDither = True
Converter.quantize

// convert back to Xojo
Converter.type = GMImageMBS.TrueColorType
Backdrop = Converter.CopyPicture
```

Notes: Empirical evidence suggests that distances in color spaces such as YUV or YIQ correspond to perceptual color differences more closely than do distances in RGB space. These color spaces may give better results when color reducing an image.
(Read and Write property)

91.42.281 quantizeDither as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply Floyd/Steinberg error diffusion to the image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.quantizeColors = 10
image.quantizeDither = true
image.quantize

image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

Notes: The basic strategy of dithering is to trade intensity resolution for spatial resolution by averaging the intensities of several neighboring pixels. Images which suffer from severe contouring when reducing colors can be improved with this option. The quantizeColors or monochrome option must be set for this option to take effect.
(Read and Write property)

91.42.282 quantizeTreeDepth as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Depth of the quantization color classification tree.
Notes: Values of 0 or 1 allow selection of the optimal tree depth for the color reduction algorithm. Values between 2 and 8 may be used to manually adjust the tree depth.
(Read and Write property)

91.42.283 Quiet as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Suppress all warning messages.
Notes: Error messages are still reported.
(Read and Write property)

91.42.284 renderingIntent as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of rendering intent (used when applying an ICC color profile).
Notes: (Read and Write property)

91.42.285 resolutionUnits as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Units of image resolution.
Example:

```
Var item As FolderItem = SpecialFolder.Desktop.Child("test.jpeg")
Var p As New GMImageMBS(item)

// scale image
p.quality = 95
p.scale New GMGeometryMBS(1000,1000)

// change resolution
p.density = New GMGeometryMBS(300, 300)
p.resolutionUnits = p.PixelsPerInchResolution

// remove metadata
Var empty As New GMBlobMBS
```

```
p.profile("EXIF") = empty
p.profile("IPTC") = empty
p.profile("XMP") = empty

Var out As FolderItem = SpecialFolder.Desktop.Child("output.jpeg")
p.write out
```

Notes: (Read and Write property)

91.42.286 rows as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of pixel rows in the image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

Title = str(image.columns)+" x "+str(image.rows)
Backdrop=image.CopyPicture
```

Notes: (Read only property)

91.42.287 scene as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image scene number.
Notes: (Read and Write property)

91.42.288 size as GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Width and height of a raw image (an image which does not support width and height information).
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

MessageBox image.size.StringValue
```

```
image.size = new GMGeometryMBS(200,200)

Backdrop=image.CopyPicture
```

Notes: Size may also be used to affect the image size read from a multi-resolution format (e.g. Photo CD, JBIG, or JPEG.
(Read and Write property)

91.42.289 strokeAntiAlias as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable/disable stroke anti-aliasing.
Notes: (Read and Write property)

91.42.290 strokeColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Color to use when drawing object outlines.
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)

Backdrop=image.CopyPicture
```

Notes: (Read and Write property)

91.42.291 strokeDashOffset as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: While drawing using a dash pattern, specify distance into the dash pattern to start the dash (default 0).
Notes: (Read and Write property)

91.42.292 strokeLineCap as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify the shape to be used at the end of open subpaths when they are stroked. #
Notes: Values of LineCap are UndefinedCap, ButtCap, RoundCap, and SquareCap.
(Read and Write property)

91.42.293 strokeLineJoin as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify the shape to be used at the corners of paths (or other vector shapes) when they are stroked. Values of LineJoin are UndefinedJoin, MiterJoin, RoundJoin, and BevelJoin.
Notes: (Read and Write property)

91.42.294 strokeMiterLimit as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify miter limit.
Notes: When two line segments meet at a sharp angle and miter joins have been specified for 'lineJoin', it is possible for the miter to extend far beyond the thickness of the line stroking the path. The miterLimit' imposes a limit on the ratio of the miter length to the 'lineWidth'. The default value of this parameter is 4.
(Read and Write property)

91.42.295 strokePattern as GMImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pattern image to use while stroking object outlines.
Notes: (Read and Write property)

91.42.296 strokeWidth as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Stroke width for drawing vector objects (default one).
Example:

```
Var g as new GMGeometryMBS(500,500)
Var c as new GMColorRGBMBS("white") // white
Var image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

Var draw as GMGraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)

Backdrop=image.CopyPicture
```

Notes: (Read and Write property)

91.42.297 subImage as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subimage of an image sequence.
Notes: (Read and Write property)

91.42.298 subRange as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of images relative to the base image.
Notes: (Read and Write property)

91.42.299 textEncoding as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Annotation text encoding (e.g. "UTF-16").

Notes: (Read and Write property)

91.42.300 tileName as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tile name.
Notes: (Read and Write property)

91.42.301 totalColors as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of colors in the image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

Title = str(image.totalColors) // shows 5284
Backdrop=image.CombinePictureWithMask
```

Notes: (Read only property)

91.42.302 type as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of this image.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)

image.type = image.GrayscaleType

Backdrop=image.CopyPicture
```

Notes: You can set this value to convert the image to the type.

Convert the image representation to the specified type or retrieve the current image type. If the image is reduced to an inferior type, then image information may be lost (e.g. color changed to grayscale).

Available enumerations for the type parameter:

BilevelType	1	black/white
GrayscaleType	2	grayscale
GrayscaleMatteType	3	grayscale with alpha (opacity) channel
PaletteType	4	colormapped
PaletteMatteType	5	colormapped with transparency
TrueColorType	6	true (full) color
TrueColorMatteType	7	true (full) color with alpha (opacity) channel
ColorSeparationType	8	Cyan, magenta, yellow, and black
ColorSeparationMatteType	9	Cyan, magenta, yellow, and black with alpha (opacity) channel
OptimizeType	10	Optimize the image type to best represent the existing pixels

(Read and Write property)

91.42.303 verbose as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Print detailed information about the image.
Notes: (Read and Write property)

91.42.304 view as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: FlashPix viewing parameters.
Notes: (Read and Write property)

91.42.305 width as Integer

MBS GraphicsMagick Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the image.
Example:

```
Var c as new GMColorRGBMBS(1.0,0.0,0.0)
Var size as new GMGeometryMBS(100,100)
Var g as new GMImageMBS(size, c)

MessageBox str(g.width)+" "+str(g.height)
```

Notes: This is a convenience function for you which calls size.width.
(Read only property)

91.42.306 x11Display as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: X11 display to display to, obtain fonts from, or to capture image from.
Notes: (Read and Write property)

91.42.307 XResolution as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: x resolution of the image.
Notes: See also density functions.
Settable with version 19.0.
(Read and Write property)

91.42.308 YResolution as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: y resolution of the image.
Notes: Settable with version 19.0.
(Read and Write property)

91.42.309 attributeValue(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Access an arbitrary named image attribute.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("IMG_4048.jpg")
Var g as new GMImageMBS(f)
Var a as string = g.attributeValue("EXIF:DateTime")
MessageBox a
```

Notes: Any number of named attributes may be attached to the image. For example, the image comment is a named image attribute with the name "comment". EXIF tags are attached to the image as named attributes. Use the syntax "EXIF:<tag>" to request an EXIF tag similar to "EXIF:DateTime":
(Read and Write computed property)

91.42.310 channelDepth(channel as Integer) as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set or obtain modulus channel depth.
Notes: (Read and Write computed property)

91.42.311 colorMap(index as UInt32) as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Color at colormap position index.
Notes: (Read and Write computed property)
See also:

- 91.42.26 colorMap as GMColorMBS() 15078

91.42.312 defineSet(magick as string, key as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set or obtain a definition flag to applied when encoding or decoding the specified format.
Notes: Similar to the defineValue() method except that passing the flag value 'true' creates a value-less define with that format and key. Passing the flag value 'false' removes any existing matching definition. The method returns 'true' if a matching key exists, and 'false' if no matching key exists.
(Read and Write computed property)

91.42.313 defineValue(magick as string, key as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set or obtain a definition string to applied when encoding or decoding the specified format.
Notes: The meanings of the definitions are format specific. The format is designated by the magick argument, the format-specific key is designated by key, and the associated value is specified by value. See the defineSet() method if the key must be removed entirely.
(Read and Write computed property)

91.42.314 pixelColor(x as UInt32, y as UInt32) as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/set pixel color at location x & y.
Example:

```
Var p as Picture = LogoMBS(500)
Var image as new GMImageMBS(p)
Var c as new GMColorMBS("red")

for x as Integer = 240 to 260
image.pixelColor(x,250)=c
next

for y as Integer = 240 to 260
image.pixelColor(250,y)=c
next

Backdrop=image.CopyPicture
```

Notes: (Read and Write computed property)

91.42.315 profile(name as string) as GMBlobMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set a named profile.
Example:

```
Var item As FolderItem = SpecialFolder.Desktop.Child("test.jpeg")
Var p As New GMImageMBS(item)

// scale image
p.quality = 95
p.scale New GMGeometryMBS(1000,1000)

// change resolution
p.density = New GMGeometryMBS(300, 300)
p.resolutionUnits = p.PixelsPerInchResolution

// remove metadata
Var empty As New GMBlobMBS
p.profile("EXIF") = empty
p.profile("IPTC") = empty
p.profile("XMP") = empty

Var out As FolderItem = SpecialFolder.Desktop.Child("output.jpeg")
p.write out
```

Notes: Add or remove a named profile to/from the image. Remove the profile by passing an empty Blob (e.g. Blob()). Valid names are "*", "8BIM", "ICM", "IPTC", or a user/format-defined profile name.

Retrieve a named profile from the image. Valid names are: "8BIM", "8BIMTEXT", "APP1", "APP1JPEG", "ICC", "ICM", & "IPTC" or an existing user/format-defined profile name
(Read and Write computed property)

91.42.316 Constants

Constants

Constant	Value	Description
AbsoluteIntent	3	One of the intent type constants.
AddCompositeOp	8	One of the composite type constants.
AllChannels	10	One of the possible channel constants.
AllCompliance	&hffff	One of the Compliance type constants.
AssociatedAlpha	1	One of the possible alpha type constants.
AtopCompositeOp	4	One of the composite type constants.
BackgroundDispose	2	One of the gif dispose type constants.
BesselFilter	14	One of the filter type constants.
BilevelType	1	One of the image type constants.
BlackChannel	8	One of the possible channel constants.
BlackmanFilter	7	One of the filter type constants.
BlueChannel	5	One of the possible channel constants.
BottomLeftOrientation	4	One of the orientation type constants. Line direction: Left to right Frame Direction: Bottom to top
BottomRightOrientation	3	One of the orientation type constants. Line direction: Right to left Frame Direction: Bottom to top
BoxFilter	2	One of the filter type constants.
BumpmapCompositeOp	12	One of the composite type constants.
BZipCompression	2	One of the compression type constants.
CatromFilter	11	One of the filter type constants.
CenterGravity	5	One of the possible gravity constants.
ClearCompositeOp	18	One of the composite type constants.
ColorizeCompositeOp	28	One of the composite type constants.
ColorSeparationMatteType	9	One of the image type constants.
ColorSeparationType	8	One of the image type constants.
ConcatenateMode	3	One of the image type constants.
CopyBlackCompositeOp	35	One of the composite type constants.
CopyBlueCompositeOp	16	One of the composite type constants.
CopyCompositeOp	13	One of the composite type constants.
CopyCyanCompositeOp	32	One of the composite type constants.
CopyGreenCompositeOp	15	One of the composite type constants.
CopyMagentaCompositeOp	33	One of the composite type constants.
CopyOpacityCompositeOp	17	One of the composite type constants.
CopyRedCompositeOp	14	One of the composite type constants.
CopyYellowCompositeOp	34	One of the composite type constants.
CubicFilter	10	One of the filter type constants.
CyanChannel	2	One of the possible channel constants.
DarkenCompositeOp	24	One of the composite type constants.
DifferenceCompositeOp	10	One of the composite type constants.
DirectClass	1	One of the class type constants.
DisplaceCompositeOp	20	One of the composite type constants.
DissolveCompositeOp	19	One of the composite type constants.
DivideCompositeOp	36	One of the composite type constants.
EastGravity	6	One of the possible gravity constants.
FaxCompression	3	One of the compression type constants.
ForgetGravity	0	One of the possible gravity constants.
FrameMode	1	One of the mode type constants.
GaussianFilter	8	One of the filter type constants.
GaussianNoise	1	One of the possible noise constants.
GrayChannel	11	One of the possible channel constants.
GrayscaleMatteType	3	One of the image type constants.
GrayscaleType	2	One of the image type constants.
GreenChannel	3	One of the possible channel constants.
Group4Compression	4	One of the compression type constants.
HammingFilter	6	One of the filter type constants.
HanningFilter	5	One of the filter type constants.

Font Stretch

Constant	Value	Description
AnyStretch	9	Don't care.
CondensedStretch	3	Condensed
ExpandedStretch	6	Expanded
ExtraCondensedStretch	2	Extra Condensed
ExtraExpandedStretch	7	Extra Expanded
NormalStretch	0	Normal (Default)
SemiCondensedStretch	4	Semi Condensed
SemiExpandedStretch	5	Semi Expanded
UltraCondensedStretch	1	Ultra Condensed
UltraExpandedStretch	8	Ultra Expanded

Font Style

Constant	Value	Description
AnyStyle	3	Don't care.
ItalicStyle	1	Italic font.
NormalStyle	0	Normal (Default)
ObliqueStyle	2	Oblique font.

Storage Types

Constant	Value	Description
StorageTypeCharPixel	0	8bit numbers.
StorageTypeDoublePixel	5	64bit floating numbers.
StorageTypeFloatPixel	4	32bit floating numbers.
StorageTypeIntegerPixel	2	32bit numbers.
StorageTypeLongPixel	3	64bit numbers.
StorageTypeShortPixel	1	16bit numbers.

91.43 class GMImageStatisticsMBS

91.43.1 class GMImageStatisticsMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for image statistics.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

91.43.2 Methods

91.43.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

91.43.4 Properties

91.43.5 blue as GMImageChannelStatisticsMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blue channel statistics.
Notes: (Read only property)

91.43.6 green as GMImageChannelStatisticsMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green channel statistics.
Notes: (Read only property)

91.43.7 opacity as GMImageChannelStatisticsMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The opacity channel statistics.
Notes: (Read only property)

91.43.8 red as GMImageChannelStatisticsMBS

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The red channel statistics.
Notes: (Read only property)

91.44 class GMLockMBS

91.44.1 class GMLockMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for locking a certain resource.
Notes: The idea is to pass the constructor a mutexlock and keep the only reference to this new lock object on the stack. On the end of the method, the destructor is called by Xojo and releases the mutexlock automatically.

91.44.2 Methods

91.44.3 Constructor(mutexlock as GMMutexLockMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new Lock based on the given mutexlock.

91.44.4 Properties

91.44.5 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

91.44.6 target as GMMutexLockMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mutexlock this lock is referencing to.
Notes: (Read and Write property)

91.45 class GMMontageFramedMBS

91.45.1 class GMMontageFramedMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: MontageFramed provides the means to specify montage options when it is desired to have decorative frames around the image thumbnails.
Notes: MontageFramed inherits from Montage and therefore provides all the methods of Montage as well as those shown in the table "MontageFramed Methods".

Framed thumbnails consist of four components: the thumbnail image, the thumbnail frame, the thumbnail border, an optional thumbnail shadow, and an optional thumbnail label area.
Subclass of the GMMontageMBS class.

91.45.2 Methods

91.45.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

91.45.4 Properties

91.45.5 borderColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the background color within the thumbnail frame.
Notes: (Read and Write computed property)

91.45.6 borderWidth as Uint32

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the border (in pixels) to place between a thumbnail and its surrounding frame.
Notes: This option only takes effect if thumbnail frames are enabled (via frameGeometry) and the thumbnail geometry specification doesn't also specify the thumbnail border width.
(Read and Write computed property)

91.45.7 frameGeometry as GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the geometry specification for frame to place around thumbnail.
Notes: If this parameter is not specified, then the montage is unframed.
(Read and Write computed property)

91.45.8 matteColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the thumbnail frame color.
Notes: (Read and Write computed property)

91.46 class GMMontageMBS

91.46.1 class GMMontageMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Montage is the base class to provide montage options and provides methods to set all options required to render simple (unframed) montages.
Example:

```
// build montage
Var StackingMontage as New GM16MontageMBS
StackingMontage.backgroundColor = New GM16ColorMBS(&cE7E7E7)
StackingMontage.fillColor = New GM16ColorMBS(&c000000)
StackingMontage.tile = New GM16GeometryMBS("1x20")
StackingMontage.geometry = New GM16GeometryMBS("160x120+5+5")
StackingMontage.font = "Helvetica"
StackingMontage.pointSize = 12
StackingMontage.title = "Title goes here"

// make picture
Var logo as Picture = LogoMBS(500)
Var image as New GM16ImageMBS(logo)

image.label("Sample label")

// Put the current image into the array
Var StackingFrames As new GM16ImageArrayMBS
StackingFrames.insert(image)

// show result
Var resultImages as GM16ImageArrayMBS = StackingFrames.montageImages(StackingMontage)
Backdrop = resultImages.Image(0).CopyPicture
```

Notes: See GMMontageFramedMBS if you would like to create a framed montage.

Unframed thumbnails consist of four components: the thumbnail image, the thumbnail border, an optional thumbnail shadow, and an optional thumbnail label area.

91.46.2 Methods

91.46.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

91.46.4 Properties

91.46.5 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

91.46.6 backgroundColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the background color that thumbnails are imaged upon.
Notes: (Read and Write computed property)

91.46.7 compose as Integer

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the image composition algorithm for thumbnails.
Notes: This controls the algorithm by which the thumbnail image is placed on the background. Use of OverCompositeOp is recommended for use with images that have transparency. This option may have negative side-effects for images without transparency.
(Read and Write computed property)

91.46.8 fileName as string

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the image filename to be used for the generated montage images.
Notes: To handle the case were multiple montage images are generated, a printf-style format may be embedded within the filename. For example, a filename specification of image%02d.miff names the montage images as image00.miff, image01.miff, etc.
(Read and Write computed property)

91.46.9 fillColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the fill color to use for the label text.
Notes: (Read and Write computed property)

91.46.10 font as string

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the thumbnail label font.
Notes: (Read and Write computed property)

91.46.11 geometry as GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the size of the generated thumbnail.
Notes: (Read and Write computed property)

91.46.12 gravity as Integer

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the thumbnail positioning within the specified geometry area.
Notes: If the thumbnail is smaller in any dimension than the geometry, then it is placed according to this specification.
See Gravity constants in GMImageMBS class.
(Read and Write computed property)

91.46.13 label as string

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the format used for the image label.
Notes: Special format characters may be embedded in the format string to include information about the image.
(Read and Write computed property)

91.46.14 penColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the pen color to use for the label text (same as fill).
Notes: (Read and Write computed property)

91.46.15 pointSize as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the thumbnail label font size.
Notes: (Read and Write computed property)

91.46.16 shadow as boolean

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable/disable drop-shadow on thumbnails.
Notes: (Read and Write computed property)

91.46.17 strokeColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the stroke color to use for the label text.
Notes: (Read and Write computed property)

91.46.18 texture as string

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies a texture image to use as montage background.
Notes: The built-in textures "granite:" and "plasma:" are available. A texture is the same as a background image.
(Read and Write computed property)

91.46.19 tile as GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the maximum number of montage columns and rows in the montage.
Notes: The montage is built by filling out all cells in a row before advancing to the next row. Once the montage has reached the maximum number of columns and rows, a new montage image is started.
(Read and Write computed property)

91.46.20 title as string

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the montage title.
Notes: (Read and Write computed property)

91.46.21 transparentColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies a montage color to set transparent.
Notes: This option can be set the same as the background color in order for the thumbnails to appear without a background when rendered on an HTML page. For best effect, ensure that the transparent color selected does not occur in the rendered thumbnail colors.
(Read and Write computed property)

91.47 class GMMutexLockMBS

91.47.1 class GMMutexLockMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mutex class for GraphicsMagick.

91.47.2 Methods

91.47.3 lock

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Locks the lock.
Notes: Only one thread at a time can get the lock. The other threads will wait when lock is called.

91.47.4 unlock

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unlocks the lock.

91.47.5 Properties

91.47.6 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

91.48 class GMNotInitializedExceptionMBS

91.48.1 class GMNotInitializedExceptionMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception raised if you access a method/property in an object and the object was not initialized propertly.
Notes: Check the message property for details.
Subclass of the GMErrorExceptionMBS class.

91.49 class GMPathArgsMBS

91.49.1 class GMPathArgsMBS

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This is a class for arguments to the path arc/curve methods in GMGraphicsMBS.
Example:

```
Var g as new GMPathArgsMBS(1,2,3,4) // for a QuadraticCurveto

MessageBox str(g.x1)+EndOfLine+str(g.y1)+EndOfLine+str(g.x)+EndOfLine+str(g.y)
```

Notes: Due we use this class for three different ways, we have three constructors to fill in the value you need for the calls.

91.49.2 Methods

91.49.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor for creating an empty object.
See also:

- 91.49.4 Constructor(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 15195
- 91.49.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double) 15196
- 91.49.6 Constructor(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 15196

91.49.4 Constructor(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create the arguments object for the PathArc methods in GMGraphicsMBS.
See also:

- 91.49.3 Constructor 15195
- 91.49.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double) 15196

- 91.49.6 Constructor(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 15196

91.49.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create the arguments object for the QuadraticCurveto methods in GMGraphicsMBS.
Example:

```
Var g as new GMPathArgsMBS(1,2,3,4)

MessageBox str(g.x1)+EndOfLine+str(g.y1)+EndOfLine+str(g.x)+EndOfLine+str(g.y)
```

See also:

- 91.49.3 Constructor 15195
- 91.49.4 Constructor(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 15195
- 91.49.6 Constructor(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 15196

91.49.6 Constructor(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create the arguments object for the Curveto methods in GMGraphicsMBS.
Example:

```
Var g as new GMPathArgsMBS(1,2,3,4,5,6)

MessageBox str(g.x1)+EndOfLine+str(g.y1)+EndOfLine+str(g.x2)+EndOfLine+str(g.y2)+EndOfLine+str(g.x)+EndOfLine+str(g.y)
```

See also:

- 91.49.3 Constructor 15195
- 91.49.4 Constructor(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 15195
- 91.49.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double) 15196

91.49.7 Properties

91.49.8 largeArcFlag as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The large arc flag.
Notes: Draw longer of the two matching arcs
(Read and Write property)

91.49.9 radiusX as Double

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The radius x value.
Notes: (Read and Write property)

91.49.10 radiusY as Double

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The radius y value.
Notes: (Read and Write property)

91.49.11 sweepFlag as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sweep flag value.
Notes: Draw arc matching clock-wise rotation.
(Read and Write property)

91.49.12 x as Double

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x value.
Notes: For an arc: End-point X
(Read and Write property)

91.49.13 x1 as Double

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x1 value.
Notes: (Read and Write property)

91.49.14 x2 as Double

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x2 value.
Notes: (Read and Write property)

91.49.15 xAxisRotation as Double

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x Axis Rotation value.
Notes: Rotation relative to X axis.
(Read and Write property)

91.49.16 y as Double

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y value.
Notes: for an arc: End-point Y
(Read and Write property)

91.49.17 y1 as Double

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y1 value.
Notes: (Read and Write property)

91.49.18 y2 as Double

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y2 value.
Notes: (Read and Write property)

91.50 class GMPixelsMBS

91.50.1 class GMPixelsMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an empty pixels object.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GMImageMBS(f)
Var p as new GMPixelsMBS(g)

// get pointer to some pixels to read/write
Var x as ptr = p.get(0, 0, 100, 100)

// draw a red line to the pixel buffer
Var o as Integer
for i as Integer = 0 to 99
o = 100 * i + i
x.UInt32(o * 4) = &hFFFF0000
next

// write back
p.sync

// show
Window1.Backdrop = g.CopyPicture
```

91.50.2 Methods

91.50.3 Constructor(Image as GMImageMBS)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new Pixels object with the pixels from an image.

91.50.4 get(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transfer pixels from the image to the pixel view as defined by the specified region.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GMImageMBS(f)
Var p as new GMPixelsMBS(g)

// get pointer to some pixels
Var x as ptr = p.get(0, 0, 100, 100)

// draw a red line to the pixel buffer
Var o as Integer
for i as Integer = 0 to 99
o = 100 * i + i
x.UInt32(o * 4) = &hFFFF0000
next

// write back
p.sync

// show
Window1.Backdrop = g.CopyPicture
```

Notes: Modified pixels may be subsequently transferred back to the image via sync.

91.50.5 getConst(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transfer read-only pixels from the image to the pixel view as defined by the specified region.

91.50.6 indexes as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return pixel colormap index array.

91.50.7 set(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allocate a pixel view region to store image pixels as defined by the region rectangle.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GMImageMBS(f)
Var p as new GMPixelsMBS(g)

// get pointer to some pixels to write
Var x as ptr = p.set(0, 0, 100, 100)

// draw a red line to the pixel buffer
Var o as Integer
for i as Integer = 0 to 99
o = 100 * i + i
x.UInt32(o * 4) = &hFFFF0000
next

// write back
p.sync

// show
Window1.Backdrop = g.CopyPicture
```

Notes: This area is subsequently transferred from the pixel view to the image via sync.

91.50.8 sync

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transfers the image cache pixels to the image.

