-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateInternetFolder function.

181.1.241 InternetPlugInFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = InternetPlugInFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateInternetPlugInFolder function.

181.1.242 InternetSearchSitesFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = InternetSearchSitesFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateInternetSearchSitesFolder function.

181.1.243 InternetSitesFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = InternetSitesFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

Also take a look on the CreateInternetSitesFolder function.

181.1.244 ISSDownloadsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = ISSDownloadsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateISSDownloadsFolder function.

181.1.245 KernelExtensionsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = KernelExtensionsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!

The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateKernelExtensionsFolder function.

181.1.246 KeyboardLayoutsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Plugin Version: 10.4, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = KeyboardLayoutsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateKeyboardLayoutsFolderMBS function.

181.1.247 KeychainFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = KeychainFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateKeychainFolder function.

181.1.248 LauncherItemsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = LauncherItemsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

Also take a look on the CreateLauncherItemsFolder function.

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

181.1.249 LibraryAssistantsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Plugin Version: 10.4, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = LibraryAssistantsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

181.1.250 LocalesFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = LocalesFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateLocalesFolder function.

181.1.251 LogsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** The log files folder.
Example:

```
const kUserDomain = -32763
Var f as folderitem = LogsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

Also take a look on the CreateLogsFolderMBS function.

181.1.252 MacOSReadMesFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = MacOSReadMesFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)

181.1.258 MultiprocessingFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = MultiprocessingFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateMultiprocessingFolder function.

181.1.259 MusicDocumentsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = MusicDocumentsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

Also take a look on the CreateMusicDocumentsFolder function.

181.1.260 OpenDocEditorsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = OpenDocEditorsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateOpenDocEditorsFolder function.

181.1.261 OpenDocFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = OpenDocFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!

The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateOpenDocFolder function.

181.1.262 OpenDocLibrariesFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = OpenDocLibrariesFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateOpenDocLibrariesFolder function.

181.1.263 OpenDocShellPlugInsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = OpenDocShellPlugInsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateOpenDocShellPlugInsFolder function.

181.1.264 PictureDocumentsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = PictureDocumentsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

Also take a look on the CreatePictureDocumentsFolder function.
As there is no such folder on Mac OS Classic, you always get nil there.

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

181.1.265 PreferencePanesFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** The preferences panes folder.
Example:

```
const kUserDomain = -32763
Var f as folderitem = PreferencePanesFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreatePreferencePanesFolderMBS function.

181.1.266 PreferencesFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
Var f as folderitem

f=preferencesFolderMBS(-32763)
if f=nil then // On Windows always nil
f=applicationsupportFolderMBS(-32763)
end if

MessageBox f.NativePath

// example output:
// "Mac OS X:Users:cs:Library:Preferences:" on Mac OS X
// "Mac OS 9:Systemordner:Preferences" on a german Mac OS 9
// "C:\Dokumente und Einstellungen\Christian\Anwendungsdaten\" on a german Windows XP.
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreatePreferencesFolder function.

181.1.267 PrinterDescriptionFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = PrinterDescriptionFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

181.1.268 PrinterDriverFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = PrinterDriverFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreatePrinterDriverFolder function.

181.1.269 PrintersFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module

instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = PrintersFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreatePrintersFolder function.

181.1.270 PrintingPlugInsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = PrintingPlugInsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

Also take a look on the CreatePrintingPlugInsFolder function.

181.1.271 PrintMonitorDocsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = PrintMonitorDocsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreatePrintMonitorDocsFolder function.

181.1.272 PrivateFrameworksFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = PrivateFrameworksFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreatePrivateFrameworksFolder function.

181.1.273 PublicFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = PublicFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreatePublicFolder function.

181.1.274 QuickLookFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Plugin Version: 10.4, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = QuickLookFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateQuickLookFolderMBS function.

-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateRecentApplicationsFolder function.

181.1.278 RecentDocumentsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = RecentDocumentsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateRecentDocumentsFolder function.

181.1.279 RecentServersFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = RecentServersFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)

-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateRecentServersFolder function.

181.1.280 ScriptingAdditionsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = ScriptingAdditionsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

Also take a look on the CreateScriptingAdditionsFolder function.

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

181.1.281 ScriptsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = ScriptsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateScriptsFolder function.

181.1.282 SharedLibrariesFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module

instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = SharedLibrariesFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateSharedLibrariesFolder function.

181.1.283 SharedUserDataFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = SharedUserDataFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

Also take a look on the CreateSharedUserDataFolder function.

181.1.284 ShutdownFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = ShutdownFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateShutdownFolder function.

181.1.285 ShutdownItemsDisabledFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = ShutdownItemsDisabledFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateShutdownItemsDisabledFolder function.

181.1.286 SoundSetsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = SoundSetsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateSoundSetsFolder function.

181.1.287 SpeakableItemsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = SpeakableItemsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateSpeakableItemsFolder function.

181.1.288 SpeechFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = SpeechFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

Also take a look on the CreateSpeechFolder function.

181.1.289 SpotlightImportersFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Plugin Version: 10.4, Platform: macOS, Targets: All.

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = SpotlightImportersFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Example:

```
const kUserDomain = -32763
Var f as folderitem = SystemControlPanelFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateSystemControlPanelFolder function.

181.1.296 SystemDesktopFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = SystemDesktopFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

Also take a look on the CreateSystemDesktopFolder function.

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

181.1.297 SystemExtensionDisabledFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = SystemExtensionDisabledFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateSystemExtensionDisabledFolder function.

181.1.298 SystemFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module

instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = SystemFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateSystemFolder function.

181.1.299 SystemPreferencesFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = SystemPreferencesFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

Also take a look on the CreateSystemPreferencesFolder function.

181.1.300 SystemSoundsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = SystemSoundsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateSystemSoundsFolder function.

181.1.301 SystemTrashFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = SystemTrashFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateSystemTrashFolder function.

181.1.302 TemporaryFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = TemporaryFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateTemporaryFolder function.

181.1.303 TemporaryItemsInCacheDataFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Plugin Version: 10.4, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = TemporaryItemsInCacheDataFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateTemporaryItemsInCacheDataFolderMBS function.

181.1.305 TextEncodingsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = TextEncodingsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateTextEncodingsFolder function.

181.1.306 ThemesFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module

instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = ThemesFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateThemesFolder function.

181.1.307 TrashFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = TrashFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

Also take a look on the CreateTrashFolder function.

181.1.308 UsersFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = UsersFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateUsersFolder function.

181.1.309 UserSpecificTmpFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = UserSpecificTmpFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateUserSpecificTmpFolder function.

181.1.310 UtilitiesFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = UtilitiesFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateUtilitiesFolder function.

181.1.311 VoicesFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = VoicesFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateVoicesFolder function.

181.1.312 VolumeRootFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = VolumeRootFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

Also take a look on the CreateVolumeRootFolder function.

181.1.313 VolumeSettingsFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = VolumeSettingsFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!
The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateVolumeSettingsFolder function.

181.1.314 WhereToEmptyTrashFolderMBS(domain as Integer) as folderitem

MBS Util Plugin, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
const kUserDomain = -32763
Var f as folderitem = WhereToEmptyTrashFolderMBS(kUserDomain)
```

Notes: Note that not every folder exists on every Mac OS Version!

The codes for domain are (The Demo includes a module for these):

-32768	On System Disk
-32767	On Appropriate Disk
-32766	System Domain, on Mac OS X mostly inside the folder /System.
-32765	Local Domain (on Netbooting for example)
-32764	Network Domain (on Netbooting for example)
-32763	User Domain, on Mac OS X mostly inside the users folder.
-32762	Classic Domain, the current used Classic System folder.

Also take a look on the CreateWhereToEmptyTrashFolder function.

181.1.315 WindowsBurnAreaFolderMBS as folderitem

MBS Util Plugin, Plugin Version: 8.5, Platform: Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns the folder which Windows uses to store temporary data for burning a CD/DVD. **Notes:** Returns nil on any error.

181.1.316 WindowsFolderMBS as folderitem

MBS Util Plugin, Platform: Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
Var f as folderitem
f=WindowsFolderMBS
```

181.1.317 WindowsSystemFolderMBS as folderitem

MBS Util Plugin, Platform: Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use SpecialFolder module instead. **Function:** Returns a folderitem to this folder if it exists on that system.
Example:

```
Var f as folderitem
```

f=WindowsSystemFolderMBS

Chapter 182

Speech

182.1 class AVSpeechSynthesisMarkerMBS

182.1.1 class AVSpeechSynthesisMarkerMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: An object that contains information about the synthesized audio.
Example:

```
// create markers for synthesized speech, e.g. to highlight the spoken word
Var text As String = "Hello world, this is Xojo speaking."
Var word As AVSpeechSynthesisMarkerMBS = AVSpeechSynthesisMarkerMBS.markerWithWordRange(New NSRangeMBS(0, 5), 0)
Var bookmark As AVSpeechSynthesisMarkerMBS = AVSpeechSynthesisMarkerMBS.markerWithBookmarkName("middle", 44100)

MessageBox "Word: " + text.Middle(word.textRange.Location, word.textRange.Length) + EndOfLine + _
"Bookmark " + bookmark.bookmarkName + " at byte " + bookmark.byteSampleOffset.ToString
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

182.1.2 Methods

182.1.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

182.1.4 copy as AVSpeechSynthesisMarkerMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a copy of the object.

182.1.5 markerWithBookmarkName(mark as string, atByteSampleOffset as Integer) as AVSpeechSynthesisMarkerMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a bookmark marker with a name and offset into the audio buffer.
Example:

```
Var m As AVSpeechSynthesisMarkerMBS

m = AVSpeechSynthesisMarkerMBS.markerWithBookmarkName("test", 1234)

MessageBox m.bookmarkName+" at "+m.byteSampleOffset.ToString
```

Notes: mark: The name of the bookmark.
byteSampleOffset: The byte offset into the audio buffer.

182.1.6 markerWithMarkerType(type as integer, TextRange as NSRangeMBS, byteSampleOffset as Integer) as AVSpeechSynthesisMarkerMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a marker with a type and location of the request,Äôs text.
Example:

```
Var m As AVSpeechSynthesisMarkerMBS

Var range As New NSRangeMBS(5, 6)
m = AVSpeechSynthesisMarkerMBS.markerWithMarkerType(AVSpeechSynthesisMarkerMBS.SpeechSynthesisMarkerMarkWord, range, 1234)

MessageBox m.textRange.String+" at "+m.byteSampleOffset.ToString
```

Notes: type: The type that describes the text.

range: The location and length of the request,Äôs text.
byteSampleOffset: The byte offset into the audio buffer.

182.1.7 markerWithParagraphRange(TextRange as NSRangeMBS, byteSampleOffset as Integer) as AVSpeechSynthesisMarkerMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a paragraph marker with a range of the paragraph and offset into the audio buffer.
Example:

```
Var m As AVSpeechSynthesisMarkerMBS

Var range As New NSRangeMBS(5, 6)
m = AVSpeechSynthesisMarkerMBS.markerWithParagraphRange(range, 1234)

MessageBox m.textRange.String+" at "+m.byteSampleOffset.ToString
```

Notes: range: The location and length of the paragraph.
byteSampleOffset: The byte offset into the audio buffer.

182.1.8 markerWithPhonemeString(phoneme as string, atByteSampleOffset as Integer) as AVSpeechSynthesisMarkerMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a phoneme marker with a range of the phoneme and offset into the audio buffer.
Example:

```
Var m As AVSpeechSynthesisMarkerMBS

m = AVSpeechSynthesisMarkerMBS.markerWithPhonemeString("I", 1234)

MessageBox m.phoneme+" at "+m.byteSampleOffset.ToString
```

Notes: phoneme: A string that represents a distinct sound.
byteSampleOffset: The byte offset into the audio buffer.

182.1.9 markerWithSentenceRange(TextRange as NSRangeMBS, byteSampleOffset as Integer) as AVSpeechSynthesisMarkerMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a sentence marker with a range of the sentence and offset into the audio buffer.
Example:

```
Var m As AVSpeechSynthesisMarkerMBS

Var range As New NSRangeMBS(5, 6)
m = AVSpeechSynthesisMarkerMBS.markerWithSentenceRange(range, 1234)

MessageBox m.textRange.String+" at "+m.byteSampleOffset.ToString
```

Notes: range: The location and length of the word.
byteSampleOffset: The byte offset into the audio buffer.

182.1.10 markerWithWordRange(TextRange as NSRangeMBS, byteSampleOffset as Integer) as AVSpeechSynthesisMarkerMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a word marker with a range of the word and offset into the audio buffer.
Example:

```
Var m As AVSpeechSynthesisMarkerMBS

Var range As New NSRangeMBS(5, 6)
m = AVSpeechSynthesisMarkerMBS.markerWithWordRange(range, 1234)

MessageBox m.textRange.String+" at "+m.byteSampleOffset.ToString
```

Notes: range: The location and length of the word.
byteSampleOffset: The byte offset into the audio buffer.

182.1.11 Properties

182.1.12 bookmarkName as String

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: A string that represents the name of a bookmark.
Notes: (Read and Write property)

182.1.13 byteSampleOffset as Integer

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The byte offset into the audio buffer.
Notes: (Read and Write property)

182.1.14 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

182.1.15 mark as Integer

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The type that describes the text.
Notes: (Read and Write property)

182.1.16 phoneme as String

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: A string that represents a distinct sound.
Notes: (Read and Write property)

182.1.17 textRange as NSRangeMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The location and length of the request,Äôs text.
Notes: (Read and Write property)

182.1.18 Constants

Marker Types

Constant	Value	Description
SpeechSynthesisMarkerMarkBookmark	4	A type of text that represents a bookmark.
SpeechSynthesisMarkerMarkParagraph	3	A type of text that represents a paragraph.
SpeechSynthesisMarkerMarkPhoneme	0	A type of text that represents a phoneme.
SpeechSynthesisMarkerMarkSentence	2	A type of text that represents a sentence.
SpeechSynthesisMarkerMarkWord	1	A type of text that represents a word.

182.2 class AVSpeechSynthesisVoiceMBS

182.2.1 class AVSpeechSynthesisVoiceMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: A distinct voice for use in speech synthesis.
Example:

```
// list all installed voices for speech synthesis
Var lines() As String
For Each voice As AVSpeechSynthesisVoiceMBS In AVSpeechSynthesisVoiceMBS.speechVoices
lines.Add voice.name + " (" + voice.language + ")"
Next

MessageBox "Current language: " + AVSpeechSynthesisVoiceMBS.currentLanguageCode + EndOfLine +
EndOfLine + String.FromArray(lines, EndOfLine)
```

Notes: The primary factors that distinguish a voice in speech synthesis are language, locale, and quality. Create an instance of AVSpeechSynthesisVoice to select a voice that,Äôs appropriate for the text and the language, and set it as the value of the voice property on an AVSpeechUtterance instance. The voice may optionally reflect a local variant of the language, such as Australian or South African English.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- News from the MBS Xojo Plugins Version 24.1

Xojo Developer Magazine

- 23.6, pages 49 to 50: Let your application speak for you, Teach your applications on Windows and Mac to speak by Stefanie Juchmes-Simonis

182.2.2 Methods

182.2.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

182.2.4 SpeechUtteranceDefaultSpeechRate as Single

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The default speech rate.

182.2.5 SpeechUtteranceMaximumSpeechRate as Single

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The maximum speech rate.

182.2.6 SpeechUtteranceMinimumSpeechRate as Single

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The minimum speech rate.

182.2.7 speechVoices as AVSpeechSynthesisVoiceMBS()

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Retrieves all available voices on the device.
Example:

```
Var voices() As AVSpeechSynthesisVoiceMBS = AVSpeechSynthesisVoiceMBS.speechVoices

Var Names() As String
For Each voice As AVSpeechSynthesisVoiceMBS In voices
names.Add voice.name
Next

MessageBox Join(names, ", ")
```

Notes: Use the language property to identify each voice by its language and locale.

182.2.8 VoiceIdentifierAlex as String

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The voice that the system identifies as Alex.
Notes: The Alex voice is only available for the en-US language code.

182.2.9 voiceWithIdentifier(identifier as string) as AVSpeechSynthesisVoiceMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Retrieves a voice for the identifier you specify.
Example:

Var voice As AVSpeechSynthesisVoiceMBS = AVSpeechSynthesisVoiceMBS.voiceWithIdentifier("com.apple.voice.compact.en-GB.Daniel")

MessageBox voice.name

Notes: identifier: The unique identifier for a voice.

A voice for the specified identifier if the identifier is valid and the voice is available on the device; otherwise, nil.

182.2.10 voiceWithLanguage(languageCode as string) as AVSpeechSynthesisVoiceMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Retrieves a voice for the BCP 47 code language code you specify.
Example:

Var voice As AVSpeechSynthesisVoiceMBS = AVSpeechSynthesisVoiceMBS.voiceWithLanguage("en-GB")

MessageBox voice.name

Notes: language: A BCP 47 code that identifies the language and locale for a voice.

Returns a voice for the specified language and locale code if the code is valid; otherwise, nil.

Pass "" for languageCode to receive the default voice for the system,Äôs language and region.

182.2.11 Properties

182.2.12 audioFileSettings as Dictionary

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: A dictionary that contains audio file settings.
Notes: If you want to generate speech and save it as an audio file to share or play later, use this dictionary

to create an AVAudioFile instance and pass it as the settings parameter.
You can determine the AVAudioCommonFormat and interleaved properties of a voice from this dictionary. The format of this dictionary matches the data that SpeechSynthesizerBuffer event provides for the same voice.
(Read only property)

182.2.13 currentLanguageCode as String

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the language and locale code for the user,Äôs current locale.
Example:

MessageBox AVSpeechSynthesisVoiceMBS.currentLanguageCode

Notes: A string that contains the BCP 47 language and locale code for the user,Äôs current locale.
(Read only property)

182.2.14 gender as Integer

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The gender for a voice.
Notes: (Read only property)

182.2.15 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

182.2.16 identifier as String

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The unique identifier of a voice.
Notes: (Read only property)

182.2.17 language as String

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: A BCP 47 code that contains the voice,Äôs language and locale.
Notes: The language of a voice controls the conversion of text to spoken phonemes. For best results, ensure that the language of an utterance,Äôs text matches the voice for the utterance. The locale of a voice reflects regional variations in pronunciation or accent. For example, a voice with a language code of en-US speaks English text with a North American accent, and a language code of en-AU speaks English text with an Australian accent.
(Read only property)

182.2.18 name as String

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The name of a voice.
Notes: (Read only property)

182.2.19 quality as Integer

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The speech quality of a voice.
Notes: (Read only property)

182.2.20 voiceTraits as Integer

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The traits of a voice.
Notes: (Read only property)

182.2.21 Constants

Gender

Constant	Value	Description
SpeechSynthesisVoiceGenderFemale	2	The female voice option.
SpeechSynthesisVoiceGenderMale	1	The male voice option.
SpeechSynthesisVoiceGenderUnspecified	0	The nonspecific gender option.

Quality

Constant	Value	Description
SpeechSynthesisVoiceQualityDefault	1	A basic quality voice that,Äôs available on the device by default.
SpeechSynthesisVoiceQualityEnhanced	2	An enhanced quality voice that you must download to use.
SpeechSynthesisVoiceQualityPremium	3	A premium quality voice that you must download to use.

Voice Traits

Constant	Value	Description
SpeechSynthesisVoiceTraitIsNoveltyVoice	1	The trait that indicates a voice is a novelty voice. An example of a novelty voice is a character,Äôs voice in a game.
SpeechSynthesisVoiceTraitIsPersonalVoice	2	The trait that indicates a voice is a personal voice. A user generates and owns a personal voice.
SpeechSynthesisVoiceTraitNone	0	The trait that indicates a voice is a regular voice.

182.3 class AVSpeechSynthesizerMBS

182.3.1 class AVSpeechSynthesizerMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: An object that produces synthesized speech from text utterances and enables monitoring or controlling of ongoing speech.
Example:

```
// speak a text with an English voice
// Synthesizer is a property of the window, so it stays alive while speaking:
// Synthesizer As AVSpeechSynthesizerMBS

Var utterance As New AVSpeechUtteranceMBS("Hello from Xojo!")
utterance.voice = AVSpeechSynthesisVoiceMBS.voiceWithLanguage("en-US")
utterance.rate = 0.5
utterance.volume = 1.0

Synthesizer = New AVSpeechSynthesizerMBS
Synthesizer.speakUtterance utterance
```

Notes: To speak some text, create an AVSpeechUtteranceMBS instance that contains the text and pass it to speakUtterance on a speech synthesizer instance. You can optionally also retrieve an AVSpeechSynthesisVoiceMBS and set it on the utterance,Äôs voice property to have the speech synthesizer use that voice when speaking the utterance,Äôs text.

The speech synthesizer maintains a queue of utterances that it speaks. If the synthesizer isn,Äôt speaking, calling speakUtterance: begins speaking that utterance either immediately or after pausing for its preUtteranceDelay, if necessary. If the synthesizer is speaking, the synthesizer adds utterances to a queue and speaks them in the order it receives them.
After speech begins, you can use the synthesizer object to pause or stop speech. After pausing, you can resume the speech from its paused point or stop the speech entirely and remove all remaining utterances in the queue.
You can monitor the speech synthesizer by examining its speaking and paused properties, or by adding events.

An AVSpeechSynthesizerMBS also controls the route where the speech plays. For more information, see Directing speech output.

The system doesn,Äôt automatically retain the speech synthesizer, so you need to manually retain it until speech concludes.

- 23.6, page 51: Let your application speak for you, Teach your applications on Windows and Mac to speak by Stefanie Juchmes-Simonis

182.3.2 Methods

182.3.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The constructor.

182.3.4 continueSpeaking as Boolean

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Resumes speech from its paused point.
Notes: Returns true if speech resumes; otherwise, false.

This method only has an effect if the speech synthesizer is in a paused state.

182.3.5 Destructor

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The destructor.

182.3.6 IPANotationAttribute as String

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: A string that contains International Phonetic Alphabet (IPA) symbols the speech synthesizer uses to control pronunciation of certain words or phrases.
Notes: For example, the speech synthesizer uses an AVSpeechSynthesisIPANotationAttribute instance to control pronunciation of a proper name.

182.3.7 pauseSpeakingAtBoundary(SpeechBoundary as Integer) as Boolean

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Pauses speech at the boundary you specify.
Notes: boundary: An enumeration that describes whether to pause speech immediately or only after the synthesizer finishes speaking the current word.

Returns true if speech pauses; otherwise, false.

The boundary parameter also affects how the speech synthesizer resumes speaking text after a pause and call to continueSpeaking. If the boundary is SpeechBoundaryImmediate, speech resumes from the exact point where it pauses, even if that point occurs in the middle of speaking a word. If the boundary is SpeechBoundaryWord, speech resumes from the word that follows the last spoken word where it pauses.

182.3.8 requestPersonalVoiceAuthorization

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Prompts the user to authorize your app to use personal voices.

182.3.9 speakUtterance(utterance as AVSpeechUtteranceMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Adds the utterance you specify to the speech synthesizer,Äôs queue.
Notes: utterance: An AVSpeechUtteranceMBS instance that contains text to speak.
Discussion

Warning: Attempting to enqueue the same utterance more than once throws an exception.

182.3.10 stopSpeakingAtBoundary(SpeechBoundary as Integer) as Boolean

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Stops speech at the boundary you specify.
Notes: boundary: An enumeration that describes whether to stop speech immediately or only after the synthesizer finishes speaking the current word.

Returns true if speech stops; otherwise, false.

Unlike pausing a speech synthesizer, which can resume after a pause, stopping the synthesizer immediately cancels speech and removes all unspoken utterances from the synthesizer,Äôs queue.

182.3.11 writeUtterance(utterance as AVSpeechUtteranceMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Generates speech for the utterance and invokes the callback with the audio buffer.
Notes: utterance: The utterance for synthesizing speech.

Call this method to receive audio buffers to store or further process synthesized speech.

Calls SpeechSynthesizerBuffer and SpeechSynthesizerMarker events later.

182.3.12 Properties

182.3.13 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

182.3.14 isPaused as Boolean

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: A Boolean value that indicates whether a speech synthesizer is in a paused state.
Notes: If true, the speech synthesizer is in a paused state after beginning to speak an utterance; otherwise, false.
(Read only property)

182.3.15 isSpeaking as Boolean

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: A Boolean value that indicates whether the speech synthesizer is speaking or is in a paused state and has utterances to speak.
Notes: If true, the synthesizer is speaking or is in a paused state with utterances in its queue. If false, the synthesizer isn,Äôt speaking and it doesn,Äôt have any utterances in its queue.

(Read only property)

182.3.16 mixToTelephonyUplink as Boolean

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: iOS only.

Function: A Boolean value that specifies whether to send synthesized speech to an active call.
Notes: This property has no effect when there isn,Äôt an active call.
(Read and Write property)

182.3.17 personalVoiceAuthorizationStatus as Integer

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Your app,Äôs authorization to use personal voices.
Notes: The user can grant or deny your app,Äôs request to use personal voices when they,Äôre initially prompted, and change the authorization in the Settings app. Additionally, the framework denies the request if the device doesn,Äôt support using personal voices.
(Read only property)

182.3.18 usesApplicationAudioSession as Boolean

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: iOS only.

Function: A Boolean value that specifies whether the app manages the audio session.
Notes: If you set this value to false, the system creates a separate audio session to automatically manage speech, interruptions, and mixing and ducking the speech with other audio sources.
(Read and Write property)

182.3.19 Events

182.3.20 availableVoicesDidChange

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: An event that indicates a change in available voices for speech synthesis.
Notes: The system posts this notification when available voices for speech synthesis on the system change. For example, a new personal voice becomes available and the user authorized the app to access personal voices. Or new 3rd party voices become available through an app the user downloads.

182.3.21 didCancelSpeechUtterance(utterance as AVSpeechUtteranceMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Tells you when the synthesizer cancels speaking an utterance.
Notes: utterance: The utterance that the speech synthesizer cancels speaking.

The system only calls this method if a speech synthesizer is speaking an utterance and the system calls its stopSpeakingAtBoundary method. The system doesn,Äôt call this method if the synthesizer is in a delay between utterances when speech stops, and it doesn,Äôt call it for unspoken utterances.

182.3.22 didContinueSpeechUtterance(utterance as AVSpeechUtteranceMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Tells you when the synthesizer resumes speaking an utterance after pausing.
Notes: utterance: The utterance that the speech synthesizer resumes speaking.

The system only calls this method if a speech synthesizer pauses speaking and the system calls its pauseSpeakingAtBoundary method. The system doesn,Äôt call this method if the synthesizer pauses while in a delay between utterances.

182.3.23 didFinishSpeechUtterance(utterance as AVSpeechUtteranceMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Tells you when the synthesizer finishes speaking an utterance.
Notes: utterance: The utterance that the speech synthesizer finishes speaking.

The system ignores the final utterance,Äôs postUtteranceDelay and calls this method immediately when speech ends.

182.3.24 didPauseSpeechUtterance(utterance as AVSpeechUtteranceMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Tells you when the synthesizer pauses while speaking an utterance.
Notes: utterance: The utterance that the speech synthesizer pauses speaking.

The system only calls this method if a speech synthesizer is speaking an utterance and the system calls its pauseSpeakingAtBoundary method. The system doesn,Äôt call this method if the synthesizer is in a delay

between utterances when speech pauses.

182.3.25 didStartSpeechUtterance(utterance as AVSpeechUtteranceMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Tells you when the synthesizer begins speaking an utterance.
Notes: utterance: The utterance that the speech synthesizer starts speaking.

If the utterance,Äôs preUtteranceDelay property is greater than zero, the system calls this method after the delay completes and speech begins.

182.3.26 requestPersonalVoiceAuthorizationCompleted(status as Integer)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: A completion event that the system calls after the user responds to a request to authorize use of personal voices, which receives the authorization status as an argument.

182.3.27 SpeechSynthesizerBuffer(buffer as AVAudioBufferMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The event that receives a buffer of generated speech.

182.3.28 SpeechSynthesizerMarker(markers() as AVSpeechSynthesisMarkerMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The event that receives speech markers.

182.3.29 willSpeakMarker(marker as AVSpeechSynthesisMarkerMBS, utterance as AVSpeechUtteranceMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Tells you when the synthesizer is about to speak a marker of an utterance,Äôs text.
Notes: marker: The synthesized audio that the speech synthesizer is about to speak.

utterance: The utterance that the speech synthesizer pauses speaking.

182.3.30 willSpeakRangeOfSpeechString(characterRange as NSRangeMBS, utterance as AVSpeechUtteranceMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Tells you when the synthesizer is about to speak a portion of an utterance,Äôs text.
Notes: characterRange: The range of characters in the utterance,Äôs speechString that correspond to the unit of speech the synthesizer is about to speak.
utterance: The utterance that the speech synthesizer is about to speak.

The system calls this method once for each unit of speech in the utterance,Äôs text, which is generally a word.

Tip
Implement this method if you want to provide a user interface to visually highlight each word as the synthesizer speaks it.

182.3.31 Constants

Speech Boundaries

Constant	Value	Description
SpeechBoundaryImmediate	0	Indicates to pause or stop speech immediately.
SpeechBoundaryWord	1	Indicates to pause or stop speech after the synthesizer finishes speaking the current word.

Authorization Status

Constant	Value	Description
SpeechSynthesisPersonalVoiceAuthorizationStatusAuthorized	3	The user granted your app,Äôs request to use
SpeechSynthesisPersonalVoiceAuthorizationStatusDenied	1	The user denied your app,Äôs request to use
SpeechSynthesisPersonalVoiceAuthorizationStatusNotDetermined	0	The app hasn,Äôt requested authorization to
SpeechSynthesisPersonalVoiceAuthorizationStatusUnsupported	2	The device doesn,Äôt support personal voices

182.4 class AVSpeechUtteranceMBS

182.4.1 class AVSpeechUtteranceMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: An object that encapsulates the text for speech synthesis and parameters that affect the speech.
Example:

```
// speak a sentence slower and with a German voice
// Synthesizer is a property of the window: Synthesizer As AVSpeechSynthesizerMBS
Synthesizer = New AVSpeechSynthesizerMBS

Var utterance As New AVSpeechUtteranceMBS("Guten Tag, willkommen bei Xojo.")
utterance.voice = AVSpeechSynthesisVoiceMBS.voiceWithLanguage("de-DE")
utterance.rate = AVSpeechSynthesisVoiceMBS.SpeechUtteranceDefaultSpeechRate * 0.8
utterance.pitchMultiplier = 1.1
utterance.volume = 0.9

Synthesizer.speakUtterance utterance
```

Notes: An AVSpeechUtterance is the basic unit of speech synthesis.

To synthesize speech, create an AVSpeechUtterance instance with text you want a speech synthesizer to speak. Optionally, change the voice, pitchMultiplier, volume, rate, preUtteranceDelay, or postUtteranceDelay parameters for the utterance. Pass the utterance to an instance of AVSpeechSynthesizer to begin speech, or enqueue the utterance to speak later if the synthesizer is already speaking.

Split a body of text into multiple utterances if you want to apply different speech parameters. For example, you can emphasize a sentence by increasing the pitch and decreasing the rate of that utterance relative to others, or you can introduce pauses between sentences by putting each into an utterance with a leading or trailing delay.

Set and use the AVSpeechSynthesizerMBS events to receive notifications when the synthesizer starts or finishes speaking an utterance. Create an utterance for each meaningful unit in a body of text if you want to receive notifications as its speech progresses.

Xojo Developer Magazine

- 23.6, page 51: Let your application speak for you, Teach your applications on Windows and Mac to speak by Stefanie Juchmes-Simonis

182.4.2 Methods

182.4.3 Constructor(s as NSAttributedStringMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Creates an utterance with the attributed text string that you specify for the speech synthesizer to speak.
Notes: To speak the text, pass the utterance to an instance of AVSpeechSynthesizerMBS.
See also:

- 182.4.4 Constructor(s as string) 22338

182.4.4 Constructor(s as string)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Creates an utterance with the text string that you specify for the speech synthesizer to speak.
Example:

```
Var s As New AVSpeechUtteranceMBS("test")

MessageBox s.speechString
```

See also:

- 182.4.3 Constructor(s as NSAttributedStringMBS) 22338

182.4.5 copy as AVSpeechUtteranceMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a copy of the object.

182.4.6 speechUtteranceWithAttributedString(s as NSAttributedStringMBS) as AVSpeechUtteranceMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Creates an utterance with the attributed text string that you specify for the speech synthesizer to speak.

182.4.7 speechUtteranceWithSSMLRepresentation(s as string) as AVSpeechUtteranceMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Returns a new speech utterance with an Speech Synthesis Markup Language (SSML) string.
Notes: string: A string to speak that contains valid SSML markup. The initializer returns nil if you pass an invalid SSML string.

Returns a new speech utterance, or nil if the SSML string is invalid.

If using SSML to request voices that fall under certain attributes, the system may split a single utterance into multiple parts and send each to an appropriate synthesizer.
If no voice matches the properties, the utterance uses the voice set in its voice property. If you don,Äôt specify a voice, the system uses its default voice.

Note
Speech utterance properties that affect the prosody of a voice, such as its rate and pitchMultiplier, don,Äôt apply to an utterance that uses an SSML representation.

182.4.8 speechUtteranceWithString(s as string) as AVSpeechUtteranceMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Creates an utterance with the text string that you specify for the speech synthesizer to speak.

182.4.9 Properties

182.4.10 attributedSpeechString as NSAttributedStringMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: An attributed string that contains the text for speech synthesis.
Notes: You can,Äôt change an utterance,Äôs text after initializaiton. If you want the speech synthesizer to speak different text, create a new utterance.
(Read only property)

182.4.11 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

182.4.12 pitchMultiplier as Single

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The baseline pitch the speech synthesizer uses when speaking the utterance.
Notes: Before enqueing the utterance, set this property to a value within the range of 0.5 for lower pitch to 2.0 for higher pitch. The default value is 1.0. Setting this after enqueing the utterance has no effect.
(Read and Write property)

182.4.13 postUtteranceDelay as Double

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The amount of time the speech synthesizer pauses after speaking an utterance before handling the next utterance in the queue.
Notes: When multiple utterances exist in the queue, the speech synthesizer pauses a minimum amount of time equal to the sum of the current utterance,Äôs postUtteranceDelay and the next utterance,Äôs preUtteranceDelay.
(Read and Write property)

182.4.14 prefersAssistiveTechnologySettings as Boolean

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: A Boolean that specifies whether assistive technology settings take precedence over the property values of this utterance.
Notes: If this property is true, but no assistive technology, such as VoiceOver, is on, the speech synthesizer uses the utterance property values.
(Read and Write property)

182.4.15 preUtteranceDelay as Double

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The amount of time the speech synthesizer pauses before speaking the utterance.
Notes: When multiple utterances exist in the queue, the speech synthesizer pauses a minimum amount of time equal to the sum of the current utterance,Äôs postUtteranceDelay and the next utterance,Äôs preUtteranceDelay.

(Read and Write property)

182.4.16 rate as Single

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The rate the speech synthesizer uses when speaking the utterance.
Notes: The speech rate is a decimal representation within the range of AVSpeechUtteranceMinimumSpeechRate and AVSpeechUtteranceMaximumSpeechRate. Lower values correspond to slower speech, and higher values correspond to faster speech. The default value is AVSpeechUtteranceDefaultSpeechRate. Set this property before enqueing the utterance because setting it afterward has no effect.
(Read and Write property)

182.4.17 speechString as String

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: A string that contains the text for speech synthesis.
Notes: You can,Äôt change an utterance,Äôs text after initializaiton. If you want the speech synthesizer to speak different text, create a new utterance.
(Read only property)

182.4.18 voice as AVSpeechSynthesisVoiceMBS

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The voice the speech synthesizer uses when speaking the utterance.
Notes: If you don,Äôt specify a voice, the speech synthesizer uses the system,Äôs default voice to speak the utterance.
(Read and Write property)

182.4.19 volume as Single

MBS AVFoundation Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The volume the speech synthesizer uses when speaking the utterance.
Notes: Before enqueing the utterance, set this property to a value within the range of 0.0 for silent to 1.0 for loudest volume. The default value is 1.0. Setting this after enqueing the utterance has no effect.
(Read and Write property)

182.5 class NSSpeechRecognizerMBS

182.5.1 class NSSpeechRecognizerMBS

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class to handle the cocoa speech recognition.
Notes: Available in Mac OS X v10.3 and later.

See newer SFSpeechRecognizerMBS class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr7

182.5.2 Methods

182.5.3 commands as string()

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the current list of commands.

182.5.4 Destructor

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

182.5.5 SetCommands(commands() as string)

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the list of commands for which the receiver should listen to commands.
Notes: If the receiver is already listening, the current command list is updated and listening continues. commands should be an array of strings. The commands must be in U.S. English.

182.5.6 StartListening

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Tells the speech recognition engine to begin listening for commands.
Notes: When a command is recognized the message didRecognizeCommand is called.

182.5.7 StopListening

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Tells the speech recognition engine to suspend listening for commands.

182.5.8 Properties

182.5.9 BlocksOtherRecognizers as boolean

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the receiver should block all other recognizers (that is, other applications attempting to understand spoken commands) when listening.
Notes: (Read and Write property)

182.5.10 DisplayedCommandsTitle as string

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the title of the commands section or "" if there is no title.
Notes: Commands are displayed in the Speech Commands window indented under a section with this title. (Read and Write property)

182.5.11 ListensInForegroundOnly as boolean

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the receiver should only enable its commands when the receiver's application is the frontmost one.
Notes: (Read and Write property)

182.5.12 Events

182.5.13 DidRecognizeCommand(command as string)

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invoked when the recognition engine has recognized the application command command.
Notes: command is one of the strings from the array passed to setCommands. The delegate typically evaluates which command was recognized and performs the related action.

182.6 class NSSpeechSynthesizerMBS

182.6.1 class NSSpeechSynthesizerMBS

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class to handle the cocoa speech synthesizing.
Example:

```
// speak a text and also save it as audio file
// Speech is a property of the window, so it stays alive while speaking:
// Speech As NSSpeechSynthesizerMBS

Speech = New NSSpeechSynthesizerMBS
Speech.rate = 180 // words per minute

If Not Speech.StartSpeakingString("Hello from Xojo!") Then
MessageBox "Failed to speak."
End If

// render to a sound file with a second synthesizer
Var file As FolderItem = SpecialFolder.Desktop.Child("hello.aiff")
Var s As New NSSpeechSynthesizerMBS
Call s.StartSpeakingString("Hello from Xojo!", file)
```

Notes: Available in Mac OS X v10.3 and later.

More details on Apple's website:
https://developer.apple.com/library/mac/documentation/Cocoa/Reference/ApplicationKit/Classes/NSSpeech-Synthesizer_Class/
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.0pr9
- MBS Xojo / Real Studio Plugins, version 13.2pr7
- MBS Real Studio Plugins, version 13.1pr11

182.6.2 Methods

182.6.3 addSpeechDictionary(speechDictionary as dictionary)

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Registers the given speech dictionary with the receiver.
Notes: speechDictionary: Speech dictionary to add to the receiver's dictionaries.

See the discussion of UseSpeechDictionary in Speech Synthesis Manager Reference for more information.
Available in OS X v10.5 and later.

182.6.4 attributesForVoice(voice as String) as NSVoiceMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns information about a voice or nil.

182.6.5 availableVoice(index as Integer) as String

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns name of a voice.
Notes: The available voices can be listed using this function.
Index is from 0 to count-1.

182.6.6 availableVoices as String()

MBS MacCocoa Plugin, Plugin Version: 10.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the array with the identifiers for the available voices.
Example:

MessageBox Join(NSSpeechSynthesizerMBS.availableVoices)

Notes: Same as availableVoice() and availableVoicesCount, but this function returns an array which is very useful for for-each-loops.

182.6.7 availableVoicesCount as Integer

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Number of voices available.

182.6.8 Constructor

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes the class with the default voice.
Notes: This constructor is needed for the events to fire.
The given voice must be valid!
See also:

- 182.6.9 Constructor(voice as string) 22347

182.6.9 Constructor(voice as string)

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes the class with a voice.
Notes: This constructor is needed for the events to fire.
See also:

- 182.6.8 Constructor 22346

182.6.10 continueSpeaking

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Continues speaking after it has been paused.
Notes: Mac OS X 10.5 only.

182.6.11 defaultVoice as String

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Provides the identifier of the default voice.
Example:

```
Var s as NSSpeechSynthesizerMBS

s=new NSSpeechSynthesizerMBS

MessageBox s.defaultVoice
```

182.6.12 Destructor

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

182.6.13 isAnyApplicationSpeaking as boolean

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether any other application is currently speaking through the sound output device.

182.6.14 NSSpeechCharacterModeProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty and objectForProperty to get or set the characteristics of a synthesizer.
Example:

```
Var s as new NSSpeechSynthesizerMBS
Var e as NSErrorMBS

call s.setObjectForProperty(s.NSSpeechModeLiteral, s.NSSpeechCharacterModeProperty, e)
MessageBox s.objectForProperty(s.NSSpeechCharacterModeProperty, e)

call s.setObjectForProperty(s.NSSpeechModeNormal, s.NSSpeechCharacterModeProperty, e)
MessageBox s.objectForProperty(s.NSSpeechCharacterModeProperty, e)
```

Notes: Get or set the synthesizer's current text-processing mode. A string that specifies whether the channel is currently in text input mode or phoneme input mode.
When the character-processing mode is NSSpeechModeNormal, input characters are spoken as you would expect to hear them. When the mode is NSSpeechModeLiteral, each character is spoken literally, so that the word "cat" is spoken "C–A–T".
Available in OS X v10.5 and later.

182.6.15 NSSpeechCommandDelimiterProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty and objectForProperty to get or set the characteristics of a synthesizer.
Notes: Set the embedded speech command delimiter characters to be used for the synthesizer. A dictionary that contains the delimiter information. See "Command Delimiter Keys" for the keys you can use to specify values in this dictionary.
By default, the opening delimiter is " [[" and the closing delimiter is "]] ". Your application might need to change these delimiters temporarily if those character sequences occur naturally in a text buffer that is to be spoken. Your application can also disable embedded command processing by passing empty delimiters (as empty strings). See "Speech Command Delimiter" for the keys you can use to specify values in this dictionary.

Available in OS X v10.5 and later.

182.6.16 NSSpeechCommandPrefix as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants speech-command delimiters keys used in NSSpeechCommandDelimiter-Property.
Notes: The command delimiter string that prefixes a command, by default, this is [[.
Available in OS X v10.5 and later.

182.6.17 NSSpeechCommandSuffix as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants speech-command delimiters keys used in NSSpeechCommandDelimiter-Property.
Notes: The command delimiter string that suffixes a command,by default, this is]] .
Available in OS X v10.5 and later.

182.6.18 NSSpeechCurrentVoiceProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty and objectForProperty to get or set the characteristics of a synthesizer.
Notes: Set the current voice on the synthesizer to the specified voice. A dictionary that contains the phoneme symbols and example words defined for the current synthesizer.
Your application might use this information to show the user what symbols to use when entering phonemic text directly. See "NSSpeechPhonemeSymbolsProperty Dictionary Keys" for the keys you can use to specify values in this dictionary.
Available in OS X v10.5 and later.

182.6.19 NSSpeechDictionaryAbbreviations as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants identify key-value pairs used to add vocabulary to the dictionary using addSpeechDictionary.
Notes: An array of dictionary objects containing the keys NSSpeechDictionaryEntrySpelling and NSSpeech-DictionaryEntryPhonemes.

Available in OS X v10.5 and later.

182.6.20 NSSpeechDictionaryEntryPhonemes as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants identify key-value pairs used to add vocabulary to the dictionary using addSpeechDictionary.
Notes: The phonemic representation of an entry. A string.
Available in OS X v10.5 and later.

182.6.21 NSSpeechDictionaryEntrySpelling as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants identify key-value pairs used to add vocabulary to the dictionary using addSpeechDictionary.
Notes: The spelling of an entry. A string.
Available in OS X v10.5 and later.

182.6.22 NSSpeechDictionaryLocaleIdentifier as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants identify key-value pairs used to add vocabulary to the dictionary using addSpeechDictionary.
Notes: The canonical locale identifier string describing the dictionary's locale. A locale is generally composed of three pieces of ordered information: a language code, a region code, and a variant code. Refer to documentation about NSLocale or Locales Programming Guide for more information
Available in OS X v10.5 and later.

182.6.23 NSSpeechDictionaryModificationDate as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants identify key-value pairs used to add vocabulary to the dictionary using addSpeechDictionary.
Notes: A string representation of the dictionary's last modification date in the international format (YYYY-MM-DD HH:MM:SS ¬±HHMM). If the same word appears across multiple dictionaries, the one from the dictionary with the most recent date will be used.

Available in OS X v10.5 and later.

182.6.24 NSSpeechDictionaryPronunciations as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants identify key-value pairs used to add vocabulary to the dictionary using addSpeechDictionary.
Notes: An array of dictionary objects containing the keys NSSpeechDictionaryEntrySpelling and NSSpeechDictionaryEntryPhonemes.

182.6.25 NSSpeechErrorCount as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the key constants identify errors that may occur during speech synthesis. They are used with NSSpeechErrorsProperty.
Notes: The number of errors that have occurred in processing the current text string, since the last call to objectForProperty with the NSSpeechErrorsProperty property. A Number
Using the NSSpeechErrorOldestCode keys and the NSSpeechErrorNewestCode keys, you can get information about the oldest and most recent errors that occurred since the last call to objectForProperty, but you cannot get information about any intervening errors.
Available in OS X v10.5 and later.

182.6.26 NSSpeechErrorNewestCharacterOffset as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the key constants identify errors that may occur during speech synthesis. They are used with NSSpeechErrorsProperty.
Notes: The position in the text string of the most recent error that occurred since the last call to objectForProperty with the NSSpeechErrorsProperty property. A Number.
Available in OS X v10.5 and later.

182.6.27 NSSpeechErrorNewestCode as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the key constants identify errors that may occur during speech synthesis. They are used with NSSpeechErrorsProperty.
Notes: The error code of the most recent error that occurred since the last call to objectForProperty with

the NSSpeechErrorsProperty property. A number
Available in OS X v10.5 and later.

182.6.28 NSSpeechErrorOldestCharacterOffset as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the key constants identify errors that may occur during speech synthesis. They are used with NSSpeechErrorsProperty.
Notes: The position in the text string of the first error that occurred since the last call to objectForProperty with the NSSpeechErrorsProperty property. A number
Available in OS X v10.5 and later.

182.6.29 NSSpeechErrorOldestCode as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the key constants identify errors that may occur during speech synthesis. They are used with NSSpeechErrorsProperty.
Notes: The error code of the first error that occurred since the last call to objectForProperty with the NSSpeechErrorsProperty property. A Number
Available in OS X v10.5 and later.

182.6.30 NSSpeechErrorsProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty and objectForProperty to get or set the characteristics of a synthesizer.
Notes: Get speech-error information for the synthesizer. An Dictionary object that contains speech-error information. See "NSSpeechErrorProperty Dictionary Keys" for a description of the keys present in the dictionary.
This property lets you get information about various run-time errors that occur during speaking, such as the detection of badly formed embedded commands. Errors returned directly by the Speech Synthesis Manager are not reported here.
If your application implements the didEncounterErrorAtIndex event, the event can use this property to get error information.
Available in OS X v10.5 and later.

182.6.31 NSSpeechInputModeProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty and objectForProperty to get or set the characteristics of a synthesizer.
Notes: Get or set the synthesizer's current text-processing mode. A string that specifies whether the channel is currently in text input mode or phoneme input mode.The supported values are listed in "Speaking Modes for NSSpeechInputModeProperty."
When in phoneme-processing mode, a text string is interpreted to be a series of characters representing various phonemes and prosodic controls. Some synthesizers might support additional input-processing modes and define constants for these modes.
Available in OS X v10.5 and later.

182.6.32 NSSpeechModeLiteral as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants defining the available text-processing and number-processing modes for a synthesizer. This key is used with NSSpeechInputModeProperty and NSSpeechNumberModeProperty)
Notes: Indicates that each digit or character is spoken literally (so that 12 is spoken as "one, two", or the word "cat" is spoken as "C A T").
Available in OS X v10.5 and later.

182.6.33 NSSpeechModeNormal as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants defining the available text-processing and number-processing modes for a synthesizer. This key is used with NSSpeechInputModeProperty and NSSpeechNumberModeProperty)
Notes: Indicates that the synthesizer assembles digits into numbers (so that 12 is spoken as "twelve") and text into words.
Available in OS X v10.5 and later.

182.6.34 NSSpeechModePhoneme as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants identify input modes are used with NSSpeechInputModeProperty.
Notes: Indicates that the synthesizer is in phoneme-processing mode. When in phoneme-processing mode, a text buffer is interpreted to be a series of characters representing various phonemes and prosodic controls.
Available in OS X v10.5 and later.

182.6.35 NSSpeechModeText as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants identify input modes are used with NSSpeechInputModeProperty.
Notes: Indicates that the synthesizer is in text-processing mode.
Available in OS X v10.5 and later.

182.6.36 NSSpeechNumberModeProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty and objectForProperty to get or set the characteristics of a synthesizer.
Example:

```
Var s as new NSSpeechSynthesizerMBS
Var e as NSErrorMBS

call s.setObjectForProperty(s.NSSpeechModeLiteral, s.NSSpeechNumberModeProperty, e)
MessageBox s.objectForProperty(s.NSSpeechNumberModeProperty, e)

call s.setObjectForProperty(s.NSSpeechModeNormal, s.NSSpeechNumberModeProperty, e)
MessageBox s.objectForProperty(s.NSSpeechNumberModeProperty, e)
```

Notes: Get or set the synthesizer's current number-processing mode. A string that specifies whether the synthesizer is currently in normal or literal number-processing mode. The constants NSSpeechModeNormal and NSSpeechModeLiteral are the possible values of this string.
When the number-processing mode is NSSpeechModeNormal, the synthesizer assembles digits into numbers (so that "12" is spoken as "twelve"). When the mode is NSSpeechModeLiteral, each digit is spoken literally (so that "12" is spoken as "one, two").
Available in OS X v10.5 and later.

182.6.37 NSSpeechOutputToFileURLProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty and objectForProperty to get or set the characteristics of a synthesizer.
Notes: Set the speech output destination to a file or to the computer's speakers. A NSURL object. To write the speech output to a file, use the file's NSURL; to generate the sound through the computer's speakers, use nil.
Available in OS X v10.5 and later.

182.6.38 NSSpeechPhonemeInfoExample as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys used in the NSSpeechPhonemeSymbolsProperty dictionary.
Notes: An example word that illustrates the use of the phoneme.
Available in OS X v10.5 and later.

182.6.39 NSSpeechPhonemeInfoHiliteEnd as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys used in the NSSpeechPhonemeSymbolsProperty dictionary.
Notes: The character offset into the example word that identifies the location of the end of the phoneme.
Available in OS X v10.5 and later.

182.6.40 NSSpeechPhonemeInfoHiliteStart as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys used in the NSSpeechPhonemeSymbolsProperty dictionary.
Notes: The character offset into the example word that identifies the location of the beginning of the phoneme.
Available in OS X v10.5 and later.

182.6.41 NSSpeechPhonemeInfoOpcode as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys used in the NSSpeechPhonemeSymbolsProperty dictionary.
Notes: The opcode as Number.
Available in OS X v10.5 and later.

182.6.42 NSSpeechPhonemeInfoSymbol as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys used in the NSSpeechPhonemeSymbolsProperty dictionary.
Notes: The symbol used to represent the phoneme.
The symbol does not necessarily have a phonetic connection to the phoneme, but might simply be an abstract textual representation of it.

Available in OS X v10.5 and later.

182.6.43 NSSpeechPhonemeSymbolsProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty and objectForProperty to get or set the characteristics of a synthesizer.
Notes: Get a list of phoneme symbols and example words defined for the synthesizer. A Dictionary object that contains the phoneme symbols and example words defined for the current synthesizer
Your application might use this information to show the user what symbols to use when entering phonemic text directly. See "NSSpeechPhonemeSymbolsProperty Dictionary Keys" for a description of the keys present in the dictionary.
Available in OS X v10.5 and later.

182.6.44 NSSpeechPitchBaseProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty and objectForProperty to get or set the characteristics of a synthesizer.
Example:

```
Var s as new NSSpeechSynthesizerMBS
Var e as NSErrorMBS

Var n as Integer = s.objectForProperty(s.NSSpeechPitchBaseProperty, e)
MessageBox str(n)
```

Notes: Get or set a synthesizer's baseline speech pitch. An number that specifies the baseline speech pitch. Typical voice frequencies range from around 90 hertz for a low-pitched male voice to perhaps 300 hertz for a high-pitched child's voice. These frequencies correspond to approximate pitch values in the ranges of 30.000 to 40.000 and 55.000 to 65.000, respectively.
Note: The change in speech pitch may not be noticeable until the next sentence or paragraph is spoken.
Available in OS X v10.5 and later.

182.6.45 NSSpeechPitchModProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty and objectForProperty to get or set the characteristics of a synthesizer.
Example:

```
Var s as new NSSpeechSynthesizerMBS
Var e as NSErrorMBS

Var n as Double = s.objectForProperty(s.NSSpeechPitchModProperty, e)
MessageBox str(n)
```

Notes: Get or set a synthesizer's pitch modulation. A number object that specifies the synthesizer's pitch modulation.
Pitch modulation is also expressed as a floating-point value in the range of 0.000 to 127.000. These values correspond to MIDI note values, where 60.000 is equal to middle C on a piano scale. The most useful speech pitches fall in the range of 40.000 to 55.000. A pitch modulation value of 0.000 corresponds to a monotone in which all speech is generated at the frequency corresponding to the speech pitch. Given a speech pitch value of 46.000, a pitch modulation of 2.000 would mean that the widest possible range of pitches corresponding to the actual frequency of generated text would be 44.000 to 48.000.

Note: The change in pitch modulation may not be noticeable until the next sentence or paragraph is spoken.
Available in OS X v10.5 and later.

182.6.46 NSSpeechRateProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty and objectForProperty to get or set the characteristics of a synthesizer.
Example:

```
Var s as new NSSpeechSynthesizerMBS
Var e as NSErrorMBS
Var value as Double = s.objectForProperty(s.NSSpeechRateProperty, e)
MessageBox str(value)
```

Notes: Get or set the synthesizer's baseline speech pitch. A number that specifies the synthesizer's baseline speech pitch.
Typical voice frequencies range from around 90 hertz for a low-pitched male voice to perhaps 300 hertz for a high-pitched child's voice. These frequencies correspond to approximate pitch values in the ranges of 30.000 to 40.000 and 55.000 to 65.000, respectively.
Available in OS X v10.5 and later.

182.6.47 NSSpeechRecentSyncProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty and objectForProperty to get or set the

characteristics of a synthesizer.
Notes: Get the message code for the most recently encountered synchronization command. A number that specifies the most recently encountered synchronization command.

Available in OS X v10.5 and later.

182.6.48 NSSpeechResetProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty to get or set the characteristics of a synthesizer.
Notes: Set a synthesizer back to its default state. There is no value associated with this property; to reset the channel to its default state, set the key to nil.
You can use this function to, for example, set speech pitch and speech rate to default values.
Available in OS X v10.5 and later.

182.6.49 NSSpeechStatusNumberOfCharactersLeft as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants identify speech status keys used with NSSpeechStatusProperty.
Notes: The number of characters left in the input string of text.
When the value of this key is zero, you can destroy the input string.
Available in OS X v10.5 and later.

182.6.50 NSSpeechStatusOutputBusy as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants identify speech status keys used with NSSpeechStatusProperty.
Notes: Indicates whether the synthesizer is currently producing speech.
A synthesizer is considered to be producing speech even at some times when no audio data is being produced through the computer's speaker. This occurs, for example, when the synthesizer is processing input, but has not yet initiated speech or when speech output is paused.
Available in OS X v10.5 and later.

182.6.51 NSSpeechStatusOutputPaused as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants identify speech status keys used with NSSpeechStatusProperty.
Notes: Indicates whether speech output in the synthesizer has been paused by sending the message pauseSpeakingAtBoundary.
Available in OS X v10.5 and later.

182.6.52 NSSpeechStatusPhonemeCode as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants identify speech status keys used with NSSpeechStatusProperty.
Notes: Indicates that the synthesizer is in phoneme-processing mode. When in phoneme-processing mode, a text buffer is interpreted to be a series of characters representing various phonemes and prosodic controls.
Available in OS X v10.5 and later.

182.6.53 NSSpeechStatusProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty and objectForProperty to get or set the characteristics of a synthesizer.
Example:

```
Var s as new NSSpeechSynthesizerMBS
Var e as NSErrorMBS

call s.startSpeakingString "Hello"

Var status as Dictionary = s.objectForProperty(s.NSSpeechStatusProperty, e)
Var CharactersLeft as Integer = status.Value(s.NSSpeechStatusNumberOfCharactersLeft)

MessageBox str(CharactersLeft)+" Characters left"
```

Notes: Get speech-status information for the synthesizer. A dictionary that contains speech-status information for the synthesizer. See "NSSpeechStatusProperty Dictionary Keys" for a description of the keys present in the dictionary.
Available in OS X v10.5 and later.

182.6.54 NSSpeechSynthesizerInfoIdentifier as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants are keys used in the NSSpeechSynthesizerInfoProperty dictionary.
Notes: The identifier of the speech synthesizer.

Available in OS X v10.5 and later.

182.6.55 NSSpeechSynthesizerInfoProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty and objectForProperty to get or set the characteristics of a synthesizer.
Notes: Get information about the speech synthesizer being used on the specified synthesizer. A dictionary object that contains information about the speech synthesizer being used on the specified synthesizer. See "Speech Synthesizer Property Keys" for a description of the keys present in the dictionary.
Available in OS X v10.5 and later.

182.6.56 NSSpeechSynthesizerInfoVersion as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants are keys used in the NSSpeechSynthesizerInfoProperty dictionary.
Notes: The version of the speech synthesizer.
Available in OS X v10.5 and later.

182.6.57 NSSpeechVolumeProperty as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants used with setObjectForProperty and objectForProperty to get or set the characteristics of a synthesizer.
Example:

```
Var s as new NSSpeechSynthesizerMBS
Var e as NSErrorMBS
Var value as Double = s.objectForProperty(s.NSSpeechVolumeProperty, e)
MessageBox str(value)
```

Notes: Get or set the speech volume for a synthesizer. A Number that specifies the synthesizer's speech volume.
Volumes are expressed in floating-point values ranging from 0.0 through 1.0. A value of 0.0 corresponds to silence, and a value of 1.0 corresponds to the maximum possible volume. Volume units lie on a scale that is linear with amplitude or voltage. A doubling of perceived loudness corresponds to a doubling of the volume.
Available in OS X v10.5 and later.

You may prefer to simply use the volume property.

182.6.58 objectForProperty(PropertyName as string, byref error as NSErrorMBS) as Variant

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Provides the value of a receiver's property.
Notes: PropertyName: Property to get.
error: On output, error that occurred while obtaining the value of speechProperty.

Returns the value of speechProperty.
Available in OS X v10.5 and later.

182.6.59 pauseSpeakingAtBoundary(boundary as Integer)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Pauses the speaking on the given boundary.
Example:

```
Var s as NSSpeechSynthesizerMBS // your synthesizer
s.pauseSpeakingAtBoundary s.NSSpeechSentenceBoundary // pause on end of sentence.
```

Notes: Mac OS X 10.5 only.
boundary can be NSSpeechImmediateBoundary, NSSpeechSentenceBoundary or NSSpeechWordBoundary.

182.6.60 phonemesFromText(text as string) as string

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the phonems from a given text.
Example:

```
Var s as new NSSpeechSynthesizerMBS

MessageBox s.phonemesFromText("Hello")

// shows "_hEHl1OW."
```

Notes: Mac OS X 10.5 only.

182.6.61 setObjectForProperty(value as Variant, PropertyName as string, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Specifies the value of a receiver's property.
Notes: PropertyName: Property to set.
Error: On output, error that occurred while setting speechProperty.

Returns true when the speechProperty was set. False when there was an error, specified in error.
Available in OS X v10.5 and later.

182.6.62 SetVoice(voice as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the receiver's current voice.
Notes: Returns true on success.

182.6.63 StartSpeakingString(text as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Begins speaking synthesized text through the system's default sound output device.
Example:

```
Var s as new NSSpeechSynthesizerMBS

s.rate=300 // not slow
s.volume=0.5 // not loud
call s.startSpeakingString "Hello World"
```

Notes: Returns true when synthesis starts successfully, false otherwise.

If the receiver is currently speaking synthesized speech when startSpeakingString is called, that process is stopped before text is spoken.

When synthesis of text finishes normally or is stopped, the message didFinishSpeaking(true) is called.
See also:

- 182.6.64 StartSpeakingString(text as string, file as folderitem) as boolean 22363
- 182.6.65 startSpeakingString(Text as String, URL as string) as boolean 22363

182.6.64 StartSpeakingString(text as string, file as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Begins synthesizing text into a sound (AIFF) file.
Notes: Returns true when synthesis starts successfully, false otherwise.

When synthesis of text finishes normally or is stopped, the message didFinishSpeaking(True) is called.

One example of how you might use this method is in an email program that automatically converts new messages into sound files that can be stored on an iPod for later listening.
See also:

- 182.6.63 StartSpeakingString(text as string) as boolean 22362
- 182.6.65 startSpeakingString(Text as String, URL as string) as boolean 22363

182.6.65 startSpeakingString(Text as String, URL as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Begins synthesizing text into a sound (AIFF) file.
Notes: Returns true when synthesis starts successfully, false otherwise.

When synthesis of text finishes normally or is stopped, the message didFinishSpeaking(True) is called.

One example of how you might use this method is in an email program that automatically converts new messages into sound files that can be stored on an iPod for later listening.
See also:

- 182.6.63 StartSpeakingString(text as string) as boolean 22362
- 182.6.64 StartSpeakingString(text as string, file as folderitem) as boolean 22363

182.6.66 StopSpeaking

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Stops synthesis in progress.
Notes: If the receiver is currently generating speech, synthesis is halted, and the message didFinishSpeaking(false) is called.

182.6.67 stopSpeakingAtBoundary(boundary as Integer)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Stops speech on the next w
Notes: Mac OS X 10.5 only.

182.6.68 Properties

182.6.69 IsSpeaking as boolean

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the receiver is currently generating synthesized speech.
Notes: true when the receiver is generating synthesized speech, false otherwise.
(Read only property)

182.6.70 rate as Double

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current rate of the speech.
Example:

```
Var s as NSSpeechSynthesizerMBS
s=new NSSpeechSynthesizerMBS
MessageBox str(s.rate)
// shows e.g. "160"
```

Notes: Mac OS X 10.5 only.
The range of supported rates is not predefined by the Speech Synthesis framework; but the synthesizer may only respond to a limited range of speech rates. Average human speech occurs at a rate of 180 to 220 words per minute.
(Read and Write property)

182.6.71 UsesFeedbackWindow as boolean

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the receiver uses the speech feedback window.
Notes: (Read and Write property)

182.6.72 Voice as string

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current voice.
Example:

```
Var s as new NSSpeechSynthesizerMBS
MessageBox s.voice
// shows e.g. "com.apple.speech.synthesis.voice.Zarvox"
```

Notes: (Read and Write property)

182.6.73 volume as Double

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The volume of the speech.
Example:

```
Var s as new NSSpeechSynthesizerMBS
MessageBox str(s.volume)
// shows e.g. 1
```

Notes: No sound is zero, full sound one.
Mac OS X 10.5 only.

Volumes are expressed in floating-point units ranging from 0.0 through 1.0. A value of 0.0 corresponds to silence, and a value of 1.0 corresponds to the maximum possible volume. Volume units lie on a scale that is linear with amplitude or voltage. A doubling of perceived loudness corresponds to a doubling of the volume.

Setting a value outside this range is undefined.
(Read and Write property)

182.6.74 Events

182.6.75 didEncounterErrorAtIndex(characterIndex as Integer, text as string, message as string)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: An event called when an error has been found in the text while speaking.
Notes: Mac OS X 10.5 only.

182.6.76 didEncounterSyncMessage(message as string)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A sync message was found in the text.
Notes: See Apple Speech documentation about the special tags you need to place in the text to get this event.
Mac OS X 10.5 only.

182.6.77 didFinishSpeaking(finishedSpeaking as boolean)

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Called when speaking through the sound output device is done.
Notes: finishedSpeaking is true when finished normally and false when StopSpeaking was called.

182.6.78 willSpeakPhoneme(phonemeOpcode as Integer)

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sent just before a synthesized phoneme is spoken through the sound output device.
Notes: phonemeOpcode: Phoneme that sender is about to speak into the sound output device.

One use of this method might be to animate a mouth on screen to match the generated speech.

Important: The delegate is not sent this message when the SpeechSynthesizer object is synthesizing speech to a file (startSpeakingString).

182.6.79 willSpeakWord(Position as Integer, Length as Integer, Text as String)

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sent just before a synthesized word is spoken through the sound output device.
Notes: Position and Length: Word that sender is about to speak into the sound output device.
text: Text that is being synthesized by sender.

One use of this method might be to visually highlight the word being spoken.

Important: The delegate is not sent this message when the SpeechSynthesizer object is synthesizing speech to a file (startSpeakingString).

182.6.80 Constants

Constants

Constant	Value	Description
NSSpeechImmediateBoundary	0	One of the constants for the pauseSpeakingAtBoundary method. Mac OS X 10.5 only.
NSSpeechSentenceBoundary	2	One of the constants for the pauseSpeakingAtBoundary method. Mac OS X 10.5 only.
NSSpeechWordBoundary	1	One of the constants for the pauseSpeakingAtBoundary method. Mac OS X 10.5 only.

182.7 class NSVoiceMBS

182.7.1 class NSVoiceMBS

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: A voice on Mac OS X with its attributes.
Example:

```
// list the installed English voices for speech synthesis
Var lines() As String
For Each identifier As String In NSSpeechSynthesizerMBS.availableVoices
Var voice As NSVoiceMBS = NSSpeechSynthesizerMBS.attributesForVoice(identifier)
If voice.LocaleIdentifier.BeginsWith("en") Then
lines.Add voice.Name + " (" + voice.LocaleIdentifier + ", " + voice.Gender + "): " + voice.Demotext
End If
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Available in Mac OS X v10.3 and later.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr7

182.7.2 Methods

182.7.3 Age as Integer

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The perceived age (in years) of the voice.

182.7.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

182.7.5 Demotext as String

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: A demonstration string to speak.

182.7.6 Gender as String

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The perceived gender of the voice.
Notes: May be either GenderNeuter ("VoiceGenderNeuter), GenderFemale ("VoiceGenderFemale"), or GenderMale ("VoiceGenderMale").

182.7.7 GenderFemale as String

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the possible values for the gender property.

182.7.8 GenderMale as String

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the possible values for the gender property.

182.7.9 GenderNeuter as String

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the possible values for the gender property.

182.7.10 Identifier as String

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: A unique string identifying the voice. The identifiers of the system voices are listed below.
Notes: Identifiers of the Mac OS X system voices
com.apple.speech.synthesis.voice.Agnes
com.apple.speech.synthesis.voice.Albert
com.apple.speech.synthesis.voice.BadNews
com.apple.speech.synthesis.voice.Bahh
com.apple.speech.synthesis.voice.Bells
com.apple.speech.synthesis.voice.Boing

com.apple.speech.synthesis.voice.Bruce
com.apple.speech.synthesis.voice.Bubbles
com.apple.speech.synthesis.voice.Cellos
com.apple.speech.synthesis.voice.Deranged
com.apple.speech.synthesis.voice.Fred
com.apple.speech.synthesis.voice.GoodNews
com.apple.speech.synthesis.voice.Hysterical
com.apple.speech.synthesis.voice.Junior
com.apple.speech.synthesis.voice.Kathy
com.apple.speech.synthesis.voice.Organ
com.apple.speech.synthesis.voice.Princess
com.apple.speech.synthesis.voice.Ralph
com.apple.speech.synthesis.voice.Trinoids
com.apple.speech.synthesis.voice.Vicki
com.apple.speech.synthesis.voice.Victoria
com.apple.speech.synthesis.voice.Whisper
com.apple.speech.synthesis.voice.Zarvox

182.7.11 Language as String

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The language of the voice (currently US English only).
Notes: Language has been replaced by LocaleIdentifier in Mac OS X 10.5.

182.7.12 LocaleIdentifier as String

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The locale identifier.
Example:

```
Var v as NSVoiceMBS
Var s as NSSpeechSynthesizerMBS
Var n as string

s=new NSSpeechSynthesizerMBS

n=s.voice
v=s.attributesForVoice(n)

MessageBox n+EndOfLine+v.LocaleIdentifier
// shows for example "en_US"
```

Notes: Mac OS X 10.5 only.

Language has been replaced by LocaleIdentifier in Mac OS X 10.5.

182.7.13 Name as String

MBS MacCocoa Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the voice suitable for display.

182.7.14 NSVoiceAge as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the properties names.
Notes: The perceived age (in years) of the voice. A string.

182.7.15 NSVoiceDemoText as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the properties names.
Notes: A demonstration string to speak. A String.

182.7.16 NSVoiceGender as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the properties names.
Notes: The perceived gender of the voice.

182.7.17 NSVoiceIdentifier as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the properties names.
Notes: A unique string identifying the voice.

Identifiers of the OS X system voices:
com.apple.speech.synthesis.voice.Agnes
com.apple.speech.synthesis.voice.Albert
com.apple.speech.synthesis.voice.Alex
com.apple.speech.synthesis.voice.BadNews
com.apple.speech.synthesis.voice.Bahh
com.apple.speech.synthesis.voice.Bells
com.apple.speech.synthesis.voice.Boing
com.apple.speech.synthesis.voice.Bruce
com.apple.speech.synthesis.voice.Bubbles
com.apple.speech.synthesis.voice.Cellos
com.apple.speech.synthesis.voice.Deranged
com.apple.speech.synthesis.voice.Fred
com.apple.speech.synthesis.voice.GoodNews
com.apple.speech.synthesis.voice.Hysterical
com.apple.speech.synthesis.voice.Junior
com.apple.speech.synthesis.voice.Kathy
com.apple.speech.synthesis.voice.Organ
com.apple.speech.synthesis.voice.Princess
com.apple.speech.synthesis.voice.Ralph
com.apple.speech.synthesis.voice.Trinoids
com.apple.speech.synthesis.voice.Vicki
com.apple.speech.synthesis.voice.Victoria
com.apple.speech.synthesis.voice.Whisper
com.apple.speech.synthesis.voice.Zarvox

182.7.18 NSVoiceIndividuallySpokenCharacters as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the properties names.
Notes: A list of unicode character id ranges that define the unicode characters that can be spoken in character-by-character mode by this voice. ach list entry is a dictionary containing two keys: "UnicodeCharBegin", an integer value containing the beginning unicode id of this range; and "UnicodeCharBegin", an integer value containing the ending unicode id of this range.
These ranges can be used by your application to determine if the voice can speak the name of an individual character when spoken in character-by-character mode.
Some voices may not provide this attribute.
Available in OS X v10.5 and later.

182.7.19 NSVoiceLanguage as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the properties names.

Notes: The language of the voice (currently US English only). A string
Deprecated: Use NSVoiceLocaleIdentifier instead.
Deprecated in OS X v10.5.

182.7.20 NSVoiceLocaleIdentifier as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the properties names.
Notes: The language of the voice. A string
The canonical locale identifier string describing the voice's locale. A locale is generally composed of three pieces of ordered information: a language code, a region code, and a variant code. Refer to documentation about the NSLocale class or Locales Programming Guide for more information.
Available in OS X v10.5 and later.

182.7.21 NSVoiceName as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the properties names.
Notes: The name of the voice suitable for display. A String.

182.7.22 NSVoiceSupportedCharacters as String

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the properties names.
Notes: A list of unicode character id ranges that define the unicode characters supported by this voice. a dictionary containing two keys: "UnicodeCharBegin", an integer value containing the beginning unicode id of this range; and "UnicodeCharBegin", an integer value containing the ending unicode id of this range. The synthesizer will convert or ignore any characters not contained in the range of supported characters.
Some voices may not provide this attribute.
Available in OS X v10.5 and later.

182.7.23 Properties as Dictionary

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns dictionary with all the properties for this voice.
Notes: This dictionary may contain additional information if Apple adds more features in newer Mac OS

X versions.

182.8 class SpeechChannelMBS

182.8.1 class SpeechChannelMBS

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use NSSpeechSynthesizerMBS instead. **Function:** A SpeechMBS channel.
Example:

```
Var s as new SpeechMBS
Var c as SpeechChannelMBS = s.Voice(1).NewChannel

call c.Speak("Hello")

MessageBox str(c.TextBytesToSpeak)
```

Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.0pr9

182.8.2 Methods

182.8.3 close

MBS MacClassic Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

182.8.4 ContinueSpeech as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Continue speaking.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(C.ContinueSpeech)
```

Notes: Renamed from Continue to ContinueSpeech in v5.3 to fix a problem with Xojo 2005r3.

182.8.5 PauseEndOfSentence as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Pauses speaking at the end of the current sentence.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(C.PauseEndOfSentence)
```

182.8.6 PauseEndOfWord as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Pauses speaking at the end of the current word.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(C.PauseEndOfWord)
```

182.8.7 PauseImmediate as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Pauses speaking.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(C.PauseImmediate)
```

182.8.8 Reset

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Resets the SpeechMBS channel to some default values.
Example:

```
Var c as SpeechChannelMBS // your channel

c.reset
```

Notes: Resets e.g. pitchbase, pitchmodulation, volume, rate.

182.8.9 SetOutputFile(file as folderitem) as boolean

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Sets the destination file.
Example:

```
Var s as new SpeechMBS
Var c as SpeechChannelMBS = s.Voice(1).NewChannel
Var f as FolderItem = SpecialFolder.Desktop.Child("test.aiff")

call c.SetOutputFile(f)
call c.Speak("Hello")

MessageBox str(c.TextBytesToSpeak)
```

Notes: Returns true on success and false on any error.
Requires Mac OS X 10.3.

182.8.10 Speak(s as string) as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Speak the given text.
Example:

```
Var s as new SpeechMBS
Var c as SpeechChannelMBS = s.Voice(1).NewChannel

MessageBox str(c.Speak("Hello"))
```

Notes: v5.1: Now encoding safe and stores result in lasterror property.

182.8.11 SpeechBusy as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns how much SpeechChannels are currently in use of you application.
Example:

```
Var c as SpeechChannelMBS // your channel
```

MessageBox str(c.SpeechBusy)

182.8.12 SpeechBusySystemWide as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns how much SpeechChannels are currently in use on this Mac.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(c.SpeechBusySystemWide)
```

182.8.13 Stop as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Stops speaking.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(c.Stop)
```

182.8.14 StopEndOfSentence as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Stops speaking at the end of the current sentence.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(c.StopEndOfSentence)
```

182.8.15 StopEndOfWord as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Stops speaking at the end of the current word.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(c.StopEndOfWord)
```

182.8.16 StopImmediate as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Stops speaking.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(c.StopImmediate)
```

182.8.17 Properties

182.8.18 Lasterror as Integer

MBS MacClassic Plugin, Plugin Version: 5.1, Platform: macOS, Targets: Desktop only.

Function: The last error code.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(c.Lasterror)
```

Notes: A Mac OS error code.
from the plugin -1 is bad parameter and 0 is success.
(Read only property)

182.8.19 Paused as boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Are we paused?
Example:

```
Var s as new SpeechMBS
Var c as SpeechChannelMBS = s.Voice(1).NewChannel

MessageBox str(c.Paused)
```

Notes: (Read only property)

182.8.20 PitchBase as Double

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: The pich base used for speaking.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(C.PitchBase)
```

Notes: (Read and Write property)

182.8.21 PitchModulation as Double

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: The pich modulation used for speaking.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(C.PitchModulation)
```

Notes: (Read and Write property)

182.8.22 Playing as boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Are we playing?
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(C.Playing)
```

Notes: (Read only property)

182.8.23 Rate as Double

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: The rate used for speaking.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(C.Rate)
```

Notes: Normally around 175 words/minute.
(Read and Write property)

182.8.24 SpeakCharactersLiteral as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: whether to speak characters literal.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(c.SpeakCharactersLiteral)
```

Notes: Speaks Hello like "H-E-L-L-O"
(Read and Write property)

182.8.25 SpeakNumbersLiteral as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: whether to speak numbers literal.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(c.SpeakNumbersLiteral)
```

Notes: Speaks 11 not like "elven", but like "one, one".
(Read and Write property)

182.8.26 TextBytesToSpeak as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: How much text is left in the text buffer?
Example:

```
Var s as new SpeechMBS
Var c as SpeechChannelMBS = s.Voice(1).NewChannel

call c.Speak("Hello")

MessageBox str(c.TextBytesToSpeak)
```

Notes: (Read only property)

182.8.27 Voice as VoiceMBS

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: The VoiceMBS used for that SpeechChannelMBS.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox c.Voice.Name
```

Notes: (Read and Write property)

182.8.28 Volume as Double

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: The current volume.
Example:

```
Var c as SpeechChannelMBS // your channel

MessageBox str(c.Volume)
```

Notes: From 0 to 65535.
(Read and Write property)

182.9 class SpeechMBS

182.9.1 class SpeechMBS

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use NSSpeechSynthesizerMBS instead. **Function:** The class for the Mac OS speech synthesizer.
Notes: For Mac OS X you can also use the NSSpeechSynthesizerMBS class and for recognition the NSSpeechRecognizerMBS class.

You can try Speech with some declares, but your app won't start if the Speech extension is not installed. This plugin won't stop, but simply will just tell you that the Speech is not available, so you can react in your application.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.0pr9

182.9.2 Methods

182.9.3 close

MBS MacClassic Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

182.9.4 DefaultVoice as VoiceMBS

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns the default VoiceMBS.
Example:

```
Var s as new SpeechMBS
Var v as VoiceMBS = s.DefaultVoice

MessageBox v.Name
```

182.9.5 Speak(s as string) as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Speaks a text using the default settings.
Example:

```
Var s as new SpeechMBS

call s.Speak("Hello")

MessageBox "you hear me?"
```

Notes: Returns directly to caller.
Returns true if speaking is working.

v5.1: Now encoding safe and stores result in lasterror property.

182.9.6 SpeechBusy as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns how much SpeechChannels are currently in use of you application.
Example:

```
Var s as new SpeechMBS

MessageBox str(s.SpeechBusy)
```

182.9.7 SpeechBusySystemWide as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns how much SpeechChannels are currently in use on this Mac.
Example:

```
Var s as new SpeechMBS

MessageBox str(s.SpeechBusySystemWide)
```

182.9.8 Voice(index as Integer) as VoiceMBS

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns the VoiceMBS with this number.
Example:

```
Var s as new SpeechMBS

MessageBox s.Voice(1).Name
```

Notes: Index is from 1 to VoiceCount.

182.9.9 Properties

182.9.10 Available as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Is SpeechMBS available?
Notes: (Read only property)

182.9.11 Lasterror as Integer

MBS MacClassic Plugin, Plugin Version: 5.1, Platform: macOS, Targets: Desktop only.

Function: The last error code.
Notes: A Mac OS error code.
from the plugin -1 is bad parameter and 0 is success.
(Read only property)

182.9.12 VersionMajor as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: The major Version number.
Example:

```
Var s as SpeechMBS
s=new SpeechMBS
MessageBox hex(s.VersionMajor)+"."+hex(s.versionMinor\16)+"."+hex(s.versionMinor mod 16)
```

Notes: (Read only property)

182.9.13 versionMinor as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: The minor Version number.
Example:

```
Var s as SpeechMBS
s=new SpeechMBS
MessageBox hex(s.VersionMajor)+"."+hex(s.versionMinor\16)+"."+hex(s.versionMinor mod 16)
```

Notes: (Read only property)

182.9.14 VersionRev as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: The revision Version number.
Example:

```
Var s as new SpeechMBS

MessageBox str(s.VersionRev)
```

Notes: (Read only property)

182.9.15 VersionStage as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: The Stage Version number.
Example:

```
Var s as new SpeechMBS

MessageBox str(s.VersionStage)
```

Notes: Some constants:

developStage	&h20
alphaStage	&h40
betaStage	&h60
finalStage	&h80

(Read only property)

182.9.16 VoiceCount as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: How much voices are present?
Example:

```
Var s as new SpeechMBS

MessageBox str(s.VoiceCount)
```

Notes: If you add or remove VoiceMBS files, please call this function as SpeechMBS can then recognice those changes.
(Read only property)

182.10 class VoiceMBS

182.10.1 class VoiceMBS

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use NSVoiceMBS instead.
Function: This class represents a voice.
Example:

```
Var s as new SpeechMBS

MessageBox s.Voice(2).name
```

Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.0pr9

182.10.2 Methods

182.10.3 close

MBS MacClassic Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

182.10.4 NewChannel as SpeechChannelMBS

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Creates a new SpeechChannel using the given voice.
Example:

```
Var s as new SpeechMBS
Var c as SpeechChannelMBS = s.Voice(1).NewChannel

MessageBox str(c.Speak("Hello"))
```

Notes: Returns nil on any error.

182.10.5 Properties

182.10.6 age as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: The approximate age in years of the individual represented by the VoiceMBS.
Example:

```
Var s as new SpeechMBS

MessageBox str(s.Voice(1).age)
```

Notes: (Read only property)

182.10.7 comment as string

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: Additional text information about the VoiceMBS. The information might indicate how much memory the VoiceMBS requires. Some synthesizers use this field to store a phrase that can be spoken.
Example:

```
Var s as new SpeechMBS
MessageBox s.Voice(1).comment
```

Notes: (Read only property)

182.10.8 file as folderitem

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: The file of this VoiceMBS.
Notes: May be nil.
(Read only property)

182.10.9 gender as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: The gender of this VoiceMBS.
Example:

```
Var s as new SpeechMBS

MessageBox str(s.Voice(1).gender)
```

Notes: Some constants for this property:

kNeuter	0
kMale	1
kFemale	2

(Read only property)

182.10.10 language as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: A code that indicates the language of VoiceMBS output.
Example:

```
Var s as new SpeechMBS

MessageBox str(s.Voice(1).language)
```

Notes: Language constants:

(Read only property)

182.10.11 name as string

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: The name of this VoiceMBS.
Example:

```
Var s as new SpeechMBS
MessageBox s.Voice(1).name
```

Notes: (Read only property)

182.10.12 region as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: A code that indicates the region represented by the VoiceMBS.
Example:

```
Var s as new SpeechMBS

MessageBox str(s.Voice(1).region)
```

Notes: Some region constants:

(Read only property)

182.10.13 ResID as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: There can be several voices in one file, but this VoiceMBS has this ResID.
Example:

```
Var s as new SpeechMBS

MessageBox str(s.Voice(1).ResID)
```

Notes: (Read only property)

182.10.14 script as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: The script code of text that the VoiceMBS can process.
Example:

```
Var s as new SpeechMBS

MessageBox str(s.Voice(1).script)
```

Notes: Script constants:

(Read only property)

182.10.15 version as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop only.

Function: The version of this VoiceMBS.
Example:

```
Var s as new SpeechMBS

MessageBox str(s.Voice(1).Version)
```

Notes: (Read only property)

182.11 class WinSpeechMBS

182.11.1 class WinSpeechMBS

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for speech on Windows.
Example:

```
// speak a text with the Windows speech engine
// Speech is a property of the window: Speech As WinSpeechMBS
Speech = New WinSpeechMBS
Speech.Rate = 1 // -10 to 10
Speech.Volume = 80 // 0 to 100
Speech.Speak "Hello from Xojo. The backup is finished."
```

Notes: You need to install the "Microsoft Reader" to get this working.

Xojo Developer Magazine

- 23.6, pages 51 to 52: Let your application speak for you, Teach your applications on Windows and Mac to speak by Stefanie Juchmes-Simonis

182.11.2 Methods

182.11.3 close

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

182.11.4 DisplayUI(type as string, title as string, parent as DesktopWindow)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Displays the UI from the underlying text-to-speech engine's object token.
Notes: Type specifies which UI you want.
Title is optional the title of the window.
You can optionally specify a parent window.
Lasterror is set.
See also:

- 182.11.5 DisplayUI(type as string, title as string, parent as window) 22397
- 182.11.6 DisplayUI(type as string, title as string="") 22397

182.11.5 DisplayUI(type as string, title as string, parent as window)

MBS Win Plugin, Plugin Version: 8.1, Platform: Windows, Targets: Desktop only.

Function: Displays the UI from the underlying text-to-speech engine's object token.
Notes: Type specifies which UI you want.
Title is optional the title of the window.
You can optionally specify a parent window.
Lasterror is set.
See also:

- 182.11.4 DisplayUI(type as string, title as string, parent as DesktopWindow) 22397
- 182.11.6 DisplayUI(type as string, title as string="") 22397

182.11.6 DisplayUI(type as string, title as string="")

MBS Win Plugin, Plugin Version: 8.1, Platform: Windows, Targets: Desktop only.

Function: Displays the UI from the underlying text-to-speech engine's object token.
Notes: Type specifies which UI you want.
Title is optional the title of the window.
You can optionally specify a parent window.
Lasterror is set.
See also:

- 182.11.4 DisplayUI(type as string, title as string, parent as DesktopWindow) 22397
- 182.11.5 DisplayUI(type as string, title as string, parent as window) 22397

182.11.7 IsUISupported(type as string) as boolean

MBS Win Plugin, Plugin Version: 8.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Checks if the underlying text-to-speech engine's object token supports the requested UI.
Notes: Returns whether the specified UI is supported. True indicates the UI is supported, and false indicates the UI is not supported.
Lasterror is set.

182.11.8 ListVoices as boolean

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Makes a list of voices which is later returned using the NextVoice function.

182.11.9 NextVoice as WinVoiceMBS

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the next voice in the list.
Notes: Returns nil on the end of the list.

182.11.10 Pause

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Pauses speech.

182.11.11 Resume

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Resumes speech.

182.11.12 Skip(sentenceCount as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Causes the voice to skip forward or backward the specified number of items within the text of the current speak call.

Notes: sentenceCount is the number of sentences to skip. If negative, you skip backward.
Returns the actual number of items skipped.
Lasterror is set.

182.11.13 Speak(text as string, Purge as Boolean = false, ContainsXML as boolean = false)

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Speaks a string.
Notes: The string must be a 16bit unicode string.

Version 7.8 of the plugins convert to unicode automatically.

If Purge is true an existing speech will be stopped.

If ContainsXML is true, you can include xml commands in the text. See MSDN page:
http://msdn.microsoft.com/en-us/library/ms717077%28v=vs.85%29.aspx

182.11.14 SpeakFile(file as folderitem, unicodestring as string, AudioFormat as Integer = 0, ContainsXML as boolean = false)

MBS Win Plugin, Plugin Version: 4.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Speaks a string to a file.
Notes: The string must be a 16bit unicode string.
File is a valid folderitem where the WAV file is stored.
The function will not return before the speaking is complete.
Lasterror is set.

Version 7.8 of the plugins convert to unicode automatically.

For AudioFormat, please use kAudioFormat* constants. Default is 22Khz Mono which is default format for speech API.

If ContainsXML is true, you can include xml commands in the text. See MSDN page:
http://msdn.microsoft.com/en-us/library/ms717077%28v=vs.85%29.aspx

182.11.15 WaitUntilDone(msTimeout as Integer)

MBS Win Plugin, Plugin Version: 8.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Blocks the caller until either the voice has completed speaking or the specified time interval has elapsed.
Notes: msTimeout: Timeout period in milliseconds. INFINITE may be used to prevent this method from timing out.

INFINITE is -1.

Lasterror is set.

182.11.16 Properties

182.11.17 Handle as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle to the speech object.
Notes: If handle is 0 there is no Speech software installed.
(Read only property)

182.11.18 IsDone as Boolean

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if the voice has finished speaking.
Notes: Lasterror is set.
(Read only property)

182.11.19 IsSpeaking as Boolean

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if the voice is speaking.
Notes: Lasterror is set.
(Read only property)

182.11.20 Lasterror as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code reported.
Notes: You may get the Speech SDK from Microsoft for more details.
(Read only property)

182.11.21 Priority as Integer

MBS Win Plugin, Plugin Version: 8.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current voice priority level.
Notes: The default priority is SPVPRI_NORMAL.
Lasterror is set.

Assuming an output object which implements ISpAudio, speak requests of similar priority voices are queued, and are spoken one at a time in the order they are issued. That is, speak requests from normal priority voices are put in one queue, while speak requests from alert priority voices (with priority SPVPRI_ALERT) are put in another queue.

Alert priority voices take priority over normal voices. If one or more speak requests from alert priority voices are pending, a normal voice that is speaking will be interrupted on the next alert boundary (see ISpVoice::SetAlertBoundary). When all the queued alert priority voice speak requests have been processed, the normal voice will continue.

Voices with the SPVPRI_OVER priority speak over (mix with) all other audio in the system with no synchronization. SPVPRI_OVER priority voices only mix on Windows 2000.

If the output object does not implement ISpAudio, no serialization will occur, and all voices will be treated as if their priority is SPVPRI_OVER.
(Read and Write property)

182.11.22 Rate as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current text rendering rate adjustment.
Notes: Ranges from kMinRate to kMaxRate.
(Read and Write property)

182.11.23 SyncSpeakTimeout as Integer

MBS Win Plugin, Plugin Version: 8.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The timeout interval in milliseconds after which, synchronous Speak calls to this instance of the voice will timeout.
Notes: Timeouts occur when waiting for access to the output object. This means that for a normal priority voice (see Priority for more information on priorities) and an output device which implements ISpAudio, a timeout may occur while waiting to reacquire the output object after an interruption by an alert priority voice. For voices of both normal and alert priorities, a timeout may also occur while waiting to reacquire the output object after the voice has been paused and resumed (see Pause and Resume).

Wait times are not accumulated - that is, if a voice waits for n milliseconds to initially acquire the output object, and is then paused and resumed, it will again wait for up to msTimeout milliseconds to reacquire the output object, not msTimeout - n milliseconds.
(Read and Write property)

182.11.24 Voice as WinVoiceMBS

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current used voice.
Notes: Set to nil to use the default voice.
(Read and Write property)

182.11.25 Volume as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The volume for the voice.
Notes: Ranges from kMinVolume to kMaxVolume.
(Read and Write property)

182.11.26 Constants

Constants

Constant	Value	Description
kMaxRate	10	The maximum for the rate property.
kMaxVolume	100	The maximum for the volume property.
kMinRate	-10	The minimum for the rate property.
kMinVolume	0	The minimum for the volume property.
PriorityAlert	1	One of the priority constants.
PriorityNormal	0	One of the priority constants.
PriorityOver	2	One of the priority constants.
SPDUI_AddRemoveWord	"AddRemoveWord"	One of the constants for the User Interfaces used with IsU DisplayUI.
SPDUI_AudioProperties	"AudioProperties"	One of the constants for the User Interfaces used with IsU DisplayUI.
SPDUI_AudioVolume	"AudioVolume"	One of the constants for the User Interfaces used with IsU DisplayUI.
SPDUI_EngineProperties	"EngineProperties"	One of the constants for the User Interfaces used with IsU DisplayUI.
SPDUI_MicTraining	"MicTraining"	One of the constants for the User Interfaces used with IsU DisplayUI.
SPDUI_RecoProfileProperties	"RecoProfileProperties"	One of the constants for the User Interfaces used with IsU DisplayUI.
SPDUI_UserTraining	"UserTraining"	One of the constants for the User Interfaces used with IsU DisplayUI.

Audio Formats

Constant	Value	Description
kAudioFormat_11kHz16BitMono	10	11 kHz, 16 Bit, Mono
kAudioFormat_11kHz16BitStereo	11	11 kHz, 16 Bit, Stereo

182.12 class WinVoiceMBS

182.12.1 class WinVoiceMBS

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for a voice.
Xojo Developer Magazine

- 23.6, pages 52 to 53: Let your application speak for you, Teach your applications on Windows and Mac to speak by Stefanie Juchmes-Simonis

182.12.2 Methods

182.12.3 Description as string

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the voice.
Notes: Returns a 16bit unicode string.

182.12.4 Properties

182.12.5 Handle as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle to the voice.
Notes: (Read only property)

182.12.6 Lasterror as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code reported.
Notes: (Read only property)

Chapter 183

SpeechRecognition

183.1 class SFAcousticFeatureMBS

183.1.1 class SFAcousticFeatureMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The value of a voice analysis metric.
Notes: Requires MacOS 10.15 or later.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Playing with SpeechRecognition

183.1.2 Methods

183.1.3 acousticFeatureValuePerFrame as Double()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: An array of feature values, one value per audio frame, corresponding to a transcript segment of recorded audio.

183.1.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The private constructor.

183.1.5 copy as SFAcousticFeatureMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

183.1.6 Properties

183.1.7 frameDuration as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The duration of the audio frame.
Notes: In seconds.
(Read only property)

183.1.8 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Internal object reference.
Notes: (Read and Write property)

183.2 class SFSpeechAudioBufferRecognitionRequestMBS

183.2.1 class SFSpeechAudioBufferRecognitionRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: A request to recognize speech from captured audio content, such as audio from the device's microphone.
Notes: Use an SFSpeechAudioBufferRecognitionRequestMBS object to perform speech recognition on live audio, or on a set of existing audio buffers. For example, use this request object to route audio from a device's microphone to the speech recognizer.

The request object contains no audio initially. As you capture audio, call appendAudioPCMBuffer or appendAudioSampleBuffer to add audio samples to the request object. The speech recognizer continuously analyzes the audio you appended, stopping only when you call the endAudio method. (You must call endAudio explicitly to stop the speech recognition process.)

Requires MacOS 10.15 or later.
Subclass of the SFSpeechRecognitionRequestMBS class.

- Playing with SpeechRecognition

183.2.2 Methods

183.2.3 appendAudioPCMBuffer(audioPCMBuffer as Variant)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Appends audio in the PCM format to the end of the recognition request.
Notes: audioPCMBuffer: An audio buffer (AVAudioPCMBufferMBS class) that contains audio in the PCM format.

The audio must be in a native format and uncompressed.

183.2.4 appendAudioSampleBuffer(sampleBuffer as Variant)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Appends audio to the end of the recognition request.
Notes: sampleBuffer: A buffer of audio. Must be CMSampleBufferMBS class.

The audio must be in a native format.

183.2.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The constructor.

183.2.6 endAudio

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Marks the end of audio input for the recognition request.
Notes: Call this method explicitly to let the speech recognizer know that no more audio input is coming.

183.2.7 Properties

183.2.8 nativeAudioFormat as Variant

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The preferred audio format for optimal speech recognition.
Notes: Use the audio format in this property as a hint for optimal recording, but don't depend on the value remaining unchanged.

Value is a AVAudioFormatMBS. We use variant to reduce dependency to other plugins.
(Read only property)

183.3 class SFSpeechRecognitionRequestMBS

183.3.1 class SFSpeechRecognitionRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: An abstract class representing a request to recognize speech from an audio source.
Notes: Do not create SFSpeechRecognitionRequestMBS objects directly. Create an SFSpeechURLRecognitionRequestMBS or SFSpeechAudioBufferRecognitionRequestMBS object instead. Use the properties of this class to configure various aspects of your request object before you start the speech recognition process. For example, use the shouldReportPartialResults property to specify whether you want partial results or only the final result of speech recognition.

Requires MacOS 10.15 or later.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Playing with SpeechRecognition

183.3.2 Methods

183.3.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The private constructor.

183.3.4 contextualStrings as String()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: An array of phrases that should be recognized, even if they are not in the system vocabulary.
Notes: Use this property to specify short custom phrases that are unique to your app. You might include phrases with the names of characters, products, or places that are specific to your app. You might also include domain-specific terminology or unusual or made-up words. Assigning custom phrases to this property improves the likelihood of those phrases being recognized.
Keep phrases relatively brief, limiting them to one or two words whenever possible. Lengthy phrases are less likely to be recognized. In addition, try to limit each phrase to something the user can say without pausing. Limit the total number of phrases to no more than 100.

183.3.5 setContextualStrings(contextualStrings() as String)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Sets array of phrases that should be recognized, even if they are not in the system vocabulary.
Notes: Use this property to specify short custom phrases that are unique to your app. You might include phrases with the names of characters, products, or places that are specific to your app. You might also include domain-specific terminology or unusual or made-up words. Assigning custom phrases to this property improves the likelihood of those phrases being recognized.
Keep phrases relatively brief, limiting them to one or two words whenever possible. Lengthy phrases are less likely to be recognized. In addition, try to limit each phrase to something the user can say without pausing. Limit the total number of phrases to no more than 100.

183.3.6 Properties

183.3.7 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Internal object reference.
Notes: (Read and Write property)

183.3.8 interactionIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: An identifier string that you use to describe the type of interaction associated with the speech recognition request.
Notes: If different parts of your app have different speech recognition needs, you can use this property to identify the part of your app that is making each request. For example, if one part of your app lets users speak phone numbers and another part lets users speak street addresses, consistently identifying the part of the app that makes a recognition request may help improve the accuracy of the results.
(Read and Write property)

183.3.9 requiresOnDeviceRecognition as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: A Boolean value that determines whether a request must keep its audio data on the device.
Notes: Set this property to true to prevent an SFSpeechRecognitionRequestMBS from sending audio over the network. However, on-device requests won,Äôt be as accurate.

The request only honors this setting if the supportsOnDeviceRecognition (SFSpeechRecognizerMBS) property is also YES.
(Read and Write property)

183.3.10 shouldReportPartialResults as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether you want intermediate results returned for each utterance.
Notes: The default value of this property is true. If you want only final results (and you don't care about intermediate results), set this property to false to prevent the system from doing extra work.
(Read and Write property)

183.3.11 taskHint as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: A value that indicates the type of speech recognition being performed.
Notes: The default value of this property is kTaskHintUnspecified. See SFSpeechRecognitionResultMBS for constants.
(Read and Write property)

183.4 class SFSpeechRecognitionResultMBS

183.4.1 class SFSpeechRecognitionResultMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: An object containing the partial or final results of a speech recognition request.
Example:

```
// show the final text and the alternative transcriptions of a speech recognition result
// MyRecognizer is a subclass of SFSpeechRecognizerMBS with the TaskDidFinishRecognition event implemented.
// Recognizer is a property of the window: Recognizer As MyRecognizer
Recognizer = New MyRecognizer
Call Recognizer.recognitionTaskWithRequest(New SFSpeechURLRecognitionRequestMBS(SpecialFolder.Desktop.Child("memo.m4a")))

// in MyRecognizer:
Sub TaskDidFinishRecognition(task As SFSpeechRecognitionTaskMBS, recognitionResult As SFSpeechRecognitionResultMBS) Handles TaskDidFinishRecognition
System.DebugLog "Best: " + recognitionResult.bestTranscription.formattedString + If(recognitionResult.final, " (final)", "")
For Each t As SFTranscriptionMBS In recognitionResult.transcriptions
System.DebugLog " Alternative: " + t.formattedString
Next
End Sub
```

Notes: Use an SFSpeechRecognitionResultMBS object to retrieve the results of a speech recognition request. You do not create these objects directly. Instead, the Speech framework creates them and passes them to the handler block or delegate object you specified when starting your speech recognition task.
A speech recognition result object contains one or more transcriptions of the current utterance. Each transcription has a confidence rating indicating how likely it is to be correct. (You can also get the transcription with the highest rating directly from the bestTranscription property.)
If you requested partial results from the speech recognizer, the transcriptions may represent only part of the total audio content. Use the final property to determine if the request contains partial or final results.

Requires MacOS 10.15 or later.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

183.4.2 Methods

183.4.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The private constructor.

183.4.4 copy as SFSpeechRecognitionResultMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

183.4.5 transcriptions as SFTranscriptionMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: An array of potential transcriptions, sorted in descending order of confidence.
Notes: All transcriptions correspond to the same utterance, which can be a partial or final result of the overall request. The first transcription in the array has the highest confidence rating, followed by transcriptions with decreasing confidence ratings.

183.4.6 Properties

183.4.7 bestTranscription as SFTranscriptionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The transcription with the highest confidence level.
Notes: (Read only property)

183.4.8 final as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether speech recognition is complete and whether the transcriptions are final.
Notes: When a speech recognition request is final, its transcriptions do not change.
(Read only property)

183.4.9 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Internal object reference.
Notes: (Read and Write property)

183.4.10 Constants

Task Hints

Constant	Value	Description
kTaskHintConfirmation	3	A task that uses captured speech for short, confirmation-style requests. Use this hint type when you are using speech recognition to handle confirmation commands, such as "yes," "no," or "maybe."
kTaskHintDictation	1	A task that uses captured speech for text entry. Use this hint type when you are using speech recognition for a task that's similar to the keyboard's built-in dictation function.
kTaskHintSearch	2	A task that uses captured speech to specify seach terms. Use this hint type when you are using speech recognition to identify search terms.
kTaskHintUnspecified	0	An unspecified type of task. Use this hint type when the intended use for captured speech does not match the other task types.

183.5 class SFSpeechRecognitionTaskMBS

183.5.1 class SFSpeechRecognitionTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: A task object that you use to monitor the speech recognition progress.
Example:

```
// turn the speech in an audio file into text (needs speech recognition permission)
// MyRecognizer is a subclass of SFSpeechRecognizerMBS with the events implemented.
// Recognizer is a property of the window: Recognizer As MyRecognizer
// Task is a property of the window: Task As SFSpeechRecognitionTaskMBS
Recognizer = New MyRecognizer(New NSLocaleMBS("en-US"))
Var request As New SFSpeechURLRecognitionRequestMBS(SpecialFolder.Desktop.Child("memo.m4a"))
Task = Recognizer.recognitionTaskWithRequest(request)

// in MyRecognizer:
Sub TaskDidFinishRecognition(task As SFSpeechRecognitionTaskMBS, recognitionResult As SFSpeechRecog-
nitionResultMBS) Handles TaskDidFinishRecognition
System.DebugLog "Text: " + recognitionResult.bestTranscription.formattedString
End Sub

Sub TaskDidFinishSuccessfully(task As SFSpeechRecognitionTaskMBS, successfully As Boolean) Handles
TaskDidFinishSuccessfully
If Not successfully And task.Error <>Nil Then System.DebugLog "Error: " + task.Error.localizedDescrip-
tion
End Sub
```

Notes: Use an SFSpeechRecognitionTaskMBS object to determine the state of a speech recognition task, to cancel an ongoing task, or to signal the end of the task.
You do not create speech recognition task objects directly. Instead, you receive one of these objects after calling recognitionTaskWithRequest.

Requires MacOS 10.15 or later.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Playing with SpeechRecognition

183.5.2 Methods

183.5.3 Cancel

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Cancels the current speech recognition task.
Notes: You can cancel recognition tasks for both prerecorded and live audio input. For example, you might cancel a task in response to a user action or because the recording was interrupted.
When canceling a task, be sure to release any resources associated with the task, such as the audio input resources you are using to capture audio samples.

183.5.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The private constructor.

183.5.5 Finish

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Stops accepting new audio and finishes processing on the audio input that has already been accepted.
Notes: For audio buffer–based recognition, recognition does not finish until this method is called, so be sure to call it when the audio source is exhausted.

183.5.6 Properties

183.5.7 Cancelled as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the speech recognition task was canceled.
Notes: By default, the value of this property is false.
(Read only property)

183.5.8 Error as NSErrorMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: An error object that specifies the error that occurred during a speech recognition task.
Notes: (Read only property)

183.5.9 Finishing as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether audio input has stopped.
Notes: By default, the value of this property is false.
(Read only property)

183.5.10 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Internal object reference.
Notes: (Read and Write property)

183.5.11 State as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The current state of the speech recognition task.
Notes: Check the value of this property to get the state of the in-progress speech recognition session. For valid values, see constants.
(Read only property)

183.5.12 Constants

States

Constant	Value	Description
kStateCanceling	3	Delivery of recognition results has finished, but audio recording may be ongoing.
kStateCompleted	4	Delivery of recognition requests has finished and audio recording has stopped.
kStateFinishing	2	Audio recording has stopped, but delivery of recognition results may continue.
kStateRunning	1	Speech recognition (potentially including audio recording) is in progress.
kStateStarting	0	Speech recognition (potentially including audio recording) has not yet started.

183.6 class SFSpeechRecognizerMBS

183.6.1 class SFSpeechRecognizerMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: An object you use to check for the availability of the speech recognition service, and to initiate the speech recognition process.
Example:

```
// transcribe an audio file to text on macOS
// The app needs speech recognition permission, see SFSpeechRecognizerMBS.requestAuthorization.
Var recognizer As New SFSpeechRecognizerMBS // uses the current locale
If Not recognizer.isAvailable Then
MessageBox "Speech recognition is not available."
Return
End If

Var request As New SFSpeechURLRecognitionRequestMBS(SpecialFolder.Desktop.Child("speech.m4a"))
// Task is a property of the window: Task As SFSpeechRecognitionTaskMBS
Task = recognizer.recognitionTaskWithRequest(request, AddressOf RecognitionCompleted)

// a method in the window:
Sub RecognitionCompleted(request As SFSpeechRecognitionRequestMBS, result As SFSpeechRecognition-
ResultMBS, error As NSErrorMBS, tag As Variant)
If result <>Nil Then
System.DebugLog result.bestTranscription.formattedString
ElseIf error <>Nil Then
System.DebugLog error.localizedDescription
End If
End Sub
```

Notes: An SFSpeechRecognizerMBS object is the central object for managing the speech recognizer process. Use this object to:

- Request authorization to use speech recognition services.
- Specify the language to use during the recognition process.
- Initiate new speech recognition tasks.

Set Up Speech Recognition
Each speech recognizer supports only one language, which you specify at creation time. The successful creation of a speech recognizer does not guarantee that speech recognition services are available. For some languages, the recognizer might require an Internet connection. Use the available property to find out if speech recognition services are available for the current language.

To initiate the speech recognition process, do the following:

- Request authorization to use speech recognition.
- Create an SFSpeechRecognizerMBS object.
- Verify the availability of services using the available property of your speech recognizer object.
- Prepare your audio content.
- Create a recognition request object—an object that descends from SFSpeechRecognitionRequest.
- Call the recognitionTaskWithRequest method to begin the recognition process.

The type of recognition request object you create depends on whether you are processing an existing audio file or an incoming stream of audio. For existing audio files, create a SFSpeechURLRecognitionRequestMBS object. For audio streams, create a SFSpeechAudioBufferRecognitionRequestMBS object.

Create a Great User Experience for Speech Recognition
Here are some tips to consider when adding speech recognition support to your app.

- Be prepared to handle failures caused by speech recognition limits. Because speech recognition is a network-based service, limits are enforced so that the service can remain freely available to all apps. Individual devices may be limited in the number of recognitions that can be performed per day, and each app may be throttled globally based on the number of requests it makes per day. If a recognition request fails quickly (within a second or two of starting), check to see if the recognition service became unavailable. If it is, you may want to ask users to try again later.
- Plan for a one-minute limit on audio duration. Speech recognition places a relatively high burden on battery life and network usage. To minimize this burden, the framework stops speech recognition tasks that last longer than one minute. This limit is similar to the one for keyboard-related dictation.
- Remind the user when your app is recording. For example, display a visual indicator and play sounds at the beginning and end of speech recognition to help users understand that they're being actively recorded. You can also display speech as it is being recognized so that users understand what your app is doing and see any mistakes made during the recognition process.
- Do not perform speech recognition on private or sensitive information. Some speech is not appropriate for recognition. Don't send passwords, health or financial data, and other sensitive speech for recognition.

Requires MacOS 10.15 or later.

- Playing with SpeechRecognition

183.6.2 Methods

183.6.3 authorizationStatus as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Returns your app's current authorization to perform speech recognition.
Notes: The user can reject your app's request to perform speech recognition, but your request can also be denied if speech recognition is not supported on the device. The app can also change your app's authorization status at any time from the Settings app.

183.6.4 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Whether the Speech Framework was loaded.
Notes: Returns true on MacOS 10.15 or newer.

183.6.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Creates a speech recognizer associated with the user's default language settings.
Notes: Returns an initialized speech recognizer object, or nil if there was a problem creating the object.

If the user's default language is not supported for speech recognition, this method attempts to fall back to the language used by the keyboard for dictation. If that fails, this method returns nil.
Even if this method returns a valid speech recognizer object, the speech recognition services may be temporarily unavailable. To determine whether speech recognition services are available, check the available property.
See also:

- 183.6.6 Constructor(locale as NSLocaleMBS) 22422

183.6.6 Constructor(locale as NSLocaleMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Creates a speech recognizer associated with the specified locale.
Notes: locale: The locale object representing the language you want to use for speech recognition. For a list of languages supported by the speech recognizer, see supportedLocales.

Returns an initialized speech recognizer object, or nil if the specified language was not supported.

If you specify a language that is not supported by the speech recognizer, this method attempts to fall back to the language used by the keyboard for dictation. If that fails, this method returns nil.
Even if this method returns a valid speech recognizer object, the speech recognition services may be temporarily unavailable. To determine whether speech recognition services are available, check the available property.
See also:

- 183.6.5 Constructor 22422

183.6.7 Destructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The destructor.

183.6.8 recognitionTaskWithRequest(request as SFSpeechRecognitionRequestMBS) as SFSpeechRecognitionTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Recognizes speech from the audio source associated with the specified request, using the specified events to manage the results.
Notes: request: A request (encapsulated in an SFSpeechRecognitionRequestMBS object) to recognize speech from an audio source.

Returns the task object you can use to manage an in-progress recognition request.

Use this method to initiate the speech recognition process on the audio contained in the request object. This method executes asynchronously and returns a SFSpeechRecognitionTaskMBS object that you can use to cancel or finalize the recognition process later. As results become available, the method calls the methods of the provided delegate object.
Note that the SFSpeechRecognitionTaskMBS object returned by this method does not retain your delegate object. You must maintain a strong reference to your delegate while speech recognition is in progress.
See also:

- 183.6.9 recognitionTaskWithRequest(request as SFSpeechRecognitionRequestMBS, delegateHandler as recognitionTaskWithRequestCompletedMBS, tag as Variant = nil) as SFSpeechRecognitionTaskMBS 22424

183.6.9 recognitionTaskWithRequest(request as SFSpeechRecognitionRequestMBS, delegateHandler as recognitionTaskWithRequestCompletedMBS, tag as Variant = nil) as SFSpeechRecognitionTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Executes the speech recognition request and delivers the results to the specified handler delegate.
Notes: request: A request (in an SFSpeechRecognitionRequestMBS object) to recognize speech from an audio source.
delegateHandler: The method to call when partial or final results are available, or when an error occurs. If the shouldReportPartialResults property is true, this event may be called multiple times to deliver the partial and final results.

The delegare has no return value and takes the following parameters:
result: A SFSpeechRecognitionResultMBS containing the partial or final transcriptions of the audio content.
error: An error object if a problem occurred. This parameter is nil if speech recognition was successful.

Request and Tag parameters are passed through to delegate.

Returns the task object you can use to manage an in-progress recognition request.

Use this method to initiate the speech recognition process on the audio contained in the request object. This method executes asynchronously and returns a SFSpeechRecognitionTaskMBS object that you can use to cancel or finalize the recognition process later. As results become available, the method calls the delegate in the delegateHandler parameter.
See also:

- 183.6.8 recognitionTaskWithRequest(request as SFSpeechRecognitionRequestMBS) as SFSpeechRecognitionTaskMBS 22423

183.6.10 requestAuthorization(delegateHandler as requestAuthorizationCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Asks the user to allow your app to perform speech recognition.
Notes: delegateHandler: The delegate to execute when your app's authorization status is known. The status parameter of the delegate contains your app's authorization status.

Call this method before performing any other tasks associated with speech recognition. This method executes asynchronously, returning shortly after you call it. At some point later, the system calls the provided handler block with the results.
When your app's authorization status is SFSpeechRecognizerAuthorizationStatusNotDetermined, this method causes the system to prompt the user to grant or deny permission for your app to use speech recognition.

The prompt includes the custom message you specify in the NSSpeechRecognitionUsageDescription key of your app's Info.plist file. The user's response is saved so that future calls to this method do not prompt the user again.

Your app's Info.plist file must contain the NSSpeechRecognitionUsageDescription key with a valid usage description. If this key is not present, your app will crash when you call this method.
For more information about requesting authorization, see Asking Permission to Use Speech Recognition.

183.6.11 supportedLocales as NSLocaleMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Returns the set of locales that are supported by the speech recognizer.
Notes: This method returns the locales for which speech recognition is supported. Support for a locale does not guarantee that speech recognition is currently possible for that locale. For some locales, the speech recognizer requires an active Internet connection to communicate with Apple's servers. If the speech recognizer is currently unable to process requests, available returns NO.
Speech recognition supports the same locales that are supported by the keyboard's dictation feature. For a list of these locales, see QuickType Keyboard: Dictation.

183.6.12 Properties

183.6.13 defaultTaskHint as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: A hint that indicates the type of speech recognition being requested.
Example:

```
Var recognizer as New MySFSpeechRecognizer
recognizer.defaultTaskHint = SFSpeechRecognitionResultMBS.kTaskHintDictation
```

Notes: By default, the value of this property overrides the SFSpeechRecognitionTaskHintUnspecified value for requests.
(Read and Write property)

183.6.14 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Internal object reference.
Notes: (Read and Write property)

183.6.15 isAvailable as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the speech recognizer is currently available.
Notes: When the value of this property is true, you may create new speech recognition tasks. When value of this property is false, speech recognition services are not available.
(Read only property)

183.6.16 locale as NSLocaleMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The locale of the speech recognizer.
Notes: The locale of the speech recognizer is an NSLocaleMBS object. The default value of this property is the system locale (that is, systemLocale).
(Read only property)

183.6.17 supportsOnDeviceRecognition as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the speech recognizer can operate without network access.
Notes: An SFSpeechRecognitionRequestMBS can only honor its requiresOnDeviceRecognition property if supportsOnDeviceRecognition is true. If supportsOnDeviceRecognition is false, the SFSpeechRecognizer requires a network in order to recognize speech.
(Read only property)

183.6.18 Events

183.6.19 availabilityDidChange(available as Boolean)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Tells you that the availability of its associated speech recognizer changed.
Notes: available: A Boolean value that indicates the new availability of the speech recognizer.

183.6.20 didDetectSpeech(task as SFSpeechRecognitionTaskMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Tells you when the task first detects speech in the source audio.
Notes: task: The speech recognition task (an SFSpeechRecognitionTaskMBS object) that represents the request.

183.6.21 TaskDidFinishRecognition(task as SFSpeechRecognitionTaskMBS, recognitionResult as SFSpeechRecognitionResultMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Tells you when the final utterance is recognized.
Notes: task: The speech recognition task (an SFSpeechRecognitionTaskMBS object) that represents the request.
recognitionResult: A recognized utterance that contains one or more transcription hypotheses in an SFSpeechRecognitionResultMBS object.

When this method is called, the delegate should expect no further information about the utterance to be reported.

183.6.22 TaskDidFinishSuccessfully(task as SFSpeechRecognitionTaskMBS, successfully as boolean)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Tells you when the recognition of all requested utterances is finished.
Notes: task: The speech recognition task (an SFSpeechRecognitionTaskMBS object) that represents the request.
successfully: A Boolean value that indicates whether the task was successful. When this parameter is false, use the error property of the task to get information about why the task was unsuccessful.

183.6.23 TaskDidHypothesizeTranscription(task as SFSpeechRecognitionTaskMBS, transcription as SFTranscriptionMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Tells you that a hypothesized transcription is available.
Notes: task: The speech recognition task (an SFSpeechRecognitionTaskMBS object) that represents the request.

transcription: The hypothesized transcription in an SFTranscriptionMBS object.

This method is called for all recognitions, including partial recognitions.

183.6.24 TaskFinishedReadingAudio(task as SFSpeechRecognitionTaskMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Tells you when the task is no longer accepting new audio input, even if final processing is in progress.
Notes: task: The speech recognition task (an SFSpeechRecognitionTask object) that represents the request.

183.6.25 TaskWasCancelled(task as SFSpeechRecognitionTaskMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Tells you that the task has been canceled.
Notes: task: The speech recognition task (an SFSpeechRecognitionTaskMBS object) that represents the request.

A speech recognition task can be canceled by the user, by your app, or by the system.

183.6.26 Constants

AuthorizationStatus

Constant	Value	Description
kAuthorizationStatusAuthorized	3	The user granted your app's request to perform speech recognition.
kAuthorizationStatusDenied	1	The user denied your app's request to perform speech recognition.
kAuthorizationStatusNotDetermined	0	The app's authorization status has not yet been determined.
kAuthorizationStatusRestricted	2	The device prevents your app from performing speech recognition.

183.6.27 Delegates

183.6.28 recognitionTaskWithRequestCompletedMBS(request as SFSpeechRecognitionRequestMBS, result as SFSpeechRecognitionResultMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The delegate for the callback when recognition is done.

183.6.29 requestAuthorizationCompletedMBS(status as integer, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The delegate to call when authorization request finished.

183.7 class SFSpeechURLRecognitionRequestMBS

183.7.1 class SFSpeechURLRecognitionRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: A request to recognize speech in a recorded audio file.
Notes: Use an SFSpeechURLRecognitionRequest object to perform speech recognition on the contents of an existing audio file.

Requires MacOS 10.15 or later.
Subclass of the SFSpeechRecognitionRequestMBS class.

183.7.2 Methods

183.7.3 Constructor(File as FolderItem)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Creates a speech recognition request, initialized with the specified folderitem.
Notes: Use this method to create a request to recognize speech in a recorded audio file that resides at the specified URL. Pass the request to the recognizer's recognitionTaskWithRequest method to start recognition.
See also:

- 183.7.4 Constructor(URL as String) 22430

183.7.4 Constructor(URL as String)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Creates a speech recognition request, initialized with the specified URL.
Notes: Use this method to create a request to recognize speech in a recorded audio file that resides at the specified URL. Pass the request to the recognizer's recognitionTaskWithRequest method to start recognition.
See also:

- 183.7.3 Constructor(File as FolderItem) 22430

183.7.5 Properties

183.7.6 File as FolderItem

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The folderitem of the audio file.
Notes: (Read only property)

183.7.7 URL as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The URL of the audio file.
Notes: (Read only property)

183.8 class SFTranscriptionMBS

183.8.1 class SFTranscriptionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: A textual representation of the given speech it its entirety, as recognized by the speech recognizer.
Notes: Use SFTranscriptionMBS to obtain all the recognized utterances from your audio content. An utterance is a vocalized word or group of words that represent a single meaning to the speech recognizer (SFSpeechRecognizerMBS).
Use the formattedString property to retrieve the entire transcription of utterances, or use the segments property to retrieve an individual utterance (SFTranscriptionSegmentMBS).
You don,Äôt create an SFTranscriptionMBS directly. Instead, you retrieve it from an SFSpeechRecognitionResultMBS instance. The speech recognizer sends a speech recognition result to your app in one of two ways, depending on how your app started a speech recognition task.
You can start a speech recognition task by using the speech recognizer,Äôs recognitionTaskWithRequest method. When the task is complete, the speech recognizer sends an SFSpeechRecognitionResult instance to your resultHandler closure. Alternatively, you can use the speech recognizer,Äôs recognitionTaskWithRequest method to start a speech recognition task. When the task is complete, the speech recognizer uses events to send a SFSpeechRecognitionResultMBS by using the TaskDidFinishRecognition event.
An SFTranscriptionMBS represents only a potential version of the speech. It might not be an accurate representation of the utterances.

Requires MacOS 10.15 or later.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Playing with SpeechRecognition

183.8.2 Methods

183.8.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The private constructor.

183.8.4 copy as SFTranscriptionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

183.8.5 segments as SFTranscriptionSegmentMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: An array of transcription segments that represent the parts of the transcription, as identified by the speech recognizer.
Notes: The order of the segments in the array matches the order in which the corresponding utterances occur in the spoken content.

183.8.6 Properties

183.8.7 averagePauseDuration as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The average pause duration between words, measured in seconds.
Notes: (Read only property)

183.8.8 formattedString as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The entire transcription of utterances, formatted into a single, user-displayable string.
Notes: (Read only property)

183.8.9 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Internal object reference.
Notes: (Read and Write property)

183.8.10 speakingRate as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The number of words spoken per minute.
Notes: (Read only property)

183.9 class SFTranscriptionSegmentMBS

183.9.1 class SFTranscriptionSegmentMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: A discrete part of an entire transcription, as identified by the speech recognizer.
Example:

```
// show each recognized word with its time stamp and confidence, e.g. for subtitles
// MyRecognizer is a subclass of SFSpeechRecognizerMBS with the TaskDidFinishRecognition event implemented.
// Recognizer is a property of the window: Recognizer As MyRecognizer
Recognizer = New MyRecognizer
Call Recognizer.recognitionTaskWithRequest(New SFSpeechURLRecognitionRequestMBS(SpecialFolder.Desktop.Child("memo.m4a")))

// in MyRecognizer:
Sub TaskDidFinishRecognition(task As SFSpeechRecognitionTaskMBS, recognitionResult As SFSpeechRecognitionResultMBS) Handles TaskDidFinishRecognition
For Each s As SFTranscriptionSegmentMBS In recognitionResult.bestTranscription.segments
System.DebugLog Format(s.timestamp, "0.00") + " s (+" + Format(s.duration, "0.00") + "): " + s.substring + ", confidence " + Format(s.confidence * 100, "0") + "%"
Next
End Sub
```

Notes: Use SFTranscriptionSegmentMBS to get details about a part of an overall SFTranscriptionMBS. An SFTranscriptionSegmentMBS represents an utterance, which is a vocalized word or group of words that represent a single meaning to the speech recognizer (SFSpeechRecognizerMBS).

You don,Äôt create transcription object segments directly. Instead, you access them from a transcription,Äôs segments property.
A transcription segment includes the following information:

- The text of the utterance, plus any alternative interpretations of the spoken word.
- The character range of the segment within the formattedString of its parent SFTranscriptionMBS.
- A confidence value, indicating how likely it is that the specified string matches the audible speech.
- A timestamp and duration value, indicating the position of the segment within the provided audio stream.
- A voiceAnalytics metric, indicating the likelihood of a voice in a segment, and that voice,Äôs pitch, jitter, and shimmer properties.

Requires MacOS 10.15 or later.

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Playing with SpeechRecognition

183.9.2 Methods

183.9.3 alternativeSubstrings as String()

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: An array of alternate interpretations of the utterance in the transcription segment.

183.9.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The private constructor.

183.9.5 copy as SFTranscriptionSegmentMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

183.9.6 Properties

183.9.7 confidence as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The level of confidence the speech recognizer has in its recognition of the speech transcribed for the segment.
Notes: This property reflects the overall confidence in the recognition of the entire phrase. The value is 0 if there was no recognition, and it is closer to 1 when there is a high certainty that a transcription matches the user's speech exactly. For example, a confidence value of 0.94 represents a very high confidence level, and is more likely to be correct than a transcription with a confidence value of 0.72.
(Read only property)

183.9.8 duration as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The number of seconds it took for the user to speak the utterance represented by the segment.
Notes: (Read only property)

183.9.9 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Internal object reference.
Notes: (Read and Write property)

183.9.10 substring as String

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The string representation of the utterance in the transcription segment.
Notes: (Read only property)

183.9.11 substringRange as NSRangeMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The range information for the transcription segment,Äôs substring, relative to the overall transcription.
Notes: Use the range information to find the position of the segment within the formattedString property of the SFTranscription object containing this segment.
(Read only property)

183.9.12 timestamp as Double

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The start time of the segment in the processed audio stream.
Notes: The timestamp is the number of seconds between the beginning of the audio content and when the user spoke the word represented by the segment. For example, if the user said the word ,Äútime,Äù one second into the transcription ,ÄúWhat time is it,Äù, the timestamp would be equal to 1.0.
(Read only property)

183.9.13 voiceAnalytics as SFVoiceAnalyticsMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: An analysis of the transcription segment,Äôs vocal properties.
Notes: (Read only property)

183.10 class SFVoiceAnalyticsMBS

183.10.1 class SFVoiceAnalyticsMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: A collection of vocal analysis metrics.
Example:

```
// show pitch and jitter of the first recognized words
// MyRecognizer is a subclass of SFSpeechRecognizerMBS with the TaskDidFinishRecognition event implemented.
// Recognizer is a property of the window: Recognizer As MyRecognizer
Recognizer = New MyRecognizer
Call Recognizer.recognitionTaskWithRequest(New SFSpeechURLRecognitionRequestMBS(SpecialFolder.Desktop.Child("memo.m4a")))

// in MyRecognizer:
Sub TaskDidFinishRecognition(task As SFSpeechRecognitionTaskMBS, recognitionResult As SFSpeechRecognitionResultMBS) Handles TaskDidFinishRecognition
For Each s As SFTranscriptionSegmentMBS In recognitionResult.bestTranscription.segments
Var va As SFVoiceAnalyticsMBS = s.voiceAnalytics
If va = Nil Then Continue
Var pitch() As Double = va.pitch.acousticFeatureValuePerFrame
System.DebugLog s.substring + ": " + pitch.Count.ToString + " pitch values, jitter frames " + va.jitter.acousticFeatureValuePerFrame.Count.ToString
Next
End Sub
```

Notes: Requires MacOS 10.15 or later.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

183.10.2 Methods

183.10.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The private constructor.

183.10.4 copy as SFVoiceAnalyticsMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

183.10.5 Properties

183.10.6 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Internal object reference.
Notes: (Read and Write property)

183.10.7 jitter as SFAcousticFeatureMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The variation in pitch in each frame of a transcription segment, expressed as a percentage of the frame,Äôs fundamental frequency.
Notes: (Read only property)

183.10.8 pitch as SFAcousticFeatureMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The highness or lowness of the tone (fundamental frequency) in each frame of a transcription segment, expressed as a logarithm.
Notes: The value is a logarithm (base e) of the normalized pitch estimate for each frame.
(Read only property)

183.10.9 shimmer as SFAcousticFeatureMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The variation in vocal volume stability (amplitude) in each frame of a transcription segment, expressed in decibels.
Notes: (Read only property)

183.10.10 voicing as SFAcousticFeatureMBS

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: The likelihood of a voice in each frame of a transcription segment, expressed as a probability in the range [0.0, 1.0] .
Notes: (Read only property)

Chapter 184

Spell Checking

184.1 class NSSpellCheckerMBS

184.1.1 class NSSpellCheckerMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The spell checker class.
Example:

```
// find the first misspelled word in a text and get a suggestion
Var checker As New NSSpellCheckerMBS
Var text As String = "This sentense has a typo."
Var r As NSRangeMBS = checker.checkSpellingOfString(text, 0)

If r.Length >0 Then
Var word As String = text.Middle(r.Location, r.Length)
Var fix As String = checker.correctionForWordRange(r, text, "en")
MessageBox "Misspelled: " + word + EndOfLine + "Suggestion: " + fix
Else
MessageBox "No spelling mistakes."
End If
```

Notes: The NSSpellChecker object is used by a client (e.g. a document in an application) to spell-check a given String.
There is only one NSSpellChecker instance per application (since spell-checking is interactive and you only have one mouse and one keyboard).

The string being spell-checked need only be valid for the duration of the call to checkSpellingOfString or countWordsInString.

Requires Mac OS X 10.2.

184.1.2 Methods

184.1.3 availableLanguages as string()

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a list of the available languages.
Notes: Requires Mac OS X 10.5.

184.1.4 checkGrammarOfString(text as string, start as Integer, language as string, wrap as boolean) as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initiates a grammatical analysis of a given string.
Notes: text: String to analyze.
start: Location within string at which to start the analysis.
language: Language use in string. When nil, the language selected in the Spelling panel is used.
wrap: true to specify that the analysis continue to the beginning of string when the end is reached. false to have the analysis stop at the end of string.

outDetails: Optional. On output, dictionaries describing grammar-analysis details within the flagged grammatical unit. See the NSSpellServer class for information about these dictionaries.

Returns Location of the first flagged grammatical unit.

Available in Mac OS X v10.5 and later.
See also:

184.1.5 checkGrammarOfString(text as string, start as Integer, language as string, wrap as boolean, Details() as dictionary) as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initiates a grammatical analysis of a given string.
Notes: text: String to analyze.
start: Location within string at which to start the analysis.
language: Language use in string. When nil, the language selected in the Spelling panel is used.
wrap: true to specify that the analysis continue to the beginning of string when the end is reached. false to have the analysis stop at the end of string.
outDetails: Optional. On output, dictionaries describing grammar-analysis details within the flagged grammatical unit. See the NSSpellServer class for information about these dictionaries.

Returns Location of the first flagged grammatical unit.

Available in Mac OS X v10.5 and later.

184.1.8 checkSpellingOfString(text as string, start as Integer, language as string, wrap as boolean, byref WordCount as Integer) as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initiates a spell-check of a string.
Notes: Returns the range of the first misspelled word (and optionally the wordCount by reference).
See also:

- 184.1.6 checkSpellingOfString(text as string, start as Integer) as NSRangeMBS 22443
- 184.1.7 checkSpellingOfString(text as string, start as Integer, language as string, wrap as boolean) as NSRangeMBS 22444

184.1.9 checkString(text as string, range as NSRangeMBS = nil, checkingTypes as Int64 = -1, options as Dictionary = nil, byref orthography as NSOrthographyMBS, byref wordCount as Integer) as NSTextCheckingResultMBS()

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Requests unified text checking for the given range of the given string.
Notes: text: The string to check.
range: The range of the string to check.
checkingTypes: The type of checking to be performed. The possible constants are listed in NSTextCheckingType and can be combined using the C bit-wise OR operator to perform multiple checks at the same time.
options: The options dictionary specifying the types of checking to perform. See Spell Checking Option Dictionary Keys for the possible keys and expected values.

orthography: Returns by-reference, the orthography of the range of the string. See NSOrthographyMBS for more information.
wordCount: Returns by-reference, the word count for the range of the string.

Returns an array of NSTextCheckingResultMBS objects describing particular items found during checking and their individual ranges, sorted by range origin, then range end, then result type.

184.1.10 completionsForPartialWordRange(start as Integer, length as Integer, text as string, language as string="") as string()

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Searches possible completions for the given word.
Notes: Returns an array of strings, in the order in which they should be presented, representing complete words that the user might be trying to type when starting by typing the partial word at the given range in the given string.

Within the text, length characters are picked starting at at position (0 based) and matched agains the dictionary defined by language.
Up to around 100 words are returned.

Requires Mac OS X 10.3.
Returns an empty string on any error.

184.1.11 correctionForWordRange(range as NSRangeMBS, text as string, language as string) as string

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a single proposed correction if a word is mis-spelled.
Notes: range: The range of the word to be corrected.
text: The string containing the proposed correction.
language: The language.

Returns the proposed correct string.

184.1.12 countWordsInString(word as string, language as string="") as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Just counts the words without checking spelling.
Example:

```
Var text as string = "Hello World"
Var spell as NSSpellCheckerMBS // your spellchecker

MessageBox str(spell.countWordsInString(text,"en"))
```

Notes: Returns the number of words in text. The language argument specifies the language used in the string. If language is the empty string, the current selection in the Spelling panel's pop-up menu is used.

Returns -1 if text is nil or this spellchecker function is not available.

Returns -1 if counting words isn't supported by the spell server selected.

184.1.13 deletesAutospaceBetweenString(precedingString as string, followingString as string, language as String = "") as Boolean

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Deletes auto space between strings.
Notes: In some cases the space automatically inserted after an accepted candidate should be deleted when the next text is typed (e.g. if it is a period or comma). This method allows clients to recognize these cases in a standardized way.

184.1.14 dismissCorrectionIndicatorForView(view as NSViewMBS)

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop only.

Function: Dismisses the correction indicator for the specified view.

184.1.15 forgetWord(word as string)

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes the given word from the user dictionary.

184.1.16 guessesForWord(range as NSRangeMBS, word as string, language as string) as string()

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of possible substitutions for the specified string.
Notes: range: The range of the string to check.
word: The string to guess
language: The language of the string

Returns an array of strings containing possible replacement words.
Available in Mac OS X v10.6 and later.
See also:

- 184.1.17 guessesForWord(word as string) as string() 22447

184.1.17 guessesForWord(word as string) as string()

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array with words matching the given word.
Example:

```
Var a() as string
Var s as new NSSpellCheckerMBS
a=s.guessesForWord("Hell")

MessageBox str(a.Count)+" suggestions."
```

Notes: Returns nil on any error.

Returns an array of suggested spellings for the misspelled word word. If word contains all capital letters, or its first letter is capitalized, the suggested words are capitalized in the same way.
See also:

- 184.1.16 guessesForWord(range as NSRangeMBS, word as string, language as string) as string() 22447

184.1.18 hasLearnedWord(word as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Checks whether a word has been learned.
Notes: Returns true if the word is known.
Requires Mac OS X 10.5.

184.1.19 ignoredWords as string()

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The list of ignored words.
Example:

```
Var spell as new NSSpellCheckerMBS
Var f as FolderItem
Var i,c as Integer
Var t as TextOutputStream
Var n(-1) as string

f=SpecialFolder.Preferences.Child("SpellCheck RB.pref")
t=f.CreateTextFile
if t<>nil and spell<>nil then
n=spell.ignoredWords
MessageBox Join(n,EndOfLine)
end if
```

Notes: Returns nil on any error.

184.1.20 ignoreWord(word as string)

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds the word to the ignore list so it will be ignored for spell checking in this NSSpellCheckerMBS object.
Notes: Requires Mac OS X 10.2.

184.1.21 isAutomaticCapitalizationEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether automatic capitalization is enabled by the user.

184.1.22 isAutomaticDashSubstitutionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether automatic dash substitution is enabled by the user.

184.1.23 isAutomaticPeriodSubstitutionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether automatic period substitution is enabled by the user.

184.1.24 isAutomaticQuoteSubstitutionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether automatic quote substitution is enabled by the user.

184.1.25 isAutomaticSpellingCorrectionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether automatic spelling correction is enabled.
Notes: Available in Mac OS X v10.6 and later.

184.1.26 isAutomaticTextCompletionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether automatic text completion is enabled by the user.

184.1.27 isAutomaticTextReplacementEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether automatic spelling replacement is enabled.
Notes: Available in Mac OS X v10.6 and later.

184.1.28 languageForWordRange(range as NSRangeMBS, text as string, orthography as NSOrthographyMBS = nil) as string

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Clients who have an NSOrthography from NSTextCheckingTypeOrthography checking and wish to determine a specific language from it for a particular word.

184.1.29 languageMenuEntries as string()

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The entries from the language menu of the panel.
Notes: Copies the list of menu entries from the panel.

Currently you can use this names to show to the user and see what languages are available. It uses a private property which works for Mac OS X 10.4 and 10.5.
For the language function you need the short names:

Australian English	en_AU
British English	en_GB
Canadian English	en_CA
Deutsch	de
English	en
Espa√±ol	es
Fran√ßais	fr
Italiano	it
Multilingual	Multilingual
Nederlands	nl
Portugu√™s	pt
Protugu√™s do Brasil	pt_BR
Svenska	sv

184.1.30 learnWord(word as string)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Learns the given word.
Notes: Requires Mac OS X 10.5.

184.1.31 menuForResult(TextCheckingResult as NSTextCheckingResultMBS, checkedString as string, options as Dictionary = nil, atLocation as NSPointMBS, view as NSViewMBS) as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop only.

Function: Provides a menu containing contextual menu items suitable for certain kinds of detected results.
Notes: TextCheckingResult: The NSTextCheckingResult instance for the checked string.
checkedString: The string that has been checked.
options: The options dictionary allows clients to pass in information associated with the document. See Spell Checking Option Dictionary Keys for possible key-value pairs.

location: The location, in the view,Äôs coordinate system, to display the menu.
view: The view object over which to display the contextual menu.

Returns a menu suitable for displaying as a contextual menu, or adding to another contextual menu as a submenu.

184.1.32 NSSpellCheckerDidChangeAutomaticCapitalizationNotification as string

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The notification named used when automatic capitalization setting changed.

184.1.33 NSSpellCheckerDidChangeAutomaticDashSubstitutionNotification as string

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The notification named used when automatic dash substitution setting changed.

184.1.34 NSSpellCheckerDidChangeAutomaticPeriodSubstitutionNotification as string

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The notification named used when automatic period substitution setting changed.

184.1.35 NSSpellCheckerDidChangeAutomaticQuoteSubstitutionNotification as string

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The notification named used when automatic quote substitution setting changed.

184.1.36 NSSpellCheckerDidChangeAutomaticSpellingCorrectionNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Use with NSNotificationObserverMBS class.
This notification is posted when the spell checker did change text using automatic spell checking correction. The are posted to the application's default notification center.
Available in Mac OS X v10.7 and later.

184.1.37 NSSpellCheckerDidChangeAutomaticTextCompletionNotification as string

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The notification named used when automatic text completion setting changed.

184.1.38 NSSpellCheckerDidChangeAutomaticTextReplacementNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Use with NSNotificationObserverMBS class.
This notification is posted when the spell checker changed text using automatic text replacement. The are posted application's to the default notification center.
Available in Mac OS X v10.7 and later.

184.1.39 NSTextCheckingDocumentAuthorKey as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for the options dictionary.
Notes: An string containing the name of an author to be associated with the document

Available in Mac OS X v10.6 and later.

184.1.40 NSTextCheckingDocumentTitleKey as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for the options dictionary.
Notes: A string containing the title to be associated with the document.

Available in Mac OS X v10.6 and later.

184.1.41 NSTextCheckingDocumentURLKey as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for the options dictionary.
Notes: An NSURL to be associated with the document.

Available in Mac OS X v10.6 and later.

184.1.42 NSTextCheckingOrthographyKey as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for the options dictionary.
Notes: An NSOrthography instance indicating an orthography to be used as a starting point for orthography checking, or as the orthography if orthography checking is not enabled.

Available in Mac OS X v10.6 and later.

184.1.43 NSTextCheckingQuotesKey as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for the options dictionary.
Notes: An NSArray containing four strings to be used with NSTextCheckingTypeQuote (opening double quote, closing double quote, opening single quote, and closing single quote in that order); if not specified, values will be taken from user's preferences.

Available in Mac OS X v10.6 and later.

184.1.44 NSTextCheckingReferenceDateKey as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for the options dictionary.
Notes: An NSDate to be associated with the document, used as a referent for relative dates; if not specified, the current date will be used.

Available in Mac OS X v10.6 and later.

184.1.45 NSTextCheckingReferenceTimeZoneKey as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for the options dictionary.
Notes: An NSTimeZone to be associated with the document, used as a reference for dates without time zones; if not specified, the current time zone will be used.

Available in Mac OS X v10.6 and later.

184.1.46 NSTextCheckingRegularExpressionsKey as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for the options dictionary.
Notes: Available in Mac OS X 10.7 or newer.
Currently not directly supported with our plugins.

184.1.47 NSTextCheckingReplacementsKey as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for the options dictionary.
Notes: A dictionary containing replacements to be used with NSTextCheckingTypeReplacement; if not specified, values will be taken from user's preferences.

Available in Mac OS X v10.6 and later.

184.1.48 NSTextCheckingSelectedRangeKey as string

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for the options dictionary.
Notes: NSValueMBS containing NSRangeMBS, should be the portion of the selected range intersecting the string being checked, or a zero-length range if there is an insertion point in or adjacent to the string being checked, or New NSRangeMBS(NSNotFound, 0) if the selection is entirely outside of the string being checked.

184.1.49 preventsAutocorrectionBeforeString(text as string, language as String = "") as Boolean

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: In some cases the next typing should prevent a pending correction (if it is an @, for example).
Notes: This method allows clients to recognize these cases in a standardized way.

184.1.50 recordResponse(response as Integer, correction as string, word as string, language as String = "")

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Records the user response to the correction indicator being displayed.
Notes: response: The user,Äôs response. The possible values are shown in NSCorrectionResponse.
correction: The corrected word. This should match the original correction.
word: The original word. This should match the original correction.
language: The language being edited. This should match the original correction.

When a correction is automatically proposed, the user may respond in one of several ways. Clients may report this to the spell checker so that it can learn from the user's response and adjust future correction behavior accordingly.

Use of this method implies that the client stored the original word and original correction at least from the point at which the user accepts it until the user edits or reverts it.

184.1.51 requestCandidatesForSelectedRange(selectedRange as NSRangeMBS, stringToCheck as string, types as Int64 = -1, options as Dictionary = nil, tag as Variant = nil) as Integer

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Requests candidates in background.

184.1.52 requestCheckingOfString(stringToCheck as string, range as NSRangeMBS, types as Int64 = -1, options as Dictionary = nil, tag as Variant = nil) as Integer

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Requests that the string be checked in the background.

Notes: stringToCheck: The string to check.
range: The range of the string to check.
types: The type of checking to be performed. The possible constants are listed in NSTextCheckingType and can be combined using the C bit-wise OR operator to perform multiple checks at the same time.
options: The options dictionary specifying the types of checking to perform. See Spell Checking Option Dictionary Keys for the possible keys and expected values.
tag: An identifier unique within the application used to inform the spell checker which document that text is associated, potentially for many purposes, not necessarily just for ignored words. A value of 0 can be passed in for text not associated with a particular document.

The return value is a monotonically increasing sequence number that can be used to keep track of requests in flight.

Calls requestCheckingOfStringCompleted event later on main thread.

184.1.53 setIgnoredWords(words() as string)

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the ignored word list.
Example:

```
Var spell as NSSpellCheckerMBS // your spellchecker

Var f as FolderItem
Var t as TextInputStream
Var words(-1),line as string

f=SpecialFolder.Preferences.Child("SpellCheck RB.pref")
t=f.OpenAsTextFile
if t<>nil and spell<>nil then

while not t.eof
line=t.ReadLine(encodings.UTF8)
if line<>"" then
words.Append line
end if
wend

spell.setIgnoredWords words

end if
```

184.1.54 setLanguage(language as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Allows programmatic setting of the language to spell-check in.
Notes: Normally chosen by a pop-up-list in the spelling panel and defaulted to the user's preferred language, so call this with care.
Set to "" to use the language from the panel popup menu.

184.1.55 sharedSpellCheckerExists as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether the application's NSSpellChecker has already been created.
Notes: Returns true if the shared spell checker already exists, otherwise false.

184.1.56 spellingPanel as NSPanelMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: The spelling panel used for spell checking.

184.1.57 unlearnWord(word as string)

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Tells the spell checker to unlearn a given word.
Notes: Available in Mac OS X v10.5 and later.
Same as the older forgetWord.

184.1.58 updatePanels

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Updates the available panels to account for user changes.
Notes: This method should be called when a client changes some relevant setting, such as what kind of spelling, grammar checking, or substitutions it uses.

Available in Mac OS X v10.6 and later.

184.1.59 updateSpellingPanelWithGrammarString(lang as string, detail as dictionary)

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Specifies a grammar-analysis detail to highlight in the Spelling panel.
Notes: problemString: Problematic grammatical unit identified by checkGrammarOfString.
detail: One of the grammar-analysis details provided by checkGrammarOfString.

Available in Mac OS X v10.5 and later.

184.1.60 updateSpellingPanelWithMisspelledWord(word as string)

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Updates the panel with the word.
Notes: The checkSpellingOfString methods return the range of the misspelled word found. It is up to the client to select that word in their document and to cause the spelling panel to update itself to reflect the found misspelling. Clients can call updateSpellPanelWithMisspelledWord to insure that the spell panel is up to date.

184.1.61 userPreferredLanguages as string()

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Provides a subset of the available languages to be used for spell checking.
Notes: Returns an array containing the user's preferred languages for spell checking. The order is set in the system preferences.

If automaticallyIdentifiesLanguages is true, then text checking will automatically use this method as appropriate; otherwise, it will use the language set by Language property.

The older checkSpellingOfString and checkGrammarOfString methods will use the language set by Language property, if they are called with an empty language argument.

Available in Mac OS X v10.6 and later.

184.1.62 userQuotesArrayForLanguage(lang as string) as string()

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the default values for quote replacement.
Example:

```
Var n as new NSSpellCheckerMBS

Var en(-1) as string = n.userQuotesArrayForLanguage("en")

MessageBox Join(en," ")
```

Notes: An array of quote replacements used by the NSTextCheckingQuotesKey key-value pair.

Available in Mac OS X v10.6 and later.

184.1.63 userReplacementsDictionary as dictionary

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the dictionary used when replacing words.
Notes: The key-value pairs in this dictionary are used by the NSTextCheckingQuotesKey when replacing characters and words.

Available in Mac OS X v10.6 and later.

184.1.64 Properties

184.1.65 accessoryView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The Spelling panel's accessory view.
Notes: The accessory view can be any custom view you want to display with the spelling panel. The accessory view is displayed below the spelling checker and the panel automatically resizes to accommodate the accessory view.

This method posts a notification named NSWindowDidResizeNotification with the Spelling panel object to the default notification center.

The accessory view or nil if there is none.
(Read and Write property)

184.1.66 automaticallyIdentifiesLanguages as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the spell checker will automatically identify languages.
Notes: Available in Mac OS X v10.6 and later.
(Read and Write property)

184.1.67 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The handle to the used NSSpellChecker reference.
Notes: (Read and Write property)

184.1.68 language as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current language used.
Example:

```
Var c as NSSpellCheckerMBS

c=new NSSpellCheckerMBS

c.Language="en"

MessageBox c.Language // shows en

c.Language="Dutch"

MessageBox c.Language // shows nl

c.Language="Multilingual"

MessageBox c.Language // shows Multilingual
```

Notes: (Read and Write property)

184.1.69 Length as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last length of the position where an error was found.
Notes: Length is 0 if no location was found.
(Read and Write property)

184.1.70 Location as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last location where an error was found.
Notes: (Read and Write property)

184.1.71 substitutionsPanel as NSPanelMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The substitutions panel.
Notes: (Read only property)

184.1.72 substitutionsPanelAccessoryViewController as NSViewControllerMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop only.

Function: Sets the substitutions panel,Äôs accessory view.
Notes: accessoryController: The accessory view controller or nil if there is none.

The accessory view controller can accommodate any custom view you want to display with the substitutions panel. The accessory view controller,Äôs view is displayed below the substitutions list and the panel automatically resizes to accommodate the accessory view.
This method posts a notification named NSWindowDidResizeNotification with the substitutions panel object to the default notification center.
(Read only property)

184.1.73 Tag as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The document tag for the current document.
Notes: Every NSSpellCheckerMBS gets a new tag. The tag identifies which ignore list is used. This value is set automatically.
(Read and Write property)

184.1.74 WordFieldValue as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The word textfield content string.
Notes: (Read and Write computed property)

184.1.75 Events

184.1.76 Correct

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: An event sent whenever the Correct button is pressed.

184.1.77 FindNext

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: An event sent whenever the Find Next button is pressed.

184.1.78 Ignore

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: An event sent whenever the Ignore button is pressed.

184.1.79 requestCandidatesForSelectedRangeCompleted(sequenceNumber as Integer, candidates() as NSTextCheckingResultMBS, stringToCheck as String, selectedRange as NSRangeMBS, checkingTypes as Int64, options as Dictionary, tag as Variant)

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Called later by requestCandidatesForSelectedRange method.

184.1.80 requestCheckingOfStringCompleted(sequenceNumber as Integer, results() as NSTextCheckingResultMBS, orthography as NSOrthographyMBS, wordCount as Integer, stringToCheck as String, Range as NSRangeMBS, checkingTypes as Int64, options as Dictionary, tag as Variant)

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Called later by requestCheckingOfString method.
Notes: sequenceNumber: A monotonically increasing sequence number.
results: An array of NSTextCheckingResultMBS objects describing particular items found during checking and their individual ranges, sorted by range origin, then range end, then result type..
orthography: The orthography of the string.
wordCount: The number of words in the range of the string.

184.1.81 Constants

Constants

Constant	Value	Description
NSGrammarCorrections	"NSGrammarCorrections"	One of the key constants for the dictionaries in the detai
NSGrammarRange	"NSGrammarRange"	One of the key constants for the dictionaries in the detai
NSGrammarUserDescription	"NSGrammarUserDescription"	One of the key constants for the dictionaries in the detai

Correction indicator type Constants

Constant	Value	Description
NSCorrectionIndicatorTypeDefault	0	The default indicator that shows a proposed correction. Available in Mac OS X v10.7 and later.
NSCorrectionIndicatorTypeGuesses	2	Shows multiple alternatives from which the user may choose the approp spelling. Available in Mac OS X v10.7 and later.
NSCorrectionIndicatorTypeReversion	1	Provides the option to revert to the original form after a correction has made. Available in Mac OS X v10.7 and later.

Response Constants

Constant	Value	Description
NSCorrectionResponseAccepted	1	The user accepted the correction. Available in Mac OS X v10.7 and later.
NSCorrectionResponseEdited	4	After the correction was accepted, the user edited the corrected word (to something other than its original form. Available in Mac OS X v10.7 and later.
NSCorrectionResponseIgnored	3	The user continued in such a way as to ignore the correction. Available in Mac OS X v10.7 and later.
NSCorrectionResponseNone	0	No response was received from the user. Available in Mac OS X v10.7 and later.
NSCorrectionResponseRejected	2	The user rejected the correction by dismissing the correction indicator. Available in Mac OS X v10.7 and later.
NSCorrectionResponseReverted	5	After the correction was accepted, the user reverted the correction back to the original word. Available in Mac OS X v10.7 and later.

184.2 class WinSpellCheckerExceptionMBS

184.2.1 class WinSpellCheckerExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: The class for an exception with spell checking classes.
Notes: Subclass of the RuntimeException class.

184.3 class WinSpellCheckerMBS

184.3.1 class WinSpellCheckerMBS

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Represents a particular spell checker for a particular language.
Example:

```
Var w As New WinSpellCheckerMBS("en-US")

Var Text As String = "Helo World"
Var errors() As WinSpellingErrorMBS = w.Check(Text)
Var Error As WinSpellingErrorMBS = errors(0)

MessageBox "Spelling error in """ + text.Mid(error.StartIndex+1, error.Length)+"""
```

Notes: Requires Windows 8.

184.3.2 Methods

184.3.3 Add(word as String)

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Treats the provided word as though it were part of the original dictionary.
Notes: The word will no longer be considered misspelled, and will also be considered as a candidate for suggestions.

Raises WinSpellCheckerExceptionMBS in case of an error.

184.3.4 AutoCorrect(FromWord as String, ToWord as String)

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Causes occurrences of one word to be replaced by another.
Notes: FromWord: The incorrectly spelled word to be autocorrected.
ToWord: The correctly spelled word that should replace from.

Raises WinSpellCheckerExceptionMBS in case of an error.

184.3.5 Check(text as String) as WinSpellingErrorMBS()

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Checks the spelling of the supplied text and returns a collection of spelling errors.
Example:

```
Var w As New WinSpellCheckerMBS("en-US")

Var Text As String = "Helo World"
Var errors() As WinSpellingErrorMBS = w.Check(Text)
Var Error As WinSpellingErrorMBS = errors(0)

MessageBox "Spelling error in """ + text.Mid(error.StartIndex+1, error.Length)+"""
```

Notes: text: The text to check.

Returns an array of error objects.

Raises WinSpellCheckerExceptionMBS in case of an error.

184.3.6 ComprehensiveCheck(text as String) as WinSpellingErrorMBS()

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Checks the spelling of the supplied text in a more thorough manner than Check, and returns a collection of spelling errors.
Notes: Raises WinSpellCheckerExceptionMBS in case of an error.

184.3.7 Constructor(languageTag as String)

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Creates a spell checker that supports the specified language.
Notes: languageTag: A BCP47 language tag that identifies the language for the requested spell checker.

Raises WinSpellCheckerExceptionMBS in case of an error.

184.3.8 Destructor

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: The destructor.

184.3.9 Ignore(word as String)

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Ignores the provided word for the rest of this session.
Notes: Until this WinSpellCheckerMBS object is released, the word will no longer be considered misspelled, but it will not be considered as a candidate for suggestions.

Raises WinSpellCheckerExceptionMBS in case of an error.

184.3.10 IsSupported(languageTag as String) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Determines if the specified language is supported by a registered spell checker.
Example:

```
If WinSpellCheckerMBS.IsSupported("en-US") Then
MessageBox "US-English is supported."
Else
MessageBox "US-English is not supported!"
End If

If WinSpellCheckerMBS.IsSupported("de-CH") Then
MessageBox "Swiss German is supported."
Else
MessageBox "Swiss German is not supported!"
```

End If

Notes: languageTag: A BCP47 language tag that identifies the language for the requested spell checker. e.g. "en-US"

Returns true if supported; false if not supported.

Raises WinSpellCheckerExceptionMBS in case of an error.

184.3.11 OptionDescription(optionId as String) as WinSpellCheckerOptionDescriptionMBS

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Retrieves the information (id, description, heading and labels) of a specific option.
Notes: optionId: Identifier of the option to be retrieved.
Returns WinSpellCheckerOptionDescriptionMBS interface that contains the information about optionId.

Raises WinSpellCheckerExceptionMBS in case of an error.

184.3.12 OptionIds as String()

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Gets all of the declared option identifiers.
Notes: Raises WinSpellCheckerExceptionMBS in case of an error.

184.3.13 OptionValue(optionId as String) as Integer

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Retrieves the value associated with the given option.
Notes: optionId: The option identifier.

Returns the value associated with optionId.

Raises WinSpellCheckerExceptionMBS in case of an error.

184.3.14 RegisterUserDictionary(dictionaryPath as String, languageTag as String)

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Registers a file to be used as a user dictionary for the current user, until unregistered.
Notes: dictionaryPath: The path of the dictionary file to be registered.
languageTag: The language for which this dictionary should be used. If left empty, it will be used for any language.

Raises WinSpellCheckerExceptionMBS in case of an error.

184.3.15 Remove(word as String)

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Removes a word that was previously added by Add, or set by Ignore to be ignored.
Notes: Word: The word to be removed from the list of added words, or from the list of ignored words. If the word is not present, nothing will be removed.

Raises exception if word is an empty string, or its length is greater than MAX_WORD_LENGTH (128).

Available on Windows 10 and later.

Raises WinSpellCheckerExceptionMBS in case of an error.

184.3.16 Suggest(word as String) as String()

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Retrieves spelling suggestions for the supplied text.
Example:

```
Var w As New WinSpellCheckerMBS("en-US")

Var suggestions() As String = w.Suggest("Helo")

MessageBox Join(suggestions, EndOfLine)
```

Notes: word: The word or phrase to get suggestions for.

Returns the list of suggestions, returned as string array.

Raises WinSpellCheckerExceptionMBS in case of an error.

184.3.17 SupportedLanguages as String()

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Gets the set of languages/dialects supported by any of the registered spell checkers.
Example:

MessageBox Join(WinSpellCheckerMBS.SupportedLanguages, EndOfLine)

Notes: The supported languages are specific, not neutral.
For Hebrew, for example, the supported language is "he-IL", not "he".

Raises WinSpellCheckerExceptionMBS in case of an error.

184.3.18 UnregisterUserDictionary(dictionaryPath as String, languageTag as String)

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Unregisters a previously registered user dictionary. The dictionary will no longer be used by the spell checking functionality.
Notes: dictionaryPath: The path of the dictionary file to be unregistered.
languageTag: The language for which this dictionary was used. It must match the language passed to RegisterUserDictionary.

Raises WinSpellCheckerExceptionMBS in case of an error.

184.3.19 Properties

184.3.20 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

184.3.21 Id as String

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Gets the identifier for this spell checker.
Example:

```
Var w As New WinSpellCheckerMBS("en-US")

MessageBox w.Id
```

Notes: Raises WinSpellCheckerExceptionMBS in case of an error.
(Read only property)

184.3.22 LanguageTag as String

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Gets the BCP47 language tag this instance of the spell checker supports.
Example:

```
Var w As New WinSpellCheckerMBS("en-US")

MessageBox w.LanguageTag
```

Notes: Raises WinSpellCheckerExceptionMBS in case of an error.
(Read only property)

184.3.23 LocalizedName as String

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Gets text, suitable to display to the user, that describes this spell checker.
Example:

```
Var w As New WinSpellCheckerMBS("en-US")

MessageBox w.LocalizedName
```

Notes: Raises WinSpellCheckerExceptionMBS in case of an error.
(Read only property)

184.3.24 Events

184.3.25 Changed

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: The changed event.
Notes: The SpellCheckerChanged event fires whenever the state of the spell checker changes in a way such that any text that has been checked should be rechecked. This should happen when the contents of a word list changes, when an option changes, or when the default spell checker changes.

184.4 class WinSpellCheckerOptionDescriptionMBS

184.4.1 class WinSpellCheckerOptionDescriptionMBS

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Represents the description of a spell checker option.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 21.2pr3

184.4.2 Methods

184.4.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

184.4.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: The destructor.

184.4.5 Labels as String()

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Gets the label enumerator for the spell checker option.
Notes: When there is a single label, the valid values for this option are 0 (not chosen) and 1 (chosen). When there is more than one label, the first label is associated with the value 0, the second with 1, and so on, effectively forming an enumeration. The labels should be in the language of the spell checker or localized to the user's UI language.

Raises WinSpellCheckerExceptionMBS in case of an error.

184.4.6 Properties

184.4.7 Description as String

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Get the description of the spell checker option.
Notes: The description explains the implications of making the various choices associated with the option. This should be in the language of the spell checker or localized to the user's UI language.

Raises WinSpellCheckerExceptionMBS in case of an error.
(Read only property)

184.4.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

184.4.9 Heading as String

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Gets the heading for the spell checker option.
Notes: The heading can be used to group sets of options by placing the header on the first item of that group. This should be in the language of the spell checker or localized to the user's UI language.

Raises WinSpellCheckerExceptionMBS in case of an error.
(Read only property)

184.4.10 Id as String

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Gets the identifier of the spell checker option.
Notes: Option identifiers all exist in the same area. Spell checker providers should use the engine identifier and the language tag (if the option is language-specific) to disambiguate potential collisions.

Specifically, the structure for naming the option identifiers should be:

For the Microsoft spell checker engine: <language tag>:<option name>. For example, ”pt-BR:2009Reform.” For spell check provider engines: <engine id>:<language tag>:<option name>(the language tag may be omitted if the option is not language specific). For example, ”samplespell:fr-FR:AccentedUppercase”.

Spell check providers are allowed to support existing Microsoft option identifiers, but they must not create new option identifiers in the Microsoft namespace. That is, spell check providers must use the engine identifier as a prefix.

An option identifier is linked to the set of labels and the semantics associated with them. If any change needs to be made between versions to the option (adding a label to the set of labels), a new option with a new identifier must be used. The only valid change that does not require a new identifier is to change from a single label to two labels and vice-versa when the semantics for values 0 and 1 do not change.

Raises WinSpellCheckerExceptionMBS in case of an error.
(Read only property)

184.5 class WinSpellingErrorMBS

184.5.1 class WinSpellingErrorMBS

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Provides information about a spelling error.
Example:

```
Var w As New WinSpellCheckerMBS("en-US")

// tell it to capitalize Xojo!
w.AutoCorrect "xojo", "Xojo"

Var Text As String = "Hello xojo!"
Var errors() As WinSpellingErrorMBS = w.check(Text)
Var Error As WinSpellingErrorMBS = errors(0)

MessageBox "Spelling error in """ + Text.Mid(error.StartIndex+1, error.Length)+"""". Must be "+error.Replacement
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

184.5.2 Methods

184.5.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

184.5.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: The destructor.

184.5.5 Properties

184.5.6 CorrectiveAction as Integer

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Indicates which corrective action should be taken for the spelling error.
Notes: Raises WinSpellCheckerExceptionMBS in case of an error.
(Read only property)

184.5.7 Length as Integer

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Gets the length of the erroneous text.
Notes: Raises WinSpellCheckerExceptionMBS in case of an error.
(Read only property)

184.5.8 Replacement as String

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Gets the text to use as replacement text when the corrective action is replace.
Example:

```
Var w As New WinSpellCheckerMBS("en-US")

// tell it to capitalize Xojo!
w.AutoCorrect "xojo", "Xojo"

Var Text As String = "Hello xojo!"
Var errors() As WinSpellingErrorMBS = w.check(Text)
Var Error As WinSpellingErrorMBS = errors(0)

MessageBox "Spelling error in """ + Text.Mid(error.StartIndex+1, error.Length)+"""". Must be "+error.Replacement
```

Notes: If the CorrectiveAction returned by CorrectiveAction is not kCorrectiveActionReplace, value is the empty string.

Raises WinSpellCheckerExceptionMBS in case of an error.

If empty, you may better go with Suggest() function in WinSpellCheckerMBS class.

(Read only property)

184.5.9 StartIndex as Integer

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: Gets the position in the checked text where the error begins.
Notes: Index is zero based!

Raises WinSpellCheckerExceptionMBS in case of an error.
(Read only property)

184.5.10 Text as String

MBS WinFrameworks Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop only.

Function: The text referenced.
Notes: For your convenience we prepare Text.Middle(StartIndex, Length) for you here.
(Read only property)

184.5.11 Constants

Corrective Actions

Constant	Value	Description
kCorrectiveActionDelete	3	The user should be prompted to delete the indicated erroneous text.
kCorrectiveActionGetSuggestions	1	The user should be prompted with a list of suggestions as returned by Suggest
kCorrectiveActionNone	0	There are no errors.
kCorrectiveActionReplace	2	Replace the indicated erroneous text with the text provided in the suggestion The user does not need to be prompted.

Chapter 185

Spotlight

185.1 class MDItemMBS

185.1.1 class MDItemMBS

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: This is the class that represents a file and the metadata associated with the file.
Example:

```
// read Spotlight metadata of a file
Var item As New MDItemMBS(SpecialFolder.Desktop.Child("photo.jpg"))

MessageBox "Name: " + item.DisplayName + EndOfLine + _
"Kind: " + item.AttributeString(MDItemMBS.kMDItemKind) + EndOfLine + _
"Size: " + item.FSSize.ToString + " bytes" + EndOfLine + _
"Width: " + item.AttributeDouble(MDItemMBS.kMDItemPixelWidth).ToString + EndOfLine + _
"Attributes: " + String.FromArray(item.AttributeNames, ", ")
```

Notes: Available in Mac OS X version 10.4 and later.

185.1.2 Methods

185.1.3 AllAttributes as string()

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a list with all possible attribute names in the system.
Notes: Var item as new MDItemMBS(SpecialFolder.Desktop)

MessageBox join(item.AllAttributes, EndOfLine)

185.1.4 AttributeBoolean(name as string) as boolean

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the value for this attribute.

185.1.5 AttributeDouble(name as string) as Double

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the value for this attribute.

185.1.6 AttributeMultiValued(name as string) as boolean

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the given attribute is an array of multiple values.

185.1.7 AttributeNames as string()

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array containing the attribute names existing in the metadata item.
Example:

Var item as new MDItemMBS(SpecialFolder.Desktop)

MessageBox join(item.AttributeNames, EndOfLine)

Notes: Available in Mac OS X version 10.4 and later.

185.1.8 AttributeString(name as string) as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the value for this attribute.
Example:

```
Var item as new MDItemMBS(SpecialFolder.Desktop)

MessageBox item.AttributeString(item.kMDItemFSName)
```

185.1.9 AttributeStringArray(name as string) as string()

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the value for this attribute.

185.1.10 AttributeType(name as string) as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The type of the attribute.
Example:

```
Var item as new MDItemMBS(SpecialFolder.Desktop)

MessageBox item.AttributeType(item.kMDItemFSName) // "String"
```

Notes: Returns "Boolean", "Number", "Date" or "String".

185.1.11 Constructor(path as folderitem)

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an MDItem object for a file at the specified path.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var m as new MDItemMBS(f)
```

MessageBox m.DisplayName

Notes: path: A path to the file from which to create the MDItem.

Available in Mac OS X version 10.4 and later.

185.1.12 DisplayDescriptionForAttribute(name as string) as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The display description for the attribute.
Notes: Var item as new MDItemMBS(SpecialFolder.Desktop)

MessageBox item.DisplayDescriptionForAttribute(item.kMDItemDisplayName)
// shows "Lokalisiert angezeigter Name der Datei" in German

185.1.13 DisplayNameForAttribute(name as string) as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The display name for this attribute.
Example:

Var item as new MDItemMBS(SpecialFolder.Desktop)

MessageBox item.DisplayNameForAttribute(item.kMDItemDisplayName)
// shows "Anzeigename" in German

185.1.14 GetAttribute(name as string) as Variant

MBS MacOSX Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the value of the given attribute for the item.
Notes: name: The name of the desired attribute.

A variant, or nil on failure, or if the attribute does not exist, of if the attribute is not readable.

185.1.15 GetAttributes as dictionary

MBS MacOSX Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries all attributes with all names and values.
See also:

- 185.1.16 GetAttributes(names() as string) as dictionary 22485

185.1.16 GetAttributes(names() as string) as dictionary

MBS MacOSX Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the values of the given attributes for the item.
Notes: names: An array of the names of the desired attributes.
A dictionary where the keys are the attribute names, and the values are the attribute values, or nil on failure.
If an attribute does not exist, or is unreadable, there will be no key-value pair for it in the dictionary.
See also:

- 185.1.15 GetAttributes as dictionary 22484

185.1.17 kMDItemAcquisitionMake as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The manufacturer of the device used to aquire the document contents. A string.

185.1.18 kMDItemAcquisitionModel as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The model of the device used to aquire the document contents. For example, 100, 200, 400, etc. A string.

185.1.19 kMDItemAlbum as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The title for a collection of media. This is analagous to a record album, or photo album. A string.

185.1.20 kMDItemAltitude as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The altitude of the item in meters above sea level, expressed using the WGS84 datum. Negative values lie below sea level. A number.

185.1.21 kMDItemAperture as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The aperture setting used to acquire the document contents. This unit is the APEX value. A number.

185.1.22 kMDItemAppleLoopDescriptors as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Specifies multiple pieces of descriptive information about a loop. An array of strings.

Besides genre and instrument, files can contain descriptive information that help users in refining searches.

185.1.23 kMDItemAppleLoopsKeyFilterType as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Specifies key filtering information about a loop. Loops are matched against projects that often in a major or minor key. A string.

To assist users in identifying loops that will "fit" with their compositions, loops can be tagged with one of the following key filters: "AnyKey" "Minor" "Major" "NeitherKey" "BothKeys". "AnyKey" means that it fits with anything (whether in a major key, minor key or neither). "Minor" fits with compositions in a minor key. "NeitherKey" doesn't work well with compositions that are in major or minor key. "BothKeys" means it fits with major or minor key.

185.1.24 kMDItemAppleLoopsLoopMode as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.

Notes: Specifies how a file should be played. A string.

Tagged files can either be loops or non-loops (e.g., a cymbal crash). "Looping" indicates if the file should be treated as a loop. "Non-looping" indicates the file should not be treated as a loop.

185.1.25 kMDItemAppleLoopsRootKey as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Specifies the loop's original key. The key is the root note or tonic for the loop, and does not include the scale type. A string.

185.1.26 kMDItemApplicationCategories as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.27 kMDItemAttributeChangeDate as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The date and time of the last change made to a metadata attribute. A date.

185.1.28 kMDItemAudiences as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The audience for which the file is intended. The audience may be determined by the creator or the publisher or by a third party. An array of strings.

185.1.29 kMDItemAudioBitRate as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The audio bit rate. A number.

185.1.30 kMDItemAudioChannelCount as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Number of channels in the audio data contained in the file. A number.

This integer value only represents the number of discreet channels of audio data found in the file. It does not indicate any configuration of the data in regards to a user's speaker setup.

185.1.31 kMDItemAudioEncodingApplication as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The name of the application that encoded the data contained in the audio file. A string.

185.1.32 kMDItemAudioSampleRate as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Sample rate of the audio data contained in the file. The sample rate is a float value representing hz (audio_frames/second). For example: 44100.0, 22254.54. A number.

185.1.33 kMDItemAudioTrackNumber as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The track number of a song or composition when it is part of an album. A number (integer).

185.1.34 kMDItemAuthorAddresses as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: This attribute indicates the author addresses of the document.
An array of string. Requires Mac OS X 10.6.

185.1.35 kMDItemAuthorEmailAddresses as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: This attribute indicates the author of the emails message addresses. (This is always the email address, and not the human readable version). An array of string. Requires Mac OS X 10.5.

185.1.36 kMDItemAuthors as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The author, or authors, of the contents of the file. An array of strings.
The order of the authors is preserved, but does not represent the main author or relative importance of the authors.