91.50.9 Properties

91.50.10 columns as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Width of view.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var g as new GMImageMBS(f)
Var p as new GMPixelsMBS(g)

// get pointer to some pixels
Var x as ptr = p.get(0, 0, 100, 100)
```

```
// and show size
MessageBox str(p.columns)+" x "+str(p.rows)
```

Notes: (Read only property)

91.50.11 handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

91.50.12 rows as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Height of view.
Notes: (Read only property)

91.50.13 x as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Left ordinate of view.
Notes: (Read only property)

91.50.14 y as Integer

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Top ordinate of view.
Notes: (Read only property)

91.51 class GMTypeMetricMBS

91.51.1 class GMTypeMetricMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The TypeMetric class provides the means to pass data from the Image class's TypeMetric method to the user.
Example:

```
// measure how much space a text needs before drawing it into an image
Var image As New GMImageMBS(New GMGeometryMBS(400, 100), New GMColorMBS("white"))
image.font = "Helvetica"
image.fontPointsize = 24

Var metric As GMTypeMetricMBS = image.fontTypeMetrics("Hello World")
MessageBox "Width: " + Format(metric.textWidth, "0") + EndOfLine + _
"Height: " + Format(metric.textHeight, "0") + EndOfLine + _
"Ascent: " + Format(metric.ascent, "0.0") + ", descent: " + Format(metric.descent, "0.0")
```

Notes: It provides information regarding font metrics such as ascent, descent, text width, text height, and maximum horizontal advance. The units of these font metrics are in pixels, and that the metrics are dependent on the current Image font (default Ghostscript's "Helvetica"), pointsize (default 12 points), and x/y resolution (default 72 DPI) settings.

The pixel units may be converted to points (the standard resolution-independent measure used by the typesetting industry) via the following equation:

size_points = (size_pixels * 72)/resolution
where resolution is in dots-per-inch (DPI). This means that at the default image resolution, there is one pixel per point.

Note that a font's pointsize is only a first-order approximation of the font height (ascender + descender) in points. The relationship between the specified pointsize and the rendered font height is determined by the font designer.

See FreeType Glyph Conventions for a detailed description of font metrics related issues.

91.51.2 Methods

91.51.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

91.51.4 Properties

91.51.5 ascent as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the distance in pixels from the text baseline to the highest/upper grid coordinate used to place an outline point.
Notes: Always a positive value.
(Read only property)

91.51.6 descent as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the distance in pixels from the baseline to the lowest grid coordinate used to place an outline point.
Notes: Always a negative value.
(Read only property)

91.51.7 maxHorizontalAdvance as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the maximum horizontal advance (advance from the beginning of a character to the beginning of the next character) in pixels.
Notes: (Read only property)

91.51.8 textHeight as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns text height in pixels.
Notes: (Read only property)

91.51.9 textWidth as Double

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns text width in pixels.
Notes: (Read only property)

91.52 class GMUnsupportedExceptionMBS

91.52.1 class GMUnsupportedExceptionMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: An exception raised if you call the GM functions on an unsupported platform.
Notes: Check the message property for details.
This exception is currently only used on Windows.
(Windows support may come later)
Subclass of the GMErrorExceptionMBS class.

Chapter 92

Handoff

92.1 class NSUserActivityEventsMBS

92.1.1 class NSUserActivityEventsMBS

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: The class to catch various events for user activity.
Notes: The user activity delegate is responsible for updating the state of an activity and is also notified when an activity has been continued on another device. The user activity delegate is typically a top-level object in the app—such as a window, view controller, or the app delegate—that manages the activity,Äôs interaction with the app.

Please have one instance only to catch the events.
Blog Entries

- News from the MBS Xojo Plugins Version 24.4
- MBS Xojo Plugins, version 24.4pr1

92.1.2 Methods

92.1.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: The constructor.

92.1.4 deleteAllSavedUserActivities

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Deletes all user activities created by your app.
Notes: Deletes all user activities stored by Core Spotlight or donated as Siri shortcuts.
Calls deletedAllSavedUserActivities event later.

92.1.5 deleteSavedUserActivities(PersistentIdentifiers() as String)

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Deletes user activities created by your app that have the specified persistent identifiers.
Notes: persistentIdentifiers: The list of persistent identifiers that the system uses to determine which user activities to delete.

Calls deletedSavedUserActivities event later.

92.1.6 SetUserActivity(Item as Variant, activity as NSUserActivityMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Sets user activity for the object.
Notes: Item can be a NSViewMBS, NSWindowMBS, NSApplicationMBS, NSPopoverMBS, Application, DesktopApplication, MobileControl, iOSControl, MobileScreen, iOSScreen, Window, DesktopWindow, RectControl or DesktopUIControl object.

By setting the userActivity property on a responder, the NSUserActivityMBS object becomes managed by AppKit. You should override updateUserActivityState evnet to write lazily any state data representing the user,Äôs activity to the userInfo dictionary. AppKit automatically saves user activities it manages at appropriate times. Multiple responders can share a single NSUserActivity instance, in which case they all get a callback, such as updateUserActivityState, when the system updates the user activity object.

Before the update callbacks are sent, the activity object,Äôs userInfo dictionary is cleared.
In macOS, NSUserActivity objects managed by NSResponder automatically becomeCurrent based on the main window and the responder chain.
A responder object can set its userActivity property to nil if it no longer wants to participate. Any NSUserActivity objects that AppKit manages but have no associated responders (or documents) are automatically invalidated.
You can use this property from any thread, and it,Äôs key-value observable (KVO).

92.1.7 UserActivity(Item as Variant) as NSUserActivityMBS

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Queries user activity for the object.
Notes: An object encapsulating a user activity supported by this responder.

Item can be a NSViewMBS, NSWindowMBS, NSApplicationMBS, NSPopoverMBS, Application, DesktopApplication, MobileControl, iOSControl, MobileScreen, iOSScreen, Window, DesktopWindow, RectControl or DesktopUIControl object.

92.1.8 Events

92.1.9 continueUserActivity(userActivity as NSUserActivityMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Tells the delegate that the data for continuing an activity is available.
Example:

```
Function continueUserActivity(userActivity as NSUserActivityMBS) Handles continueUserActivity as Boolean
// Tells the delegate that the data for continuing an activity is available.
Log CurrentMethodName

If userActivity.activityType = "de.monkeybreadsoftware.example.handoff" Then
// we like this type

return True
End If
End Function
```

Notes: userActivity: The activity object containing the data associated with the task the user was performing. Use the data to continue the user's activity in your app.

Return true to indicate that your app handled the activity or false to let iOS know that your app didn't handle the activity.

The app calls this method when it receives data associated with a user activity, for example, when the user transfers an activity from a different device using Handoff.

Implement this method to update your app so that the user can continue the activity from where they left off. If you don't implement this method or if your implementation returns false, iOS tries to create a document for your app to open using a URL.

If you return true, will trigger restoreUserActivityState event.

92.1.10 deletedAllSavedUserActivities

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: The event that the system invokes after deleting the user activities.
Notes: Wait for the system to call this block to ensure that the system deletes the activities (or marks them for deletion).

92.1.11 deletedSavedUserActivities(persistentIdentifiers() as String)

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: The event that the system invokes after deleting the user activities.
Notes: Wait for the system to call this block to ensure that the system deletes the activities (or marks them for deletion).

92.1.12 didFailToContinueUserActivityWithType(userActivityType as String, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Tells the delegate that the activity couldn,Äôt be continued.
Notes: userActivityType: The activity type that was attempted.
error: An error object indicating the reason for the failure.

Use this method to let the user know that the specified activity could not be continued. If you do not implement this method, UIKit displays an error to the user with an appropriate message about the reason for the failure.

92.1.13 didUpdateUserActivity(userActivity as NSUserActivityMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Tells the delegate that the activity was updated.
Notes: userActivity: The activity object containing the data associated with the task the user was performing.

This method is called on the main thread when a user activity managed by UIKit has been updated. You can implement this event as a final opportunity to add data to the user activity object.

92.1.14 gotContinuationStreams(userActivity as NSUserActivityMBS, inputStream as Variant, outputStream as Variant, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Received the streams.
Notes: inputStream: The stream from which the continuing app can read data written by the originating app. a NSInputStreamMBS object.
outputStream: The stream to which the continuing app writes data to be read by the originating app. a NSOutputStreamMBS object.
error: If successful, nil; if not successful, an NSErrorMBS object that encapsulates the reason why the streams could not be created.

When an app is launched for a continuation event, it can request streams back to the originating app. Streams can be successfully retrieved only from the NSUserActivityMBS object in this event called for a continuation event. The streams are provided by the completion handler in an unopened state, and the delegate should open them immediately to start communicating with the continuing side.

Continuation streams are an optional feature of Handoff, and most user activities do not need them for successful continuation. When streams are needed, a simple request from the continuing app accompanied by a response from the originating app is enough for most continuation events.

92.1.15 restoreUserActivityState(userActivity as NSUserActivityMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Restores the state necessary to continue the specified user activity.
Notes: userActivity: The user activity to continue.

Implement this method to restore an object,Äôs state using the specified user activity. The system calls this event after continueUserActivity. Your implementation should use the state data contained in the specified user activity,Äôs userInfo dictionary to restore the object.

92.1.16 updateUserActivityState(responder as Variant, userActivity as NSUserActivityMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Updates the state of the given user activity.
Notes: activity: The user activity to be updated.

We catch this and report who received it. So Responder may be an application, a window, control or screen.

92.1.17 userActivityDidReceiveStreams(userActivity as NSUserActivityMBS, inputStream as Variant, outputStream as Variant)

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Notifies the user activity delegate that an input and output streams are available to open.
Notes: userActivity: The user activity that is continuing on another device. This user activity's supportsContinuationStreams property must be true.
inputStream: The stream from which the originating app can read data written from the continuing app. A NSInputStreamMBS object.
outputStream: The stream to which the originating app writes data to be read by the continuing app. A NSOutputStreamMBS object.

If supportsContinuationStreams is true, the continuing app can request streams back to the originating app. This delegate callback is received with the streams from the continuing side. The streams are provided in an unopened state, and the delegate should open them immediately to start communicating with the continuing side.
Continuation streams are an optional feature of Handoff, and most user activities do not need them for successful continuation. When streams are needed, a simple request from the continuing app accompanied by a response from the originating app is enough for most continuation events.

92.1.18 userActivityWasContinued(userActivity as NSUserActivityMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Notifies the delegate that the user activity was continued on another device.
Notes: userActivity: The user activity that was continued.

92.1.19 userActivityWillSave(userActivity as NSUserActivityMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Notifies the delegate that the user activity will be saved to be continued or persisted.
Notes: userActivity: The user activity to update.

You implement this event to update the activity with current state.

92.1.20 willContinueUserActivityWithType(userActivityType as String) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Tells the delegate if your app takes responsibility for notifying users when a continuation activity takes longer than expected.
Notes: userActivityType: The requested activity type.

Returns true if you want to notify the user that a continuation is in progress or false if you want iOS to notify the user.

Use this method to provide immediate feedback to the user that an activity is about to continue on this device. The app calls this method as soon as the user confirms that an activity should be continued but possibly before the data associated with that activity is available.

Your implementation of this method should prepare to initiate the activity. If you notify the user as part of your preparations, return true from this method so that iOS does not also notify the user. If you do not implement this method or your implementation returns false, iOS notifes the user.

92.2 class NSUserActivityMBS

92.2.1 class NSUserActivityMBS

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: A representation of the state of your app at a moment in time.
Example:

```
userActivity = New NSUserActivityMBS("de.monkeybreadsoftware.example.handoff")
userActivity.title = "Example"
userActivity.EligibleForHandoff = True
```

Notes: An NSUserActivity object provides a lightweight way to capture the state of your app and put it to use later. Create this object to capture information about what a person was doing, such as viewing app content, editing a document, viewing a web page, or watching a video. When the system launches your app and an activity object is available, your app can use the information in that object to restore itself to an appropriate state. Spotlight also uses these objects to improve search results for people.

92.2.2 Methods

92.2.3 addUserInfoEntries(otherDictionary as Dictionary)

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Adds the contents of the specified dictionary to the user info dictionary.
Notes: otherDictionary: The dictionary containing entries to be added.

Use this method to add the keys from otherDictionary into the dictionary in the userInfo property. If the same key is in both dictionaries, the value of the key is set to the value in the otherDictionary parameter. It,Äôs recommended that you keep the userInfo dictionary as small as possible. The larger the dictionary, the longer it takes to deliver that payload and resume the activity.

92.2.4 becomeCurrent

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Marks the activity as currently in use by the user.
Notes: Call this method to let the system know that the user is performing the associated activity. The system makes this object the current user activity object, which makes it available for Handoff and search indexing. If another user activity object was previously active, that object is made inactive.

Don,Äôt call this method when providing a user activity object for a Siri request. Siri holds on to user activity objects and passes them along to your app automatically in response to specific events.

If you previously called the invalidate method on the current object, calling this method has no effect.

92.2.5 Constructor(activityType as String)

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Creates a user activity object with the specified type.
Notes: activityType: The type of the activity. The value is a developer-defined string in reverse-DNS format by convention, for example, com.myCompany.myEditor.editing.

92.2.6 getContinuationStreams

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Requests streams back to the originating app.
Notes: Calls later gotContinuationStreams event in NSUserActivityEventsMBS class.

When an app is launched for a continuation event, it can request streams back to the originating app. Streams can be successfully retrieved only from the NSUserActivityMBS object in the gotContinuationStreams event in NSUserActivityEventsMBS class called for a continuation event. The streams are provided by the completion handler in an unopened state, and the delegate should open them immediately to start communicating with the continuing side.

Continuation streams are an optional feature of Handoff, and most user activities do not need them for successful continuation. When streams are needed, a simple request from the continuing app accompanied by a response from the originating app is enough for most continuation events.

92.2.7 invalidate

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Invalidates an activity and marks it as no longer eligible for continuation.
Notes: Call this method when the user stops engaging in the associated activity and that activity is no longer available. For example, you might call this method when the user closes the window associated with the activity. After calling this method on a user activity object, calling the becomeCurrent method on that object has no effect.

92.2.8 keywords as String()

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: A set of localized keywords that can help users find the activity in search results.
Notes: The default value of this property is nil. The system indexes the keywords you provide.

92.2.9 NSUserActivityTypeBrowsingWeb as String

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: An activity that continues from Handoff or a universal link.
Notes: An NSUserActivityMBS object with an activityType value of NSUserActivityTypeBrowsingWeb indicates either an activity continued from a web browser-to-native app Handoff or a universal link. For this activity type, the webpageURL property contains the http or https URL associated with the activity.

92.2.10 requiredUserInfoKeys as String()

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: A set of keys that represent the minimal information about the activity that should be stored for later restoration.
Notes: The keys come from the userInfo property.

92.2.11 resignCurrent

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Marks this activity object as inactive without invalidating it.
Notes: Calling this method marks the user activity as no longer current, but doesn,Äôt invalidate it entirely. You can call this method when you want to stop advertising the activity for continuation and search indexing

only temporarily. You may call becomeCurrent later to restore this object as the current activity.

92.2.12 setKeywords(keywords() as String)

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Sets the set of localized keywords that can help users find the activity in search results.
Notes: The default value of this property is nil. The system indexes the keywords you provide.

92.2.13 setRequiredUserInfoKeys(requiredUserInfoKeys() as String)

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Sets the set of keys that represent the minimal information about the activity that should be stored for later restoration.
Notes: The keys come from the userInfo property.

92.2.14 Properties

92.2.15 activityType as String

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: The user activity object,Äôs activity type.
Notes: This property is set at initialization time and can,Äôt be changed later. Typically, you specify activity type strings using a reverse-DNS format that uniquely identifies the activity.
(Read only property)

92.2.16 EligibleForHandoff as Boolean

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: A Boolean value that indicates whether the activity can be continued on another device using Handoff.
Notes: The default value of this property is true.
(Read and Write property)

92.2.17 EligibleForPrediction as Boolean

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that determines whether Siri can suggest the user activity as a shortcut to the user.
Notes: To donate a user activity to Siri Shortcuts, set eligibleForPrediction to true and make the user activity current. To make the user activity current, call the activity,Äôs becomeCurrent method, or assign it to the userActivity property on a UIViewController or UIResponder object. For more information, see Donating Shortcuts.
(Read and Write property)

92.2.18 EligibleForPublicIndexing as Boolean

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: A Boolean value that indicates whether the activity can be publicly accessed by all iOS users.
Notes: The default value of this property is NO, which indicates that the activity object contains private or sensitive information or that the activity isn,Äôt useful to other users. When the value of this property is YES, the system identifies this activity as one that can be shared publicly. When you make an activity public, the system indexes the values in the requiredUserInfoKeys or webpageURL properties, and you must provide a value for one of those properties.

Identifying an activity as public confers an advantage when you also add web markup to the content on your related website. Specifically, when users engage with your app,Äôs public activities in search results, it indicates to Apple that public information on your website is popular, which can help increase your ranking and potentially lead to expanded indexing of your website,Äôs content.
(Read and Write property)

92.2.19 EligibleForSearch as Boolean

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: A Boolean value that indicates whether the activity should be added to the on-device index.
Notes: The default value of this property is false.
(Read and Write property)

92.2.20 expirationDate as Date

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platform: macOS, Targets: Desktop only.

Function: The date after which the activity is no longer eligible for Handoff or indexing.
Notes: If you don,Äôt set the value of this property, the system automatically expires the activity after a

period of time.
(Read and Write property)

92.2.21 expirationDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: The date after which the activity is no longer eligible for Handoff or indexing.
Notes: If you don,Äôt set the value of this property, the system automatically expires the activity after a period of time.
(Read and Write property)

92.2.22 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

92.2.23 mapItem as Variant

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Attaches the specified map item to a user activity object.
Notes: Use this property to share a map item,Äôs location information with other apps so that users can benefit from a more contextually integrated experience. For example, if a user views a location in an app that provides restaurant reviews, this property can make the same location available to the user when they switch to an app that helps them make travel plans.

Setting the mapItem property also populates the user activity object,Äôs contentAttributeSet property. After attaching a map item to a user activity object, you can easily adopt app search by setting the object,Äôs eligibleForSearch property to true. To learn more about participating in app search, see App Search Programming Guide.

Value is a MKMapItemMBS object.
(Read and Write property)

92.2.24 needsSave as Boolean

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: A Boolean value that indicates whether the state of the activity needs to be updated.
Notes: If true, the delegate for this user activity receives a userActivityWillSave event before the activity is sent for continuation on another device.
(Read and Write property)

92.2.25 persistentIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: A value used to identify the user activity.
Notes: Set this property to a value that identifies the user activity so you can later delete it with deleteSavedUserActivities(). For example, if the user checks the weather for Cupertino each morning from home, the weather app sets the persistent identifier to the city name (Cupertino). When the user deletes Cupertino from the weather app, the app deletes the user activity associated with the identifier, ,ÄúCupertino,Äù.
(Read and Write property)

92.2.26 referrerURL as String

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: The URL of the webpage that linked to the webpage URL.
Notes: (Read and Write property)

92.2.27 supportsContinuationStreams as Boolean

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: A Boolean value that determines whether the continuing app can request streams to be opened back to the originating app.
Notes: If the value of this property is true, the continuing app can connect back to the originating app for more information using streams. The default value of this property is NO. It can dynamically be set to true to selectively support continuation streams based on the state of the user activity.
(Read and Write property)

92.2.28 targetContentIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: A string that identifies the user activity,Äôs content.
Notes: A target content identifier is a string you define within your app. This string provides a unique identifier for specific content in your app, like a particular document or the location of a piece of data in a

database. This string isn,Äôt visible to the user.

If you set this property, when the system delivers an NSUserActivity object to an app with multiple scenes, it chooses the UIScene whose UISceneActivationConditions have the best match with the target content identifier. For more information, see UISceneActivationConditions. (not sure how this would apply in Xojo!)

This property is optional but is highly recommended to create a great multitasking experience for apps that run on iPad. Setting this property doesn,Äôt automatically set needsSave to true.
(Read and Write property)

92.2.29 title as String

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: An optional, user-visible title for this activity, such as a document name or web page title.
Notes: Always specify a title string for activity objects that are eligible for searches, and it,Äôs recommended that you include a title string for all user activity objects. For search-related user activity objects, this string is displayed in the search results.
(Read and Write property)

92.2.30 userInfo as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: A dictionary containing app-specific state information needed to continue an activity on another device.
Notes: Each key and value must be of the following types: array, MemoryBlock, Date/DateTime, Dictionary, nil, Number, String, or NSURLMBS. The system may translate file scheme URLs that refer to iCloud documents to valid file URLs on a continuing device.
(Read and Write property)

92.2.31 webpageURL as String

MBS MacFrameworks Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: The URL of the webpage to load in a browser to continue the activity.
Notes: When no suitable app is installed on a resuming device and the webpageURL property is set, the specified webpage is loaded and the user activity is continued in a web browser.
If your activity's content can be restored on the web or you support Safari universal links, be sure to set this property so that the system can resume the activity in Safari or your app. After setting the webpageURL property on an activity for which eligibleForSearch is true, also set the requiredUserInfoKeys property, using the keys of the userInfo dictionary that must be stored. If you don,Äôt also set the requiredUserInfoKeys

property, the userInfo dictionary will be empty when the activity is restored.

If eligibleForSearch is true for this activity and you,Äôre using both NSUserActivity and web markup to index the same item, set webpageURL to the relevant URL on your website to avoid showing duplicate results in Spotlight. The NSUserActivity API does not perform any modifications to the URL that you specify. URL components, such as the query string and the fragment identifier, are used for matching the item against pages that are indexed by Applebot.

The scheme of the webpageURL must be http or https. Any other scheme throws an exception.
(Read and Write property)

Chapter 93

Hotkey

93.1 class HotKeyMBS

93.1.1 class HotKeyMBS

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The class for registering hotkeys.
Example:

```
// register Command-Shift-H (Control-Shift-H on Windows) as global hotkey
// MyHotKey is a subclass of HotKeyMBS with the KeyDown event implemented.
// Hotkey is a property of the app: Hotkey As MyHotKey
Var modifiers As Integer = HotKeyMBS.ShiftKey
#If TargetMacOS Then
modifiers = modifiers + HotKeyMBS.CommandKey
#Else
modifiers = modifiers + HotKeyMBS.ControlKey
#EndIf

Hotkey = New MyHotKey(HotKeyMBS.KeyCodeForText("h"), modifiers)

// in MyHotKey:
Sub KeyDown() Handles KeyDown
System.DebugLog "Hotkey pressed"
End Sub
```

Notes: This is a crossplatform replacement for our CarbonHotKeyMBS class.

93.1.2 Methods

93.1.3 Close

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Closes hotkey.
Notes: Same as destructor, but to unregister hotkey now.

93.1.4 Constructor(KeyCode as Integer, Modifiers as Integer, Exclusive as Boolean = false)

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Registers a new keycode.
Notes: The plugin may not check if combination is allowed, makes sense or can be pressed.

93.1.5 KeyCodeForText(name as string) as Integer

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Queries a keycode for a character.
Example:

```
MessageBox "Return: "+str(HotKeyMBS.KeyCodeForText("return"))
```

Notes: Helper function to return platform specific key codes for various keys.
Plugin has a list based on the constants defined by Apple and Microsoft for keys.

93.1.6 Properties

93.1.7 Exclusive as Boolean

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Whether exclusive ownership of hotkey was requested.
Notes: (Read only property)

93.1.8 Handle as Integer

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Only used on Mac OS X.
(Read only property)

93.1.9 ID as Integer

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The internal ID of the hotkey.
Notes: (Read only property)

93.1.10 KeyCode as Integer

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The keycode registered.
Notes: (Read only property)

93.1.11 Modifiers as Integer

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The modifiers used at registration.
Notes: (Read only property)

93.1.12 Events

93.1.13 KeyDown

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The key down event.

93.1.14 KeyUp

MBS Util Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The key up event.

93.1.15 Constants

Modifier Flags

Constant	Value	Description
AlphaKey	&h400	Alpha Lock
CommandKey	&h100	Command Key on Mac, Windows Key on Windows.
ControlKey	&h1000	Control Key
OptionKey	&h800	Option/Alt Key
ShiftKey	&h200	Shift Key

Chapter 94

HTMLViewer

94.1 class DesktopHTMLViewer

94.1.1 class DesktopHTMLViewer

Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Class in Xojo for HTML rendering.
Notes: We have multiple methods for macOS, Windows and Linux, so please check each method.

94.1.2 Methods

94.1.3 ChromiumBrowserMBS as ChromiumBrowserMBS

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Queries browser object for htmlviewer.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MessageBox b.MainFrame.URL
```

Notes: Works only on Windows if Webkit is chosen as renderer.
Returns nil on any error.

Please call all chromium functions only on main thread.
Do not call in open event of HTMLViewer as browser control is not yet initialized there.

94.1.4 LinuxWebViewMBS as LinuxWebViewMBS

MBS Linux Plugin, Plugin Version: 24.5, Platform: Linux, Targets: Desktop only.

Function: Queries the Linux WebKit web view for the given htmlviewer.
Notes: Requires a recent Xojo version. And libwekit-1.0 must be installed, so Xojo uses it for browsing.
Check Also the Available shared method on LinuxWebViewMBS class.

94.1.5 WebView2BrowserMBS as WebView2BrowserMBS

MBS WinFrameworks Plugin, Plugin Version: 26.3, Platform: Windows, Targets: Desktop only.

Function: Queries the browser object for the given HTMLViewer.
Example:

```
// This example needs a window with HTMLViewer1.
Var b As WebView2BrowserMBS = HTMLViewer1.WebView2BrowserMBS
```

Notes: Only for Xojo 2026r2 or newer when using WebView2 for HTMLViewer without WinUI.

94.1.6 WKWebViewMBS as WKWebViewMBS

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Queries WKWebViewMBS associated to HTMLViewer.
Notes: Returns WKWebView for Xojo when used in HTMLViewer.

Chapter 95

HTMLViewer Linux

95.1 class HTMLViewer

95.1.1 class HTMLViewer

Plugin Version: 7.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Class in Xojo 2005 for HTML rendering.
Notes: We have multiple methods for macOS, Windows and Linux, so please check each method.

95.1.2 Methods

95.1.3 ChromiumBrowserMBS as ChromiumBrowserMBS

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Queries browser object for htmlviewer.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MessageBox b.MainFrame.URL
```

Notes: Works only on Windows if Webkit is chosen as renderer.
Returns nil on any error.

Please call all chromium functions only on main thread.
Do not call in open event of HTMLViewer as browser control is not yet initialized there.

May not work in Xojo 2021r3 due to changes inside the control.

95.1.4 IEContinueFindTextMBS(text as string, count as Integer, flags as Integer, selectText as boolean) as boolean

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Continues a search started with IEFindTextMBS.
Notes: Parameters are the same as for IEFindTextMBS.

95.1.5 IEDocumentMBS as IEDocumentMBS

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Queries web document object for this HTMLViewer.
Notes: For browser based on Internet Explorer on Windows.
Raises exception on failure.

Not available for DesktopHTMLViewer control since there is no support for Internet Explorer for that control.

95.1.6 IEDrawToHDCMBS(HDC as Ptr, PrinterName as string = "") as boolean

MBS Win Plugin, Plugin Version: 12.2, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Draws the content of the html document into the graphics context.
Notes: As of Windows Internet Explorer 9, this method is deprecated and should not be used.
Returns true on success and false on failure.

With some printers, running DrawToDC may cause problems. You can ensure that DrawToDC works properly on all printers by running SetDocumentPrinter method first, and then passing the modified device context to DrawToDC. The plugin calls SetDocumentPrinter for you when you provide a printer name.

95.1.7 IEFileCreationDateMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Retrieves the date the file was created.

Notes: Example value: "09/13/2007"

95.1.8 IEFileModifiedDateMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Retrieves the date the file was last modified.
Notes: Example value: "12/03/2007"

95.1.9 IEFileSizeMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Retrieves the file size.
Notes: Example value: "12475"

95.1.10 IEFileUpdatedDateMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Retrieves the date the file was last updated.
Notes: Example value: "01/01/1601"

95.1.11 IEFindTextMBS(text as string, count as Integer, flags as Integer, selectText as boolean) as boolean

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Finds text on the current website.
Notes: text: the string that specifies the text to find.
count: long that specifies the number of characters to search from the starting point of the range. A positive integer indicates a forward search; a negative integer indicates a backward search.
Flags: integer that specifies one or more of the following flags to indicate the type of search:

Returns true: The search text was found.
Returns false: The search text was not found.

0	Default. Match partial words.
1	Match backwards.
2	Match whole words only.
4	Match case.
131072	Match bytes.
536870912	Match diacritical marks.
1073741824	Match Kashida character.
2147483648	Match AlefHamza character.

95.1.12 IEGetTextAreaMBS(FormName as String, FieldName as String) as String

MBS Win Plugin, Plugin Version: 16.3, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Queries text for a textarea.
Notes: FormName can be "" to look for any field with given name.
Raises exception if field is not found.
Returns text from textarea.
Blog Entries

- HTMLViewer JavaScript communication for Xojo
- HTMLViewer JavaScript communication for Xojo

95.1.13 IEHandleMBS as Integer

MBS Win Plugin, Plugin Version: 8.0, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** The handle to the windows browser object.
Notes: If this value is zero, the plugin htmlviewer functions for Windows will not work.

95.1.14 IEHistoryBackMBS

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEHistoryMBS class instead. **Function:** Loads a previous URL from the History list.

95.1.15 IEHistoryForwardMBS

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEHistoryMBS class instead. **Function:** Loads the next URL from the History list.

95.1.16 IEHistoryLengthMBS as Integer

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEHistoryMBS class instead. **Function:** Retrieves the number of elements in the History list.
Notes: Example value: "0"

95.1.17 IEHTMLTextMBS as string

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Returns a copy of the html source code of the current webpage.
Example:

MessageBox HTMLViewer1.IEHTMLTextMBS

Notes: Improved in plugin version 12.2 to return better HTML text. This is the html generated from current web content and not the page we originally loaded. So this works with IEEditableMBS property.
Returns "" on any error.
Blog Entries

- MBS Xojo Plugins, version 20.2pr3
- MBS Real Studio Plugins, version 12.2pr1

95.1.18 IEImageMBS as picture

MBS Win Plugin, Plugin Version: 9.5, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Copies the picture from the htmlviewer.
Example:

```
// This example needs a window with HTMLViewer1.
Sub Action()
ClearFocus
```

```
Var picWeb As Picture

// Get image from IE
picWeb = HTMLViewer1.IEImageMBS

Canvas1.backdrop = picWeb
End Sub
```

Notes: You may want to resize the htmlviewer to get a picture without scrollbars. (See example projects) You may need to call ClearFocus as it seems like if the focus is on the htmlviewer it does not draw itself in our picture.

- Render Image from a HTMLViewer
- MBS REALbasic plug-ins version 9.5

95.1.19 IELastModifiedMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Gets the date that the page was last modified, if the page supplies one. **Notes:** Example value: "12/03/2007 20:08:17"

95.1.20 IELoadHTMLMBS(HTMLText as string) as boolean

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Loads the HTML text into the htmlviewer.
Example:

```
// This example needs a window with HTMLViewer1.
// in window open event, load blank page
HTMLViewer1.LoadURL "about:blank"

// later somewhere in app load HTML:
HTMLViewer1.IELoadHTMLMBS "<html><body>Hello World</body></html>"
```

Notes: Does not use a temp file like Xojo's built in method.
Returns true on success.
On Windows you may need to reset webviewer before or load "about:blank" to initialize the webviewer by Xojo (or Xojo).
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.1pr5

95.1.21 IEMimeTypeMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Retrieves the MIME type for the file.
Notes: Example value: "HTM-Datei"
See also MimeTypeToFileExtensionMBS function.

95.1.22 IENamePropMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Gets the title of the document file.
Notes: Example value: "Apple"

95.1.23 IENavigatorAppMinorVersionMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IENavigatorMBS class instead. **Function:** Retrieves the application's minor version value.
Notes: Example value: ";SP2;"

95.1.24 IENavigatorAppNameMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IENavigatorMBS class instead. **Function:** Retrieves the name of the browser.
Notes: Example value: "Microsoft Internet Explorer"

95.1.25 IENavigatorAppVersionMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IENavigatorMBS class instead. **Function:** Retrieves the platform and version of the browser.
Notes: Example value: "4.0 (compatible; MSIE 6.0; Windows NT 5.1; SV1; .NET CLR 1.1.4322; .NET CLR 2.0.50727)"

95.1.26 IENavigatorBrowserLanguageMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IENavigatorMBS class instead. **Function:** Retrieves the current browser language.
Notes: Example value: "de"

95.1.27 IENavigatorCookieEnabledMBS as boolean

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IENavigatorMBS class instead. **Function:** Retrieves whether client-side persistent cookies are enabled in the browser.
Notes: Persistent cookies are those that are stored on the client-side computer.
Example value: "True"

95.1.28 IENavigatorJavaEnabledMBS as boolean

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IENavigatorMBS class instead. **Function:** Returns whether Java is enabled.
Notes: Example value: "True"

95.1.29 IENavigatorOnLineMBS as boolean

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IENavigatorMBS class instead. **Function:** Retrieves a value indicating whether the system is in global offline mode.
Notes: The user can modify the global offline state by choosing Work Offline from the File menu in Microsoft Internet Explorer version 4.0 or later. This property does not indicate whether the system is connected to

the network.

Example value: "True"

95.1.30 IENavigatorUserAgentMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IENavigatorMBS class instead. **Function:** Retrieves a string equivalent to the HTTP user-agent request header.
Notes: The HTTP user-agent request header contains information about compatibility, the browser, and the platform name. For more information about the browser, see the IENavigatorappNameMBS property. For more information about the platform, see the IENavigatorappVersionMBS property.

The IENavigatoruserAgentMBS property dynamically returns a different value depending on the browser and platform versions. For example, Microsoft Internet Explorer 6 returns the following string for Microsoft Windows XP.

Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1)

Example value: "Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1; SV1; .NET CLR 1.1.4322; .NET CLR 2.0.50727)"

Like other plugin function, this can only work if a page has been loaded. Xojo won't create the internal htmlviewer object before you load a page.

95.1.31 IENavigatorUserLanguageMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IENavigatorMBS class instead. **Function:** Retrieves the operating system's natural language setting.
Notes: Example value: "de"

95.1.32 IEPrintMBS as boolean

MBS Win Plugin, Plugin Version: 9.5, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEWindowMBS class instead. **Function:** Opens the normal print dialog for the Internet Explorer.

Notes: Returns false on failure.
Blog Entries

- MBS REALbasic plug-ins version 9.5

95.1.33 IEPrintPreviewMBS as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Commands Internet Explorer to show the print preview dialog for this htmlviewer.
Example:

call HTMLViewer1.IEPrintPreviewMBS

Notes: Returns true on success. Returns false if function is not supported.
The function returns directly while the preview dialog is still running.
Blog Entries

- MBS Real Studio Plugins, version 12.1pr6

95.1.34 IEProtocolMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Sets or retrieves the protocol portion of a URL.
Notes: Example value: "HTTP (HyperText Transfer-Protokoll)"

95.1.35 IEReadyStateMBS as string

MBS Win Plugin, Plugin Version: 12.2, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Retrieves a value that indicates the current state of the htmlviewer.
Notes: uninitialized: Object is not initialized with data.
loading: Object is loading its data.
loaded: Object has finished loading its data.
interactive: User can interact with the object even though it is not fully loaded.
complete: Object is completely initialized.

An object's state is initially set to uninitialized, and then to loading. When data loading is complete, the state of the link object passes through the loaded and interactive states to reach the complete state.

The states through which an object passes are determined by that object; an object can skip certain states (for example, interactive) if the state does not apply to that object.

Data source objects and databound elements are normally populated asynchronously, and certain programmatic operations can only be performed reliably on databound objects when they are ready for use. Therefore, the appropriate code should be written to confirm the readyState of objects prior to performing certain operations on them. For example, walking the rows of a table should not be attempted until after the table has reached the complete state.

The readyState property enables the status of an object to be tested. The correct place to test the readyState property is in the event handler for onreadystatechange. Similarly, a data source object (DSO) fires the ondatasetcomplete event to notify the document that the dataset is ready for programmatic operation.

95.1.36 IERefCountMBS as Integer

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Queries the reference count of the IE browser object.
Notes: Useful to check if references are leaked.

95.1.37 IEReferrerMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Gets the URL of the location that referred the user to the current page.
Notes: Example value: "http://www.apple.com/"

95.1.38 IEReloadMBS(Force as boolean = false) as boolean

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Reloads the current page.
Notes: Boolean that specifies one of the following possible values:
False: Default. Reloads the document from the cache.

True: Reloads the document from the server.
Blog Entries

- MBS Real Studio Plugins, version 12.0pr5

95.1.39 IERunJavaScriptMBS(JavaScript as string) as boolean

MBS Win Plugin, Plugin Version: 8.0, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEWindowMBS class instead. **Function:** Runs a given javascript code.
Example:

```
// This example needs a window with HTMLViewer1.
// shows current user agent string which the control sends to website
call HTMLViewer1.IERunJavaScriptMBS("document.title=navigator.userAgent;")
MessageBox HTMLViewer1.IETitleMBS

// load a dummy page:
HTMLViewer1.LoadPage "<html><head></head><body></body></html>", nil

// shows an error message because of the navigator having a 6 inside:
call HTMLViewer1.IERunJavaScriptMBS("document.title=navig6ator.userAgent;")

// uses try to avoid error message

Var script as string = "document.title=navig6ator.userAgent;"
Var s as string = "try { "+SCRIPT+" } catch(err) { document.title = err.description; } "

call HTMLViewer1.IERunJavaScriptMBS(s)
MessageBox HTMLViewer1.IETitleMBS // shows "navig6ator is undefined"
```

Notes: Returns true if the javascript code was sent to the browser.
Returns false on any error.

The IE API does not allow to return values from Javascript. So you need to store your result in window.title and access it later using IETitleMBS.

IERunJavaScriptMBS fails if the htmlviewer is empty. You can load a dummy page like above.

You can use JavaScriptEngineMBS class to execute JavaScript without HTMLViewer in our own cross platform JavaScript engine.

See IEDocumentMBS.Eval for newer version which can return result.

95.1.42 IESecurityMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Retrieves the security state.
Notes: Example value: "F√ºr diesen Dokumententyp gibt es kein Sicherheitszertifikat."

95.1.43 IESetTextAreaMBS(FormName as String, FieldName as String, Value as String) as Boolean

MBS Win Plugin, Plugin Version: 16.3, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Sets text for a textarea.
Notes: FormName can be "" to look for any field with given name.
Raises exception if field is not found.
Returns true if text is set or false on failure.
Blog Entries

- HTMLViewer JavaScript communication for Xojo
- HTMLViewer JavaScript communication for Xojo

95.1.44 IEStopMBS as boolean

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop only.

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Returns a copy of the text of the current webpage.
Example:

MessageBox HTMLViewer1.IETextMBS

Notes: Asks Internet Explorer for a selection of the whole document and asks selection about the text content.
Returns "" on any error.
Blog Entries

- MBS Xojo Plugins, version 20.2pr3

95.1.46 IEToStringMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Retrieves a string representation of the object.
Notes: Example value: " [object] "

95.1.47 IEWebBrowserMBS as IEWebBrowserMBS

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Queries web browser object for this HTMLViewer.
Notes: For browser based on Internet Explorer on Windows.
Raises exception on failure.

Not available for DesktopHTMLViewer control since there is no support for Internet Explorer for that control.

95.1.48 IEWindowMBS as IEWindowMBS

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Queries web window object for this HTMLViewer.
Notes: For browser based on Internet Explorer on Windows.
Raises exception on failure.

Not available for DesktopHTMLViewer control since there is no support for Internet Explorer for that control.

95.1.49 IEZoomMBS(factor as Integer) as boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEWebBrowserMBS class instead. **Function:** Zooms the web content.
Notes: Factor can be 50 for 50%.
Returns true on success.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr1

95.1.50 LinuxWebViewMBS as LinuxWebViewMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Queries the Linux WebKit web view for the given htmlviewer.
Notes: Requires a recent Xojo version. And libwekit-1.0 must be installed, so Xojo uses it for browsing.
Check Also the Available shared method on LinuxWebViewMBS class.

95.1.51 WebView2BrowserMBS as WebView2BrowserMBS

MBS WinFrameworks Plugin, Plugin Version: 26.3, Platform: Windows, Targets: Desktop only.

Function: Queries the browser object for the given HTMLViewer.
Example:

```
// This example needs a window with HTMLViewer1.
Var b As WebView2BrowserMBS = HTMLViewer1.WebView2BrowserMBS
```

Notes: Only for Xojo 2026r2 or newer when using WebView2 for HTMLViewer without WinUI.

95.1.52 WKWebViewMBS as WKWebViewMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: Desktop only.

Function: Queries WKWebViewMBS associated to HTMLViewer.
Notes: Returns WKWebView for Xojo when used in HTMLViewer.

95.1.53 Properties

95.1.54 IECharSetMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Sets or retrieves the character set used to encode the object.
Notes: Example value: "utf-8"
(Read and Write computed property)

95.1.55 IECookieMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Sets or gets the string value of a cookie.
Notes: Example value: "s_vi= [CS] v1 | 427CA13500002D10-A000B5B00000001 [CE] ; s_cc=true; s_nr=1196708888562; s_sq=%5B%5BB%5D%5D"
(Read and Write computed property)

95.1.56 IEDefaultCharsetMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Gets the default character set from the current regional language settings.
Notes: Example value: "windows-1252"
(Read and Write computed property)

95.1.57 IEDomainMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Sets or gets the security domain of the document.
Notes: Example value: "www.apple.com"
(Read and Write computed property)

95.1.58 IEEditableMBS as boolean

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Makes the htmlviewer editable on Windows.
Notes: (Read and Write computed property)

95.1.59 IETitleMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Sets or gets the title of the document.
Notes: Example value: "Apple"

(Read and Write computed property)

95.1.60 IEURLMBS as string

MBS Win Plugin, Plugin Version: 7.8, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use methods in IEDocumentMBS class instead. **Function:** Sets or gets the URL for the current document.
Notes: Example value: "http://www.apple.com/"
(Read and Write computed property)

95.2 class LinuxJavaScriptContextMBS

95.2.1 class LinuxJavaScriptContextMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The class for a javascript context.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

95.2.2 Methods

95.2.3 CheckScriptSyntax(script as string, sourceURL as string = """, StartLineNumber as Integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Checks for syntax errors in a string of JavaScript.
Notes: script: A string containing the script to check for syntax errors.
sourceURL: A string containing a URL for the script's source file. This is only used when reporting exceptions. Pass "" if you do not care to include source file information in exceptions.
startingLineNumber: An integer value specifying the script's starting line number in the file located at sourceURL. This is only used when reporting exceptions.
exception: A string in which to store a syntax error exception, if any.
Returns true if the script is syntactically correct, otherwise false.
See also:

- 95.2.4 CheckScriptSyntax(script as string, sourceURL as string, StartLineNumber as Integer, byref JSException as string) as boolean 15249

95.2.4 CheckScriptSyntax(script as string, sourceURL as string, StartLineNumber as Integer, byref JSException as string) as boolean

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Checks for syntax errors in a string of JavaScript.
Notes: script: A string containing the script to check for syntax errors.
sourceURL: A string containing a URL for the script's source file. This is only used when reporting exceptions. Pass "" if you do not care to include source file information in exceptions.
startingLineNumber: An integer value specifying the script's starting line number in the file located at sourceURL. This is only used when reporting exceptions.

exception: A string in which to store a syntax error exception, if any.
Returns true if the script is syntactically correct, otherwise false.
See also:

- 95.2.3 CheckScriptSyntax(script as string, sourceURL as string = """, StartLineNumber as Integer = 0) as boolean 15249

95.2.5 Constructor

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The private constructor.

95.2.6 Destructor

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The destructor.

95.2.7 EvaluateScript(script as string, sourceURL as string = """, StartLineNumber as Integer = 0) as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Evaluates a string of JavaScript.
Notes: script A string containing the script to evaluate.
sourceURL: A string containing a URL for the script's source file. This is only used when reporting exceptions. Pass "" if you do not care to include source file information in exceptions.
startingLineNumber: An integer value specifying the script's starting line number in the file located at sourceURL. This is only used when reporting exceptions.
exception A string in which to store an exception, if any.
Returns the value as string that results from evaluating script, or "" if an exception is thrown.

You can use JavaScriptEngineMBS class to execute JavaScript without HTMLViewer in our own cross platform JavaScript engine.
See also:

- 95.2.8 EvaluateScript(script as string, sourceURL as string, StartLineNumber as Integer, byref JSException as string) as string 15251

95.2.8 EvaluateScript(script as string, sourceURL as string, StartLineNumber as Integer, byref JSException as string) as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Evaluates a string of JavaScript.
Notes: script A string containing the script to evaluate.
sourceURL: A string containing a URL for the script's source file. This is only used when reporting exceptions. Pass "" if you do not care to include source file information in exceptions.
startingLineNumber: An integer value specifying the script's starting line number in the file located at sourceURL. This is only used when reporting exceptions.
exception A string in which to store an exception, if any.
Returns the value as string that results from evaluating script, or "" if an exception is thrown.

You can use JavaScriptEngineMBS class to execute JavaScript without HTMLViewer in our own cross platform JavaScript engine.
See also:

- 95.2.7 EvaluateScript(script as string, sourceURL as string = "", StartLineNumber as Integer = 0) as string 15250

95.2.9 GarbageCollect

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Performs a JavaScript garbage collection.
Notes: You should not need to call this.

95.2.10 Properties

95.2.11 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

95.2.12 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The reference to the parent HTMLViewer.
Notes: (Read and Write property)

95.3 class LinuxWebBackForwardListMBS

95.3.1 class LinuxWebBackForwardListMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The history of a WebView.

95.3.2 Methods

95.3.3 AddItem(item as LinuxWebHistoryItemMBS)

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Adds the item to the WebBackForwardList.

95.3.4 BackItem as LinuxWebHistoryItemMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns the item that precedes the current item.

95.3.5 BackLength as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns the number of items that preced the current item.

95.3.6 Clear

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Clears the webBackForwardList by removing all its elements.
Notes: Note that not even the current page is kept in list when cleared so you would have to add it later. This method also clears the list of visited links which means that all links will appear unvisited.

95.3.7 Constructor(webview as LinuxWebViewMBS)

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Creates an instance of the back forward list with a controlling WebView.

95.3.8 ContainsItem(item as LinuxWebHistoryItemMBS) as boolean

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Checks if item is in the back forward list.

95.3.9 CurrentItem as LinuxWebHistoryItemMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The current item.
Notes: Returns a nil value if the back forward list is empty.

95.3.10 Destructor

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The destructor.

95.3.11 ForwardItem as LinuxWebHistoryItemMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The next item forward in the list.
Notes: Returns a nil value if there nothing that succeeds the current item.

95.3.12 ForwardLength as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns the number of items that succeed the current item.

95.3.13 GoBack

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Steps backward in the back forward list

95.3.14 GoForward

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Steps forward in the back forward list.

95.3.15 GoToItem(item as LinuxWebHistoryItemMBS)

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Go to the specified item in the back forward list.

95.3.16 Item(index as Integer) as LinuxWebHistoryItemMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns the item at a given index relative to the current item.

95.3.17 Properties

95.3.18 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

95.3.19 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The parent htmlviewer.
Notes: (Read and Write property)

95.3.20 Limit as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The maximum limit of the back forward list.
Notes: (Read and Write computed property)

95.4 class LinuxWebCookieMBS

95.4.1 class LinuxWebCookieMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The class for a cookie used with WebKit on Linux.
Example:

```
Var c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", "", LinuxWebCookieMBS.kMaxAgeWeek)
MessageBox c.Expires.ShortDate+" "+c.Expires.ShortTime
```

Notes: LinuxWebCookieMBS implements HTTP cookies, primarily as described by the original Netscape cookie specification, but with slight modifications based on RFC 2109, Microsoft's HttpOnly extension attribute, and observed real-world usage (and, in particular, based on what Firefox does).

An HTTP cookie.

name and value will be set for all cookies. If the cookie is generated from a string that appears to have no name, then name will be the empty string.

domain and path give the host or domain, and path within that host/domain, to restrict this cookie to. If domain starts with ".", that indicates a domain (which matches the string after the ".", or any hostname that has domain as a suffix). Otherwise, it is a hostname and must match exactly.

expires will be non-nil if the cookie uses either the original "expires" attribute, or the "max-age" attribute specified in RFC 2109. If expires is nil, it indicates that neither "expires" nor "max-age" was specified, and the cookie expires at the end of the session.

If http_only is set, the cookie should not be exposed to untrusted code (eg, javascript), so as to minimize the danger posed by cross-site scripting attacks.
Blog Entries

- Cookies in HTMLViewer

95.4.2 Methods

95.4.3 Constructor(name as string, value as string, domain as string, path as string, maxAge as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Creates a new cookie with the given attributes.
Example:

```
Var c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", "", LinuxWebCookieMBS.kMaxAge-
Week)
MessageBox str(c.Name)
```

Notes: Use Secure and HTTPOnly properties if you need to set those attributes on the returned cookie.

maxAge is used to set the "expires" attribute on the cookie; pass -1 to not include the attribute (indicating that the cookie expires with the current session), 0 for an already-expired cookie, or a lifetime in seconds. You can use the constants kMaxAgeHour, kMaxAgeDay, kMaxAgeWeek and kMaxAgeYear (or multiples thereof) to calculate this value. (If you really care about setting the exact time that the cookie will expire, use Expire property.)

name: cookie name
value: cookie value
domain: cookie domain or hostname
path: cookie path, or ""
maxage: max age of the cookie, or -1 for a session cookie

95.4.4 Copy as LinuxWebCookieMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Creates a copy.
Notes: If you want to edit an existing cookie, please make a copy first.

95.4.5 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The destructor.

95.4.6 Equal(other as LinuxWebCookieMBS) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Compares two cookies.
Notes: Returns true if they are equal.

95.4.7 SetMaxAge(value as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Sets cookie's max age to value.
Example:

```
Var c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", "", LinuxWebCookieMBS.kMaxAge-
Hour)
c.SetMaxAge(c.kMaxAgeWeek)
MessageBox c.ToSetCookieHeader
```

Notes: If max_age is -1, the cookie is a session cookie, and will expire at the end of the client's session. Otherwise, it is the number of seconds until the cookie expires. You can use the constants kMaxAgeHour, kMaxAgeDay, kMaxAgeWeek and kMaxAgeYear (or multiples thereof) to calculate this value. (A value of 0 indicates that the cookie should be considered already-expired.)

(This sets the same property as Expire.)

95.4.8 ToCookieHeader as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Serializes cookie in the format used by the Cookie header (ie, for returning a cookie from to a server).
Example:

```
Var c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", "", LinuxWebCookieMBS.kMaxAge-
Week)
MessageBox c.ToCookieHeader
```

95.4.9 ToSetCookieHeader as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Serializes cookie in the format used by the Set-Cookie header (ie, for sending a cookie from to a client).
Example:

```
Var c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", "", LinuxWebCookieMBS.kMaxAge-
Week)
MessageBox c.ToSetCookieHeader
```

95.4.10 Properties

95.4.11 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

95.4.12 Owner as Variant

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The owner of this object.
Notes: (Read and Write property)

95.4.13 Domain as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The domain text.
Example:

```
Var c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", "", LinuxWebCookieMBS.kMaxAgeWeek)
MessageBox str(c.Domain)
```

Notes: (Read and Write computed property)

95.4.14 Expires as date

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The expiration time.
Example:

```
Var c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", "", LinuxWebCookieMBS.kMaxAgeWeek)
MessageBox c.Expires.ShortDate+" "+c.Expires.ShortTime
```

Notes: If expires is nil, cookie will be a session cookie and will expire at the end of the client's session.
(Read and Write computed property)

95.4.15 ExpiresDateTime as DateTime

MBS Linux Plugin, Plugin Version: 20.5, Platform: Linux, Targets: Desktop only.

Function: The expiration time.
Notes: (Read and Write computed property)

95.4.16 HTTPOnly as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The httponly attribute.
Notes: If true, cookie will be marked as "http only", meaning it should not be exposed to web page scripts or other untrusted code.
(Read and Write computed property)

95.4.17 Name as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The name of the cookie.
Example:

```
Var c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", "", LinuxWebCookieMBS.kMaxAge-
Week)
MessageBox str(c.Name)
```

Notes: (Read and Write computed property)

95.4.18 Path as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The path of the cookie.
Example:

```
Var c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", "test", LinuxWebCookieMBS.kMax-
AgeWeek)
MessageBox str(c.Path)
```

Notes: (Read and Write computed property)

95.4.19 Secure as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The secure attribute.
Example:

```
Var c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", "", LinuxWebCookieMBS.kMaxAge-
Week)
MessageBox str(c.Secure)
c.Secure = true
MessageBox str(c.Secure)
```

Notes: Cookie will only be transmitted from the client to the server over secure (https) connections if secure is true.
(Read and Write computed property)

95.4.20 Value as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The value of the cookie.
Example:

```
Var c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", "", LinuxWebCookieMBS.kMaxAge-
Week)
MessageBox str(c.Value)
```

Notes: (Read and Write computed property)

95.4.21 Constants

Constants

Constant	Value	Description
kMaxAgeDay	86400	A constant for one day in seconds.
kMaxAgeHour	3600	A constant for one hour in seconds.
kMaxAgeWeek	604800	A constant for one week in seconds.
kMaxAgeYear	31556926	A constant for one year in seconds.

95.5 class LinuxWebCookieStoreMBS

95.5.1 class LinuxWebCookieStoreMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The store for cookies.
Example:

```
Var store as LinuxWebCookieStoreMBS = LinuxWebCookieStoreMBS.CookieStore
Var cookies() as LinuxWebCookieMBS = store.AllCookies
MessageBox str(cookies.Count)+" cookies"
```

Blog Entries

- Cookies in HTMLViewer

95.5.2 Methods

95.5.3 AddCookie(cookie as LinuxWebCookieMBS)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Adds cookie to store.

95.5.4 AllCookies as LinuxWebCookieMBS()

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Returns an array with all cookies.
Example:

```
// show all cookies
Var store as LinuxWebCookieStoreMBS = LinuxWebCookieStoreMBS.CookieStore
Var cookies(-1) as LinuxWebCookieMBS = store.AllCookies
Var lines() as string

for each c as LinuxWebCookieMBS in cookies
lines.Add c.ToSetCookieHeader
next

MessageBox Join(lines,EndOfLine)
```

95.5.5 Available as Boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Returns true if the plugin found all functions for the web cookie store.

95.5.6 Constructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Creates a new cookie store.
Notes: The base LinuxWebCookieStoreMBS class does not support persistent storage of cookies; use a subclass for that.

95.5.7 CookieStore as LinuxWebCookieStoreMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Queries the default cookie store.
Example:

```
Var w as LinuxWebCookieStoreMBS = LinuxWebCookieStoreMBS.CookieStore

MessageBox "AcceptPolicy: "+str(w.AcceptPolicy)
w.AcceptPolicy = w.kAcceptNoThirdParty
MessageBox "AcceptPolicy: "+str(w.AcceptPolicy)
```

95.5.8 DeleteAllCookies

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Deletes all cookies.
Example:

```
Var w as LinuxWebCookieStoreMBS = LinuxWebCookieStoreMBS.CookieStore
w.DeleteAllCookies
```

95.5.9 DeleteCookie(cookie as LinuxWebCookieMBS)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Deletes cookie.

95.5.10 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The destructor.

95.5.11 SetCookieStore(newStore as LinuxWebCookieStoreMBS)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Makes the given cookie store the default one.

95.5.12 Properties

95.5.13 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

95.5.14 Owner as Variant

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The owner of this object.
Notes: (Read and Write property)

95.5.15 AcceptPolicy as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Get/set the policy for accepting cookies.
Example:

```
Var w as LinuxWebCookieStoreMBS = LinuxWebCookieStoreMBS.CookieStore

MessageBox "AcceptPolicy: "+str(w.AcceptPolicy)
```

```
w.AcceptPolicy = w.kAcceptNoThirdParty
MessageBox "AcceptPolicy: "+str(w.AcceptPolicy)
```

Notes: (Read and Write computed property)

95.5.16 Constants

Cookie Accept Modes

Constant	Value	Description
kAcceptAlways	0	Accept all cookies unconditionally.
kAcceptNever	1	Reject all cookies unconditionally.
kAcceptNoThirdParty	2	No Third party cookies. Accept all cookies set by the main document loaded in the application using libsoup. An example of the most common case, web browsers, would be: If http://www.example.com is the page loaded, accept all cookies set by example.com, but if a resource from http://www.third-party.com is loaded from that page reject any cookie that it could try to set. For libsoup to be able to tell apart first party cookies from the rest, the application must call soup_message_set_first_party() on each outgoing SoupMessage, setting the SoupURI of the main document. If no first party is set in a message when this policy is in effect, cookies will be assumed to be third party by default. (this is done by webkit)

95.6 class LinuxWebDataSourceMBS

95.6.1 class LinuxWebDataSourceMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Data source encapsulates the content of a WebFrame.
Notes: A WebFrame has a main resource and subresources and the data source provides access to these resources. When a request gets loaded initially, it is set to a provisional state. The application can request for the request that initiated the load by asking for the provisional data source and invoking the InitialRequest method of DataSource. This data source may not have enough data and some methods may return empty values. To get a "full" data source with the data and resources loaded, you need to get the non-provisional data source through WebFrame's DataSource method. This data source will have the data after everything was loaded. Make sure that the data source was finished loading before using any of its methods. You can do this via IsLoading.

95.6.2 Methods

95.6.3 Constructor

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Creates a new WebKitWebDataSource instance.
Notes: The URL of the WebKitWebDataSource will be set to "about:blank".
See also:

- 95.6.4 Constructor(request as LinuxWebNetworkRequestMBS) 15267

95.6.4 Constructor(request as LinuxWebNetworkRequestMBS)

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Creates a new data source with the given network request.
See also:

- 95.6.3 Constructor 15267

95.6.5 Data as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns the raw data that represents the frame's content.
Notes: The data will be incomplete until the data has finished loading. Returns "" if the web frame hasn't loaded any data. Use isLoading to test if data source is in the process of loading.

95.6.6 Destructor

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The destructor.

95.6.7 Encoding as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns the text encoding name as set in the WebView, or if not, the text encoding of the response.

95.6.8 InitialRequest as LinuxWebNetworkRequestMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns a reference to the original request that was used to load the web content.
Notes: The NetworkRequest returned by this method is the request prior to the "committed" load state. See Request for getting the "committed" request.

95.6.9 IsLoading as boolean

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Determines whether the data source is in the process of loading its content.
Notes: Returns true if loading or false if not.

95.6.10 MainResource as LinuxWebResourceMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns the main resource of the data source.

95.6.11 Request as LinuxWebNetworkRequestMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns a NetworkRequest that was used to create this DataSource.
Notes: The NetworkRequest returned by this method is the request that was "committed", and hence,

different from the request you get from the InitialRequest method.

95.6.12 Subresources as LinuxWebResourceMBS()

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Gives you a list of WebKitWebResource objects that compose the WebView to which this DataSource is attached.

95.6.13 UnrechableURI as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Return the unreachable URI of data_source.
Notes: The data source will have an unreachable URL if it was created using WebFrame's LoadAlternateHtmlString method.

95.6.14 WebFrame as LinuxWebFrameMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns the WebFrame that represents this data source.
Notes: The WebFrame is owned by WebKit and should not be freed or destroyed.
This will return nil if the data_source is not attached to a frame.

95.6.15 Properties

95.6.16 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

95.6.17 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The parent HTMLViewer.
Notes: (Read and Write property)

95.7 class LinuxWebFrameMBS

95.7.1 class LinuxWebFrameMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The class for a WebKit WebFrame on Linux.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MonkeyBread Software Releases the MBS Real Studio plug-ins in version 12.4
- MBS Real Studio Plugins, version 12.4pr3
- Linux WebKit Support for Real Studio's HTMLViewer control

95.7.2 Methods

95.7.3 Constructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The private constructor.

95.7.4 DataSource as LinuxWebDataSourceMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns the committed data source.

95.7.5 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The destructor.

95.7.6 FindFrame(name as string) as LinuxWebFrameMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Searches a frame by name.
Notes: For pre-defined names, returns frame if name is "_self" or "_current", returns frame's parent frame

if name is "_parent", and returns the main frame if name is "_top". Also returns frame if it is the main frame and name is either "_parent" or "_top". For other names, this function returns the first frame that matches name. This function searches frame and its descendents first, then frame's parent and its children moving up the hierarchy until a match is found. If no match is found in frame's hierarchy, this function will search for a matching frame in other main frame hierarchies. Returns nil if no match is found.

name: the name of the frame to be found
Returns the found WebKitWebFrame or nil in case none is found.

95.7.7 JSContext as LinuxJavaScriptContextMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Queries the javascript context for this webframe.

95.7.8 LoadAlternateString(content as string, BaseURL as string, unreachableURL as string)

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Request loading of an alternate content for a URL that is unreachable.
Notes: Using this method will preserve the back-forward list. The URI passed in base url has to be an absolute URI.

95.7.9 LoadRequest(request as LinuxWebNetworkRequestMBS)

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Connects to a given URI by initiating an asynchronous client request.
Notes: Creates a provisional data source that will transition to a committed data source once any data has been received. Use StopLoading to stop the load. This function is typically invoked on the main frame.

95.7.10 LoadStatus as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Returns the current load state.

95.7.11 LoadString(content as string, MimeType as String, Encoding as String, BaseURL as string)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Requests loading of the given content with the specified MimeType, encoding and BaseURL.
Notes: If mime_type is "", "text/html" is assumed.
If encoding is "", "UTF-8" is assumed.

Content: an URI string
MimeType: the MIME type, or "".
Encoding: the encoding, or "".
BaseURL: the base URI for relative locations.
See also FileExtensionToMimeTypeMBS function.

95.7.12 LoadURL(URL as string)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Requests loading of the specified URI string.

95.7.13 Name as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Returns the frame's name

95.7.14 NetworkResponse as LinuxWebNetworkResponseMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns the network response.
Notes: Returns a NetworkResponse object representing the response that was given to the request for the given frame, or nil if the frame was not created by a load. You must unref the object when you are done with it.

95.7.15 Parent as LinuxWebFrameMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Returns the frame's parent frame, or nil if it has none.

95.7.16 Print

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Asks the control to print it's content.

95.7.17 ProvisionalDataSource as LinuxWebDataSourceMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: You use the LoadRequest method to initiate a request that creates a provisional data source.
Notes: The provisional data source will transition to a committed data source once any data has been received. Use DataSource to get the committed data source.

Returns the provisional WebDataSource or nil if a load request is not in progress.

95.7.18 Reload

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Reloads the initial request.

95.7.19 StopLoading

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Stops any pending loads on frame's data source, and those of its children.

95.7.20 Title as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Returns the frame's document title

95.7.21 URL as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Returns the current URI of the contents displayed by the frame.

95.7.22 Properties

95.7.23 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

95.7.24 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The parent HTMLViewer.
Notes: (Read and Write property)

95.7.25 WebView as LinuxWebViewMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The reference to the parent webview.
Notes: (Read and Write property)

95.7.26 Constants

Load State Constants

Constant	Value	Description
kLoadCommitted	1	The first data chunk has arrived, meaning that the necessary transport req ments are stabilished, and the load is being performed.
kLoadFailed	4	This state means that some error occurred during the page load that preve it from being completed. You can connect to the error event if you war know precisely what kind of error occurred.
kLoadFinished	2	This state means that everything that was required to display the page been loaded.
kLoadFirstVisuallyNonEmptyLayout	3	The first layout with actual visible content happened; one or more layouts have happened before that caused nothing to be visible on the screen, bec the data available at the time was not significant enough.
kLoadProvisional	0	No data has been received yet, empty structures have been allocated to perf the load; the load may still fail for transport issues such as not being ab resolve a name, or connect to a port.

95.8 class LinuxWebHistoryItemMBS

95.8.1 class LinuxWebHistoryItemMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: One item of the WebBackForwardList and or global history.
Notes: A history item consists out of a title and a uri. It can be part of the WebBackForwardList and the global history. The global history is used for coloring the links of visited sites. WebHistoryItem's constructed with Constructor() are automatically added to the global history.

95.8.2 Methods

95.8.3 Constructor

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Creates a new WebHistoryItem instance.
See also:

- 95.8.4 Constructor(URI as string, Title as string) 15277

95.8.4 Constructor(URI as string, Title as string)

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Creates a new WebHistoryItem with the given URI and title.
See also:

- 95.8.3 Constructor 15277

95.8.5 Copy as LinuxWebHistoryItemMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Makes a copy of the item for use with other WebView objects.

95.8.6 Destructor

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The destructor.

95.8.7 LastVisitedTime as Double

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The last visited timestamp.

95.8.8 OriginalURI as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The original URL of this item.

95.8.9 Title as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The title of this item.

95.8.10 URI as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The URL of this item.

95.8.11 Properties

95.8.12 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

95.8.13 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The parent htmlviewer.
Notes: (Read and Write property)

95.8.14 AlternateTitle as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The alternate title.
Notes: (Read and Write computed property)

95.9 class LinuxWebInspectorMBS

95.9.1 class LinuxWebInspectorMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The WebKit Inspector is a graphical tool to inspect and change the content of a WebKitWebView.
Notes: It also includes an interactive JavaScriptDebugger. Using this class one can get a GtkWidget which can be embedded into an application to show the inspector.

The inspector is available when the WebKitWebSettings of the WebKitWebView has set the "enable-developer-extras" to true otherwise no inspector is available.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

95.9.2 Methods

95.9.3 Close

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Causes the Web Inspector to be closed.

95.9.4 Constructor

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The private constructor.

95.9.5 Destructor

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The destructor.

95.9.6 InspectCoordinates(x as Double, y as Double)

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Causes the Web Inspector to inspect the node that is located at the given coordinates of the widget.
Notes: The coordinates should be relative to the WebKitWebView widget, not to the scrollable content, and may be obtained from a GdkEvent directly. This means x, and y being zero doesn't guarantee you will hit the left-most top corner of the content, since the contents may have been scrolled.

x: the X coordinate of the node to be inspected
y: the Y coordinate of the node to be inspected

95.9.7 InspectedURI as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Obtains the URI that is currently being inspected.

95.9.8 Show

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Causes the Web Inspector to be shown.

95.9.9 WebView as LinuxWebViewMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Obtains the WebKitWebView that is used to render the inspector.

95.9.10 Properties

95.9.11 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

95.9.12 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The reference to the parent HTMLViewer.
Notes: (Read and Write property)

95.10 class LinuxWebNetworkRequestMBS

95.10.1 class LinuxWebNetworkRequestMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: This class represents the network related aspects of a navigation request.
Notes: It is used whenever WebKit wants to provide information about a request that will be sent, or has been sent. Inside it you can find the URI of the request, and, for valid URIs, a SoupMessage object, which provides access to further information such as headers.

95.10.2 Methods

95.10.3 Constructor(url as string)

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Creates a new NetworkRequest initialized with an URI.

95.10.4 Destructor

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The destructor.

95.10.5 Properties

95.10.6 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

95.10.7 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The parent HTMLViewer.
Notes: (Read and Write property)

95.10.8 URL as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Get or set the URL for this request.
Notes: (Read and Write computed property)

95.11 class LinuxWebNetworkResponseMBS

95.11.1 class LinuxWebNetworkResponseMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: This class represents the network related aspects of a navigation response.

95.11.2 Methods

95.11.3 Constructor(url as string)

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Creates a new response object with the given URL.

95.11.4 Destructor

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The destructor.

95.11.5 Properties

95.11.6 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

95.11.7 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The parent HTMLViewer.
Notes: (Read and Write property)

95.11.8 URL as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Get or set the URL for this request.
Notes: (Read and Write computed property)

95.12 class LinuxWebResourceMBS

95.12.1 class LinuxWebResourceMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: A web resource encapsulates the data of the download as well as the URI, MIME type and frame name of the resource.

95.12.2 Methods

95.12.3 Constructor(data as string, uri as string, mimeType as string, encoding as string = ””, FrameName as string = ””)

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Creates a new WebKitWebResource.
Notes: The encoding can be ””. The FrameName argument can be used if the resource represents contents of an entire HTML frame, otherwise pass ””.
See also FileExtensionToMimeTypeMBS function.

95.12.4 Data as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns the data of the webResource.

95.12.5 Destructor

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The destructor.

95.12.6 Encoding as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns the encoding for this resource.

95.12.7 FrameName as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Queries the frame name.