185.1.37 kMDItemBitsPerSample as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The number of bits per sample. For example, the bit depth of an image (8-bit, 16-bit etc...) or the bit depth per audio sample of uncompressed audio data (8, 16, 24, 32, 64, etc..). A number.

185.1.38 kMDItemCameraOwner as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.39 kMDItemCFBundleIdentifier as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: If this item is a bundle, then this is the CFBundleIdentifier. A string

185.1.40 kMDItemCity as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Identifies city of origin according to guidelines established by the provider. A string.

For example, "New York", "Cupertino", or "Toronto".

185.1.41 kMDItemCodecs as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The codecs used to encode/decode the media. An array of strings.

185.1.42 kMDItemColorSpace as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The color space model used by the document contents. For example, "RGB", "CMYK", "YUV", or "YCbCr". A string.

185.1.43 kMDItemComment as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: A comment related to the file. This differs from the Finder comment, kMDItemFinderComment. A string.

185.1.44 kMDItemComposer as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The composer of the music contained in the audio file. A string.

185.1.45 kMDItemContactKeywords as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: A list of contacts that are associated with this document, not including the authors. An array of strings.

185.1.46 kMDItemContentCreationDate as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The date that the contents of the file were created. A date.

This is different than the file creation date. Its can be used to store when the file contents were first created, or first modified.

185.1.47 kMDItemContentModificationDate as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The date and time that the contents of the file were last modified. A date.

This is not necessarily the file modification date.

185.1.48 kMDItemContentType as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: For example, a jpeg image file will have a value of public.jpeg/public.image/public.data. The value of this attribute is set by the MDImporter. Changes to this value are lost when the file attributes are next imported.

185.1.49 kMDItemContentTypeTree as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Array of string

185.1.50 kMDItemContributors as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The entities responsible for making contributions to the content of the resource. An array of strings.

Examples of a contributor include a person, an organization or a service.

185.1.51 kMDItemCopyright as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The copyright owner of the file contents. A string.

185.1.52 kMDItemCountry as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The full, publishable name of the country or primary location where the intellectual property of the item was created, according to guidelines of the provider. A string.

185.1.53 kMDItemCoverage as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The extent or scope of the content of the resource. A string.

Coverage will typically include spatial location (a place name or geographic co-ordinates), temporal period (a period label, date, or date range) or jurisdiction (such as a named administrative entity).

Recommended best practice is to select a value from a controlled vocabulary, and that, where appropriate, named places or time periods be used in preference to numeric identifiers such as sets of co-ordinates or date ranges.

185.1.54 kMDItemCreator as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Application used to create the document content (e.g. "Word", "AppleWorks", etc.). A string.

185.1.55 kMDItemDateAdded as string

MBS MacOSX Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: This is the date that the file was moved into the current location.
Not all files will have this attribute.
Not all file systems support this attribute.

185.1.56 kMDItemDeliveryType as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The delivery type. Values are "Fast start" or "RTSP". A string.

185.1.57 kMDItemDescription as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: A description of the content of the resource. The description may include an abstract, table of contents, reference to a graphical representation of content or a free-text account of the content. A string.

185.1.58 kMDItemDirector as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Director of the movie. A string. Requires Mac OS X 10.5.

185.1.59 kMDItemDisplayName as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The localized version of the file name. A string.

185.1.60 kMDItemDownloadedDate as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.61 kMDItemDueDate as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Date this item is due. A date.

185.1.62 kMDItemDurationSeconds as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The duration, in seconds, of the content of file. A value of 10.5 represents media that is 10 and 1/2 seconds long. A number.

185.1.63 kMDItemEditors as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The list of editor/editors that has worked on this file. There could be 0 or more editors of a particular file. The order of the editors in the array is preserved, but is not intended to represent the main editor

or relative importance of the editors. Type is An array of strings.

185.1.64 kMDItemEmailAddresses as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Email addresses related to this item. An array of strings.

185.1.65 kMDItemEncodingApplications as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Application used to convert the original content into it's current form. For example, a PDF file might have an encoding application set to "Distiller". An array of strings.

185.1.66 kMDItemExecutableArchitectures as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.67 kMDItemEXIFGPSVersion as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The version of GPSInfoIFD header that was used to generate the metadata. A string. Requires Mac OS X 10.5.

185.1.68 kMDItemEXIFVersion as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The version of the EXIF header used to generate the metadata. A string.

185.1.69 kMDItemExposureMode as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The exposure mode used to acquire the document contents. A number.

Possible values are 0 (auto exposure), 1 (manual exposure) and 2 (auto bracket).

185.1.70 kMDItemExposureProgram as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The class of the exposure program used by the camera to set exposure when the image is taken. Possible values include: Manual, Normal, and Aperture priority. A string.

185.1.71 kMDItemExposureTimeSeconds as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The exposure time, in seconds, used to acquire the document contents. A number.

185.1.72 kMDItemExposureTimeString as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The time of the exposure. A string.

185.1.73 kMDItemFinderComment as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Finder comments for this file. A string.

185.1.74 kMDItemFlashOnOff as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Indicates if a camera flash was used. A number.

185.1.75 kMDItemFNumber as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The diameter of the diaphragm aperture in terms of the effective focal length of the lens.

185.1.76 kMDItemFocalLength as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The actual focal length of the lens, in millimeters. A number.

185.1.77 kMDItemFocalLength35mm as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.78 kMDItemFonts as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Fonts used in this item. You should store the font's full name, the postscript name, or the font family name, based on the available information. An array of strings.

185.1.79 kMDItemFSContentChangeDate as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The date the file contents last changed. A date.

185.1.80 kMDItemFSCreationDate as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The date and time that the file was created. A date.

185.1.81 kMDItemFSExists as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: This attribute is deprecated and was never implemented.

185.1.82 kMDItemFSHasCustomIcon as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Boolean indicating if this file has a custom icon. Type is a boolean.

185.1.83 kMDItemFSInvisible as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Indicates whether the file is invisible. A boolean.

185.1.84 kMDItemFSIsExtensionHidden as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Indicates whether the file extension of the file is hidden. A boolean.

185.1.85 kMDItemFSIsReadable as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: This attribute is deprecated and was never implemented.

185.1.86 kMDItemFSIsStationery as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Boolean indicating if this file is stationery. Type is a boolean.

185.1.87 kMDItemFSIsWriteable as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: This attribute is deprecated and was never implemented.

185.1.88 kMDItemFSLabel as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Index of the Finder label of the file. Possible values are 0 through 7. A number.

185.1.89 kMDItemFSName as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The file name of the item. A string.

185.1.90 kMDItemFSNodeCount as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Number of files in a directory. A number.

185.1.91 kMDItemFSOwnerGroupID as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The group ID of the owner of the file. A number.

185.1.92 kMDItemFSOwnerUserID as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The user ID of the owner of the file. A number.

185.1.93 kMDItemFSSize as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The size, in bytes, of the file on disk. A number.

185.1.94 kMDItemGenre as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Genre of the movie. A string.
Requires Mac OS X 10.5.

185.1.95 kMDItemGPSAreaInformation as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.96 kMDItemGPSDateStamp as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.97 kMDItemGPSDestBearing as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.98 kMDItemGPSDestDistance as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.99 kMDItemGPSDestLatitude as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.100 kMDItemGPSDestLongitude as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.101 kMDItemGPSDifferental as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.102 kMDItemGPSDOP as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.103 kMDItemGPSMapDatum as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.104 kMDItemGPSMeasureMode as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.105 kMDItemGPSProcessingMethod as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.106 kMDItemGPSStatus as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.107 kMDItemGPSTrack as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The direction of travel of the item, in degrees from true north. A number.
Requires Mac OS X 10.5.

185.1.108 kMDItemHasAlphaChannel as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Indicates if this image file has an alpha channel. A boolean.

185.1.109 kMDItemHeadline as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: A publishable entry providing a synopsis of the contents of the file. For example, "Apple Introduces the iPod Photo". A string.

185.1.110 kMDItemIdentifier as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: A formal identifier used to reference the resource within a given context. A string.

185.1.111 kMDItemImageDirection as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The direction of the item's image, in degrees from true north. A number.
Requires Mac OS X 10.5.

185.1.112 kMDItemInformation as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Information about the item. A string.
Requires Mac OS X 10.5.

185.1.113 kMDItemInstantMessageAddresses as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Instant message addresses related to this item. An array of strings.

185.1.114 kMDItemInstructions as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Editorial instructions concerning the use of the item, such as embargoes and warnings. For example, "Second of four stories". A string.

185.1.115 kMDItemIsApplicationManaged as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.116 kMDItemIsGeneralMIDISequence as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Indicates whether the MIDI sequence contained in the file is setup for use with a General MIDI device. A boolean.

185.1.117 kMDItemIsLikelyJunk as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.118 kMDItemISOSpeed as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The ISO speed used to acquire the document contents. A number.

185.1.119 kMDItemKeySignature as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The key of the music contained in the audio file. For example: C, Dm, F#m, Bb. A string.

185.1.120 kMDItemKeywords as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Keywords associated with this file. For example, "Birthday", "Important", etc. An array of strings.

185.1.121 kMDItemKind as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: A description of the kind of item this file represents. A string.

185.1.122 kMDItemLabelIcon as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.123 kMDItemLabelID as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.124 kMDItemLabelKind as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.125 kMDItemLabelUUID as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.126 kMDItemLanguages as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Indicates the languages of the intellectual content of the resource. Recommended best practice for the values of the Language element is defined by RFC 3066. An array of strings.

185.1.127 kMDItemLastUsedDate as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The date and time that the file was last used. This value is updated automatically by LaunchServices everytime a file is opened by double clicking, or by asking LaunchServices to open a file. A date.

185.1.128 kMDItemLatitude as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The latitude of the item in degrees north of the equator, expressed using the WGS84 datum. Negative values lie south of the equator. A number.
Requires Mac OS X 10.5.

185.1.129 kMDItemLayerNames as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The names of the layers in the file. An array of strings.

185.1.130 kMDItemLensModel as string

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Available in Mac OS X 10.7 and later.

185.1.131 kMDItemLongitude as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The longitude of the item in degrees east of the prime meridian, expressed using the WGS84 datum. Negative values lie west of the prime meridian. A number.
Requires Mac OS X 10.5.

185.1.132 kMDItemLyricist as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The lyricist, or text writer, of the music contained in the audio file. A string.

185.1.133 kMDItemMaxAperture as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The smallest f-number of the lens. Ordinarily it is given in the range of 00.00 to 99.99. A number.

185.1.134 kMDItemMediaTypes as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The media types present in the content. An array of strings.

185.1.135 kMDItemMeteringMode as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The metering mode used to take the image. A string.

Possible values are: Unknown, Average, CenterWeightedAverage, Spot, MultiSpot, Pattern, and Partial.

185.1.136 kMDItemMusicalGenre as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The musical genre of the song or composition contained in the audio file. For example: Jazz, Pop, Rock, Classical. A string.

185.1.137 kMDItemMusicalInstrumentCategory as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Specifies the category of an instrument. A string.

Files should have an instrument associated with them (”Other Instrument” is provided as a catch-all). For some categories, such as ”Keyboards”, there are instrument names which provide a more detailed instrument definition, for example ”Piano” or ”Organ”.

185.1.138 kMDItemMusicalInstrumentName as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Specifies the name of instrument relative to the instrument category. A string.

Files can have an instrument name associated with them if they have certain instrument categories. For example, the ”Percussion” category has multiple instruments, including ”Conga” and ”Bongo”.

185.1.139 kMDItemNamedLocation as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The name of the location or point of interest associated with the item. The name may be user provided. A string

185.1.140 kMDItemNumberOfPages as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Number of pages in the document. A number.

185.1.141 kMDItemOrganizations as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The company or organization that created the document. An array of strings.

185.1.142 kMDItemOrientation as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The orientation of the document contents. Possible values are 0 (landscape) and 1 (portrait). A number.

185.1.143 kMDItemOriginalFormat as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Original format of the movie.
A string.
Requires Mac OS X 10.5

185.1.144 kMDItemOriginalSource as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Original source of the movie. A string.
Requires Mac OS X 10.5.

185.1.145 kMDItemPageHeight as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Height of the document page, in points (72 points per inch). For PDF files this indicates the height of the first page only. A number.

185.1.146 kMDItemPageWidth as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Width of the document page, in points (72 points per inch). For PDF files this indicates the width of the first page only. A number.

185.1.147 kMDItemParticipants as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The list of people who are visible in an image or movie or written about in a document. Type is array of strings.
Requires Mac OS X 10.6.

185.1.148 kMDItemPath as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The complete path to the file. A string.

185.1.149 kMDItemPerformers as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Performers in the movie. An array of string.
Requires Mac OS X 10.5.

185.1.150 kMDItemPhoneNumbers as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Phone numbers related to this item. An array of strings.

185.1.151 kMDItemPixelCount as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The total number of pixels in the contents. Same as kMDItemPixelWidth x kMDItemPixelHeight. A number.

185.1.152 kMDItemPixelHeight as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The height, in pixels, of the contents. For example, the image height or the video frame height. A number.

185.1.153 kMDItemPixelWidth as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The width, in pixels, of the contents. For example, the image width or the video frame width. A number.

185.1.154 kMDItemProducer as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Producer of the content. A string. Requires Mac OS X 10.5.

185.1.155 kMDItemProfileName as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The name of the color profile used by the document contents. A string.

185.1.156 kMDItemProjects as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The list of projects that this file is part of. For example, if you were working on a movie all of the files could be marked as belonging to the project "My Movie". An array of strings.

185.1.157 kMDItemPublishers as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The entity responsible for making the resource available. For example, a person, an organization, or a service. Typically, the name of a publisher should be used to indicate the entity. An array of strings.

185.1.158 kMDItemRecipientAddresses as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: This attribute indicates the recipient addresses of the document. array of string. Requires Mac OS X 10.6.

185.1.159 kMDItemRecipientEmailAddresses as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: This attribute indicates the reciepients email addresses. (This is always the email address, and not the human readable version). An array of string.
Requires Mac OS X 10.5.

185.1.160 kMDItemRecipients as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Recipients of this item. An array of strings.

185.1.161 kMDItemRecordingDate as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The recording date of the song or composition. A date.

This is in contrast to kMDItemContentCreationDate which, could indicate the creation date of an edited or 'mastered' version of the original art.

185.1.162 kMDItemRecordingYear as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Indicates the year the item was recorded. For example, 1964, 2003, etc. A number.

185.1.163 kMDItemRedEyeOnOff as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Indicates if red-eye reduction was used to take the picture. A boolean.

Possible values are 0 (no red-eye reduction mode or unknown) and 1 (red-eye reduction used).

185.1.164 kMDItemResolutionHeightDPI as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Resolution height of this image in DPI. A number.

185.1.165 kMDItemResolutionWidthDPI as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Resolution width, in DPI, of this image. A number.

185.1.166 kMDItemRights as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Provides a link to information about rights held in and over the resource. A string.

Contains a rights management statement for the resource, or reference a service providing such information. Rights information often encompasses Intellectual Property Rights (IPR), Copyright, and various Property Rights.

If this attribute is absent, no assumptions can be made about the status of these and other rights with respect to the resource.

185.1.167 kMDItemSecurityMethod as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The security or encryption method used for the file. A number.

185.1.168 kMDItemSpeed as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The speed of the item, in kilometers per hour. A number.

Requires Mac OS X 10.5

185.1.169 kMDItemStarRating as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: User rating of this item. For example, the stars rating of an iTunes track. A number.

185.1.170 kMDItemStateOrProvince as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Identifies the province or state of origin according to guidelines established by the provider. For example, "CA", "Ontario", or "Sussex". A string.

185.1.171 kMDItemStreamable as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Whether the content is prepared for streaming. A boolean.

185.1.172 kMDItemSubject as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Subject of the this item. Type is a string.

185.1.173 kMDItemSupportFileType as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: array of strings

185.1.174 kMDItemTempo as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: A float value that specifies the beats per minute of the music contained in the audio file. A number.

185.1.175 kMDItemTextContent as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Contains a text representation of the content of the document. Data in multiple fields should be combined using a whitespace character as a separator. A string.

An application's Spotlight importer provides the content of this attribute. Applications can search for values in this attribute, but are not able to read the content of this attribute directly.

185.1.176 kMDItemTheme as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: Theme of the this item. Type is a string.

185.1.177 kMDItemTimeSignature as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The time signature of the musical composition contained in the audio/MIDI file. For example: "4/4", "7/8". A string.

185.1.178 kMDItemTimestamp as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The timestamp on the item. This generally is used to indicate the time at which the event captured by the item took place.

Mac OS X 10.5

185.1.179 kMDItemTitle as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The title of the file. For example, this could be the title of a document, the name of an song, or the subject of an email message. A string.

185.1.180 kMDItemTotalBitRate as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The total bit rate, audio and video combined, of the media. A number.

185.1.181 kMDItemURL as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: URL of the item.

Mac OS X 10.5

185.1.182 kMDItemVersion as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The version number of this file. A string

185.1.183 kMDItemVideoBitRate as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The video bit rate. A number.

185.1.184 kMDItemWhereFroms as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Example:

```
Var file as FolderItem = DownloadsFolderMBS(0).Child("test.html")
Var item as new MDItemMBS(file)
Var value as Variant = item.GetAttribute(MDItemMBS.kMDItemWhereFroms)

if value <>nil then
Var values() as Variant = value
Var Link as String = values(0)
MessageBox link
end if
```

Notes: Describes where the file was obtained from. An array of strings.

For example, a downloaded file may refer to the URL, files received by email may indicate the sender's email address, message subject, etc.

185.1.185 kMDItemWhiteBalance as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the item attribute constants.
Notes: The white balance setting used to acquire the document contents. Possible values are 0 (auto white balance) and 1 (manual). A number.

185.1.186 Properties

185.1.187 DisplayName as String

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The localized version of the file name.
Example:

```
Var item as new MDItemMBS(SpecialFolder.Desktop)

MessageBox item.DisplayName // shows "Schreibtisch"
```

Notes: This is a shortcut for AttributeString(kMDItemDisplayName).
(Read only property)

185.1.188 FSName as String

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The file name of the item.
Example:

```
Var item as new MDItemMBS(SpecialFolder.Desktop)

MessageBox item.FSName // shows "Desktop"
```

Notes: This is a shortcut for AttributeString(kMDItemFSName).
(Read only property)

185.1.189 FSSize as Int64

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The size, in bytes, of the file on disk.
Example:

```
Var item as new MDItemMBS(SpecialFolder.Desktop)

MessageBox str(item.FSSize) // shows 0
```

Notes: This is a shortcut for AttributeString(kMDItemFSSize).
(Read only property)

185.1.190 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference to the item.
Notes: (Read and Write property)

185.1.191 Path as String

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The complete path to the file.
Example:

```
Var item as new MDItemMBS(SpecialFolder.Desktop)

MessageBox item.path // shows "/Users/cs/Desktop"
```

Notes: This is a shortcut for AttributeString(kMDItemPath).
(Read only property)

185.1.192 Tag as Variant

MBS MacOSX Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The attached value.
Notes: You can use this property as you like.
(Read and Write property)

185.2 class MDQueryBatchingParamsMBS

185.2.1 class MDQueryBatchingParamsMBS

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: This class containing the progress notification batching parameters of an MDQuery.
Notes: The first notification can be triggered by the either firstmaxnum or firstmaxms limit being exceeded. Subsequent notifications are triggered by either the progressmaxnum or progressmaxms limit. The default batching parameters are undefined and subject to change.

185.2.2 Properties

185.2.3 firstMaxMS as Integer

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The maximum number of milliseconds that can pass before a progress notification is sent out.
Notes: This value is advisory, in that the notification will be triggered "at some point after firstmaxms milliseconds have passed since the query began accumulating results", but generally not very long after, for the first progress notification.
(Read and Write property)

185.2.4 firstMaxNum as Integer

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The maximum number of results that can accumulate before a progress notification is sent out by the MDQuery, for the first notification.
Notes: (Read and Write property)

185.2.5 progressMaxMS as Integer

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The maximum number of milliseconds that can pass before a progress notification is sent out.
Notes: This value is advisory, in that the notification will be triggered "at some point after firstmaxms milliseconds have passed since the query began accumulating results", but generally not very long after, for progress notifications after the first, during the initial gathering phase of the query.
(Read and Write property)

185.2.6 progressMaxNum as Integer

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The maximum number of results that can accumulate before a progress notification is sent out by the MDQuery, for notifications after the first, during the initial gathering phase of the query.
Notes: (Read and Write property)

185.2.7 updateMaxMS as Integer

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The maximum number of milliseconds that can pass before a progress notification is sent out.
Notes: This value is advisory, in that the notification will be triggered "at some point after firstmaxms milliseconds have passed since the query began accumulating results", but generally not very long after, for update notifications after the gathering phase of the query has finished.
(Read and Write property)

185.2.8 updateMaxNum as Integer

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The maximum number of results that can accumulate before an update notification is sent out by the MDQuery, for update notifications after the gathering phase of the query has finished.
Notes: (Read and Write property)

185.3 class MDQueryMBS

185.3.1 class MDQueryMBS

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: MDQuery encapsulates all queries against the MetaData database.
Example:

```
Var m as new MDQueryMBS("* == ""Hello""wcd | | kMDItemTextContent = ""Hello""c")

call m.Execute(m.kMDQuerySynchronous)

MessageBox str(m.ResultCount) // shows a lot of results
```

Notes: Depending on what and how you want to search, you can decide whether MDQueryMBS or CatSearchMBS is the better choice.

Available in Mac OS X version 10.4 and later.

Queries gather results or process updates only while the current thread's run loop is running. Queries normally operate asynchronously, and only send out progress notificiations as the list is being collected. The query list is kept up to date with respect to value lists and sorting as the progress notifications are sent out, so the query is in a good state during those events.

An MDQuery presents its results as if it were a simple array object. The results are MDItem.

Query Sorting Sorting the results from a query can be performed in one of two ways. First is to let the library sort the results for you by passing an array of attributes to sort on to constructor. The default sort provided by the constructor is a ascending sort strings are compared using CFStringCompare() with the options kCFCompareNonliteral | kCFCompareLocalized | kCFCompareNumerically.

If used in a thread, please use a loop with calling NSRunLoopMBS.currentRunLoop.runUntilDate(nil) to give time for update events to fire.

185.3.2 Methods

185.3.3 AttributeValueOfResultAtIndex(name as string, index as UInt32) as Variant

MBS MacOSX Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the value of the named attribute for the result at the given index.
Notes: name: The attribute name for which to return the values. If the attribute is not one of those requested in the valueListAttrs or sortingAttrs parameters to one of the query creation functions, the result will be nil.
index: The index into the query's result list. If the index is negative, or is equal to or larger than the current number of results in the query, the behavior is undefined.
Returns he value of the attribute, or nil if the attribute doesn't exist in the query on that result.

185.3.4 Constructor(query as MDQueryMBS, queryString as string)

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new query, which is a subset of the given query.
Notes: Only results matched by the given query can be matched by the query expression of this query.

query: The parent query of the new query.
queryString: The query expression string for this query. This expression in effect may further restrict the matches found by the parent query. If the string is empty the behavior is undefined.
valueListAttributes: An optional array of attribute names. The query will collect the values of these attributes into uniqued lists, which can be used or displayed to summarize the results of the query, or allow a user to further qualify the items for which they are searching. This parameter may be empty if no value lists are desired. Value list collection increases CPU usage and significantly increases the memory usage of an MDQuery. The attribute names are strings.
sortingAttributes: An optional array of attribute names. The query will results of the query based on the values of these attributes. The first name in the array is used as the primary sort key, the second as the secondary key, and so on. The comparison of like-typed values is a simple, literal comparison. This parameter may be empty if no sorting is desired. Sorting increases memory usage and significantly increases the CPU usage of an MDQuery. However, when possible, it is almost always cheaper to have the MDQuery do the sorting, rather than you fetching all the results and attributes from each of them and doing the sorting yourself. The attribute names are strings.

185.3.5 Constructor(query as MDQueryMBS, queryString as string, valueListAttributes() as string)

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new query, which is a subset of the given query.
Notes: Only results matched by the given query can be matched by the query expression of this query.

query: The parent query of the new query.
queryString: The query expression string for this query. This expression in effect may further restrict the matches found by the parent query. If the string is empty the behavior is undefined.
valueListAttributes: An optional array of attribute names. The query will collect the values of these attributes into uniqued lists, which can be used or displayed to summarize the results of the query, or allow a user to further qualify the items for which they are searching. This parameter may be empty if no value lists are desired. Value list collection increases CPU usage and significantly increases the memory usage of an MDQuery. The attribute names are strings.
sortingAttributes: An optional array of attribute names. The query will results of the query based on the values of these attributes. The first name in the array is used as the primary sort key, the second as the secondary key, and so on. The comparison of like-typed values is a simple, literal comparison. This parameter may be empty if no sorting is desired. Sorting increases memory usage and significantly increases the CPU usage of an MDQuery. However, when possible, it is almost always cheaper to have the MDQuery do the sorting, rather than you fetching all the results and attributes from each of them and doing the sorting yourself. The attribute names are strings.

185.3.6 Constructor(query as MDQueryMBS, queryString as string, valueListAttributes() as string, sortingAttributes() as string)

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new query, which is a subset of the given query.
Notes: Only results matched by the given query can be matched by the query expression of this query.

query: The parent query of the new query.
queryString: The query expression string for this query. This expression in effect may further restrict the matches found by the parent query. If the string is empty the behavior is undefined.
valueListAttributes: An optional array of attribute names. The query will collect the values of these attributes into uniqued lists, which can be used or displayed to summarize the results of the query, or allow a user to further qualify the items for which they are searching. This parameter may be empty if no value lists are desired. Value list collection increases CPU usage and significantly increases the memory usage of an MDQuery. The attribute names are strings.
sortingAttributes: An optional array of attribute names. The query will results of the query based on the values of these attributes. The first name in the array is used as the primary sort key, the second as the secondary key, and so on. The comparison of like-typed values is a simple, literal comparison. This parameter may be empty if no sorting is desired. Sorting increases memory usage and significantly increases the CPU usage of an MDQuery. However, when possible, it is almost always cheaper to have the MDQuery do the sorting, rather than you fetching all the results and attributes from each of them and doing the sorting yourself. The attribute names are strings.

- 185.3.9 Constructor(queryString as string, valueListAttributes() as string, sortingAttributes() as string) 22529

185.3.7 Constructor(queryString as string)

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new query with the given query expression.
Notes: queryString: The query expression string for this query. The syntax for query expressions is explained above in the header overview documentation.

valueListAttributes: An optional array of attribute names. The query will collect the values of these attributes into uniqued lists, which can be used or displayed to summarize the results of the query, or allow a user to further qualify the items for which they are searching. This parameter may be empty if no value lists are desired. Value list collection increases CPU usage and significantly increases the memory usage of an MDQuery. The attribute names are string.

sortingAttributes: An optional array of attribute names. The query will results of the query based on the values of these attributes. The first name in the array is used as the primary sort key, the second as the secondary key, and so on. The comparison of like-typed values is a simple, literal comparison. This parameter may be empty if no sorting is desired. Sorting increases memory usage and significantly increases the CPU usage of an MDQuery. However, when possible, it is almost always cheaper to have the MDQuery do the sorting, rather than you fetching all the results and attributes from each of them and doing the sorting yourself. The attribute names are strings.

The handle value is zero on failure.

185.3.8 Constructor(queryString as string, valueListAttributes() as string)

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new query with the given query expression.
Notes: queryString: The query expression string for this query. The syntax for query expressions is explained above in the header overview documentation.

valueListAttributes: An optional array of attribute names. The query will collect the values of these attributes into uniqued lists, which can be used or displayed to summarize the results of the query, or allow a user to further qualify the items for which they are searching. This parameter may be empty if no value lists are desired. Value list collection increases CPU usage and significantly increases the memory usage of an MDQuery. The attribute names are string.

sortingAttributes: An optional array of attribute names. The query will results of the query based on the values of these attributes. The first name in the array is used as the primary sort key, the second as the secondary key, and so on. The comparison of like-typed values is a simple, literal comparison. This parameter may be empty if no sorting is desired. Sorting increases memory usage and significantly increases the CPU usage of an MDQuery. However, when possible, it is almost always cheaper to have the MDQuery do the sorting, rather than you fetching all the results and attributes from each of them and doing the sorting yourself. The attribute names are strings.

The handle value is zero on failure.

185.3.9 Constructor(queryString as string, valueListAttributes() as string, sortingAttributes() as string)

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new query with the given query expression.
Notes: queryString: The query expression string for this query. The syntax for query expressions is explained above in the header overview documentation.

valueListAttributes: An optional array of attribute names. The query will collect the values of these attributes into uniqued lists, which can be used or displayed to summarize the results of the query, or allow a user to further qualify the items for which they are searching. This parameter may be empty if no value lists are desired. Value list collection increases CPU usage and significantly increases the memory usage of an MDQuery. The attribute names are string.

sortingAttributes: An optional array of attribute names. The query will results of the query based on the values of these attributes. The first name in the array is used as the primary sort key, the second as the secondary key, and so on. The comparison of like-typed values is a simple, literal comparison. This parameter may be empty if no sorting is desired. Sorting increases memory usage and significantly increases the CPU usage of an MDQuery. However, when possible, it is almost always cheaper to have the MDQuery do the sorting, rather than you fetching all the results and attributes from each of them and doing the sorting yourself. The attribute names are strings.

The handle value is zero on failure.

- 185.3.8 Constructor(queryString as string, valueListAttributes() as string) 22528

185.3.10 CountOfResultsWithAttributeValue(name as string, Value as Variant) as UInt32

MBS MacOSX Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of results which have the given attribute and attribute value. Note that this count may change over time, as the query's result list is updated.
Notes: name: The attribute name for which to return the number of results with the given value. If the attribute is not one of those requested in the valueListAttrs parameter to one of the query creation functions, the behavior is undefined.

value: The attribute value for which to return the number of results with that value. This parameter may be nil, in which case the number of results that do not contain the named attribute is returned.

Returns the number of results with that attribute and value.

185.3.11 DisableUpdates

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Disables updates to the query result list.
Notes: This should be called before iterating through the list of results to prevent the result list from changing during the iteration. The disabled state is a counter, and disabling can be done recursively and from different threads.

185.3.12 EnableUpdates

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Re-enables updates to the query result list.
Notes: This should be called when finished iterating through the list of results, to allow changes to the result list to occur. Changes will be allowed when all the disables have been matched by a corresponding enable.

185.3.13 Execute(flags as Integer) as boolean

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Run the query, and populate the query with the results.
Example:

```
Var q as new MDQueryMBS("kMDItemContentModificationDate>=$ time.now")
// you will want to use a MDQueryMBS subclass here to catch the events

if not q.Execute(q.kMDQueryWantsUpdates) then
MessageBox "Failed to query"
end if
```

Notes: Queries only gather results or process updates while the current thread's run loop is running. Queries normally operate asynchronously, and send out progress and update notifications to report changes to the list of results that has been collected. Queries have two phases: the initial gathering of all currently matching results, and a second live-update phase where queries monitor the state of the system and update themselves to external changes in files or the operating environment (for example, as time advances, files which did not match the query when it was started may later match the query). Query notifications are posted within the context of the same thread which executes the query. [

here are three operational modes: (1) synchronous static queries, which collect the list of current results and then do not watch for updates to the results, (2) asynchronous static queries, which collect the results asychronously after this function returns, and then do not watch for updates to the results, and (3) asynchronous live queries which collect the initial results asychronously after this function returns, and then do watch for updates to the results, until the query is destroyed. There is little reason not to allow the fourth case, synchronous collection of initial results, followed by asynchronous monitoring for updates, so this may change in the future.

Flags: Options for the query.

Returns true if the query was started (executed in the case of a synchronous query), false otherwise. Queries cannot be executed more than once.

185.3.14 GetSortOptionFlagsForAttribute(fieldName as string) as Integer

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets the sort option flags for a sorting attribute.
Notes: fieldName: The attribute name for which sort option flags are to be fetched.
Returns an integer with flags. Currently can be 0 or 1.

Available on Mac OS X 10.7 or later.

185.3.15 IndexOfResult(it as MDItemMBS) as Integer

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the current index of the given result.
Notes: Note that the index of a result will change over time, as the query's result list is updated.

Returns the index of the given result, or -1 if the value is not one of the query's existing results.

185.3.16 IsGatheringComplete as boolean

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if the first phase of a query, the initial result gathering, has finished.
Notes: A boolean indicating whether or not the first phase of a query has completed.

185.3.17 QueryString as string

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the query string of the query.

185.3.18 ResultAtIndex(index as Integer) as MDItemMBS

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the current result at the given index.
Notes: This function causes the result object to be created if it hasn't been created already. For performance reasons, it is not advisable to ask for results that you don't need, to avoid the cost of creating them. If possible, call this function to fetch only the results you need to display or otherwise process. Note that the index of a particular result will change over time, as the query's result list is updated.

index: The index into the query's result list.

If the index is negative, or is equal to or larger than the current number of results in the query, the behavior is undefined.

Returns the MDItem currently at the given index, or if a result-create function has been set, returns the result returned by that function.

185.3.19 ResultCount as Integer

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of results currently collected by the query.
Example:

```
Var m as new MDQueryMBS("kMDItemContentModificationDate>=$ time.today")

call m.Execute(m.kMDQuerySynchronous)

MessageBox str(m.ResultCount)+" files modified today"
```

Notes: Note that the number of results in a query will change over time as the query's result list is updated.

185.3.20 Results(limit as Integer = -1) as MDItemMBS()

MBS MacOSX Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries result items.
Notes: Internally does what ResultAtIndex does for up to limit entries.
Limit with -1 will cause no limit.
If possible, call this function to fetch only the results you need to display or otherwise process.

185.3.21 SetMaxCount(size as Integer)

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Use SetMaxCount to limit the number of results returned by the query engine.
Notes: This must be called before the query is executed.
size: The maximum number of results desired.

185.3.22 SetSearchScope(paths() as folderitem, options() as string)

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Use SetSearchScope to limit the results returned by the query engine to those MDItem that appear within the specified directories.

Example:

```
Var q as MDQueryMBS // your query

q.SetSearchScope nil, array(q.kMDQueryScopeComputer)
```

Notes: This may be used to limit searching to particular volumes. Tilde paths, or environment variables are not expanded. Calling this multiple times will replace the previous options. This must be called before the query is executed.

paths: An array of directories where you want to search. This array can be empty.
options: An array of scope options. Pass the kMDQueryScope* constants. This array can be empty.

185.3.23 SetSortOptionFlagsForAttribute(fieldName as string, flags as UInt32) as Boolean

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the sort flags for a query.
Notes: fieldName: The attribute name for which sort option flags are to be set.

The attribute name must have been part of the sortingFlags when the query was created.

flags: An integer containing MDQuerySortOptionFlags to be applied to the attribute

Returns a boolean, true on success, false on failure.

Available on Mac OS X 10.7 or later.

185.3.24 SetSortOrder(sortingAttrs() as string) as Boolean

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the sort order for a query.
Notes: sortingAttrs An array of attribute names, as in MDQueryCreate.
The query's result set will be sorted according to the order of these attributes. All names in the array have to have been passed as sortingAttrs when the query was created. The attribute names are strings.

Returns a boolean, true on success, false on failure.

Available on Mac OS X 10.7 or later.

185.3.25 SortingAttributes as string()

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the list of attribute names the query is using to sort the results.

185.3.26 Stop

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Stops the query from ever generating more results.
Notes: Queries may be executed only once, so a stopped query cannot be restarted. The query will also not generate any result updates. The query is static after this function returns. The query will do final processing of results that have come in but not yet been processed (because, say, the batching parameters hasn't triggered that yet). That may trigger a progress notification, so be aware of that if you are stopping a query from within your progress note handler; that is, during this function, a recursive progress and/or finished notification might occur, which might recursively call your notification handler. It is safe to call this function recursively. You would call this function to stop a query that is generating way too many results to be useful, but still want to access the results that have come in so far. If a query is stopped before the gathering phase finishes, it will not report itself as finished, nor will it send out a finished notification.

185.3.27 ValueListAttributes as string()

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the list of attribute names for which the query is collecting the lists of values.

185.3.28 ValuesOfAttribute(name as string) as Variant()

MBS MacOSX Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the list of values, from the results of the query, of the named attribute.
Notes: The list is not ordered in any way. The list contains only one occurrence of each value. Note that this list may change over time, as the query's result list is updated.

name: The attribute name for which to return the values. If the attribute is not one of those requested in the valueListAttrs parameter to one of the query creation functions, the behavior is undefined.

Returns an array holding the value objects for that attribute.

185.3.29 Properties

185.3.30 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference for the MDQuery.
Notes: (Read and Write property)

185.3.31 Tag as Variant

MBS MacOSX Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The attached value.
Notes: You can use this property as you like.
(Read and Write property)

185.3.32 BatchingParameters as MDQueryBatchingParamsMBS

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The query whose batching parameters are to be set.
Notes: (Read and Write computed property)

185.3.33 Events

185.3.34 Finish()

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called when the query has finished.
Notes: Called when the query has finished with the initial result-gathering phase, and may now proceed into the live-update phase (if that option was chosen when the query was executed). This event often shortly follows after the last progress notification. It is usually not necessary to update any displayed UI in response to this event, since it doesn't indicate any change in the result list of a query.

185.3.35 Progress(AddedItems() as MDItemMBS, ChangedItems() as MDItemMBS, RemovedItems() as MDItemMBS)

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event sent to indicate changes to the query's results list during the initial gathering phase of a query's execution.
Notes: Mostly adds will occur during this phase, but removals and changes can also occur, as in any update.
For performance reasons the arrays are empty in newer Mac OS X SDK versions.
In that case please use the result functions.

185.3.36 Update(AddedItems() as MDItemMBS, ChangedItems() as MDItemMBS, RemovedItems() as MDItemMBS)

MBS MacOSX Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event is sent to indicate changes to the query's results list during the second, live-update, phase of a query's execution.

185.3.37 Constants

Constants

Constant	Value	Description
kMDQueryReverseSortOrderFlag	1	A flag constant for calling SetSortOptionFla Sort the attribute in reverse order. Available on Mac OS X 10.7 or later.
kMDQueryScopeAllIndexed	”kMDQueryScopeAllIndexed”	One of the option constants for the search sc A constant, which can be passed in the scop the search should be restricted to indexed, dexed user mounted remote volumes, plus th
kMDQueryScopeComputer	”kMDQueryScopeComputer”	One of the option constants for the search sc A constant, which can be passed in the scop the search should be restricted to all locally home directory (which may be on a remote
kMDQueryScopeComputerIndexed	”kMDQueryScopeComputerIndexed”	One of the option constants for the search sc A constant, which can be passed in the scop the search should be restricted to indexed, l user’s home directory (which may be on a re
kMDQueryScopeHome	”kMDQueryScopeHome”	One of the option constants for the search sc A constant, which can be passed in the scop the search should be restricted to the volum current user’s home directory
kMDQueryScopeNetwork	”kMDQueryScopeNetwork”	One of the option constants for the search sc A constant, which can be passed in the scop the search should include all user mounted r
kMDQueryScopeNetworkIndexed	”kMDQueryScopeNetworkIndexed”	One of the option constants for the search sc A constant, which can be passed in the scop the search should include indexed user mour
kMDQuerySynchronous	1	One of the constants for executing a query. Block during the gathering phase. If this pa not return until the query has finished gath loop will run in the default mode, which will mode with this run loop to execute as wel function returns immediately after starting t
kMDQueryWantsUpdates	4	One of the constants for executing a query. When set, after gathering the initial results t the system which should update the list of re cause new files to now match the query, or result list to continue to match, or no long begin to match the query are added to the re match the query expression are removed fro Currently, this parameter is ignored if the sy is subject to change, and you should always

185.4 Globals

185.4.1 SpotlightMBS(searchString as string) as Integer

MBS MacOSX Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Displays a Spotlight search window.
Example:

call SpotlightMBS("Hello")

Notes: searchString: An initial query string. Pass "" to open the search window with no initial query string.

Returns a Mac OS error code and -1 if the function is not available and 0 on success.
Requires Mac OS X 10.4.

Chapter 186

SQL

186.1 class Database

186.1.1 class Database

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Xojo Database class is the base class for the database subclasses that communicate with a variety of databases.
Notes: Use one of the subclasses to connect to your database.

186.1.2 Methods

186.1.3 AddRow(TableName as String, row as DatabaseRow)

MBS SQL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts Data (a populated DatabaseRow) as a new row in TableName.
See also:

- 186.1.4 AddRow(TableName as String, row as DatabaseRow, idColumnName as string = "") as Integer 22541

186.1.4 AddRow(TableName as String, row as DatabaseRow, idColumnName as string = "") as Integer

MBS SQL Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts Data (a populated DatabaseRow) as a new row in TableName.

Notes: Returns insert ID if possible or -1 if not found.
Implemented directly in SQLDatabaseMBS for CubeSQL, SQLite, mariaDB and MySQL. Other databases need column name for ID to run a select to get the value.
For PostgreSQL we use RETURNING, so you need to pass name of the ID column.
See also:

- 186.1.3 AddRow(TableName as String, row as DatabaseRow) 22541

186.1.5 BeginTransaction

MBS SQL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new transaction.
Notes: Changes to the database made after this call can be saved with CommitTransaction or undone with RollbackTransaction.

186.1.6 Close

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes or disconnects the database.
Notes: Calling Close does not issue a Commit, but some databases will automatically Commit changes in a transaction when you Close the connection and some database will automatically Rollback changes in a transaction when the connection is closed. Refer to the documentation for your database to check what its behavior is.

For desktop applications, you will often Connect to the database when the app starts and Close it when the app quits.

For web applications, you usually Connect to the database when the Session starts and Close it when the Session quits.

186.1.7 Commit

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Commits an open transaction. This permanently saves changes to the database.
Notes: You have to have an open transaction to be able to use Commit. On SQLite (and other databases), you can start a transaction with this command:

BEGIN TRANSACTION

It can be sent using SQLExecute:

DB.SQLExecute("BEGIN TRANSACTION")

186.1.8 CommitTransaction

MBS SQL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Commits an open transaction. This permanently saves changes to the database.

186.1.9 Connect

MBS SQL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Connects to the database so that you can begin using it.
See also:

- 186.1.10 Connect as boolean 22543

186.1.10 Connect as boolean

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Connects to the database so that you can begin using it.
Notes: Before proceeding with database operations, test to be sure that Connect returns True.
If Connect returns False, you should also check the ErrorCode and ErrorMessage.

See Option() for various options you can set before connecting.
e.g. c.Option("SQLiteVFSFlags") = "1" for SQLite for read only access.
See also:

- 186.1.9 Connect 22543

186.1.11 ExecuteSQL(sql As String, ParamArray values As Variant)

MBS SQL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Used to execute an SQL command.
Notes: Use this for commands that do not return any data, such as CREATE TABLE or INSERT.
See also:

- 186.1.12 ExecuteSQL(sql As String, values() As Variant) 22544

186.1.12 ExecuteSQL(sql As String, values() As Variant)

MBS SQL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Used to execute an SQL command.
Notes: Use this for commands that do not return any data, such as CREATE TABLE or INSERT.
See also:

- 186.1.11 ExecuteSQL(sql As String, ParamArray values As Variant) 22543

186.1.13 InsertRecord(TableName as String, Data as DatabaseRecord)

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts Data (a populated DatabaseRecord) as a new row in TableName.
Notes: Always check the Error property to verity that the data was added.

186.1.14 Prepare(statement as String) as PreparedSQLStatement

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a PreparedSQLStatement using the SQL statement for use with the various database prepared statement classes.
Notes: A prepared statement is an SQL statement with parameters that has been pre-processed by the database so that it can be executed more quickly if it is re-used with different parameters. Prepared statements also mitigate the risk of SQL injection in web apps.

186.1.15 Rollback

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Cancels an open transaction restoring the database to the state it was in before the transaction began.
Notes: You will generally want to rollback database changes if a database error occurs within the transaction.
You have to have an open transaction to be able to use Rollback. On SQLite (and other databases), you can start a transaction with this command:

BEGIN TRANSACTION

It can be sent using SQLExecute:

DB.SQLExecute("BEGIN TRANSACTION")

186.1.16 RollbackTransaction

MBS SQL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Cancels an open transaction restoring the database to the state it was in before the transaction began.

186.1.17 SelectSQL(sql As String, ParamArray values As Variant) as RowSet

MBS SQL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes a SQL SELECT statement and returns the results in a RowSet.
See also:

- 186.1.18 SelectSQL(sql As String, values() As Variant) as RowSet 22545

186.1.18 SelectSQL(sql As String, values() As Variant) as RowSet

MBS SQL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes a SQL SELECT statement and returns the results in a RowSet.
See also:

- 186.1.17 SelectSQL(sql As String, ParamArray values As Variant) as RowSet 22545

186.1.19 SQLExecute(ExecuteString as string)

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Used to execute an SQL command. Use this for commands that do not return any data, such as CREATE TABLE or INSERT. ExecuteString contains the SQL statement.
Notes: To avoid SQL Injection, be sure to use Prepared SQL Statements.

186.1.20 SQLSelect(SelectString as string) as RecordSet

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This is an SQL statement that returns a RecordSet.
Notes: SelectString contains the SQL statement.

Typically only SQL SELECT statements return a RecordSet, but some databases return a RecordSet for SQL commands such as INSERT, UPDATE or stored procedures.

If the SQL does not return data then Nil is returned. Nil is also usually returned if there is an error in the SQL statement, but you should instead check Database.Error to check if an error occurred.

To avoid SQL Injection, be sure to use Prepared SQL Statements.

186.1.21 Properties

186.1.22 DatabaseName as String

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the database to open.
Example:

```
Var db as new SQLDatabaseMBS
db.DatabaseName="PostgreSQL:127.0.0.1,5432@dbname=postgres connect_timeout=10 sslmode=require"
```

Notes: The DatabaseName is typically used with server databases (such as MySQL or PostgreSQL) to identify the specific database to use on the server.

Please set the DatabaseName, UserName and Password properties when using SQLDatabaseMBS class. The Host property is ignored.
The database name must contain the complete information and a prefix for the kind of database.
(Read and Write property)

186.1.23 Error as Boolean

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if an error is returned from the database engine.
Notes: See the values of the ErrorCode and ErrorMessage properties to learn the specifics of the error.

You should check the Error property after each database operation to see if there was an error. If there is an error, you can display or log the ErrorCode and ErrorMessage.
(Read and Write property)

186.1.24 ErrorCode as Integer

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error code returned from the database.
Notes: Error codes and error messages are different for each database.
(Read and Write property)

186.1.25 ErrorMessage as String

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Text of the error message returned from the database.
Notes: Error codes and error messages are different for each database.
You should check the Error property after each database operation to see if there was an error. If there is an error, you can display or log the ErrorCode and ErrorMessage.
(Read and Write property)

186.1.26 Host as String

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The database host name or IP address of the database server.
Notes: (Read and Write property)

186.1.27 Password as String

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The password that is required for access to the database.
Notes: Typically used in conjunction with UserName.
(Read and Write property)

186.1.28 UserName as String

MBS SQL Plugin, Plugin Version: 1.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The username that is required for access to the database.
Notes: (Read and Write property)

186.2 class DB2MBS

186.2.1 class DB2MBS

MBS SQL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The class for some DB2 related API commands.
Example:

```
Var cmd as new SQLCommandMBS // your command
Var con as new SQLConnectionMBS // your connection
Var api as DB2MBS = con.NativeAPI

// now use an API function
MessageBox str(api.SQLRowCount(cmd))
```

Notes: More commands are added as requested.

Deprecated in favor of direct methods on SQLCommandMBS. Please let us know if you need more DB2 specific functions.
Subclass of the SQLAPIMBS class.

186.2.2 Methods

186.2.3 SQLExecDirect(cmd as SQLCommandMBS, text as string)

MBS SQL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes an SQL command directly without any preprocessing in the plugin.
Example:

```
Var cmd as new SQLCommandMBS // your command
Var con as new SQLConnectionMBS // your connection
Var api as DB2MBS = con.NativeAPI

// now use an API function
const sql = "some sql command"
```

api.SQLExecDirect cmd, sql

Notes: Lasterror is set.

186.2.4 SQLRowCount(cmd as SQLCommandMBS) as Int64

MBS SQL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the affected number of rows for the last operation.
Notes: Lasterror is set.

186.2.5 Properties

186.2.6 Lasterror as Integer

MBS SQL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

186.3 class InformixMBS

186.3.1 class InformixMBS

MBS SQL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The class for Informix specific functions.
Notes: Deprecated in favor of direct methods on SQLConnectionMBS. Please let us know if you need more Informix specific functions.
Subclass of the SQLAPIMBS class.
Blog Entries

- MonkeyBread Software Releases the MBS Real Studio plug-ins in version 13.0
- MBS Real Studio Plugins, version 13.0fc1

186.3.2 Methods

186.3.3 Error(cmd as SQLCommandMBS, byref SQLState as string, byref NativeError as Integer, byref ErrorMsg as string) as Integer

MBS SQL Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the error status.

186.3.4 GetCursorName(cmd as SQLCommandMBS) as string

MBS SQL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries cursor name for given recordset.

186.3.5 HDBC as Integer

MBS SQL Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns Database Connection handle.

186.3.6 HENV as Integer

MBS SQL Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The environment handle.

186.3.7 HSTMT(cmd as SQLCommandMBS) as Integer

MBS SQL Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the statement handle for the command object.
Notes: Returns 0 on any error.

186.3.8 SetCursorName(cmd as SQLCommandMBS, name as string) as boolean

MBS SQL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets cursor name for given recordset.
Notes: Returns true on success.

186.4 module InternalCubeSQLLibraryMBS

186.4.1 module InternalCubeSQLLibraryMBS

MBS SQL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The module for our internal CubeSQL client connector.
Example:

```
if InternalCubeSQLLibraryMBS.Use then
MessageBox "Using internal CubeSQL library."
else
MessageBox "Failed, so please use library file."
end if

Var db As SQLDatabaseMBS // or SQLConnectionMBS

db.Option("ConnectionTimeout") = "30" // 30 seconds timeout
db.Option("ConnectionEncryption") = "SSL_AES256"
db.Option("SSLCertificatePath") = SSLCertificatePath

// connect...
```

Notes: This is a CubeSQL client library built into a plugin, so you can decide with use of MBS SQL Plugin to use this plugin instead of providing your own external copy of CubeSQL shared library.

Version 19.4 or newer have CubeSQL with SSL included.
You can use Option("ConnectionEncryption") with SSL, SSL+AES128, SSL+AES192 and SSL+AES256 as values.

If ConnectionEncryption is SSL, we can pass path from Option("SSLCertificatePath") with the certificate file.
Blog Entries

Videos

- Presentation from Xojo Developer Conference 2019 in Miami.

186.4.2 Methods

186.4.3 SSLVersion as String

MBS SQL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries SSL version of library.

186.4.4 Use as boolean

MBS SQL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Registers the built in CubeSQL client library for use.
Example:

```
if InternalCubeSQLLibraryMBS.Use then
MessageBox "Using internal CubeSQL library."
else
MessageBox "Failed, so please use library file."
end if
```

Notes: So instead of having SQL Plugin load CubeSQL shared library from file, we use the one built into this plugin.

186.4.5 Version as String

MBS SQL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries version of library.

186.5 module InternalSQLiteLibraryMBS

186.5.1 module InternalSQLiteLibraryMBS

MBS SQL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The module for our internal SQLite3 engine.
Example:

```
// enable our built-in SQLite library, which supports encryption
Call InternalSQLiteLibraryMBS.Use

// where to store?
Var f As FolderItem = SpecialFolder.Desktop.Child("test.db")
Var storage_database As New SQLDatabaseMBS ' SQLiteDatabase
storage_database.SQLiteEncryptionKey = "aes256:password" ' <- password with AES256 as prefix to pick algorithm
storage_database.DatabaseName = "sqlite:"+ f.NativePath

If storage_database.Connect Then

// create table if this is not yet here
storage_database.SQLExecute "Create table if not exists pics(pic_id integer PRIMARY KEY AUTOINCREMENT, name varchar(20), pic blob)"

// done
MessageBox "Ready"
Else
MessageBox storage_database.ErrorMessage
End If
```

Notes: This is a SQLite3 library built into a plugin, so you can decide with use of MBS SQL Plugin to use this plugin instead of providing your own external copy of SQLite shared library.

Our internal SQLite library includes the following extensions:

- JSON1, the extension to provide JSON functions
- FTS5, the full text search extension in version 5
- R*Tree index extension
- SOUNDEX function
- SQL math functions
- Geopoly extension

- ICU extension for unicode handling
- The RBU Extension
- SQLite Encryption Extension

You can turn on these SQLite extensions at runtime with MBS Plugin:

- UUID extension
- Base64 extension
- CSV extension

More extensions could be added on request.

186.5.2 Methods

186.5.3 CompileOption(index as Integer) as String

MBS SQL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries name of a compile option.
Example:

```
Var list() as string

for i as Integer = 0 to 100
Var s as string = InternalSQLiteLibraryMBS.CompileOption(i)
if s = "" then exit
Var b as Boolean = InternalSQLiteLibraryMBS.CompileOptionUsed(s)
Var t as string
if b then
t = ": yes"
else
t = ": no"
end if
list.Add s + t
next

MessageBox Join(list, EndOfLine)
```

Notes: Index index starting with zero until you get back an empty name.

186.5.4 CompileOptionUsed(optionName as String) as Boolean

MBS SQL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries if a given compile option was set on or off.
Example:

```
Var list() as string

for i as Integer = 0 to 100
Var s as string = InternalSQLiteLibraryMBS.CompileOption(i)
if s = "" then exit
Var b as Boolean = InternalSQLiteLibraryMBS.CompileOptionUsed(s)
Var t as string
if b then
t = ": yes"
else
t = ": no"
```

```
end if
list.Add s + t
next

MessageBox Join(list, EndOfLine)
```

Notes: If you need a specific option set, please contact MBS support.

186.5.5 DumpToFile(SqliteDBConectionHandle as Ptr, File as FolderItem, TableName as string = """, PreserveRowid as Boolean = false, Newlines as Boolean = false, DumpDataOnly as Boolean = false, DumpNoSys as Boolean = false)

MBS SQL Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Dumps SQLite database to text file just like dump command in SQLite command line tool.
Example:

```
Call InternalSQLiteLibraryMBS.Use

Var con As New SQLConnectionMBS

// connect....

Var handle As ptr = con.SQLiteConnectionHandle
Var file As FolderItem = SpecialFolder.Desktop.Child("dump.txt")
InternalSQLiteLibraryMBS.DumpToFile(handle, file)
```

Notes: Must use the internal SQLite database, otherwise it will crash.
Raises exception if handle or file is nil.
SQL errors are output by SQLite to the output file.

186.5.6 DumpToString(SqliteDBConectionHandle as Ptr, byref Data as String, MaximumSize as Integer = 10000000, TableName as string = """, PreserveRowid as Boolean = false, Newlines as Boolean = false, DumpDataOnly as Boolean = false, DumpNoSys as Boolean = false)

MBS SQL Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Dumps SQLite database to text file just like dump command in SQLite command line tool.
Example:

```
Call InternalSQLiteLibraryMBS.Use
```

```
Var con As New SQLConnectionMBS

// connect....

Var handle As ptr = con.SQLiteConnectionHandle
Var data as string
InternalSQLiteLibraryMBS.DumpToFile(handle, data, 1000000)
```

Notes: Must use the internal SQLite database, otherwise it will crash.
Raises exception if handle is nil or we run out of memory.
SQL errors are output by SQLite to the output file.

Please pass size of memory we should allocate. Then we can run the dump.
if the final COMMIT is missing or the size is close to the limit you gave, you may run again with higher limit.

186.5.7 DumpToStrings(SqliteDBConectionHandle as Ptr, SchemaName as String = ””, TableName as string = ””) as String()

MBS SQL Plugin, Plugin Version: 25.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert an SQLite database into SQL statements that will recreate that database.
Notes: Schema: Which schema to dump. Usually ”main”.
Table: Which table to dump. Pass ”” for all tables.

This subroutine converts the content of an SQLite database into UTF-8 text SQL statements that can be used to exactly recreate the original database. ROWID values are preserved.

The connection handle parameter is the SQLite database connection using our internal SQLite library. Schema is the schema within that database which is to be dumped. Usually the zSchema is ”main” but can also be ”temp” or any ATTACH-ed database. If Table is not empty, then only the content of that one table is dumped. If zTable is empty, then all tables are dumped.

The generate text is collected and returned as a string array.

186.5.8 isKeyword(name as string) as boolean

MBS SQL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if an identifier is a keyword.
Example:

```
if InternalSQLiteLibraryMBS.isKeyword("TABLE") then
MessageBox "Table is a keyword"
else
MessageBox "Table is not a keyword!"
end if
```

186.5.9 Keywords as String()

MBS SQL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of keywords.
Example:

```
MessageBox Join(InternalSQLiteLibraryMBS.Keywords,EndOfLine)
```

186.5.10 LoadICU as Boolean

MBS SQL Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads ICU libraries now.
Example:

```
If InternalSQLiteLibraryMBS.ICULoaded Then
MessageBox "already loaded"
ElseIf InternalSQLiteLibraryMBS LoadICU Then
MessageBox "loaded successfully"
Else
MessageBox "failed to load the unicode libraries."
End If
```

Notes: Returns true on success.
Normally we load them when SQLite initializes and we then add the ICU extension if we find the library.
Call this function toe explicit load them now.

If MBS Plugin can find International Components for Unicode library files, we can load them and use them for proper unicode handling in SQLite.

186.5.11 SourceID as String

MBS SQL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The source code ID.
Example:

MessageBox InternalSQLiteLibraryMBS.SourceID

186.5.12 Use as boolean

MBS SQL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Registers the built in SQLite library for use.
Example:

```
if InternalSQLiteLibraryMBS.Use then
MessageBox "Using internal SQLite"
else
MessageBox "Failed, so please use library file."
end if
```

Notes: So instead of having SQL Plugin load sqlite3 shared library from file, we use the one built into this plugin.

186.5.13 Version as String

MBS SQL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the version number.
Example:

```
MessageBox InternalSQLiteLibraryMBS.Version
```

186.5.14 VersionNumber as Integer

MBS SQL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the sqlite version number.
Example:

```
MessageBox str(InternalSQLiteLibraryMBS.VersionNumber)
```

186.5.15 Properties

186.5.16 Base64ExtensionEnabled as Boolean

MBS SQL Plugin, Plugin Version: 25.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to enable the Base64 extensions.
Notes: This is a SQLite extension for converting in either direction between a (binary) blob and base64 text. Base64 can transit a sane USASCII channel unmolested. It also plays nicely in CSV or written as TCL brace-enclosed literals or SQL string literals, and can be used unmodified in XML-like documents.

This is an independent implementation of conversions specified in RFC 4648, done on the above date by the author (Larry Brasfield) who thereby has the right to put this into the public domain.

The conversions meet RFC 4648 requirements, provided that this C source specifies that line-feeds are included in the encoded data to limit visible line lengths to 72 characters and to terminate any encoded blob having non-zero length.

Length limitations are not imposed except that the runtime SQLite string or blob length limits are respected. Otherwise, any length binary sequence can be represented and recovered. Generated base64 sequences, with their line-feeds included, can be concatenated; the result converted back to binary will be the concatenation of the represented binary sequences.

This SQLite3 extension creates a function, base64(x), which either: converts text x containing base64 to a returned blob; or converts a blob x to returned text containing base64. An error will be thrown for other input argument types.
(Read and Write property)

186.5.17 CSVExtensionEnabled as Boolean

MBS SQL Plugin, Plugin Version: 25.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to enable the CSV extensions.
Notes: This file contains the implementation of an SQLite virtual table for reading CSV files.

Usage:

.load ./csv
CREATE VIRTUAL TABLE temp.csv USING csv(filename=FILENAME);
SELECT * FROM csv;

The columns are named "c1", "c2", "c3", ... by default. Or the application can define its own CREATE TABLE statement using the schema= parameter, like this:

CREATE VIRTUAL TABLE temp.csv2 USING csv(
filename = "../http.log",
schema = "CREATE TABLE x(date,ipaddr,url,referrer,userAgent)"

);

Instead of specifying a file, the text of the CSV can be loaded using the data= parameter.

If the columns=N parameter is supplied, then the CSV file is assumed to have N columns. If both the columns= and schema= parameters are omitted, then the number and names of the columns is determined by the first line of the CSV input.
(Read and Write property)

186.5.18 ICUEnabled as Boolean

MBS SQL Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether ICU libraries are enabled.
Notes: If MBS Plugin can find International Components for Unicode library files, we can load them and use them for proper unicode handling in SQLite.
Default is true to enable them, if possible.
(Read and Write property)

186.5.19 ICULoaded as Boolean

MBS SQL Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether ICU libraries are loaded.
Notes: If MBS Plugin can find International Components for Unicode library files, we can load them and use them for proper unicode handling in SQLite.
(Read only property)

186.5.20 ICUUsed as Boolean

MBS SQL Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether ICU libraries have been used.
Notes: Once SQLite is initialized, we set this to 1 if we passed the functionality to SQLite.
Starts with false and should later turn true if ICU libraries are loaded and enabled for usage.
(Read only property)

186.5.21 MemoryHighwater as Int64

MBS SQL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries high water memory usage mark.
Example:

```
MessageBox "SQLite uses "+_
str(InternalSQLiteLibraryMBS.MemoryUsed)+_
" bytes and has a high mark of "+_
str(InternalSQLiteLibraryMBS.MemoryHighwater)+" bytes."
```

Notes: (Read only property)

186.5.22 MemoryUsed as Int64

MBS SQL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current memory usage.
Example:

```
MessageBox "SQLite uses "+_
str(InternalSQLiteLibraryMBS.MemoryUsed)+_
" bytes and has a high mark of "+_
str(InternalSQLiteLibraryMBS.MemoryHighwater)+" bytes."
```

Notes: (Read only property)

186.5.23 Path as String

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries file path to the plugin library.
Notes: Allows you to query path for plugin library, so you can pass it to SQLite to load as extension.
(Read only property)

186.5.24 UUIDExtensionEnabled as Boolean

MBS SQL Plugin, Plugin Version: 25.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to enable the uuid extensions.
Notes: This SQLite extension implements functions that handling RFC-4122 UUIDs

Three SQL functions are implemented:

uuid()	generate a version 4 UUID as a string
uuid_str(X)	convert a UUID X into a well-formed UUID string
uuid_blob(X)	convert a UUID X into a 16-byte blob

The output from uuid() and uuid_str(X) are always well-formed RFC-4122 UUID strings in this format:

xxxxxxxx-xxxx-Mxxx-Nxxx-xxxxxxxxxxxx

All of the 'x', 'M', and 'N' values are lower-case hexadecimal digits. The M digit indicates the "version". For uuid()-generated UUIDs, the version is always "4" (a random UUID). The upper three bits of N digit are the "variant". This library only supports variant 1 (indicated by values of N between '8' and 'b') as those are overwhelming the most common. Other variants are for legacy compatibility only.

The output of uuid_blob(X) is always a 16-byte blob. The UUID input string is converted in network byte order (big-endian) in accordance with RFC-4122 specifications for variant-1 UUIDs. Note that network byte order is *always* used, even if the input self-identifies as a variant-2 UUID.

The input X to the uuid_str() and uuid_blob() functions can be either a string or a BLOB. If it is a BLOB it must be exactly 16 bytes in length or else a NULL is returned. If the input is a string it must consist of 32 hexadecimal digits, upper or lower case, optionally surrounded by { ... } and with optional "-" characters interposed in the middle. The flexibility of input is inspired by the PostgreSQL implementation of UUID functions that accept in all of the following formats:

- A0EEBC99-9C0B-4EF8-BB6D-6BB9BD380A11
- { a0eebc99-9c0b-4ef8-bb6d-6bb9bd380a11 }
- a0eebc999c0b4ef8bb6d6bb9bd380a11
- a0ee-bc99-9c0b-4ef8-bb6d-6bb9-bd38-0a11
- { a0eebc99-9c0b4ef8-bb6d6bb9-bd380a11 }

If any of the above inputs are passed into uuid_str(), the output will always be in the canonical RFC-4122 format:

- a0eebc99-9c0b-4ef8-bb6d-6bb9bd380a11

If the X input string has too few or too many digits or contains stray characters other than { , } , or -, then NULL is returned.
(Read and Write property)

186.6 class MySQLMBS

186.6.1 class MySQLMBS

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The class for MySQL specific functionality.
Notes: Deprecated in favor of direct methods on SQLConnectionMBS. Please let us know if you need more MySQL or MariaDB specific functions.
Subclass of the SQLAPIMBS class.

186.6.2 Methods

186.6.3 AffectedRows as UInt64

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the number of affected rows in the last statement.
Notes: see also
http://dev.mysql.com/doc/refman/5.1/en/mysql-affected-rows.html

186.6.4 Error as string

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the last error text.
Notes: see also
http://dev.mysql.com/doc/refman/5.1/en/mysql-error.html

186.6.5 ErrorNumber as UInt32

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the last error code.
Notes: see also
http://dev.mysql.com/doc/refman/5.1/en/mysql-errno.html

186.6.6 FieldCount as UInt32

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of columns for the most recent query on the connection.
Notes: see also
http://dev.mysql.com/doc/refman/5.1/en/mysql-field-count.html

186.6.7 Info as string

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves an info string providing information about the most recently executed statement.
Notes: see also
http://dev.mysql.com/doc/refman/5.1/en/mysql-info.html

186.6.8 InsertID as Int64

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the last auto increment value from last insert command.
Notes: Please query value right after doing Insert. This value is reset when you call commit.
For mySQL and MariaDB connections.

see also
http://dev.mysql.com/doc/refman/5.1/en/mysql-insert-id.html

186.6.9 NumberOfRows(cmd as SQLCommandMBS) as UInt64

MBS SQL Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of records in a command.

186.6.10 SetSSL(keyPath as string, CertificatePath as string, AuthorityPath as string, authorityFolderPath as string, Cipher as string)

MBS SQL Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets SSL connection parameters.
Notes: Calls mysql_ssl_set internally.
Used for establishing secure connections using SSL. It must be called before Connect(). It does nothing unless SSL support is enabled in the client library.

keyPath is the path name to the key file.
CertificatePath is the path name to the certificate file.
AuthorityPath is the path name to the certificate authority file.
authorityFolderPath is the path name to a directory that contains trusted SSL CA certificates in PEM format.
Cipher is a list of permissible ciphers to use for SSL encryption.

Any unused SSL parameters may be given as empty string.
For paths, please use folderitem.NativePath and not folderitem.ShellPath.

Please switch to using the following options on the connection:

MYSQL_SSL_KEY
MYSQL_SSL_CERT
MYSQL_SSL_CA
MYSQL_SSL_CAPATH
MYSQL_SSL_CIPHER

They should be specified before the connection is made.
e.g.

db.Option("MYSQL_SSL_CIPHER") = "DHE-RSA-AES256-SHA"

Allows to specify MySQL SSL parameters that will be used with mysql_ssl_set. MySQL API method called only when at least one parameter specified. See MySQL documentation for more information about these options.

186.7 class PostgreSQLAPIMBS

186.7.1 class PostgreSQLAPIMBS

MBS SQL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The class for Postgre SQL specific functions.
Notes: The Listen method and Notification event are in the SQLDatabaseMBS/SQLConnectionMBS classes directly.

Deprecated in favor of direct methods on SQLCommandMBS. Please let us know if you need more postgreSQL specific functions.
Subclass of the SQLAPIMBS class.
Blog Entries

186.7.2 Methods

186.7.3 DB as string

MBS SQL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The database name used to create the connection.

186.7.4 ErrorMessage as string

MBS SQL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error message.

186.7.5 Field(cmd as SQLCommandMBS, RecordIndex as Integer, FieldIndex as Integer) as string

MBS SQL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a field by index for the row with the RecordIndex.
See also:

- 186.7.6 Field(cmd as SQLCommandMBS, RecordIndex as Integer, FieldName as string) as string 22569

186.7.6 Field(cmd as SQLCommandMBS, RecordIndex as Integer, FieldName as string) as string

MBS SQL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a field by name for the row with the RecordIndex.
See also:

- 186.7.5 Field(cmd as SQLCommandMBS, RecordIndex as Integer, FieldIndex as Integer) as string 22568

186.7.7 FieldCount(cmd as SQLCommandMBS) as Integer

MBS SQL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of fields in the result.

186.7.8 Host as string

MBS SQL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The host used to create the connection.

186.7.9 Options as string

MBS SQL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The options used to create the connection.

186.7.10 Password as string

MBS SQL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The password used to create the connection.

186.7.11 Port as string

MBS SQL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The port used to create the connection.

186.7.12 RecordCount(cmd as SQLCommandMBS) as Integer

MBS SQL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of records in the result.

186.7.13 TTY as string

MBS SQL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tty used to create the connection.

186.7.14 User as string

MBS SQL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The user name used to create the connection.

186.8 Globals

186.8.1 BuildRecordSetMBS(fieldNames() as string, values() as string) as RecordSet

MBS SQL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Builds a recordset from strings.
Example:

```
Var names() as string = array("Firstname", "Lastname")
Var values() as string

values.Add "Stefan"
values.Add "Miller"
values.Add "Patrick"
values.Add "Maier"

Var r as RecordSet = BuildRecordSetMBS(names, values)
```

Notes: First array has field names. Second array has all values.
As plugin can't access multi dimensional arrays, we have to flatten it into one dimension and concat all rows.
Returns nil on low memory.
Array sizes should be like: Ubound(values)+1 = (ubound(fieldNames)+1) * RecordCount

See also BuildRowSetMBS for newer Xojo versions.

186.8.2 BuildRowSetMBS(fieldNames() as string, values() as string) as RowSet

MBS SQL Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Builds a recordset from strings.
Example:

```
Var names() as string = array("Firstname", "Lastname")
Var values() as string

values.Add "Stefan"
values.Add "Miller"
values.Add "Patrick"
values.Add "Maier"

Var r as RowSet = BuildRowSetMBS(names, values)
```

Notes: First array has field names. Second array has all values.
As plugin can't access multi dimensional arrays, we have to flatten it into one dimension and concat all rows.
Returns nil on low memory.
Array sizes should be like: Ubound(values)+1 = (ubound(fieldNames)+1) * RecordCount

RowSet requires Xojo 2019r2 or newer.

- 186.11.7 Constructor(dataProvider as SQLDataProviderMBS, BlockSize as UInt32) 22576

186.11.5 Constructor(data as SQLStringMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new blob object from a string object.
See also:

- 186.11.3 Constructor 22575
- 186.11.4 Constructor(Data as MemoryBlock) 22575
- 186.11.6 Constructor(Data as string, isText as Boolean = True) 22576
- 186.11.7 Constructor(dataProvider as SQLDataProviderMBS, BlockSize as UInt32) 22576

186.11.6 Constructor(Data as string, isText as Boolean = True)

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new string object with data or text copied from the data string.
Notes: If isText is true, the data is interpreted as text and string encoding conversion may modify it. If isText is false the bytes are copied raw.
See also:

- 186.11.3 Constructor 22575
- 186.11.4 Constructor(Data as MemoryBlock) 22575
- 186.11.5 Constructor(data as SQLStringMBS) 22576
- 186.11.7 Constructor(dataProvider as SQLDataProviderMBS, BlockSize as UInt32) 22576

186.11.7 Constructor(dataProvider as SQLDataProviderMBS, BlockSize as UInt32)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new blob object from a data provider.
Notes: The blocksize specifies in which sizes data is requested from the provider.
You must make sure that the data provider and this new blob object life long enough. Because the actual data is requested later when you do the update on the database.

If BlockSize is 0, the default block size is used.

- 186.13.5 Constructor(Data as string, isText as boolean=true) 22579

186.14 class SQLCommandMBS

186.14.1 class SQLCommandMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This is the central class for the using the SQL database access.
Example:

```
Var con as SQLConnectionMBS
Var cmd as SQLCommandMBS

try

con = new SQLConnectionMBS // connection object
cmd = new SQLCommandMBS // create command object

// where is the library?
con.SetFileOption con.kOptionLibraryMySQL, SpecialFolder.UserHome.Child("libmysqlclient.dylib")

// connect to database (mySQL in our example)
// server: 192.168.1.80
// port: 3306
// database: test
// name: root
// no password
con.Connect("192.168.1.80,3306@test","root","",SQLConnectionMBS.kMySQLClient)
// associate a command with connection
// connection can also be specified in SACommand constructor
cmd.Connection=con

// create table
cmd.setCommandText("Create table test_tbl(fid integer, fvarchar20 varchar(20), fblob blob)")
cmd.Execute

// insert value
cmd.setCommandText("Insert into test_tbl(fid, fvarchar20) values (1, 'Some string (1)')")
cmd.Execute

// commit changes on success
con.Commit

MessageBox("Table created, row inserted!")

catch r as SQLErrorExceptionMBS
// SAConnection::Rollback()
// can also throw an exception
// (if a network error for example),
```

```
// we will be ready
try

// on error rollback changes
if con<>nil then
con.rollback
end if
catch x as SQLErrorExceptionMBS
// ignore
end try

// show error message
MessageBox r.message
end try
```

Notes: The plugin can cache the recordset locally. To enable you can call SQLCommandMBS.Cache or use the Option("AutoCache") = "true" on either command or connection or database objects. The plugin will than fetch all records and store them in memory. After this you can walk over the recordset and use FetchPos, FetchFirst, FetchLast, FetchPrev and FetchNext to locate the rows you need. When you call Field() you always get last row, but to read from cached result set, please use Value() function. When using RecordSet, the values are read via Value() functions automatically.

186.14.2 Methods

186.14.3 AsRecordSet as RecordSet

MBS SQL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a recordset using the command to query fields.
Notes: You can use normal RecordSet functions to walk through fields and they simply control the command object.
This is for convenience like passing RecordSet to report functions in Xojo.

For this method to work, you need to have somewhere a property with SQLDatabaseMBS so Xojo includes our SQLDatabase plugin which provides the RecordSet functionality.

The record set may not have a valid RecordCount or have working movefirst/movelast/moveprev methods unless the underlaying database supports those and Scrollable result sets is enabled/supported.

186.14.4 AsRowSet as RowSet

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a RowSet using the command to query fields.
Notes: You can use normal RowSet functions to walk through fields and they simply control the command object.
This is for convenience like passing RowSet to other functions in Xojo.

For this method to work, you need to have somewhere a property with SQLDatabaseMBS so Xojo includes our SQLDatabase plugin which provides the RowSet functionality.

The RowSet may not have a valid RecordCount or have working movefirst/movelast/moveprev methods unless the underlaying database supports those and Scrollable result sets is enabled/supported.

Requires Xojo 2019r2 or newer.

186.14.5 Cache

MBS SQL Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Caches values.
Notes: The plugin will load the whole recordset and store it in memory.
Now you can move forward/backward as needed to read data.

If you set Option("AutoCache") = "true", the plugin will call Cache automatically for all result sets.
We can only cache first result set.

186.14.6 Cancel

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Attempts to cancel the pending result set, or current statement execution.
Notes: Only if isExecuting is true, doing cancel makes sense.

Cancel can cancel the following types of processing on a statement:

A function running asynchronously on the statement.
A function running on the statement on another thread.
After an application calls a function asynchronously, it checks repeatedly to determine whether it has finished processing. While the function is processing, an application can call Cancel to cancel the function.

In a multithread application, the application can cancel a function that is running synchronously on a statement.

see also
https://www.sqlapi.com/ApiDoc/class_s_a_command.html

186.14.7 Close

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes the specified command object.
Notes: Use the Close method to close the command explicitly.

A command will be implicitly closed in destructor, so you don't have to call Close method explicitly.

186.14.8 Constructor

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new command object with no connection and no command text.
See also:

- 186.14.9 Constructor(connection as SQLConnectionMBS, SQLCommand as String, CommandType as Integer = 0) 22585

186.14.9 Constructor(connection as SQLConnectionMBS, SQLCommand as String, CommandType as Integer = 0)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This constructor initializes a new SQLCommandMBS object.
Example:

```
// your connection
Var con as SQLConnectionMBS
Var SQL as string = "Insert into test_tbl(fid, fvarchar20) values(:id, :name)"

// create command object
Var cmd as new SQLCommandMBS(con, sql)

// assign values by name of parameter:
cmd.Param("id").setAsLong(2)
cmd.Param("name").setAsString(new SQLStringMBS("Some string (2)"))

// Insert first row
cmd.Execute
```

Notes: Connection: the connection to associated with the command.
SQLCommand: A string which represents command text string (an SQL statement or a stored procedure name). If it is an empty string, no command text is associated with the command, and you have to call setCommandText method later.
CommandType: The type of command like kCommandTypeUnknown, kCommandTypeSQLStatement, kCommandTypeSQLStatementRaw or kCommandTypeStoredProcedure.

All text strings sent to the plugin must have a defined encoding. Else the internal text encoding conversions will fail.
See also:

- 186.14.8 Constructor 22585

186.14.10 CreateParam(name as string, ParamType as Integer, DirType as Integer=0) as SQLParamMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates parameter associated with the specified command.
Notes: Parameters

name:	A string representing the name of parameter.
ParamType:	Type of the parameter's value. Use the kDataType constants.
ParamSize:	An integer value represents parameter's value size.
ParamPrecision:	An integer value represents parameter's value precision.
ParamScale:	An integer value represents parameter's value scale.
DirType:	Type of the parameter. Use the kParamDirType* constants.

Returns a new SQLParamMBS object on success or nil on any error.

Normally you should not create parameters by yourself. The Library automatically detects whether the command has parameters in terms of the command text and implicitly creates a set of SAParam objects.

Nevertheless, if you call CreateParam explicitly you have to delete all SAParam objects created automatically by the Library before. Use DestroyParams method before the first call of CreateParam method.
See also:

- 186.14.11 CreateParam(name as string, ParamType as Integer, NativeType as Integer, ParamSize as Integer, ParamPrecision as Integer, ParamScale as Integer, DirType as Integer=0) as SQLParamMBS 22586

186.14.11 CreateParam(name as string, ParamType as Integer, NativeType as Integer, ParamSize as Integer, ParamPrecision as Integer, ParamScale as Integer, DirType as Integer=0) as SQLParamMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates parameter associated with the specified command.
Notes: Parameters

name:	A string representing the name of parameter.
ParamType:	Type of the parameter's value. Use the kDataType constants.
ParamSize:	An integer value represents parameter's value size.
ParamPrecision:	An integer value represents parameter's value precision.
ParamScale:	An integer value represents parameter's value scale.
DirType:	Type of the parameter. Use the kParamDirType* constants.

Returns a new SQLParamMBS object on success or nil on any error.

Normally you should not create parameters by yourself. The Library automatically detects whether the command has parameters in terms of the command text and implicitly creates a set of SAParam objects.

Nevertheless, if you call CreateParam explicitly you have to delete all SAParam objects created automatically by the Library before. Use DestroyParams method before the first call of CreateParam method.
See also:

- 186.14.10 CreateParam(name as string, ParamType as Integer, DirType as Integer=0) as SQLParamMBS 22586

186.14.12 DB2SQLExecDirect(sql as string)

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes an SQL command directly without any preprocessing in the plugin.
Example:

```
Var cmd as new SQLCommandMBS // your command
Var con as new SQLConnectionMBS // your connection

// now use an API function
const sql = "some sql command"
cmd.DB2SQLExecDirect sql
```

Notes: Lasterror is set.

186.14.13 DB2SQLRowCount as Int64

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the affected number of rows for the last operation.
Notes: Lasterror is set.

186.14.14 DestroyParams

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Destroys all parameters associated with the specified command.
Notes: DestroyParams method destroys all parameters either created automatically by the Library or by user.

Normally you should not create and delete parameters by yourself. The Library automatically detects whether the command has parameters, implicitly creates a set of SAParam objects and then deletes them in SACommanddestructor. But if you have some reason to create parameters explicitly use CreateParam method and then call DestroyParams method to delete all parameters after your work with parameters is over.

186.14.15 Execute

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes the current command.
Example:

```
// your connection
Var con as SQLConnectionMBS
Var SQL as string = "Insert into test_tbl(fid, fvarchar20) values(:id, :name)"

// create command object
Var cmd as new SQLCommandMBS(con, sql)

// assign values by name of parameter:
cmd.Param("id").setAsLong(2)
cmd.Param("name").setAsString(new SQLStringMBS("Some string (2)"))

// Insert first row
cmd.Execute
```

Notes: Use the Execute method to execute the query or stored procedure specified in the command text. Execute method calls Prepare method implicitly if needed. If the command has input parameters, they should be bound before calling Execute method. Input parameters represented by SAParam object. To bind input variables assign a value to SAParam object returning by Param or ParamByIndex methods.

A command (an SQL statement or procedure) can have a result set after executing. To check whether a result set exists use isResultSet method. If result set exists, a set of SAField objects is created after command execution. Rows from the result set can be fetched one by one using FetchNext method. To get field description or value use Field method.

Output parameters represented by SAParam objects. They are available after command execution. To get parameter description or value use Param or ParamByIndex methods.

186.14.16 ExecuteCommand(SQLCommand as string, CommandType as Integer=0)

MBS SQL Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes the given command.
Notes: This is a convenience function.
Internally it calls setCommandText with the given command and calls Execute.

All text strings sent to the plugin must have a defined encoding. Else the internal text encoding conversions will fail.

186.14.17 ExecuteCommandMT(SQLCommand as string, CommandType as Integer=0)

MBS SQL Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes the given command.
Notes: This is a convenience function.
Internally it calls setCommandText with the given command and calls Execute.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

All text strings sent to the plugin must have a defined encoding. Else the internal text encoding conversions will fail.

186.14.18 ExecuteMT

MBS SQL Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes the current command.
Notes: Use the Execute method to execute the query or stored procedure specified in the command text. Execute method calls Prepare method implicitly if needed. If the command has input parameters, they should be bound before calling Execute method. Input parameters represented by SAParam object. To bind input variables assign a value to SAParam object returning by Param or ParamByIndex methods.

A command (an SQL statement or procedure) can have a result set after executing. To check whether a result set exists use isResultSet method. If result set exists, a set of SAField objects is created after command execution. Rows from the result set can be fetched one by one using FetchNext method. To get field description or value use Field method.

Output parameters represented by SAParam objects. They are available after command execution. To get parameter description or value use Param or ParamByIndex methods.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

186.14.19 FetchFirst as boolean

MBS SQL Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fetches first row from a result set.
Notes: Same as FetchNext, but jumps to the first row.
Returns true if the row was fetched; otherwise false.

Not supported for Interbase and SQLite.

When you cache the result set, you can always move within the result set.

186.14.20 FetchLast as boolean

MBS SQL Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fetches last row from a result set.
Notes: Same as FetchNext, but jumps to the last row.
Returns true if the row was fetched; otherwise false.

Not supported for Interbase and SQLite.

When you cache the result set, you can always move within the result set.

186.14.21 FetchNext as boolean

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fetches next row from a result set.
Notes: Returns true if the next row was fetched; otherwise false .

Use FetchNext method to fetch row by row from the result set.

Each column of fetched row is represented by SAField object. If a result set exists after the last command execution, a set of SAField objects is created implicitly. To check whether a result set exists use isResultSet method. FetchNext method updates value parts of SAField objects.

To get field description or value use Field method.

When you cache the result set, you can always move within the result set.

186.14.22 FetchPos(offset as Integer, relative as boolean = false) as boolean

MBS SQL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fetches a row by index.
Notes: Returns true if the row was fetched; otherwise false.
You may need to request recordset to be scrollable to have this work.
For that, please set Option("Scrollable") = "true" before doing the query.

When you cache the result set, you can always move within the result set.

186.14.23 FetchPrior as boolean

MBS SQL Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fetches previous row from a result set.
Notes: Returns true if the row was fetched; otherwise false.
Same as FetchNext, just going back inside the result set.

Not supported for Interbase and SQLite.

When you cache the result set, you can always move within the result set.

186.14.24 Field(index as Integer) as SQLFieldMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the column specified by its position in the result set.
Example:

```
Var c as SQLCommandMBS // your command object

// get field by name
Var f1 as SQLFieldMBS = c.Field("FirstName")

// get field by Index
Var f2 as SQLFieldMBS = c.Field(1)
```

Notes: index: A one-based field number in a result set.

Use Field method to access a field by its name or position in the result set.
For Cached result sets, please use Value() function to get values.

Using an index smaller than 1 and greater then the value returned by FieldCount method will result in a failed assertion.

A set of SAField objects creates implicitly after the command execution if the result set exists.SAField object contains full information about a column: name, type, size, value.

Raises OutOfBoundsException exception if index parameter is out of range.
See also:

- 186.14.25 Field(name as string) as SQLFieldMBS 22592

186.14.25 Field(name as string) as SQLFieldMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the column specified by its name in the result set.
Example:

```
Var c as SQLCommandMBS // your command object

// get field by name
Var f1 as SQLFieldMBS = c.Field("FirstName")

// get field by Index
Var f2 as SQLFieldMBS = c.Field(1)
```

Notes: name: A string that represents a name of the requested field.

Returns a reference to a SAField object.

Use Field method to access a field by its name or position in the result set.
For Cached result sets, please use Value() function to get values.

Using a non-existent field name will throw an exception.

A set of SAField objects creates implicitly after the command execution if the result set exists.SAField object contains full information about a column: name, type, size, value.
See also:

- 186.14.24 Field(index as Integer) as SQLFieldMBS 22592

186.14.26 FieldExists(name as string) as Boolean

MBS SQL Plugin, Plugin Version: 21.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether a field exists.
Notes: Returns true if field is found or false if not.

186.14.27 FieldNames as String()

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an array with all the field names for quick inspection.
Example:

```
Var cmd as SQLCommandMBS // your command

Var FieldNames() as String = cmd.FieldNames
```

186.14.28 Open

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens the specified command object.
Notes: Use the Open method to open the command explicitly.

A command will be implicitly opened by any method that needs an open command, therefore you don't have to call it explicitly.

To test whether a command is opened use isOpened method.

186.14.29 Param(ID as Integer) as SQLParamMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the command parameter specified by its position.
Notes: ID: A position of parameter specified in the command text. Normally position is a number stated in the command text after a colon (for example, 1 for :1, 5 for :5).

Returns a reference to a SAParam object which is only valid as long as the param object is not deleted by the library.

Use Param method to access a parameter by its name or position (in SQL statement). If, for example, you want to walk through all the parameters use ParamByIndex method.

If parameters were not created before calling Param method the Library creates them implicitly (can query native API if needed and therefore can throw exception on error) and then returns the specified parameter.

Passing a value of name or position which does not specified in the command text will throw an exception.

SAParam object contains full information about a parameter: name, type, size, etc. Values for the input parameters can be assigned to SAParam object.
See also:

- 186.14.30 Param(name as string) as SQLParamMBS 22594

186.14.30 Param(name as string) as SQLParamMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the command parameter specified by its name.
Example:

```
// your connection
Var con as SQLConnectionMBS
Var SQL as string = "Insert into test_tbl(fid, fvarchar20) values(:id, :name)"

// create command object
```

```
Var cmd as new SQLCommandMBS(con, sql)

// assign values by name of parameter:
cmd.Param("id").setAsLong(2)
cmd.Param("name").setAsString(new SQLStringMBS("Some string (2)"))

// Insert first row
cmd.Execute
```

Notes: Name: A string that represents a name of the requested parameter. Normally name is a string stated in the command text after a colon (for example, 'city' for :city, 'my city' for :"my city") or a parameter name in a stored procedure or function.

Returns a reference to a SAParam object which is only valid as long as the param object is not deleted by the library.

Use Param method to access a parameter by its name or position (in SQL statement). If, for example, you want to walk through all the parameters use ParamByIndex method.

If parameters were not created before calling Param method the Library creates them implicitly (can query native API if needed and therefore can throw exception on error) and then returns the specified parameter.

Passing a value of name or position which does not specified in the command text will throw an exception.

SAParam object contains full information about a parameter: name, type, size, etc. Values for the input parameters can be assigned to SAParam object.
See also:

- 186.14.29 Param(ID as Integer) as SQLParamMBS 22594

186.14.31 ParamByIndex(index as Integer) as SQLParamMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the command parameter specified by index.
Notes: Index: A zero-based index of the requested parameter in the array of SAParam objects. It must be greater than or equal to 0 and 1 less than the value returned by ParamCount method.

Returns a reference to a SAParam object.

Normally you should use Param method to access a parameter by its name or position (in SQL statement). ParamByIndex method can be used if, for example, you want to walk through all the parameters.

If parameters were not created before calling ParamByIndex method the Library creates them implicitly (can query native API if needed and therefore can throw exception on error) and then returns the specified parameter.

Passing a negative value of index or a value greater or equal than the value returned by ParamCount method will result in a failed assertion.

SAParam object contains full information about a parameter: name, type, size, etc. Values for the input parameters can be assigned to SAParam object.

Raises OutOfBoundsException exception if index parameter is out of range.

186.14.32 PostgreSQLField(RecordIndex as integer, FieldIndex as integer) as string

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a field by index for the row with the RecordIndex.
See also:

- 186.14.33 PostgreSQLField(RecordIndex as integer, FieldName as string) as string 22596

186.14.33 PostgreSQLField(RecordIndex as integer, FieldName as string) as string

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a field by name for the row with the RecordIndex.
See also:

- 186.14.32 PostgreSQLField(RecordIndex as integer, FieldIndex as integer) as string 22596

186.14.34 PostgreSQLFieldCount as Integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of fields in the result.

186.14.35 PostgreSQLRowCount as Integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of records in the result.

186.14.36 Prepare

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prepares command before execution.
Notes: Prepare method compiles the command, but does not execute it. The method detects syntax errors in command text and verifies the existence of database objects.

Execute method calls Prepare method implicitly if needed, therefore you don't have to call it explicitly.

186.14.37 setCommandText(SQLCommand as string, CommandType as Integer = 0)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the command text.
Example:

```
Var s as new SQLCommandMBS

s.setCommandText "select * from test"

MessageBox s.CommandText
```

Notes: SQLCommand: A string which represents command text string (an SQL statement or a stored procedure name).
CommandType: The type of command like kCommandTypeUnknown, kCommandTypeSQLStatement, kCommandTypeSQLStatementRaw or kCommandTypeStoredProcedure.

It's not necessary to set a command type explicitly, because it is defined automatically in terms of command text string. But if you still have any reason to do it, use one of the kCommandType* constants. To get command type use CommandType method.

186.14.38 SetParameters(Params as dictionary)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the parameters based on the keys and values in the dictionary.
Example:

```
Var con as SQLConnectionMBS // your connection
Var pic as picture // some picture

// get picture data
Var jpegData as MemoryBlock = pic.GetData(Picture.FormatJPEG, 80)

// parse a SQL command
Var sql as string = "Insert into BlobTest(name, image) values (:name, :image)"
Var cmd as new SQLCommandMBS(con, sql)

Var d as new Dictionary
// set by param index
d.Value(0) = "test.jpg"
// set by param name
d.Value("image") = jpegData

// set all parameters together
cmd.SetParameters d
cmd.Execute
```

Notes: Keys can be String, Text or numeric types. Text and String are used to pick parameters by name.
Numeric values are used to pick parameter by index (zero based).
MemoryBlock and Strings without text encoding are converted to byte values (BLOB).
Texts and Strings with encoding are converted to text values.
Raises exceptions if you pass anything which is not recognized.
Other types are translated as good as possible.

Raises OutOfBoundsException exception if index parameter is out of range.

186.14.39 Value(index as Integer) as SQLValueReadMBS

MBS SQL Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value specified by its position in the result set.
Example:

```
Var c as SQLCommandMBS // your command object

// get field by name
```

```
Var f1 as SQLValueReadMBS = c.Value("FirstName")

// get field by Index
Var f2 as SQLValueReadMBS = c.Value(1)
```

Notes: You can use Value() to get values for normal or cached result sets.

index: A one-based field number in a result set.

Use Value method to access a field by its name or position in the result set.
For Cached result sets, please use Value() function to get values.

Using an index smaller than 1 and greater then the value returned by FieldCount method will result in a failed assertion.

A set of SAField objects creates implicitly after the command execution if the result set exists. SAField object contains full information about a column: name, type, size, value.

Raises OutOfBoundsException exception if index parameter is out of range.
See also:

- 186.14.40 Value(name as string) as SQLValueReadMBS 22599

186.14.40 Value(name as string) as SQLValueReadMBS

MBS SQL Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value specified by its name in the result set.
Example:

```
Var c as SQLCommandMBS // your command object

// get value by name
Var f1 as SQLValueReadMBS = c.Value("FirstName")

// get value by Index
Var f2 as SQLValueReadMBS = c.Value(1)
```

Notes: You can use Value() to get values for normal or cached result sets.

name: A string that represents a name of the requested field.

Returns a reference to a SAValueRead object.

Use Value method to access a field by its name or position in the result set.
Using a non-existent field name will throw an exception.

A set of SAField objects creates implicitly after the command execution if the result set exists.SAField object contains full information about a column: name, type, size, value.
See also:

- 186.14.39 Value(index as Integer) as SQLValueReadMBS 22598

186.14.41 Properties

186.14.42 CommandCount as Integer

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of current command objects.
Notes: This method should help you find leaked objects by keeping track of current count from the plugin perspective.
This includes SQLCommandMBS and RecordSet objects.
(Read only property)

186.14.43 CommandText as string

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the command text associated with the SACommand object.
Example:

```
Var s as new SQLCommandMBS(nil, "select * from test")

MessageBox s.CommandText
```

Notes: Use the CommandText method to return the command text declared in SACommand constructor or setCommandText method.

All text strings sent to the plugin must have a defined encoding. Else the internal text encoding conversions will fail.
(Read and Write property)

186.14.44 CommandType as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the command type currently associated with the SACommand object.
Notes: One of the following values from SACommandType_t enum:

- kCommandTypeUnknown Command type is not defined. Library will detect command type automatically when needed.
- kCommandTypeSQLStmt Command is an SQL statement.
- kCommandTypeSQLStmtRaw Command is an SQL statement that mustn't be interpreted by SQLAPI++.
- kCommandTypeStoredProc Command is a stored procedure or a function.

Remarks

The command type can be explicitly set in SACommand constructor and setCommandText method, but it's not necessary to do it.

The CommandTypemethod returns the command type value that was specified in SACommand constructor or setCommandText method. If you declared the command type value as kCommandTypeUnknown (the default value) then command type is detected by the Library and the CommandType method returns this detected value.
(Read only property)

186.14.45 Connection as SQLConnectionMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The connection for the command.
Notes: When you set the connection on a command object that already has associated connection, the previous association will be correctly discarded (with closing opened command if needed) and new connection will be set.

If you attempt to call any method on a SACommand object that requires database access with no valid connection, an error occurs.
(Read and Write property)

186.14.46 FieldCount as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of fields (columns) in a result set.
Notes: FieldCount method returns the number of fields created implicitly after the command execution if a result set exists.

A field is represented by SAField object. You can get field value and description using Field method.
(Read only property)

186.14.47 Fields as Dictionary

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Provides dictionary with all fields.
Notes: This dictionary should help for debugging to inspect all fields and their text value.
(Read only property)

186.14.48 hasCache as Boolean

MBS SQL Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether cache is active.
Notes: (Read only property)

186.14.49 isBOF as Boolean

MBS SQL Plugin, Plugin Version: 24.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether we are at the beginning of the result set.
Notes: Set to true when running the query and when FetchFirst succeeds.
Otherwise false.
(Read only property)

186.14.50 isEOF as Boolean

MBS SQL Plugin, Plugin Version: 24.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether we are at the end of the result set.
Notes: True if we are at the end of the recordset, e.g. FetchNext failed.
Set to false by Execute.

We set it to true, when something goes wrong, so Xojo's RecordSet and RowSet end looping.

We can only know, that we are not at the last one, if FetchNext internally failed to get the next record.
(Read only property)

186.14.51 isExecuted as boolean

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this command was already executed.
Notes: (Read only property)

186.14.52 isExecuting as Boolean

MBS SQL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this command is executing.
Notes: You only see this true if you use threaded queries and look on the property from another thread.
(Read only property)

186.14.53 isOpened as boolean

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the SACommand object is opened; otherwise false.
Notes: (Read only property)

186.14.54 isResultSet as boolean

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tests whether a result set exists after the command execution.
Notes: Returns true if the result set exists; otherwise false.
(Read only property)

186.14.55 Options as Dictionary

MBS SQL Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a dictionary with all options.
Notes: For debugging, it may be useful to inspect options in debugger.

(Read only property)

186.14.56 ParamCount as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of parameters associated with the SACommand object.
Notes: ParamCount method returns the number of parameters created explicitly by using CreateParam method or (if parameters were not created before) creates them implicitly (can query native API if needed and therefore can throw exception on error) and returns the number of created parameters.

Command parameter is represented by SAParam object. You can look SAParam objects through and assign their values with Param and ParamByIndex methods.
(Read only property)

186.14.57 Parameters as Dictionary

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Provides dictionary with all parameters.
Notes: This dictionary should help for debugging to inspect all parameters and their text value.
(Read only property)

186.14.58 RowsAffected as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of rows affected by the last insert/update/delete command execution.
Example:

```
Var con as SQLConnectionMBS // your connection

Var sql as string = "UPDATE Test SET MyField=1"
Var c as new SQLCommandMBS(con, sql)

c.Execute

MessageBox str(c.RowsAffected)
```

Notes: (Read only property)

186.14.59 Tag as Variant

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag property.
Example:

```
Var c as SQLCommandMBS // your command object

// store reference to window/control, so we have it available in events
c.Tag = self
```

Notes: You can store here whatever you like.
(Read and Write property)

186.14.60 Option(name as string) as string

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string value of a specific command option.
Example:

```
Var cmd as SQLCommandMBS // your command

// turn on auto cache
cmd.Option("AutoCache") = "true"
```

Notes: see also:
https://www.sqlapi.com/ApiDoc/class_s_a_command.html
(Read and Write computed property)

186.14.61 Events

186.14.62 Trace(traceInfo as Integer, SQL as string)

MBS SQL Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event to trace SQL commands.

186.14.63 Working

MBS SQL Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called while the ExecuteMT and ExecuteCommandMT methods are running.

186.14.64 Constants

Constants

Constant	Value	Description
kOptionPreFetchRows	"PreFetchRows"	One of the option constants.
kParamDirTypeInput	0	One of the parameter direction type constants. Input parameter.
kParamDirTypeInputOutput	1	One of the parameter direction type constants. Input/output parameter.
kParamDirTypeOutput	2	One of the parameter direction type constants. Output parameter.
kParamDirTypeReturn	3	One of the parameter direction type constants. Returning parameter.

Command Types

Constant	Value	Description
kCommandTypeSQLStatement	1	Command is an SQL statement.
kCommandTypeSQLStatementRaw	2	Command is an SQL statement that mustn't be interpreted by SQLAPI.
kCommandTypeStoredProcedure	3	Command is a stored procedure or a function.
kCommandTypeUnknown	0	Used by default. Library detects command type automatically.

186.15 class SQLConnectionMBS

186.15.1 class SQLConnectionMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a SQL Plugin Database connection.
Example:

```
Var con as new SQLConnectionMBS

try

// where is the library?
con.SetFileOption con.kOptionLibraryMySQL, SpecialFolder.UserHome.Child("libmysqlclient.dylib")

// connect to database
// in this example it is Oracle,
// but can also be Sybase, Informix, DB2
// SQLServer, InterBase, SQLBase and ODBC

Var server as string = "192.168.1.80,3306@test"

con.Connect(server,"root","",SQLConnectionMBS.kMySQLClient)

MessageBox "We are connected!"

// Disconnect is optional
// autodisconnect will occur in destructor if needed
con.Disconnect

MessageBox "We are disconnected!"

catch r as RuntimeException
MessageBox r.message

// SAConnection::Rollback()
// can also throw an exception
// (if a network error for example),
// we will be ready
try

// on error rollback changes
con.Rollback

catch rr as runtimeexception
MessageBox rr.message
end try
```

end try

Notes: Supported databases: CubeSQL, Centura SQLBase, DB2, DuckDB, Firebird, Informix, InterBase, MariaDB, Microsoft Access, Microsoft SQL Server, MySQL, ODBC, Oracle Database Server, PostgreSQL, SQL Anywhere, SQLite, SQLCipher and Sybase.
Connect to Microsoft Access, FileMaker Server (or Pro), Microsoft Visual FoxPro and others via ODBC.

With Xojo 2013r1, you only need a database server license from Xojo, Inc. if you use the SQLDatabaseMBS class. The SQLConnectionMBS class does not require this license. But some features like getting a recordset do need the license as they refer to the SQLDatabaseMBS class.

Please free all RecordSets and SQLCommand objects before you close the SQLConnection or the SQL-Database. The plugin keeps references from RecordSets and SQLCommand to prevent automatic destruction of the database connection. If you close a database connection while you have RecordSets and SQLCommand in use, things may go wrong.

The plugin can cache the recordset locally. To enable you can call SQLCommandMBS.Cache or use the Option("AutoCache") = "true" on either command or connection or database objects. The plugin will than fetch all records and store them in memory. After this you can walk over the recordset and use FetchPos, FetchFirst, FetchLast, FetchPrev and FetchNext to locate the rows you need. When you call Field() you always get last row, but to read from cached result set, please use Value() function. When using RecordSet, the values are read via Value() functions automatically.

You can use InternalPostgreSQLLibraryMBS or InternalSQLiteLibraryMBS if you like to use our built in SQLite or PostgreSQL database libraries.

see also
https://www.sqlapi.com/ApiDoc/class_s_a_connection.html

The class pings the database every minute by checking whether it's alive and to avoid server dropping connection. This can be disabled by setting Option("Ping") = "false". Ping is not used for SQLite.

MBS Database connections are implemented via SQLConnectionMBS and SQLCommandMBS classes. We provide a thin layer on top with SQLDatabaseMBS class to make it compatible to the Xojo database class. And when you use SQLDatabaseMBS, you can always get the matching SQLConnectionMBS objet via Connection property. Instead of SQLCommandMBS class, you may just use SelectSQL/ExecuteSQL or older SQLSelect/SQLExecute functions.

We have a collection of library files here:

186.15.2 Methods

186.15.3 BeginTransaction

MBS SQL Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Begins a transaction.
Notes: This method does nothing. Why?
Well, if auto commit is on, you don't need to call this.
If auto commit is off, we call BeginTransaction for you, so if you call this method you would call it a second time and get an error.
We have this method for compatibility to other SQL database classes from Xojo.

186.15.4 CancelAllCommands

MBS SQL Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Cancel all commands for the connection.
Notes: This loops over the list of commands associated with this connection and calls Cancel on them.

186.15.5 Commands as SQLCommandMBS()

MBS SQL Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of all command objects related to the connection.

186.15.6 Commit

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves any changes and ends the current transaction.
Notes: Use Commit method to write transaction changes permanently to a database. It commits the work of all commands that associated with that connection.

All changes to the database since the last commit are made permanent and cannot be undone. Before a commit, all changes made since the start of the transaction can be rolled back using Rollback method.

186.15.7 Connect(DBString as string, UserID as string, Password as string, client as Integer = 0)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens the connection to a data source.
Example:

```
Var con as SQLConnectionMBS// your connection

// some calls for MS SQL Server:
con.Connect("srv2@pubs","", "", SQLConnectionMBS.kSQLServerClient)
con.Connect("@pubs", "", "", SQLConnectionMBS.kSQLServerClient)
con.Connect("BEDLAM\SQL2005EX_EN@pubs", "", "", SQLConnectionMBS.kSQLServerClient)
con.Connect("BEDLAM\SQLEXPRESS@master", "", "", SQLConnectionMBS.kSQLServerClient)

// for MySQL:

con.Connect("192.168.1.80,3306@test","root","password", SQLConnectionMBS.kMySQLClient)

// for Postgre SQL:

con.Connect("somedb", "name", "password",SQLConnectionMBS.kPostgreSQLClient)
// with options
con.Connect("127.0.0.1,5432@dbname=postgres connect_timeout=10 sslmode=require", "name", "password",SQL-
ConnectionMBS.kPostgreSQLClient)

// for SQLite:

con.Connect("/test.db", "", "",SQLConnectionMBS.kSQLiteClient)
```

Notes:

DBString:	Name of database this connection will connect to (see Server specific notes).
UserID:	A string containing a user name to use when establishing the connection (see Server specific notes).
Password:	A string containing a password to use when establishing the connection.
client:	Optional. One of the following values from k*Client constants.

Using the Connect method on a SAConnection object establishes the physical connection to a data source. After this method successfully completes, the connection is live and you can issue commands against it and process the results.

If you use the default value of Client parameter, you should set Client before using Connect.

To check whether a connection established use isConnected method. To check whether a connection is broken or not use isAlive method.

see also for server specific notes:
https://www.sqlapi.com/ApiDoc/class_s_a_connection.html

For IPv6 we changed plugin to use , instead of : for the port separator. So please use , to separate port from IP or host.

For Firebird, if you connect to a database and you have 32/64bit mismatch, you get error number 3.

See Option() for various options you can set before connecting.
e.g. c.Option("SQLiteVFSFlags") = "1" for SQLite for read only access.

Raises OutOfBoundsException exception if client parameter is out of range.

186.15.8 ConnectMT(DBString as string, UserID as string, Password as string, client as Integer = 0)

MBS SQL Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens the connection to a data source.
Notes:

DBString:	Name of database this connection will connect to (see Server specific notes).
UserID:	A string containing a user name to use when establishing the connection (see Server specific notes).
Password:	A string containing a password to use when establishing the connection.
client:	Optional. One of the following values from k*Client constants.

Using the Connect method on a SAConnection object establishes the physical connection to a data source. After this method successfully completes, the connection is live and you can issue commands against it and process the results.

If you use the default value of Client parameter, you should set Client before using Connect.

To check whether a connection established use isConnected method. To check whether a connection is broken or not use isAlive method.

see also for server specific notes:

https://www.sqlapi.com/ApiDoc/class_s_a_connection.html

For IPv6 we changed plugin to use , instead of : for the port separator. So please use , to separate port from IP or host.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

The MT method will not trigger WillConnect and DidConnect events.
Raises OutOfBoundsException exception if client parameter is out of range.

186.15.9 CubeSQLLastInsertID as Int64

MBS SQL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the last auto increment value from last insert command.
Notes: Only for CubeSQL connections. May raise error if not available.

186.15.10 CubeSQLReceiveData(byref data as String, byref IsEndChunk as Boolean) as Boolean

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Receives a data chunk for file download.
Notes: Returns true on success.
Data is set with data and IsEndChunk is set to true for last chunk.

186.15.11 CubeSQLSendData(data as MemoryBlock)

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends data chunk for file upload.
Notes: This is the sendchunk function in CubeSQL.
See also:

- 186.15.12 CubeSQLSendData(data as String) 22614

186.15.12 CubeSQLSendData(data as String)

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends data chunk for file upload.
Notes: This is the sendchunk function in CubeSQL.
See also:

- 186.15.11 CubeSQLSendData(data as MemoryBlock) 22613

186.15.13 CubeSQLSendEndData

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends end data packet.
Notes: This is the send_enddata function in CubeSQL.

186.15.14 Disconnect

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Disconnects the connection from the database.
Notes: Closes all commands objects and RecordSets.

186.15.15 InsertRecord(TableName as String, Record as Dictionary)

MBS SQL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convenience function to insert a record.
Example:

```
Var con as SQLConnectionMBS // your database connection

Var d as new Dictionary

d.Value("ID")=2
d.Value("text")="test insert"
d.Value("other")="Just a test"

con.InsertRecord("test_tbl", d)
```

Notes: The plugin builds for you SQL statement with prepared statement and runs the insert command with values.

Lasterror is set or exception raised as with SQLExecute.

Internally this uses a prepared statement. You can check the generated statement via LastStatement property.

186.15.16 kOptionLibrarySeparator as String

MBS SQL Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the option constant to specify the platform specific path separator.
Notes: Use with Option() to specify multiple file paths for a library.
Has a different value on the different platforms.
Value is ";" on Windows and ":" on macOS/Linux.

186.15.17 Listen

MBS SQL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Start listening for notifications.
Notes: Works only for PostgresSQL Client.
Please set client or connect before calling this method.

186.15.18 MySQLInsertID as Int64

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the last auto increment value from last insert command.
Notes: Please query value right after doing Insert. This value is reset when you call commit.
For mySQL and MariaDB connections.

see also
http://dev.mysql.com/doc/refman/5.1/en/mysql-insert-id.html

186.15.19 Rollback

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Cancels any changes made during the current transaction and ends the transaction.
Notes: Rollback method rolls back the database to the state it was in at the completion of the last commit

operation. All uncommitted work is undone.

Rollback method rolls back the work of all commands that associated with that connection.

To commit all changes made since the start of the transaction use Commit method.

186.15.20 SetFileOption(name as string, file as folderitem)

MBS SQL Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an option with passing a file path.
Example:

```
Var db as new SQLConnectionMBS

// where is the library?
db.SetFileOption SQLConnectionMBS.kOptionLibraryMySQL, SpecialFolder.UserHome.Child("libmysqlclient.dylib")
```

Notes: Allows you to specify a file path with a folderitem.

Makes sure the path is correct and you have a 32 or 64-bit library matching the architecture of your application.

186.15.21 SQLExecute(command as string, CommandType as Integer = 0)

MBS SQL Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes a SQL command and ignores result.
Notes: This is a convenience function.
Internally it creates a SQLCommandMBS with the given command and calls Execute.

All text strings sent to the plugin must have a defined encoding. Else the internal text encoding conversions will fail.

186.15.22 SQLExecuteMT(command as string, CommandType as Integer = 0)

MBS SQL Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes a SQL command and ignores result.
Notes: This is a convenience function.

Internally it creates a SQLCommandMBS with the given command and calls Execute.

All text strings sent to the plugin must have a defined encoding. Else the internal text encoding conversions will fail.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

186.15.23 SQLiteBackupFinish(Backup as SQLite3BackupMBS) as integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finishes a backup run.
Notes: When BackupStep has returned kErrorDone, or when the application wishes to abandon the backup operation, the application should destroy the SQLite3BackupMBS by passing it to BackupFinish. The BackupFinish interfaces releases all resources associated with the SQLite3BackupMBS object. If BackupStep has not yet returned kErrorDone, then any active write-transaction on the destination database is rolled back. The SQLite3BackupMBS object is invalid and may not be used following a call to BackupFinish.
The value returned by BackupFinish is kErrorOK if no BackupStep errors occurred, regardless or whether or not BackupStep completed. If an out-of-memory condition or IO error occurred during any prior BackupStep call on the same SQLite3BackupMBS object, then BackupFinish returns the corresponding error code.
A return of kErrorBusy or kErrorLocked from BackupStep is not a permanent error and does not affect the return value of BackupFinish.

186.15.24 SQLiteBackupInit(Dest as Variant, DestName as String, Source as Variant, SourceName as String) as SQLite3BackupMBS

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes a backup.
Notes: The backup API copies the content of one database into another. It is useful either for creating backups of databases or for copying in-memory databases to or from persistent files.

see also
http://www.sqlite.org/c3ref/backup_finish.html

Exclusive access is required to the destination database for the duration of the operation. However the source database is only read-locked while it is actually being read; it is not locked continuously for the entire backup operation. Thus, the backup may be performed on a live source database without preventing other users from reading or writing to the source database while the backup is underway.

To perform a backup operation:

- BackupInit is called once to initialize the backup,
- BackupStep is called one or more times to transfer the data between the two databases, and finally
- BackupFinish is called to release all resources associated with the backup operation.

There should be exactly one call to BackupFinish for each successful call to BackupInit.

The D and N arguments to BackupInit(D,N,S,M) are the database connection associated with the destination database and the database name, respectively. The database name is "main" for the main database, "temp" for the temporary database, or the name specified after the AS keyword in an ATTACH statement for an attached database. The S and M arguments passed to BackupInit(D,N,S,M) identify the database connection and database name of the source database, respectively. The source and destination database connections (parameters S and D) must be different or else BackupInit(D,N,S,M) will file with an error.
If an error occurs within BackupInit(D,N,S,M), then nil is returned and an error code and error message are store3d in the destination database connection D. The error code and message for the failed call to BackupInit can be retrieved using the ErrCode and ErrMessage functions. A successful call to BackupInit returns a SQLite3BackupMBS object. The SQLite3BackupMBS object may be used with the BackupStep and BackupFinish functions to perform the specified backup operation.

Concurrent Usage of Database Handles
The source database connection may be used by the application for other purposes while a backup operation is underway or being initialized. If SQLite is compiled and configured to support threadsafe database connections, then the source database connection may be used concurrently from within other threads.
However, the application must guarantee that the destination database connection is not passed to any other API (by any thread) after BackupInit is called and before the corresponding call to BackupFinish. SQLite does not currently check to see if the application incorrectly accesses the destination database connection and so no error code is reported, but the operations may malfunction nevertheless. Use of the destination database connection while a backup is in progress might also also cause a mutex deadlock.
If running in shared cache mode, the application must guarantee that the shared cache used by the destination database is not accessed while the backup is running. In practice this means that the application must guarantee that the disk file being backed up to is not accessed by any connection within the process, not just the specific connection that was passed to BackupInit.
The SQLite3BackupMBS object itself is partially threadsafe. Multiple threads may safely make multiple concurrent calls to BackupStep. However, the BackupRemaining and BackupPageCount APIs are not strictly speaking threadsafe. If they are invoked at the same time as another thread is invoking BackupStep it is possible that they return invalid values.

Source and Dest can be SQLConnectionMBS or SQLDatabaseMBS. You need to pass source and dest, even if one is self as we give you the option to decide where to pass the current database connection.

186.15.25 SQLiteBackupPageCount(Backup as SQLite3BackupMBS) as integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of pages in total.
Notes: Each call to BackupStep sets two values inside the SQLite3BackupMBS object: the number of pages still to be backed up and the total number of pages in the source databae file. The BackupRemaining and BackupPageCount interfaces retrieve these two values, respectively.
The values returned by these functions are only updated by BackupStep. If the source database is modified during a backup operation, then the values are not updated to account for any extra pages that need to be updated or the size of the source database file changing.

186.15.26 SQLiteBackupRemaining(Backup as SQLite3BackupMBS) as integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of pages remaining.
Notes: Each call to BackupStep sets two values inside the SQLite3BackupMBS object: the number of pages still to be backed up and the total number of pages in the source databae file. The BackupRemaining and BackupPageCount interfaces retrieve these two values, respectively.
The values returned by these functions are only updated by BackupStep. If the source database is modified during a backup operation, then the values are not updated to account for any extra pages that need to be updated or the size of the source database file changing.

186.15.27 SQLiteBackupStep(Backup as SQLite3BackupMBS, Pages as Integer) as integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies up to Pages pages between the source and destination databases specified by SQLite3BackupMBS object.
Notes: If N is negative, all remaining source pages are copied. If BackupStep(B,N) successfully copies N pages and there are still more pages to be copied, then the function resturns kErrorOK. If BackupStep(B,N) successfully finishes copying all pages from source to destination, then it returns kErrorDone. If an error occurs while running BackupStep(B,N), then an error code is returned. As well as kErrorOK and kErrorDone, a call to BackupStep may return kErrorReadOnly, kErrorNoMem, kErrorBusy, kErrorLocked, or an kErrorIOACCESS | kErrorIOXXX extended error code.
The BackupStep might return kErrorReadOnly if the destination database was opened read-only or if the destination is an in-memory database with a different page size from the source database.
If BackupStep cannot obtain a required file-system lock, then the sqlite3_busy_handler | busy-handler function is invoked (if one is specified). If the busy-handler returns non-zero before the lock is available, then kErrorBusy is returned to the caller. In this case the call to BackupStep can be retried later. If the source database connection is being used to write to the source database when BackupStep is called, then kErrorLocked is returned immediately. Again, in this case the call to BackupStep can be retried later on. (If kErrorIOACCESS | kErrorIOXXX, kErrorNoMem, or kErrorReadOnly is returned, then there is no point

in retrying the call to BackupStep. These errors are considered fatal.) The application must accept that the backup operation has failed and pass the backup operation handle to the BackupFinish to release associated resources.
The first call to BackupStep obtains an exclusive lock on the destination file. The exclusive lock is not released until either BackupFinish is called or the backup operation is complete and BackupStep returns kErrorDone. Every call to BackupStep obtains a shared lock on the source database that lasts for the duration of the BackupStep call. Because the source database is not locked between calls to BackupStep, the source database may be modified mid-way through the backup process. If the source database is modified by an external process or via a database connection other than the one being used by the backup operation, then the backup will be automatically restarted by the next call to BackupStep. If the source database is modified by the using the same database connection as is used by the backup operation, then the backup database is automatically updated at the same time.

186.15.28 SQLiteConnectionHandle as Ptr

MBS SQL Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current connection reference for the database.
Notes: sqlite3 pointer for using in declares.

186.15.29 SQLiteEnableLoadExtension(OnOff as boolean)

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables/disables extension loading for the given connection.

186.15.30 SQLiteLastInsertRowID as Int64

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns Last Insert Rowid.
Notes: Each entry in an SQLite table has a unique 64-bit signed integer key called the ROWID. The rowid is always available as an undeclared column named ROWID, OID, or _ROWID_ as long as those names are not also used by explicitly declared columns. If the table has a column of type INTEGER PRIMARY KEY then that column is another alias for the rowid.

This routine returns the rowid of the most recent successful INSERT into the database from the database connection in the first argument. If no successful INSERTs have ever occurred on that database connection, zero is returned.

(If an INSERT occurs within a trigger, then the rowid of the inserted row is returned by this routine as long as the trigger is running. But once the trigger terminates, the value returned by this routine reverts to the

last value inserted before the trigger fired.)

An INSERT that fails due to a constraint violation is not a successful INSERT and does not change the value returned by this routine. ^Thus INSERT OR FAIL, INSERT OR IGNORE, INSERT OR ROLLBACK, and INSERT OR ABORT make no changes to the return value of this routine when their insertion fails. ^(When INSERT OR REPLACE encounters a constraint violation, it does not fail. The INSERT continues to completion after deleting rows that caused the constraint problem so INSERT OR REPLACE will always change the return value of this interface.)^

For the purposes of this routine, an INSERT is considered to be successful even if it is subsequently rolled back.

This function is accessible to SQL statements via the last_insert_rowid() SQL function.

If a separate thread performs a new INSERT on the same database connection while the LastInsertRowID function is running and thus changes the last insert rowid, then the value returned by LastInsertRowID is unpredictable and might not equal either the old or the new last insert rowid.

186.15.31 SQLiteLibVersion as String

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the version string of the SQLite library.

186.15.32 SQLiteLoadExtension(file as FolderItem, ByRef ErrorMessage as String) as Integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads an SQLite extension library from the named file.
Notes: The LoadExtension interface attempts to load an SQLite extension library contained in the file.

Returns kErrorOk on success and kErrorError if something goes wrong.
Extension loading must be enabled using EnableLoadExtension prior to calling this API, otherwise an error will be returned.
See also:

- 186.15.33 SQLiteLoadExtension(path as String, ByRef ErrorMessage as String) as Integer 22622

186.15.33 SQLiteLoadExtension(path as String, ByRef ErrorMessage as String) as Integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads an SQLite extension library from the named file.
Notes: The LoadExtension interface attempts to load an SQLite extension library contained in the file.

Returns kErrorOk on success and kErrorError if something goes wrong.
Extension loading must be enabled using EnableLoadExtension prior to calling this API, otherwise an error will be returned.
See also:

- 186.15.32 SQLiteLoadExtension(file as FolderItem, ByRef ErrorMessage as String) as Integer 22621

186.15.34 SQLiteMemoryHighwater(reset as boolean = false) as Int64

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries maximum memory usage so far.
Notes: Can be reset with reset parameter being true.

186.15.35 SQLiteMemoryUsed as Int64

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries memory in use by SQLite.
Notes: This is memory allocated, but not yet freed.
Value is zero until SQLite3 initialized.

186.15.36 SQLiteReKey(Key as String) as Integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: You can change the key on a database using the Rekey Function.
Notes: An empty key decrypts the database.

Rekeying requires that every page of the database file be read, decrypted, reencrypted with the new key, then written out again. Consequently, rekeying can take a long time on a larger database.

Most SEE variants allow you to encrypt an existing database that was created using the public domain version of SQLite. This is not possible when using the authenticating version of the encryption extension in

see-aes128-ccm. If you do encrypt a database that was created with the public domain version of SQLite, no nonce will be used and the file will be vulnerable to a chosen-plaintext attach. If you call SetKey() immediately after Open when you are first creating the database, space will be reserved in the database for a nonce and the encryption will be much stronger. If you do not want to encrypt right away, call SetKey() anyway, with an empty key, and the space for the nonce will be reserved in the database even though no encryption is done initially.

A public domain version of the SQLite library can read and write an encrypted database with an empty key. You only need the encryption extension if the key is non-empty.

Returns a SQLite error code.

186.15.37 SQLiteSetBusyHandler(MaxAttempts as Integer = 5)

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Installs busy handler for this connection.
Notes: This routine sets a callback function that might be invoked whenever an attempt is made to open a database table that another thread or process has locked.

The plugin has an busy handler which will wait up to MaxAttemps and yield to other Xojo threads while waiting.
Passing 5 should wait up to 100ms.

There can only be a single busy handler defined for each [database connection] . Setting a new busy handler clears any previously set handler.) Note that calling SetBusyTimeout will also set or clear the busy handler.

The busy callback should not take any actions which modify the database connection that invoked the busy handler. Any such actions result in undefined behavior.

186.15.38 SQLiteSetBusyTimeout(TimeOutMS as Integer = 20)

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: This routine sets a busy handler that sleeps for a specified amount of time when a table is locked.
Notes: The handler will sleep multiple times until at least "ms" milliseconds of sleeping have accumulated. ^After at least "ms" milliseconds of sleeping, the handler returns 0 which causes SQLite query to return SQLite Busy or IO Blocked error.

Calling this routine with an argument less than or equal to zero turns off all busy handlers.

(There can only be a single busy handler for a particular database connection any any given moment. If another busy handler was defined (using SetBusyHandler prior to calling this routine, that other busy handler is cleared.)

186.15.39 SQLiteSetKey(Key as String) as Integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies encryption to a database connection.
Notes: Returns a SQLite error code.

The amount of key material actually used by the encryption extension depends on which variant of SEE you are using. With RC4, the first 256 byte of key are used. With the AES128, the first 16 bytes of the key are used. With AES256, the first 32 bytes of key are used.

If you specify a key that is shorter than the maximum key length, then the key material is repeated as many times as necessary to complete the key. If you specify a key that is larger than the maximum key length, then the excess key material is silently ignored.

The key must begin with an ASCII prefix to specify which algorithm to use. The prefix must be one of "rc4:", "aes128:", or "aes256:". The prefix is not used as part of the key sent into the encryption algorithm. So the real key should begin on the first byte after the prefix.

The string provided to the plugin is used with it's current encoding. So be sure you use right text encoding for what you want. e.g. using "M√ºller" as key in text encoding Windows ANSI will not open a database which used that key in UTF-8 encoding.

The Xojo database encryption in SQLiteDatabase class uses AES-128 OFB.

186.15.40 SQLiteTableColumnMetaData(DBName as string, TableName as string, ColumnName as string, byref DataType as string, byref CollationSequence as string, byref NotNull as boolean, byref PrimaryKey as boolean, byref AutoIncrement as Boolean) as integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extract Metadata About A Column Of A Table
Notes: Not available in all sqlite libraries!

This routine returns metadata about a specific column of a specific database table accessible using the database connection handle passed as the first function argument.

The column is identified by the second, third and fourth parameters to this function. The second parameter is either the name of the database (i.e. "main", "temp", or an attached database) containing the specified table or NULL. If it is NULL, then all attached databases are searched for the table using the same algorithm used by the database engine to resolve unqualified table references.
The third and fourth parameters to this function are the table and column name of the desired column, respectively. Neither of these parameters may be NULL.
Metadata is returned by writing to the memory locations passed as the 5th and subsequent parameters to this function. Any of these arguments may be NULL, in which case the corresponding element of metadata is omitted.

CollationSequence is assigned the Name of default collation sequence. NotNull is set to true if column has a NOT NULL constraint. PrimaryKey is set to true if column is part of the PRIMARY KEY and AutoIncrement is set to true if column is AUTOINCREMENT.

If the specified table is actually a view, an error code is returned.

If the specified column is "rowid", "oid" or "_rowid_" and an INTEGER PRIMARY KEY column has been explicitly declared, then the output parameters are set for the explicitly declared column. (If there is no explicitly declared INTEGER PRIMARY KEY column, then the output parameters are set as follows:

data type: "INTEGER"
collation sequence: "BINARY"
not null: false
primary key: true
auto increment: false

(This function may load one or more schemas from database files. If an error occurs during this process, or if the requested table or column cannot be found, an error code is returned and an error message left in the database connection (to be retrieved using ErrMessage).)

This API is only available if the library was compiled with the SQLITE_ENABLE_COLUMN_METADATA C-preprocessor symbol defined.

186.15.41 SQLiteThreadsafe as integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Test To See If The Library Is Threadsafe.
Notes: The threadsafe() function returns zero if and only if SQLite was compiled mutexing code omitted due to the SQLITE_THREADSAFE compile-time option being set to 0.

SQLite can be compiled with or without mutexes. When the SQLITE_THREADSAFE C preprocessor

macro is 1 or 2, mutexes are enabled and SQLite is threadsafe. When the SQLITE_THREADSAFE macro is 0, the mutexes are omitted. Without the mutexes, it is not safe to use SQLite concurrently from more than one thread.

Enabling mutexes incurs a measurable performance penalty. So if speed is of utmost importance, it makes sense to disable the mutexes. But for maximum safety, mutexes should be enabled. The default behavior is for mutexes to be enabled.

This interface can be used by an application to make sure that the version of SQLite that it is linking against was compiled with the desired setting of the SQLITE_THREADSAFE macro.

This interface only reports on the compile-time mutex setting of the SQLITE_THREADSAFE flag. If SQLite is compiled with SQLITE_THREADSAFE=1 or =2 then mutexes are enabled by default but can be fully or partially disabled using a call to sqlite3_config() with the verbs SQLITE_CONFIG_SINGLETHREAD, SQLITE_CONFIG_MULTITHREAD, or SQLITE_CONFIG_MUTEX. ^(The return value of the sqlite3_threadsafe() function shows only the compile-time setting of thread safety, not any run-time changes to that setting made by sqlite3_config(). In other words, the return value from sqlite3_threadsafe() is unchanged by calls to sqlite3_config().)^

See the threading mode documentation for additional information.

186.15.42 SQLSelect(command as string, CommandType as Integer = 0) as string

MBS SQL Plugin, Plugin Version: 10.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes a SQL command and returns the first field's string value.
Notes: This is a convenience function.
Internally it creates a SQLCommandMBS with the given command and calls Execute.
If the result is a record set, the first field from the first row is returned.
This is basicly useful for commands like "select sqlite_version()".

All text strings sent to the plugin must have a defined encoding. Else the internal text encoding conversions will fail.

186.15.43 SQLSelectAsRecordSet(command as string, CommandType as Integer = 0) as RecordSet

MBS SQL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes a SQL command and returns the result as RecordSet object.

Notes: This is a convenience function.
Internally it creates a SQLCommandMBS with the given command and calls Execute.

For this method to work, you need to have somewhere a property with SQLDatabaseMBS so Xojo includes our SQLDatabase plugin which provides the RecordSet functionality.

If Scrollable property is true, the recordset will be requested to be scrollable.

The record set may not have a valid RecordCount or have working movefirst/movelast/moveprev methods unless the underlaying database supports those and Scrollable result sets is enabled/supported.

186.15.44 SQLSelectAsRecordSetMT(command as string, CommandType as Integer = 0) as RecordSet

MBS SQL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes a SQL command and returns the result as RecordSet object.
Notes: This is a convenience function.
Internally it creates a SQLCommandMBS with the given command and calls Execute.

For this method to work, you need to have somewhere a property with SQLDatabaseMBS so Xojo includes our SQLDatabase plugin which provides the RecordSet functionality.

If Scrollable property is true, the recordset will be requested to be scrollable.

The record set may not have a valid RecordCount or have working movefirst/movelast/moveprev methods unless the underlaying database supports those and Scrollable result sets is enabled/supported.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

186.15.45 SQLSelectAsRowSet(command as string, CommandType as integer = 0) as RowSet

MBS SQL Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes a SQL command and returns the result as RowSet object.
Notes: This is a convenience function.
Internally it creates a SQLCommandMBS with the given command and calls Execute.

For this method to work, you need to have somewhere a property with SQLDatabaseMBS so Xojo includes our SQLDatabase plugin which provides the RowSet functionality.

If Scrollable property is true, the RowSet will be requested to be scrollable.

The RowSet may not have a valid RecordCount or have working movefirst/movelast/moveprev methods unless the underlaying database supports those and Scrollable result sets is enabled/supported.

For Xojo 2019r2 and newer. See SQLSelectAsRecordSet for older versions.

186.15.46 SQLSelectAsRowSetMT(command as string, CommandType as integer = 0) as RowSet

MBS SQL Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes a SQL command and returns the result as RowSet object.
Notes: This is a convenience function.
Internally it creates a SQLCommandMBS with the given command and calls Execute.

For this method to work, you need to have somewhere a property with SQLDatabaseMBS so Xojo includes our SQLDatabase plugin which provides the RowSet functionality.

If Scrollable property is true, the RowSet will be requested to be scrollable.

The RowSet may not have a valid RecordCount or have working movefirst/movelast/moveprev methods unless the underlaying database supports those and Scrollable result sets is enabled/supported.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

For Xojo 2019r2 and newer. See SQLSelectAsRecordSetMT for older versions.

186.15.47 SQLSelectMT(command as string, CommandType as Integer = 0) as string

MBS SQL Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes a SQL command and returns the first field's string value.
Notes: This is a convenience function.
Internally it creates a SQLCommandMBS with the given command and calls Execute.
If the result is a record set, the first field from the first row is returned.
This is basicly useful for commands like "select sqlite_version()".

All text strings sent to the plugin must have a defined encoding. Else the internal text encoding conversions will fail.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

186.15.48 UpdateRecord(TableName as String, Record as Dictionary, Keys as Dictionary)

MBS SQL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convenience function to update a record.
Example:

```
Var con as SQLConnectionMBS // your database connection

Var d as new Dictionary

d.Value("text")="new text"
d.Value("other")="second value"

con.UpdateRecord("test_tbl", d, new dictionary("ID":2))
```

Notes: The plugin builds for you SQL statement with prepared statement and runs the update command with given values for records with given key values.

You can put multiple field names in the keys dictionary.

Lasterror is set or exception raised as with SQLExecute.
Internally this uses a prepared statement. You can check the generated statement via LastStatement property.

186.15.49 Properties

186.15.50 AutoCommit as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether autocommit is enabled or disabled for the current connection.
Example:

```
Var con as SQLConnectionMBS // your database connection
con.AutoCommit = SQLConnectionMBS.kAutoCommitOn
```

Notes: If autocommit is on, the database is committed automatically after each SQL command. Otherwise, transaction is committed only after Commit calling.
(Read and Write property)

186.15.51 Client as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current DBMS client assigned for the connection.
Example:

```
Var con as new SQLConnectionMBS
con.client = SQLConnectionMBS.kSQLiteClient
```

Notes: Raises OutOfBoundsException exception if value parameter is out of range on setting.
(Read and Write property)

186.15.52 ClientVersion as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the DBMS client API version number.
Example:

```
Call InternalSQLiteLibraryMBS.Use

Var con As New SQLConnectionMBS
con.Client = con.kSQLiteClient

Var version As Integer = con.ClientVersion
Var HighVersion As Integer = Bitwise.ShiftRight(version, 16)
Var LowVersion As Integer = Bitwise.BitAnd(version, 65535)
```

```
var v as string = InternalSQLiteLibraryMBS.Version

MessageBox HighVersion.ToString+"."+LowVersion.ToString+EndOfLine+v
```

Notes: The higher word contains the major client version (the XX value in the XX.YY version number); the lower word contains the minor client version (the YY value in the XX.YY version number).

If an DBMS client was not set calling ClientVersion method will throw an exception.
(Read only property)

186.15.53 ConnectionCount as Integer

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of current connection objects.
Notes: This method should help you find leaked objects by keeping track of current count from the plugin perspective.
This includes SQLConnectionMBS and SQLDatabaseMBS objects.
(Read only property)

186.15.54 Error as Boolean

MBS SQL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether an error occurred.
Notes: This is set always when an error occurs and cleared if no error happened.
Be aware that the next call to a plugin function may reset error status.
If you look on this property in debugger, it's probably already cleared by the debugger querying a property.
(Read only property)

186.15.55 ErrorCode as Integer

MBS SQL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: This is set always when an error occurs and cleared if no error happened.
(Read only property)

186.15.56 ErrorMessage as string

MBS SQL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error message.
Notes: This is set always when an error occurs and cleared if no error happened.
(Read only property)

186.15.57 isAlive as boolean

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the database server connection status for a particular connection object.
Notes: Returns true if the database server is active and accessible; otherwise false.
This method uses the safe query execution for most supported DBMS-es. The query uses the well known database table or procedure (mysql_ping is used for MySQL or MariaDB). If the query fails the method returns false.
(Read only property)

186.15.58 isConnected as boolean

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the connection state for a particular connection object.
Notes: Returns true if connected; otherwise false.
If you connect over a network, please check with isAlive whether the connection is still alive.
(Read only property)

186.15.59 IsolationLevel as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The transaction isolation level.
Example:

```
Var con as SQLConnectionMBS // your connection
con.IsolationLevel = SQLConnectionMBS.kReadUncommitted
```

Notes: Use the kReadCommitted, kReadUncommitted, kRepeatableRead, kSerializable and kLevelUnknown constants.
(Read and Write property)

186.15.60 LastStatement as String

MBS SQL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last executed SQL Statement.
Notes: (Read only property)

186.15.61 NativeAPI as Variant

MBS SQL Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns a set of functions of native DBMS client API.
Notes: Returns a SQLAPIMBS object.
Deprecated in version 19.5 in favor of direct methods in SQLDatabaseMBS and SQLConnectionMBS classes.
(Read only property)

186.15.62 Options as Dictionary

MBS SQL Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a dictionary with all options.
Notes: For debugging, it may be useful to inspect options in debugger.
(Read only property)

186.15.63 RaiseExceptions as Boolean

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to raise exceptions.
Notes: Default is true which means we set error, ErrorCode and ErrorMessage properties and than raise SQLErrorExceptionMBS exception.
If you set to false, we don't raise the exception and you have similar behavior as with database class.
We recommend to use exceptions as they are not so easily ignored like an error property being true.
(Read and Write property)

186.15.64 RowsAffected as Integer

MBS SQL Plugin, Plugin Version: 23.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns number of rows affected by last DML operation.
Notes: Returns the number of rows affected by the last insert/update/delete command execution.

Can also return the result set rows count, usually when the result set is cached at the client side.
(Read only property)

186.15.65 Scrollable as Boolean

MBS SQL Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to make internally created SQLCommand objects scrollable.
Notes: Since plugin version 15.0, Scrollable is false by default.
(Read and Write property)

186.15.66 ServerVersion as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the currently connected DBMS server version number.
Notes: The higher word contains the major server version (the XX value in the XX.YY version number); the lower word contains the minor server version (the YY value in the XX.YY version number).
(Read only property)

186.15.67 ServerVersionString as string

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the currently connected DBMS server version string.
Notes: A server version string may contain some useful information about server brand, configuration and so on. It is a good idea to display this information in all your applications.
(Read only property)

186.15.68 SQLiteEncryptionKey as String

MBS SQL Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The encryption key to use.
Example:

```
Var db as new SQLConnectionMBS
db.SQLiteEncryptionKey = "Hello"
```

Notes: This key is applied to the database after connecting. In case of an error, the plugin raises an exception. An empty key can be used for having no encryption.
Alternatively you can use SQLite3MBS.SetKey yourself.

The amount of key material actually used by the encryption extension depends on which variant of SEE you are using. With RC4, the first 256 byte of key are used. With the AES128, the first 16 bytes of the key are used. With AES256, the first 32 bytes of key are used.

If you specify a key that is shorter than the maximum key length, then the key material is repeated as many times as necessary to complete the key. If you specify a key that is larger than the maximum key length, then the excess key material is silently ignored.

The key must begin with an ASCII prefix to specify which algorithm to use. The prefix must be one of "rc4:", "aes128:", or "aes256:". The prefix is not used as part of the key sent into the encryption algorithm. So the real key should begin on the first byte after the prefix. If no prefix is given, we default to AES 128. To be compatible to Xojo, you can use AES128.

The string provided to the plugin is used with it's current encoding. So be sure you use right text encoding for what you want. e.g. using "M√ºller" as key in text encoding Windows ANSI will not open a database which used that key in UTF-8 encoding.

The Xojo database encryption in SQLiteDatabase class uses AES-128 OFB.
(Read and Write property)

186.15.69 Tag as Variant

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag property.
Notes: You can store here whatever you like.
(Read and Write property)

186.15.70 VariantsKeepSQLObjects as Boolean

MBS SQL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether variants should use SQL types.
Notes: If set to true, we return datetime and numeric as SQLDateTimeMBS and SQLNumericMBS objects. If false, we return them as date and double.
(Read and Write property)

186.15.71 Option(name as string) as string

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string value of a specific connection or command option.
Example:

```
Var c as SQLConnectionMBS // your connection

// for Microsoft SQL use OLEDB, so you don't need native SQL drivers installed...
c.Option("UseAPI") = "OLEDB"
c.Option("SQLNCLI.LIBS") = "sqlsrv32.dll" // Library included in Windows Vista and newer

// for SQLite, set flag to open database file read only:
c.Option("SQLiteVFSFlags") = "1"

// set 10 seconds timeout for MySQL
c.Option("MYSQL_OPT_CONNECT_TIMEOUT") = "10"

// turn on auto cache
c.Option("AutoCache") = "true"

// set connection timeout for ODBC:
c.Option("SQL_ATTR_CONNECTION_TIMEOUT") = "10"

// for mySQL allow multiple RowSets
c.Option("CLIENT_MULTI_STATEMENTS") = "true"
c.Option("CLIENT_MULTI_RESULTS") = "true"
```

Notes: see also:
https://www.sqlapi.com/ApiDoc/class_s_a_connection.html

We have a collection of library files here:
https://www.monkeybreadsoftware.de/xojo/download/plugin/Libs/
(Read and Write computed property)

186.15.72 Events

186.15.73 DidConnect

MBS SQL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Event called after connection was made.
Notes: After we got connected, you can apply various options on the new connection here.

186.15.74 PostgresNotification(NotificationName as string, PID as Integer, Extras as String)

MBS SQL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A postgresSQL notification was received.
Notes: Provides notification name, process ID of app and optional extra information.

186.15.75 Trace(traceInfo as Integer, SQL as string, Command as SQLCommandMBS)

MBS SQL Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event to trace SQL commands.

186.15.76 WillConnect

MBS SQL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Event called before connection is established.
Notes: Last chance to set connection options.

186.15.77 Working

MBS SQL Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called while the SQLExecuteMT and SQLSelectMT methods are running.

186.15.78 Constants

Constants

Constant	Value	Description
kOptionAPPNAME	”APPNAME”	A constant for the options.
kOptionLibraryCubeSQL	”CUBESQL.LIBS”	One of the option constant to specify the library with the SetFileO method. Tells the plugin where to find the library for CubeSQL. Only needed don’t use InternalCubeSQLLibraryMBS module! The value can contain multiple names and paths separated with ”;” on Wi and ”:” on macOS/Linux. The library extension on Mac is ”.dylib”, on Linux ”.so” and on Windows You get this library with the CubeSQL download on their homepage. If no value is given, we default to Windows: cubeSQL_64bit.dll;cubesql.dll macOS: libcubesql_r.dylib Linux: libcubesql_r.so The default is set to work in most cases and try various possible library r
kOptionWSID	”WSID”	A constant for the options.
SQLiteInMemory	”:memory:”	Connection string for SQLite for a new in-memory database.

Isolation Levels

Constant	Value	Description
kANSILevel0	0	ANSI Level 0
kANSILevel1	1	ANSI Level 1
kANSILevel2	2	ANSI Level 2
kANSILevel3	3	ANSI Level 3
kLevelUnknown	-1	Unknown
kReadCommitted	1	Read committed.
kReadUncommitted	0	Read uncommitted.
kRepeatableRead	2	Repeatable read.
kSerializable	3	Serializable.
kSnapshot	4	Changes made in other transactions can not be seen. For Microsoft SQL Server.

Values for autocommit property

Constant	Value	Description
kAutoCommitOff	0	Autocommit is off.
kAutoCommitOn	1	Autocommit is on.
kAutoCommitUnknown	-1	Autocommit unknown

The database client constants

Constant	Value	Description
kClientNotSpecified	0	Client is not specified.
kCubeSQLClient	13	CubeSQL client. (coming soon)
kDB2Client	6	DB2 client.
kDuckDBClient	14	DuckDB client
kFirebirdClient	4	InterBase/Firebird client.
kInformixClient	7	Informix client.
kInterBaseClient	4	InterBase/Firebird client.
kMariaDBClient	15	MariaDB client.
kMySQLClient	9	MySQL or MariaDB client.
kODBCClient	1	ODBC client.
kOLEDBClient	16	The OLEDB client.
kOracleClient	2	Oracle client. For Windows the file is "oci.dll", for Linux libclntsh.so and for Mac OS X libclntsh.dylib.
kPostgreSQLClient	10	PostgreSQL client.
kSQLAnywhereClient	12	SQL Anywhere client.
kSQLBaseClient	5	SQLbase client.
kSQLiteClient	11	SQLite client. Or spatialite.
kSQLServerClient	3	Mircosoft SQL Server client. You may need to download the client packages for accessing SQL Server. Files like the SQLNCLI dll may be missing. You can download for example the Feature Pack for Microsoft SQL Server 2005 from the microsoft download page.
kSybaseClient	8	Sybase client.

Error Codes

Constant	Value	Description
kErrorBindVarNotFound	7	Bind variable not found.
kErrorClientInitFails	6	Initialization failed for client.
kErrorClientNotSet	1	Client not set.
kErrorClientNotSupported	2	Unsupported client type for this platform.
kErrorClientVersionOld	5	Library file is too old.
kErrorFieldNotFound	8	Field not found.
kErrorGetLibraryVersionFails	4	Failed to query library version.
kErrorLoadLibraryFails	3	Failed to load a library. For example path could be wrong or 32/64bit mismatch.
kErrorNoMemory	0	Out of memory.
kErrorUnknownColumnType	11	Unknown column type.
kErrorUnknownDataType	9	Unknown data type.
kErrorUnknownParameterType	10	Unknown parameter type.
kErrorWrongConversion	12	Failed to convert a value, e.g. string to number.
kErrorWrongDatetime	13	Can't convert text to date.

Options to specify the library with SetFileOption

Constant	Value	Description
kOptionLibraryDB2	”DB2CLI.LIBS”	Tells the plugin where to find the library for DB2. The value can contain multiple names and paths separated with ”;” o and ”:” on macOS/Linux. The library extension on Mac is ”.dylib”, on Linux ”.so” and on Win You get this library with the DB2 download on their homepage. If no value is given, we default to Windows: db2clio.dll macOS: libdb2.dylib Linux: libdb2.so
kOptionLibraryDuckDB	”DUCKDB.LIBS”	Tells the plugin where to find the library for DuckDB. The value can contain multiple names and paths separated with ”;” o and ”:” on macOS/Linux. The library extension on Mac is ”.dylib”, on Linux ”.so” and on Win You get this library with the DuckDB download on their homepage If no value is given, we default to Windows: duckdb.dll macOS: libduckdb.dylib Linux: libduckdb.so
kOptionLibraryFirebird	”IBASE.LIBS”	Tells the plugin where to find the library for FireBird (or Interbase The value can contain multiple names and paths separated with ”;” o and ”:” on macOS/Linux. The library extension on Mac is ”.dylib”, on Linux ”.so” and on Win You get this library with the FireBird download on their homepage If no value is given, we default to Windows: ibclient64.dll;fbclient.dll;gds32.dll macOS: libgds.dylib:libfbclient.dylib Linux: libgds.so:libfbclient.so The default is set to work in most cases and try various possible libr
kOptionLibraryInformix	”INFCLI.LIBS”	Tells the plugin where to find the library for Informix. The value can contain multiple names and paths separated with ”;” o and ”:” on macOS/Linux. The library extension on Mac is ”.dylib”, on Linux ”.so” and on Win You get this library with the Informix download on their homepage If no value is given, we default to Windows: ICLIT09B.DLL;ICLIT09A.DLL macOS: iclit09b.dylib:iclit09a.dylib:libifcli.dylib Linux: iclit09b.so:iclit09a.so:libifcli.so The default is set to work in most cases and try various possible libr
kOptionLibraryInterbase	”IBASE.LIBS”	Tells the plugin where to find the library for FireBird (or Interbase The value can contain multiple names and paths separated with ”;” o and ”:” on macOS/Linux. The library extension on Mac is ”.dylib”, on Linux ”.so” and on Win You get this library with the FireBird download on their homepage If no value is given, we default to Windows: ibclient64.dll;fbclient.dll;gds32.dll macOS: libgds.dylib:libfbclient.dylib Linux: libgds.so:libfbclient.so The default is set to work in most cases and try various possible libr
kOptionLibraryMySQL	”MYSQL.LIBS”	Tells the plugin where to find the library for MySQL (or MariaDB The value can contain multiple names and paths separated with ”;” o and ”:” on macOS/Linux. The library extension on Mac is ”.dylib”, on Linux ”.so” and on Win You get this library with the MySQL download on their homepage Libs folder on our website. If no value is given, we default to Windows: libmySQL.dll;libmariadb.dll macOS: libmysqlclient.dylib.21:libmysqlclient_r.dyli client_r.18.dylib:libmysqlclient_r.16.dylib:libmysqlclient_r.15.dylib

186.16 class SQLDatabaseMBS

186.16.1 class SQLDatabaseMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The database class for the SQL plugin
Example:

```
Var db as new SQLDatabaseMBS

// where is the library?
db.SetFileOption SQLConnectionMBS.kOptionLibrarySQLite, New FolderItem("/usr/lib/libsqlite3.0.dylib",
FolderItem.PathModes.Shell)

// connect to database
// in this example it is SQLite,
// but can also be Sybase, Oracle, Informix, DB2, SQLServer, InterBase, MySQL, SQLBase and ODBC

Var path as string

if TargetMacOS then
path = "/tmp/test.db" // put the database in the temporary folder
else
path = "test.db" // for Windows and Linux in the current folder the application is inside.
end if

db.DatabaseName = "sqlite:"+path

if db.Connect then

MessageBox "We are connected!"

// Disconnect is optional
// autodisconnect will occur in destructor if needed
db.close

MessageBox "We are disconnected!"
end if
```

Notes: You can use the SQL plugin without using Xojo built in database classes if you use the SQLConnectionMBS and SQLCommandMBS classes.

Or you use the SQLDatabaseMBS class which is a subclass of the database class and can be used with Xojo's RecordSet class. The current implementation is not complete. You can connect with passing the database URL in the DatabaseName property of the SQLDatabaseMBS class. You prefix this URL with the database type you are using.

You can use Execute and Select to run SQL statements. Errors can be queries with the lasterror properties. For the RecordSet, you can get the column count, the column names and values and move to the next row. All the other methods like deleting a record or updating a value are not implemented and you need to use SQL commands to do this.

Supported databases: CubeSQL, Centura SQLBase, DB2, DuckDB, Firebird, Informix, InterBase, MariaDB, Microsoft Access, Microsoft SQL Server, MySQL, ODBC, Oracle Database Server, PostgreSQL, SQL Anywhere, SQLite, SQLCipher and Sybase.
Connect to Microsoft Access, FileMaker Server (or Pro), Microsoft Visual FoxPro and others via ODBC.

As field and table schema functions are not implemented, you can't use this database with the database browser features in the Xojo IDE.
The plugin does not provide RecordCount on RecordSet class. For that you need to make a extra SELECT count(*) query.

With Xojo 2013r1, you only need a database server license from Xojo, Inc. if you use the SQLDatabaseMBS class. The SQLConnectionMBS class does not require this license. But some features like getting a recordset do need the license as they refer to the SQLDatabaseMBS class.

Please free all RecordSets and SQLCommand objects before you close the SQLConnection or the SQLDatabase. The plugin keeps references from RecordSets and SQLCommand to prevent automatic destruction of the database connection. If you close a database connection while you have RecordSets and SQLCommand in use, things may go wrong.

The plugin can cache the recordset locally. To enable you can call SQLCommandMBS.Cache or use the Option("AutoCache") = "true" on either command or connection or database objects. The plugin will than fetch all records and store them in memory. After this you can walk over the recordset and use FetchPos, FetchFirst, FetchLast, FetchPrev and FetchNext to locate the rows you need. When you call Field() you always get last row, but to read from cached result set, please use Value() function. When using RecordSet, the values are read via Value() functions automatically.

You can use InternalPostgreSQLLibraryMBS or InternalSQLiteLibraryMBS if you like to use our built in SQLite or PostgreSQL database libraries.

The class pings the database every minute by checking whether it's alive and to avoid server dropping connection. This can be disabled by setting Option("Ping") = "false". Ping is not used for SQLite.

MBS Plugin 21.1 adds support for Edit/Update methods in RecordSet and RowSet classes.

MBS Database connections are implemented via SQLConnectionMBS and SQLCommandMBS classes. We provide a thin layer on top with SQLDatabaseMBS class to make it compatible to the Xojo database class.

And when you use SQLDatabaseMBS, you can always get the matching SQLConnectionMBS objet via Connection property. Instead of SQLCommandMBS class, you may just use SelectSQL/ExecuteSQL or older SQLSelect/SQLExecute functions.

We have a collection of library files here:
https://www.monkeybreadsoftware.de/xojo/download/plugin/Libs/
Subclass of the Database class.

186.16.2 Methods

186.16.3 BeginTransaction

MBS SQL Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Begins a transaction.
Notes: This method does nothing. Why?
Well, if auto commit is on, you don't need to call this.
If auto commit is off, we call BeginTransaction for you, so if you call this method you would call it a second time and get an error.
We have this method for compatibility to other SQL database classes from Xojo.

186.16.4 CancelAllCommands

MBS SQL Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Cancel all commands for the connection.
Notes: This loops over the list of commands associated with this connection and calls Cancel on them.

186.16.5 Commands as SQLCommandMBS()

MBS SQL Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of all command objects related to the connection.

186.16.6 Connect as boolean

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Connects to the database.
Example:

```
Var db as new SQLDatabaseMBS

// where is the library?
db.SetFileOption SQLConnectionMBS.kOptionLibraryMySQL, SpecialFolder.UserHome.Child("libmysqlclient.dylib")

// connect to database
// in this example it is MySQL,
// but can also be Sybase, Informix, Oracle, DB2
// SQLServer, InterBase, SQLBase and ODBC

db.DatabaseName="mysql:192.168.1.80,3306@test"

db.UserName="root"
db.Password=""

// or postgreSQL with timeout and ssl mode
db.DatabaseName="PostgreSQL:127.0.0.1,5432@dbname=postgres connect_timeout=10 sslmode=require"

if db.Connect then

MessageBox "We are connected!"

MessageBox "Server Version: "+db.Connection.ServerVersionString

// Disconnect is optional
// autodisconnect will occur in destructor if needed

else
MessageBox db.ErrorMessage
end if
```

Notes: Returns true on success and false on failure.

Please set the DatabaseName, UserName and Password properties. The Host property is ignored.
The database name must contain the complete information and a prefix for the kind of database.

Use this prefixes: "CubeSQL:", "SQLAnywhere:", "ODBC:", "Oracle:", "SQLServer:", "Firebird:", "DuckDB:", "InterBase:", "SQLBase:", "DB2:", "Informix:", "Sybase:", "MySQL:", "MariaDB:", "PostgreSQL:" or "SQLite:".
Connect to Microsoft Access, FileMaker Server (or Pro), Microsoft Visual FoxPro and others via ODBC.

For IPv6 we changed plugin to use , instead of : for the port separator. So please use , to separate port from IP or host.

For Firebird, if you connect to a database and you have 32/64bit mismatch, you get error number 3.

186.16.7 ConnectMT as Boolean

MBS SQL Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Connects to the database.
Notes: Returns true on success and false on failure.

Please set the DatabaseName, UserName and Password properties. The Host property is ignored.
The database name must contain the complete information and a prefix for the kind of database.

Use this prefixes: "CubeSQL:", "SQLAnywhere:", "ODBC:", "Oracle:", "SQLServer:", "Firebird:", "DuckDB:", "InterBase:", "SQLBase:", "DB2:", "Informix:", "Sybase:", "MySQL:", "MariaDB:", "PostgreSQL:" or "SQLite:".
Connect to Microsoft Access, FileMaker Server (or Pro), Microsoft Visual FoxPro and others via ODBC.

For IPv6 we changed plugin to use , instead of : for the port separator. So please use , to separate port from IP or host.

Same as Connect, but if you run this on a thread, the plugin gives time to other threads so the rest of your application runs just fine.

The MT method will not trigger WillConnect and DidConnect events.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

186.16.8 Constructor(globals as SQLGlobalsMBS = nil)

MBS SQL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: Please don't call this directly as it's called automatically with using new command.

186.16.9 CubeSQLLastInsertID as Int64

MBS SQL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the last auto increment value from last insert command.
Notes: Only for CubeSQL connections. May raise error if not available.

186.16.10 CubeSQLReceiveData(byref data as String, byref IsEndChunk as Boolean) as Boolean

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Receives a data chunk for file download.
Notes: Returns true on success.
Data is set with data and IsEndChunk is set to true for last chunk.

186.16.11 CubeSQLSendData(data as MemoryBlock)

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends data chunk for file upload.
Notes: This is the sendchunk function in CubeSQL.
See also:

- 186.16.12 CubeSQLSendData(data as String) 22647

186.16.12 CubeSQLSendData(data as String)

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends data chunk for file upload.
Notes: This is the sendchunk function in CubeSQL.
See also:

- 186.16.11 CubeSQLSendData(data as MemoryBlock) 22647

186.16.13 CubeSQLSendEndData

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends end data packet.
Notes: This is the send_enddata function in CubeSQL.

186.16.14 InsertRecord(TableName as String, Record as Dictionary)

MBS SQL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convenience function to insert a record.
Example:

```
Var db as SQLDatabaseMBS // your database connection

Var d as new Dictionary

d.Value("ID")=2
d.Value("text")="test insert"
d.Value("other")="Just a test"

db.InsertRecord("test_tbl", d)

if db.Error then
MessageBox db.ErrorMessage
end if
```

Notes: The plugin builds for you SQL statement with prepared statement and runs the insert command with values.
Lasterror is set or exception raised as with SQLExecute.
Internally this uses a prepared statement. You can check the generated statement via LastStatement property.

186.16.15 Listen

MBS SQL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Start listening for notifications.
Notes: Works only for PostgresSQL Client.
Please set client or connect before calling this method.

186.16.16 MySQLInsertID as Int64

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the last auto increment value from last insert command.
Notes: Please query value right after doing Insert. This value is reset when you call commit.
For mySQL and MariaDB connections.

see also
http://dev.mysql.com/doc/refman/5.1/en/mysql-insert-id.html

186.16.17 Prepare(statement as string) as SQLPreparedStatementMBS

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prepares a statement.
Notes: Returns prepared statement or nil in case of error.
Please check ErrorMessage property for errors.

186.16.18 SetFileOption(name as string, file as folderitem)

MBS SQL Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an option with passing a file path.
Example:

```
Var db as new SQLDatabaseMBS

// where is the library?
db.SetFileOption SQLConnectionMBS.kOptionLibraryMySQL, SpecialFolder.UserHome.Child("libmysqlclient.dylib")
```

Notes: Allows you to specify a file path with a folderitem.

Makes sure the path is correct and you have a 32 or 64-bit library matching the architecture of your application.

186.16.19 SQLExecute(ExecuteString as string, CommandType as Integer)

MBS SQL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the SQLExecute threaded.
Notes: Same as SQLExecute, but with additional CommandType parameter.

186.16.20 SQLExecuteMT(ExecuteString as string, CommandType as Integer = 0)

MBS SQL Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the SQLExecute threaded.
Notes: Same as SQLExecute, but if you run this on a thread, the plugin gives time to other threads so the rest of your application runs just fine.

The work is performed on a preemptive thread, so this function does not block the application and can yield

time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

186.16.21 SQLiteBackupFinish(Backup as SQLite3BackupMBS) as integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finishes a backup run.
Notes: When BackupStep has returned kErrorDone, or when the application wishes to abandon the backup operation, the application should destroy the SQLite3BackupMBS by passing it to BackupFinish. The BackupFinish interfaces releases all resources associated with the SQLite3BackupMBS object. If BackupStep has not yet returned kErrorDone, then any active write-transaction on the destination database is rolled back. The SQLite3BackupMBS object is invalid and may not be used following a call to BackupFinish.
The value returned by BackupFinish is kErrorOK if no BackupStep errors occurred, regardless or whether or not BackupStep completed. If an out-of-memory condition or IO error occurred during any prior BackupStep call on the same SQLite3BackupMBS object, then BackupFinish returns the corresponding error code.
A return of kErrorBusy or kErrorLocked from BackupStep is not a permanent error and does not affect the return value of BackupFinish.

186.16.22 SQLiteBackupInit(Dest as Variant, DestName as String, Source as Variant, SourceName as String) as SQLite3BackupMBS

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes a backup.
Notes: The backup API copies the content of one database into another. It is useful either for creating backups of databases or for copying in-memory databases to or from persistent files.

see also
http://www.sqlite.org/c3ref/backup_finish.html

Exclusive access is required to the destination database for the duration of the operation. However the source database is only read-locked while it is actually being read; it is not locked continuously for the entire backup operation. Thus, the backup may be performed on a live source database without preventing other users from reading or writing to the source database while the backup is underway.

To perform a backup operation:

- BackupInit is called once to initialize the backup,
- BackupStep is called one or more times to transfer the data between the two databases, and finally
- BackupFinish is called to release all resources associated with the backup operation.

There should be exactly one call to BackupFinish for each successful call to BackupInit.

The D and N arguments to BackupInit(D,N,S,M) are the database connection associated with the destination database and the database name, respectively. The database name is "main" for the main database, "temp" for the temporary database, or the name specified after the AS keyword in an ATTACH statement for an attached database. The S and M arguments passed to BackupInit(D,N,S,M) identify the database connection and database name of the source database, respectively. The source and destination database connections (parameters S and D) must be different or else BackupInit(D,N,S,M) will file with an error.
If an error occurs within BackupInit(D,N,S,M), then nil is returned and an error code and error message are store3d in the destination database connection D. The error code and message for the failed call to BackupInit can be retrieved using the ErrCode and ErrMessage functions. A successful call to BackupInit returns a SQLite3BackupMBS object. The SQLite3BackupMBS object may be used with the BackupStep and BackupFinish functions to perform the specified backup operation.

Concurrent Usage of Database Handles
The source database connection may be used by the application for other purposes while a backup operation is underway or being initialized. If SQLite is compiled and configured to support threadsafe database connections, then the source database connection may be used concurrently from within other threads.
However, the application must guarantee that the destination database connection is not passed to any other API (by any thread) after BackupInit is called and before the corresponding call to BackupFinish. SQLite does not currently check to see if the application incorrectly accesses the destination database connection and so no error code is reported, but the operations may malfunction nevertheless. Use of the destination database connection while a backup is in progress might also also cause a mutex deadlock.
If running in shared cache mode, the application must guarantee that the shared cache used by the destination database is not accessed while the backup is running. In practice this means that the application must guarantee that the disk file being backed up to is not accessed by any connection within the process, not just the specific connection that was passed to BackupInit.
The SQLite3BackupMBS object itself is partially threadsafe. Multiple threads may safely make multiple concurrent calls to BackupStep. However, the BackupRemaining and BackupPageCount APIs are not strictly speaking threadsafe. If they are invoked at the same time as another thread is invoking BackupStep it is possible that they return invalid values.

Source and Dest can be SQLConnectionMBS or SQLDatabaseMBS. You need to pass source and dest, even if one is self as we give you the option to decide where to pass the current database connection.

186.16.23 SQLiteBackupPageCount(Backup as SQLite3BackupMBS) as integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of pages in total.
Notes: Each call to BackupStep sets two values inside the SQLite3BackupMBS object: the number of pages still to be backed up and the total number of pages in the source databae file. The BackupRemaining and BackupPageCount interfaces retrieve these two values, respectively.
The values returned by these functions are only updated by BackupStep. If the source database is modified

during a backup operation, then the values are not updated to account for any extra pages that need to be updated or the size of the source database file changing.

186.16.24 SQLiteBackupRemaining(Backup as SQLite3BackupMBS) as integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of pages remaining.
Notes: Each call to BackupStep sets two values inside the SQLite3BackupMBS object: the number of pages still to be backed up and the total number of pages in the source databae file. The BackupRemaining and BackupPageCount interfaces retrieve these two values, respectively.
The values returned by these functions are only updated by BackupStep. If the source database is modified during a backup operation, then the values are not updated to account for any extra pages that need to be updated or the size of the source database file changing.

186.16.25 SQLiteBackupStep(Backup as SQLite3BackupMBS, Pages as Integer) as integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies up to Pages pages between the source and destination databases specified by SQLite3BackupMBS object.
Notes: If N is negative, all remaining source pages are copied. If BackupStep(B,N) successfully copies N pages and there are still more pages to be copied, then the function resturns kErrorOK. If BackupStep(B,N) successfully finishes copying all pages from source to destination, then it returns kErrorDone. If an error occurs while running BackupStep(B,N), then an error code is returned. As well as kErrorOK and kErrorDone, a call to BackupStep may return kErrorReadOnly, kErrorNoMem, kErrorBusy, kErrorLocked, or an kErrorIOACCESS | kErrorIOXXX extended error code.
The BackupStep might return kErrorReadOnly if the destination database was opened read-only or if the destination is an in-memory database with a different page size from the source database.
If BackupStep cannot obtain a required file-system lock, then the sqlite3_busy_handler | busy-handler function is invoked (if one is specified). If the busy-handler returns non-zero before the lock is available, then kErrorBusy is returned to the caller. In this case the call to BackupStep can be retried later. If the source database connection is being used to write to the source database when BackupStep is called, then kErrorLocked is returned immediately. Again, in this case the call to BackupStep can be retried later on. (If kErrorIOACCESS | kErrorIOXXX, kErrorNoMem, or kErrorReadOnly is returned, then there is no point in retrying the call to BackupStep. These errors are considered fatal.) The application must accept that the backup operation has failed and pass the backup operation handle to the BackupFinish to release associated resources.
The first call to BackupStep obtains an exclusive lock on the destination file. The exclusive lock is not released until either BackupFinish is called or the backup operation is complete and BackupStep returns kErrorDone. Every call to BackupStep obtains a shared lock on the source database that lasts for the duration of the BackupStep call. Because the source database is not locked between calls to BackupStep, the source database may be modified mid-way through the backup process. If the source database is modified

by an external process or via a database connection other than the one being used by the backup operation, then the backup will be automatically restarted by the next call to BackupStep. If the source database is modified by the using the same database connection as is used by the backup operation, then the backup database is automatically updated at the same time.

186.16.26 SQLiteConnectionHandle as Ptr

MBS SQL Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current connection reference for the database.
Notes: sqlite3 pointer for using in declares.

186.16.27 SQLiteEnableLoadExtension(OnOff as boolean)

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables/disables extension loading for the given connection.

186.16.28 SQLiteLastInsertRowID as Int64

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns Last Insert Rowid.
Notes: Each entry in an SQLite table has a unique 64-bit signed integer key called the ROWID. The rowid is always available as an undeclared column named ROWID, OID, or _ROWID_ as long as those names are not also used by explicitly declared columns. If the table has a column of type INTEGER PRIMARY KEY then that column is another alias for the rowid.

This routine returns the rowid of the most recent successful INSERT into the database from the database connection in the first argument. If no successful INSERTs have ever occurred on that database connection, zero is returned.

(If an INSERT occurs within a trigger, then the rowid of the inserted row is returned by this routine as long as the trigger is running. But once the trigger terminates, the value returned by this routine reverts to the last value inserted before the trigger fired.)

An INSERT that fails due to a constraint violation is not a successful INSERT and does not change the value returned by this routine. ^Thus INSERT OR FAIL, INSERT OR IGNORE, INSERT OR ROLLBACK, and INSERT OR ABORT make no changes to the return value of this routine when their insertion fails. ^(When INSERT OR REPLACE encounters a constraint violation, it does not fail. The INSERT continues to completion after deleting rows that caused the constraint problem so INSERT OR REPLACE will always

change the return value of this interface.)^

For the purposes of this routine, an INSERT is considered to be successful even if it is subsequently rolled back.

This function is accessible to SQL statements via the last_insert_rowid() SQL function.

If a separate thread performs a new INSERT on the same database connection while the LastInsertRowID function is running and thus changes the last insert rowid, then the value returned by LastInsertRowID is unpredictable and might not equal either the old or the new last insert rowid.

186.16.29 SQLiteLibVersion as String

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the version string of the SQLite library.

186.16.30 SQLiteLoadExtension(file as FolderItem, ByRef ErrorMessage as String) as Integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads an SQLite extension library from the named file.
Notes: The LoadExtension interface attempts to load an SQLite extension library contained in the file.

Returns kErrorOk on success and kErrorError if something goes wrong.
Extension loading must be enabled using EnableLoadExtension prior to calling this API, otherwise an error will be returned.
See also:

- 186.16.31 SQLiteLoadExtension(path as String, ByRef ErrorMessage as String) as Integer 22654

186.16.31 SQLiteLoadExtension(path as String, ByRef ErrorMessage as String) as Integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads an SQLite extension library from the named file.
Notes: The LoadExtension interface attempts to load an SQLite extension library contained in the file.

Returns kErrorOk on success and kErrorError if something goes wrong.
Extension loading must be enabled using EnableLoadExtension prior to calling this API, otherwise an error will be returned.
See also:

- 186.16.30 SQLiteLoadExtension(file as FolderItem, ByRef ErrorMessage as String) as Integer 22654

186.16.32 SQLiteMemoryHighwater(reset as boolean = false) as Int64

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries maximum memory usage so far.
Notes: Can be reset with reset parameter being true.

186.16.33 SQLiteMemoryUsed as Int64

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries memory in use by SQLite.
Notes: This is memory allocated, but not yet freed.
Value is zero until SQLite3 initialized.

186.16.34 SQLiteReKey(Key as String) as Integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: You can change the key on a database using the Rekey Function.
Notes: An empty key decrypts the database.

Rekeying requires that every page of the database file be read, decrypted, reencrypted with the new key, then written out again. Consequently, rekeying can take a long time on a larger database.

Most SEE variants allow you to encrypt an existing database that was created using the public domain version of SQLite. This is not possible when using the authenticating version of the encryption extension in see-aes128-ccm. If you do encrypt a database that was created with the public domain version of SQLite, no nonce will be used and the file will be vulnerable to a chosen-plaintext attach. If you call SetKey() immediately after Open when you are first creating the database, space will be reserved in the database for a nonce and the encryption will be much stronger. If you do not want to encrypt right away, call SetKey() anyway, with an empty key, and the space for the nonce will be reserved in the database even though no encryption is done initially.

A public domain version of the SQLite library can read and write an encrypted database with an empty key.

You only need the encryption extension if the key is non-empty.

Returns a SQLite error code.

186.16.35 SQLiteSetBusyHandler(MaxAttempts as Integer = 5)

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Installs busy handler for this connection.
Notes: This routine sets a callback function that might be invoked whenever an attempt is made to open a database table that another thread or process has locked.

The plugin has an busy handler which will wait up to MaxAttemps and yield to other Xojo threads while waiting.
Passing 5 should wait up to 100ms.

There can only be a single busy handler defined for each [database connection] . Setting a new busy handler clears any previously set handler.) Note that calling SetBusyTimeout will also set or clear the busy handler.

The busy callback should not take any actions which modify the database connection that invoked the busy handler. Any such actions result in undefined behavior.

186.16.36 SQLiteSetBusyTimeout(TimeOutMS as Integer = 20)

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: This routine sets a busy handler that sleeps for a specified amount of time when a table is locked.
Notes: The handler will sleep multiple times until at least "ms" milliseconds of sleeping have accumulated. ^After at least "ms" milliseconds of sleeping, the handler returns 0 which causes SQLite query to return SQLite Busy or IO Blocked error.

Calling this routine with an argument less than or equal to zero turns off all busy handlers.