95.12.8 MimeType as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The MIME Type for this resource.
Notes: See also MimeTypeToFileExtensionMBS function.

95.12.9 URL as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The URL for this resource.

95.12.10 Properties

95.12.11 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

95.12.12 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The parent HTMLViewer.
Notes: (Read and Write property)

95.13 class LinuxWebSettingsMBS

95.13.1 class LinuxWebSettingsMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: WebSettings can be applied to a WebKitWebView to control text encoding, color, font sizes, printing mode, script support, loading of images and various other things.
Notes: After creation, a WebSettings object contains default settings.

95.13.2 Methods

95.13.3 Constructor

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Creates a new WebSettings instance with default values.
Notes: It must be manually attached to a WebView.

95.13.4 Copy as LinuxWebSettingsMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Copies an existing WebSettings instance.

95.13.5 Destructor

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The destructor.

95.13.6 UserAgent as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns the User-Agent string currently used by the web view(s) associated with the web_settings.

95.13.7 Properties

95.13.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

95.13.9 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The parent htmlviewer.
Notes: (Read and Write property)

95.14 class LinuxWebViewMBS

95.14.1 class LinuxWebViewMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The class for a WebKit WebView on Linux.
Notes: With MBS Plugin 19.3 and Xojo 2018r2 and later, this plugin will try to load WebKit 2.0 (libwebkit2gtk-4.0.so.37) instead of WebKit 1.0 (libwebkitgtk-3.0.so).

Most functions still work for WebKit 1.x only. Let us know if you need something for WebKit 2.x.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

95.14.2 Methods

95.14.3 Available as Boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Whether the plugin found libwebkit on Linux.
Notes: Returns true on Linux if the class can work. Else it returns false.

For Xojo 2018.02 and later we try to load libwebkit2gtk-4.0.so.37 library.

95.14.4 BackForwardList as LinuxWebBackForwardListMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Obtains the BackForwardList associated with the given WebView.
Notes: The BackForwardList is owned by the WebView.

95.14.5 CanCopyClipboard as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Whether copy is possible.

95.14.6 CanCutClipboard as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Whether cut is possible.

95.14.7 CanGoBack as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Determines whether web_view has a previous history item.
Notes: Returns true if able to move back, false otherwise.

95.14.8 CanGoBackOrForward(steps as Integer) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Determines whether web_view has a history item of steps.
Notes: Negative values represent steps backward while positive values represent steps forward.
steps: the number of steps
Returns true if able to move back or forward the given number of steps, false otherwise.

95.14.9 CanGoForward as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Determines whether web_view has a next history item.
Notes: Returns true if able to move forward, false otherwise

95.14.10 CanPasteClipboard as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Whether paste is possible.

95.14.11 CanRedo as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Whether redo is possible.

95.14.12 CanShowMimeType(MimeType as string) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: This functions returns whether or not a MIME type can be displayed using this view.
Notes: MimeType: a MIME type

Return boolean indicating if the MIME type can be displayed.
See also FileExtensionToMimeTypeMBS function.

95.14.13 CanUndo as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Whether undo is possible.

95.14.14 Constructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The private constructor.

95.14.15 CookieStore as LinuxWebCookieStoreMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Queries the default cookie store.

95.14.16 CopyClipboard

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Copies the current selection inside the web_view to the clipboard.

95.14.17 CutClipboard

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Cuts the current selection inside the web_view to the clipboard.

95.14.18 DeleteSelection

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Deletes the current selection inside the web_view.

95.14.19 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The destructor.

95.14.20 Encoding as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Returns the default encoding of the WebKitWebView.

95.14.21 EvaluateScript(script as string) as string

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Evaluates a string of JavaScript.
Notes: script A string containing the script to evaluate.

Returns the value as string that results from evaluating script, or "" if an exception is thrown.

95.14.22 ExecuteScript(script as string)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Executes java script.

95.14.23 FocusedFrame as LinuxWebFrameMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Returns the frame that has focus or an active text selection.
Notes: Returns the focused frame or nil if no frame is focused

95.14.24 GoBack

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Loads the previous history item.

95.14.25 GoBackOrForward(steps as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Loads the history item that is the number of steps away from the current item.
Notes: Negative values represent steps backward while positive values represent steps forward.

95.14.26 GoForward

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Loads the next history item.

95.14.27 GoToItem(item as LinuxWebHistoryItemMBS) as boolean

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Go to the specified history item.
Notes: Returns true if loading of item is successful, false if not.

95.14.28 HasSelection as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Determines whether text was selected.
Notes: Returns true if there is selected text, false if not

95.14.29 IconURL as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Returns the favorite icon URL for the current website.

95.14.30 Inspector as LinuxWebInspectorMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Obtains the WebKitWebInspector associated with the WebKitWebView.
Notes: Every WebKitWebView object has a WebKitWebInspector object attached to it as soon as it is created, so this function will only return nil if the argument is not a valid WebKitWebView.

95.14.31 IsLoading as Boolean

MBS Linux Plugin, Plugin Version: 19.3, Platform: Linux, Targets: Desktop only.

Function: Returns true while web view is loading.
Notes: Works for WebKit 1.x and 2.x.

95.14.32 JSContext as LinuxJavaScriptContextMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Queries the javascript context for the main webframe.

95.14.33 LoadHTMLString(HTMLString as string, BaseURL as string = "")

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Loads a HTML string.

95.14.34 LoadRequest(request as LinuxWebNetworkRequestMBS)

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Requests loading of the specified asynchronous client request.
Notes: Creates a provisional data source that will transition to a committed data source once any data has been received. Use StopLoading to stop the load.

95.14.35 LoadStatus as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Returns the current load state.
Notes: Works for WebKit 1.x and 2.x.

Name	Value	Description
WEBKIT_LOAD_PROVISIONAL	0	No data has been received yet, empty structures have been allocated to perform the load; the load may still fail for transport issues such as not being able to resolve a name, or connect to a port.
WEBKIT_LOAD_COMMITTED	1	The first data chunk has arrived, meaning that the necessary transport requirements are stabilished, and the load is being performed.
WEBKIT_LOAD_FINISHED	2	This state means that everything that was required to display the page has been loaded.
WEBKIT_LOAD_FIRST_VISUALLY_NON_EMPTY_LAYOUT	3	The first layout with actual visible content happened; one or more layouts may have happened before that caused nothing to be visible on the screen, because the data available at the time was not significant enough.
WEBKIT_LOAD_FAILED	4	This state means that some error occurred during the page load that prevented it from being completed. You can connect to the #WebKitWebView::load-error signal if you want to know precisely what kind of error occurred.

95.14.36 LoadString(content as string, MimeType as String, Encoding as String, BaseURL as string)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Requests loading of the given content with the specified MimeType, encoding and BaseURL.
Notes: If mime_type is "", "text/html" is assumed.
If encoding is "", "UTF-8" is assumed.

Content: an URI string

MimeType: the MIME type, or "".
Encoding: the encoding, or "".
BaseURL: the base URI for relative locations.

See also FileExtensionToMimeTypeMBS function.

95.14.37 LoadURL(URL as string)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Requests loading of the specified URI string.

95.14.38 MainFrame as LinuxWebFrameMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Returns the main frame of the document.

95.14.39 MajorVersion as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns major version of webkit.

95.14.40 MarkTextMatches(text as string, caseSensitive as boolean = false, limit as Integer = 99) as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Attempts to highlight all occurances of string inside webview.
Notes: string: a string to look for
case_sensitive: whether to respect the case of text
limit: the maximum number of strings to look for or 0 for all
Returns the number of strings highlighted.

95.14.41 MicroVersion as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns micro version of webkit.

95.14.42 MinorVersion as Integer

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Returns minor version of webkit.

95.14.43 PasteClipboard

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Pastes the current contents of the clipboard to the webview.

95.14.44 Progress as Double

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The global locating progress in percent.
Notes: 1.0 is full progress.

95.14.45 Redo

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Redos last action if possible.

95.14.46 Reload

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Reloads the initial request.

95.14.47 ReloadIgnoreCache

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Reloads the webview without using any cached data.

95.14.48 SearchText(text as string, caseSensitive as boolean = false, forward as boolean = true, wrap as boolean = true) as boolean

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Looks for a specified string inside webview.
Notes: text: a string to look for.
case_sensitive: whether to respect the case of text.
forward: whether to find forward or not.
wrap: whether to continue looking at the beginning after reaching the end.
Returns trueT on success or false on failure.

95.14.49 SelectAll

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Attempts to select everything inside the webview.

95.14.50 SetCookieStore(newStore as LinuxWebCookieStoreMBS)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Makes the given cookie store the default one.

95.14.51 SetHighlightTextMatches(highlight as boolean)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Highlights text matches previously marked by MarkTextMatches.

95.14.52 SetMaintainsBackForwardList(flag as boolean)

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: Set the view to maintain a back or forward list of history items.

95.14.53 StopLoading

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Stops any pending loads on frame's data source, and those of its children.

95.14.54 Title as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The title of the website.

95.14.55 Undo

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Undos last action if possible.

95.14.56 UnmarkTextMatches

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Unmarks text matches from search.

95.14.57 URL as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Returns the current URL.

95.14.58 ZoomIn

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Increases the zoom level of web_view.
Notes: The current zoom level is incremented by the value of the "zoom-step" property of the settings associated with webview.

95.14.59 ZoomOut

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Decreases the zoom level of webview.
Notes: The current zoom level is decremented by the value of the "zoom-step" property of the settings associated with webview.

95.14.60 Properties

95.14.61 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

95.14.62 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The reference to the parent HTMLViewer.
Notes: (Read and Write property)

95.14.63 CacheModel as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The cache model for the htmlviewer.
Notes: (Read and Write computed property)

95.14.64 CustomEncoding as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The current WebKitWebView encoding.
Notes: (Read and Write computed property)

95.14.65 Editable as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Whether the user is allowed to edit the document.
Notes: If flag is true, webview allows the user to edit the document. If flag is false, an element in webview's document can only be edited if the CONTENTEDITABLE attribute has been set on the element or one of its parent elements. You can change webview's document programmatically regardless of this setting. By default a WebKitWebView is not editable.

Normally, an HTML document is not editable unless the elements within the document are editable. This function provides a low-level way to make the contents of a WebKitWebView editable without altering the document or DOM structure.
(Read and Write computed property)

95.14.66 FullContentZoom as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Whether the zoom level affects only text or all elements.
Notes: False if only text should be scaled (the default), true if the full content of the view should be scaled.
(Read and Write computed property)

95.14.67 ProxyURL as String

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: The proxy URL setting.
Notes: (Read and Write computed property)

95.14.68 Settings as LinuxWebSettingsMBS

MBS Linux Plugin, Plugin Version: 13.5, Platform: Linux, Targets: Desktop only.

Function: The settings for this webview.
Notes: (Read and Write computed property)

95.14.69 Transparent as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Whether the WebKitWebView has a transparent background.
Notes: False when the WebKitWebView draws a solid background (the default), otherwise true.
(Read and Write computed property)

95.14.70 ViewSourceMode as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Whether we are viewing the source code.
Notes: (Read and Write computed property)

95.14.71 ZoomLevel as Double

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop only.

Function: Returns the zoom level of web_view, i.e. the factor by which elements in the page are scaled with respect to their original size.
Notes: If the "full-content-zoom" property is set to false (the default) the zoom level changes the text size, or if true, scales all elements in the page.
(Read and Write computed property)

95.14.72 Constants

Cache Model Constants

Constant	Value	Description
kCacheModelDocumentViewer	1	Cache in Document Viewer.
kCacheModelWebBrowser	2	Cache in Web Browser.

Load State Constants

Constant	Value	Description
kLoadCommitted	1	The first data chunk has arrived, meaning that the necessary transport req ments are stabilished, and the load is being performed.
kLoadFailed	4	This state means that some error occurred during the page load that preve it from being completed. You can connect to the error event if you war know precisely what kind of error occurred.
kLoadFinished	2	This state means that everything that was required to display the page been loaded.
kLoadFirstVisuallyNonEmptyLayout	3	The first layout with actual visible content happened; one or more layouts have happened before that caused nothing to be visible on the screen, bec the data available at the time was not significant enough.
kLoadProvisional	0	No data has been received yet, empty structures have been allocated to perf the load; the load may still fail for transport issues such as not being ab resolve a name, or connect to a port.

Chapter 96

HTMLViewer Win

96.1 class ChromiumBrowserMBS

96.1.1 class ChromiumBrowserMBS

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: The class for a WebKit browser on Windows.
Notes: Supports Xojo 2019r3 with MBS Plugin 20.1.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

96.1.2 Methods

96.1.3 AddCrossOriginWhitelist(SourceOrigin as String, TargetProtocol as String, TargetDomain as String, AllowTargetSubdomains as Boolean) as Boolean

MBS Win Plugin, Plugin Version: 21.3, Platform: Windows, Targets: Desktop only.

Function: Add an entry to the cross-origin access whitelist.
Example:

Var r as Boolean = ChromiumBrowserMBS.AddCrossOriginWhitelist("http://side1.mydomain.com", "http", "side2.mydomain.com", false)

Notes: The same-origin policy restricts how scripts hosted from different origins (scheme + domain + port) can communicate. By default, scripts can only access resources with the same origin. Scripts hosted on the HTTP and HTTPS schemes (but no other schemes) can use the "Access-Control-Allow-Origin" header to allow cross-origin requests. For example, https://source.example.com can make XMLHttpRequest requests on http://target.example.com if the http://target.example.com request returns an "Access-Control-Allow-Origin: https://source.example.com" response header.

Scripts in separate frames or iframes and hosted from the same protocol and domain suffix can execute cross-origin JavaScript if both pages set the document.domain value to the same domain suffix. For example, scheme://foo.example.com and scheme://bar.example.com can communicate using JavaScript if both domains set document.domain="example.com".