(There can only be a single busy handler for a particular database connection any any given moment. If another busy handler was defined (using SetBusyHandler prior to calling this routine, that other busy handler is cleared.)

186.16.37 SQLiteSetKey(Key as String) as Integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies encryption to a database connection.
Notes: Returns a SQLite error code.

The amount of key material actually used by the encryption extension depends on which variant of SEE you are using. With RC4, the first 256 byte of key are used. With the AES128, the first 16 bytes of the key are used. With AES256, the first 32 bytes of key are used.

If you specify a key that is shorter than the maximum key length, then the key material is repeated as many times as necessary to complete the key. If you specify a key that is larger than the maximum key length, then the excess key material is silently ignored.

The key must begin with an ASCII prefix to specify which algorithm to use. The prefix must be one of "rc4:", "aes128:", or "aes256:". The prefix is not used as part of the key sent into the encryption algorithm. So the real key should begin on the first byte after the prefix.

The string provided to the plugin is used with it's current encoding. So be sure you use right text encoding for what you want. e.g. using "M√ºller" as key in text encoding Windows ANSI will not open a database which used that key in UTF-8 encoding.

The Xojo database encryption in SQLiteDatabase class uses AES-128 OFB.

186.16.38 SQLiteTableColumnMetaData(DBName as string, TableName as string, ColumnName as string, byref DataType as string, byref CollationSequence as string, byref NotNull as boolean, byref PrimaryKey as boolean, byref AutoIncrement as Boolean) as integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extract Metadata About A Column Of A Table
Notes: Not available in all sqlite libraries!

This routine returns metadata about a specific column of a specific database table accessible using the database connection handle passed as the first function argument.
The column is identified by the second, third and fourth parameters to this function. The second parameter is either the name of the database (i.e. "main", "temp", or an attached database) containing the specified table or NULL. If it is NULL, then all attached databases are searched for the table using the same algorithm used by the database engine to resolve unqualified table references.
The third and fourth parameters to this function are the table and column name of the desired column,

respectively. Neither of these parameters may be NULL.
Metadata is returned by writing to the memory locations passed as the 5th and subsequent parameters to this function. Any of these arguments may be NULL, in which case the corresponding element of metadata is omitted.

CollationSequence is assigned the Name of default collation sequence. NotNull is set to true if column has a NOT NULL constraint. PrimaryKey is set to true if column is part of the PRIMARY KEY and AutoIncrement is set to true if column is AUTOINCREMENT.

If the specified table is actually a view, an error code is returned.

If the specified column is "rowid", "oid" or "_rowid_" and an INTEGER PRIMARY KEY column has been explicitly declared, then the output parameters are set for the explicitly declared column. (If there is no explicitly declared INTEGER PRIMARY KEY column, then the output parameters are set as follows:

data type: "INTEGER"
collation sequence: "BINARY"
not null: false
primary key: true
auto increment: false

(This function may load one or more schemas from database files. If an error occurs during this process, or if the requested table or column cannot be found, an error code is returned and an error message left in the database connection (to be retrieved using ErrMessage).)

This API is only available if the library was compiled with the SQLITE_ENABLE_COLUMN_METADATA C-preprocessor symbol defined.

186.16.39 SQLiteThreadsafe as integer

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Test To See If The Library Is Threadsafe.
Notes: The threadsafe() function returns zero if and only if SQLite was compiled mutexing code omitted due to the SQLITE_THREADSAFE compile-time option being set to 0.

SQLite can be compiled with or without mutexes. When the SQLITE_THREADSAFE C preprocessor macro is 1 or 2, mutexes are enabled and SQLite is threadsafe. When the SQLITE_THREADSAFE macro is 0, the mutexes are omitted. Without the mutexes, it is not safe to use SQLite concurrently from more than one thread.

Enabling mutexes incurs a measurable performance penalty. So if speed is of utmost importance, it makes sense to disable the mutexes. But for maximum safety, mutexes should be enabled. The default behavior is for mutexes to be enabled.

This interface can be used by an application to make sure that the version of SQLite that it is linking against was compiled with the desired setting of the SQLITE_THREADSAFE macro.

This interface only reports on the compile-time mutex setting of the SQLITE_THREADSAFE flag. If SQLite is compiled with SQLITE_THREADSAFE=1 or =2 then mutexes are enabled by default but can be fully or partially disabled using a call to sqlite3_config() with the verbs SQLITE_CONFIG_SINGLETHREAD, SQLITE_CONFIG_MULTITHREAD, or SQLITE_CONFIG_MUTEX. ^(The return value of the sqlite3_threadsafe() function shows only the compile-time setting of thread safety, not any run-time changes to that setting made by sqlite3_config(). In other words, the return value from sqlite3_threadsafe() is unchanged by calls to sqlite3_config().)^

See the threading mode documentation for additional information.

186.16.40 SQLSelect(SelectString as string, CommandType as Integer) as RecordSet

MBS SQL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the SQLSelect threaded.
Notes: Same as SQLSelect, but with additional CommandType parameter.

For this method to work, you need to have somewhere a property with SQLDatabaseMBS so Xojo includes our SQLDatabase plugin which provides the RecordSet functionality.

If Scrollable property is true, the recordset will be requested to be scrollable.

The record set may not have a valid RecordCount or have working movefirst/movelast/moveprev methods unless the underlaying database supports those and Scrollable result sets is enabled/supported.

186.16.41 SQLSelectMT(SelectString as string, CommandType as Integer = 0) as RecordSet

MBS SQL Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the SQLSelect threaded.
Notes: Same as SQLSelect, but if you run this on a thread, the plugin gives time to other threads so the rest of your application runs just fine.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

If Scrollable property is true, the recordset will be requested to be scrollable.

The record set may not have a valid RecordCount or have working movefirst/movelast/moveprev methods unless the underlaying database supports those and Scrollable result sets is enabled/supported.

186.16.42 UpdateRecord(TableName as String, Record as Dictionary, Keys as Dictionary)

MBS SQL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convenience function to update a record.
Example:

```
Var db as SQLDatabaseMBS // your database connection

Var d as new Dictionary

d.Value("text")="new text"
d.Value("other")="second value"

db.UpdateRecord("test_tbl", d, new dictionary("ID":2))

if db.Error then
MessageBox db.ErrorMessage
end if
```

Notes: The plugin builds for you SQL statement with prepared statement and runs the update command with given values for records with given key values.

You can put multiple field names in the keys dictionary.

Lasterror is set or exception raised as with SQLExecute.
Internally this uses a prepared statement. You can check the generated statement via LastStatement property.

186.16.43 Properties

186.16.44 AutoCommit as Integer

MBS SQL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether autocommit is enabled or disabled for the current connection.
Example:

```
Var db as SQLDatabaseMBS // your database connection
db.AutoCommit = SQLDatabaseMBS.kAutoCommitOn
```

Notes: If autocommit is on, the database is committed automatically after each SQL command. Otherwise, transaction is committed only after Commit calling.
(Read and Write property)

186.16.45 Client as Integer

MBS SQL Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current DBMS client assigned for the connection.
Example:

```
Var con as new SQLDatabaseMBS
db.client = SQLConnectionMBS.kSQLiteClient
```

Notes: Raises OutOfBoundsException exception if value parameter is out of range on setting.
With SQLDatabaseMBS, the client is usually taken from the DatabaseName property with a prefix, e.g. "ODBC:test".
(Read and Write property)

186.16.46 ClientVersion as Integer

MBS SQL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the DBMS client API version number.
Example:

```
Call InternalSQLiteLibraryMBS.Use

Var db As New SQLDatabaseMBS
db.Client = SQLConnectionMBS.kSQLiteClient

Var version As Integer = db.ClientVersion
Var HighVersion As Integer = Bitwise.ShiftRight(version, 16)
```

```
Var LowVersion As Integer = Bitwise.BitAnd(version, 65535)

var v as string = InternalSQLiteLibraryMBS.Version

MessageBox HighVersion.ToString+"."+LowVersion.ToString+EndOfLine+v
```

Notes: The higher word contains the major client version (the XX value in the XX.YY version number); the lower word contains the minor client version (the YY value in the XX.YY version number).

If an DBMS client was not set calling ClientVersion method will throw an exception.
(Read only property)

186.16.47 Connection as SQLConnectionMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The connection for this database used in the background.
Notes: Note that methods on this connection object can raise exceptions while methods on the SQLDatabaseMBS class sets the error properties.
(Read only property)

186.16.48 isAlive as boolean

MBS SQL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the database server connection status for a particular connection object.
Notes: Returns true if the database server is active and accessible; otherwise false.
This method uses the safe query execution for most supported DBMS-es. The query uses the well known database table or procedure (mysql_ping is used for MySQL or MariaDB). If the query fails the method returns false.

For Sybase, SQLBase, MS SQL Server, Oracle, ODBC, MySQL, MariaDB, DB2, CubeSQL, Informix, Interbase, FireBase and PostgreSQL we check the status of the connection. This may send a query over the network and sees if server responds properly. If network connection breaks, this function returns false.

For SQLite, DuckDB and SQL Anywhere we return true if we are connected, just like isConnected property.
(Read only property)

186.16.49 isConnected as boolean

MBS SQL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the connection state for a particular connection object.
Notes: Returns true if connected; otherwise false.
If you connect over a network, please check with isAlive whether the connection is still alive.
(Read only property)

186.16.50 IsolationLevel as Integer

MBS SQL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The transaction isolation level.
Notes: Use the kReadCommitted, kReadUncommitted, kRepeatableRead, kSerializable and kLevelUnknown constants.
(Read and Write property)

186.16.51 LastStatement as String

MBS SQL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last executed SQL Statement.
Notes: (Read only property)

186.16.52 NativeAPI as Variant

MBS SQL Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns a set of functions of native DBMS client API.
Notes: Returns a SQLAPIMBS object.
Deprecated in version 19.5 in favor of direct methods in SQLDatabaseMBS and SQLConnectionMBS classes.
(Read only property)

186.16.53 Options as Dictionary

MBS SQL Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a dictionary with all options.
Notes: For debugging, it may be useful to inspect options in debugger.

(Read only property)

186.16.54 RaiseExceptions as Boolean

MBS SQL Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to raise exceptions.
Notes: Default is false which means we set error, ErrorCode and ErrorMessage properties and not raise SQLErrorExceptionMBS exception.
If you set to true, we do raise the exception and you have similar behavior as with SQLConnection class.
We recommend to use exceptions as they are not so easily ignored like an error property being true.
(Read and Write property)

186.16.55 RowsAffected as Integer

MBS SQL Plugin, Plugin Version: 23.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns number of rows affected by last DML operation.
Notes: Returns the number of rows affected by the last insert/update/delete command execution.

Can also return the result set rows count, usually when the result set is cached at the client side.
(Read only property)

186.16.56 Scrollable as Boolean

MBS SQL Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to make internally created SQLCommand objects scrollable.
Notes: Since plugin version 15.0, Scrollable is false by default.
(Read and Write property)

186.16.57 ServerVersion as Integer

MBS SQL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the currently connected DBMS server version number.
Notes: The higher word contains the major server version (the XX value in the XX.YY version number); the lower word contains the minor server version (the YY value in the XX.YY version number).
(Read only property)

186.16.58 ServerVersionString as string

MBS SQL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the currently connected DBMS server version string.
Notes: A server version string may contain some useful information about server brand, configuration and so on. It is a good idea to display this information in all your applications.
(Read only property)

186.16.59 SQLiteEncryptionKey as String

MBS SQL Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The encryption key to use.
Example:

```
// enable our built-in SQLite library, which supports encryption
Call InternalSQLiteLibraryMBS.Use

// where to store?
Var f As FolderItem = SpecialFolder.Desktop.Child("test.db")
Var storage_database As New SQLDatabaseMBS ' SQLiteDatabase
storage_database.SQLiteEncryptionKey = "aes256:password" ' <- password with AES256 as prefix to pick algorithm
storage_database.DatabaseName = "sqlite:"+ f.NativePath

If storage_database.Connect Then

// create table if this is not yet here
storage_database.SQLExecute "Create table if not exists pics(pic_id integer PRIMARY KEY AUTOINCREMENT, name varchar(20), pic blob)"

// done
MessageBox "Ready"
Else
MessageBox storage_database.ErrorMessage
End If
```

Notes: This key is applied to the database after connecting. In case of an error, the plugin raises an exception. An empty key can be used for having no encryption.
Alternatively you can use SQLite3MBS.SetKey yourself.

The amount of key material actually used by the encryption extension depends on which variant of SEE you are using. With RC4, the first 256 byte of key are used. With the AES128, the first 16 bytes of the key are used. With AES256, the first 32 bytes of key are used.

If you specify a key that is shorter than the maximum key length, then the key material is repeated as many times as necessary to complete the key. If you specify a key that is larger than the maximum key length, then the excess key material is silently ignored.

The key must begin with an ASCII prefix to specify which algorithm to use. The prefix must be one of "rc4:", "aes128:", or "aes256:". The prefix is not used as part of the key sent into the encryption algorithm. So the real key should begin on the first byte after the prefix. If no prefix is given, we default to AES 128. To be compatible to Xojo, you can use AES128.

The string provided to the plugin is used with it's current encoding. So be sure you use right text encoding for what you want. e.g. using "M√ºller" as key in text encoding Windows ANSI will not open a database which used that key in UTF-8 encoding.

The Xojo database encryption in SQLiteDatabase class uses AES-128 OFB.
(Read and Write property)

186.16.60 Tag as Variant

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag property.
Notes: You can store here whatever you like.
(Read and Write property)

186.16.61 Option(name as string) as string

MBS SQL Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an option for the connection.
Example:

```
Var c as SQLDatabaseMBS // your database connection

// for Microsoft SQL use OLEDB, so you don't need native SQL drivers installed...
c.Option("UseAPI") = "OLEDB"
c.Option("SQLNCLI.LIBS") = "sqlsrv32.dll" // Library included in Windows Vista and newer

// for SQLite, set flag to open database file read only:
c.Option("SQLiteVFSFlags") = "1"

// turn on auto cache
c.Option("AutoCache") = "true"
```

```
// set connection timeout for ODBC:
c.Option("SQL_ATTR_CONNECTION_TIMEOUT") = "10"

// cache insert statements for AddRow/InsertRecord
c.Option("CacheInsertStatement") = "true"

// for mySQL allow multiple RowSets
c.Option("CLIENT_MULTI_STATEMENTS") = "true"
c.Option("CLIENT_MULTI_RESULTS") = "true"
```

Notes: We have a collection of library files here:
https://www.monkeybreadsoftware.de/xojo/download/plugin/Libs/
(Read and Write computed property)

186.16.62 Events

186.16.63 DidConnect

MBS SQL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Event called after connection was made.
Notes: After we got connected, you can apply various options on the new connection here.

186.16.64 PostgresNotification(NotificationName as string, PID as Integer, Extras as String)

MBS SQL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A postgresSQL notification was received.
Notes: Provides notification name, process ID of app and optional extra information.

186.16.65 Trace(traceInfo as Integer, SQL as string, Command as SQLCommandMBS)

MBS SQL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event to trace SQL commands.

186.16.66 WillConnect

MBS SQL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Event called before connection is established.
Notes: Last chance to set connection options.

186.16.67 Constants

Constants

Constant	Value	Description
kOptionLibraryCubeSQL	"CUBESQL.LIBS"	One of the option constant to specify the library with the SetFileO method. Tells the plugin where to find the library for CubeSQL. Only needed don't use InternalCubeSQLLibraryMBS module! The value can contain multiple names and paths separated with ";" on Wi and ":" on macOS/Linux. The library extension on Mac is ".dylib", on Linux ".so" and on Windows You get this library with the CubeSQL download on their homepage. If no value is given, we default to Windows: cubeSQL_64bit.dll;cubesql.dll macOS: libcubesql_r.dylib Linux: libcubesql_r.so The default is set to work in most cases and try various possible library r
SQLiteInMemory	"Sqlite::memory:"	Connection string for SQLite for a new in-memory database. Prefixed with SQLite to use directly.

Isolation Levels

Constant	Value	Description
kANSILevel0	0	ANSI Level 0
kANSILevel1	1	ANSI Level 1
kANSILevel2	2	ANSI Level 2
kANSILevel3	3	ANSI Level 3
kLevelUnknown	-1	Unknown
kReadCommitted	1	Read committed.
kReadUncommitted	0	Read uncommitted.
kRepeatableRead	2	Repeatable read.
kSerializable	3	Serializable.
kSnapshot	4	Changes made in other transactions can not be seen. For Microsoft SQL Server.

Values for autocommit property

Constant	Value	Description
kAutoCommitOff	0	Autocommit is off.
kAutoCommitOn	1	Autocommit is on.
kAutoCommitUnknown	-1	Autocommit unknown

Command Types

Constant	Value	Description
kCommandTypeSQLStatement	1	Command is an SQL statement.
kCommandTypeSQLStatementRaw	2	Command is an SQL statement that mustn't be interpreted by SQLAPI.
kCommandTypeStoredProcedure	3	Command is a stored procedure or a function.
kCommandTypeUnknown	0	Used by default. Library detects command type automatically.

Error Codes

Constant	Value	Description
kErrorBindVarNotFound	7	Bind variable not found.
kErrorClientInitFails	6	Initialization failed for client.
kErrorClientNotSet	1	Client not set.
kErrorClientNotSupported	2	Unsupported client type for this platform.
kErrorClientVersionOld	5	Library file is too old.
kErrorFieldNotFound	8	Field not found.
kErrorGetLibraryVersionFails	4	Failed to query library version.
kErrorLoadLibraryFails	3	Failed to load a library. For example path could be wrong or 32/64bit mismatch.
kErrorNoMemory	0	Out of memory.
kErrorUnknownColumnType	11	Unknown column type.
kErrorUnknownDataType	9	Unknown data type.
kErrorUnknownParameterType	10	Unknown parameter type.
kErrorWrongConversion	12	Failed to convert a value, e.g. string to number.
kErrorWrongDatetime	13	Can't convert text to date.

Options to specify the library with SetFileOption

Constant	Value	Description
kOptionLibraryDB2	”DB2CLI.LIBS”	Tells the plugin where to find the library for DB2. The value can contain multiple names and paths separated with ”;” o and ”:” on macOS/Linux. The library extension on Mac is ”.dylib”, on Linux ”.so” and on Win You get this library with the DB2 download on their homepage. If no value is given, we default to Windows: db2clio.dll macOS: libdb2.dylib Linux: libdb2.so
kOptionLibraryDuckDB	”DUCKDB.LIBS”	Tells the plugin where to find the library for DuckDB. The value can contain multiple names and paths separated with ”;” o and ”:” on macOS/Linux. The library extension on Mac is ”.dylib”, on Linux ”.so” and on Win You get this library with the DuckDB download on their homepage If no value is given, we default to Windows: duckdb.dll macOS: libduckdb.dylib Linux: libduckdb.so
kOptionLibraryFirebird	”IBASE.LIBS”	Tells the plugin where to find the library for FireBird (or Interbase The value can contain multiple names and paths separated with ”;” o and ”:” on macOS/Linux. The library extension on Mac is ”.dylib”, on Linux ”.so” and on Win You get this library with the Firebird download on their homepage If no value is given, we default to Windows: ibclient64.dll;fbclient.dll;gds32.dll macOS: libgds.dylib:libfbclient.dylib Linux: libgds.so:libfbclient.so The default is set to work in most cases and try various possible libr
kOptionLibraryInformix	”INFCLI.LIBS”	Tells the plugin where to find the library for Informix. The value can contain multiple names and paths separated with ”;” o and ”:” on macOS/Linux. The library extension on Mac is ”.dylib”, on Linux ”.so” and on Win You get this library with the Informix download on their homepage If no value is given, we default to Windows: ICLIT09B.DLL;ICLIT09A.DLL macOS: iclit09b.dylib:iclit09a.dylib:libifcli.dylib Linux: iclit09b.so:iclit09a.so:libifcli.so The default is set to work in most cases and try various possible libr
kOptionLibraryInterbase	”IBASE.LIBS”	Tells the plugin where to find the library for FireBird (or Interbase The value can contain multiple names and paths separated with ”;” o and ”:” on macOS/Linux. The library extension on Mac is ”.dylib”, on Linux ”.so” and on Win You get this library with the FireBird download on their homepage If no value is given, we default to Windows: ibclient64.dll;fbclient.dll;gds32.dll macOS: libgds.dylib:libfbclient.dylib Linux: libgds.so:libfbclient.so The default is set to work in most cases and try various possible libr
kOptionLibraryMySQL	”MYSQL.LIBS”	Tells the plugin where to find the library for MySQL (or MariaDB The value can contain multiple names and paths separated with ”;” o and ”:” on macOS/Linux. The library extension on Mac is ”.dylib”, on Linux ”.so” and on Win You get this library with the MySQL download on their homepage Libs folder on our website. If no value is given, we default to Windows: libmySQL.dll;libmariadb.dll macOS: libmysqlclient.dylib.21:libmysqlclient_r.dyli client_r.18.dylib:libmysqlclient_r.16.dylib:libmysqlclient_r.15.dylib

186.17 class SQLDataConsumerMBS

186.17.1 class SQLDataConsumerMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a data consumer.
Notes: If you query a clob/blob value, that value may not fit into memory, so you may prefer to get a callback for data and write it to a file in small chunks.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.1pr4

Xojo Developer Magazine

- 14.1, page 30: The MBS SQL Plugin, An alternative way to connect to databases by Christian Schmitz

186.17.2 Events

186.17.3 Write(PieceType as Integer, data as string, Length as UInt32, BlobSize as UInt32)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called to process data.
Notes: PieceType is kOnePiece, kFirstPiece, kLastPiece or kNextPiece.
Data is the raw data in a binary string.
Length is the number of bytes and BlobSize the size of data blocks used.

186.17.4 Constants

Constants

Constant	Value	Description
kFirstPiece	1	One of the piece type constants. The first piece is processed. You may setup everything you need to handle the data.
kLastPiece	3	One of the piece type constants. The last piece is processed. You can close files/network connections.
kNextPiece	2	One of the piece type constants. The next piece is processed. Not the first one or the last one, but one between.
kOnePiece	4	One of the piece type constants. The whole data stream is delivered in one call of the event.

186.18 class SQLDataProviderMBS

186.18.1 class SQLDataProviderMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a data provider.
Notes: Use this to set a blob/clob object with streaming data. For example if you want to add a 1 GB big file to the database without loading it into RAM in one piece, you can use this class to read it in small chunks.

186.18.2 Events

186.18.3 Read(byref PieceType as Integer, Length as UInt32) as string

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called whenever new data is needed.
Notes: PieceType is kOnePiece, kFirstPiece, kLastPiece or kNextPiece.
If your stream is on the end, you set this to kLastPiece.
Return the raw data in a string.
Length is the number of bytes.

186.18.4 Constants

Constants

Constant	Value	Description
kFirstPiece	1	One of the piece type constants. The first piece is processed. You may setup everything you need to handle the data.
kLastPiece	3	One of the piece type constants. The last piece is processed. You can close files/network connections.
kNextPiece	2	One of the piece type constants. The next piece is processed. Not the first one or the last one, but one between.
kOnePiece	4	One of the piece type constants. The whole data stream is delivered in one call of the event.

186.19 class SQLDateTimeMBS

186.19.1 class SQLDateTimeMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The SQL date/time value class.
Example:

```
Var d as new SQLDateTimeMBS(2008, 3, 4, 23, 10, 20)

MessageBox d.StringValue // shows "2008-03-04T23:10:20"
```

186.19.2 Methods

186.19.3 Constructor(DateTimeValue as DateTime)

MBS SQL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the datetime value with the given DateTime object.
See also:

- 186.19.4 Constructor(DateValue as Date) 22674
- 186.19.5 Constructor(Hour as Integer, Minute as Integer, Second as Integer = 0, Fraction as Integer = 0) 22674
- 186.19.6 Constructor(other as SQLDateTimeMBS) 22675
- 186.19.7 Constructor(StringValue as String) 22675

- 186.19.8 Constructor(value as Double) 22676
- 186.19.9 Constructor(Year as Integer, Month as Integer, Day as Integer, Hour as Integer, Minute as Integer, Second as Integer = 0, Fraction as Integer = 0, TimeZone as String = "") 22677
- 186.19.10 Constructor(Year as Integer, Month as Integer, Day as Integer, Hour as Integer, Minute as Integer, Second as Integer, TimeZone as String) 22677

186.19.4 Constructor(DateValue as Date)

MBS SQL Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Initializes the datetime value with the given date.
See also:

- 186.19.3 Constructor(DateTimeValue as DateTime) 22673
- 186.19.5 Constructor(Hour as Integer, Minute as Integer, Second as Integer = 0, Fraction as Integer = 0) 22674
- 186.19.6 Constructor(other as SQLDateTimeMBS) 22675
- 186.19.7 Constructor(StringValue as String) 22675
- 186.19.8 Constructor(value as Double) 22676
- 186.19.9 Constructor(Year as Integer, Month as Integer, Day as Integer, Hour as Integer, Minute as Integer, Second as Integer = 0, Fraction as Integer = 0, TimeZone as String = "") 22677
- 186.19.10 Constructor(Year as Integer, Month as Integer, Day as Integer, Hour as Integer, Minute as Integer, Second as Integer, TimeZone as String) 22677

186.19.5 Constructor(Hour as Integer, Minute as Integer, Second as Integer = 0, Fraction as Integer = 0)

MBS SQL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new SQL Datetime with the given values.
See also:

- 186.19.3 Constructor(DateTimeValue as DateTime) 22673
- 186.19.4 Constructor(DateValue as Date) 22674
- 186.19.6 Constructor(other as SQLDateTimeMBS) 22675
- 186.19.7 Constructor(StringValue as String) 22675
- 186.19.8 Constructor(value as Double) 22676

- 186.19.9 Constructor(Year as Integer, Month as Integer, Day as Integer, Hour as Integer, Minute as Integer, Second as Integer = 0, Fraction as Integer = 0, TimeZone as String = "") 22677
- 186.19.10 Constructor(Year as Integer, Month as Integer, Day as Integer, Hour as Integer, Minute as Integer, Second as Integer, TimeZone as String) 22677

186.19.6 Constructor(other as SQLDateTimeMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the SQL Date Time.
Example:

```
Var d as new SQLDateTimeMBS(2008, 3, 4, 23, 10, 20)
Var e as new SQLDateTimeMBS(d)

MessageBox e.StringValue // shows "2008-03-04T23:10:20"
```

See also:

- 186.19.3 Constructor(DateTimeValue as DateTime) 22673
- 186.19.4 Constructor(DateValue as Date) 22674
- 186.19.5 Constructor(Hour as Integer, Minute as Integer, Second as Integer = 0, Fraction as Integer = 0) 22674
- 186.19.7 Constructor(StringValue as String) 22675
- 186.19.8 Constructor(value as Double) 22676
- 186.19.9 Constructor(Year as Integer, Month as Integer, Day as Integer, Hour as Integer, Minute as Integer, Second as Integer = 0, Fraction as Integer = 0, TimeZone as String = "") 22677
- 186.19.10 Constructor(Year as Integer, Month as Integer, Day as Integer, Hour as Integer, Minute as Integer, Second as Integer, TimeZone as String) 22677

186.19.7 Constructor(StringValue as String)

MBS SQL Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initialized a date time value from a string.
Example:

```
Var d As New SQLDateTimeMBS("2021-04-12T18:46:16.242")
MessageBox d.StringValue

Var d2 As New SQLDateTimeMBS("now")
```

MessageBox d2.StringValue

Notes: You can pass "now" for current time, a string containing a double value for seconds since epoche or a string formatted with SQL datetime. Either with T or space as separator. If fraction is given, it should be 3 digits for milliseconds.

186.19.8 Constructor(value as Double)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new SQL date time value based on the double value.
Example:

```
Var d as new SQLDateTimeMBS(2008, 3, 4, 23, 10, 20)
Var e as new SQLDateTimeMBS(d.DoubleValue+1) // clone with one day more

MessageBox e.StringValue // shows "2008-03-05T23:10:20"
```

186.19.9 Constructor(Year as Integer, Month as Integer, Day as Integer, Hour as Integer, Minute as Integer, Second as Integer = 0, Fraction as Integer = 0, TimeZone as String = "")

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new SQL Datetime with the given values.
Example:

```
Var d as new SQLDateTimeMBS(2008, 3, 4, 23, 10, 20)

MessageBox d.StringValue // shows "2008-03-04T23:10:20"
```

- 186.19.7 Constructor(StringValue as String) 22675
- 186.19.8 Constructor(value as Double) 22676
- 186.19.9 Constructor(Year as Integer, Month as Integer, Day as Integer, Hour as Integer, Minute as Integer, Second as Integer = 0, Fraction as Integer = 0, TimeZone as String = "") 22677

186.19.11 Set(DateTimeValue as DateTime)

MBS SQL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns the datetime value with the given dateTime object.
See also:

- 186.19.12 Set(value as Date) 22678

186.19.12 Set(value as Date)

MBS SQL Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Assigns the datetime value with the given date.
See also:

- 186.19.11 Set(DateTimeValue as DateTime) 22678

186.19.13 Properties

186.19.14 DateTimeValue as DateTime

MBS SQL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the value of this datetime object as a date object.
Notes: (Read only property)

186.19.15 DateValue as Date

MBS SQL Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries the value of this datetime object as a date object.
Notes: (Read only property)

186.19.16 Day as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the day this SADateTime object represents (1 –31).
Notes: (Read only property)

186.19.17 DayOfWeek as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the day of the week this SADateTime object represents (Sunday = 1).
Notes: (Read only property)

186.19.18 DayOfYear as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the day of the year this SADateTime object represents (Jan 1 = 1).
Notes: (Read only property)

186.19.19 DoubleValue as Double

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The double value of this date/time.
Notes: Use these operators to get current date/time value using standard double representation. Days are represented by whole number increments starting with 30 December 1899, midnight as time zero. Hour values are expressed as the absolute value of the fractional part of the number.

Date and time	Representation
30 December 1899, midnight	0.00
1 January 1900, midnight	2.00
4 January 1900, midnight	5.00
4 January 1900, 6 A.M.	5.25
4 January 1900, noon	5.50
4 January 1900, 9 P.M.	5.875

(Read only property)

186.19.20 Fraction as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of the fraction of second (0 to 999,999,999) this SQLDateTime object represents.
Notes: The value of the fraction field is the number of billionths of a second and ranges from 0 through 999,999,999 (1 less than 1 billion). For example, the value of the fraction field for a half-second is 500,000,000, for a thousandth of a second (one millisecond) is 1,000,000, for a millionth of a second (one microsecond) is 1,000, and for a billionth of a second (one nanosecond) is 1.
(Read only property)

186.19.21 hasDate as Boolean

MBS SQL Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this date & time object contains a date.
Notes: (Read only property)

186.19.22 hasTime as Boolean

MBS SQL Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this date & time object contains a time.
Notes: (Read only property)

186.19.23 Hour as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the hour this SADateTime object represents (0 –23).
Notes: (Read only property)

186.19.24 Minute as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the minute this SADateTime object represents (0 –59).
Notes: (Read only property)

186.19.25 Month as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the month this SADateTime object represents (1 –12).
Notes: (Read only property)

186.19.26 Second as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the second this SADateTime object represents (0 –59).
Notes: (Read only property)

186.19.27 StringValue as string

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The string value for this date/time.
Notes: (Read only property)

186.19.28 TimeZone as String

MBS SQL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time zone.
Notes: Should be in format "00:00" and should be supported for Oracle and Postgres.
(Read and Write property)

186.19.29 Year as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the year this SADateTime object represents.
Notes: (Read only property)

186.20 class SQLErrorExceptionMBS

186.20.1 class SQLErrorExceptionMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error exception class to report SQL errors.
Notes: The SQLDatabaseMBS class sets its error properties on an error. All other SQL classes raise exceptions where you can check the message property.
Subclass of the RuntimeException class.

Xojo Developer Magazine

- 14.1, page 27: The MBS SQL Plugin, An alternative way to connect to databases by Christian Schmitz

186.20.2 Properties

186.20.3 ErrorClass as Integer

MBS SQL Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a class of error.
Notes: Returns one of the following values:

SA_No_Error	0	No error occurred.
SA_UserGenerated_Error	1	User-generated error.
SA_Library_Error	2	The Library error occurred.
SA_DBMS_API_Error	3	DBMS API error occurred.

A SQLErrorExceptionMBS object handles the next error classes:

- User-generated errors
- Library errors

- DBMS API errors

The Library errors are generated by the Library itself. It can be like detecting some mistake in passing arguments to the function or referencing the parameter with an inappropriate name. To get a Library-defined error text call ErrorMessage method.

The DBMS API errors come to the Library from the DBMS Client or Server. In this case the Library returns an error code and text Client- or Server-defined. To get error code and error text returned by the server call NativeError and ErrorMessage methods.

The User-generated exception is "SQLAPI++ compatible" exception thrown by the user. To throw user exception use throwUserException method.
(Read only property)

186.20.4 ErrorMessage as String

MBS SQL Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets an error text.
Notes: A error text depends on a class of error.

If error class is Library error the ErrorMessage method returns Library-defined error text. If error class is DBMS API error the ErrorMessage method returns an error text gotten from DBMS Server or Client. If error class is User-defined error the ErrorMessage method returns an error text specified by user (see throwUserException method).

To get the error class call ErrorClass method.
(same as Message property)
(Read only property)

186.20.5 ErrorPosition as Integer

MBS SQL Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets an error position in SQL statement.
Notes: Returns an integer value representing error position.
Not all DBMS servers allow to get error position. See Server specific notes to get detailed information about returned value.

If a command object's associated SQL statement contains any syntax errors, an exception will be thrown when you try to compile. ErrorPosition method returns the error position within the command string.

Server specific notes

DBMS server	ErrorPosition method returned value
Oracle	ErrorPosition returns parse error offset.
SQL Server	ErrorPosition returns the number of line within SQL statement where error occurred.
Sybase	ErrorPosition returns the number of line within SQL statement where error occurred.
DB2	ErrorPosition returns -1. DB2 does not support this function.
Informix	ErrorPosition returns -1. Informix does not support this function.
InterBase	ErrorPosition returns -1. InterBase does not support this function.
SQLBase	ErrorPosition returns character position of the syntax error within an SQL statement. The first character is position 0.
MySQL	ErrorPosition returns -1. MySQL does not support this function.
PostgreSQL	ErrorPosition returns -1. PostgreSQL does not support this function.
ODBC	ErrorPosition returns -1. ODBC does not support this function.

(Read only property)

186.20.6 NativeError as Integer

MBS SQL Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a native code associated with current error.
Notes: Returns an integer value represents a native code associated with current error.

If error class is DBMS API error the NativeError method returns error code received from DBMS Server or Client. If error class is User-defined error the NativeError method returns an error code specified by user (see throwUserException method). If error class is Library error the NativeError method returns -1.

To get the error class call ErrorClass method.

See server specific documentation to get more information about DBMS API error code.
(same as ErrorNumber property)
(Read only property)

186.20.7 SQL as String

MBS SQL Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The SQL string set when this error occurred.
Notes: (Read only property)

186.21 class SQLFieldMBS

186.21.1 class SQLFieldMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This is the class for a SQL field in a record.
Example:

```
// run a query with the SQL plugin and show all field names, types and values
// con is a connected SQLConnectionMBS, see there
Var con As SQLConnectionMBS // your connection
If con = Nil Then Return

Var cmd As New SQLCommandMBS(con, "SELECT * FROM customers")
cmd.Execute
While cmd.FetchNext
Var values() As String
For i As Integer = 1 To cmd.FieldCount // fields start at 1
Var f As SQLFieldMBS = cmd.Field(i)
If f.isNull Then
values.Add f.Name + "=NULL"
Else
values.Add f.Name + "=" + f.asStringValue
End If
Next
System.DebugLog String.FromArray(values, ", ")
Wend
```

Notes: Be aware that field objects exists only as long as their SQLCommand exists.

- Upcoming Changes for our SQL Plugin

Xojo Developer Magazine

- 24.5, page 73: The MBS Xojo SQL Plugin in Action, Connecting to a PostgreSQL Database by Stefanie Juchmes-Simonis

186.21.2 Methods

186.21.3 ReadLongOrLob(toConsumer as SQLDataConsumerMBS, BlockSize as Integer)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Starts reading of Long or BLob(CLob) value using the given data consumer.
Notes: BlockSize: Size of piece of data you want to get to the consumer event.

After a command execution all output parameters are updated by their values, including Long and BLob(CLob) parameters. If you want to control piecewise reading of Long or BLob(CLob) data you should do the following:

Before a command execution set kLongOrLobReaderManual reading mode (see LongOrLobReaderMode) for Long or BLob(CLob) parameters you want to process by a data consumer. After that SQLAPI++ will skip reading output Long and BLob(CLob) parameters that you set to be read manually.
After command execution use ReadLongOrLob method for each output parameter defined to be read manually.
Note, that if the command has result set(s) (it is possible in some servers, see Server specific notes) then output parameters are available only after all result sets are completely processed using FetchNext method.
See also:

- 186.21.4 ReadLongOrLob(toFile as FolderItem) 22687
- 186.21.5 ReadLongOrLob(toStream as Writeable) 22688

186.21.4 ReadLongOrLob(toFile as FolderItem)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Starts reading of Long or BLob(CLob) value to the given file.
Example:

```
Var cmd as SQLCommandMBS // your command
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var field as SQLFieldMBS = cmd.Field("image")
// read blob content to binarystream
field.ReadLongOrLob(f)
```

Notes: May raise IOExceptions if things go wrong.
See also:

- 186.21.3 ReadLongOrLob(toConsumer as SQLDataConsumerMBS, BlockSize as Integer) 22687
- 186.21.5 ReadLongOrLob(toStream as Writeable) 22688

186.21.5 ReadLongOrLob(toStream as Writeable)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Starts reading of Long or BLob(CLob) value to the given writeable stream.
Example:

```
Var cmd as SQLCommandMBS // your command
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var b as BinaryStream = BinaryStream.Create(f, true)
Var field as SQLFieldMBS = cmd.Field("image")
// read blob content to binarystream
field.ReadLongOrLob(b)
```

Notes: This allows you to read in chunks the data to a stream, e.g. binarystream, textoutputstream or socket.
See also:

- 186.21.3 ReadLongOrLob(toConsumer as SQLDataConsumerMBS, BlockSize as Integer) 22687
- 186.21.4 ReadLongOrLob(toFile as FolderItem) 22687

186.21.6 Properties

186.21.7 FieldNativeType as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns native type code of the field.
Notes: Deprecated. Please use NativeType property instead.
(Read only property)

186.21.8 FieldPrecision as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns precision of the field value (the total number of allowable digits).
Notes: Deprecated. Please use Precision property instead.
(Read only property)

186.21.9 FieldScale as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns scale of the field value (the number of digits to the right of the decimal point).
Notes: Deprecated. Please use Scale property instead.
(Read and Write property)

186.21.10 FieldSize as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns field data size.
Notes: Deprecated. Please use Size property instead.
(Read only property)

186.21.11 FieldType as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns field data type.
Notes: Value is one of the kDataType* constants.
Deprecated. Please use Type property instead.
(Read and Write property)

186.21.12 isFieldRequired as boolean

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shows if it is possible for the field value to be null.
Notes: Returns true if the field value can be null; false otherwise.
(Read only property)

186.21.13 Name as string

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns name of the field.
Notes: (Read only property)

186.21.14 NativeType as Integer

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns native type code of the field.
Notes: (Read only property)

186.21.15 Options as Dictionary

MBS SQL Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a dictionary with all options.
Notes: For debugging, it may be useful to inspect options in debugger.
(Read only property)

186.21.16 Pos as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a one-based position of the field in a result set.
Notes: (Read only property)

186.21.17 Precision as Integer

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns precision of the field value (the total number of allowable digits).
Notes: (Read only property)

186.21.18 Scale as Integer

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns scale of the field value (the number of digits to the right of the decimal point).
Notes: (Read and Write property)

186.21.19 Size as Integer

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns field data size.
Notes: (Read only property)

186.21.20 Type as Integer

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns field data type.
Example:

```
Var db as SQLConnectionMBS
Var cmd as new SQLCommandMBS(db, "select * from test")

cmd.Execute

Var f as SQLFieldMBS = cmd.Field("test")

if f.Type = f.kDataTypeLong then
MessageBox "type is long"
end if
```

Notes: Value is one of the kDataType* constants.
(Read and Write property)

186.21.21 Option(name as string) as string

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The string value of a specific field option.
Notes: See for more details:
https://www.sqlapi.com/ApiDoc/class_s_a_field.html
(Read and Write computed property)

186.22 class SQLGlobalsMBS

186.22.1 class SQLGlobalsMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for the global methods of the SQL plugin.

186.22.2 Methods

186.22.3 FindTableName(SQL as String) as String

MBS SQL Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries table name used in a SQL SELECT statement.
Example:

```
Var sql As String = "SELECT First, Last FROM MyTable WHERE ID = 1"
Var TableName As String = SQLGlobalsMBS.FindTableName(sql)

MessageBox TableName // shows MyTable
```

Notes: This is a helper function used by our Edit/Update methods in RecordSet.
Returns either the found table name or empty text if something got wrong. e.g. multiple tables affected due to JOIN operation.

If you find a case where the parser crashes or reports wrong result, please contact us.

186.22.4 GetEnv(name as string) as string

MBS SQL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries environment variable.
Notes: Returns empty string if variable is undefined.

186.22.5 GetVersion as String

MBS SQL Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version string of the SQLAPI library.

186.22.6 GetVersionBuild as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The build number of the SQLAPI library.

186.22.7 GetVersionMajor as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The major version number of the SQLAPI library.

186.22.8 GetVersionMinor as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minor version number of the SQLAPI library.

186.22.9 PutEnv(line as string) as boolean

MBS SQL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets environment variable.
Notes: Line format should be ”key=value” and returns true on success and false on failure.

186.22.10 RaiseException(message as string)

MBS SQL Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Raises an exception to test exception handling in SQL Plugin.
Notes: Raises directly a SQLErrorExceptionMBS with the given message.

186.22.11 RaiseSQLErrorException(UserCode as Integer, message as string)

MBS SQL Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Raises an exception to test exception handling in SQL Plugin.
Notes: Raises a SAUserException which the plugin catches and translates to a SQLErrorExceptionMBS in Xojo.

186.22.12 SetCurrentWorkingDirectory(path as folderitem) as boolean

MBS SQL Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the current working directory.
Notes: This is often useful to make sure the DLLs in that folder are found.
See also:

- 186.22.13 SetCurrentWorkingDirectory(path as String) as boolean 22694

186.22.13 SetCurrentWorkingDirectory(path as String) as boolean

MBS SQL Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the current working directory.
Notes: This is often useful to make sure the DLLs in that folder are found.
See also:

- 186.22.12 SetCurrentWorkingDirectory(path as folderitem) as boolean 22694

186.22.14 SetDllDirectory(path as folderitem) as boolean

MBS SQL Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: Adds a directory to the search path used to locate DLLs for the application.
Notes: The directory to be added to the search path. If this parameter is an empty string (""), the call removes the current directory from the default DLL search order. If this parameter is nil, the function

restores the default search order.

If the function succeeds, the return value is true, otherwise false.

The SetDllDirectory function affects all subsequent calls to the LoadLibrary and LoadLibraryEx functions. It also effectively disables safe DLL search mode while the specified directory is in the search path.

After calling SetDllDirectory, the standard DLL search path is:

- The directory from which the application loaded.
- The directory specified by the SetDllDirectory function.
- The system directory. Use the GetSystemDirectory function to get the path of this directory. The name of this directory is System32.
- The Windows directory. Use the GetWindowsDirectory function to get the path of this directory.
- The directories that are listed in the PATH environment variable.

Each time the SetDllDirectory function is called, it replaces the directory specified in the previous SetDllDirectory call.

To revert to the standard search path used by LoadLibrary and LoadLibraryEx, call SetDllDirectory with nil. This also restores safe DLL search mode based on the SafeDllSearchMode registry value.
See also:

- 186.22.15 SetDllDirectory(path as String) as boolean 22695

186.22.15 SetDllDirectory(path as String) as boolean

MBS SQL Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: Adds a directory to the search path used to locate DLLs for the application.
Example:

```
call SQLGlobalsMBS.SetDllDirectory("C:\Program Files\MySQL\MySQL Server 5.7\lib")
```

Notes: The directory to be added to the search path. If this parameter is an empty string (""), the call removes the current directory from the default DLL search order. If this parameter is nil, the function restores the default search order.

If the function succeeds, the return value is true, otherwise false.

The SetDllDirectory function affects all subsequent calls to the LoadLibrary and LoadLibraryEx functions. It also effectively disables safe DLL search mode while the specified directory is in the search path.

After calling SetDllDirectory, the standard DLL search path is:

- The directory from which the application loaded.
- The directory specified by the SetDllDirectory function.
- The system directory. Use the GetSystemDirectory function to get the path of this directory. The name of this directory is System32.
- The Windows directory. Use the GetWindowsDirectory function to get the path of this directory.
- The directories that are listed in the PATH environment variable.

Each time the SetDllDirectory function is called, it replaces the directory specified in the previous SetDllDirectory call.

To revert to the standard search path used by LoadLibrary and LoadLibraryEx, call SetDllDirectory with nil. This also restores safe DLL search mode based on the SafeDllSearchMode registry value.
See also:

- 186.22.14 SetDllDirectory(path as folderitem) as boolean 22694

186.22.16 SetEnv(name as string, value as string) as boolean

MBS SQL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an environment variable.
Notes: Existing variable with same name will be overwritten.
Returns true on success and false on failure.

186.22.17 SetLicenseCode(n as string, enddate as Integer, v1 as Integer, v2 as Integer)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Registeres the SQL plugin and library.
Notes: Once you ordered a license, you receive details on how to call this method.

186.22.18 Setlocale(category as Integer, locale as string)

MBS SQL Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the locale to use.
Example:

```
// ask for English for USA with 1252 codepage
SQLGlobalsMBS.Setlocale SQLGlobalsMBS.LocaleAll, "English_United States.1252"
```

Notes: The Setlocale function sets the C library's notion of natural language formatting style for particular sets of routines. Each such style is called a 'locale' and is invoked using an appropriate name passed as a C string.

The setlocale() function recognizes several categories of routines. These are the categories and the sets of routines they select:

LocaleAll	Set the entire locale generically.
LocaleCollate	Set a locale for string collation routines. This controls alphabetic ordering in strcoll() and strxfrm().
LocaleCType	Set a locale for the ctype and multibyte functions. This controls recognition of upper and lower case, alphabetic or non-alphabetic characters, and so on.
LocaleMessages	Set a locale for message catalogs, see catopen function.
LocaleMonetary	Set a locale for formatting monetary values; this affects the localeconv() function.
LocaleNumeric	Set a locale for formatting numbers. This controls the formatting of decimal points in input and output of floating point numbers in functions such as printf() and scanf(), as well as values returned by localeconv().
LocaleTime	Set a locale for formatting dates and times using the strftime() function.

Only three locales are defined by default: the empty string "" (which denotes the native environment) and the "C" and "POSIX" locales (which denote the C-language environment). By default, C programs start in the "C" locale.

186.22.19 UnInitialize

MBS SQL Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Explicitly shutdown SQL engine.
Notes: You can call this in App Close or Destructor, but only after you destroyed all Connections, e.g. all SQLDatabaseMBS and SQLConnectionMBS objects.

186.22.20 UnSetEnv(name as string) as boolean

MBS SQL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes environment variable.
Notes: Returns true on success and false on failure.

186.22.21 Properties

186.22.22 UseFractions as Boolean

MBS SQL Plugin, Plugin Version: 26.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to include nanoseconds when converting to DateTime.
Notes: The date class doesn't do fractions of a second.
But DateTime class does do fractions.
You can enable fractions globally by setting this property.
(Read and Write property)

186.22.23 Events

186.22.24 Trace(traceInfo as Integer, SQL as string, Connection as SQLConnectionMBS, Command as SQLCommandMBS)

MBS SQL Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event to trace SQL commands.

186.22.25 Constants

Constants

Constant	Value	Description
LocaleAll	0	One of the locale category constants for SetLocale. Set the entire locale generically.
LocaleCollate	1	One of the locale category constants for SetLocale. Set a locale for string collation routines. This controls alphabetic ordering in strcoll() and strxfrm().
LocaleCType	2	One of the locale category constants for SetLocale. et a locale for the ctype(3) and multibyte(3) functions. This controls recognition of upper and lower case, alphabetic or non-alphabetic characters, and so on.
LocaleMessages	6	One of the locale category constants for SetLocale. Set a locale for message catalogs, see catopen(3) function.
LocaleMonetary	3	One of the locale category constants for SetLocale. Set a locale for formatting monetary values; this affects the localeconv() function.
LocaleNumeric	4	One of the locale category constants for SetLocale. Set a locale for formatting numbers. This controls the formatting of decimal points in input and output of floating point numbers in functions such as printf() and scanf(), as well as values returned by localeconv().
LocaleTime	5	One of the locale category constants for SetLocale. Set a locale for formatting dates and times using the strftime() function.

186.23 class SQLIntervalMBS

186.23.1 class SQLIntervalMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class in the SQL Plugin for an interval.
Example:

```
// calculate with time intervals, e.g. for interval columns in PostgreSQL or Oracle
Var a As New SQLIntervalMBS(1, 2, 30, 0) // 1 day, 2 hours, 30 minutes
Var b As New SQLIntervalMBS(0, 12, 0, 0) // 12 hours
a.Inc b

MessageBox "Total: " + Format(a.TotalHours, "0.0") + " hours = " + a.Days.ToString + " days " +
a.Hours.ToString + " hours " + a.Minutes.ToString + " minutes"

// use it as parameter: cmd.Param("duration").setAsInterval a
```

186.23.2 Methods

186.23.3 Constructor

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new zero interval.
See also:

- 186.23.4 Constructor(days as Integer, hours as Integer, minutes as Integer, seconds as Integer = 0, NanoSeconds as Integer = 0) 22700
- 186.23.5 Constructor(value as Double) 22701

186.23.4 Constructor(days as Integer, hours as Integer, minutes as Integer, seconds as Integer = 0, NanoSeconds as Integer = 0)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new interval with the given values.
See also:

- 186.23.3 Constructor 22700
- 186.23.5 Constructor(value as Double) 22701

186.23.5 Constructor(value as Double)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new interval with the given time delta.
Example:

```
Var n as new SQLIntervalMBS(5)

MessageBox n.StringValue // shows "120:00:00" for 120 hours
```

See also:

- 186.23.3 Constructor 22700
- 186.23.4 Constructor(days as Integer, hours as Integer, minutes as Integer, seconds as Integer = 0, NanoSeconds as Integer = 0) 22700

186.23.6 Dec(interval as SQLIntervalMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decrements the interval.

186.23.7 Inc(interval as SQLIntervalMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Increments the interval.

186.23.8 SetInterval(days as Integer, hours as Integer, minutes as Integer, seconds as Integer = 0, NanoSeconds as Integer = 0)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the interval values.

186.23.9 Properties

186.23.10 Days as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The days in this interval.
Notes: (Read only property)

186.23.11 DoubleValue as Double

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of this interval.
Example:

```
Var n as new SQLIntervalMBS(1,2,3,4)

MessageBox str(n.DoubleValue) // shows "1.085463" for 1 day, 2 hours, 3 minutes and 4 seconds
```

Notes: (Read only property)

186.23.12 Fraction as Integer

MBS SQL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The fraction of a second in nano seconds.
Notes: Range 0..999999999.
(Read only property)

186.23.13 Hours as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The hours value.
Notes: (Read only property)

186.23.14 Minutes as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minutes value.
Notes: (Read only property)

186.23.15 Seconds as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The seconds value.
Notes: (Read only property)

186.23.16 StringValue as string

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The interval as a string.
Example:

```
Var n as new SQLIntervalMBS(5)

MessageBox n.StringValue // shows "120:00:00" for 120 hours
```

Notes: (Read only property)

186.23.17 TotalDays as Double

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The total days value.
Example:

```
Var n as new SQLIntervalMBS(1,2,3,4)

MessageBox str(n.TotalDays) // shows "1"
```

Notes: (Read only property)

186.23.18 TotalHours as Double

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The total hours value.
Example:

```
Var n as new SQLIntervalMBS(1,2,3,4)
```

MessageBox str(n.TotalHours) // shows "26"

Notes: (Read only property)

186.23.19 TotalMinutes as Double

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The total minutes value.
Example:

Var n as new SQLIntervalMBS(1,2,3,4)

MessageBox str(n.TotalMinutes) // shows "1563"

Notes: (Read only property)

186.23.20 TotalSeconds as Double

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The total seconds value.
Notes: Var n as new SQLIntervalMBS(1,2,3,4)

MessageBox str(n.GetTotalSeconds) // shows "93784"
(Read only property)

186.24 class SQLite3BackupMBS

186.24.1 class SQLite3BackupMBS

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The object for a running backup.
Notes: The backup object records state information about an ongoing online backup operation. The sqlite3_backup object is created by a call to BackupInit() and is destroyed by a call to BackupFinish().
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

186.24.2 Methods

186.24.3 Constructor

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

186.24.4 Properties

186.24.5 Handle as Integer

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

186.25 class SQLite3MBS

186.25.1 class SQLite3MBS

MBS SQL Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The class for the native SQLite API.
Example:

```
Var con as new SQLConnectionMBS
Var path as string = "/tmp/test.db" // change path for Windows!

con.Connect(path,"","",SQLConnectionMBS.kSQLiteClient)

Var api as SQLAPIMBS = con.NativeAPI
if api isa SQLite3MBS then
Var s as SQLite3MBS = SQLite3MBS(api)
MessageBox s.Version
end if
```

Notes: Deprecated in favor of direct methods on SQLConnectionMBS. Please let us know if you need more SQLite specific functions.
Subclass of the SQLAPIMBS class.

186.25.2 Methods

186.25.3 BackupFinish(Backup as SQLite3BackupMBS) as Integer

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finishes a backup run.
Notes: When BackupStep has returned kErrorDone, or when the application wishes to abandon the backup operation, the application should destroy the SQLite3BackupMBS by passing it to BackupFinish. The BackupFinish interfaces releases all resources associated with the SQLite3BackupMBS object. If BackupStep has not yet returned kErrorDone, then any active write-transaction on the destination database is rolled back. The SQLite3BackupMBS object is invalid and may not be used following a call to BackupFinish.
The value returned by BackupFinish is kErrorOK if no BackupStep errors occurred, regardless or whether or not BackupStep completed. If an out-of-memory condition or IO error occurred during any prior BackupStep call on the same SQLite3BackupMBS object, then BackupFinish returns the corresponding error code.
A return of kErrorBusy or kErrorLocked from BackupStep is not a permanent error and does not affect the return value of BackupFinish.

186.25.4 BackupInit(Dest as Variant, DestName as String, Source as Variant, SourceName as String) as SQLite3BackupMBS

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes a backup.
Notes: The backup API copies the content of one database into another. It is useful either for creating backups of databases or for copying in-memory databases to or from persistent files.

see also
http://www.sqlite.org/c3ref/backup_finish.html

Exclusive access is required to the destination database for the duration of the operation. However the source database is only read-locked while it is actually being read; it is not locked continuously for the entire backup operation. Thus, the backup may be performed on a live source database without preventing other users from reading or writing to the source database while the backup is underway.

To perform a backup operation:

- BackupInit is called once to initialize the backup,
- BackupStep is called one or more times to transfer the data between the two databases, and finally
- BackupFinish is called to release all resources associated with the backup operation.

There should be exactly one call to BackupFinish for each successful call to BackupInit.

The D and N arguments to BackupInit(D,N,S,M) are the database connection associated with the destination database and the database name, respectively. The database name is "main" for the main database, "temp" for the temporary database, or the name specified after the AS keyword in an ATTACH statement for an attached database. The S and M arguments passed to BackupInit(D,N,S,M) identify the database connection and database name of the source database, respectively. The source and destination database connections (parameters S and D) must be different or else BackupInit(D,N,S,M) will file with an error.
If an error occurs within BackupInit(D,N,S,M), then nil is returned and an error code and error message are store3d in the destination database connection D. The error code and message for the failed call to BackupInit can be retrieved using the ErrCode and ErrMessage functions. A successful call to BackupInit returns a SQLite3BackupMBS object. The SQLite3BackupMBS object may be used with the BackupStep and BackupFinish functions to perform the specified backup operation.

Concurrent Usage of Database Handles
The source database connection may be used by the application for other purposes while a backup operation is underway or being initialized. If SQLite is compiled and configured to support threadsafe database connections, then the source database connection may be used concurrently from within other threads.
However, the application must guarantee that the destination database connection is not passed to any other API (by any thread) after BackupInit is called and before the corresponding call to BackupFinish. SQLite does not currently check to see if the application incorrectly accesses the destination database connection and so no error code is reported, but the operations may malfunction nevertheless. Use of the destination database connection while a backup is in progress might also also cause a mutex deadlock.
If running in shared cache mode, the application must guarantee that the shared cache used by the destination database is not accessed while the backup is running. In practice this means that the application must guarantee that the disk file being backed up to is not accessed by any connection within the process, not just the specific connection that was passed to BackupInit.
The SQLite3BackupMBS object itself is partially threadsafe. Multiple threads may safely make multiple concurrent calls to BackupStep. However, the BackupRemaining and BackupPageCount APIs are not strictly speaking threadsafe. If they are invoked at the same time as another thread is invoking BackupStep it is possible that they return invalid values.

Source and Dest can be SQLConnectionMBS or SQLDatabaseMBS. You need to pass source and dest, even if one is self as we give you the option to decide where to pass the current database connection.

186.25.5 BackupPageCount(Backup as SQLite3BackupMBS) as Integer

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of pages in total.
Notes: Each call to BackupStep sets two values inside the SQLite3BackupMBS object: the number of pages still to be backed up and the total number of pages in the source databae file. The BackupRemaining and BackupPageCount interfaces retrieve these two values, respectively.
The values returned by these functions are only updated by BackupStep. If the source database is modified

during a backup operation, then the values are not updated to account for any extra pages that need to be updated or the size of the source database file changing.

186.25.6 BackupRemaining(Backup as SQLite3BackupMBS) as Integer

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of pages remaining.
Notes: Each call to BackupStep sets two values inside the SQLite3BackupMBS object: the number of pages still to be backed up and the total number of pages in the source databae file. The BackupRemaining and BackupPageCount interfaces retrieve these two values, respectively.
The values returned by these functions are only updated by BackupStep. If the source database is modified during a backup operation, then the values are not updated to account for any extra pages that need to be updated or the size of the source database file changing.

186.25.7 BackupStep(Backup as SQLite3BackupMBS, Pages as Integer) as Integer

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies up to Pages pages between the source and destination databases specified by SQLite3BackupMBS object.
Notes: If N is negative, all remaining source pages are copied. If BackupStep(B,N) successfully copies N pages and there are still more pages to be copied, then the function resturns kErrorOK. If BackupStep(B,N) successfully finishes copying all pages from source to destination, then it returns kErrorDone. If an error occurs while running BackupStep(B,N), then an error code is returned. As well as kErrorOK and kErrorDone, a call to BackupStep may return kErrorReadOnly, kErrorNoMem, kErrorBusy, kErrorLocked, or an kErrorIOACCESS | kErrorIOXXX extended error code.
The BackupStep might return kErrorReadOnly if the destination database was opened read-only or if the destination is an in-memory database with a different page size from the source database.
If BackupStep cannot obtain a required file-system lock, then the sqlite3_busy_handler | busy-handler function is invoked (if one is specified). If the busy-handler returns non-zero before the lock is available, then kErrorBusy is returned to the caller. In this case the call to BackupStep can be retried later. If the source database connection is being used to write to the source database when BackupStep is called, then kErrorLocked is returned immediately. Again, in this case the call to BackupStep can be retried later on. (If kErrorIOACCESS | kErrorIOXXX, kErrorNoMem, or kErrorReadOnly is returned, then there is no point in retrying the call to BackupStep. These errors are considered fatal.) The application must accept that the backup operation has failed and pass the backup operation handle to the BackupFinish to release associated resources.
The first call to BackupStep obtains an exclusive lock on the destination file. The exclusive lock is not released until either BackupFinish is called or the backup operation is complete and BackupStep returns kErrorDone. Every call to BackupStep obtains a shared lock on the source database that lasts for the duration of the BackupStep call. Because the source database is not locked between calls to BackupStep, the source database may be modified mid-way through the backup process. If the source database is modified

by an external process or via a database connection other than the one being used by the backup operation, then the backup will be automatically restarted by the next call to BackupStep. If the source database is modified by the using the same database connection as is used by the backup operation, then the backup database is automatically updated at the same time.

186.25.8 EnableLoadExtension(OnOff as boolean)

MBS SQL Plugin, Plugin Version: 14.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables/disables extension loading for the given connection.

186.25.9 ErrCode as Integer

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The ErrCode function returns the numeric result code or extended result code for the most recent failed sqlite3 API call associated with a database connection.
Notes: If a prior API call failed but the most recent API call succeeded, the return value from ErrCode is undefined.

186.25.10 ErrMessage as string

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the most recent error message in english for the given connection.

186.25.11 LastInsertRowID as Int64

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns Last Insert Rowid.
Notes: Each entry in an SQLite table has a unique 64-bit signed integer key called the ROWID. The rowid is always available as an undeclared column named ROWID, OID, or _ROWID_ as long as those names are not also used by explicitly declared columns. If the table has a column of type INTEGER PRIMARY KEY then that column is another alias for the rowid.

This routine returns the rowid of the most recent successful INSERT into the database from the database connection in the first argument. If no successful INSERTs have ever occurred on that database connection, zero is returned.

(If an INSERT occurs within a trigger, then the rowid of the inserted row is returned by this routine as long as the trigger is running. But once the trigger terminates, the value returned by this routine reverts to the last value inserted before the trigger fired.)

An INSERT that fails due to a constraint violation is not a successful INSERT and does not change the value returned by this routine. ^Thus INSERT OR FAIL, INSERT OR IGNORE, INSERT OR ROLLBACK, and INSERT OR ABORT make no changes to the return value of this routine when their insertion fails. ^(When INSERT OR REPLACE encounters a constraint violation, it does not fail. The INSERT continues to completion after deleting rows that caused the constraint problem so INSERT OR REPLACE will always change the return value of this interface.)^

For the purposes of this routine, an INSERT is considered to be successful even if it is subsequently rolled back.

This function is accessible to SQL statements via the last_insert_rowid() SQL function.

If a separate thread performs a new INSERT on the same database connection while the LastInsertRowID function is running and thus changes the last insert rowid, then the value returned by LastInsertRowID is unpredictable and might not equal either the old or the new last insert rowid.

186.25.12 LoadExtension(file as FolderItem, ByRef ErrorMessage as String) as Integer

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads an SQLite extension library from the named file.
Notes: The LoadExtension interface attempts to load an SQLite extension library contained in the file.

Returns kErrorOk on success and kErrorError if something goes wrong.
Extension loading must be enabled using EnableLoadExtension prior to calling this API, otherwise an error will be returned.
See also:

- 186.25.13 LoadExtension(path as String, ByRef ErrorMessage as String) as Integer 22711

186.25.13 LoadExtension(path as String, ByRef ErrorMessage as String) as Integer

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads an SQLite extension library from the named file.
Notes: The LoadExtension interface attempts to load an SQLite extension library contained in the file.

Returns kErrorOk on success and kErrorError if something goes wrong.
Extension loading must be enabled using EnableLoadExtension prior to calling this API, otherwise an error will be returned.
See also:

- 186.25.12 LoadExtension(file as FolderItem, ByRef ErrorMessage as String) as Integer 22711

186.25.14 MemoryHighwater(reset as boolean) as Int64

MBS SQL Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries maximum memory usage so far.
Notes: Can be reset with reset parameter being true.
See also:

- 186.25.23 MemoryHighwater as Int64 22716

186.25.15 ReKey(Key as String) as Integer

MBS SQL Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: You can change the key on a database using the Rekey Function.
Notes: An empty key decrypts the database.

Rekeying requires that every page of the database file be read, decrypted, reencrypted with the new key, then written out again. Consequently, rekeying can take a long time on a larger database.

Most SEE variants allow you to encrypt an existing database that was created using the public domain version of SQLite. This is not possible when using the authenticating version of the encryption extension in see-aes128-ccm. If you do encrypt a database that was created with the public domain version of SQLite, no nonce will be used and the file will be vulnerable to a chosen-plaintext attach. If you call SetKey() immediately after Open when you are first creating the database, space will be reserved in the database for a nonce and the encryption will be much stronger. If you do not want to encrypt right away, call SetKey() anyway, with an empty key, and the space for the nonce will be reserved in the database even though no encryption is done initially.

A public domain version of the SQLite library can read and write an encrypted database with an empty key. You only need the encryption extension if the key is non-empty.

Returns a SQLite error code.

186.25.16 SetBusyHandler(MaxAttempts as Integer = 5)

MBS SQL Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Installs busy handler for this connection.
Notes: This routine sets a callback function that might be invoked whenever an attempt is made to open a database table that another thread or process has locked.

The plugin has an busy handler which will wait up to MaxAttemps and yield to other Xojo threads while waiting.
Passing 5 should wait up to 100ms.

There can only be a single busy handler defined for each [database connection] . Setting a new busy handler clears any previously set handler.) Note that calling SetBusyTimeout will also set or clear the busy handler.

The busy callback should not take any actions which modify the database connection that invoked the busy handler. Any such actions result in undefined behavior.

186.25.17 SetBusyTimeout(TimeOutMS as Integer = 20)

MBS SQL Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: This routine sets a busy handler that sleeps for a specified amount of time when a table is locked.
Notes: The handler will sleep multiple times until at least "ms" milliseconds of sleeping have accumulated. ^After at least "ms" milliseconds of sleeping, the handler returns 0 which causes SQLite query to return SQLite Busy or IO Blocked error.

Calling this routine with an argument less than or equal to zero turns off all busy handlers.

(There can only be a single busy handler for a particular database connection any any given moment. If another busy handler was defined (using SetBusyHandler prior to calling this routine, that other busy handler is cleared.)

186.25.18 SetKey(Key as String) as Integer

MBS SQL Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies encryption to a database connection.
Notes: Returns a SQLite error code.

The amount of key material actually used by the encryption extension depends on which variant of SEE you

are using. With RC4, the first 256 byte of key are used. With the AES128, the first 16 bytes of the key are used. With AES256, the first 32 bytes of key are used.

If you specify a key that is shorter than the maximum key length, then the key material is repeated as many times as necessary to complete the key. If you specify a key that is larger than the maximum key length, then the excess key material is silently ignored.

The key must begin with an ASCII prefix to specify which algorithm to use. The prefix must be one of "rc4:", "aes128:", or "aes256:". The prefix is not used as part of the key sent into the encryption algorithm. So the real key should begin on the first byte after the prefix.

The string provided to the plugin is used with it's current encoding. So be sure you use right text encoding for what you want. e.g. using "M√ºller" as key in text encoding Windows ANSI will not open a database which used that key in UTF-8 encoding.

The Xojo database encryption in SQLiteDatabase class uses AES-128 OFB.

186.25.19 TableColumnMetaData(DBName as string, TableName as string, ColumnName as string, byref DataType as string, byref CollationSequence as string, byref NotNull as boolean, byref PrimaryKey as boolean, byref AutoIncrement as Boolean) as Integer

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extract Metadata About A Column Of A Table
Notes: Not available in all sqlite libraries!

This routine returns metadata about a specific column of a specific database table accessible using the database connection handle passed as the first function argument.
The column is identified by the second, third and fourth parameters to this function. The second parameter is either the name of the database (i.e. "main", "temp", or an attached database) containing the specified table or NULL. If it is NULL, then all attached databases are searched for the table using the same algorithm used by the database engine to resolve unqualified table references.
The third and fourth parameters to this function are the table and column name of the desired column, respectively. Neither of these parameters may be NULL.
Metadata is returned by writing to the memory locations passed as the 5th and subsequent parameters to this function. Any of these arguments may be NULL, in which case the corresponding element of metadata is omitted.

CollationSequence is assigned the Name of default collation sequence. NotNull is set to true if column has a NOT NULL constraint. PrimaryKey is set to true if column is part of the PRIMARY KEY and AutoIncrement is set to true if column is AUTOINCREMENT.

If the specified table is actually a view, an error code is returned.

If the specified column is "rowid", "oid" or "_rowid_" and an INTEGER PRIMARY KEY column has been explicitly declared, then the output parameters are set for the explicitly declared column. (If there is no explicitly declared INTEGER PRIMARY KEY column, then the output parameters are set as follows:

data type: "INTEGER"
collation sequence: "BINARY"
not null: false
primary key: true
auto increment: false

(This function may load one or more schemas from database files. If an error occurs during this process, or if the requested table or column cannot be found, an error code is returned and an error message left in the database connection (to be retrieved using ErrMessage).)

This API is only available if the library was compiled with the SQLITE_ENABLE_COLUMN_METADATA C-preprocessor symbol defined.

186.25.20 Threadsafe as Integer

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Test To See If The Library Is Threadsafe.
Notes: The threadsafe() function returns zero if and only if SQLite was compiled mutexing code omitted due to the SQLITE_THREADSAFE compile-time option being set to 0.

SQLite can be compiled with or without mutexes. When the SQLITE_THREADSAFE C preprocessor macro is 1 or 2, mutexes are enabled and SQLite is threadsafe. When the SQLITE_THREADSAFE macro is 0, the mutexes are omitted. Without the mutexes, it is not safe to use SQLite concurrently from more than one thread.

Enabling mutexes incurs a measurable performance penalty. So if speed is of utmost importance, it makes sense to disable the mutexes. But for maximum safety, mutexes should be enabled. The default behavior is for mutexes to be enabled.

This interface can be used by an application to make sure that the version of SQLite that it is linking against was compiled with the desired setting of the SQLITE_THREADSAFE macro.

This interface only reports on the compile-time mutex setting of the SQLITE_THREADSAFE flag. If SQLite

is compiled with SQLITE_THREADSAFE=1 or =2 then mutexes are enabled by default but can be fully or partially disabled using a call to sqlite3_config() with the verbs SQLITE_CONFIG_SINGLETHREAD, SQLITE_CONFIG_MULTITHREAD, or SQLITE_CONFIG_MUTEX. ^(The return value of the sqlite3_threadsafe() function shows only the compile-time setting of thread safety, not any run-time changes to that setting made by sqlite3_config(). In other words, the return value from sqlite3_threadsafe() is unchanged by calls to sqlite3_config().)^

See the threading mode documentation for additional information.

186.25.21 Properties

186.25.22 ConnectionHandle as Ptr

MBS SQL Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current connection reference for the database.
Notes: sqlite3 pointer for using in declares.
(Read only property)

186.25.23 MemoryHighwater as Int64

MBS SQL Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries maximum memory usage so far.
Notes: Can be reset with reset parameter.
(Read only property)
See also:

- 186.25.14 MemoryHighwater(reset as boolean) as Int64 22712

186.25.24 MemoryUsed as Int64

MBS SQL Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries memory in use by SQLite.
Notes: This is memory allocated, but not yet freed.
Value is zero until SQLite3 initialized.
(Read only property)

186.25.25 Version as string

MBS SQL Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version string of the SQLite library.
Notes: (Read only property)

186.25.26 VersionNumber as Integer

MBS SQL Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version number of the SQLite library.
Notes: (Read only property)

186.25.27 Constants

Error Codes

Constant	Value	Description
kErrorAbort	4	Callback routine requested an abort.
kErrorAuth	23	Authorization denied
kErrorBusy	5	The database file is locked.
kErrorCantopen	14	Unable to open the database file.
kErrorConstraint	19	Abort due to constraint violation.
kErrorCorrupt	11	The database disk image is malformed.
kErrorDone	101	sqlite3_step() has finished executing.
kErrorEmpty	16	Database is empty
kErrorError	1	SQL error or missing database.
kErrorFormat	24	Auxiliary database format error.
kErrorFull	13	Insertion failed because database is full.
kErrorInternal	2	Internal logic error in SQLite
kErrorInterrupt	9	Operation terminated by sqlite3_interrupt().
kErrorIoerr	10	Some kind of disk I/O error occurred.
kErrorLocked	6	A table in the database is locked.
kErrorMismatch	20	Data type mismatch.
kErrorMisuse	21	Library used incorrectly.
kErrorNolfs	22	Uses OS features not supported on host.
kErrorNoMem	7	Out of memory.
kErrorNotaDB	26	File opened that is not a database file.
kErrorNotFound	12	NOT USED. Table or record not found.
kErrorOk	0	Successful result
kErrorPerm	3	Access permission denied.
kErrorProtocol	15	NOT USED. Database lock protocol error.
kErrorRange	25	2nd parameter to sqlite3_bind out of range.
kErrorReadonly	8	Attempt to write a readonly database.
kErrorRow	100	sqlite3_step() has another row ready.
kErrorSchema	17	The database schema changed.
kErrorToobig	18	String or BLOB exceeds size limit.

186.26 class SQLiteFunctionMBS

186.26.1 class SQLiteFunctionMBS

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a custom SQLite function implemented in Xojo.
Example:

```
// Create a custom function with a handler function:
Var f As New SQLiteFunctionMBS
f.name = "SHA256"
f.ArgumentCount = 1
f.Flags = f.kFlagDeterministic OR f.kFlagUTF8 OR f.kFlagInnocuous
// Text encoding UTF8, function is deterministic and can be cached, function is innocuous as it depends only on parameters
AddHandler f.Perform, AddressOf PerformSHA256
functions.Append f // keep reference
```

Notes: You can use this with our InternalSQLiteLibraryMBS module and the SQL classes within MBS Plugin to work on SQLite databases and as extension for SQLiteDatabase in Xojo.

186.26.2 Methods

186.26.3 Constructor

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
Example:

```
Var f As New SQLiteFunctionMBS
f.name = "SHA256"
```

Notes: Please keep a reference to the function in a global array to avoid it being destroyed.

186.26.4 Destructor

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

186.26.5 ResultBlob(data as MemoryBlock)

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a BLOB value to SQLite.
Notes: We have three variants, so you can pass string, MemoryBlock or ptr.
See also:

- 186.26.6 ResultBlob(data as ptr, size as Integer) 22720
- 186.26.7 ResultBlob(text as string) 22720

186.26.6 ResultBlob(data as ptr, size as Integer)

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a BLOB value to SQLite.
Notes: We have three variants, so you can pass string, MemoryBlock or ptr.
See also:

- 186.26.5 ResultBlob(data as MemoryBlock) 22720
- 186.26.7 ResultBlob(text as string) 22720

186.26.7 ResultBlob(text as string)

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a BLOB value to SQLite.
Example:

me.ResultBlob "Hello World"

Notes: We have three variants, so you can pass string, MemoryBlock or ptr.
See also:

- 186.26.5 ResultBlob(data as MemoryBlock) 22720
- 186.26.6 ResultBlob(data as ptr, size as Integer) 22720

186.26.8 ResultDouble(value as Double)

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a double value back to SQLite.
Example:

```
Sub Perform(ArgumentCount as Integer, Arguments() as Variant) Handles Perform
#Pragma BackgroundTasks False
#Pragma BoundsChecking False
#Pragma StackOverflowChecking False

// square function
Var a as double = arguments(0).DoubleValue
ResultDouble a * a

End Sub
```

186.26.9 ResultError(ErrorMessage as string)

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns an error message for the function call.
Example:

```
Sub Perform(ArgumentCount as Integer, Arguments() as Variant) Handles Perform
#Pragma BackgroundTasks False
#Pragma BoundsChecking False
#Pragma StackOverflowChecking False

Var v as string = arguments(0)
if v.length = 0 then
ResultError "Please pass text"
ResultErrorCode 12345 // custom error code
else
ResultText v + v
end if
End Sub
```

Notes: Sets error code to 1. Use ResultErrorCode to change this.

186.26.10 ResultErrorCode(ErrorCode as Integer)

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets error code for the function call.

186.26.11 ResultInteger(value as Integer)

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns an integer value back to SQLite.
Example:

```
Sub Perform(ArgumentCount as Integer, Arguments() as Variant) Handles Perform
#Pragma BackgroundTasks False
#Pragma BoundsChecking False
#Pragma StackOverflowChecking False

// square function
Var a as Integer = arguments(0).IntegerValue
ResultInteger a * a

End Sub
```

186.26.12 ResultNull

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a null value back to SQLite.
Example:

```
Sub Perform(ArgumentCount as Integer, Arguments() as Variant) Handles Perform
#Pragma BackgroundTasks False
#Pragma BoundsChecking False
#Pragma StackOverflowChecking False

// return NULL value
ResultNull

End Sub
```

186.26.13 ResultText(text as string)

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a string value back to SQLite.
Example:

```
Sub Perform(ArgumentCount as Integer, Arguments() as Variant) Handles Perform
#Pragma BackgroundTasks False
#Pragma BoundsChecking False
#Pragma StackOverflowChecking False

ResultText "Hello World"

End Sub
```

186.26.14 ResultZeroBlob(Length as Integer)

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a zero filled BLOB value back to SQLite.

186.26.15 Properties

186.26.16 ArgumentCount as Integer

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of arguments expected for this function.
Notes: Pass 0 to 127 for number of arguments or -1 for variable number of arguments.
(Read and Write property)

186.26.17 CallCounter as Integer

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of times the function was called.
Notes: (Read only property)

186.26.18 DatabaseCount as Integer

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of times the function was registered to a database connection.
Notes: (Read only property)

186.26.19 Enabled as Boolean

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether this function is enabled.
Notes: The value is checked when connecting to a new SQLite database.
Defaults to true.
(Read and Write property)

186.26.20 Flags as Integer

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The flags for the function.
Example:

```
Var f As New SQLiteFunctionMBS

f.Flags = f.kFlagDeterministic OR f.kFlagUTF8 OR f.kFlagInnocuous
// Text encoding UTF8, function is deterministic and can be cached, function is innocuous as it depends only on parameters
```

Notes: See kFlag* constants.
(Read and Write property)

186.26.21 Name as String

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name of the function.
Notes: (Read and Write property)

186.26.22 Events

186.26.23 Perform(ArgumentCount as Integer, Arguments() as Variant)

MBS SQL Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The event called to perform the function.
Example:

```
Sub Perform(ArgumentCount as Integer, Arguments() as Variant) Handles Perform
#Pragma BackgroundTasks False
```

```
#Pragma BoundsChecking False
#Pragma StackOverflowChecking False

ResultText "Hello World"

End Sub
```

Notes: ArgumentCount is the number of arguments passed in the array.
Arguments contains values, which may be nil, double, integer, string, Memoryblock for BLOB.

Please use #pragmas like in the sample project to disable stack checking and background tasks for best performance. Also catch all exceptions that may happen to prevent trouble.

Call one of the result functions to return the result.

186.26.24 Constants

Flags

Constant	Value	Description
kFlagDeterministic	&h800	The function always gives the same output when the input parameters are the same.
kFlagDirectOnly	&h80000	The function may only be invoked from top-level SQL, and cannot be used in VIEWs or TRIGGERs nor in schema structures.
kFlagInnocuous	&h200000	The function is unlikely to cause problems even if misused. An innocuous function should have no side effects and should not depend on any values other than its input parameters.
kFlagUTF8	1	Specifies text encoding to be UTF-8.

186.27 class SQLLongBinaryMBS

186.27.1 class SQLLongBinaryMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a long binary object.
Notes: Basicly this is a SQLStringMBS which is always marked to contain binary data. You only need this class to use the constructor with dataprovider to stream data to the database.
Subclass of the SQLLongOrLobMBS class.
Blog Entries

- MBS Real Studio Plugins, version 12.4pr1

186.27.2 Methods

186.27.3 Constructor

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.
See also:

- 186.27.4 Constructor(Data as MemoryBlock) 22726
- 186.27.5 Constructor(data as SQLStringMBS) 22727
- 186.27.6 Constructor(Data as string, isText as Boolean = True) 22727
- 186.27.7 Constructor(dataProvider as SQLDataProviderMBS, BlockSize as UInt32) 22727

186.27.4 Constructor(Data as MemoryBlock)

MBS SQL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new string object with data, e.g. for blob.
See also:

- 186.27.3 Constructor 22726
- 186.27.5 Constructor(data as SQLStringMBS) 22727
- 186.27.6 Constructor(Data as string, isText as Boolean = True) 22727
- 186.27.7 Constructor(dataProvider as SQLDataProviderMBS, BlockSize as UInt32) 22727

186.27.5 Constructor(data as SQLStringMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new long binary object from a string object.
See also:

- 186.27.3 Constructor 22726
- 186.27.4 Constructor(Data as MemoryBlock) 22726
- 186.27.6 Constructor(Data as string, isText as Boolean = True) 22727
- 186.27.7 Constructor(dataProvider as SQLDataProviderMBS, BlockSize as UInt32) 22727

186.27.6 Constructor(Data as string, isText as Boolean = True)

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new string object with data or text copied from the data string.
Notes: If isText is true, the data is interpreted as text and string encoding conversion may modify it. If isText is false the bytes are copied raw.
See also:

- 186.27.3 Constructor 22726

- 186.27.7 Constructor(dataProvider as SQLDataProviderMBS, BlockSize as UInt32) 22727

186.27.7 Constructor(dataProvider as SQLDataProviderMBS, BlockSize as UInt32)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new long binary object from a data provider.
Notes: The blocksize specifies in which sizes data is requested from the provider.
You must make sure that the data provider and this new blob object life long enough. Because the actual data is requested later when you do the update on the database.

If BlockSize is 0, the default block size is used.

- 186.27.6 Constructor(Data as string, isText as Boolean = True) 22727

186.28 class SQLLongCharMBS

186.28.1 class SQLLongCharMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for the long character data type.
Notes: Basicly this is a SQLStringMBS which is always marked to contain text. You only need this class to use the constructor with dataprovider to stream data to the database.
Subclass of the SQLLongOrLobMBS class.

186.28.2 Methods

186.28.3 Constructor

MBS SQL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.
See also:

- 186.28.4 Constructor(data as SQLStringMBS) 22728
- 186.28.5 Constructor(Data as string, isText as boolean=true) 22728
- 186.28.6 Constructor(dataProvider as SQLDataProviderMBS, BlockSize as UInt32) 22729

186.28.4 Constructor(data as SQLStringMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new long character object from a string object.
See also:

- 186.28.3 Constructor 22728
- 186.28.5 Constructor(Data as string, isText as boolean=true) 22728
- 186.28.6 Constructor(dataProvider as SQLDataProviderMBS, BlockSize as UInt32) 22729

186.28.5 Constructor(Data as string, isText as boolean=true)

MBS SQL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new string object with data or text copied from the data string.
Notes: If isText is true, the data is interpreted as text and string encoding conversion may modify it. If isText is false the bytes are copied raw.
See also:

- 186.28.3 Constructor 22728

- 186.28.6 Constructor(dataProvider as SQLDataProviderMBS, BlockSize as UInt32) 22729

186.28.6 Constructor(dataProvider as SQLDataProviderMBS, BlockSize as UInt32)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new long character object from a data provider.
Notes: The blocksize specifies in which sizes data is requested from the provider.
You must make sure that the data provider and this new long character object life long enough. Because the actual data is requested later when you do the update on the database.

If BlockSize is 0, the default block size is used.

186.29 class SQLLongOrLobMBS

186.29.1 class SQLLongOrLobMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The super class for Long Binary/Text and BLOB/CLOB classes.
Notes: Subclass of the SQLStringMBS class.

186.30 class SQLNotInitializedExceptionMBS

186.30.1 class SQLNotInitializedExceptionMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception raised if you call a method on an object which was not properly initialized.
Notes: Subclass of the RuntimeException class.

- MBS Xojo Plugins, version 19.2pr1

186.31 class SQLNullMBS

186.31.1 class SQLNullMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class used internally for null values.

186.32 class SQLNumericMBS

186.32.1 class SQLNumericMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for numeric values.
Example:

```
// pass an exact decimal value to the database without rounding errors
Var price As SQLNumericMBS = SQLNumericMBS.NumericWithString("1234567.89")
MessageBox "Value: " + price.StringValue + ", precision " + price.precision.ToString + ", scale " +
price.scale.ToString

// use it as parameter: cmd.Param("price").setAsNumeric price
```

186.32.2 Methods

186.32.3 Constructor

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an empty numeric object.
See also:

- 186.32.4 Constructor(value as Double) 22734
- 186.32.5 Constructor(value as string) 22734

186.32.4 Constructor(value as Double)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new numeric object based on the given double value.
See also:

- 186.32.3 Constructor 22733
- 186.32.5 Constructor(value as string) 22734

186.32.5 Constructor(value as string)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new numeric object based on the given string.
See also:

- 186.32.3 Constructor 22733
- 186.32.4 Constructor(value as Double) 22734

186.32.6 NumericWithCurrency(value as Currency) as SQLNumericMBS

MBS SQL Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new numeric value object with given currency value.
Example:

```
// test code for currency
Var c1 as Currency = 12345678.
Var c2 as Currency = 1234567.8
Var c3 as Currency = 123456.78
Var c4 as Currency = 12345.678
Var c5 as Currency = 1234.5678
Var c6 as Currency = 123.45678

Var n1 as SQLNumericMBS = SQLNumericMBS.NumericWithCurrency(c1)
Var n2 as SQLNumericMBS = SQLNumericMBS.NumericWithCurrency(c2)
Var n3 as SQLNumericMBS = SQLNumericMBS.NumericWithCurrency(c3)
Var n4 as SQLNumericMBS = SQLNumericMBS.NumericWithCurrency(c4)
Var n5 as SQLNumericMBS = SQLNumericMBS.NumericWithCurrency(c5)
Var n6 as SQLNumericMBS = SQLNumericMBS.NumericWithCurrency(c6)

Var s1 as string = n1.StringValue
Var s2 as string = n2.StringValue
Var s3 as string = n3.StringValue
Var s4 as string = n4.StringValue
```

```
Var s5 as string = n5.StringValue
Var s6 as string = n6.StringValue

Var d1 as Double = n1.DoubleValue
Var d2 as Double = n2.DoubleValue
Var d3 as Double = n3.DoubleValue
Var d4 as Double = n4.DoubleValue
Var d5 as Double = n5.DoubleValue
Var d6 as Double = n6.DoubleValue

Var x1 as Currency = n1.CurrencyValue
Var x2 as Currency = n2.CurrencyValue
Var x3 as Currency = n3.CurrencyValue
Var x4 as Currency = n4.CurrencyValue
Var x5 as Currency = n5.CurrencyValue
Var x6 as Currency = n6.CurrencyValue

// check for errors
if x1<>c1 then break
if x2<>c2 then break
if x3<>c3 then break
if x4<>c4 then break
if x5<>c5 then break
if x6<>c6 then break

if x1*10000 <>round(d1 * 10000) then Break
if x2*10000 <>round(d2 * 10000) then Break
if x3*10000 <>round(d3 * 10000) then Break
if x4*10000 <>round(d4 * 10000) then Break
if x5*10000 <>round(d5 * 10000) then Break
if x6*10000 <>round(d6 * 10000) then Break

Break // if no break before, it's okay.
```

186.32.7 NumericWithDouble(value as Double) as SQLNumericMBS

MBS SQL Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number with the given double value.

186.32.8 NumericWithInt64(value as Int64) as SQLNumericMBS

MBS SQL Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number with the given Int64 value.

186.32.9 NumericWithString(value as string) as SQLNumericMBS

MBS SQL Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number with the given string value.
Notes: If string is empty, we return a number with zero as value.

186.32.10 NumericWithUInt64(value as UInt64) as SQLNumericMBS

MBS SQL Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number with the given unsigned integer value.

186.32.11 Properties

186.32.12 CurrencyValue as Currency

MBS SQL Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The currency value.
Example:

```
// test code for currency
Var c1 as Currency = 12345678.
Var c2 as Currency = 1234567.8
Var c3 as Currency = 123456.78
Var c4 as Currency = 12345.678
Var c5 as Currency = 1234.5678
Var c6 as Currency = 123.45678

Var n1 as SQLNumericMBS = SQLNumericMBS.NumericWithCurrency(c1)
Var n2 as SQLNumericMBS = SQLNumericMBS.NumericWithCurrency(c2)
Var n3 as SQLNumericMBS = SQLNumericMBS.NumericWithCurrency(c3)
Var n4 as SQLNumericMBS = SQLNumericMBS.NumericWithCurrency(c4)
Var n5 as SQLNumericMBS = SQLNumericMBS.NumericWithCurrency(c5)
Var n6 as SQLNumericMBS = SQLNumericMBS.NumericWithCurrency(c6)

Var s1 as string = n1.StringValue
Var s2 as string = n2.StringValue
Var s3 as string = n3.StringValue
Var s4 as string = n4.StringValue
Var s5 as string = n5.StringValue
```

```
Var s6 as string = n6.StringValue

Var d1 as Double = n1.DoubleValue
Var d2 as Double = n2.DoubleValue
Var d3 as Double = n3.DoubleValue
Var d4 as Double = n4.DoubleValue
Var d5 as Double = n5.DoubleValue
Var d6 as Double = n6.DoubleValue

Var x1 as Currency = n1.CurrencyValue
Var x2 as Currency = n2.CurrencyValue
Var x3 as Currency = n3.CurrencyValue
Var x4 as Currency = n4.CurrencyValue
Var x5 as Currency = n5.CurrencyValue
Var x6 as Currency = n6.CurrencyValue

// check for errors
if x1<>c1 then break
if x2<>c2 then break
if x3<>c3 then break
if x4<>c4 then break
if x5<>c5 then break
if x6<>c6 then break

if x1*10000 <>round(d1 * 10000) then Break
if x2*10000 <>round(d2 * 10000) then Break
if x3*10000 <>round(d3 * 10000) then Break
if x4*10000 <>round(d4 * 10000) then Break
if x5*10000 <>round(d5 * 10000) then Break
if x6*10000 <>round(d6 * 10000) then Break

Break // if no break before, it's okay.
```

Notes: (Read and Write property)

186.32.13 DoubleValue as Double

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The double value for this number.
Notes: (Read and Write property)

186.32.14 Int64Value as Int64

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number value as an int64.
Notes: (Read and Write property)

186.32.15 precision as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum number of digits in base 10.
Notes: (Read only property)

186.32.16 scale as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of digits to the right of the decimal point.
Notes: (Read only property)

186.32.17 sign as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sign: 1 for positive numbers, 0 for negative numbers.
Notes: (Read only property)

186.32.18 StringValue as string

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The string value of this number.
Notes: (Read and Write property)

186.32.19 UInt64Value as UInt64

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number value as an uint64.
Notes: (Read and Write property)

186.33 class SQLParamMBS

186.33.1 class SQLParamMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The SQL class for parameters.
Example:

```
// insert a record with bound parameters using the SQL plugin
// con is a connected SQLConnectionMBS, see there
Var con As SQLConnectionMBS // your connection
If con = Nil Then Return

Var cmd As New SQLCommandMBS(con, "INSERT INTO customers (name, city) VALUES (:1, :2)")
cmd.Param(1).setAsString("Miller")
cmd.Param(2).setAsString("Berlin")
cmd.Execute

For i As Integer = 1 To cmd.ParamCount
Var p As SQLParamMBS = cmd.Param(i)
System.DebugLog "Parameter " + p.Name + ", type " + p.Type.ToString + ", input: " + p.IsInput.ToString
Next
```

Notes: see also
https://www.sqlapi.com/ApiDoc/class_s_a_param.html
Subclass of the SQLValueMBS class.

186.33.2 Methods

186.33.3 ReadLongOrLob(toConsumer as SQLDataConsumerMBS, BlockSize as Integer)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Long or Lob data reading mode.
Notes: SQLAPI++ Library provides two ways to read Long or BLob(CLob) object's value (usually SQLField or SQLParam objects):

1. reading of Long or Lob data at once into an internal buffer (like ordinary string or binary values);
2. piecewise reading of Long or Lob data using user defined callback.

kLongOrLobReaderDefault reading mode used by default.

If you want to control piecewise reading of Long or BLob(CLob) data you should set LongOrLobReaderMode and use kLongOrLobReaderManual reading mode for Long or BLob(CLob) parameters or fields you want to process with your data consumer. After that each fetch will skip reading Long and BLob(CLob) parameters that you set to be read manually. To read field or parameter defined to be read manually you should call ReadLongOrLob method for each of them after the fetch. ReadLongOrLob method will repeatedly call the data consumer Write event.
See also:

- 186.33.4 ReadLongOrLob(toFile as FolderItem) 22741
- 186.33.5 ReadLongOrLob(toStream as Writeable) 22741

186.33.4 ReadLongOrLob(toFile as FolderItem)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Starts reading of Long or BLob(CLob) value to the given file.
Example:

```
Var cmd as SQLCommandMBS // your command
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var Param as SQLParamMBS = cmd.Param("image")
// read blob content to binarystream
Param.ReadLongOrLob(f)
```

Notes: May raise IOExceptions if things go wrong.
See also:

- 186.33.3 ReadLongOrLob(toConsumer as SQLDataConsumerMBS, BlockSize as Integer) 22740
- 186.33.5 ReadLongOrLob(toStream as Writeable) 22741

186.33.5 ReadLongOrLob(toStream as Writeable)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Starts reading of Long or BLob(CLob) value to the given writeable stream.
Example:

```
Var cmd as SQLCommandMBS // your command
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var b as BinaryStream = BinaryStream.Create(f, true)
Var param as SQLParamMBS = cmd.param("image")
// read blob content to binarystream
param.ReadLongOrLob(b)
```

Notes: This allows you to read in chunks the data to a stream, e.g. binarystream, textoutputstream or socket.
See also:

- 186.33.3 ReadLongOrLob(toConsumer as SQLDataConsumerMBS, BlockSize as Integer) 22740
- 186.33.4 ReadLongOrLob(toFile as FolderItem) 22741

186.33.6 Properties

186.33.7 DirType as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The direction type of parameter (input, output, etc.).
Notes: Use the kParamDirType* constants.

Usually the Library automatically detects parameter's direction type and implicitly creates an appropriate SAParam object. But not all of DBMS clients/servers provide complete parameters information. In that situation programmer need to describe parameter's direction type explicitly. See Server specific notes for details.

https://www.sqlapi.com/ApiDoc/class_s_a_param.html
(Read and Write property)

186.33.8 IsInput as Boolean

MBS SQL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this is an input paramater.
Notes: Checks ParamType property internally.
(Read only property)

186.33.9 IsOutput as Boolean

MBS SQL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this is an output paramater.
Notes: Checks ParamType property internally.
(Read only property)

186.33.10 Name as string

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the parameter.
Notes: (Read only property)

186.33.11 NativeType as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The native type code of the parameter.
Notes: (Read and Write property)

186.33.12 Options as Dictionary

MBS SQL Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a dictionary with all options.
Notes: For debugging, it may be useful to inspect options in debugger.
(Read only property)

186.33.13 Precision as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The precision of the parameter value (the total number of allowable digits).
Notes: (Read and Write property)

186.33.14 Scale as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The scale of the parameter value (the number of digits to the right of the decimal point).
Notes: (Read and Write property)

186.33.15 Size as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parameter's data size.
Notes: (Read and Write property)

186.33.16 Type as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parameter's data type.
Notes: See the kDataType constants.
(Read and Write property)

186.33.17 Option(name as string) as string

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The string value of a specific parameter option.
Notes: see also:
https://www.sqlapi.com/ApiDoc/class_s_a_param.html
(Read and Write computed property)

186.33.18 Constants

Constants

Constant	Value	Description
kParamDirTypeInput	0	One of the parameter direction type constants. Input parameter.
kParamDirTypeInputOutput	1	One of the parameter direction type constants. Input/output parameter.
kParamDirTypeOutput	2	One of the parameter direction type constants. Output parameter.
kParamDirTypeReturn	3	One of the parameter direction type constants. Returning parameter.

186.34 class SQLPositionMBS

186.34.1 class SQLPositionMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a position value.

186.34.2 Methods

186.34.3 Constructor(withID as Integer)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new Position value with an ID.
See also:

- 186.34.4 Constructor(withName as string) 22745

186.34.4 Constructor(withName as string)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new Position value with a name.
See also:

- 186.34.3 Constructor(withID as Integer) 22745

186.35 class SQLPreparedStatementMBS

186.35.1 class SQLPreparedStatementMBS

MBS SQL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for prepared statements if you work with SQLDatabaseMBS class.
Example:

```
// insert and query rows with prepared statements using the built-in SQLite library
Call InternalSQLiteLibraryMBS.Use

Var db As New SQLDatabaseMBS
db.RaiseExceptions = True // report errors as DatabaseException
db.DatabaseName = "sqlite:" + SpecialFolder.Temporary.Child("test.db").NativePath

Try
If Not db.Connect Then Return

db.ExecuteSQL "CREATE TABLE IF NOT EXISTS people(id INTEGER, name TEXT)"

// insert a row with parameters
Var insert As SQLPreparedStatementMBS = db.Prepare("INSERT INTO people(id, name) VALUES(:id,
:name)")
insert.Bind("id", 1)
insert.Bind("name", "Christian")
insert.ExecuteSQL

// query with a parameter
Var query As SQLPreparedStatementMBS = db.Prepare("SELECT name FROM people WHERE id = :id")
query.Bind("id", 1)

Var rows As RowSet = query.SelectSQL
If rows <>Nil And Not rows.AfterLastRow Then
MessageBox rows.Column("name").StringValue
End If

Catch e As DatabaseException
MessageBox "Database error: " + e.Message
End Try
```

Notes: If you work with SQLCommandMBS class, you can set parameters there directly.

For the SQL string you number parameters with colon and number. Like this: :1, :2, :3.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Interfaces: PreparedSQLStatement

186.35.2 Methods

186.35.3 Bind(name As String, value as Variant)

MBS SQL Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Defines the value for one parameter.
Example:

```
Var db as SQLDatabaseMBS // your db connection
Var sql as string = "Insert into test_tbl(fid, fvarchar20) values(:fid, :fvarchar20)"
Var v as Variant = db.Prepare(sql)
Var p as SQLPreparedStatementMBS = v

p.BindType("fid", SQLPreparedStatementMBS.kTypeLong)
```

```
p.BindType("fvarchar20", SQLPreparedStatementMBS.kTypeString)
p.Bind("fid", 2345)
p.Bind("fvarchar20", "Hello World by name")

p.SQLExecute
```

Notes: Version 16.4 and newer allow you to bind BLOB fields using a Memoryblock or a String value. Older versions only accepted string.

When passing variant for value, MemoryBlock and Strings without text encoding are converted to byte values (BLOB). Texts and Strings with encoding are converted to text values. Other types are translated as good as possible. Raises exceptions if you pass anything which is not recognized.

With version 19.0 or later, you can pass folderitem to stream blob from file. This may raise exception if file can't be opened.

- 186.35.8 Bind(zeroBasedIndex as Integer, value as Variant, type as Integer) 22751

186.35.4 Bind(name As String, value as Variant, type as Integer)

MBS SQL Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Defines one paramater with value and type.
Example:

```
Var db as SQLDatabaseMBS // your db connection
Var sql as string = "Insert into test_tbl(fid, fvarchar20) values(:fid, :fvarchar20)"
Var v as Variant = db.Prepare(sql)
Var p as SQLPreparedStatementMBS = v

p.Bind("fid", 2345, SQLPreparedStatementMBS.kTypeLong)
p.Bind("fvarchar20", "Hello World by name", SQLPreparedStatementMBS.kTypeString)

p.SQLExecute
```

Notes: Version 16.4 and newer allow you to bind BLOB fields using a Memoryblock or a String value. Older versions only accepted string.

When passing variant for value, MemoryBlock and Strings without text encoding are converted to byte values (BLOB). Texts and Strings with encoding are converted to text values. Other types are translated as good as possible. Raises exceptions if you pass anything which is not recognized.

With version 19.0 or later, you can pass folderitem to stream blob from file. This may raise exception if file can't be opened.

With plugin version 16.4 and newer binding type is optional. In that case the type is determinated from the value type.

- 186.35.5 Bind(Values as Dictionary) 22749
- 186.35.6 Bind(values() as Variant) 22750
- 186.35.7 Bind(zeroBasedIndex as Integer, value as Variant) 22751
- 186.35.8 Bind(zeroBasedIndex as Integer, value as Variant, type as Integer) 22751

186.35.5 Bind(Values as Dictionary)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the parameters based on the keys and values in the dictionary.
Example:

```
Var db as SQLDatabaseMBS // your database
Var pic as Picture // some picture
Var jpegData as MemoryBlock = pic.GetData(Picture.FormatJPEG, 80)

// get an insert command
Var sql as string = "Insert into BlobTest(name, image) values (:name, :image)"
Var p as SQLPreparedStatementMBS = db.Prepare(sql)

// put parameter values in a dictionary
Var d as new Dictionary

// by param index
d.Value(0) = "logo.jpg"
// by param name
d.Value("image") = jpegData

// bind values and run it
p.Bind(d)
p.SQLExecute
```

Notes: The dictionary is saved to fill parameters later.
Keys can be String, Text or numeric types. Text and String are used to pick parameters by name. Numeric values are used to pick parameter by index (zero based).
MemoryBlock and Strings without text encoding are converted to byte values (BLOB).
Texts and Strings with encoding are converted to text values.
Raises exceptions if you pass anything which is not recognized.
Other types are translated as good as possible.
See also:

- 186.35.4 Bind(name As String, value as Variant, type as Integer) 22748
- 186.35.6 Bind(values() as Variant) 22750
- 186.35.7 Bind(zeroBasedIndex as Integer, value as Variant) 22751
- 186.35.8 Bind(zeroBasedIndex as Integer, value as Variant, type as Integer) 22751

186.35.6 Bind(values() as Variant)

MBS SQL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the value list with the given values.
Notes: You can either pass values to the SQLExecute/SQLSelect method or call Bind methods to set values. You have to define for each parameter both the type and the value.

Version 16.4 and newer allow you to bind BLOB fields using a Memoryblock or a String value.
Older versions only accepted string.

When passing variant for value, MemoryBlock and Strings without text encoding are converted to byte values (BLOB). Texts and Strings with encoding are converted to text values. Other types are translated as good as possible. Raises exceptions if you pass anything which is not recognized.

With version 19.0 or later, you can pass folderitem to stream blob from file. This may raise exception if file can't be opened.

- 186.35.5 Bind(Values as Dictionary) 22749
- 186.35.7 Bind(zeroBasedIndex as Integer, value as Variant) 22751
- 186.35.8 Bind(zeroBasedIndex as Integer, value as Variant, type as Integer) 22751

186.35.7 Bind(zeroBasedIndex as Integer, value as Variant)

MBS SQL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Defines the value for one parameter.
Notes: You can either pass values to the SQLExecute/SQLSelect method or call Bind methods to set values. You have to define for each parameter both the type and the value.

Version 16.4 and newer allow you to bind BLOB fields using a Memoryblock or a String value.
Older versions only accepted string.

When passing variant for value, MemoryBlock and Strings without text encoding are converted to byte values (BLOB). Texts and Strings with encoding are converted to text values. Other types are translated as good as possible. Raises exceptions if you pass anything which is not recognized.

With version 19.0 or later, you can pass folderitem to stream blob from file. This may raise exception if file can't be opened.

Raises OutOfBoundsException exception if index parameter is out of range.
See also:

- 186.35.3 Bind(name As String, value as Variant) 22747
- 186.35.4 Bind(name As String, value as Variant, type as Integer) 22748

- 186.35.6 Bind(values() as Variant) 22750
- 186.35.8 Bind(zeroBasedIndex as Integer, value as Variant, type as Integer) 22751

186.35.8 Bind(zeroBasedIndex as Integer, value as Variant, type as Integer)

MBS SQL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Defines one paramater with value and type.
Notes: You can either pass values to the SQLExecute/SQLSelect method or call Bind methods to set values. You have to define for each parameter both the type and the value.

Version 16.4 and newer allow you to bind BLOB fields using a Memoryblock or a String value.
Older versions only accepted string.

When passing variant for value, MemoryBlock and Strings without text encoding are converted to byte values (BLOB). Texts and Strings with encoding are converted to text values. Other types are translated as good as possible. Raises exceptions if you pass anything which is not recognized.

With plugin version 16.4 and newer binding type is optional. In that case the type is determinated from the value type.

With version 19.0 or later, you can pass folderitem to stream blob from file. This may raise exception if file can't be opened.

Raises OutOfBoundsException exception if index parameter is out of range.
See also:

- 186.35.3 Bind(name As String, value as Variant) 22747

- 186.35.6 Bind(values() as Variant) 22750
- 186.35.7 Bind(zeroBasedIndex as Integer, value as Variant) 22751

186.35.9 BindType(name As String, type as Integer)

MBS SQL Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Defines the type of one value.
Example:

```
Var db as SQLDatabaseMBS // your db connection
Var sql as string = "Insert into test_tbl(fid, fvarchar20) values(:fid, :fvarchar20)"
Var v as Variant = db.Prepare(sql)
Var p as SQLPreparedStatementMBS = v

p.BindType("fid", SQLPreparedStatementMBS.kTypeLong)
p.BindType("fvarchar20", SQLPreparedStatementMBS.kTypeString)
p.Bind("fid", 2345)
p.Bind("fvarchar20", "Hello World by name")

p.SQLExecute
```

Notes: With plugin version 16.4 and newer binding type is optional. In that case the type is determinated from the value type.
See also:

- 186.35.10 BindType(types() as Integer) 22753
- 186.35.11 BindType(zeroBasedIndex as Integer, type as Integer) 22753

186.35.10 BindType(types() as Integer)

MBS SQL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Defines the types for all values.
Notes: You can either pass values to the SQLExecute/SQLSelect method or call Bind methods to set values. You have to define for each parameter both the type and the value.

With plugin version 16.4 and newer binding type is optional. In that case the type is determinated from the value type.
See also:

- 186.35.9 BindType(name As String, type as Integer) 22752
- 186.35.11 BindType(zeroBasedIndex as Integer, type as Integer) 22753

186.35.11 BindType(zeroBasedIndex as Integer, type as Integer)

MBS SQL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Defines the type of one value.
Notes: You can either pass values to the SQLExecute/SQLSelect method or call Bind methods to set values. You have to define for each parameter both the type and the value.

With plugin version 16.4 and newer binding type is optional. In that case the type is determinated from the value type.
See also:

- 186.35.9 BindType(name As String, type as Integer) 22752
- 186.35.10 BindType(types() as Integer) 22753

186.35.12 Clear

MBS SQL Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears all parameters for reusing the SQL Prepared statement.

186.35.13 Constructor

MBS SQL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.
Notes: This constructor makes sure you don't create useless SQLPreparedStatementMBS objects by error.

The only way to create an object is to use the prepare method in the database class.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

186.35.14 ExecuteSQL(ParamArray bindItems As Variant)

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the SQL command with the given parameters.
Notes: You can decide whether you pass values here or call Bind methods.

When passing variant for value, MemoryBlock and Strings without text encoding are converted to byte values (BLOB). Texts and Strings with encoding are converted to text values. Other types are translated as good as possible. Raises exceptions if you pass anything which is not recognized.

With version 19.0 or later, you can pass folderitem to stream blob from file. This may raise exception if file can't be opened.

If bindItems is not nil, we bind parameters using it.
If you like to pass an array of variant for the values, please pass this to Bind() and no parameters here. Otherwise passing an array here would create a variant array with your array as content.

This version of the function raises always exceptions, while SQLExecute only if you set RaiseException property to true.

186.35.15 ExecuteSQLMT(ParamArray bindItems As Variant)

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the SQL command with the given parameters.
Notes: You can decide whether you pass values here or call Bind methods.

When passing variant for value, MemoryBlock and Strings without text encoding are converted to byte values (BLOB). Texts and Strings with encoding are converted to text values. Other types are translated as good as possible. Raises exceptions if you pass anything which is not recognized.

If bindItems is not nil, we bind parameters using it.

With version 19.0 or later, you can pass folderitem to stream blob from file. This may raise exception if file can't be opened.

This version of the function raises always exceptions, while SQLExecuteMT only if you set RaiseException property to true.

If you like to pass an array of variant for the values, please pass this to Bind() and no parameters here. Otherwise passing an array here would create a variant array with your array as content.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

186.35.16 SelectSQL(ParamArray bindItems As Variant) As RowSet

MBS SQL Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the query with the given parameters.
Notes: Returns the RowSet object or nil on error.
You can decide whether you pass values here or call Bind methods.

For this method to work, you need to have somewhere a property with SQLDatabaseMBS so Xojo includes our SQLDatabase plugin which provides the RecordSet functionality.

The record set may not have a valid RecordCount or have working movefirst/movelast/moveprev methods unless the underlaying database supports those and Scrollable result sets is enabled/supported.

If bindItems is not nil, we bind parameters using it.
If you like to pass an array of variant for the values, please pass this to Bind() and no parameters here. Otherwise passing an array here would create a variant array with your array as content.

When passing variant for value, MemoryBlock and Strings without text encoding are converted to byte values (BLOB). Texts and Strings with encoding are converted to text values. Other types are translated as good as possible. Raises exceptions if you pass anything which is not recognized.

This version of the function raises always exceptions, while SQLSelect only if you set RaiseException property to true.

186.35.17 SelectSQLMT(ParamArray bindItems As Variant) As Rowset

MBS SQL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the RowSet object or nil on error.
Notes: You can decide whether you pass values here or call Bind methods.

For this method to work, you need to have somewhere a property with SQLDatabaseMBS so Xojo includes our SQLDatabase plugin which provides the RecordSet functionality.

The record set may not have a valid RecordCount or have working movefirst/movelast/moveprev methods unless the underlaying database supports those and Scrollable result sets is enabled/supported.

If bindItems is not nil, we bind parameters using it.
If you like to pass an array of variant for the values, please pass this to Bind() and no parameters here. Otherwise passing an array here would create a variant array with your array as content.

When passing variant for value, MemoryBlock and Strings without text encoding are converted to byte values (BLOB). Texts and Strings with encoding are converted to text values. Other types are translated as good as possible. Raises exceptions if you pass anything which is not recognized.

This version of the function raises always exceptions, while SQLSelectMT only if you set RaiseException property to true.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

186.35.18 SQLExecute(ParamArray bindItems as Variant)

MBS SQL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the SQL command with the given parameters.
Notes: You can decide whether you pass values here or call Bind methods.

When passing variant for value, MemoryBlock and Strings without text encoding are converted to byte values (BLOB). Texts and Strings with encoding are converted to text values. Other types are translated as good as possible. Raises exceptions if you pass anything which is not recognized.

If you like to pass an array of variant for the values, please pass this to Bind() and no parameters here. Otherwise passing an array here would create a variant array with your array as content.

With version 19.0 or later, you can pass folderitem to stream blob from file. This may raise exception if file can't be opened.

186.35.19 SQLExecuteMT(ParamArray bindItems as Variant)

MBS SQL Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the SQL command with the given parameters.
Notes: You can decide whether you pass values here or call Bind methods.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

When passing variant for value, MemoryBlock and Strings without text encoding are converted to byte values (BLOB). Texts and Strings with encoding are converted to text values. Other types are translated as good as possible. Raises exceptions if you pass anything which is not recognized.

If you like to pass an array of variant for the values, please pass this to Bind() and no parameters here. Otherwise passing an array here would create a variant array with your array as content.

With version 19.0 or later, you can pass folderitem to stream blob from file. This may raise exception if file can't be opened.

186.35.20 SQLSelect(ParamArray bindItems as Variant) As RecordSet

MBS SQL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the query with the given parameters.
Notes: Returns the recordset object or nil on error.
You can decide whether you pass values here or call Bind methods.

For this method to work, you need to have somewhere a property with SQLDatabaseMBS so Xojo includes our SQLDatabase plugin which provides the RecordSet functionality.

The record set may not have a valid RecordCount or have working movefirst/movelast/moveprev methods unless the underlaying database supports those and Scrollable result sets is enabled/supported.

If you like to pass an array of variant for the values, please pass this to Bind() and no parameters here. Otherwise passing an array here would create a variant array with your array as content.

When passing variant for value, MemoryBlock and Strings without text encoding are converted to byte values (BLOB). Texts and Strings with encoding are converted to text values. Other types are translated as good as possible. Raises exceptions if you pass anything which is not recognized.

With version 19.0 or later, you can pass folderitem to stream blob from file. This may raise exception if file can't be opened.

186.35.21 SQLSelectMT(ParamArray bindItems as Variant) As RecordSet

MBS SQL Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the query with the given parameters.
Notes: Returns the recordset object or nil on error.
You can decide whether you pass values here or call Bind methods.

For this method to work, you need to have somewhere a property with SQLDatabaseMBS so Xojo includes our SQLDatabase plugin which provides the RecordSet functionality.

The record set may not have a valid RecordCount or have working movefirst/movelast/moveprev methods unless the underlaying database supports those and Scrollable result sets is enabled/supported.

If you like to pass an array of variant for the values, please pass this to Bind() and no parameters here. Otherwise passing an array here would create a variant array with your array as content.

When passing variant for value, MemoryBlock and Strings without text encoding are converted to byte values (BLOB). Texts and Strings with encoding are converted to text values. Other types are translated as good as possible. Raises exceptions if you pass anything which is not recognized.

With version 19.0 or later, you can pass folderitem to stream blob from file. This may raise exception if file can't be opened.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

186.35.22 Properties

186.35.23 BoundTypes as Dictionary

MBS SQL Plugin, Plugin Version: 19.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The binded types to inspect in debugger.
Notes: When queried, the plugin creates a copy of the dictionary for you to inspect in debugger.
Changes to the dictionary do not bind types.

Renamed to BoundTypes in version 19.4. Was BindedTypes, but that was not proper english.
(Read only property)

186.35.24 BoundValues as Dictionary

MBS SQL Plugin, Plugin Version: 19.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The binded values to inspect in debugger.
Notes: When queried, the plugin creates a copy of the dictionary for you to inspect in debugger. Changes to the dictionary do not bind values.

Renamed to BoundValues in version 19.4. Was BindedValues, but that was not proper english.
(Read only property)

186.35.25 Scrollable as Boolean

MBS SQL Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the plugin will ask for a scrollable recordset when doing SQLSelect.
Notes: Since plugin version 15.0, Scrollable is false by default.
(Read and Write property)

186.35.26 SQL as String

MBS SQL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The SQL command for this prepared statement.
Notes: (Read and Write property)

186.35.27 Constants

Data Type Constants

Constant	Value	Description
kTypeBlob	16	Binary large Object. Pass a string or memoryblock.
kTypeBool	1	Boolean
kTypeBytes	13	a binary string or MemoryBlock. (which is a string without text encoding) This is usually a varbinary field. kTypeLongBinary is used for bigger binary data and streamed. And kTypeBlob is used for huge streams of bytes and also transferred in chunks. In most data base systems the varchar field is stored within the record, while BLOB and CLOB are stored separately.
kTypeClob	17	Character Large Object.
kTypeDateTime	10	Date and/or Time.
kTypeDouble	8	double float value.
kTypeInt32	4	signed 32 bit integer
kTypeInt64	6	Signed 64-bit integer.
kTypeInterval	11	An interval. Please pass SQLIntervalMBS in the variant. If the variant contains anything else, the plugin will pass nil value. When passing variant for value, MemoryBlock and Strings without text encoding are converted to byte values (BLOB). Texts and Strings with encoding are converted to text values. Other types are translated as good as possible. Raises exceptions if you pass anything which is not recognized.
kTypeLong	4	signed 32 bit integer
kTypeLongBinary	14	Long binary.
kTypeLongChar	15	Long string.
kTypeNull	99	NULL value
kTypeNumeric	9	A number (Int64 or double). This can be used for Int64 or Double values. Depending of the type of number in the variant, the plugin will either make an Int64 or a double internally. When passing variant for value, MemoryBlock and Strings without text encoding are converted to byte values (BLOB). Texts and Strings with encoding are converted to text values. Other types are translated as good as possible. Raises exceptions if you pass anything which is not recognized.
kTypeShort	2	signed 16 bit integer
kTypeString	12	String. This is usually a varchar field. kTypeLongChar is used for bigger varchars and streamed. And kTypeClob is used for huge streams of characters (BLOB for text) and also transferred in chunks. In most data base systems the varchar field is stored within the record, while BLOB and CLOB are stored separately.
kTypeUInt32	5	unsigned 32 bit integer
kTypeUInt64	7	Unsigned 64-bit integer.
kTypeULong	5	unsigned 32 bit integer
kTypeUnknown	0	unknown type
kTypeUShort	3	unsigned 16 bit integer

186.36 class SQLStringMBS

186.36.1 class SQLStringMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for strings in this plugin.
Example:

```
Var s as new SQLStringMBS("Hello √§√√º")

MessageBox "Characters: "+str(s.GetLength)+" Bytes: "+str(s.GetBinaryLength)

Var a as string= s.CopyBinaryData
Var b as string= s.CopyText

MessageBox a // RB shows garbage as it tries to display bytes as UTF8 which does not work
MessageBox b // displays correct
```

Notes: A string can be text (with text encoding) or bytes (raw binary data).

186.36.2 Methods

186.36.3 Compare(text as SQLStringMBS) as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares this string object with another string.
Notes: Function performs a case-sensitive comparison of the strings, and is not affected by locale.

Returns zero if the strings are identical, <0 if this string object is less than text, or >0 if this string object is greater than text.
See also:

- 186.36.4 Compare(text as string) as Integer 22762

186.36.4 Compare(text as string) as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares this string object with another string.
Notes: Function performs a case-sensitive comparison of the strings, and is not affected by locale.

Returns zero if the strings are identical, <0 if this string object is less than text, or >0 if this string object is greater than text.
See also:

- 186.36.3 Compare(text as SQLStringMBS) as Integer 22761

186.36.5 CompareNoCase(text as SQLStringMBS) as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares this string object with another string.
Notes: Function performs a case-insensitive comparison of the strings, and is not affected by locale.

Returns zero if the strings are identical (ignoring case), <0 if this string object is less than text (ignoring case), or >0 if this string object is greater than text (ignoring case).
See also:

- 186.36.6 CompareNoCase(text as string) as Integer 22762

186.36.6 CompareNoCase(text as string) as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares this string object with another string.
Notes: Function performs a case-insensitive comparison of the strings, and is not affected by locale.

Returns zero if the strings are identical (ignoring case), <0 if this string object is less than text (ignoring case), or >0 if this string object is greater than text (ignoring case).
See also:

- 186.36.5 CompareNoCase(text as SQLStringMBS) as Integer 22762

186.36.7 Constructor

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new empty string object.
See also:

- 186.36.8 Constructor(Data as MemoryBlock) 22763
- 186.36.9 Constructor(Data as string, isText as Boolean = True) 22763
- 186.36.10 Constructor(other as SQLStringMBS) 22763

186.36.8 Constructor(Data as MemoryBlock)

MBS SQL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new string object with data, e.g. for blob.
See also:

- 186.36.7 Constructor 22763
- 186.36.9 Constructor(Data as string, isText as Boolean = True) 22763
- 186.36.10 Constructor(other as SQLStringMBS) 22763

186.36.9 Constructor(Data as string, isText as Boolean = True)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new string object with data or text copied from the data string.
Notes: If isText is true, the data is interpreted as text and string encoding conversion may modify it. If isText is false the bytes are copied raw.
See also:

- 186.36.7 Constructor 22763
- 186.36.8 Constructor(Data as MemoryBlock) 22763
- 186.36.10 Constructor(other as SQLStringMBS) 22763

186.36.10 Constructor(other as SQLStringMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new string object with data copied from the other string object.
See also:

- 186.36.7 Constructor 22763
- 186.36.8 Constructor(Data as MemoryBlock) 22763
- 186.36.9 Constructor(Data as string, isText as Boolean = True) 22763

186.36.11 CopyBinaryData as string

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the bytes from the internal buffer ignoring any text encoding.

186.36.12 CopyMemoryBlock as MemoryBlock

MBS SQL Plugin, Plugin Version: 24.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the content of the string/BLOB as MemoryBlock.

186.36.13 CopyText as string

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the characters of this string as text.
Notes: Text encoding conversion may happen.

186.36.14 Empty

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Forces a string to have 0 length.

186.36.15 GetBinaryLength as UInt32

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use BinaryLength instead.
Function: Returns a count of the bytes in the binary data buffer.
Notes: Deprecated. Please use BinaryLength property.

186.36.16 GetLength as UInt32

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use Length instead. **Function:** Returns the number of characters in a SAString object.
Notes: Deprecated. Please use Length property.
For multibyte character sets, GetLength counts each 8-bit character; that is, a lead and trail byte in one multibyte character are counted as two bytes.

186.36.17 Left(count as Integer) as SQLStringMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts the left part of a string.

186.36.18 MakeLower

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes all characters in the string to lower case.

186.36.19 MakeUpper

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes all characters in the string to upper case.

186.36.20 Mid(first as Integer) as SQLStringMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts the middle part of a string.
Notes: first: The zero-based index of the first character in this string object that is to be included in the extracted substring.
See also:

- 186.36.21 Mid(first as Integer, Count as Integer) as SQLStringMBS 22766

186.36.21 Mid(first as Integer, Count as Integer) as SQLStringMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts the middle part of a string.
Notes: first: The zero-based index of the first character in this string object that is to be included in the extracted substring.
count: The number of characters to extract from this string object. If this parameter is not supplied, then the remainder of the string is extracted.
See also:

- 186.36.20 Mid(first as Integer) as SQLStringMBS 22765

186.36.22 Operator_Convert as string

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert operation for assignment to string.
See also:

- 186.36.23 Operator_Convert(text as string) 22766

186.36.23 Operator_Convert(text as string)

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert operation for assigning text string.
See also:

- 186.36.22 Operator_Convert as string 22766

186.36.24 Right(count as Integer) as SQLStringMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts the right part of a string.

186.36.25 TrimLeft

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Trim leading whitespace characters from the string.

186.36.26 TrimRight

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Trim trailing whitespace characters from the string.

186.36.27 Properties

186.36.28 BinaryLength as UInt32

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a count of the bytes in the binary data buffer.
Notes: (Read only property)

186.36.29 DebugText as String

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Text content for debugging.
Notes: We show up to 1000 characters here for debugger.
(Read only property)

186.36.30 IsEmpty as boolean

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tests whether a String object contains no characters.
Notes: Returns true if length is zero.
(Read only property)

186.36.31 Length as UInt32

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of characters in a SAString object.
Notes: For multibyte character sets, GetLength counts each 8-bit character; that is, a lead and trail byte in one multibyte character are counted as two bytes.
(Read only property)

186.37 class SQLUnsupportedExceptionMBS

186.37.1 class SQLUnsupportedExceptionMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an exception to report that the function is not supported on this platform.
Notes: This one raises only if the plugin is compiled for Mac OS Classic.
Subclass of the RuntimeException class.

186.38 class SQLValueMBS

186.38.1 class SQLValueMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The SQL class for mutable values.
Example:

```
// insert a row with parameters of different types
// con is a connected SQLConnectionMBS
Var con As New SQLConnectionMBS
con.Connect(SpecialFolder.Desktop.Child("test.db").NativePath, "", "", SQLConnectionMBS.kSQLiteClient)

Var cmd As New SQLCommandMBS(con, "INSERT INTO orders (customer, amount, note) VALUES (:customer, :amount, :note)")
cmd.Param("customer").setAsString "John Smith"
cmd.Param("amount").setAsDouble 49.95
cmd.Param("note").setAsNull // no note
cmd.Execute
```

Notes: Subclass of the SQLValueReadMBS class.

186.38.2 Methods

186.38.3 Constructor(DataType as Integer)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new empty value object with the given data type.

186.38.4 setAsBlob(data as MemoryBlock)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as BLob data using a memoryblock.
See also:

- 186.38.5 setAsBlob(data as SQLDataProviderMBS, BlockSize as UInt32) 22770
- 186.38.6 setAsBlob(data as SQLStringMBS) 22771
- 186.38.7 setAsBlob(data as string) 22771
- 186.38.8 setAsBlob(file as folderItem) 22771
- 186.38.9 setAsBlob(stream as Readable) 22772

186.38.5 setAsBlob(data as SQLDataProviderMBS, BlockSize as UInt32)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as BLob data (SQLString)
Notes: When you call the SQLCommandMBS.Execute method all input parameters are bound with their values, including Long and BLob(CLob) parameters.
That is the time when the data provider Read event runs to get the values in the block size you specify.

The default value for the block size is 0. If you use the default value, SQLAPI++ Library will automatically use the most appropriate size for current DBMS.
See also:

- 186.38.4 setAsBlob(data as MemoryBlock) 22770
- 186.38.6 setAsBlob(data as SQLStringMBS) 22771
- 186.38.7 setAsBlob(data as string) 22771
- 186.38.8 setAsBlob(file as folderItem) 22771
- 186.38.9 setAsBlob(stream as Readable) 22772

186.38.6 setAsBlob(data as SQLStringMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as BLob data (SQLString)
See also:

- 186.38.4 setAsBlob(data as MemoryBlock) 22770
- 186.38.5 setAsBlob(data as SQLDataProviderMBS, BlockSize as UInt32) 22770
- 186.38.7 setAsBlob(data as string) 22771
- 186.38.8 setAsBlob(file as folderItem) 22771
- 186.38.9 setAsBlob(stream as Readable) 22772

186.38.7 setAsBlob(data as string)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as BLob data (SQLString)
Example:

```
Var c as SQLCommandMBS // your command object
Var JPEGData as string // some data

c.Param("imageData").setAsBlob JPEGData
```

See also:

- 186.38.4 setAsBlob(data as MemoryBlock) 22770
- 186.38.5 setAsBlob(data as SQLDataProviderMBS, BlockSize as UInt32) 22770
- 186.38.6 setAsBlob(data as SQLStringMBS) 22771
- 186.38.8 setAsBlob(file as folderItem) 22771
- 186.38.9 setAsBlob(stream as Readable) 22772

186.38.8 setAsBlob(file as folderItem)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets field with content of file.
Example:

```
Var cmd as SQLCommandMBS // your command object
```

```
// pass folderitem to BLOB field
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
cmd.Param("image").setAsBlob(f)
```

Notes: The file will be read later when statement is executed.
May not work when using preemptive threads.
See also:

- 186.38.4 setAsBlob(data as MemoryBlock) 22770
- 186.38.5 setAsBlob(data as SQLDataProviderMBS, BlockSize as UInt32) 22770
- 186.38.6 setAsBlob(data as SQLStringMBS) 22771
- 186.38.7 setAsBlob(data as string) 22771
- 186.38.9 setAsBlob(stream as Readable) 22772

186.38.9 setAsBlob(stream as Readable)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets field with content of stream.
Example:

```
Var cmd as SQLCommandMBS // your command object

// pass BinaryStream to BLOB field
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var b as BinaryStream = BinaryStream.open(f)
cmd.Param("image").setAsBlob(b)
```

Notes: The stream will be read later when statement is executed.
May not work when using preemptive threads.
See also:

- 186.38.4 setAsBlob(data as MemoryBlock) 22770
- 186.38.5 setAsBlob(data as SQLDataProviderMBS, BlockSize as UInt32) 22770
- 186.38.6 setAsBlob(data as SQLStringMBS) 22771
- 186.38.7 setAsBlob(data as string) 22771
- 186.38.8 setAsBlob(file as folderItem) 22771

186.38.10 setAsBool(value as boolean)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as bool data.

186.38.11 setAsBytes(data as MemoryBlock)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as binary data from memoryblock.
See also:

- 186.38.12 setAsBytes(data as string) 22773
- 186.38.13 setAsBytes(value as SQLBytesMBS) 22773
- 186.38.14 setAsBytes(value as SQLStringMBS) 22774

186.38.12 setAsBytes(data as string)

MBS SQL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the value to be bytes with content of given string.
Notes: For BLOB fields or parameters.
Same as the other variant, but avoids creating extra SQLStringMBS object.
See also:

- 186.38.11 setAsBytes(data as MemoryBlock) 22773
- 186.38.13 setAsBytes(value as SQLBytesMBS) 22773
- 186.38.14 setAsBytes(value as SQLStringMBS) 22774

186.38.13 setAsBytes(value as SQLBytesMBS)

MBS SQL Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the value to be bytes with content of given Bytes object.
Notes: For BLOB fields or parameters.
Same as the other variant, but avoids creating extra SQLStringMBS object.
See also:

- 186.38.11 setAsBytes(data as MemoryBlock) 22773
- 186.38.12 setAsBytes(data as string) 22773
- 186.38.14 setAsBytes(value as SQLStringMBS) 22774

186.38.14 setAsBytes(value as SQLStringMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as binary string data (SQLString).
See also:

- 186.38.11 setAsBytes(data as MemoryBlock) 22773
- 186.38.12 setAsBytes(data as string) 22773
- 186.38.13 setAsBytes(value as SQLBytesMBS) 22773

186.38.15 setAsClob(data as MemoryBlock)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Private method.
Notes: This method should make sure you don't accidentally a memoryblock instead of a text.
See also:

- 186.38.16 setAsClob(data as SQLDataProviderMBS, BlockSize as UInt32) 22774
- 186.38.17 setAsClob(file as folderItem) 22775
- 186.38.18 setAsClob(stream as Readable) 22775
- 186.38.19 setAsClob(text as SQLStringMBS) 22775
- 186.38.20 setAsClob(text as string) 22776

186.38.16 setAsClob(data as SQLDataProviderMBS, BlockSize as UInt32)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as CLob data (SQLString)
Notes: nWhen you call the SQLCommandMBS.Execute method all input parameters are bound with their values, including Long and BLob(CLob) parameters.
That is the time when the data provider Read event runs to get the values in the block size you specify.

The default value for the block size is 0. If you use the default value, SQLAPI++ Library will automatically use the most appropriate size for current DBMS.
See also:

- 186.38.15 setAsClob(data as MemoryBlock) 22774
- 186.38.17 setAsClob(file as folderItem) 22775
- 186.38.18 setAsClob(stream as Readable) 22775

- 186.38.19 setAsClob(text as SQLStringMBS) 22775
- 186.38.20 setAsClob(text as string) 22776

186.38.17 setAsClob(file as folderItem)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets field with content of file.
Notes: The file will be read later when statement is executed.
May not work when using preemptive threads.
See also:

- 186.38.15 setAsClob(data as MemoryBlock) 22774
- 186.38.16 setAsClob(data as SQLDataProviderMBS, BlockSize as UInt32) 22774
- 186.38.18 setAsClob(stream as Readable) 22775
- 186.38.19 setAsClob(text as SQLStringMBS) 22775
- 186.38.20 setAsClob(text as string) 22776

186.38.18 setAsClob(stream as Readable)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets field with content of stream.
Notes: The stream will be read later when statement is executed.
May not work when using preemptive threads.
See also:

- 186.38.15 setAsClob(data as MemoryBlock) 22774
- 186.38.16 setAsClob(data as SQLDataProviderMBS, BlockSize as UInt32) 22774
- 186.38.17 setAsClob(file as folderItem) 22775
- 186.38.19 setAsClob(text as SQLStringMBS) 22775
- 186.38.20 setAsClob(text as string) 22776

186.38.19 setAsClob(text as SQLStringMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as CLob data (SQLString)
See also:

- 186.38.15 setAsClob(data as MemoryBlock) 22774
- 186.38.16 setAsClob(data as SQLDataProviderMBS, BlockSize as UInt32) 22774
- 186.38.17 setAsClob(file as folderItem) 22775
- 186.38.18 setAsClob(stream as Readable) 22775
- 186.38.20 setAsClob(text as string) 22776

186.38.20 setAsClob(text as string)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as CLob data (SQLString)
See also:

- 186.38.15 setAsClob(data as MemoryBlock) 22774
- 186.38.16 setAsClob(data as SQLDataProviderMBS, BlockSize as UInt32) 22774
- 186.38.17 setAsClob(file as folderItem) 22775
- 186.38.18 setAsClob(stream as Readable) 22775
- 186.38.19 setAsClob(text as SQLStringMBS) 22775

186.38.21 setAsDate(value as date)

MBS SQL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets parameter's value with a date.
Example:

```
Var cmd as SQLCommandMBS // your command object
Var d as new date(2012,12,24,16,0,0) // some date
cmd.Param(3).setAsDate(d) // set third parameter
```

Notes: Same as setAsDateTime, but here we take a date object to make it more convenient.

186.38.22 setAsDateTime(value as dateTime)

MBS SQL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value with a dateTime.
Notes: Same as setAsDate, but here we take a dateTime object to make it more convenient.
See also:

• 186.38.23 setAsDateTime(value as SQLDateTimeMBS) 22777

186.38.23 setAsDateTime(value as SQLDateTimeMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as SQLDateTime data.
See also:

• 186.38.22 setAsDateTime(value as dateTime) 22776

186.38.24 setAsDefault

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Forces to use the default parameter's value.
Notes: Forces DBMS API to use the default parameter value as the input value for an input or input/output parameter in a procedure.

If DBMS API does not support the concept of "default parameter values" in stored procedures, this setting will be ignored.

If you set this flag for the parameter that doesn't have a default value, the effect is DBMS defined (e.g. an error can be returned or NULL can be bound).

To cancel using the default parameter value you should call any other SQLValue::setAs... method to bind a parameter value.

To check whether this flag is set or not use isDefault method.

186.38.25 setAsDouble(value as Double)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as Double data.

186.38.26 setAsInt32(value as Int32)

MBS SQL Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as Int32 data.

186.38.27 setAsInt64(value as Int64)

MBS SQL Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as Int64 data.

186.38.28 setAsInteger(value as Integer)

MBS SQL Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as Integer data.
Notes: Int32 or Int64 depending whether app is 32 or 64 bit.

186.38.29 setAsInterval(value as SQLIntervalMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an interval value.

186.38.30 setAsLong(value as Int32)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as Int32 data.

186.38.31 setAsLongBinary(data as MemoryBlock)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as long binary data from memoryblock.
See also:

- 186.38.32 setAsLongBinary(data as SQLDataProviderMBS, BlockSize as UInt32) 22779
- 186.38.33 setAsLongBinary(data as SQLStringMBS) 22779
- 186.38.34 setAsLongBinary(data as string) 22779
- 186.38.35 setAsLongBinary(file as folderItem) 22780

- 186.38.36 setAsLongBinary(stream as Readable) 22780

186.38.32 setAsLongBinary(data as SQLDataProviderMBS, BlockSize as UInt32)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as long binary data (SQLString)
Notes: When you call the SQLCommandMBS.Execute method all input parameters are bound with their values, including Long and BLob(CLob) parameters.
That is the time when the data provider Read event runs to get the values in the block size you specify.

The default value for the block size is 0. If you use the default value, SQLAPI++ Library will automatically use the most appropriate size for current DBMS.

- 186.38.36 setAsLongBinary(stream as Readable) 22780

186.38.33 setAsLongBinary(data as SQLStringMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as long binary data (SQLString)
See also:

- 186.38.31 setAsLongBinary(data as MemoryBlock) 22778
- 186.38.32 setAsLongBinary(data as SQLDataProviderMBS, BlockSize as UInt32) 22779

- 186.38.35 setAsLongBinary(file as folderItem) 22780
- 186.38.36 setAsLongBinary(stream as Readable) 22780

186.38.34 setAsLongBinary(data as string)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as long binary data (SQLString)
See also:

- 186.38.31 setAsLongBinary(data as MemoryBlock) 22778
- 186.38.32 setAsLongBinary(data as SQLDataProviderMBS, BlockSize as UInt32) 22779
- 186.38.33 setAsLongBinary(data as SQLStringMBS) 22779
- 186.38.35 setAsLongBinary(file as folderItem) 22780
- 186.38.36 setAsLongBinary(stream as Readable) 22780

186.38.35 setAsLongBinary(file as folderItem)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets field with content of file.
Notes: The file will be read later when statement is executed.
May not work when using preemptive threads.
See also:

- 186.38.31 setAsLongBinary(data as MemoryBlock) 22778
- 186.38.32 setAsLongBinary(data as SQLDataProviderMBS, BlockSize as UInt32) 22779
- 186.38.33 setAsLongBinary(data as SQLStringMBS) 22779
- 186.38.34 setAsLongBinary(data as string) 22779
- 186.38.36 setAsLongBinary(stream as Readable) 22780

186.38.36 setAsLongBinary(stream as Readable)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets field with content of stream.
Notes: The stream will be read later when statement is executed.
May not work when using preemptive threads.
See also:

- 186.38.35 setAsLongBinary(file as folderItem) 22780

186.38.37 setAsLongChar(data as MemoryBlock)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Private method.
Notes: This method should make sure you don't accidentally a memoryblock instead of a text.
See also:

- 186.38.38 setAsLongChar(data as SQLDataProviderMBS, BlockSize as UInt32) 22781
- 186.38.39 setAsLongChar(file as folderItem) 22781
- 186.38.40 setAsLongChar(stream as Readable) 22782
- 186.38.41 setAsLongChar(text as SQLStringMBS) 22782
- 186.38.42 setAsLongChar(text as string) 22783

186.38.38 setAsLongChar(data as SQLDataProviderMBS, BlockSize as UInt32)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as long character data (SQLString)
Notes: When you call the SQLCommandMBS.Execute method all input parameters are bound with their values, including Long and BLob(CLob) parameters.
That is the time when the data provider Read event runs to get the values in the block size you specify.

The default value for the block size is 0. If you use the default value, SQLAPI++ Library will automatically use the most appropriate size for current DBMS.

- 186.38.39 setAsLongChar(file as folderItem) 22781
- 186.38.40 setAsLongChar(stream as Readable) 22782
- 186.38.41 setAsLongChar(text as SQLStringMBS) 22782
- 186.38.42 setAsLongChar(text as string) 22783

186.38.39 setAsLongChar(file as folderItem)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets field with content of file.
Notes: The file will be read later when statement is executed.
May not work when using preemptive threads.
See also:

- 186.38.37 setAsLongChar(data as MemoryBlock) 22781
- 186.38.38 setAsLongChar(data as SQLDataProviderMBS, BlockSize as UInt32) 22781
- 186.38.40 setAsLongChar(stream as Readable) 22782
- 186.38.41 setAsLongChar(text as SQLStringMBS) 22782
- 186.38.42 setAsLongChar(text as string) 22783

186.38.40 setAsLongChar(stream as Readable)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets field with content of stream.
Notes: The stream will be read later when statement is executed.
May not work when using preemptive threads.
See also:

- 186.38.37 setAsLongChar(data as MemoryBlock) 22781
- 186.38.38 setAsLongChar(data as SQLDataProviderMBS, BlockSize as UInt32) 22781
- 186.38.39 setAsLongChar(file as folderItem) 22781
- 186.38.41 setAsLongChar(text as SQLStringMBS) 22782
- 186.38.42 setAsLongChar(text as string) 22783

186.38.41 setAsLongChar(text as SQLStringMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as long character data (SQLString)
See also:

- 186.38.37 setAsLongChar(data as MemoryBlock) 22781
- 186.38.38 setAsLongChar(data as SQLDataProviderMBS, BlockSize as UInt32) 22781
- 186.38.39 setAsLongChar(file as folderItem) 22781
- 186.38.40 setAsLongChar(stream as Readable) 22782
- 186.38.42 setAsLongChar(text as string) 22783

186.38.42 setAsLongChar(text as string)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as long character data (SQLString)
See also:

- 186.38.37 setAsLongChar(data as MemoryBlock) 22781
- 186.38.38 setAsLongChar(data as SQLDataProviderMBS, BlockSize as UInt32) 22781
- 186.38.39 setAsLongChar(file as folderItem) 22781
- 186.38.40 setAsLongChar(stream as Readable) 22782
- 186.38.41 setAsLongChar(text as SQLStringMBS) 22782

186.38.43 setAsNull

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets value to null.

186.38.44 setAsNumeric(value as SQLNumericMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as SQLNumeric data.

186.38.45 setAsShort(value as Int16)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as short data.

186.38.46 setAsString(data as MemoryBlock)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Private method.
Notes: This method should make sure you don't accidentally a memoryblock instead of a text.
See also:

- 186.38.47 setAsString(value as SQLStringMBS) 22784

- 186.38.48 setAsString(value as string) 22784

186.38.47 setAsString(value as SQLStringMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as character string data (SQLString)
See also:

- 186.38.46 setAsString(data as MemoryBlock) 22783
- 186.38.48 setAsString(value as string) 22784

186.38.48 setAsString(value as string)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as character string data.
Notes: Same as setAsString, but for your convenience with a Xojo string instead of a SQLStringMBS object.
See also:

- 186.38.46 setAsString(data as MemoryBlock) 22783
- 186.38.47 setAsString(value as SQLStringMBS) 22784

186.38.49 setAsUInt32(value as UInt32)

MBS SQL Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as UInt32 data.

186.38.50 setAsULong(value as UInt32)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as unsigned long data.

186.38.51 setAsUnknown

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's type as unknown.

186.38.52 setAsUShort(value as UInt16)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value as unsigned short data.
Notes: Sets value as unsigned short data.

186.38.53 setAsValueRead(value as SQLValueReadMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameter's value from SQLParam or SQLField objects.
Notes: This method allows using SQLField or SQLParam object received from one SQL statement as a parameter for another SQL statement.

186.38.54 setVariant(value as Variant)

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the value based on a variant.
Example:

```
Var con as SQLConnectionMBS // your connection
Var pic as picture // some picture

// get picture data
Var jpegData as MemoryBlock = pic.GetData(Picture.FormatJPEG, 80)

// get a command for an Insert command
Var sql as string = "Insert into BlobTest(name, image) values (:name, :image)"
Var cmd as new SQLCommandMBS(con, sql)

// set values by variant
cmd.Param("name").setVariant "logo.jpg"
cmd.Param("image").setVariant jpegData

// do the insert
cmd.Execute
```

Notes: MemoryBlock and Strings without text encoding are converted to byte values (BLOB).
Texts and Strings with encoding are converted to text values.
Raises exceptions if you pass anything which is not recognized.
Other types are translated as good as possible.

With version 19.0 or later, you can pass folderitem to stream blob from file. This may raise exception if file can't be opened.

186.38.55 Properties

186.38.56 isDefault as boolean

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the plugin has been forced to use parameter's default value by calling setAsDefault method; false otherwise.
Notes: (Read only property)

186.39 class SQLValueReadMBS

186.39.1 class SQLValueReadMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class used in the SQL Plugin for value objects which can be read.
Example:

```
// read values of different types from a query
Var con As New SQLConnectionMBS
con.Connect(SpecialFolder.Desktop.Child("test.db").NativePath, "", "", SQLConnectionMBS.kSQLiteClient)

Var cmd As New SQLCommandMBS(con, "SELECT customer, amount, note FROM orders")
cmd.Execute

Var lines() As String
While cmd.FetchNext
Var line As String = cmd.Field("customer").asStringValue + ": " + Format(cmd.Field("amount").asDouble,
"0.00")
If Not cmd.Field("note").isNull Then line = line + " (" + cmd.Field("note").asStringValue + ")"
lines.Add line
Wend
MessageBox String.FromArray(lines, EndOfLine)
```

186.39.2 Methods

186.39.3 asBLob as SQLStringMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as BLob (SQLString) data.
Notes: If the value of current object is NULL, asBLob method returns an empty string. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is string (kDataTypeString), bytes (kDataTypeBytes), long binary (kDataTypeLongBinary), long character (kDataTypeLongChar), BLob (kDataTypeBLob) or CLob (kDataTypeCLob), asBLob method returns the object's value as SQLString object.

If the value's type of current object is bool (kDataTypeBool), short (kDataTypeShort), long (kDataTypeLong), double (kDataTypeDouble), numeric (kDataTypeNumeric), date-time (kDataTypeDateTime) or cursor (kDataTypeCursor), the result is undefined and debug version asserts.

Use DataType method to get the value's type of SQLValueRead object.

186.39.4 asBLobMemory as MemoryBlock

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as BLob data in a memoryblock.

186.39.5 asBLobString as String

MBS SQL Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as BLob data in a string.

186.39.6 asBytes as SQLStringMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as binary string data (SQLString).
Notes: If the value of current object is NULL, asBytes method returns an empty string. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is string (kDataTypeString), bytes (kDataTypeBytes), long binary (kDataTypeLongBinary), long character (kDataTypeLongChar), BLob (kDataTypeBLob) or CLob (kDataTypeCLob), asBytes method returns the object's value as SQLString object.

If the value's type of current object is bool (kDataTypeBool), short (kDataTypeShort), long (kDataTypeLong), double (kDataTypeDouble), numeric (kDataTypeNumeric) or date-time (kDataTypeDateTime), asBytes method returns a block of data with size sizeof(value's type) as SQLString object.

If the value's type of current object is cursor (kDataTypeCursor), the result is undefined and debug version asserts.

Use DataType method to get the value's type of SQLValueRead object.

186.39.7 asCLob as SQLStringMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as CLob (SQLString) data.
Notes: If the value of current object is NULL, asCLob method returns an empty string. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is string (kDataTypeString), bytes (kDataTypeBytes), long binary (kDataTypeLongBinary), long character (kDataTypeLongChar), BLob (kDataTypeBLob) or CLob (kDataTypeCLob), asCLob method returns the object's value as SQLString object.

If the value's type of current object is bool (kDataTypeBool), short (kDataTypeShort), long (kDataTypeLong), double (kDataTypeDouble), numeric(kDataTypeNumeric), date-time (kDataTypeDateTime) or cursor (kDataTypeCursor), the result is undefined and debug version asserts.

Use DataType method to get the value's type of SQLValueRead object.

186.39.8 asDate as Date

MBS SQL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the value as date.
Example:

```
Var cmd as SQLCommandMBS // your command object
Var d as date = cmd.Field("mydate").asDate // read date value
```

Notes: If the value of current object is NULL, asDate method returns an empty date object. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is kDataTypeDateTime, asDate method returns date object.

If the value's type of current object is any data type except kDataTypeDateTime, the result is undefined and debug version asserts.

Use DataType method to get the value's type of SQLValueRead object.

186.39.9 asDateTime as SQLDateTimeMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as SQLDateTimeMBS object.
Notes: If the value of current object is NULL, asDateTime method returns an empty SQLDateTime object. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is kDataTypeDateTime, asDateTime method returns SQLDateTime object.

If the value's type of current object is any data type except kDataTypeDateTime, the result is undefined and debug version asserts.

Use DataType method to get the value's type of SQLValueRead object.

186.39.10 asDateTimeValue as DateTime

MBS SQL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as date.
Notes: If the value of current object is NULL, asDate method returns an empty date object. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is kDataTypeDateTime, asDate method returns date object.

If the value's type of current object is any data type except kDataTypeDateTime, the result is undefined and debug version asserts.

Use DataType method to get the value's type of SQLValueRead object.

186.39.11 asInterval as SQLIntervalMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as interval (SQLIntervalMBS).

186.39.12 asLongBinary as SQLStringMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as long binary (SQLString) data.
Notes: If the value of current object is NULL, asLongBinary method returns an empty string. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is string (kDataTypeString), bytes (kDataTypeBytes), long binary (kDataTypeLongBinary), long character (kDataTypeLongChar), BLob (kDataTypeBLob) or CLob (kDataTypeCLob), asLongBinary method returns the object's value as SQLString object.

If the value's type of current object is bool (kDataTypeBool), short (kDataTypeShort), long (kDataTypeLong), double (kDataTypeDouble), numeric (kDataTypeNumeric), date-time (kDataTypeDateTime) or cursor (kDataTypeCursor), the result is undefined and debug version asserts.

Use DataType method to get the value's type of SQLValueRead object.

186.39.13 asLongChar as SQLStringMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as long character (SQLString) data.
Notes: If the value of current object is NULL, asLongChar method returns an empty string. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is string (kDataTypeString), bytes (kDataTypeBytes), long binary (kDataTypeLongBinary), long character (kDataTypeLongChar), BLob (kDataTypeBLob) or CLob (kDataTypeCLob), asLongChar method returns the object's value as SQLString object.

If the value's type of current object is bool (kDataTypeBool), short (kDataTypeShort), long (kDataTypeLong), double (kDataTypeDouble), numeric (kDataTypeNumeric), date-time (kDataTypeDateTime) or cursor (kDataTypeCursor), the result is undefined and debug version asserts.

Use DataType method to get the value's type of SQLValueRead object.

186.39.14 asNumeric as SQLNumericMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as SQLNumeric data.
Notes: If the value of current object is NULL, asNumeric method returns 0. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is exact numeric value (kDataTypeNumeric), asNumeric method returns the original value with no conversion.

If the value's type of current object is bool (kDataTypeBool), short (kDataTypeShort), double (kDataTypeDouble) or long (kDataTypeLong), asNumeric method converts it to SQLNumeric .

If the value's type of current object is string (kDataTypeString), asNumeric method tries to convert it from SQLChar* value. If the conversion is possible and correct, asNumeric converts to SQLNumeric from SQLChar* value. If conversion is incorrect asNumeric method throws an exception.

If the value's type of current object is any data type except the described above, the result is undefined and debug version asserts.

Use DataType method to get the value's type of SQLValueRead object.

186.39.15 asString as SQLStringMBS

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: returns the value as string (SQLString) data.
Notes: If the value of current object is NULL, asString method returns an empty string. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is bool (kDataTypeBool), asString method returns "true" or "false" string (SQLString object).

If the value's type of current object is short (kDataTypeShort), asString method converts it to decimal string (SQLString object) like function printf("%hd", ...) does.

If the value's type of current object is long (kDataTypeLong), asString method converts it to decimal string (SQLString object) like function printf("%ld", ...) does.

If the value's type of current object is double (kDataTypeDouble), asString method converts it to decimal string (SQLString object) like function printf("%g", ...) does.

If the value's type of current object is numeric (kDataTypeNumeric), asString method converts it to decimal string (SQLString object) without precision loss.

If the value's type of current object is date-time (kDataTypeDateTime), asString method converts it to string (SQLString object) like function asctime(...) does.

If the value's type of current object is string (kDataTypeString, kDataTypeLongChar, kDataTypeCLob), asString method returns the original object's value as SQLString object.

If the value's type of current object is binary (kDataTypeBytes, kDataTypeLongBinary, kDataTypeBLob), asString method converts it to hexadecimal string (SQLString object).

If the value's type of current object is cursor (kDataTypeCursor), the result is undefined and debug version asserts.

Use DataType method to get the value's type of SQLValueRead object.
For numbers, this may give english decimal separator. For getting localized one, please use AsDoubleValue and use cstr() function.

186.39.16 Constructor(DataType as Integer)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new empty value object for the given data type.
See also:

- 186.39.17 Constructor(value as SQLValueReadMBS) 22793

186.39.17 Constructor(value as SQLValueReadMBS)

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new value object by copying the given one.
See also:

- 186.39.16 Constructor(DataType as Integer) 22793

186.39.18 Properties

186.39.19 asBool as boolean

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of current object as bool data.
Notes: f the value of current object is NULL, asBool method returns false. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is bool (kDataTypeBool), asBool method returns the original value with no conversion.

If the value's type of current object is short (kDataTypeShort), long (kDataTypeLong) or double (kDataTypeDouble), asBool method converts it to bool data type. Conversion returns false if the value is 0; true otherwise.

If the value's type of current object is any data type except the described above, the result is undefined and debug version asserts.

Use DataType method to get the value's type of SQLValueRead object.
(Read only property)

186.39.20 asDouble as Double

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: returns the value as Double data.
Notes: If the value of current object is NULL, asDouble method returns 0. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is double (kDataTypeDouble), asDouble method returns the original value with no conversion.

If the value's type of current object is bool (kDataTypeBool), short (kDataTypeShort), long (kDataTypeLong) or numeric (kDataTypeNumeric), asDouble method converts it to double (kDataTypeDouble) data

type.

If the value's type of current object is string (kDataTypeString), asDouble method tries to convert it to double value. If the conversion is possible and correct, asDouble returns kDataTypeDouble value. If conversion is incorrect asDouble method throws an exception.

If the value's type of current object is kDataTypeDateTime, asDouble method converts it to standard double representation. Days are represented by whole number increments starting with 30 December 1899, midnight as time zero. Hour values are expressed as the absolute value of the fractional part of the number. See SQLDateTime::operator double() for more detailes.

If the value's type of current object is any data type except the described above, the result is undefined and debug version asserts.

Use DataType method to get the value's type of SQLValueRead object.
(Read only property)

186.39.21 asInt32 as Int32

MBS SQL Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as Int32 data.
Notes: (Read only property)

186.39.22 asInt64 as Int64

MBS SQL Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as Int64 data.
Notes: (Read only property)

186.39.23 asInteger as Integer

MBS SQL Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as Integer data.
Notes: Either Int32 or Int64 depending on whether the application is 32 or 64 bit.
(Read only property)

186.39.24 asLong as Int32

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as Int32 data.
Notes: If the value of current object is NULL, asLong method returns 0. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is long (kDataTypeLong), asLong method returns the original value with no conversion.

If the value's type of current object is bool (kDataTypeBool), short (kDataTypeShort), double (kDataTypeDouble) or numeric (kDataTypeNumeric), asLong method converts it to long data type. Note, that in this case the returned value can be truncated.

If the value's type of current object is string (kDataTypeString), asLong method tries to convert it to long (kDataTypeLong) value. If the conversion is possible and correct, asLong returns kDataTypeLong value. If conversion is incorrect asLong method throws an exception.

If the value's type of current object is any data type except the described above, the result is undefined and debug version asserts.

Use DataType method to get the value's type of SQLValueRead object.
(Read only property)

186.39.25 asShort as Int16

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as short.
Notes: If the value of current object is NULL, asShort method returns 0. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is short, asShort method returns the original value with no conversion.

If the value's type of current object is bool (kDataTypeBool), long (kDataTypeLong), unsigned long (SkDataTypeULong), double (kDataTypeDouble) or numeric (kDataTypeNumeric), asShort method converts it to short data type. Note, that in this case the returned value can be truncated.

If the value's type of current object is string (kDataTypeString), asShort method tries to convert it to short value. If the conversion is possible and correct, asShort returns the value. If conversion is incorrect asShort method throws an exception.

If the value's type of current object is any data type except the described above, the result is undefined and debug version asserts.

Use DataType method to get the value's type of SAValueRead object.
(Read only property)

186.39.26 asStringValue as String

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value string.
Notes: Same as asString but returns a Xojo string.
Please use SQLStringMBS and CopyBinaryData if the string you want to read is a BLOB value, else text encoding will change your data!
For numbers, this may give english decimal separator. For getting localized one, please use AsDoubleValue and use cstr() function.
(Read only property)

186.39.27 asUInt32 as UInt32

MBS SQL Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as UInt32 data.
Notes: (Read only property)

186.39.28 asULong as UInt32

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as an unsigned 32 bit integer value.
Notes: If the value of current object is NULL, asULong method returns 0. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is long (kDataTypeLong), asULong method returns the original value with no conversion.

If the value's type of current object is bool (kDataTypeBool), short (kDataTypeShort), double (kDataTypeDouble) or numeric (kDataTypeNumeric), asULong method converts it to long data type. Note, that in this case the returned value can be truncated.

If the value's type of current object is string (kDataTypeString), asULong method tries to convert it to long (kDataTypeLong) value. If the conversion is possible and correct, asULong returns kDataTypeLong value. If conversion is incorrect asULong method throws an exception.

If the value's type of current object is any data type except the described above, the result is undefined and debug version asserts.

Use DataType method to get the value's type of SQLValueRead object.
(Read only property)

186.39.29 asUShort as UInt16

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as unsigned short.
Notes: If the value of current object is NULL, asUShort method returns 0. Use isNull method to make sure if the value is NULL or not.

If the value's type of current object is unsigned short, asUShort method returns the original value with no conversion.

If the value's type of current object is bool (kDataTypeBool), long (kDataTypeLong), unsigned long (SkDataTypeULong), double (kDataTypeDouble) or numeric (kDataTypeNumeric), asUShort method converts it to unsigned short data type. Note, that in this case the returned value can be truncated.

If the value's type of current object is string (kDataTypeString), asUShort method tries to convert it to unsigned short value. If the conversion is possible and correct, asUShort returns the value. If conversion is incorrect asUShort method throws an exception.

If the value's type of current object is any data type except the described above, the result is undefined and debug version asserts.

Use DataType method to get the value's type of SAValueRead object.
(Read only property)

186.39.30 asVariant as Variant

MBS SQL Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value as a variant.

Notes: This is a convenience function.
May return nil, date, number or string.
BLOB strings without encoding and text strings as UTF-8.
(Read only property)

186.39.31 DataType as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns SAValueRead object's data type.
Notes: One of the kDataType constants.
(Read only property)

186.39.32 isNull as boolean

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the value of current object is NULL; otherwise false.
Notes: (Read only property)

186.39.33 LongOrLobReaderMode as Integer

MBS SQL Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Long or Lob data reading mode.
Notes: SQLAPI++ Library provides two ways to read Long or BLob(CLob) object's value (usually SQLField or SQLParam objects):

1. reading of Long or Lob data at once into an internal buffer (like ordinary string or binary values);
2. piecewise reading of Long or Lob data using user defined callback.

kLongOrLobReaderDefault reading mode used by default.

If you want to control piecewise reading of Long or BLob(CLob) data you should set LongOrLobReaderMode and use kLongOrLobReaderManual reading mode for Long or BLob(CLob) parameters or fields you want to process with your data consumer. After that each fetch will skip reading Long and BLob(CLob) parameters that you set to be read manually. To read field or parameter defined to be read manually you should call ReadLongOrLob method for each of them after the fetch. ReadLongOrLob method will repeatedly call the data consumer Write event.
(Read and Write property)

186.39.34 Constants

Constants

Constant	Value	Description
kDataTypeInt64	6	One of the field type constants Signed 64-bit integer.
kDataTypeUInt64	7	One of the field type constants Unsigned 64-bit integer.

Data Types

Constant	Value	Description
kDataTypeBlob	16	Data type is BLob data (SQLStringMBS).
kDataTypeBool	1	Data type is a boolean.
kDataTypeBytes	13	Data type is binary string (SQLStringMBS).
kDataTypeClob	17	Data type is CLob data (SQLStringMBS).
kDataTypeCursor	18	Data type is Oracle REF CURSOR (SQLCommand).
kDataTypeDateTime	10	Data type is SQLDateTime.
kDataTypeDouble	8	This is a normal double variable.
kDataTypeInterval	11	Data type is an interval (SQLIntervalMBS).
kDataTypeLong	4	A 32 bit integer.
kDataTypeLongBinary	14	Data type is long binary data (SQLStringMBS).
kDataTypeLongChar	15	Data type is long character data (SQLStringMBS).
kDataTypeNumeric	9	Data type is SQLNumeric (used internally).
kDataTypeShort	2	Data type is a 16 bit signed integer.
kDataTypeSpecificToDBMS	19	Data type is server-specific.
kDataTypeString	12	Data type is character string (SQLString).
kDataTypeULong	5	Data type is a 32 bit unsigned integer.
kDataTypeUnknown	0	Data type is unknown.
kDataTypeUShort	3	A 16 bit unsigned integer.

Read Modes

Constant	Value	Description
kLongOrLobReaderModeDefault	0	Long or Lob(CLob) data reading mode is default (automatic).
kLongOrLobReaderModeManual	1	Long or Lob(CLob) data reading mode is manual.

Chapter 187

Statusitem

187.1 class NSStatusBarButtonMBS

187.1.1 class NSStatusBarButtonMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: StatusBarButtons are the visual representation of NSStatusItems, and are primarily displayed on the right side of the menu bar.
Notes: When a template image is set as the \c image property of the status bar button, it is rendered with the correct menu bar style. This guarantees that the button will look correct in various button states and appearances (such as dark menu bar).

Available on Mac OS X 10.10 and newer.
Subclass of the NSButtonMBS class.

- MBS Xojo / Real Studio Plugins, version 15.0pr11

187.1.2 Methods

187.1.3 Available as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Whether this class is available.
Notes: Returns true on OS X 10.10.

187.1.4 Properties

187.1.5 appearsDisabled as Boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Whether icon appears disabled.
Notes: When true the status bar icon has a disabled/off appearance while still being functional, such as allowing selection and actions. Defaults to false.
(Read and Write property)

187.2 class NSStatusItemMBS

187.2.1 class NSStatusItemMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: A class to handle a NSStatusitem which is a tiny little item in the menu bar.
Example:

```
// show an icon in the menu bar and react to clicks
// MyStatusItem is a subclass of NSStatusItemMBS with the Action event implemented.
// StatusItem is a property of the app: StatusItem As MyStatusItem
StatusItem = New MyStatusItem
If StatusItem.CreateMenu Then
StatusItem.image = NSImageMBS.imageWithSystemSymbolName("bolt.fill", "MyApp")
End If

// in MyStatusItem:
Sub Action() Handles Action
System.DebugLog "Menu bar icon clicked."
End Sub
```

Notes: All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

187.2.2 Methods

187.2.3 Available as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Whether Statusitems are available.
Notes: True on MachO platforms.

187.2.4 Close

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

187.2.5 CreateMenu as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new menu.
Notes: Handle is not 0 after this call was successful.

If the NSGrayBackground option is set in the system defaults, Mac OS X 10.5 will raise an NSImageCache-Exception, so please install an exception handle to catch NSExceptionMBS so your application can handle that.
See also:

- 187.2.6 CreateMenu(length as single) as boolean 22804

187.2.6 CreateMenu(length as single) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Creates the StatusItem menu with the given width.
Example:

```
Var e as new NSStatusItemMBS
call e.CreateMenu(24) // best for a 16x16 picture
```

Notes: Constants:

NSVariableStatusItemLength	-1
NSSquareStatusItemLength	-2

Other values between 0 and 10000 are used for the length.
Bad values like 20000 will crash the application.

Handle is not 0 after this call was successful.

If the NSGrayBackground option is set in the system defaults, Mac OS X 10.5 will raise an NSImageCacheException, so please install an exception handle to catch NSExceptionMBS so your application can handle that.
See also:

- 187.2.5 CreateMenu as boolean 22804

187.2.7 CreateMenuMiddle(length as single) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use CreateMenu instead.
Function: Same as CreateMenu but tries to place Statusitem on the right side.
Notes: Uses private Apple API which may break on future Mac OS X versions. Returns false if Apple changes something in the future and the function we use will not be available. So if this function returns false, you can call CreateMenu to continue. Works on Mac OS X 10.4 to 10.6 and make the new statusitem being the rightmost one (left to Apples MenuItems).

Constants:

NSVariableStatusItemLength	-1
NSSquareStatusItemLength	-2

Other values between 0 and 10000 are used for the length.
Bad values like 20000 will crash the application.

Handle is not 0 after this call was successful.

If the NSGrayBackground option is set in the system defaults, Mac OS X 10.5 will raise an NSImageCacheException, so please install an exception handle to catch NSExceptionMBS so your application can handle that.

Deprecated.

187.2.8 CreateMenuRight(length as single) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use CreateMenu instead.
Function: Same as CreateMenu but tries to place Statusitem on the right side.
Notes: Uses private Apple API which may break on future Mac OS X versions. Returns false if Apple changes something in the future and the function we use will not be available. So if this function returns false, you can call CreateMenu to continue. Works on Mac OS X 10.4 to 10.6 and make the new statusitem being the rightmost one.

If you run this code after you used CreateMenuRight, the new menu will be right of all other statusitems:

```
Var sh as new Shell
sh.Execute "killall","SystemUIServer"
```

Constants:

NSVariableStatusItemLength	-1
NSSquareStatusItemLength	-2

Other values between 0 and 10000 are used for the length.
Bad values like 20000 will crash the application.

Handle is not 0 after this call was successful.

If the NSGrayBackground option is set in the system defaults, Mac OS X 10.5 will raise an NSImageCacheException, so please install an exception handle to catch NSExceptionMBS so your application can handle that.

Deprecated.

187.2.9 DrawStatusBarBackground(x as Double, y as Double, width as Double, height as Double, highlight as boolean)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Draws the menu background pattern for a custom status-bar item in regular or highlight pattern.

Notes: x, y, width and height: A rectangle defining the area of a custom status-bar item.
highlight: true to draw the background pattern in the standard highlight pattern, false to not highlight the pattern.

You can use this method to help a custom status-bar item emulate the behavior of a standard item.

Available in Mac OS X v10.3 and later.

187.2.10 MenuIsVertical as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns true if the statusitem has a vertical orientation.
Example:

MessageBox str(NSStatusItemMBS.MenuIsVertical)

187.2.11 MenuThickness as Double

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The thickness of the status bar.
Example:

MessageBox str(NSStatusItemMBS.MenuThickness)

Notes: The status bar returned by systemStatusBar has a thickness of 22 pixels, the thickness of the menu bar.

187.2.12 popUpStatusItemMenu(menu as NSMenuMBS)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Displays a menu under a custom status bar item.
Notes: You can use this method to cause a popup menu to appear under a custom status bar item when the user clicks the item. Note that view must exist (that is, it must not be nil).

187.2.13 SendActionOn(mode as Integer)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Sets the conditions on which action event is called.
Notes: mask is set with one or more of the following bit masks described in NSEvent Constants: NSLeftMouseUpMask, NSLeftMouseDownMask, NSLeftMouseDraggedMask, and NSPeriodicMask.

mode is set with one or more of the following bit masks:

```
const NSLeftMouseDownMask      = &h00002
const NSLeftMouseUpMask        = &H00004
const NSLeftMouseDraggedMask   = &h00040
const NSPeriodicMask           = &h10000
```

187.2.14 Properties

187.2.15 alternateImage as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: An alternate image to be displayed when a status bar item is highlighted.
Notes: (Read and Write property)

187.2.16 attributedTitle as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The attributed string that is displayed at the status item's position in the status bar.
Notes: If an image is also set, the title appears to the right of the image.
(Read and Write property)

187.2.17 Button as Variant

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The button that is displayed in the status bar.
Notes: Value is a NSStatusBarButtonMBS object. Returned as Variant to reduce plugin dependencies.

This is created automatically on the creation of the StatusItem. Behavior customization for the button, such as image, target/action, tooltip, can be set with this property.

Available on Mac OS X 10.10 and newer.
(Read only property)

187.2.18 Enabled as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Whether this status item is enabled.
Notes: (Read and Write property)

187.2.19 frame as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 24.4, Platform: macOS, Targets: Desktop only.

Function: Queries the frame rectangle of the window used by the status item.
Notes: (Read only property)

187.2.20 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The handle of the NSStatusItem object used internally.
Notes: (Read and Write property)

187.2.21 Height as single

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The height of the status item.
Notes: Should be 22 pixels.
This is a function using undocumented features from the Apple NSStatusItem class, so there is not guarantee that it will work in future versions.
(Read only property)

187.2.22 HighlightMode as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver is highlighted when clicked.
Notes: If you use HighlightMode and Menu, you need to first assign the menu and later set HighlightMode to true.

(Read and Write property)

187.2.23 image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The image that is displayed at the statusitem's position in the status bar.
Notes: nil if an image has not been set.
(Read and Write property)

187.2.24 Left as single

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The left position of the status item.
Notes: Valid only after item was drawn the first time.
This is a function using undocumented features from the Apple NSStatusItem class, so there is not guarantee that it will work in future versions.
(Read only property)

187.2.25 Length as single

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The length of the status item in pixels.
Notes: Constants for special values:

NSVariableStatusItemLength	-1
NSSquareStatusItemLength	-2

(Read and Write property)

187.2.26 Menu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The menu attached to this statusitem.
Notes: Nil if no menu is attached.
(Read and Write property)

187.2.27 Title as String

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The title of the status item.
Notes: (Read and Write property)

187.2.28 ToolTip as String

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The help tag for a menu item.
Notes: (Read and Write property)

187.2.29 Top as single

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The top position of the status item.
Notes: Always 0.
This is a function using undocumented features from the Apple NSStatusItem class, so there is not guarantee that it will work in future versions.
(Read only property)

187.2.30 View as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Sets the view to be used for this status menuitem.
Notes: Using a custom view you can draw whatever you like in the menu item.
You can set it to nil to remove the view.
(Read and Write property)

187.2.31 Width as single

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The width of the status item.
Notes: This is a function using undocumented features from the Apple NSStatusItem class, so there is not guarantee that it will work in future versions.
(Read only property)

187.2.32 Window as NSWindowMBS

MBS MacCocoa Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: The window used for this NSStatusItem.
Notes: This is a function using undocumented features from the Apple NSStatusItem class, so there is not guarantee that it will work in future versions.
Returns nil on 64 bit target.
(Read only property)

187.2.33 Events

187.2.34 Action

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The event called when the user clicks on the statusitem.
Notes: Mouse position can be calculated based on System.MouseX/System.MouseY relative to Left/Top. Mouse status can be read using System.MouseDown.

This event is limited. You can't for example do everything like quit an application. For using quit, start a timer which will remove the menu 500ms later and than quit 500ms later.

This event is coming from the Cocoa event system. What you can do is a bit limited when using GUI functions from Xojo. To avoid some redraw errors, you may want to start a timer and let your Xojo code run a millisecond after the menu code has finished.
Depending on what you do, you can see the menu not redrawing properly (staying highlighted) and crashes if the Xojo code modifies some global Cocoa states.

187.2.35 DidChangeOcclusionState

MBS MacCocoa Plugin, Plugin Version: 24.4, Platform: macOS, Targets: Desktop only.

Function: The event raised when the statusitem is shown/hidden due to limited space in menu bar.
Notes: Please check visible property.

187.2.36 DidMove

MBS MacCocoa Plugin, Plugin Version: 24.4, Platform: macOS, Targets: Desktop only.

Function: The event raised when the statusitem moves.
Notes: e.g. when user moves it.

187.2.37 DidResize

MBS MacCocoa Plugin, Plugin Version: 24.4, Platform: macOS, Targets: Desktop only.

Function: The event raised when the statusitem resizes.
Notes: e.g. when content changes.

187.2.38 DoubleAction

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The event called when the user double clicks on the statusitem.
Notes: If two Action Events happen very fast, this one is called the second time so you can e.g. react on double clicks.
Mouse position can be calculated based on System.MouseX/System.MouseY relative to Left/Top. Mouse status can be read using System.MouseDown.

This event is coming from the Cocoa event system. What you can do is a bit limited when using GUI functions from Xojo. To avoid some redraw errors, you may want to start a timer and let your Xojo code run a millisecond after the menu code has finished.
Depending on what you do, you can see the menu not redrawing properly (staying highlighted) and crashes if the Xojo code modifies some global Cocoa states.

187.2.39 Screenshots

187.2.40 NSStatusItem.jpg

Function: The NSStatusItem running a menu on the top right of the menu bar.

Chapter 188

StoreKit

188.1 class AppReceiptIAPMBS

188.1.1 class AppReceiptIAPMBS

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The class to represent an in-app purchase in the app receipt.
Example:

```
// open a receipt
Var f as FolderItem = SpecialFolder.Desktop.Child("receipt")
Var r as AppReceiptMBS = AppReceiptMBS.receiptForFile(f)

// show purchases
Var inAppPurchases() as AppReceiptIAPMBS = r.inAppPurchases
for each p as AppReceiptIAPMBS in inAppPurchases
MessageBox str(p.quantity)+"x "+p.productIdentifier+" "+p.purchaseDate.AbbreviatedDate
next
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Validating Receipts of Mac App Store Purchases including In-App Purchases

188.1.2 Methods

188.1.3 Constructor

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The private constructor.

188.1.4 isActiveAutoRenewableSubscriptionForDate(d as Date) as boolean

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether the auto renewable subscription is active for the given date.
Notes: date: The date in which the auto-renewable subscription should be active. If you are using the current date, you might not want to take it from the device in case the user has changed it.
Returns true if the auto-renewable subscription is active for the given date, false otherwise.

Auto-renewable subscription lapses are possible. If you are checking against the current date, you might want to deduct some time as tolerance.
If this method fails Apple recommends to refresh the receipt and try again once.
See also:

- 188.1.5 isActiveAutoRenewableSubscriptionForDate(d as DateTime) as boolean 22816

188.1.5 isActiveAutoRenewableSubscriptionForDate(d as DateTime) as boolean

MBS Encryption Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Returns whether the auto renewable subscription is active for the given date.
Notes: date: The date in which the auto-renewable subscription should be active. If you are using the current date, you might not want to take it from the device in case the user has changed it.
Returns true if the auto-renewable subscription is active for the given date, false otherwise.

Auto-renewable subscription lapses are possible. If you are checking against the current date, you might want to deduct some time as tolerance.
If this method fails Apple recommends to refresh the receipt and try again once.
See also:

- 188.1.4 isActiveAutoRenewableSubscriptionForDate(d as Date) as boolean 22816

188.1.6 Properties

188.1.7 cancellationDate as Date

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: For a transaction that was canceled by Apple customer support, the date of the cancellation.
Notes: (Read only property)

188.1.8 cancellationDateTime as DateTime

MBS Encryption Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: For a transaction that was canceled by Apple customer support, the date of the cancellation.
Notes: (Read only property)

188.1.9 originalPurchaseDate as Date

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: For a transaction that restores a previous transaction, the date of the original transaction.
Notes: This value corresponds to the original transaction's transactionDate property.
In an auto-renewable subscription receipt, this indicates the beginning of the subscription period, even if the subscription has been renewed.
(Read only property)

188.1.10 originalPurchaseDateTime as DateTime

MBS Encryption Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: For a transaction that restores a previous transaction, the date of the original transaction.
Notes: This value corresponds to the original transaction's transactionDate property.
In an auto-renewable subscription receipt, this indicates the beginning of the subscription period, even if the subscription has been renewed.
(Read only property)

188.1.11 originalTransactionIdentifier as String

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: For a transaction that restores a previous transaction, the transaction identifier of the original

transaction.
Notes: Otherwise, identical to the transaction identifier.
This value corresponds to the original transaction's transactionIdentifier property.
All receipts in a chain of renewals for an auto-renewable subscription have the same value for this field.
(Read only property)

188.1.12 productIdentifier as String

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The product identifier of the item that was purchased.
Example:

```
// open a receipt
Var f as FolderItem = SpecialFolder.Desktop.Child("receipt")
Var r as AppReceiptMBS = AppReceiptMBS.receiptForFile(f)

// show purchases
Var inAppPurchases() as AppReceiptIAPMBS = r.inAppPurchases
for each p as AppReceiptIAPMBS in inAppPurchases
MessageBox str(p.quantity)+"x "+p.productIdentifier+" "+p.purchaseDate.AbbreviatedDate
next
```

Notes: This value corresponds to the productIdentifier property of the SKPayment object stored in the transaction,Äôs payment property.
(Read only property)

188.1.13 purchaseDate as Date

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time that the item was purchased.
Notes: This value corresponds to the transaction,Äôs transactionDate property.

For a transaction that restores a previous transaction, the purchase date is the date of the restoration. Use originalPurchaseDate to get the date of the original transaction.

In an auto-renewable subscription receipt, this is always the date when the subscription was purchased or renewed, regardles of whether the transaction has been restored.
(Read only property)

188.1.14 purchaseDateTime as DateTime

MBS Encryption Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The date and time that the item was purchased.
Notes: (Read only property)

188.1.15 quantity as Integer

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The number of items purchased.
Example:

```
// open a receipt
Var f as FolderItem = SpecialFolder.Desktop.Child("receipt")
Var r as AppReceiptMBS = AppReceiptMBS.receiptForFile(f)

// show purchases
Var inAppPurchases() as AppReceiptIAPMBS = r.inAppPurchases
for each p as AppReceiptIAPMBS in inAppPurchases
MessageBox str(p.quantity)+"x "+p.productIdentifier+" "+p.purchaseDate.AbbreviatedDate
next
```

Notes: This value corresponds to the quantity property of the SKPayment object stored in the transaction,Äôs payment property.
(Read only property)

188.1.16 subscriptionExpirationDate as Date

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The expiration date for the subscription.
Notes: Only present for auto-renewable subscription receipts.
(Read only property)

188.1.17 subscriptionExpirationDateTime as DateTime

MBS Encryption Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The expiration date for the subscription.
Notes: Only present for auto-renewable subscription receipts.

(Read only property)

188.1.18 transactionIdentifier as String

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The transaction identifier of the item that was purchased.
Notes: This value corresponds to the transaction's transactionIdentifier property.
(Read only property)

188.1.19 webOrderLineItemID as Integer

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The primary key for identifying subscription purchases.
Notes: (Read only property)

188.2 class AppReceiptMBS

188.2.1 class AppReceiptMBS

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The class for an app receipt.
Example:

```
// open a receipt
Var f as FolderItem = SpecialFolder.Desktop.Child("receipt")
Var r as AppReceiptMBS = AppReceiptMBS.receiptForFile(f)

// show value
MessageBox r.bundleIdentifier
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Validating Receipts of Mac App Store Purchases including In-App Purchases

188.2.2 Methods

188.2.3 bundleReceipt as AppReceiptMBS

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Returns the app receipt contained in the bundle, if any and valid.
Notes: Extracts the receipt in ASN1 from the PKCS #7 container, and then parses the ASN1 data into a AppReceiptMBS instance. If an Apple Root certificate is available, it will also verify that the signature of the receipt is valid.
Returns the app receipt contained in the bundle, or nil if there is no receipt or if it is invalid.

188.2.4 Constructor

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The private constructor.

188.2.5 containsActiveAutoRenewableSubscriptionOfProductIdentifier(productIdentifier as string, d as date) as boolean

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether the receipt contains an active auto-renewable subscription for the given product identifier and for the given date.
Notes: productIdentifier: The identifier of the auto-renewable subscription.
date: The date in which the latest auto-renewable subscription should be active. If you are using the current date, you might not want to take it from the device in case the user has changed it.
Returns true if the latest auto-renewable subscription is active for the given date, false otherwise.

Auto-renewable subscription lapses are possible. If you are checking against the current date, you might want to deduct some time as tolerance.
If this method fails Apple recommends to refresh the receipt and try again once.
See also:

- 188.2.6 containsActiveAutoRenewableSubscriptionOfProductIdentifier(productIdentifier as string, d as dateTime) as boolean 22822

188.2.6 containsActiveAutoRenewableSubscriptionOfProductIdentifier(productIdentifier as string, d as dateTime) as boolean

MBS Encryption Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Returns whether the receipt contains an active auto-renewable subscription for the given product identifier and for the given date.
Notes: productIdentifier: The identifier of the auto-renewable subscription.
date: The date in which the latest auto-renewable subscription should be active. If you are using the current date, you might not want to take it from the device in case the user has changed it.
Returns true if the latest auto-renewable subscription is active for the given date, false otherwise.

Auto-renewable subscription lapses are possible. If you are checking against the current date, you might want to deduct some time as tolerance.
If this method fails Apple recommends to refresh the receipt and try again once.
See also:

- 188.2.5 containsActiveAutoRenewableSubscriptionOfProductIdentifier(productIdentifier as string, d as date) as boolean 22822

188.2.7 containsInAppPurchaseOfProductIdentifier(productIdentifier as string) as boolean

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Returns whether there is an in-app purchase in the receipt for the given product.
Notes: productIdentifier: The identifier of the product.
True if there is an in-app purchase for the given product, false otherwise.

188.2.8 inAppPurchases as AppReceiptIAPMBS()

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Array of in-app purchases contained in the receipt.

188.2.9 receiptForFile(file as folderitem) as AppReceiptMBS

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Returns the app receipt contained in the given file, if any and valid.
Example:

```
Var a as new AppReceiptVerificatorMBS
Var f as FolderItem = SpecialFolder.Desktop.Child("receipt")
Var r as AppReceiptMBS = AppReceiptMBS.receiptForFile(f)

// testing with receipt from current Dash app
a.bundleIdentifier = "com.kapeli.dash"
a.bundleVersion = "2.1.2"

if a.verifyReceipt(r) then
MessageBox "My receipt is valid"
else
MessageBox "My receipt is invalid."
end if
```

Notes: Extracts the receipt in ASN1 from the PKCS #7 container, and then parses the ASN1 data into a AppReceiptMBS instance. If an Apple Root certificate is available, it will also verify that the signature of the receipt is valid.
Returns the receipt contained in the given file, or nil if there is no receipt or if it is invalid.

188.2.10 setAppleRootCertificate(Data as Memoryblock)

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Sets the certificate data of the Apple Root certificate that will be used to verifiy the signature of the bundle receipt.
Notes: If none is provided, the resource AppleIncRootCertificate.cer will be used. If no certificate is

available, no signature verification will be performed.
data: The contents of the Apple Root certificate file to use.
See also:

- 188.2.11 setAppleRootCertificate(File as FolderItem) 22824

188.2.11 setAppleRootCertificate(File as FolderItem)

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Sets the file of the Apple Root certificate that will be used to verifiy the signature of the bundle receipt.
Notes: If none is provided, the resource AppleIncRootCertificate.cer will be used. If no certificate is available, no signature verification will be performed.
file: The folderitem of the Apple Root certificate.
See also:

- 188.2.10 setAppleRootCertificate(Data as Memoryblock) 22823

188.2.12 verifyReceiptHash as boolean

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Returns wheter the receipt hash corresponds to the device's GUID by calcuting the expected hash using the GUID, bundleIdentifierData and opaqueValue.
Notes: Returns true if the hash contained in the receipt corresponds to the device's GUID, false otherwise.

188.2.13 Properties

188.2.14 appVersion as String

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The app,Äôs version number.
Example:

```
// open a receipt
Var f as FolderItem = SpecialFolder.Desktop.Child("receipt")
Var r as AppReceiptMBS = AppReceiptMBS.receiptForFile(f)

// show value
MessageBox r.appVersion
```

Notes: This corresponds to the value of CFBundleVersion (in iOS) or CFBundleShortVersionString (in OS X) in the Info.plist.

(Read only property)

188.2.15 bundleIdentifier as String

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The bundle identifier.
Example:

```
// open a receipt
Var f as FolderItem = SpecialFolder.Desktop.Child("receipt")
Var r as AppReceiptMBS = AppReceiptMBS.receiptForFile(f)

// show value
MessageBox r.bundleIdentifier
```

Notes: This corresponds to the value of CFBundleIdentifier in the Info.plist file.
(Read only property)

188.2.16 bundleIdentifierData as Memoryblock

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The bundle identifier as data.
Notes: The bundle identifier as data, as contained in the receipt. Used to verifiy the receipt's hash.
(Read only property)

188.2.17 creationDate as Date

MBS Encryption Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The creation date of the receipt.
Notes: (Read only property)

188.2.18 creationDateTime as DateTime

MBS Encryption Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The creation date of the receipt.
Notes: (Read only property)

188.2.19 expirationDate as Date

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date that the app receipt expires.
Notes: Only for apps purchased through the Volume Purchase Program. If nil, the receipt does not expire. When validating a receipt, compare this date to the current date to determine whether the receipt is expired. Do not try to use this date to calculate any other information, such as the time remaining before expiration. (Read only property)

188.2.20 expirationDateTime as DateTime

MBS Encryption Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The date that the app receipt expires.
Notes: Only for apps purchased through the Volume Purchase Program. If nil, the receipt does not expire. When validating a receipt, compare this date to the current date to determine whether the receipt is expired. Do not try to use this date to calculate any other information, such as the time remaining before expiration. (Read only property)

188.2.21 opaqueValue as Memoryblock

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: An opaque value used as part of the SHA-1 hash.
Notes: (Read only property)

188.2.22 originalAppVersion as String

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The version of the app that was originally purchased.
Example:

```
// open a receipt
Var f as FolderItem = SpecialFolder.Desktop.Child("receipt")
Var r as AppReceiptMBS = AppReceiptMBS.receiptForFile(f)

// show value
MessageBox r.originalAppVersion
```

Notes: This corresponds to the value of CFBundleVersion (in iOS) or CFBundleShortVersionString (in OS X) in the Info.plist file when the purchase was originally made. In the sandbox environment, the value of

this field is always "1.0".
(Read only property)

188.2.23 purchaseDate as Date

MBS Encryption Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Another date.
Notes: Digging in a receipt we found this field and assume it is the original purchase date.
(Read only property)

188.2.24 purchaseDateTime as DateTime

MBS Encryption Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Another date.
Notes: Digging in a receipt we found this field and assume it is the original purchase date.
(Read only property)

188.2.25 receiptHash as Memoryblock

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: A SHA-1 hash, used to validate the receipt.
Notes: (Read only property)

188.2.26 transactionDate as Date

MBS Encryption Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Another date.
Notes: Digging in a receipt we found this field and assume it is the transaction date.
(Read only property)

188.2.27 transactionDateTime as DateTime

MBS Encryption Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Another date.
Notes: Digging in a receipt we found this field and assume it is the transaction date.

(Read only property)

188.3 class AppReceiptVerificatorMBS

188.3.1 class AppReceiptVerificatorMBS

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Reference implementation of an app receipt verificator.
Example:

```
Var a as new AppReceiptVerificatorMBS

if a.verifyAppReceipt then
MessageBox "My receipt is valid"
else
MessageBox "My receipt is invalid."
end if
```

Notes: If security is a concern you might want to avoid using a verificator whose code is open source.

- Validating Receipts of Mac App Store Purchases including In-App Purchases

188.3.2 Methods

188.3.3 Constructor

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The constructor.

188.3.4 ExitApp(code as Integer = 173)

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Quits the application directly.
Example:

```
AppReceiptVerificatorMBS.ExitApp 173
```

Notes: This does not call the destructors and CancelClose events. The app is quit right away.
If you use code 173 the Finder will show error message that app needs to be downloaded again from Mac App Store.

188.3.5 GUID as string

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Reads the GUID of the Mac.
Example:

```
Var g as String = AppReceiptVerificatorMBS.GUID
MessageBox EncodeHex(g)
```

Notes: This is normally build from the MAC ID of the ethernet card.

188.3.6 verifyAppReceipt as boolean

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Verifies the app's receipt file.
Example:

```
Var a as new AppReceiptVerificatorMBS

if a.verifyAppReceipt then
MessageBox "My receipt is valid"
else
MessageBox "My receipt is invalid."
end if
```

Notes: Verifies the receipt by checking the integrity of the receipt, comparing its bundle identifier and bundle version to the values returned by the corresponding properties and verifying the receipt hash.

Returns true if the receipt is verified, false otherwise.
If validation fails, Apple recommends to refresh the receipt and try again.

If you set bundleVersion and/or bundleIdentifier properties, we use those values.
Else we pick them from the info.plist of the app.

188.3.7 verifyReceipt(Receipt as AppReceiptMBS) as boolean

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Verifies the given receipt file.
Example:

```
Var a as new AppReceiptVerificatorMBS
Var f as FolderItem = SpecialFolder.Desktop.Child("receipt")
Var r as AppReceiptMBS = AppReceiptMBS.receiptForFile(f)

// testing with receipt from current Dash app
a.bundleIdentifier = "com.kapeli.dash"
a.bundleVersion = "2.1.2"

if a.verifyReceipt(r) then
MessageBox "My receipt is valid"
else
MessageBox "My receipt is invalid."
end if
```

Notes: Verifies the receipt by checking the integrity of the receipt, comparing its bundle identifier and bundle version to the values returned by the corresponding properties and verifying the receipt hash.

Returns true if the receipt is verified, false otherwise.
If validation fails, Apple recommends to refresh the receipt and try again.

188.3.8 Properties

188.3.9 bundleIdentifier as String

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The value that will be used to validate the bundle identifier included in the app receipt.
Notes: Given that it is possible to modify the app bundle in jailbroken devices, setting this value from a hardcoded string might provide better protection.
Returns the given value, or the app's bundle identifier by default.
(Read and Write property)

188.3.10 bundleVersion as String

MBS Encryption Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The value that will be used to validate the bundle version included in the app receipt.

Notes: Given that it is possible to modify the app bundle in jailbroken devices, setting this value from a hardcoded string might provide better protection.
Returns the given value, or the app's bundle version by default.
(Read and Write property)

188.3.11 FailReason as String

MBS Encryption Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The reason for a failure.
Notes: This is for debugging and to help you to find the reason for why a verification fails.
(Read only property)

188.3.12 MACAddress as MemoryBlock

MBS Encryption Plugin, Plugin Version: 18.0, Platform: macOS, Targets: All.

Function: The MAC Address to use.
Example:

```
// get the one of this Mac
Var m as MemoryBlock = AppReceiptVerificatorMBS.MACAddress

// now set a fake one
Var x as MemoryBlock = DecodeHex("12347890ABCD")
AppReceiptVerificatorMBS.MACAddress = x

// and display
MessageBox EncodeHex(m)+EndOfLine+EncodeHex(AppReceiptVerificatorMBS.MACAddress)
```

Notes: Can be queried to automatically get the one we detect.
Or set to use a custom one for testing.
(Read and Write property)

188.4 class SKDownloadMBS

188.4.1 class SKDownloadMBS

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Deprecated: This item is deprecated and should no longer be used. **Function:** This storeKit class gives you information about the download status of a content file.
Example:

```
// handle hosted content downloads of in-app purchases
// MyPaymentQueue is a subclass of SKPaymentQueueMBS with the updatedDownloads event implemented.
// Queue is a property of the app: Queue As MyPaymentQueue
Queue = New MyPaymentQueue
// When a purchased transaction has downloads, start them with Queue.startDownloads(transaction.downloads).

// in MyPaymentQueue:
Sub updatedDownloads(downloads() As SKDownloadMBS) Handles updatedDownloads
For Each d As SKDownloadMBS In downloads
Select Case d.state
Case SKDownloadMBS.kStateActive
System.DebugLog d.contentIdentifier + ": " + Format(d.progress * 100, "0") + "%, " + Format(d.timeRemaining, "0") + " s left"
Case SKDownloadMBS.kStateFinished
System.DebugLog d.contentIdentifier + " downloaded to " + d.contentURL
finishTransaction d.Transaction
Case SKDownloadMBS.kStateFailed
System.DebugLog d.contentIdentifier + " failed: " + d.error.localizedDescription
End Select
Next
End Sub
```

Notes: Available in Mac OS X 10.8 and newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 22.5pr1

188.4.2 Methods

188.4.3 Constructor

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

188.4.4 contentURLForProductID(productID as string) as string

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Queries content URL for a product.

188.4.5 deleteContentForProductID(productID as string)

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Deletes the content for that identifier from disk.

188.4.6 Properties

188.4.7 contentIdentifier as string

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Product identifier entered in iTunesConnect.
Notes: (Read only property)

188.4.8 contentLength as Int64

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Filesize of the asset.
Notes: (Read only property)

188.4.9 contentURL as string

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Content URL.
Notes: (Read only property)

188.4.10 contentVersion as string

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Version string of the product.
Notes: (Read only property)

188.4.11 error as NSErrorMBS

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Last error, can be nil.
Notes: (Read only property)

188.4.12 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

188.4.13 progress as Double

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Download progress.
Notes: (Read only property)

188.4.14 state as Integer

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Download state.
Notes: (Read only property)

188.4.15 timeRemaining as Double

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Estimated number of seconds remaining in the download.
Notes: (Read only property)

188.4.16 Transaction as SKPaymentTransactionMBS

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The transaction associated with the downloadable file
Notes: Available in MacOS 10.11 or newer.
(Read only property)

188.4.17 Constants

Download State Constants

Constant	Value	Description
kStateActive	1	Active
kStateCancelled	5	Cancelled
kStateFailed	4	Failed
kStateFinished	3	Finished
kStatePaused	2	Paused
kStateWaiting	0	Waiting

188.5 class SKMutablePaymentMBS

188.5.1 class SKMutablePaymentMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The mutable class for SKPaymentMBS.
Example:

```
// buy three units of a consumable product
// product is an SKProductMBS from SKProductsRequestMBS
// Queue is a property of the app: Queue As SKPaymentQueueMBS (with updatedTransactions event, see SKPaymentQueueMBS)
Var product As SKProductMBS // your product
If product = Nil Or Not SKPaymentQueueMBS.canMakePayments Then Return

Var payment As SKMutablePaymentMBS = SKMutablePaymentMBS.paymentWithProduct(product)
payment.quantity = 3
payment.applicationUsername = "user-12345" // an opaque ID of the user account in your app

Queue.addPayment payment
```

Notes: The SKMutablePayment class defines a request to the Apple App Store to process payment for additional functionality offered by your application. A payment encapsulates a string that identifies a particular product and the quantity of that item the user would like to purchase.

When a mutable payment is added to the payment queue, the payment queue copies the contents into an immutable request before queueing the request. Your application can safely change the contents of the mutable payment object.

Please also check the documentation from Apple for the SKMutablePayment class.
Subclass of the SKPaymentMBS class.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr1

188.5.2 Methods

188.5.3 Constructor(payment as SKPaymentMBS)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a mutable copy of the given payment.
See also:

• 188.5.4 Constructor(product as SKProductMBS) 22838

188.5.4 Constructor(product as SKProductMBS)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new payment for the specified product.
Example:

```
Var product as SKProductMBS // your product
Var queue as SKPaymentQueueMBS // your queue

Var payment as new SKMutablePaymentMBS(product)
payment.quantity = 5

MessageBox str(payment.quantity)+" units of "+product.localizedTitle

queue.addPayment payment
```

See also:

• 188.5.3 Constructor(payment as SKPaymentMBS) 22837

188.5.5 paymentWithProduct(product as SKProductMBS) as SKMutablePaymentMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new payment for the specified product with the given quantity.
Example:

```
Var product as SKProductMBS // your product
Var payment as SKMutablePaymentMBS = SKMutablePaymentMBS.paymentWithProduct(product)

MessageBox str(payment.quantity)+" units of "+product.localizedTitle
```

Notes: product: The product the user wishes to purchase.
quantity: Optional quantity. If you don't pass it, we default to 1.

This factory Method in Cocoa Core Competencies uses the productIdentifier property obtained from the product parameter to create and return a new payment with that identifier.

Available in Mac OS X v10.7 and later.
See also:

- 188.5.6 paymentWithProduct(product as SKProductMBS, quantity as Integer) as SKMutablePaymentMBS 22839

188.5.6 paymentWithProduct(product as SKProductMBS, quantity as Integer) as SKMutablePaymentMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new payment for the specified product with the given quantity.
Example:

```
Var product as SKProductMBS // your product
Var payment as SKMutablePaymentMBS = SKMutablePaymentMBS.paymentWithProduct(product, 5)

MessageBox str(payment.quantity)+" units of "+product.localizedTitle
```

Notes: product: The product the user wishes to purchase.
quantity: Optional quantity. If you don't pass it, we default to 1.

This factory Method in Cocoa Core Competencies uses the productIdentifier property obtained from the product parameter to create and return a new payment with that identifier.

Available in Mac OS X v10.7 and later.
See also:

- 188.5.5 paymentWithProduct(product as SKProductMBS) as SKMutablePaymentMBS 22838

188.5.7 Properties

188.5.8 applicationUsername as String

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: Application-specific user identifier. Optional.
Notes: (Read and Write property)

188.5.9 productIdentifier as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: A string that identifies a product that can be purchased from within your application.
Notes: The product identifier is a string previously agreed on between your application and the Apple App

Store.

Available in Mac OS X v10.7 and later.
(Read and Write property)

188.5.10 quantity as Integer

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The number of items the user wants to purchase.
Notes: The quantity property must be greater than 0.
Available in Mac OS X v10.7 and later.
(Read and Write property)

188.5.11 requestData as Memoryblock

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Reserved for future use.
Notes: The default value is nil. If requestData is not nil, your payment will be rejected by the Apple App Store.

Available in Mac OS X v10.7 and later.
(Read and Write property)

188.5.12 simulatesAskToBuyInSandbox as Boolean

MBS MacCloud Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that produces an ‚Äúask to buy‚Äù flow for this payment in the sandbox.
Notes: Available on MacOS 10.14 or newer.
(Read and Write property)

188.6 class SKPaymentMBS

188.6.1 class SKPaymentMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The class for a payment in the App Store.
Example:

```
// buy one unit of a product
// product is an SKProductMBS from SKProductsRequestMBS
// Queue is a property of the app: Queue As SKPaymentQueueMBS (with updatedTransactions event, see SKPaymentQueueMBS)
Var product As SKProductMBS // your product
If product = Nil Or Not SKPaymentQueueMBS.canMakePayments Then Return

Var payment As SKPaymentMBS = SKPaymentMBS.paymentWithProduct(product)
System.DebugLog "Buying " + payment.productIdentifier + ", quantity " + payment.quantity.ToString
Queue.addPayment payment

// to buy more than one, use SKMutablePaymentMBS
```

Notes: The SKPayment class defines a request to the Apple App Store to process payment for additional functionality offered by your application. A payment encapsulates a string that identifies a particular product and the quantity of those items the user would like to purchase.

Please also check the documentation from Apple for the SKPayment class.
Available in Mac OS X v10.7 and later.

188.6.2 Methods

188.6.3 Constructor(product as SKProductMBS)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new payment for the specified product.
Example:

```
Var product as SKProductMBS // your product
Var queue as SKPaymentQueueMBS // your queue

Var payment as new SKPaymentMBS(product)
```

```
MessageBox str(payment.quantity)+" units of "+product.localizedTitle

queue.addPayment payment
```

188.6.4 copy as SKPaymentMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the object.

188.6.5 mutableCopy as SKMutablePaymentMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a mutable copy of the object.

188.6.6 paymentWithProduct(product as SKProductMBS) as SKPaymentMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new payment for the specified product.
Example:

```
Var product as SKProductMBS // your product
Var queue as SKPaymentQueueMBS // your queue

Var payment as SKPaymentMBS = SKPaymentMBS.paymentWithProduct(product)
MessageBox str(payment.quantity)+" units of "+product.localizedTitle

queue.addPayment payment
```

Notes: product: The product the user wishes to purchase.

This factory Method in Cocoa Core Competencies uses the productIdentifier property obtained from the product parameter to create and return a new payment with that identifier. The quantity property defaults to 1.

To create a SKPaymentMBS object with a quantity greater than 1, create a SKMutablePaymentMBS object, adjust its quantity property and then add it to the payment queue.

Available in Mac OS X v10.7 and later.

188.6.7 Properties

188.6.8 applicationUsername as String

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: Application-specific user identifier. Optional.
Notes: (Read only property)

188.6.9 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal reference to the SKPayment object.
Notes: (Read and Write property)

188.6.10 productIdentifier as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: A string used to identify a product that can be purchased from within your application. (read-only)
Notes: The product identifier is a string previously agreed on between your application and the Apple App Store.

Available in Mac OS X v10.7 and later.
(Read only property)

188.6.11 quantity as Integer

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The number of items the user wants to purchase. (read-only)
Notes: Default value is 1.
Available in Mac OS X v10.7 and later.
(Read only property)

188.6.12 requestData as Memoryblock

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Reserved for future use. (read-only)
Notes: The default value is nil. If requestData is not nil, your payment will be rejected by the Apple App Store.

Available in Mac OS X v10.7 and later.
(Read only property)

188.6.13 simulatesAskToBuyInSandbox as Boolean

MBS MacCloud Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that produces an ‚Äúask to buy‚Äù flow for this payment in the sandbox.
Notes: Available on MacOS 10.14 or newer.
(Read only property)

188.7 class SKPaymentQueueMBS

188.7.1 class SKPaymentQueueMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The SKPaymentQueue class defines a queue of payment transactions to send to the Apple App Store.
Example:

```
// buy a product and handle the transaction updates
// MyPaymentQueue is a subclass of SKPaymentQueueMBS with the updatedTransactions event implemented.
// Queue is a property of the app: Queue As MyPaymentQueue
// product is an SKProductMBS from SKProductsRequestMBS
Var product As SKProductMBS // your product
If product = Nil Or Not SKPaymentQueueMBS.canMakePayments Then Return

Queue = New MyPaymentQueue
Queue.addPayment SKPaymentMBS.paymentWithProduct(product)

// in MyPaymentQueue:
Sub updatedTransactions(transactions() As SKPaymentTransactionMBS) Handles updatedTransactions
For Each t As SKPaymentTransactionMBS In transactions
If t.transactionState = SKPaymentTransactionMBS.StatePurchased Then
// unlock the feature here
Me.finishTransaction t
ElseIf t.transactionState = SKPaymentTransactionMBS.StateFailed Then
Me.finishTransaction t
End If
Next
End Sub
```

Notes: To use the payment queue, you add one or more payments. When payments are added to the queue, Store Kit connects to the Apple App Store and presents a user interface so that the user can authorize payment. As payments are fulfilled, the payment queue updates transactions and delivers them through events.

Available in Mac OS X v10.7 and later.
Please also check the documentation from Apple for the SKPaymentQueue class.
The plugin installs a transaction observer for you.
Blog Entries

- MBS Xojo Plugins, version 19.1pr6
- MBS Xojo Plugins, version 18.1pr3

188.7.2 Methods

188.7.3 addPayment(payment as SKPaymentMBS)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Adds a payment request to the queue.
Notes: payment: A payment request.

The payment request must have a product identifier registered with the Apple App Store and a quantity greater than 0. If either property is invalid, addPayment throws an exception.

When a payment request is added to the queue, the payment queue processes that request with the Apple App Store and arranges for payment from the user. When that transaction is complete or if a failure occurs, the payment queue sends the SKPaymentTransaction object that encapsulates the request to all transaction observers.

188.7.4 cancelDownload(download as SKDownloadMBS)

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Cancel one download.
Notes: Available in Mac OS X 10.8 and newer.

188.7.5 cancelDownloads(downloads() as SKDownloadMBS)

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Cancel a few downloads.
Notes: Available in Mac OS X 10.8 and newer.

188.7.6 canMakePayments as boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns whether the user is allowed to make payments.
Example:

```
if SKPaymentQueueMBS.canMakePayments then
MessageBox "can make payments"
else
MessageBox "not available"
```

end if

Notes: A Mac can be restricted from accessing the Apple App Store. For example, parents can restrict their children's ability to purchase additional content. Your application should confirm that the user is allowed to authorize payments before adding a payment to the queue. Your application may also want to alter its behavior or appearance when the user is not allowed to authorize payments.

188.7.7 Constructor

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new SKPaymentQueueMBS object for the default payment queue of the app.
Notes: The constructor queries the default payment queue (SKPaymentQueue.defaultQueue in Apple's documentation), so there is no separate defaultQueue function in the plugin.
Please make a subclass of this class to fill code into the events.
And please only have one instance of this class.

188.7.8 Destructor

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

188.7.9 finishTransaction(transaction as SKPaymentTransactionMBS)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Completes a pending transaction.
Notes: transaction: The transaction to finish.

Your application should call this method from a transaction observer that received a notification from the payment queue. Calling finishTransaction on a transaction removes it from the queue. Your application should call finishTransaction only after it has successfully processed the transaction and unlocked the functionality purchased by the user.

Calling finishTransaction on a transaction that is in the SKPaymentTransactionMBS.StatePurchasing state throws an exception.

188.7.10 pauseDownload(download as SKDownloadMBS)

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Pauses one download.
Notes: Available in Mac OS X 10.8 and newer.

188.7.11 pauseDownloads(downloads() as SKDownloadMBS)

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Pauses a few downloads.
Notes: Available in Mac OS X 10.8 and newer.

188.7.12 restoreCompletedTransactions

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Asks the payment queue to restore previously completed purchases.
Notes: Your application calls this method to restore transactions that were previously finished so that you can process them again. For example, your application would use this to allow a user to unlock previously purchased content onto a new device.

When you create a new product to be sold in your store, you choose whether that product can be restored or not. See the In App Purchase Programming Guide for more information.

The payment queue will deliver a new transaction for each previously completed transaction that can be restored. Each transaction includes a copy of the original transaction.

After the transactions are delivered, the payment queue calls the observer's paymentQueueRestoreCompletedTransactionsFinished event. If an error occurred while restoring transactions, the observer will be notified through its paymentQueue:restoreCompletedTransactionsFailedWithError event.

188.7.13 restoreCompletedTransactionsWithApplicationUsername(username as String)

MBS MacCloud Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Asks the payment queue to restore previously completed purchases, providing an opaque identifier for the user,Äôs account.
Notes: username: An opaque identifier for the user,Äôs account on your system.

188.7.14 resumeDownload(download as SKDownloadMBS)

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Resumes one download.
Notes: Available in Mac OS X 10.8 and newer.

188.7.15 resumeDownloads(downloads() as SKDownloadMBS)

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Resumes a few downloads.
Notes: Available in Mac OS X 10.8 and newer.

188.7.16 startDownload(download as SKDownloadMBS)

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Start one download.
Notes: Available in Mac OS X 10.8 and newer.

188.7.17 startDownloads(downloads() as SKDownloadMBS)

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Starts a few downloads.
Notes: Available in Mac OS X 10.8 and newer.

188.7.18 transactions as SKPaymentTransactionMBS()

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns an array of pending transactions.
Notes: The value of this property is undefined when there are no observers attached to the payment queue.

188.7.19 Properties

188.7.20 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal reference.
Notes: (Read and Write property)

188.7.21 Events

188.7.22 paymentQueueRestoreCompletedTransactionsFinished

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Tells the observer that the payment queue has finished sending restored transactions.
Notes: This method is called after all restorable transactions have been processed by the payment queue. Your application is not required to do anything in this method.

188.7.23 removedTransactions(transactions() as SKPaymentTransactionMBS)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Tells an observer that one or more transactions have been removed from the queue.
Notes: transactions: An array of the transactions that were removed.

Your application does not typically need to implement this event but might implement it to update its own user interface to reflect that a transaction has been completed.

188.7.24 restoreCompletedTransactionsFailedWithError(Error as NSErrorMBS)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Tells the observer that an error occurred while restoring transactions.

188.7.25 updatedDownloads(downloads() as SKDownloadMBS)

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Sent when the download state has changed.

Notes: Available in Mac OS X 10.8 and newer.

188.7.26 updatedTransactions(transactions() as SKPaymentTransactionMBS)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Tells an observer that one or more transactions have been updated.
Notes: transactions: An array of the transactions that were updated.

The application should process each transaction by examining the transaction's transactionState property. If transactionState is SKPaymentTransactionStatePurchased, payment was successfully received for the desired functionality. The application should make the functionality available to the user. If transactionState is SKPaymentTransactionStateFailed, the application can read the transaction's error property to return a meaningful error to the user.

Once a transaction is processed, it should be removed from the payment queue by calling the payment queue's finishTransaction: method, passing the transaction as a parameter.

Important: Once the transaction is finished, Store Kit can not tell you that this item is already purchased. It is important that applications process the transaction completely before calling finishTransaction:.

188.8 class SKPaymentTransactionMBS

188.8.1 class SKPaymentTransactionMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The SKPaymentTransactionMBS class defines objects residing in the payment queue.
Example:

```
// handle purchases in the payment queue and unlock features
// MyPaymentQueue is a subclass of SKPaymentQueueMBS with the updatedTransactions event implemented.
// Queue is a property of the app: Queue As MyPaymentQueue
Queue = New MyPaymentQueue

// in MyPaymentQueue:
Sub updatedTransactions(transactions() As SKPaymentTransactionMBS) Handles updatedTransactions
For Each t As SKPaymentTransactionMBS In transactions
Select Case t.transactionState
Case SKPaymentTransactionMBS.StatePurchased, SKPaymentTransactionMBS.StateRestored
System.DebugLog "Unlock " + t.payment.productIdentifier + " (" + t.transactionIdentifier + ")"
finishTransaction t
Case SKPaymentTransactionMBS.StateFailed
System.DebugLog "Purchase failed: " + t.error.localizedDescription
finishTransaction t
End Select
Next
End Sub
```

Notes: A payment transaction is created whenever a payment is added to the payment queue. Transactions are delivered to your application when the App Store has finished processing the payment. Completed transactions provide a receipt and transaction identifier that your application can use to save a permanent record of the processed payment.

Please also check the documentation from Apple for the SKPaymentTransaction class.
Available in Mac OS X v10.7 and later.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

188.8.2 Methods

188.8.3 Constructor

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

188.8.4 downloads as SKDownloadMBS()

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the downloads for this transaction.
Notes: Available in Mac OS X 10.8 and newer.

188.8.5 Properties

188.8.6 error as NSErrorMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: An object describing the error that occurred while processing the transaction.
Notes: The error property is undefined except when transactionState is set to StateFailed. Your application can read the error property to determine why the transaction failed.
(Read only property)

188.8.7 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal reference to the SKPaymentTransaction object.
Notes: (Read and Write property)

188.8.8 originalTransaction as SKPaymentTransactionMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The transaction that was restored by the App Store.
Notes: The contents of this property are undefined except when transactionState is set to StateRestored. When a transaction is restored, the current transaction holds a new transaction identifier, receipt, and so on. Your application will read this property to retrieve the restored transaction.
(Read only property)

188.8.9 payment as SKPaymentMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The payment for the transaction.
Notes: Each payment transaction is created in response to a payment that your application added to the payment queue.
(Read only property)

188.8.10 transactionDate as date

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The date the transaction was added to the App Store's payment queue.
Notes: The contents of this property are undefined except when transactionState is set to StatePurchased or StateRestored.
(Read only property)

188.8.11 transactionDateTime as DateTime

MBS MacCloud Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The date the transaction was added to the App Store's payment queue.
Notes: The contents of this property are undefined except when transactionState is set to StatePurchased or StateRestored.
(Read only property)

188.8.12 transactionIdentifier as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: A string that uniquely identifies a successful payment transaction.
Notes: The contents of this property are undefined except when transactionState is set to StatePurchased or StateRestored. The transactionIdentifier is a string that uniquely identifies the processed payment. Your application may wish to record this string as part of an audit trail for App Store purchases. See In App Purchase Programming Guide for more information.
(Read only property)

188.8.13 transactionState as Integer

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The current state of the transaction.
Notes: see State* constants.

(Read only property)

188.8.14 Constants

Transaction State Constants

Constant	Value	Description
StateDeferred	4	Transaction is neither purchased nor failed, yet.
StateFailed	2	The transaction failed. Check the error property to determine what happened.
StatePurchased	1	The App Store successfully processed payment. Your application should provide the content the user purchased.
StatePurchasing	0	The transaction is being processed by the App Store.
StateRestored	3	This transaction restores content previously purchased by the user. Read the originalTransaction property to obtain information about the original purchase.

188.9 class SKProductDiscountMBS

188.9.1 class SKProductDiscountMBS

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The class for product discounts.
Example:

```
// show the introductory offer of a subscription product
// p is a SKProductMBS from a SKProductsRequestMBS, see SKProductMBS
Var p As SKProductMBS // your product
If p = Nil Or p.introductoryPrice = Nil Then Return

Var offer As SKProductDiscountMBS = p.introductoryPrice
MessageBox p.localizedTitle + ": first " + offer.NumberOfPeriods.ToString + " periods for " + offer.PriceString + _
", then " + p.priceString
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

188.9.2 Methods

188.9.3 Constructor

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

188.9.4 Properties

188.9.5 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

188.9.6 NumberOfPeriods as Integer

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of periods this price is valid.
Notes: (Read only property)

188.9.7 PaymentMode as Integer

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The payment mode.
Notes: (Read only property)

188.9.8 Price as Double

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The price of the product.
Notes: (Read only property)

188.9.9 priceLocale as NSLocaleMBS

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The price locale.
Notes: (Read only property)

188.9.10 PriceString as String

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The price as formatted string.
Notes: (Read only property)

188.9.11 subscriptionPeriod as SKProductSubscriptionPeriodMBS

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The subscription period.
Notes: (Read only property)

188.9.12 Constants

Payment Modes

Constant	Value	Description
kPaymentModeFreeTrial	2	Free trial
kPaymentModePayAsYouGo	0	Pay ss you go
kPaymentModePayUpFront	1	Pay Upfront

188.10 class SKProductMBS

188.10.1 class SKProductMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The App Store class for a product.
Example:

```
// load the in-app purchase products of your app and show their prices
// MyProductsRequest is a subclass of SKProductsRequestMBS with the didReceiveResponse event implemented.
// Request is a property of the window: Request As MyProductsRequest
Var ids() As String = Array("com.example.myapp.pro", "com.example.myapp.tips")
Request = New MyProductsRequest(ids)
Request.start

// in MyProductsRequest:
Sub didReceiveResponse(products() As SKProductMBS, invalidProductIdentifiers() As String) Handles didReceiveResponse
For Each p As SKProductMBS In products
System.DebugLog p.productIdentifier + ": " + p.localizedTitle + " for " + p.priceString
Next
End Sub
```

Notes: SKProductMBS objects are returned as part of an didReceiveResponse event in SKProductsRequestMBS class and are used to provide information about a product previously registered with the Apple App Store.

Please also check the documentation from Apple for the SKProduct class.
Available in Mac OS X v10.7 and later.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 19.1pr6

188.10.2 Methods

188.10.3 Constructor

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

188.10.4 contentLengths as Int64()

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Array with filesizes of the assets.
Notes: Available in Mac OS X 10.8 and newer.

188.10.5 downloadContentLengths as Int64()

MBS MacCloud Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop only.

Function: The lengths of the downloadable files available for this product.
Notes: The array holds Int64 values that is the size of one of the downloadable files (in bytes).

For MacOS 10.14 or newer.
Falls back to downloadLengths for older OS versions.

188.10.6 Properties

188.10.7 contentLength as Int64

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Total filesize of the assets.
Notes: Available in Mac OS X 10.8 and newer.
(Read only property)

188.10.8 contentVersion as string

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Version string of the product.
Notes: Available in Mac OS X 10.8 and newer.
(Read only property)

188.10.9 downloadable as boolean

MBS MacCloud Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Whether this is a download item.
Notes: Available in Mac OS X 10.8 and newer.

(Read only property)

188.10.10 downloadContentLength as Int64

MBS MacCloud Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop only.

Function: The length of the downloadable files available for this product.
Notes: For MacOS 10.14 or newer.
Falls back to downloadLength for older OS versions.
(Read only property)

188.10.11 downloadContentVersion as String

MBS MacCloud Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A string that identifies which version of the content is available for download.
Notes: The version string is formatted as a series of integers separated by periods.

For MacOS 10.14 or newer.
Falls back to ContentVersion for older OS versions.
(Read only property)

188.10.12 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal reference to the SKProduct object.
Notes: (Read and Write property)

188.10.13 introductoryPrice as SKProductDiscountMBS

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: Introductory Price.
Notes: Available on MacOS 10.13.2 or later.
Value is nil on older systems.
(Read only property)

188.10.14 localizedDescription as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: A description of the product.
Notes: The description is localized based on the currentLocale property.
(Read only property)

188.10.15 localizedTitle as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The name of the product.
Notes: The description is localized based on the currentLocale property.
(Read only property)

188.10.16 price as Double

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The cost of the product in the local currency.
Notes: Use PriceString to get a localized formatted price.
(Read only property)

188.10.17 priceLocale as NSLocaleMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The locale used to format the price of the product.
Notes: (Read only property)

188.10.18 priceString as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The cost of the product in the local currency.
Notes: We format the price in the locale currency format.
(Read only property)

188.10.19 productIdentifier as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The string that identifies the product to the Apple App Store.
Notes: (Read only property)

188.10.20 subscriptionGroupIdentifier as String

MBS MacCloud Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The identifier of the subscription group to which the subscription belongs.
Notes: All auto-renewable subscriptions must be a part of a group. You create the group identifiers in App Store Connect.
Available on MacOS 10.14 or newer.
(Read only property)

188.10.21 subscriptionPeriod as SKProductSubscriptionPeriodMBS

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: Subscription period.
Notes: Available on MacOS 10.13.2 or later.
Value is nil on older systems.
(Read only property)

188.11 class SKProductsRequestMBS

188.11.1 class SKProductsRequestMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: An SKProductsRequestMBS object is used to retrieve localized information about a list of products from the Apple App Store.
Example:

```
// load price and title of in-app purchase products from the App Store
// MyProductsRequest is a subclass of SKProductsRequestMBS with the events implemented.
// Request is a property of the window: Request As MyProductsRequest
Var ids() As String = Array("com.example.myapp.pro", "com.example.myapp.coins100")
Request = New MyProductsRequest(ids)
Request.start

// in MyProductsRequest:
Sub didReceiveResponse(products() As SKProductMBS, invalidProductIdentifiers() As String) Handles didReceiveRe-
sponse
For Each product As SKProductMBS In products
System.DebugLog product.productIdentifier + ": " + product.localizedTitle + " for " + product.priceString
Next
End Sub

Sub didFailWithError(error As NSErrorMBS) Handles didFailWithError
System.DebugLog error.localizedDescription
End Sub
```

Notes: Your application uses this request to present localized prices and other information to the user without having to maintain that list itself.

To use an SKProductsRequest object, you initialize it with a list of product identifier strings, attach a delegate, and then call the request's start method. When the request completes, you receive the didReceiveResponse event.

Please also check the documentation from Apple for the SKProductsRequest class.
Available in Mac OS X v10.7 and later.

188.11.2 Methods

188.11.3 cancel

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Cancels a previously started request.
Notes: When you cancel a request, the events are not called with an error.

188.11.4 Constructor(productIdentifiers() as string)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes the request with the set of product identifiers.
Notes: productIdentifiers: The list of product identifiers for the products you wish to retrieve descriptions of.

188.11.5 Destructor

MBS MacCloud Plugin, Plugin Version: 17.4, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

188.11.6 start

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sends the request to the Apple App Store.
Notes: The results for a request are sent to the events.

188.11.7 Properties

188.11.8 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal reference to the SKProductsRequest object.
Notes: (Read and Write property)

188.11.9 Events

188.11.10 didFailWithError(error as NSErrorMBS)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Called if the request failed to execute.
Notes: error: The error that caused the request to fail.

When the request fails, your application should release the request. The requestDidFinish event is not called after this method is called.

188.11.11 didFinish

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Called when the request has completed.
Notes: This method is called after all processing of the request has been completed.

188.11.12 didReceiveResponse(products() as SKProductMBS, invalidProductIdentifiers() as string)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Called when the Apple App Store responds to the product request.
Notes: products: A list of products, one product for each valid product identifier provided in the original request.
invalidProductIdentifiers: An array of product identifier strings that were not recognized by the Apple App Store. This array should typically be empty.

188.12 class SKProductSubscriptionPeriodMBS

188.12.1 class SKProductSubscriptionPeriodMBS

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The class for a subscription period.
Notes: Available on MacOS 10.13.2.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

188.12.2 Methods

188.12.3 Constructor

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

188.12.4 Properties

188.12.5 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

188.12.6 numberOfUnits as Integer

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of units.
Notes: (Read only property)

188.12.7 unit as Integer

MBS MacCloud Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: The unit of the period from day to year.
Notes: (Read only property)

188.12.8 Constants

Period units

Constant	Value	Description
PeriodUnitDay	0	Day
PeriodUnitMonth	2	Month
PeriodUnitWeek	1	Week
PeriodUnitYear	3	Year

188.13 class SKReceiptRefreshRequestMBS

188.13.1 class SKReceiptRefreshRequestMBS

MBS MacCloud Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop & iOS.

Function: The SKReceiptRefreshRequest class allows an app to refresh its receipt.
Example:

```
// get a new App Store receipt, e.g. if the receipt file is missing
// MyReceiptRequest is a subclass of SKReceiptRefreshRequestMBS with the events implemented.
// Request is a property of the window: Request As MyReceiptRequest
Request = New MyReceiptRequest
Request.start

// in MyReceiptRequest:
Sub didFinish() Handles didFinish
System.DebugLog "Receipt refreshed, check it now."
End Sub

Sub didFailWithError(error As NSErrorMBS) Handles didFailWithError
System.DebugLog error.localizedDescription
End Sub
```

Notes: With this API, the app can request a new receipt if the receipt is invalid or missing. In the sandbox environment, you can request a receipt with any combination of properties to test the state transitions related to Volume Purchase Plan receipts.
Requires Mac OS X 10.9.

188.13.2 Methods

188.13.3 cancel

MBS MacCloud Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop & iOS.

Function: Cancels a previously started request.
Notes: When you cancel a request, the events are not called with an error.

188.13.4 Constructor(properties as dictionary = nil)

MBS MacCloud Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop & iOS.

Function: Initialized a receipt refresh request with optional properties.
Notes: In the test enviroment, the properties that the new receipt should have. For keys, see SKReceiptProperty* methods.
In the production environment, set this parameter to nil.

188.13.5 Destructor

MBS MacCloud Plugin, Plugin Version: 17.4, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

188.13.6 SKReceiptPropertyIsExpired as string

MBS MacCloud Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for properties in initialization.
Notes: A key whose value is a Boolean value, indicating whether the receipt is expired.

188.13.7 SKReceiptPropertyIsRevoked as string

MBS MacCloud Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for properties in initialization.
Notes: A key whose value is a Boolean value, indicating whether the receipt has been revoked.

188.13.8 SKReceiptPropertyIsVolumePurchase as string

MBS MacCloud Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for properties in initialization.
Notes: A key whose value is a Boolean value, indicating whether the receipt is a Volume Purchase Plan receipt.

188.13.9 start

MBS MacCloud Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop & iOS.

Function: Sends the request to the Apple App Store.
Notes: The results for a request are sent to the events.

188.13.10 TerminateForInvalidReceipt

MBS MacCloud Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Terminates an app if the license to use the app has expired.
Notes: Falls back to exit(173) for MacOS before 10.14.

188.13.11 Properties

188.13.12 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

188.13.13 receiptProperties as Dictionary

MBS MacCloud Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop & iOS.

Function: The properties of the receipt. (read-only)
Notes: (Read only property)

188.13.14 Events

188.13.15 didFailWithError(error as NSErrorMBS)

MBS MacCloud Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop & iOS.

Function: Called if the request failed to execute.
Notes: error: The error that caused the request to fail.

When the request fails, your application should release the request. The requestDidFinish event is not called

after this method is called.

188.13.16 didFinish

MBS MacCloud Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop & iOS.

Function: Called when the request has completed.
Notes: This method is called after all processing of the request has been completed.

188.14 module StoreKit2MBS

188.14.1 module StoreKit2MBS

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The module for the StoreKit 2 framework in Swift.
Example:

```
// on app start ask for products, updates and current entitlements
StoreKit2MBS.QueryProducts Array("test1"), AddressOf QueryProductsCompleted
StoreKit2MBS.SetUpdates AddressOf updatesReceived
StoreKit2MBS.CurrentEntitlements AddressOf CurrentEntitlementsCompleted
```

Notes: Due to bridging between C++ and Swift, we pass content of classes as Dictionaries, so we don't need to bridge each property and copy over data efficiently.

Support In-App Purchases and interactions with the App Store.

Use the StoreKit framework to provide the following features and services for your apps and In-App Purchases:

- In-App Purchase. Offer and promote In-App Purchases for content and services.
- App transaction. Verify a customer,Äôs app purchase with an App Store-signed transaction.
- Reviews. Request App Store reviews and ratings from your customers.

Most functions require macOS 12, iOS 15 or newer.
For a lot of things, we have additional properties in dictionaries for newer OS versions.

188.14.2 Methods

188.14.3 AllTransactions(completed as TransactionsCompletedMBS)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A sequence that emits all the customer,Äôs transactions for your app.
Notes: Queries the transactions and calls delegate to pass them.
This sequence returns the customer,Äôs transaction history current to the moment you access it. The sequence emits a finite number of transactions. If the App Store processes additional transactions for the customer while you,Äôre accessing this sequence, they appear in the transaction listener updates.

The transaction history includes the following in-app purchases:

- Unfinished consumables
- Finished consumables that are refunded or revoked
- Non-consumables
- Auto-renewable subscriptions, including all renewals
- Auto-renewable subscriptions and non-consumables that the customer gets through Family Sharing

By default, when the SKIncludeConsumableInAppPurchaseHistory property list key is false, the transaction information excludes finished consumables (unless refunded or revoked).

To get all possible transactions, including all finished consumables, set the SKIncludeConsumableInAppPurchaseHistory property list key to true.

Requires iOS 15.0, macOS 12.0 or newer.
See also:

- 188.14.4 AllTransactions(ProductID as String, completed as TransactionsCompletedMBS) 22874

188.14.4 AllTransactions(ProductID as String, completed as TransactionsCompletedMBS)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Gets all the transactions associated with this product ID.
Notes: productID: Identifies the product to filter the transaction cache against.

Returns: A sequence containing all transactions for the given product.
See also:

• 188.14.3 AllTransactions(completed as TransactionsCompletedMBS) 22874

188.14.5 beginRefundRequest(TransactionID as UInt64, completed as BeginRefundRequestCompletedMBS)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Presents the refund request sheet for the transaction in a window.
Example:

StoreKit2MBS.beginRefundRequest transactionId, AddressOf refundRequestCompleted

Notes: transactionID: The identifier of the transaction the user is requesting a refund for.

Call this function from account settings or a help menu to enable customers to request a refund for an in-app purchase within your app. When you call this function, the system displays a refund sheet with the customer,Äôs purchase details and a list of reason codes for the customer to choose from.

When a customer requests a refund for consumable in-app purchases through your app, the App Stores sends a CONSUMPTION_REQUEST notificationType to your server. If the customer provided consent, respond by sending consumption data to the App Store using the Send Consumption Information endpoint. If not, don,Äôt respond to the CONSUMPTION_REQUEST notification.

The App Store takes up to 48 hours to either approve or deny a refund.

188.14.6 CanMakePayments as Boolean

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the person can make purchases.
Example:

BuyButton.Enabled = StoreKit2MBS.CanMakePayments

Notes: Use canMakePayments to determine at runtime whether a person can authorize payments. If the value is false, a person can,Äôt authorize payments, so don,Äôt offer In-App Purchases or external purchases.

Your app might need to alter its behavior or appearance when people can,Äôt make purchases. For example, don,Äôt enable your user interface for making In-App Purchases or external purchases when purchases are blocked.

The following conditions can cause the value of canMakePayments to be false:

- A person sets the Content & Privacy Restrictions in Screen Time to prevent purchases. For more information, see Use parental controls on your child,Äôs iPhone, iPad, and iPod touch.
- The device has a mobile device management (MDM) profile that prevents purchases. For more information, see Device Management.
- If canMakePayments is true and your app uses only StoreKit In-App Purchase APIs, the person can authorize purchases in the App Store and your app can offer In-App Purchases.

Requires macOS 12.0, iOS 15.0 or newer.

188.14.7 ClearUpdates

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Clears the update delegate.
Notes: Optional method to call when application quits.

188.14.8 currentEntitlement(ProductIdentifier as String, completed as TransactionsCompletedMBS)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: he transaction that entitles the user to the product.
Notes: Calls delegate when the transaction data is available. Value is nil if the user isn,Äôt currently entitled to this product. Current entitlement information applies only to non-consumables, non-renewing subscriptions, and auto-renewable subscriptions.

For iOS 15.0 to 18.4. For newer versions, you may better use currentEntitlements.

188.14.9 CurrentEntitlements(completed as TransactionsCompletedMBS)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Queries a sequence of the latest transactions that entitle a customer to In-App Purchases and subscriptions.
Example:

StoreKit2MBS.CurrentEntitlements AddressOf CurrentEntitlementsCompleted

Notes: The current entitlements sequence emits the latest transaction for each product the customer has an entitlement to, specifically:

- A transaction for each non-consumable In-App Purchase
- The latest transaction for each auto-renewable subscription that has a Product.SubscriptionInfo.RenewalState state of subscribed or inGracePeriod
- The latest transaction for each non-renewing subscription, including finished ones

Products that the App Store has refunded or revoked don,Äôt appear in the current entitlements. Consumable In-App Purchases also don,Äôt appear in the current entitlements. To get transactions for unfinished consumables, use the unfinished or all sequences in Transaction.

Requires iOS 15.0 or macOS 12.0 or newer.
See also:

- 188.14.10 CurrentEntitlements(ProductID as String, completed as TransactionsCompletedMBS) 22877

188.14.10 CurrentEntitlements(ProductID as String, completed as TransactionsCompletedMBS)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Gets the transactions that entitle the user to items purchased under a product ID.
Notes: If a generic SKU is provided, the returned sequence will yield all transactions that entitle the user to Advanced Commerce Items purchased using the generic product's ID.

If an ID for a regular IAP is provided, the returned sequence will contain no more than one transaction.

productID: Identifies the product to check entitlements for.

Returns: A sequence containing all transactions that entitle the user to the product.
See also:

- 188.14.9 CurrentEntitlements(completed as TransactionsCompletedMBS) 22876

188.14.11 FinishTransaction(completed as FinishCompletedMBS = nil)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Indicates to the App Store that the app delivered the purchased content or enabled the service to finish the transaction.
Example:

StoreKit2MBS.FinishTransaction AddressOf FinishCompleted

Notes: Call finish() to complete a transaction after you deliver the purchased content or enable the purchased service. For on-demand resources, don,Äôt finish the transaction until the app completes downloading the resource or you,Äôve otherwise delivered the resource.

Requires macOS 12.0, iOS 15.0 or newer.

188.14.12 latestTransaction(ProductIdentifier as String, completed as TransactionsCompletedMBS)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The most recent transaction for the product.
Notes: Queries the latest transaction and calls the delegate.
This value is nil if the customer has never purchased this product.

By default, when the SKIncludeConsumableInAppPurchaseHistory property list key is false, this value excludes finished consumable in-app purchases unless they are refunded or revoked.
If you set the SKIncludeConsumableInAppPurchaseHistory property list key to true, this value returns all transactions, including consumable in-app purchases that your app marked as finished (finish()).

Requires macOS 12.0, iOS 15.0 or newer.

188.14.13 presentOfferCodeRedeemSheet

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Displays a sheet in the window scene that enables users to redeem a subscription offer code that you configure in App Store Connect.
Notes: This method displays a system sheet in the view, where customers can enter and redeem subscription offer codes. Use this method if you generate subscription offer codes in App Store Connect.

Set up subscription offer codes in App Store Connect before calling this API. Customers can only redeem these offers in your app through the redemption sheet; don,Äôt use a custom UI.

When customers redeem an offer code, StoreKit emits the resulting transaction in updates. Set up a transaction listener as soon as your app launches to receive new transactions while the app is running.

188.14.14 Product(Index as Integer) as Dictionary

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Queries a product by index.
Notes: We cache the products we got from QueryProducts, so you can query them anytime.

188.14.15 PurchaseProduct(ProductIdentifier as String, parentWindow as DesktopWindow, PurchaseOptions as Dictionary, completed as PurchaseProductCompletedMBS = nil)

MBS Swift Plugin, Plugin Version: 25.4, Platform: macOS, Targets: Desktop only.

Function: Initiates a purchase for the product with the App Store and displays the confirmation sheet.
Notes: The version taking a DesktopWindow as parent for dialogs.
See also:

- 188.14.16 PurchaseProduct(ProductIdentifier as String, parentWindow as Window, PurchaseOptions as Dictionary, completed as PurchaseProductCompletedMBS = nil) 22879
- 188.14.17 PurchaseProduct(ProductIdentifier as String, PurchaseOptions as Dictionary, completed as PurchaseProductCompletedMBS = nil) 22879

188.14.16 PurchaseProduct(ProductIdentifier as String, parentWindow as Window, PurchaseOptions as Dictionary, completed as PurchaseProductCompletedMBS = nil)

MBS Swift Plugin, Plugin Version: 25.4, Platform: macOS, Targets: Desktop only.

Function: Initiates a purchase for the product with the App Store and displays the confirmation sheet.
Notes: The version taking a window as parent for dialogs.
See also:

- 188.14.15 PurchaseProduct(ProductIdentifier as String, parentWindow as DesktopWindow, PurchaseOptions as Dictionary, completed as PurchaseProductCompletedMBS = nil) 22879
- 188.14.17 PurchaseProduct(ProductIdentifier as String, PurchaseOptions as Dictionary, completed as PurchaseProductCompletedMBS = nil) 22879

188.14.17 PurchaseProduct(ProductIdentifier as String, PurchaseOptions as Dictionary, completed as PurchaseProductCompletedMBS = nil)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Initiates a purchase for the product with the App Store and displays the confirmation sheet.
Example:

```
Var purchaseOptions As New Dictionary
purchaseOptions.value("quantity") = 2
purchaseOptions.value("appAccountToken") = "xxx"
purchaseOptions.value("simulatesAskToBuyInSandbox") = False
purchaseOptions.value("customkey") = "customvalue"

StoreKit2MBS.PurchaseProduct("test", Self, purchaseOptions, AddressOf PurchaseCompleted)
```

Notes: Please query products before calling this. We find the product in the products array by the given identifier.

Call the purchase method when a customer initiates a purchase, either within your app or after selecting a promoted in-app purchase on the App Store. This method brings up the system-confirmation sheet. The user can confirm to complete the transaction or cancel it.
Include the purchase options to provide additional information about the purchase, such as:

- appAccountToken to associate the purchase with the resulting transaction
- quantity, if the customer is purchasing more than one of the product
- If you,Äôre testing your app in the sandbox environment, test an Ask to Buy scenario by setting the simulatesAskToBuyInSandbox purchase option to true.

PurchaseOptions dictionary may have the following keys:

appAccountToken	Sets a UUID to associate the purchase with an account in your system.
quantity	Indicates the quantity of items the customer is purchasing. Default is 1. Maximum is 10.
simulatesAskToBuyInSandbox	Simulates an Ask to Buy scenario when testing your app in the sandbox environment. Set to true to simulate a child,Äôs account asking permission to make a purchase.

See also:

- 188.14.15 PurchaseProduct(ProductIdentifier as String, parentWindow as DesktopWindow, PurchaseOptions as Dictionary, completed as PurchaseProductCompletedMBS = nil) 22879
- 188.14.16 PurchaseProduct(ProductIdentifier as String, parentWindow as Window, PurchaseOptions as Dictionary, completed as PurchaseProductCompletedMBS = nil) 22879

188.14.18 QueryProducts(identifiers() as String, completed as QueryProductsCompletedMBS = nil)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Requests product data from the App Store.
Notes: identifiers: A collection of unique in-app purchase product identifiers that you previously configured in App Store Connect. StoreKit ignores any duplicate identifiers in the collection.

Use this method to get an instance of Product. Your app must have its product identifiers available to provide them to this function.

You initially create product identifiers when you configure in-app purchases in App Store Connect.

Your app can store or retrieve product identifiers in several ways, such as embedding the identifiers in the app bundle, or fetching them from your server.
If any identifiers are invalid or the App Store can,Äôt find them, the App Store excludes them from the return value.

A product comes with these values in the dictionary:

Key	Description
id	The product identifier.
displayName	The localized display name of the product, if it exists.
description	The localized description of the product.
price	The decimal representation of the cost of the product, in local currency. (as double)
displayPrice	The localized string representation of the product price, suitable for display.
isFamilyShareable	A Boolean value that indicates whether the product is available for Family Sharing in App Store Connect.
jsonRepresentation	The JSON representation of the product information.
type	A dictionary with type value and if available the localized description.
debugDescription	The debug description.

Requires macOS 12.0, iOS 15.0 or newer.

188.14.19 refreshAppTransaction(completed as TransactionsCompletedMBS)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Gets the App Store-signed app transaction information from the App Store server.
Notes: This method queries the App Store server to refresh the app transaction information. This method

returns a VerificationResult that contains the App Store-signed app transaction information for your app.

Calling refresh() displays a system prompt that asks users to authenticate with their App Store credentials. Call this function only in response to an explicit user action, like tapping or clicking a button.

Use this method to get an AppTransaction in the following cases:

- The shared property throws an error.
- The shared property returns an unverified unverified result.

This method throws an error if the user cancels the authentication prompt, if there,Äôs no network connectivity, or if the call fails to update the app transaction.

188.14.20 requestAgeRange(Age1 as integer, Age2 as Integer, Age3 as Integer, completed as RequestAgeRangeCompletedMBS)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Requests the age range of a person logged onto the current device.
Notes: Use ‘AgeRangeService‘ to request a person’s age range and manage their access to content on your app.

Age2 or Age3 can be zero if you only need 1 or 2 age limits.
Typically you would ask for something like 13, 15 and 18 to know whether you should display content >= 13, >= 15 and >= 18 for your app.

Your app needs to have the com.apple.developer.declared-age-range entitlement with value true to call the API.

188.14.21 RequestReview

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Tells StoreKit to request an App Store rating or review from the user, if appropriate, using the specified scene.
Example:

StoreKit2MBS.RequestReview

Notes: When you call this method in your shipping app and the system displays a rating and review request view, the system handles the entire process for you. Although you normally call this method when it makes sense in the user experience flow of your app, App Store policy governs the actual display of a rating and review request view. When your app calls this API, StoreKit uses the following criteria:

- If the person hasn,Äôt rated or reviewed your app on this device, StoreKit displays the ratings and review request a maximum of three times within a 365-day period.
- If the person has rated or reviewed your app on this device, StoreKit displays the ratings and review request if the app version is new, and if more than 365 days have passed since the person,Äôs previous review.

Requires macOS 13.0, iOS 16.0 or newer.
We use current window/screen as root for the dialog.

188.14.22 SetUpdates(update as TransactionsCompletedMBS)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Sets the asynchronous delegate that emits a transaction when the system creates or updates transactions that occur outside the app or on other devices.
Notes: Use updates to receive new transactions while the app is running. This sequence receives transactions that occur outside of the app, such as Ask to Buy transactions, subscription offer code redemptions, and purchases that customers make in the App Store. It also emits transactions that customers complete in your app on another device.

Note that after a successful in-app purchase on the same device, StoreKit returns the transaction through purchase delegate.

Set this when the app launches. If your app has unfinished transactions, the updates listener receives them once, immediately after the app launches. Without the Task to listen for these transactions, your app may miss them.

The updates listener receives unfinished transactions just once at app launch, but you can use the unfinished listener to get your app,Äôs unfinished transactions at any time. For information on finishing transactions, see FinishTransaction.

188.14.23 sharedAppTransaction(completed as TransactionsCompletedMBS)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Gets the App Store-signed app transaction information for the app.
Notes: Queries the app transaction and calls delegate.

Use this property to get a VerificationResult that contains the App Store-signed app transaction information for your app, including the first time the app launches. StoreKit automatically keeps the app transaction up-to-date.

This property throws an error if the AppTransaction isn,Äôt available or if the user isn,Äôt authenticated with the App Store. Getting an AppTransaction may require network connectivity.

If your app fails to get an AppTransaction by accessing the shared property, see refreshAppTransaction.

188.14.24 ShowManageSubscriptions

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: iOS only.

Function: Presents the App Store sheet for managing subscriptions.
Notes: Use this function to display the manage subscriptions sheet within your app. Consider adding a manage subscriptions option to your app. For design guidance on supporting this functionality, see Human Interface Guidelines >In-App Purchase >Helping People Manage Their Subscriptions.

The showManageSubscriptions function presents a manage subscription sheet that,Äôs the same as what customers can view in their account settings in the App Store app or by choosing Settings >Apple Account >Subscriptions on an iOS or iPadOS device. The sheet displays the customer,Äôs currently active subscription for your app and the options to view, upgrade, downgrade, or cancel their subscription.

Avoid showing the user interface for this feature in Mac apps built with Mac Catalyst and on iOS apps running on Mac computers with Apple silicon because this sheet isn,Äôt supported in macOS.

- In Mac apps built with Mac Catalyst, enclose the code in a compilation conditional block that uses the targetEnvironment(): platform condition. For more information on Mac Catalyst, see Creating a Mac version of your iPad app.

- For iOS apps running on Apple silicon, if isiOSAppOnMac is true, avoid showing the user interface for this feature.

See also:

- 188.14.25 ShowManageSubscriptions(GroupID as String)

188.14.25 ShowManageSubscriptions(GroupID as String)

MBS Swift Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: iOS only.

Function: Presents the App Store sheet for managing subscriptions.
Notes: subscriptionGroupID: The subscription group identifier that the subscription belongs to.
See also:

- 188.14.24 ShowManageSubscriptions 22884

188.14.26 Sync(completed as SyncCompletedMBS = nil)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Synchronizes your app,Äôs transaction information and subscription status with information from the App Store.
Example:

StoreKit2MBS.Sync AddressOf syncCompleted

Notes: Include some mechanism in your app, such as a Restore Purchases button, to let users restore their in-app purchases. In rare cases when a user suspects the app isn,Äôt showing all the transactions, call sync(). By calling sync(), you force the app to obtain transaction information and subscription status from the App Store.

Calling sync()displays a system prompt that asks users to authenticate with their App Store credentials. Call this function only in response to an explicit user action, like tapping or clicking a button.

In regular operations, there,Äôs no need to call sync(). StoreKit automatically keeps up to date transaction information and subscription status available to your app. When users reinstall your app or download it on a new device, the app automatically has all transactions available to it upon initial launch. There,Äôs no need for users to ask your app to restore transactions —your app can immediately get the current entitlements using currentEntitlements and transaction history using all. For more information about transactions, see Transaction.

Requires macOS 12.0, iOS 15.0 or newer.

188.14.27 Transaction as Dictionary

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Queries the current transaction.

188.14.28 Properties

188.14.29 deviceVerificationID as String

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The device verification identifier to use to verify whether signed information is valid for the current device.
Example:

Var uuid As String = StoreKit2MBS.deviceVerificationID
MessageBox uuid

Notes: Use this property to verify whether an App Store-signed JSON Web Signature (JWS) is valid for the current device.
(Read only property)

188.14.30 ProductCount as Integer

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Queries list of products.
Notes: We cache the products we got from QueryProducts, so you can query them anytime.
This number is only filled after QueryProducts was successful.
(Read only property)

188.14.31 Constants

App Store Environments

Constant	Value	Description
AppStoreEnvironmentProduction	"Production"	A value that indicates the production server environment.
AppStoreEnvironmentSandbox	"Sandbox"	A value that indicates the sandbox server environment.
AppStoreEnvironmentXcode	"Xcode"	A value that indicates the StoreKit Testing in Xcode environment.

188.14.32 Delegates

188.14.33 BeginRefundRequestCompletedMBS(errorMessage as String, status as String)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The event called when the refund request started.
Notes: Status may be "success", "userCancelled" or "unknown".
Error may show any error message we may have got. Then status is empty.

188.14.34 FinishCompletedMBS(errorMessage as String)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The delegate for the method to call when transaction finish is completed.
Notes: We pass any error message if one happened.

188.14.35 PurchaseProductCompletedMBS(errorMessage as String, result as Dictionary)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The delegate called when purchase is completed.
Notes: If an error occurred, we pass an error message.

The result dictionary contains:

Key	Description
Result	The status, which is either success, pending, userCancelled, unknown or failed.
verified	Boolean on whether the result was verified. If false, iPhone may be jailbroken.
verificationError	If verification fails, the error message.
transaction	The details on the transaction.

188.14.36 QueryProductsCompletedMBS(errorMessage as String, products() as Dictionary)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The delegate to use with QueryProducts method.
Example:

```
Public Sub QueryProductsCompleted(errorMessage as String, products() as Dictionary)
Log CurrentMethodName

If errorMessage <>"" Then
Log "Failed to query products: "+errorMessage
End If
```

```
If products <>Nil Then
For Each product As Dictionary In products
Var id As String = product.Value("id")
Var displayName As String = product.Value("displayName")
Var description As String = product.Value("description")
Var price As double = product.Value("price")
Var displayPrice As String = product.Value("displayPrice")
Var isFamilyShareable As boolean = product.Value("isFamilyShareable")
Var type As Dictionary = product.Value("type")
Var typeValue As String = type.Value("value")

// iOS 15.4, macOS 12.3 or newer
var typeDescription as string = type.Lookup("localizedDescription", "")

log displayName+": "+displayPrice

Break // see in debugger
Next
End If
End Sub
```

Notes: We pass any error message if an error happens.
And all products are converted to dictionaries.

188.14.37 RequestAgeRangeCompletedMBS(errorMessage as String, result as Dictionary)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The delegate to report back the answer for the requestAgeRange method.
Notes: errorMessage contains message from any exception that happens. Or an error reported by our plugin like an old OS.

The result parameter contains the following keys:

Key	Description
response	declined, sharing or unknown.
lowerBound	The lower bound of the age range.
upperBound	The upper bound of the age range.
ageRangeDeclaration	guardianDeclared, selfDeclared or unknown.
activeParentalControls	Bitmask for parental controls.

Some keys may be missing if not available.

188.14.38 SyncCompletedMBS(errorMessage as String)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The delegate called when Sync method finishes.

188.14.39 TransactionsCompletedMBS(errorMessage as String, transactions() as Dictionary)

MBS Swift Plugin, Plugin Version: 25.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The delegate called to return information about transactions.
Example:

```
Public Sub TransactionsComplete(errorMessage as String, transactions() as Dictionary)
Log CurrentMethodName

If errorMessage <>"" Then
Log "Failed to get updates: "+errorMessage
End If

If transactions <>Nil Then
For Each transaction As Dictionary In transactions

Break // see in debugger
Next
End If
End Sub
```

Notes: Please check for verified value in the dictionary to know if it was verified.
If the verification failed, you may ignore it.

188.15 module StoreKitMBS

188.15.1 module StoreKitMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Globals for the StoreKit plugin.
Example:

```
// ask the user for an App Store rating after they used your app for a while
If StoreKitMBS.StoreReviewAvailable Then
StoreKitMBS.requestReview // macOS decides whether the dialog shows
End If
System.DebugLog "Receipt: " + StoreKitMBS.appStoreReceiptURL
```

Notes: Be aware that StoreKit requires your app to be signed.
Blog Entries

- MBS Xojo Plugins, version 19.1pr6

188.15.2 Methods

188.15.3 appStoreReceiptURL as string

MBS MacCloud Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Queries URL for the app store receipt file.
Example:

```
Var url As String = StoreKitMBS.appStoreReceiptURL

If url.Len >0 Then
Var file As New FolderItem(url, FolderItem.PathModes.URL)

If file.Exists then
// check it
End If
End If
```

188.15.4 available as Boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the StoreKit framework is available.
Example:

MessageBox "StoreKit available: "+str(StoreKitMBS.available)

Notes: Should always be true on Mac OS X 10.7 and newer.

188.15.5 requestReview

MBS MacCloud Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Tells StoreKit to ask the user to rate or review your app, if appropriate.
Example:

```
If StoreKitMBS.StoreReviewAvailable Then
StoreKitMBS.requestReview
End If
```

Notes: Although you should call this method when it makes sense in the user experience flow of your app, the actual display of a rating/review request view is governed by App Store policy. Because this method may or may not present an alert, it's not appropriate to call it in response to a button tap or other user action.

When you call this method while your app is still in development mode, a rating/review request view is always displayed so that you can test the user interface and experience. However, this method has no effect when you call it in an app that you distribute using TestFlight.

When you call this method in your shipping app and a rating/review request view is displayed, the system handles the entire process for you. In addition, you can continue to include a persistent link in the settings or configuration screens of your app that deep-links to your App Store product page. To automatically open a page on which users can write a review in the App Store, append the query parameter action=write-review to your product URL.

Available on MacOS 10.14 or newer.
requestReview method will only work, if StoreReviewAvailable returns true.
Does nothing if called on older OS versions.

188.15.6 SKErrorDomain as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The domain for StoreKit errors.

188.15.7 StoreReviewAvailable as Boolean

MBS MacCloud Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether SKStoreReviewController class is available.
Example:

```
If StoreKitMBS.StoreReviewAvailable Then
StoreKitMBS.requestReview
End If
```

Notes: requestReview method will only work, if StoreReviewAvailable returns true.

188.15.8 Constants

StoreKit error codes

Constant	Value	Description
SKErrorClientInvalid	1	client is not allowed to issue the request, etc.
SKErrorPaymentCancelled	2	user cancelled the request, etc.
SKErrorPaymentInvalid	3	purchase identifier was invalid, etc.
SKErrorPaymentNotAllowed	4	this machine is not allowed to make the payment
SKErrorUnknown	0	unknown error

Chapter 189

String

189.1 Globals

189.1.1 InStrByteRangeMBS(target as string, find as string, StartValue as Integer, EndValue as Integer) as Integer

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds bytes or byte ranges in a string.
Example:

```
// search for question mark or uppercase letters A to Z
MessageBox str(InStrByteRangeMBS("Hello?", "?", 65, 90)) // shows 1 as H is found.

MessageBox str(InStrByteRangeMBS("hello?", "?", 65, 90)) // shows 6 as ? is found.
```

Notes: You may want to make sure target and find are both in the same 8bit encoding (UTF-8, MacRoman, Windows ANSI, Latin 1, ASCII, etc. but not UTF16/UTF32).

The optional find string defines the bytes to search. This gives you a way to see whether one of those bytes is inside or to find the first byte matching a certain value.

The StartValue/EndValue parameters define ranges of values which you consider to match.

Returns 0 if nothing is found or the position of the found character.
See also:

- 189.1.2 InStrByteRangeMBS(target as string, find as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer) as Integer 22894

- 189.1.3 InStrByteRangeMBS(target as string, find as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer, StartValue3 as Integer, EndValue3 as Integer) as Integer 22895
- 189.1.4 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer) as Integer 22896
- 189.1.5 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer) as Integer 22897
- 189.1.6 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer, StartValue3 as Integer, EndValue3 as Integer) as Integer 22897

189.1.2 InStrByteRangeMBS(target as string, find as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer) as Integer

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds bytes or byte ranges in a string.
Example:

```
// search for question mark or uppercase letters A to Z or numbers from 0 to 9
MessageBox str(InStrByteRangeMBS("Hello?", "?", 65, 90, 48, 57)) // shows 1 as H is found.
MessageBox str(InStrByteRangeMBS("hello?", "?", 65, 90, 48, 57)) // shows 6 as ? is found
MessageBox str(InStrByteRangeMBS("Hello 123", "?", 65, 90, 48, 57)) // shows 1 as H is found.
MessageBox str(InStrByteRangeMBS("hello 123", "?", 65, 90, 48, 57)) // shows 7 as 1 is found.
```

Notes: You may want to make sure target and find are both in the same 8bit encoding (UTF-8, MacRoman, Windows ANSI, Latin 1, ASCII, etc. but not UTF16/UTF32).

The optional find string defines the bytes to search. This gives you a way to see whether one of those bytes is inside or to find the first byte matching a certain value.

The StartValue/EndValue parameters define ranges of values which you consider to match.

Returns 0 if nothing is found or the position of the found character.

- 189.1.1 InStrByteRangeMBS(target as string, find as string, StartValue as Integer, EndValue as Integer) as Integer 22893
- 189.1.3 InStrByteRangeMBS(target as string, find as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer, StartValue3 as Integer, EndValue3 as Integer) as Integer 22895

- 189.1.4 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer) as Integer 22896
- 189.1.5 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer) as Integer 22897
- 189.1.6 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer, StartValue3 as Integer, EndValue3 as Integer) as Integer 22897

189.1.3 InStrByteRangeMBS(target as string, find as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer, StartValue3 as Integer, EndValue3 as Integer) as Integer

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds bytes or byte ranges in a string.
Example:

```
// search for question mark, low byte values, high byte values or numbers from 0 to 9
MessageBox str(InStrByteRangeMBS("Hello?", "?", 0, 31, 127, 255, 48, 57 )) // shows 6 as ? is found.
MessageBox str(InStrByteRangeMBS("123", "?", 0, 31, 127, 255, 48, 57 )) // shows 1 as 1 is found.
MessageBox str(InStrByteRangeMBS(EndOfLine.Windows, "?", 0, 31, 127, 255, 48, 57 )) // shows 1 as chr(13) is found.
MessageBox str(InStrByteRangeMBS("Hello", "?", 0, 31, 127, 255, 48, 57 )) // shows 0 as nothing is found.
```

Notes: You may want to make sure target and find are both in the same 8bit encoding (UTF-8, MacRoman, Windows ANSI, Latin 1, ASCII, etc. but not UTF16/UTF32).

The optional find string defines the bytes to search. This gives you a way to see whether one of those bytes is inside or to find the first byte matching a certain value.

The StartValue/EndValue parameters define ranges of values which you consider to match.

Returns 0 if nothing is found or the position of the found character.

- 189.1.4 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer) as Integer 22896
- 189.1.5 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer) as Integer 22897

- 189.1.6 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer, StartValue3 as Integer, EndValue3 as Integer) as Integer 22897

189.1.4 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer) as Integer

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds bytes or byte ranges in a string.
Example:

```
// search for uppercase letters A to Z
MessageBox str(InStrByteRangeMBS("Hello?", 65, 90)) // shows 1 as H is found.

MessageBox str(InStrByteRangeMBS("hello?", 65, 90)) // shows 0 as nothing is found.
```

Notes: You may want to make sure target and find are both in the same 8bit encoding (UTF-8, MacRoman, Windows ANSI, Latin 1, ASCII, etc. but not UTF16/UTF32).

The optional find string defines the bytes to search. This gives you a way to see whether one of those bytes is inside or to find the first byte matching a certain value.

The StartValue/EndValue parameters define ranges of values which you consider to match.

Returns 0 if nothing is found or the position of the found character.

- 189.1.5 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer) as Integer 22897
- 189.1.6 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer, StartValue3 as Integer, EndValue3 as Integer) as Integer 22897

189.1.5 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer) as Integer

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds bytes or byte ranges in a string.
Example:

```
// search for uppercase letters A to Z or numbers from 0 to 9
MessageBox str(InStrByteRangeMBS("Hello?", 65, 90, 48, 57)) // shows 1 as H is found.
MessageBox str(InStrByteRangeMBS("hello?", 65, 90, 48, 57)) // shows 0 as nothing is found.
MessageBox str(InStrByteRangeMBS("Hello 123", 65, 90, 48, 57)) // shows 1 as H is found.
MessageBox str(InStrByteRangeMBS("hello 123", 65, 90, 48, 57)) // shows 7 as 1 is found.
```

Notes: You may want to make sure target and find are both in the same 8bit encoding (UTF-8, MacRoman, Windows ANSI, Latin 1, ASCII, etc. but not UTF16/UTF32).

The optional find string defines the bytes to search. This gives you a way to see whether one of those bytes is inside or to find the first byte matching a certain value.

The StartValue/EndValue parameters define ranges of values which you consider to match.

Returns 0 if nothing is found or the position of the found character.

- 189.1.3 InStrByteRangeMBS(target as string, find as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer, StartValue3 as Integer, EndValue3 as Integer) as Integer 22895
- 189.1.4 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer) as Integer 22896
- 189.1.6 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer, StartValue3 as Integer, EndValue3 as Integer) as Integer 22897

189.1.6 InStrByteRangeMBS(target as string, StartValue as Integer, EndValue as Integer, StartValue2 as Integer, EndValue2 as Integer, StartValue3 as Integer, EndValue3 as Integer) as Integer

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds bytes or byte ranges in a string.
Example:

```
// search for low byte values, high byte values or numbers from 0 to 9
MessageBox str(InStrByteRangeMBS("Hello?", 0, 31, 127, 255, 48, 57 )) // shows 0 as nothing is found.
MessageBox str(InStrByteRangeMBS("123", 0, 31, 127, 255, 48, 57 )) // shows 1 as 1 is found.
MessageBox str(InStrByteRangeMBS(EndOfLine.Windows, 0, 31, 127, 255, 48, 57 )) // shows 1 as chr(13) is found.
MessageBox str(InStrByteRangeMBS("Hello", 0, 31, 127, 255, 48, 57 )) // shows 0 as nothing is found.
```

Notes: You may want to make sure target and find are both in the same 8bit encoding (UTF-8, MacRoman, Windows ANSI, Latin 1, ASCII, etc. but not UTF16/UTF32).

The optional find string defines the bytes to search. This gives you a way to see whether one of those bytes is inside or to find the first byte matching a certain value.

The StartValue/EndValue parameters define ranges of values which you consider to match.

Returns 0 if nothing is found or the position of the found character.

189.1.7 InStrBytesMBS(target as string, find as string) as Integer

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the first position of one of the bytes given in the find string in the target string.
Example:

```
MessageBox str(InStrBytesMBS("Hello", "e")) // shows 2, as e is found
MessageBox str(InStrBytesMBS("Hello", "abcd")) // shows 0, as nothing is found
MessageBox str(InStrBytesMBS("Hello World", "abcd")) // shows 11, as d is found
```

Notes: You may want to make sure target and find are both in the same 8bit encoding (UTF-8, MacRoman, Windows ANSI, Latin 1, ASCII, etc. but not UTF16/UTF32).
The find string defines the bytes to search. This gives you a way to see whether one of those bytes is inside or to find the first byte matching a certain value.

Returns 0 if nothing is found or the position of the found character.

189.1.8 EncodingNameMBS(extends Text as string) as string

MBS Util Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the text encoding name for this string.
Example:

```
Var t as string = "Hello World"

MessageBox "InternetName: "+t.Encoding.InternetName
MessageBox "InternetNameMBS: "+t.Encoding.InternetNameMBS
MessageBox "EncodingNameMBS: "+t.EncodingNameMBS
```

Blog Entries

189.1.9 RemoveAccentsMBS(text as string, IgnoreCase as boolean = false) as string

MBS Util Plugin, Plugin Version: 12.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes accents from text.
Example:

```
Var s as string = "L'√©l√®ve pr√©f√©r√©"
Var a as string = RemoveAccentsMBS(s)
```

```
Var b as string = RemoveAccentsMBS(s, true)
// check values in debugger
Var x As String = RemoveAccentsMBS("‘ ,Äò ,Äô ,Ä¢ \¶¬® √Ä √Å √Ç √É √Ñ √Ö √Ü √á √à √É √Ä √Å √Â √Ã √Ä √Å √Ç √É √Ä √Å √Â √Ã √Ä √Å √Ç √É √Ä √Å √Â √Ã √Ä √Å √Ç
```

```
t.Encoding = encodings.MacRoman

while not t.EOF
Var line as string = t.ReadLine
Var items() as string = SplitCommaSeparatedValuesMBS(line)

// process items array
wend

// 2. compare with split:

Var test as string = "Hello,""World,test"",end"

Var a() as string = split(test, ",")
Var b() as string = SplitCommaSeparatedValuesMBS(test, ",")

MessageBox Join(a,EndOfLine)+EndOfLine+EndOfLine+Join(b,EndOfLine)
```

Notes: This function is better for CSV data than the Split function as it handles quoted text right.
For 17.5 we rewrote this function. Now auto detects the delimiter (comma or semicolon) if none passed. Default quote character is " if nothing is passed. Please only one character for delimiter.

Version 18.0 can detect tab character, too.

189.1.11 CheckUTF8MBS(data as ptr, size as Integer, Placeholder as string) as string

MBS Util Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns string as UTF-8 and replacing invalid UTF-8 sequences with placeholder.
Notes: This function is more save than simply DefineEncoding as it makes sure the returned text actually is valid UTF-8.
You can replace missing characters with empty text, question mark or any other symbol.

This function is overloaded, so you can directly pass in string, memoryblock or ptr+size.
Checks byte sequence with up to 4 byte long sequences. Does not verify whether code points are valid.
See also:

- 189.1.12 CheckUTF8MBS(data as string, Placeholder as string) as string 22902
- 189.1.13 CheckUTF8MBS(mem as MemoryBlock, Placeholder as string) as string 22903

189.1.12 CheckUTF8MBS(data as string, Placeholder as string) as string

MBS Util Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns string as UTF-8 and replacing invalid UTF-8 sequences with placeholder.
Example:

```
// some random bytes
Var t as string = RandomBytesStringMBS(20, false)

// and some text
t = t + " √§√√º üòÄ"

// checked
Var s as string = CheckUTF8MBS(t, "üòÇ")

MessageBox s
```

Notes: This function is more save than simply DefineEncoding as it makes sure the returned text actually is valid UTF-8.
You can replace missing characters with empty text, question mark or any other symbol.

This function is overloaded, so you can directly pass in string, memoryblock or ptr+size.
Checks byte sequence with up to 4 byte long sequences. Does not verify whether code points are valid.
See also:

- 189.1.11 CheckUTF8MBS(data as ptr, size as Integer, Placeholder as string) as string 22902
- 189.1.13 CheckUTF8MBS(mem as MemoryBlock, Placeholder as string) as string 22903

189.1.13 CheckUTF8MBS(mem as MemoryBlock, Placeholder as string) as string

MBS Util Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns string as UTF-8 and replacing invalid UTF-8 sequences with placeholder.
Example:

```
// some random bytes
Var t as string = RandomBytesStringMBS(20, false)

// and some text
t = t + " √§√√º üòÄ"

// checked in memoryblock
Var m as MemoryBlock = t
Var s as string = CheckUTF8MBS(m, "üòÇ")

MessageBox s
```

Notes: This function is more save than simply DefineEncoding as it makes sure the returned text actually is valid UTF-8.
You can replace missing characters with empty text, question mark or any other symbol.

This function is overloaded, so you can directly pass in string, memoryblock or ptr+size.
Checks byte sequence with up to 4 byte long sequences. Does not verify whether code points are valid.

189.1.14 ClearStringContentMBS(s as String) as Boolean

MBS Util Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears string content.
Example:

```
// this is a constant string
Var c As String = "Hello"

// this is an allocated string
Var a As String = c + "World"

// try to clear both
Call ClearStringContentMBS c
Call ClearStringContentMBS a

MessageBox "const: "+c+" "+Str(Len(c))+EndOfLine+"allocated: "+a+" "+Str(Len(a))
```

Notes: Overwrites content of string with zeros.
We check if this is a constant string and for those do nothing.
Returns true if we zeroed content, otherwise false.

This function can help to clear memory for passwords stored in strings.

189.1.15 ConcatBinaryStringsMBS(a as string, b as string) as string

MBS Util Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Concats the given strings with binary encoding.
Example:

```
Var a as string = "Hello"
Var b as string = "World"
Var c as string = ConcatBinaryStringsMBS(a,b)
Var d as string = ConvertEncoding(b, encodings.UTF16)
Var e as string = ConcatBinaryStringsMBS(a,d)
```

MessageBox "ConcatBinaryStringsMBS"+EndOfLine+EndOfLine+c+EndOfLine+EncodingToHexMBS(c)+EndOfLine+EndOfLine+e+EndOfLine+EncodingToHexMBS(e)

Notes: If RB concats strings the encoding is changed before concating to match the other strings.

189.1.20 ContainsWholeWordMBS(Text as String, Word as String) as boolean

MBS Util Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks whether text contains whole word.
Example:

```
// let's try a few test cases

If ContainsWholeWordMBS("Hello World", "Hello") Then
// okay
Else
Break
End If

If ContainsWholeWordMBS("Hello World", "World") Then
// okay
Else
Break
End If

If ContainsWholeWordMBS("Hello World", "ello") Then
Break
Else
// okay
End If

If ContainsWholeWordMBS("Hello World", "Worl") Then
Break
Else
// okay
End If

If ContainsWholeWordMBS("Hello World", "orld") Then
Break
Else
// okay
End If

If ContainsWholeWordMBS("Hello World!", "orld") Then
Break
Else
// okay
End If
```

Notes: This function is optimized for speed and should only be used with ASCII as it handles all unicode characters as word characters.
Returns true if whole word is found inside text.
Returns false if the word was either not found or is contained, but has other letters before/after.

This function should be faster than doing a RegEx with "\b" + word "\b", but the RegEx may handle

unicode word delimiters better.

189.1.21 CountOccurancesMBS(s as string, find as string) as Integer

MBS Util Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts the occurances of a string.
Example:

```
Var s as string

s="11111000111010101011 1"

MessageBox str(CountOccurancesMBS(s,"1")) // 14
MessageBox str(CountOccurancesMBS(s,"0")) // 7
MessageBox str(len(s)) // 21
```

Notes: Returns the number of occurances of a substring in a string.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr5
- MonkeyBread Software Releases the MBS Plugins 8.2

189.1.22 CreateStringMBS(Length as Integer, Content as String) as string

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a string based on a pattern.
Example:

```
Var c as string = CreateStringMBS(20, "Hello")
Var t as string = CreateStringMBS(10, chrb(255))
```

Break

Notes: The content string is repeated until size is matched and returned.
The string returned has the same encoding set as the content string.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.4pr5

189.1.23 DecodingFromHTMLMBS(s as string) as string

MBS Util Plugin, Plugin Version: 2.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decodes a string with HTML escaped characters.
Example:

```
Var html as string = "<p><B>Gr&uuml;&szlig;e</B></P>"
Var htmltext as string = RemoveHTMLTagsMBS(html)
Var text as string = DecodingFromHTMLMBS(htmltext)

MessageBox text // shows: Gr√º√üe
```

Notes: The source string is converted to a native string if it is not allready in ASCII. Than for every character the functions looks for the unescaped character code and returns a normal unicode string.

e.g. "München" ->"M√ºnchen"

This functions uses Xojo unicode strings, so you may need to convert back to a NativeString before saveing the string to a file. (using e.g. ConvertEncoding(string, encodings.UTF8))

May return "" on low memory conditions.
Strings and encoding work only perfectly for RB 4.5 or newer.

Speed optimized in version 2.8 to be a hundret times faster.
Added Linux support in v5.1.

The result of this function is unpredictable on bad input strings.
(e.g. no encoding, or encoding does not match the content of the string)

- MBS Xojo / Real Studio Plugins, version 15.0pr7

189.1.24 DecodingFromMySQLMBS(s as string) as string

MBS Util Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decodes a string from MySQL.
Example:

MessageBox DecodingFromMySQLMBS("test\\test\%2.doc")

Notes: Replaces all the escapes in a mysql string like (\0, \t or \\) to their binary replacement.

189.1.25 DecodingFromQuotedPrintableMBS(s as string) as string

MBS Util Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decodes a string with quoted printable encoding.
Example:

MessageBox DecodingFromQuotedPrintableMBS("Hi, =A1=92")

Notes: The decoded string is marked to have an ASCII encoding, but you may need to set the encoding to something like ISO. Than you need a text converter to make something printable from it.

May return "" on low memory conditions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.3pr9

189.1.26 DecodingFromURLMBS(s as string) as string

MBS Util Plugin, Plugin Version: 2.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decodes a string with URL escaped characters.
Example:

```
Var s as string
Var t as string
Var u as string

t="Hello World √§√√º"

s= EncodingToURLMBS(t,0)

u=DecodingFromURLMBS(s,0)
```

```
SetEncodingOfStringMBS u,GetEncodingOfStringMBS(t) // restore encoding

// Hello World √§√√º
MessageBox t
// Hello%20World%20%C3%A4%C3%B6%C3%BC
MessageBox s
// Hello World √§√√º
MessageBox u
```

Notes: Decodes an URL encoded ASCII string. The string returned is marked as a binary string (without encoding). You need to set the encoding to whatever the original was (ISO-9660 or UTF8 for example).

e.g. "Wie%20geht's%3F" ->"Wie geht's?"

May return "" on low memory conditions.
Strings and encoding work only perfectly for RB 4.5 or newer.
Added Linux support in v5.1.
See also:

- 189.1.27 DecodingFromURLMBS(s as string, options as Integer) as string 22911

189.1.27 DecodingFromURLMBS(s as string, options as Integer) as string

MBS Util Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decodes a string with URL escaped characters.
Example:

```
Var s as string
Var t as string
Var u as string

t="Hello World √§√√º"

s= EncodingToURLMBS(t,1)

u=DecodingFromURLMBS(s,1)

SetEncodingOfStringMBS u,GetEncodingOfStringMBS(t) // restore encoding

// Hello World √§√√º
MessageBox t
// Hello+World+%C3%A4%C3%B6%C3%BC
MessageBox s
// Hello World √§√√º
MessageBox u
```

Notes: Decodes an URL encoded ASCII string. The string returned is marked as a binary string (without encoding). You need to set the encoding to whatever the original was (ISO-9660 or UTF8 for example).

e.g. "Wie%20geht's%3F" ->"Wie geht's?"

May return "" on low memory conditions.
Strings and encoding work only perfectly for RB 4.5 or newer.

Pass 1 for the options parameter to get PHP/Perl compatible output (+ instead of spaces and %20 for spaces).
Added Linux support in v5.1.
See also:

- 189.1.26 DecodingFromURLMBS(s as string) as string 22910

189.1.28 DecodingFromXMLMBS(s as string) as string

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decodes a string with XML escaped characters.
Example:

```
// turn XML entities back into normal characters
MessageBox DecodingFromXMLMBS("Tom & Jerry <Cartoon>") // Tom & Jerry <Cartoon>
```

Notes: see DecodingFromHTMLMBS.

189.1.29 DetectUnicodeMarkersMBS(s as string) as Integer

MBS Util Plugin, Plugin Version: 7.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tries to get the unicode marker from the string.
Example:

```
const EncodingUnknown=0
const EncodingUTF8=1
const EncodingUTF16be=3
const EncodingUTF16le=4
const EncodingUTF32be=6
const EncodingUTF32le=7

Var text as string = "Hello World" // this text does not have a marker..
```

MessageBox str(DetectUnicodeMarkersMBS(text))

Notes: For some UTF16 LittleEndian strings this function may return UTF32.

189.1.30 EncodeEmailSubjectMBS(s as string) as string

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function:

Encodes an email subject.
Text is encoded with UTF-8 Quoted Printable encoding.
If text does not need to be encoded (pure ASCII), we return the input text.
Example:

```
MessageBox EncodeEmailSubjectMBS("Hello World")+EndOfLine+EncodeEmailSubjectMBS("Test √§√√º")
```

Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.3pr3

189.1.31 EncodingToHTMLMBS(s as string, options as Integer = 0) as string

MBS Util Plugin, Plugin Version: 2.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a string with HTML escaped characters.
Example:

```
Var f as folderItem
Var b as binaryStream

f=FolderItem.ShowSaveFileDialog("text/html","new.html")
if f<>nil then
b=f.createBinaryFile("text/html")
if b<>nil then
b.write nativeStringMBS(EncodingToHTMLMBS(editfield1.text))
b.close
end if
end if
```

Notes: The source string is converted to unicode if it is not allready in unicode. Than for every character the functions looks for the escaped character code and returns a HTML encoded string.

e.g. ”M√ºnchen” ->”München”

This functions uses Xojo unicode strings, so you may need to convert back to a NativeString before saveing the string to a file.

Return characters (chr(10) and chr(13)) are not converted to
codes.

May return ”” on low memory conditions.

The result of this function is unpredictable on bad input strings.
(e.g. no encoding, or encoding does not match the content of the string)

Options can be 1 to not encode ASCII values <128, so quotes, <, >and & are not encoded.

189.1.32 EncodingToQuotedPrintableMBS(s as string, LineLen as Integer = 72) as string

MBS Util Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a string with quoted printable characters.
Example:

```
Var a as string = ”Hello √§√√º!”
Var b as string = EncodingToQuotedPrintableMBS(a)
Var c as string = ConvertEncoding(a, encodings.ISOLatin1)
Var d as string = EncodingToQuotedPrintableMBS(c)
Var e as string = EncodeQuotedPrintable(a)
Var f as string = EncodeQuotedPrintable(c)

MessageBox b+EndOfLine+d+EndOfLine+e+EndOfLine+f
```

Notes: Line wrap is per default at 72 characters but you can pass some other positive value here.
Quoted printable encoded strings have some ISO encoding as base, you need to pass a valid ISO string to

this function to get the correct result.
May return "" on low memory conditions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.3pr9

189.1.33 EncodingToURLMBS(s as string) as string

MBS Util Plugin, Plugin Version: 2.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a string with URL escaped characters.
Example:

MessageBox EncodingToURLMBS("Wie geht's?")

Notes: Encodings a string for an URL. Use with UTF8 or ISO-9660 encoded strings. This function does not work correctly with UTF16 strings.

e.g. "Wie geht's?" ->"Wie%20geht's%3F"

May return "" on low memory conditions.
Strings and encoding work only perfectly for RB 4.5 or newer.
Added Linux support in v5.1.
See also:

- 189.1.34 EncodingToURLMBS(s as string, options as Integer) as string 22915

189.1.34 EncodingToURLMBS(s as string, options as Integer) as string

MBS Util Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a string with URL escaped characters.
Example:

```
Var s as string = "20101210 1244 - Sky Cinema +24 - Wen die Geister lieben"

MessageBox EncodingToURLMBS(s)

// gives: 20101210%201244%20-%20Sky%20Cinema%20+24%20-%20Wen%20die%20Geister%20lieben

MessageBox EncodingToURLMBS(s,1)

// gives: 20101210+1244+-+Sky+Cinema+%2B24+-+Wen+die+Geister+lieben

MessageBox EncodingToURLMBS(s,2)
```

```
// gives: 20101210%201244%20-%20Sky%20Cinema%20%2b24%20-%20Wen%20die%20Geister%20lieben
```

Notes: Encodings a string for an URL. Use with UTF8 or ISO-9660 encoded strings. This function does not work correctly with UTF16 strings.

e.g. "Wie geht's?" ->"Wie%20geht's%3F"

May return "" on low memory conditions.
Strings and encoding work only perfectly for RB 4.5 or newer.

Pass 1 for the options parameter to get PHP/Perl compatible output (+ instead of spaces and %20 for spaces).
Pass 2 for the options parameter to get plus to %2B and space to %20. Added in plugin version 10.6.

See also:

- 189.1.33 EncodingToURLMBS(s as string) as string 22915

189.1.35 EncodingToXMLMBS(s as string, options as Integer = 0) as string

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a string with XML escaped characters.
Example:

```
// escape a text before putting it into XML
Var title As String = "Tom & Jerry <Cartoon>"
Var xml As String = "<title>" + EncodingToXMLMBS(title) + "</title>"
MessageBox xml // <title>Tom & Jerry <Cartoon></title>
```

Notes: see EncodingToHTMLMBS.

189.1.36 GetStringsFromDataMBS(data as MemoryBlock, MinLength as Integer = 0) as string()

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks for strings within a data block.
Example:

```
// find readable strings of at least 6 characters in a binary file, like the strings tool
Var data As MemoryBlock = BinaryStream.Open(SpecialFolder.Desktop.Child("data.bin")).Read(1000000)
Var found() As String = GetStringsFromDataMBS(data, 6)
MessageBox found.Count.ToString + " strings found"
```

Notes: Looks over the bytes in the data block to see if there are useful byte sequences which could be text. Returns an array with all text fragments found.

This function is UTF8 aware and will work well for UTF-8 encoded text fragments.
See also:

- 189.1.37 GetStringsFromDataMBS(data as ptr, size as Integer, MinLength as Integer = 0) as string() 22917
- 189.1.38 GetStringsFromDataMBS(data as String, MinLength as Integer = 0) as string() 22917

189.1.37 GetStringsFromDataMBS(data as ptr, size as Integer, MinLength as Integer = 0) as string()

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks for strings within a data block.
Notes: Looks over the bytes in the data block to see if there are useful byte sequences which could be text. Returns an array with all text fragments found.

This function is UTF8 aware and will work well for UTF-8 encoded text fragments.
See also:

- 189.1.36 GetStringsFromDataMBS(data as MemoryBlock, MinLength as Integer = 0) as string() 22916
- 189.1.38 GetStringsFromDataMBS(data as String, MinLength as Integer = 0) as string() 22917

189.1.38 GetStringsFromDataMBS(data as String, MinLength as Integer = 0) as string()

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks for strings within a data block.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var b as BinaryStream = BinaryStream.Open(f)
Var s as string = b.Read(b.Length)
Var texts() as string = GetStringsFromDataMBS(s, 3)
```

Break

Notes: Looks over the bytes in the data block to see if there are useful byte sequences which could be text. Returns an array with all text fragments found.

This function is UTF8 aware and will work well for UTF-8 encoded text fragments.

- 189.1.37 GetStringsFromDataMBS(data as ptr, size as Integer, MinLength as Integer = 0) as string() 22917

189.1.39 GetUnicodeMarkersMBS(kind as Integer) as string

MBS Util Plugin, Plugin Version: 7.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the unicode marker with the given code.
Example:

```
const EncodingUnknown=0
const EncodingUTF8=1
const EncodingUTF16=2 // native
const EncodingUTF16be=3
const EncodingUTF16le=4
const EncodingUTF32=5 // native
const EncodingUTF32be=6
const EncodingUTF32le=7

MessageBox EncodingToHexMBS(GetUnicodeMarkersMBS(EncodingUTF8))
```

Notes: If you concat strings, RB may convert the string to UTF8.

189.1.40 HasPostfixMBS(Text as String, Prefix as String) as boolean

MBS Util Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether text has given postfix.
Example:

```
Var t as string = "Hello World"
Var p as string = "Hello"
Var w as string = "World"

if HasPrefixMBS(t, p) then
// ok
else
break
MessageBox "failed?"
end if

if HasPostfixMBS(t, w) then
// ok
else
break
MessageBox "failed?"
end if

if HasPrefixMBS(t, w) then
break
MessageBox "failed?"
else
// ok
end if

if HasPostfixMBS(t, p) then
break
MessageBox "failed?"
else
// ok
end if

Break
```

Notes: Returns true if yes, or false if not.
We may convert text to UTF-8 to compare.
Blog Entries

- MBS Xojo Plugins, version 18.5pr6

189.1.41 HasPrefixMBS(Text as String, Prefix as String) as boolean

MBS Util Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether text has given prefix.
Example:

```
Var t as string = "Hello World"
Var p as string = "Hello"
Var w as string = "World"

if HasPrefixMBS(t, p) then
// ok
else
break
MessageBox "failed?"
end if

if HasPostfixMBS(t, w) then
// ok
else
break
MessageBox "failed?"
end if

if HasPrefixMBS(t, w) then
break
MessageBox "failed?"
else
// ok
end if

if HasPostfixMBS(t, p) then
break
MessageBox "failed?"
else
// ok
end if

Break
```

Notes: Returns true if yes, or false if not.
We may convert text to UTF-8 to compare.

- MBS Xojo Plugins, version 18.5pr6

189.1.42 HexstringMBS(input as string, hexlen as Integer, linelen as Integer, linestart as string, lineend as string, spacer as string,filler as string) as string

MBS Util Plugin, Plugin Version: 2.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a hexadecimal string.
Example:

```
Var s as string
s=HexstringMBS("Hello World",2,10,"<",">"+endofline,"","0")
```

Notes: Fails if input="" or hexlen<1 or linelen<1 or on low memory conditions.
If filler is "", filler is set to "0".

Memory requirement is around 5 times the memory for input.
or exactly:
mem=20+linelen*hexlen*(1+len(filler))+2*((linelen*hexlen*len(filler)+len(lineend)+len(linestart))*(len(input)*2/hexlen))

All strings must be in the encoding you want to have.
Can raise OutOfMemoryException on low memory.

189.1.43 IsASCIIStringMBS(s as string) as boolean

MBS Util Plugin, Plugin Version: 7.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if this string is an ASCII string.
Example:

```
// check whether a text only contains ASCII characters
MessageBox IsASCIIStringMBS("Hello").ToString + " / " + IsASCIIStringMBS("Gr√º√üe").ToString // True / False
```

Notes: False if one of the characters of the string has a numeric value of 128 or higher. (->string is not a 7 bit ASCII string)
True if all bytes are in the valid ASCII range.
See also:

- 189.1.44 IsASCIIStringMBS(s as string, mode as Integer) as boolean 22921

189.1.44 IsASCIIStringMBS(s as string, mode as Integer) as boolean

MBS Util Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if this string is an ASCII string.
Notes: Does not work for 16bit unicode strings.

But it works fine with UTF8.

Mode values:

0 False if one of the characters of the string has a numeric value of 128 or higher. (->string is not a 7 bit ASCII string)
1 False if one of the characters of the string has a numeric value >128 or <32. (->string may not be printable in ASCII, which may require some kind of Base64 encoding to transfer it.)
2 False if one of the characters of the string has a numeric value below 32. (->string may contain line breaks or other control characters)

Added Linux support in v5.1.
See also:

189.1.45 JaroWinklerDistanceMBS(a as string, b as string) as Double

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the string distance.
Example:

```
Var s1 as string = "Hello"
Var s2 as string = "Hallo"
Var s3 as string = "Helo"
Var s4 as string = "Helllo"

// 0 for equal, the more it goes to 1.0

Var d1 as Double = levenshteinDistanceMBS(s1,s1)
Var d2 as Double = levenshteinDistanceMBS(s1,s2)
Var d3 as Double = levenshteinDistanceMBS(s1,s3)
Var d4 as Double = levenshteinDistanceMBS(s1,s4)

Var d5 as Double = jaroWinklerDistanceMBS(s1,s1)
Var d6 as Double = jaroWinklerDistanceMBS(s1,s2)
Var d7 as Double = jaroWinklerDistanceMBS(s1,s3)
Var d8 as Double = jaroWinklerDistanceMBS(s1,s4)

break // check values in debugger
```

Notes: Value is normalized, so 0.0 is equal text and 1.0 is totally unequal.

189.1.46 LevenshteinDistanceMBS(a as string, b as string) as Double

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the string distance.
Example:

```
Var s1 as string = "Hello"
Var s2 as string = "Hallo"
Var s3 as string = "Helo"
Var s4 as string = "Helllo"

// 0 for equal, the more it goes to 1.0

Var d1 as Double = levenshteinDistanceMBS(s1,s1)
Var d2 as Double = levenshteinDistanceMBS(s1,s2)
Var d3 as Double = levenshteinDistanceMBS(s1,s3)
Var d4 as Double = levenshteinDistanceMBS(s1,s4)

Var d5 as Double = jaroWinklerDistanceMBS(s1,s1)
Var d6 as Double = jaroWinklerDistanceMBS(s1,s2)
Var d7 as Double = jaroWinklerDistanceMBS(s1,s3)
Var d8 as Double = jaroWinklerDistanceMBS(s1,s4)

break // check values in debugger
```

Notes: Value is normalized, so 0.0 is equal text and 1.0 is totally unequal.

189.1.47 NativeStringMBS(s as string) as string

MBS Util Plugin, Plugin Version: 2.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a native string with the given string as content.
Example:

```
// convert a text to the native platform encoding
Var s As String = NativeStringMBS("Gr√º√üe")
MessageBox s + " (" + s.Encoding.InternetName + ")"
```

Notes: If the string in the parameter s is allready native it is returned unchanged and without allocating additional memory. Else the string is copied into a new string with native characters.
On Mac OS Classic native means MacRoman encoding, on Mac OS X it's UTF8 and on Windows the ANSI Codepage.
May return "" on low memory conditions.
Strings and encoding work only perfectly for RB 4.5 or newer.
Added Linux support in v5.1.

189.1.48 RandomBytesStringMBS(Length as Integer, ASCII as boolean=false) as string

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a string with random content.
Example:

```
Var s as string

s = RandomBytesStringMBS(10, true)

MessageBox s

s = RandomBytesStringMBS(10, false)

MessageBox s
```

Notes: Length is the number of bytes in the string.
If ASCII is true the string returned in an ASCII string.

189.1.49 RemoveHTMLTagsMBS(AsciiTextWithTags as string) as string

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes all html tags from the string.
Example:

```
Var s As String = "<div><P param=""value""><Hello</P></div>"
Var t As String = RemoveHTMLTagsMBS(s)

MessageBox t // returns "Hello"
```

Notes: Returns "" on low memory.
Written to be used with UTF8 strings.
Added Linux support in v5.1.
Blog Entries

189.1.50 RemoveHTMLTagsWithMBS(AsciiTextWithTags as string, Replacement as string) as string

MBS Util Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes all html tags from the string and replaces them with the replacement string.
Example:

```
MessageBox RemoveHTMLTagsWithMBS("<P>Hello</P>"," ") // returns " Hello "
```

Notes: Returns "" on low memory.
Written to be used with UTF8 strings.

189.1.51 ReplaceLineEndingsMBS(Text as String, NewLine as String, yield as boolean = false) as String

MBS Util Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces line endings.
Example:

```
Var s as string = "Some text"
Var t as string = ReplaceLineEndingsMBS(s, endofline.Unix)
```

Notes: Whether we got CR, LF, CRLF or even LFCR, we'll replace it with the given replacement text.
If yield is true, we yield to other Xojo threads every 16 MB of input text to keep other threads responsive.

Handles UTF16/UTF32 by converting first to UTF-8.
Other 8 bit encodings (or no encoding set) are passed through.

Returns new text. May raise OutOfMemoryException in case of no memory available.
Blog Entries

- MBS Xojo Plugins, version 19.0pr7
- New ReplaceLineEndingsMBS function

189.1.52 ReplaceNonPrintableCharactersMBS(s as string, replacevalue as Integer=46) as string

MBS Util Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces bytes in the string which are not printable with the given byte value.
Example:

```
MessageBox ReplaceNonPrintableCharactersMBS("Hello World")
MessageBox ReplaceNonPrintableCharactersMBS("Hello √§√√º World")
MessageBox ReplaceNonPrintableCharactersMBS("Hello √§√√º World",32)
```

Notes: All bytes in range 32 to 127 are copied and all others replaces with the given byte value. Default is 46 which is a dot.
Returns always an ASCII string.
On low memory this function returns an empty string.
Blog Entries

- New ReplaceLineEndingsMBS function

189.1.53 ScientificStrMBS(d as Double, digits as Integer) as string

MBS Util Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the given value formatted as scientific number with the given number of digits.
Example:

```
Var d as Double = 3.1415926535897

MessageBox ScientificStrMBS(d,6)+EndOfLine+ScientificStrMBS(d,9)
```

Blog Entries

189.1.54 SplitMBS(value as String, delimiter as String = " ") as String()

MBS DataTypes Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Splits string.
Example:

```
Var a() as string = SplitMBS("Hello World Test", " ")
Var b() as string = SplitMBS("Gr√º√üe", "")
Var c() as string = SplitMBS("Just$ test$ a$ test$ test", "$ test$ ")

break
```

Notes: Similar to the Split() function, but without the problems we see with Split function. See feedback cases for Split.

If delimiter is "", we return an array with all characters in string.
Else we split given string with delimiter.

189.1.55 SQLReplaceBooleanMBS(SQL as string) as string

MBS Util Plugin, Plugin Version: 10.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces all false/true strings with 0/1 and handles quotes correctly.
Example:

```
MessageBox SQLReplaceBooleanMBS("INSERT INTO criteria VALUES ('1','9999','0001','000001557',false);")
```

Notes: SQLite used in REALSQLDatabase does not like false and true literals for boolean values. You need to use 0 and 1. So this function helps you converting old queries using false/true.
false and true inside a quoted string are not changed.
Blog Entries

- MBS Plugins 10.3 Release Notes

189.1.56 StrCompBytesMBS(a as string, b as string) as Integer

MBS Util Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares two strings.
Example:

MessageBox str(StrCompBytesMBS("Hello","hello"))

Notes: Returns zero if the two strings are identical.
Returns 1 or -1 if the strings are different.
Empty strings are equal.

Compares the bytes of both strings independent of the text encoding.

So if a="A" in UTF-8 and b="A" in UTF-16 they will not be equal!

189.1.57 StrCompCharactersMBS(a as string, b as string) as Integer

MBS Util Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares two strings.
Example:

MessageBox str(StrCompCharactersMBS("Hello","hello"))

Notes: Returns zero if the two strings are identical.
Returns 1 or -1 if the strings are different.
Empty strings are equal.

Compares the characters of both strings. If the text encodings are not equal, they are both converted to UTF-8 before comparing them.

So if a="A" in UTF-8 and b="A" in UTF-16 they will be equal!

189.1.58 StringANDMBS(a as string,b as string) as string

MBS Util Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a binary AND on the bytes from the both strings.
Example:

```
// mask bits of binary data with an AND operation
Var data As String = ChrB(&hFF) + ChrB(&h0F) + ChrB(&hAA)
Var mask As String = ChrB(&h0F) + ChrB(&hFF) + ChrB(&hF0)
MessageBox EncodeHex(StringANDMBS(data, mask)) // 0F0FA0
```

Notes: If a is "" or memory is low, the result is "".
If b is shorter as a the b string is used several times.
The function is optimized for several cases, e.g. the case where b is only one, two or four bytes long.
Returns a string with binary encoding. Before using this function, make sure both strings have the same encoding.
Added Linux support in v5.1.

189.1.59 StringIsHTMLreadyMBS(s as string) as boolean

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Test whether a string is html safe.
Example:

```
Function html(t as string) As string
#pragma disablebackgroundtasks
#pragma disableautowaitcursor

if StringIsHTMLreadyMBS(t) then
Return t
else
t=EncodingToHTMLMBS(t)
Return ConvertEncoding(t,encodings.UTF8)
end if
End Function
```

Notes: String which are not html safe, need to go through EncodingToHTMLMBS.
Using this function saves a lot of time!

Returns true for strings which are html safe.

189.1.60 StringIsXMLreadyMBS(s as string) as boolean

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Test whether a string is xml safe.
Example:

```
// check whether a text can go into XML without escaping
Var a As String = "Hello World"
Var b As String = "Tom & Jerry"
MessageBox StringIsXMLreadyMBS(a).ToString + " / " + StringIsXMLreadyMBS(b).ToString // True / False
```

Notes: String which are not html safe, need to go through EncodingToXMLMBS.
Using this function saves a lot of time!

Returns true for strings which are xml safe.

189.1.61 StringORMBS(a as string,b as string) as string

MBS Util Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a binary OR on the bytes from the both strings.
Example:

```
// combine bit flags of binary data with an OR operation
Var a As String = ChrB(&h01) + ChrB(&h10)
Var b As String = ChrB(&h02) + ChrB(&h20)
MessageBox EncodeHex(StringORMBS(a, b)) // 0330
```

Notes: If a is "" or memory is low, the result is "".
If b is shorter as a the b string is used several times.
The function is optimized for several cases, e.g. the case where b is only one, two or four bytes long.
Returns a string with binary encoding. Before using this function, make sure both strings have the same encoding.
Added Linux support in v5.1.

189.1.62 StringXOR2MBS(data as string, XorMask as string, MaskOffset as Integer = 0) as string

MBS Util Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a binary XOR on the bytes from the both strings.
Example:

```
Var s as string = StringXORMBS("Hello", "World")
Var t as string = StringXOR2MBS("Hello", "World")

MessageBox EncodeHex(S)+" "+EncodeHex(t)

Var ss as string = StringXORMBS(s, "World")
Var tt as string = StringXOR2MBS(t, "World")

MessageBox ss+" "+tt
```

Notes: If data is "" or memory is low, the result is "".
If XorMask is shorter as data the XorMask string is used several times.
Returns a string with binary encoding. Before using this function, make sure both strings have the same encoding.

The difference between StringXORMBS and StringXOR2MBS is that the second version xors also with position of byte in string, so your text looks a little bit more random.
MaskOffset specifies where in the XorMask string to start. This is useful for partial blocks.
Blog Entries

- MBS Real Studio Plugins, version 12.3pr8

189.1.63 StringXORMBS(data as string, XorMask as string, MaskOffset as Integer = 0) as string

MBS Util Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a binary XOR on the bytes from the both strings.
Example:

```
// obfuscate a text with a XOR mask and restore it again
Var mask As String = "secret"
Var hidden As String = StringXORMBS("Hello World", mask)
Var restored As String = StringXORMBS(hidden, mask) // XOR twice gives the original
MessageBox EncodeHex(hidden) + EndOfLine + restored.DefineEncoding(Encodings.UTF8)
```

Notes: If data is "" or memory is low, the result is "".
If XorMask is shorter as data the XorMask string is used several times.
The function is optimized for several cases, e.g. the case where b is only one, two or four bytes long.
Returns a string with binary encoding. Before using this function, make sure both strings have the same encoding.
MaskOffset specifies where in the XorMask string to start. This is useful for partial blocks.

189.1.64 StrMBS(d as Double) as string

MBS Util Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Formats numbers more human readable
Example:

```
// shows: 0.000000012339 1.234560e-8
MessageBox StrMBS(0.00000001234)+" "+str(0.00000001234)

// shows 123456789.0 1.234568e+8
MessageBox StrMBS(123456789.0)+" "+str(123456789.0)
```

Notes: The idea is to have a dynamically changing number of digits. We have no scientific notation and up to 15 digits visible (not counting zeros).
Blog Entries

189.1.65 UnicodeStringMBS(s as string) as string

MBS Util Plugin, Plugin Version: 2.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a unicode string with the given string as content.
Example:

```
// convert a text to UTF-16
Var u As String = UnicodeStringMBS("Hello")
MessageBox u.Bytes.ToString + " bytes in " + u.Encoding.InternetName
```

Notes: If the string in the parameter s is allready unicode it is returned unchanged and without allocating additional memory. Else the string is copied into a new string with unicode (16bit) characters.
May return "" on low memory conditions.
Strings and encoding work only perfectly for RB 4.5 or newer.
Added Linux support in v5.1.

The result of this function is unpredictable on bad input strings.
(e.g. no encoding, or encoding does not match the content of the string)

189.1.66 ConvertUnicodeToCharacterCompositionMBS(text as string) as string

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts unicode characters to composed normalization form.
Example:

```
Var s1 as string = ConvertUnicodeToCharacterDecompositionMBS("√§")

MessageBox s1+": "+EncodeHex(s1)
// shows √§: 61CC88

Var s2 as string = ConvertUnicodeToCharacterCompositionMBS("√§")

MessageBox s2+": "+EncodeHex(s2)
// shows √§: C3A4
```

Notes: This function replaces character represented by decomposed representation with the composed representation.

https://en.wikipedia.org/wiki/Unicode_equivalence
Blog Entries

- MBS Xojo Plugins, version 22.1pr1

189.1.67 ConvertUnicodeToCharacterDecompositionMBS(text as string) as string

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts unicode characters to decomposed normalization form.
Example:

```
Var s1 as string = ConvertUnicodeToCharacterDecompositionMBS("√§")

MessageBox s1+": "+EncodeHex(s1)
// shows √§: 61CC88

Var s2 as string = ConvertUnicodeToCharacterCompositionMBS("√§")

MessageBox s2+": "+EncodeHex(s2)
// shows √§: C3A4
```

Notes: This function replaces character represented by one unicode character by the decomposed variant.

189.1.68 DecodingFromCP1252MBS(s as string) as string

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decodes a string with ISO 8859 encoding.
Example:

```
// read Windows codepage 1252 text, e.g. from an old CSV file
Var raw As String = ChrB(&h47) + ChrB(&h72) + ChrB(&hFC) + ChrB(&hDF) + ChrB(&h65) +
ChrB(&h20) + ChrB(&h80)
MessageBox DecodingFromCP1252MBS(raw) // Gr√º√üe ,Ç¨
```

Notes: The source string must be really an CP1252 string!
The string returned is Unicode and you may try NativeString to make a string you can display better.

May return "" on low memory conditions.
Strings and encoding work only perfectly for RB 4.5 or newer.
Added Linux support in v5.1.

189.1.69 DecodingFromHexMBS(s as string) as string

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decodes a Hex string to a binary string.
Example:

```
Var s as String

s=EncodingToHexMBS("Hallo")

MessageBox DecodingFromHexMBS(s)
```

Notes: May return "" on low memory conditions.
Added Linux support in v5.1.
The string returned has no defined string encoding, so use DefineEncoding on the result if needed.

189.1.70 DecodingFromISO8859MBS(s as string) as string

MBS Util Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decodes a string with ISO 8859 encoding.

Example:

```
Var s as String

s=EncodingToISO8859MBS("hallo √§√√º")

MessageBox s

s=DecodingFromISO8859MBS(s)

MessageBox s

s=NativeStringMBS(s)

MessageBox s
```

Notes: The source string must be really an ISO 8859-1 string!
The string returned is Unicode and you may try NativeString to make a string you can display better.

May return "" on low memory conditions.
Strings and encoding work only perfectly for RB 4.5 or newer.
Added Linux support in v5.1.

189.1.71 EncodingToCP1252MBS(s as string) as string

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a string encoded with Codepage 1252.
Example:

```
// convert a text to Windows codepage 1252 before writing it into a legacy file
Var text As String = "Gr√º√üe f√ºr 5 ,Ç¨"
Var cp1252 As String = EncodingToCP1252MBS(text)
MessageBox text.Bytes.ToString + " bytes UTF-8, " + cp1252.Bytes.ToString + " bytes CP1252"
```

Notes: The string is converted to Unicode (if it's not allready Unicode) and than encoded to a CP 1252 string which is returned with encoding set to binary.
(other encodings are available, but currently not in the plugin)

May return "" on low memory conditions.
Strings and encoding work only perfectly for RB 4.5 or newer.
Added Linux support in v5.1.

189.1.72 EncodingToHexMBS(s as string) as string

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Encodes a binary string to a hex string.
Example:

```
Var s1 as string = "Hello World"
Var s2 as string = EncodingToHexMBS(s1)

Var t1 as string = "Umlauts √§√√º"
Var t2 as string = EncodingToHexMBS(t1)

Var u as new UUIDMBS
Var u1 as string = u.ValueString
Var u2 as string = EncodingToHexMBS(u1)

break // see variables in debugger
```

Notes: May return "" on low memory conditions.
Added Linux support in v5.1.

189.1.73 EncodingToISO8859MBS(s as string) as string

MBS Util Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a string encoded with ISO 8859-1.
Example:

```
Var s as String

s=EncodingToISO8859MBS("hallo √§√√º")

MessageBox s

s=DecodingFromISO8859MBS(s)

MessageBox s

s=NativeStringMBS(s)

MessageBox s
```

Notes: The string is converted to Unicode (if it's not allready Unicode) and than encoded to a ISO 8859-1 string which is returned with encoding set to binary.
(other encodings are available, but currently not in the plugin)

May return "" on low memory conditions.
Strings and encoding work only perfectly for RB 4.5 or newer.
Added Linux support in v5.1.

189.1.74 JoinDataMBS(blocks() as memoryblock) as string

MBS DataTypes Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Joins an array of memoryblocks in new string.
Example:

```
Var s() as MemoryBlock

// make memoryblock with a space character
Var m as MemoryBlock = "Hello"

s.Add m
s.Add m
s.Add m

// now join
Var r as string = JoinDataMBS(s)

// define to be ASCII:
r = DefineEncoding(r, encodings.ASCII)

// and show
MessageBox r
```

Notes: Returned string has no encoding defined.
Raises OutOfMemoryException in case of low memory.
See also:

- 189.1.75 JoinDataMBS(strings() as string) as string 22937
- 189.1.76 JoinDataMBS(values() as Variant) as string 22938

189.1.75 JoinDataMBS(strings() as string) as string

MBS DataTypes Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Joins an array of strings in new string.
Example:

```
Var s() as string

s.Add "Hello"
s.Add " "
s.Add "World"

// now join
Var r as string = JoinDataMBS(s)

// define to be ASCII:
r = DefineEncoding(r, encodings.ASCII)

// and show
MessageBox r
```

Notes: Returned string has no encoding defined.
Raises OutOfMemoryException in case of low memory.
See also:

- 189.1.74 JoinDataMBS(blocks() as memoryblock) as string 22937
- 189.1.76 JoinDataMBS(values() as Variant) as string 22938

189.1.76 JoinDataMBS(values() as Variant) as string

MBS DataTypes Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Joins an array of variants in new string.
Example:

```
Var s() as Variant

// make memoryblock with a space character
Var m as new MemoryBlock(1)
m.Int8Value(0) = 32

s.Add "Hello"
s.Add m
s.Add "World"

// now join
Var r as string = JoinDataMBS(s)

// define to be ASCII:
r = DefineEncoding(r, encodings.ASCII)

// and show
```

MessageBox r

Notes: Variants can be memoryblocks or strings or normal objects which can give stringValue.
Returned string has no encoding defined.
Raises OutOfMemoryException in case of low memory.

See also:

- 189.1.74 JoinDataMBS(blocks() as memoryblock) as string 22937
- 189.1.75 JoinDataMBS(strings() as string) as string 22937

189.1.77 JoinStringMBS(strings() as string) as string

MBS DataTypes Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Joins an array of strings in new string.
Example:

```
Var s() as string

s.Add "Hello"
s.Add " "
s.Add "World"

Var r as string = JoinStringMBS(s)

MessageBox r
```

Notes: Converts all strings if necessary into UTF-8. If you want to join them as they are, please use JoinDataMBS.
Raises OutOfMemoryException in case of low memory.
See also:

- 189.1.78 JoinStringMBS(values() as Variant) as string 22939

189.1.78 JoinStringMBS(values() as Variant) as string

MBS DataTypes Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Joins an array of strings in new string.
Example:

```
Var s() as Variant

s.Add "Hello"
s.Add " "
s.Add "World"

Var r as string = JoinStringMBS(s)

MessageBox r
```

Notes: Converts all strings if necessary into UTF-8.
Raises OutOfMemoryException in case of low memory.
Blog Entries

- Split and Join strings
- MBS Xojo / Real Studio Plugins, version 14.2pr3

See also:

- 189.1.77 JoinStringMBS(strings() as string) as string 22939

189.1.79 StringCodePointsMBS(text as string) as UInt32()

MBS DataTypes Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Query unicode code points for a text.
Example:

```
// take Hello World in Japanese
Var Text As String = "„Åì„Çì„Å´„Å°„ÅØ‰ñÁïå"

// get code points
Var v() As UInt32 = StringCodePointsMBS(Text)

// check in debugger
Break
```

Notes: We get text as UTF32 and return you the characters as an array of numbers.

Can be faster than Xojo's character iterator as we don't construct temporary strings and an iterator object here.

189.2 class StringHandleMBS

189.2.1 class StringHandleMBS

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for attaching strings together very fast.
Example:

```
Var s as StringHandleMBS

s=new StringHandleMBS

// Add some text
s.Add "Hello"
s.Add " "
s.Add "World"

// Insert a string
s.Insert " great",6

// check it
MessageBox s.Copy

// Delete the great from above
s.Delete 6,7

// check
MessageBox s.Copy

// Insert again
s.Insert " great ",6

// check
MessageBox s.Copy

// Now we extract the middle, so it's deleted
MessageBox s.Extract(6,7)

// check again
MessageBox s.copy
```

Notes: The class initalized itself on the first use.

189.2.2 Methods

189.2.3 Add(data as MemoryBlock)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds data from memoryblock to the string handle.
See also:

- 189.2.4 Add(data as Ptr, size as Integer) 22943
- 189.2.5 Add(data as string) 22943
- 189.2.6 Add(data as StringHandleMBS) 22943

189.2.4 Add(data as Ptr, size as Integer)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds data from ptr to the string handle with given size.
Notes: Using invalid Ptr or size combination can cause a crash.
See also:

- 189.2.3 Add(data as MemoryBlock) 22942
- 189.2.5 Add(data as string) 22943
- 189.2.6 Add(data as StringHandleMBS) 22943

189.2.5 Add(data as string)

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the string at the end of the current data.
Notes: Note that all strings added must have the same encoding.
See also:

- 189.2.3 Add(data as MemoryBlock) 22942
- 189.2.4 Add(data as Ptr, size as Integer) 22943
- 189.2.6 Add(data as StringHandleMBS) 22943

189.2.6 Add(data as StringHandleMBS)

MBS DataTypes Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds content of other string handle to this one.
Example:

```
Var s1 As New StringHandleMBS

s1.add "Hello World"

Var s2 As New StringHandleMBS

s2.add "Got: "
s2.add s1

MessageBox s2.Copy
```

Notes: Just like asking first StringHandle for content as string or Memoryblock and then adding that to the target one. But without the intermediate copying.
See also:

- 189.2.3 Add(data as MemoryBlock) 22942
- 189.2.4 Add(data as Ptr, size as Integer) 22943
- 189.2.5 Add(data as string) 22943

189.2.7 AddByte(value as UInt8)

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a byte to the string handle.

189.2.8 AddInteger(value as Int64)

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a integer value to the string handle.
Notes: This is like AddString(str(value)).

189.2.9 Clear

MBS DataTypes Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the string handle.
Notes: Resets size to zero, but does not release memory, so it can be reused.

189.2.10 clone as StringHandleMBS

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new StringHandleMBS object with the same content.

189.2.11 Constructor

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor of this class.
See also:

- 189.2.12 Constructor(InitValue as MemoryBlock) 22945
- 189.2.13 Constructor(initvalue as string) 22945

189.2.12 Constructor(InitValue as MemoryBlock)

MBS DataTypes Plugin, Plugin Version: 23.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes a StringHandle and inserts the content of the memoryblock.
See also:

- 189.2.11 Constructor 22944
- 189.2.13 Constructor(initvalue as string) 22945

189.2.13 Constructor(initvalue as string)

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The second constructor of this class which sets the value directly to the given Xojo string.
Example:

```
// An utility function you can define in a module:

Function BinaryReplaceAll(s as string, a as string,b as string) As string
Var h as StringHandleMBS

h=new StringHandleMBS(s)
h.ReplaceAll(a,b)

Return h.Copy
End Function
```

See also:

- 189.2.11 Constructor 22944
- 189.2.12 Constructor(InitValue as MemoryBlock) 22945

189.2.14 Copy as string

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the content as a Xojo string.
Notes: This string will have the encoding set in the encoding property.

189.2.15 CopyMemory as MemoryBlock

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies content of handle in new memoryblock.

189.2.16 Delete(start as Integer, lengthBytes as Integer)

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes the bytes within the range.
Notes: One based like RB's string functions.
The start and length parameters use bytes not characters as unit. You can use the Copy method to get a RB string for characterwise editing.

189.2.17 Extract(start as Integer, lengthBytes as Integer) as string

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a part of the string.
Notes: One based and the returned part is removed form the string data.
The start and length parameters use bytes not characters as unit. You can use the Copy method to get a RB string for characterwise editing.

189.2.18 FindByte(value as UInt8, StartByteOffset as Integer = 1) as Integer

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds position of a given value.
Example:

```
Var s As New StringHandleMBS("Hello")

// 64 = big letters
// +32 = small letters
// + 5 = for 5th letter in alphabet

Var c As Integer = 64+32+5
Var p As Integer = s.FindByte(c)

MessageBox "position "+Str(p)+" for letter e"
```

Notes: Returns one based byte offset.
Result is 0 if not found.

StartPosition added in v21.3.

See also:

- 189.2.19 FindByte(values() as UInt8, StartByteOffset as Integer = 1) as Integer 22947

189.2.19 FindByte(values() as UInt8, StartByteOffset as Integer = 1) as Integer

MBS DataTypes Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds position of a given value.
Example:

```
Var s As New StringHandleMBS("Hello Welt")

Var values() As UInt8
values.Add Asc("e")
values.Add Asc("o")
Var p As Integer = s.FindByte(values, 3)

MessageBox "position "+Str(p)+" for letter "+s.Mid(p, 1)
```

Notes: Values is an array of possible values to find.
For best performance avoid duplicates in that array.

Returns one based byte offset.
Result is 0 if not found.
See also:

- 189.2.18 FindByte(value as UInt8, StartByteOffset as Integer = 1) as Integer 22946

189.2.20 FirstNonWhiteSpace(StartByteOffset as Integer = 1) as Integer

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds first non-whitespace byte in the data starting at given offset.
Example:

```
Var s As New StringHandleMBS("Hello World")
Var p As Integer = s.FirstWhiteSpace(1)
Var x As Integer = s.FirstNonWhiteSpace(p+1)

MessageBox "position "+Str(p)+" for white space and "+Str(x)+" for following text"
```

Notes: StartByteOffset is one based.
White space are space, tab and new line characters.
Returns 0 if not found.

189.2.21 FirstWhiteSpace(StartByteOffset as Integer = 1) as Integer

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds first whitespace byte in the data starting at given offset.
Example:

```
Var s As New StringHandleMBS("Hello World")
Var p As Integer = s.FirstWhiteSpace(1)
Var x As Integer = s.FirstNonWhiteSpace(p+1)

MessageBox "position "+Str(p)+" for white space and "+Str(x)+" for following text"
```

Notes: StartByteOffset is one based.
White space are space, tab and new line characters.
Returns 0 if not found.

189.2.22 Insert(data as string, position as Integer)

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts the string data at the given byte position.
Notes: One based.
Note that on Unicode the character position and the byte position are not equal!
(On 16bit Unicode charpos=2*bytepos and on US ASCII charpos=bytepos)

The position parameter uses bytes not characters as unit. You can use the Copy method to get a RB string for characterwise editing.

189.2.23 InStr(OffsetBytes as Integer = 1, target as String, EndOffsetBytes as Integer = -1) as Integer

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for a binary string inside the StringHandle.
Example:

```
// We test if RB returns the same values as the plugin

Var s as String
Var h as StringHandleMBS

s="Christian"
h=new StringHandleMBS
```

h.Add s

```
MessageBox "MBS: "+str(h.InStr("is"))+", RB: "+str(InStr(s,"is"))
MessageBox "MBS: "+str(h.InStr(5,"ia"))+", RB: "+str(InStr(5,s,"ia"))
MessageBox "MBS: "+str(h.InStr("xy"))+", RB: "+str(InStr(s,"xy"))
```

Notes: The same as InStr but with a second parameter to specify the start of the search inside the string handled.

The srcOfs parameter uses bytes not characters as unit. You can use the Copy method to get a RB string for characterwise editing.

Returns positive value if something is found and zero in case nothing is found.
Returns negative value in case of error.
Casesensitive search!

189.2.24 InStrUTF8(OffsetCharacters as Integer = 1, target as String, EndOffsetCharacters as Integer = -1) as Integer

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches for a binary string inside the StringHandle.
Example:

```
Var sh As New StringHandleMBS
sh.Encoding = sh.encodingUTF8 // so copy gives right encoding

sh.Add "√Ñ test Hello Word √§√ºº test string."

Var s As String = sh.Copy

MessageBox "position of text: "+Str(sh.InStr(5,"test"))+"/"+Str(s.InStrB(5,"test"))+"th byte "+_
"or "+Str(sh.InStrUTF8(5,"test"))+"/"+Str(s.InStr(5,"test"))+"th character"
```

Notes: This function uses UTF8 characters instead of bytes as unit.
Returns positive value if something is found and zero in case nothing is found.
Returns negative value in case of error.
The same as InStrUTF8 but with a second parameter to specify the start of the search inside the string handle.
Casesensitive search!

189.2.25 IsValidASCII(data as ptr, TotalByteLength as integer) as Boolean

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether given data is valid ASCII text.

189.2.26 IsValidUTF8(data as ptr, TotalByteLength as integer) as Boolean

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether given data is valid UTF-8 text.

189.2.27 Left(lengthBytes as Integer) as string

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a copy of the first left bytes of the string.
Notes: May return less strings if the stored string is not long enough.

The length parameter uses bytes not characters as unit. You can use the Copy method to get a RB string for characterwise editing.

189.2.28 LeftUTF8(lengthCharacter as integer) as string

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries given number of characters from string from the left side.
Example:

```
Var s As String = "Hello √√§√º!"
Var d As New StringHandleMBS(s)

d.Encoding = d.encodingUTF8

// √ is two bytes
MessageBox d.LeftUTF8(8)+" in UTF8 and "+d.Left(8)+" in bytes"
```

189.2.29 Mid(startByte as Integer, lengthBytes as Integer) as string

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a part of the string.
Notes: One based.
The length parameter uses bytes not characters as unit. You can use the Copy method to get a RB string for characterwise editing.

189.2.30 MidInteger(startByte As Integer, lengthBytes As Integer = -1) as Int64

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts some bytes read as ASCII text to number.
Example:

```
Var s As New StringHandleMBS("123456789")

Var v As Integer = s.MidInteger(3,3)
MessageBox str(v)
```

Notes: startByte is one based.

189.2.31 MidUTF8(startCharacter as integer, lengthCharacter as integer) as string

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries characters from UTF-8 string with given characters.
Example:

```
Var s As String = "Hello √√§√º!"
Var d As New StringHandleMBS(s)

d.Encoding = d.encodingUTF8

// √ is two bytes
MessageBox d.MidUTF8(7,4)+" in UTF8 and "+d.Mid(7,4)+" in bytes"
```

Notes: startCharacter starts with 1 as in Xojo's mid function.

189.2.32 Replace(a as String, b as string)

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces the first string found with content of a with the content of b.
Example:

```
Var s as StringHandleMBS

s=new StringHandleMBS

s.Add "Hallo Leutle, Hellau"

s.Replace("H","h")
s.Replace("l","i")

MessageBox s.Copy+" "+str(s.Len)
```

Notes: Note that all strings are compared binary and must have the same encoding.
Basicly this is just a call to instr, one to delete and one to insert.
See also:

- 189.2.33 Replace(startpos as Integer, a as String, b as string) 22952

189.2.33 Replace(startpos as Integer, a as String, b as string)

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces the first string found with content of a with the content of b.
Notes: If you don't give a startpos parameter the call uses one and is equal to Replace(a,b).
Startpos is one based like all indexes in this class.
The startpos parameter uses bytes not characters as unit. You can use the Copy method to get a RB string for characterwise editing.
See also:

- 189.2.32 Replace(a as String, b as string) 22951

189.2.34 ReplaceAll(a as String, b as string)

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces all strings with content of a with the content of b.
Example:

```
Var s as StringHandleMBS

s=new StringHandleMBS

s.Add "Hallo Leutle, Hellau"

s.Replaceall("H","h")
```

s.Replaceall("l","i")

MessageBox s.Copy+" "+str(s.Len)

Notes: Note that all strings are compared binary and must have the same encoding.
Basicly this is just a loop with calls to instr, to delete and to insert.
See also:

- 189.2.35 ReplaceAll(startpos as Integer, a as String, b as string) 22953

189.2.35 ReplaceAll(startpos as Integer, a as String, b as string)

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces all strings with content of a with the content of b.
Notes: If you don't give a startpos parameter the call uses one and is equal to ReplaceAll(a,b).
Startpos is one based like all indexes in this class.

The startpos parameter uses bytes not characters as unit. You can use the Copy method to get a RB string for characterwise editing.
See also:

- 189.2.34 ReplaceAll(a as String, b as string) 22952

189.2.36 Reverse as StringHandleMBS

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reverses bytes in string.
Example:

```
Var s As New StringHandleMBS("Hello")
Var r As StringHandleMBS = s.Reverse

MessageBox r.Copy
```

Notes: Returns copy of the string with reversed order.

189.2.37 Right(lengthBytes as Integer) as string

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a copy of the first right bytes of the string.
Example:

```
// There was a small bug in the Right and the Mid function for the version 3.1 of this plugin.
// This test failed in 3.1, but works in 3.2:

Var Text as StringhandleMBS
Var Part as String

Text = New StringHandleMBS
Text.Add "." + chr(13) + chr(10)

Part = Text.Copy
' Now Part is ".<CR><LF" which is correct

if lenb(Part)<>3 then
MessageBox "Failed on Copy "+str(lenb(Part))
end if

Part = Text.Right(1)
' Now Part is "<LF>" which is correct

if lenb(Part)<>1 then
MessageBox "Failed on Right(1) "+str(lenb(Part))
end if

Part = Text.Right(2)
' Now Part is "<CR><LF>" which is correct

if lenb(Part)<>2 then
MessageBox "Failed on Right(2) "+str(lenb(Part))
end if

Part = Text.Right(3)
' Now Part is "" which is wrong!

if lenb(Part)<>3 then
MessageBox "Failed on Right(3) "+str(lenb(Part))
end if
```

Notes: May return less strings if the stored string is not long enough.
The length parameter uses bytes not characters as unit. You can use the Copy method to get a RB string for characterwise editing.

189.2.38 RightUTF8(lengthCharacter as integer) as string

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries given number of characters from string from the right side.

Example:

```
Var s As String = "Hello √√§√º!"
Var d As New StringHandleMBS(s)

d.Encoding = d.encodingUTF8

// √ is two bytes
MessageBox d.RightUTF8(8)+" in UTF8 and "+d.Right(8)+" in bytes"
```

189.2.39 Truncate(lengthBytes as Integer)

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Truncates the string handle content.
Notes: Sets the length of the string back to the given value if it's greater.

The length parameter uses bytes not characters as unit. You can use the Copy method to get a RB string for characterwise editing.

189.2.40 TruncateUTF8(lengthCharacters as integer)

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Truncates data to given number of UTF-8 characters.
Example:

```
Var s As New StringHandleMBS("√§√√º")

// limit to 2 characters, here 4 bytes
s.TruncateUTF8 2

MessageBox s.Copy
```

189.2.41 UTF8Length(data as ptr, TotalByteLength as integer) as Integer

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries how many UTF-8 characters are in one memory area.
Example:

```
Var s As String = "Hello √§√√º"
Var m As MemoryBlock = s
```

```
Var c As Integer = StringHandleMBS.UTF8Length(m, m.size)

MessageBox str(c)+" characters, "+str(m.size)+" bytes"
```

Notes: Please make sure ptr is a valid ptr.
This is the internal function we use ourselves for the UTF-8 related functions.

189.2.42 UTF8LengthToBytes(data as ptr, TotalByteLength as integer, Characters as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries how many bytes are needed for UTF-8 characters.
Example:

```
Var s As String = "Hello √§√√º"
Var m As MemoryBlock = s

Var c As Integer = StringHandleMBS.UTF8Length(m, m.size)
Var b As Integer = StringHandleMBS.UTF8LengthToBytes(m, m.size, c)

MessageBox Str(c)+" characters, "+Str(b)+" bytes"
```

Notes: Please make sure ptr is a valid ptr.
This is the internal function we use ourselves for the UTF-8 related functions.

189.2.43 Properties

189.2.44 BlockLen as Int64

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of the memory currently used for this class.
Notes: This value increases by BlockSize if more memory is needed.
(Read only property)

189.2.45 BlockSize as Int64

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of the blocks to allocate for storing the data.
Notes: (Read and Write property)

189.2.46 Encoding as Int64

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The encoding to use for returned strings.
Notes: Only useful on Xojo 4.5 and newer.

Some example values for encoding:

MacRoman	0	Also for ASCII or binary data used.
WindowsLatin1	&h0500	ANSI codepage 1252
ISOLatin1	&h0201	ISO 8859-1
NextStepLatin	&h0B01	NextStep encoding
Unicode	&h0100	16 bit Unicode
UTF8	&h08000100	8 bit Unicode
Invalid	&hFFFFFFFF	(Binary)
Invalid	&hFFFF	(Binary)

(Read and Write property)

189.2.47 Len as Int64

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the len in bytes of the stored string.
Notes: (Read only property)

189.2.48 LenUTF8 as Int64

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries length of text in UTF-8 encoded characters.
Example:

```
Var s As String = "Hello √√§√º!"
Var d As New StringHandleMBS(s)

MessageBox Str(d.Len)+" bytes, "+Str(d.LenUTF8)+" characters"
```

Notes: Returns incorrect values if string is not UTF-8!

(Read only property)

189.2.49 ReplaceCount as Int64

MBS DataTypes Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: After a call to one of the Replace functions the number of items replaced.
Notes: (Read and Write property)

189.2.50 ValidASCII as Boolean

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this string handle contains valid ASCII text.
Notes: (Read only property)

189.2.51 ValidUTF8 as Boolean

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this string handle contains valid UTF-8 text.
Example:

```
Var s As New StringHandleMBS

s.Add "Hello World"

Var validUTF8a As Boolean = s.ValidUTF8

// now make invalid
s.AddByte 222

Var validUTF8b As Boolean = s.ValidUTF8

Break
```

Notes: (Read only property)

189.2.52 UInt16Value(offset as Integer) as UInt16

MBS DataTypes Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set an UInt16 value.
Example:

```
Var t As String = ConvertEncoding("Hello Welt", encodings.UTF16)
Var s As New StringHandleMBS(t)

// offset 1 is first character, so second character is offset 3
Var n As Integer = s.UInt16Value(3)
s.UInt16Value(3) = Asc("a")

MessageBox s.Copy

// append

s.UInt16Value(s.Len+1) = Asc("!")
MessageBox s.Copy
```

Notes: Offset is range checked and may raise an OutOfBoundsException.

When you assign a value and the offset is exactly size of the string handle plus one, we append the new byte.
(Read and Write computed property)

189.2.53 UInt32Value(offset as Integer) as UInt32

MBS DataTypes Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set an UInt32 value.
Notes: Offset is range checked and may raise an OutOfBoundsException.

When you assign a value and the offset is exactly size of the string handle plus one, we append the new byte.
(Read and Write computed property)

189.2.54 UInt8Value(offset as Integer) as UInt8

MBS DataTypes Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set a byte value.
Example:

```
Var s As New StringHandleMBS("Hello Welt")

Var n as integer = s.UInt8Value(2)
s.UInt8Value(2) = Asc("a")
```

```
MessageBox s.Copy

// append

s.UInt8Value(s.Len+1) = Asc("!")
MessageBox s.Copy
```

Notes: Offset is range checked and may raise an OutOfBoundsException.

When you assign a value and the offset is exactly size of the string handle plus one, we append the new byte. (Read and Write computed property)

189.2.55 Constants

Encodings

Constant	Value	Description
encodingASCII	&h0600	ASCII encoding.
encodingBinary	&hFFFF	No encoding.
encodingLatin1	&h0201	ISO Latin 1 encoding.
encodingMacRoman	0	Mac Roman encoding.
encodingUnicode	&h0100	Unicode UTF16 encoding.
encodingUTF8	&h08000100	UTF-8 encoding.
encodingWindows	&h0500	Windows encoding.

189.3 class StringMBS

189.3.1 class StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: A class for a string of unicode characters.
Example:

```
// build a long string efficiently by appending pieces
Var s As New StringMBS
s.Reserve 100000 // avoid reallocations

For i As Integer = 1 To 1000
s.Append "Line " + i.ToString + EndOfLine
Next

s.Insert 0, "Report" + EndOfLine
Var result As String = s.StringValue
MessageBox result.Left(100)
```

Notes: Internally using UTF-32, so each character is one unit.
Subclass of the StringViewMBS class.

189.3.2 Methods

189.3.3 Append(other as StringViewMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Appends the new text to the current text.
Example:

```
Var s As New StringMBS
Var v As New StringViewMBS("Hello")
var t as New StringViewMBS("World")
```

```
s.append(v)
s.append(" ")
s.append(t)

MessageBox s.StringValue
```

See also:

- 189.3.4 Append(other as StringViewMBS) as StringMBS 22962
- 189.3.5 Append(other as StringViewMBS, pos as Integer, length as Integer = -1) 22962
- 189.3.6 Append(value as String) 22963
- 189.3.7 Append(value as String) as StringMBS 22964

189.3.4 Append(other as StringViewMBS) as StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Appends the new text to the current text.
Example:

```
Var s As New StringMBS
Var v As New StringViewMBS("Hello")
var t as New StringViewMBS("World")

s = s.append(v)
s = s.append(" ")
s = s.append(t)

MessageBox s.StringValue
```

- 189.3.5 Append(other as StringViewMBS, pos as Integer, length as Integer = -1) 22962
- 189.3.6 Append(value as String) 22963
- 189.3.7 Append(value as String) as StringMBS 22964

189.3.5 Append(other as StringViewMBS, pos as Integer, length as Integer = -1)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Appends the given range of a text to the current text.
Example:

```
Var s As New StringMBS("Hello World")
Var t as New StringMBS

t.append(s, 2, 5)

MessageBox t.StringValue
```

See also:

- 189.3.3 Append(other as StringViewMBS) 22961
- 189.3.4 Append(other as StringViewMBS) as StringMBS 22962
- 189.3.6 Append(value as String) 22963
- 189.3.7 Append(value as String) as StringMBS 22964

189.3.6 Append(value as String)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Appends the new text to the current text.
Example:

```
Var s As New StringMBS

s.Reserve(20)
s.append("Hello")
s.append(" ")
s.append("World")

MessageBox s.StringValue
```

See also:

- 189.3.3 Append(other as StringViewMBS) 22961
- 189.3.4 Append(other as StringViewMBS) as StringMBS 22962
- 189.3.5 Append(other as StringViewMBS, pos as Integer, length as Integer = -1) 22962
- 189.3.7 Append(value as String) as StringMBS 22964

189.3.7 Append(value as String) as StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Appends the new text to the current text.
See also:

- 189.3.3 Append(other as StringViewMBS) 22961
- 189.3.4 Append(other as StringViewMBS) as StringMBS 22962
- 189.3.5 Append(other as StringViewMBS, pos as Integer, length as Integer = -1) 22962
- 189.3.6 Append(value as String) 22963

189.3.8 Assign(value as String)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Assigns the value of the string to the string view.
Notes: We copy the content into the StringMBS object.
See also:

- 189.3.9 Assign(value as StringViewMBS) 22964

189.3.9 Assign(value as StringViewMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Assigns the string view to point to the content of the existing one.
Notes: We copy the content into the StringMBS object.
See also:

- 189.3.8 Assign(value as String) 22964

189.3.10 Clear

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Clears the content.
Example:

```
Var s As New StringMBS("Hello")
s.Clear

If s.Empty Then
MessageBox "is empty"
```

```
Else
Break // failed?
End If
```

189.3.11 Clone as StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Copies the text into a new string object.
Example:

```
Var s As New StringMBS("Hello")
var c as StringMBS = s.Clone

MessageBox c.StringValue
```

189.3.12 Constructor

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
Example:

```
var n as new StringMBS
```

See also:

- 189.3.13 Constructor(value as String) 22965
- 189.3.14 Constructor(value as StringViewMBS) 22966

189.3.13 Constructor(value as String)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
Example:

```
Var s As New StringMBS("Hello")

MessageBox s.StringValue
```

See also:

- 189.3.12 Constructor 22965
- 189.3.14 Constructor(value as StringViewMBS) 22966

189.3.14 Constructor(value as StringViewMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The copy constructor.
Example:

```
Var s As New StringMBS("Hello")
var n as new StringMBS(s)

MessageBox s.StringValue
```

See also:

- 189.3.12 Constructor 22965
- 189.3.13 Constructor(value as String) 22965

189.3.15 Erase(pos as Integer = 0, length as Integer = -1)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Erases characters from the string.
Example:

```
Var s As New StringMBS("Hello World")

s.erase(2, 5)

MessageBox s.StringValue
```

189.3.16 Insert(pos as Integer, other as StringViewMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Inserts text at the given position.
See also:

- 189.3.17 Insert(pos as Integer, other as StringViewMBS, spos as Integer, length as Integer = -1) 22967
- 189.3.18 Insert(pos as Integer, value as String) 22967

189.3.17 Insert(pos as Integer, other as StringViewMBS, spos as Integer, length as Integer = -1)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Inserts text at the given position.
Example:

```
Var s As New StringMBS("Held")
var t as new StringMBS("xxxllo Worxxx")

s.Insert(2, t, 3, 7)

MessageBox s.StringValue
```

See also:

- 189.3.16 Insert(pos as Integer, other as StringViewMBS) 22966
- 189.3.18 Insert(pos as Integer, value as String) 22967

189.3.18 Insert(pos as Integer, value as String)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Inserts text at the given position.
Example:

```
Var s As New StringMBS("Held")

s.Insert(2, "llo Wor")

MessageBox s.StringValue
```

See also:

- 189.3.16 Insert(pos as Integer, other as StringViewMBS) 22966
- 189.3.17 Insert(pos as Integer, other as StringViewMBS, spos as Integer, length as Integer = -1) 22967

189.3.19 Operator_Add(other as StringViewMBS) as StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Appends text to the string.
Example:

```
Var s As New StringMBS
Var v As New StringViewMBS("Hello")
var t as New StringViewMBS("World")

s = s + v
s = s + " "
s = s + t

MessageBox s.StringValue
```

Notes: We return self here and don't create a copy.
See also:

- 189.3.20 Operator_Add(value as String) as StringMBS 22968

189.3.20 Operator_Add(value as String) as StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Appends text to the string.
Example:

```
Var s As New StringMBS

s = s + "Hello"
s = s + " "
s = s + "World"

MessageBox s.StringValue
```

Notes: We return self here and don't create a copy.
See also:

- 189.3.19 Operator_Add(other as StringViewMBS) as StringMBS 22967

189.3.21 PopBack

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes the last character.

189.3.22 PushBack(c as UInt32)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a character to the end of the string.

189.3.23 RemovePrefix(Characters as integer)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes characters on the start of the string.
Notes: Effectively moves start pointer and reduces length.

189.3.24 RemoveSuffix(Characters as integer)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes characters on the end of the string.
Notes: Effectively reduces length.

189.3.25 Replace(find as StringMBS, text as StringMBS) as StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Replaces a text in the text with a new text.
Example:

```
Var s As New StringMBS("Hello")
var c as StringMBS = s.Replace(New StringMBS("l"), New StringMBS("o"))

MessageBox c.StringValue
```

Notes: Replaces only once.
There is a faster code path, when source and destination are only one character.
Returns original text if find text is empty.
See also:

- 189.3.26 Replace(pos as Integer, length as Integer, text as String) 22969
- 189.3.27 Replace(pos as Integer, length as Integer, text as StringViewMBS) 22970

189.3.26 Replace(pos as Integer, length as Integer, text as String)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Replaces a range of text in the string with a new text.
Example:

```
Var s As New StringMBS("Hello")

s.Replace(1,1,"a")

MessageBox s.StringValue
```

See also:

- 189.3.25 Replace(find as StringMBS, text as StringMBS) as StringMBS 22969
- 189.3.27 Replace(pos as Integer, length as Integer, text as StringViewMBS) 22970

189.3.27 Replace(pos as Integer, length as Integer, text as StringViewMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Replaces a range of text in the string with a new text.
See also:

- 189.3.25 Replace(find as StringMBS, text as StringMBS) as StringMBS 22969
- 189.3.26 Replace(pos as Integer, length as Integer, text as String) 22969

189.3.28 ReplaceAll(find as StringMBS, text as StringMBS) as StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Replaces all texts with a new text.
Example:

```
Var s As New StringMBS("Hello")
var c as StringMBS = s.ReplaceAll(New StringMBS("l"), New StringMBS("o"))

MessageBox c.StringValue
```

Notes: There is a faster code path, when source and destination are only one character.
Returns original text if find text is empty.

189.3.29 Reserve(amount as Integer)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reserves memory for the string.
Example:

```
Var s As New StringMBS

MessageBox s.Capacity.ToString+" capacity, "+s.Length.ToString+" length"

s.Reserve(1000)
MessageBox s.Capacity.ToString+" capacity, "+s.Length.ToString+" length"

s.Append "Hello World"
MessageBox s.Capacity.ToString+" capacity, "+s.Length.ToString+" length"
```

189.3.30 Resize(amount as Integer, Character as UInt32 = 0)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Resizes the string to the given size.
Example:

```
Var s As New StringMBS("Hello")
s.Resize(3)

MessageBox s.StringValue
```

Notes: Either appends characters with the given codepoint or reduces the length.

189.3.31 ShrinkToFit

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Shrinks memory allocation to the required space.
Example:

```
Var s As New StringMBS

s.Reserve(1000)
s.Append "Hello World"

// 1001 characters allocated
MessageBox s.Capacity.ToString

s.ShrinkToFit

// now only 11 characters allocated
MessageBox s.Capacity.ToString
```

Notes: Requests the removal of unused capacity.

189.3.32 StringFromCharacters(Characters() as UInt32) as StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a string with given characters.
Example:

```
Var v As StringMBS = StringMBS.StringFromString("Hello")
// let's ger characters
Var Characters() As UInt32 = v.Characters
// inspect in debugger and build to a new string view
Var n As StringMBS = StringMBS.StringFromCharacters(Characters)
MessageBox n.StringValue
```

Notes: The text is copied into a new String object.

189.3.33 StringFromData(Data as MemoryBlock) as StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a string from data.
Example:

```
Var v As StringMBS = StringMBS.StringFromString("Hello")
// let's ger characters as MemoryBlock
Var data as MemoryBlock = v.ToData
// inspect in debugger and build to a new string view
Var n As StringMBS = StringMBS.StringFromData(Data)
MessageBox n.StringValue
```

Notes: The MemoryBlock must contain UTF-32 characters (4 bytes per character).
The text is copied into a new String object.

189.3.34 StringFromString(s as String) as StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a string from a string.
Example:

```
Var s As StringMBS = StringMBS.StringFromString("Hello")
```

MessageBox s.StringValue

Notes: The text is copied into a new String object.

189.3.35 SubString(Pos as Integer, Length as Integer = -1) as StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a substring on the given range.
Notes: Th text is copied into a new text object.
If length is omitted or -1, we return until the end of the string.

189.3.36 Swap(other as StringMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Swaps content of two string objects.

189.3.37 Properties

189.3.38 Capacity as UInt64

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The capacity of the string.
Example:

```
Var s As New StringMBS

MessageBox s.Capacity.ToString+" capacity, "+s.Length.ToString+" length"

s.Reserve(1000)
MessageBox s.Capacity.ToString+" capacity, "+s.Length.ToString+" length"

s.Append "Hello World"
MessageBox s.Capacity.ToString+" capacity, "+s.Length.ToString+" length"
```

Notes: Capacity of the currently allocated storage, i.e. the storage available for storing elements.
(Read only property)

189.3.39 Small as Boolean

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether this is a small string.
Example:

```
Var s As New StringMBS("Hello")
var n as new StringMBS

MessageBox s.Small.ToString+" "+n.Small.ToString
```

Notes: (Read only property)

189.3.40 StringValue as String

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the content of the string as a Xojo string.
Notes: The string is returned in UTF-8.
(Read and Write property)

189.3.41 Character(Index as Integer) as UInt32

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set or query a character in the string.
Example:

```
Var s As New StringMBS("Hello")

s.Character(0) = 73

MessageBox s.StringValue
```

Notes: (Read and Write computed property)

189.4 class StringViewMBS

189.4.1 class StringViewMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The string view for our StringMBS class.
Example:

```
// look into a string without copying it
Var text As String = "Hello World from Xojo"
Var view As StringViewMBS = StringViewMBS.ViewFromString(text)

Var pos As Integer = view.Find("World")
If pos >= 0 Then
Var word As StringViewMBS = view.SubView(pos, 5)
MessageBox "Found " + word.StringValue + " at " + pos.ToString
End If

MessageBox "Starts with Hello: " + view.StartsWith("Hello").ToString + EndOfLine + _
"Ends with Xojo: " + view.EndsWith("Xojo").ToString + EndOfLine + _
"Length: " + view.Length.ToString
```

Notes: Allows you to have a view on a string, so you can access it without copying the data.

Search operations are case sensitive.

189.4.2 Methods

189.4.3 Assign(value as String)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Assigns the value of the string to the string view.
Notes: The plugin keeps a reference to the string to avoid it being freed too early.
See also:

- 189.4.4 Assign(value as StringViewMBS) 22976

189.4.4 Assign(value as StringViewMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Assigns the string view to point to the content of the existing one.
Notes: The plugin keeps a reference to the StringViewMBS to avoid it being freed too early.
See also:

- 189.4.3 Assign(value as String) 22975

189.4.5 Character(Index as Integer) as UInt32

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Query a character in the string.
Example:

```
Var s As New StringMBS("Hello")

MessageBox s.Character(0).ToString // 72 for H
```

189.4.6 Characters as UInt32()

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an array with the characters.
Example:

```
Var v As StringViewMBS = StringViewMBS.ViewFromString("Hello")
// let's ger characters
Var Characters() As UInt32 = v.Characters
// inspect in debugger and build to a new string view
Var n As StringViewMBS = StringViewMBS.ViewFromCharacters(Characters)
MessageBox n.StringValue
```

Notes: Copies data into the new array.

189.4.7 Compare(value as String) as Integer

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compares two strings.
Notes: Returns zero if strings are equal.
See also:

- 189.4.8 Compare(value as StringViewMBS) as Integer 22977

189.4.8 Compare(value as StringViewMBS) as Integer

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compares two strings.
Example:

```
Var s As New StringMBS("Hello")
Var t As New StringMBS("Hallo")

Var c1 As Integer = s.Compare(t)
Var c2 As Integer = s.Compare(s)
Var c3 As Integer = t.Compare(s)

Break
```

Notes: Returns zero if strings are equal.
See also:

- 189.4.7 Compare(value as String) as Integer 22976

189.4.9 Constructor

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
Notes: Creates an empty string view.
See also:

- 189.4.10 Constructor(value as String) 22977
- 189.4.11 Constructor(value as StringViewMBS) 22978

189.4.10 Constructor(value as String)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
Notes: Creates a string view looking into the given string.
See also:

- 189.4.9 Constructor 22977
- 189.4.11 Constructor(value as StringViewMBS) 22978

189.4.11 Constructor(value as StringViewMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
Notes: Creates a string view copying the existing one.
See also:

- 189.4.9 Constructor 22977
- 189.4.10 Constructor(value as String) 22977

189.4.12 Contains(value as String) as Boolean

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks whether the given text is contained in the current view.
Example:

```
Var s As New StringMBS("Hello World!")

If s.Contains("World") Then
MessageBox "found"
Else
Break
End If
```

Notes: Returns true if the given value is found within the string.
See also:

- 189.4.13 Contains(value as StringViewMBS) as Boolean 22978

189.4.13 Contains(value as StringViewMBS) as Boolean

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks whether the given text is contained in the current view.
Example:

```
Var s As New StringMBS("Hello World!")
var w as new StringMBS("World")

If s.Contains(w) Then
MessageBox "found"
Else
Break
```

```
End If
```

Notes: Returns true if the given value is found within the string.
Search is case sensitive.
See also:

- 189.4.12 Contains(value as String) as Boolean 22978

189.4.14 EndsWith(value as String) as Boolean

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks if the string ends with the given suffix.
Example:

```
Var s As New StringMBS("Hello World!")

// starts with Hello?
Var b1 As Boolean = s.StartsWith("Hello")
Var b2 As Boolean = s.StartsWith("Hallo")

// ends with World!?
Var b3 As Boolean = s.EndsWith("World!")
Var b4 As Boolean = s.EndsWith("World.")

Break
```

Notes: Returns true if the string ends with the provided suffix, false otherwise.
See also:

- 189.4.15 EndsWith(value as StringViewMBS) as Boolean 22979

189.4.15 EndsWith(value as StringViewMBS) as Boolean

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks if the string ends with the given suffix.
Notes: Returns true if the string ends with the provided suffix, false otherwise.
See also:

- 189.4.14 EndsWith(value as String) as Boolean 22979

189.4.16 Find(value as String, pos as Integer = 0) as Integer

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Finds the first substring equal to the given character sequence.
Example:

```
Var s As New StringMBS("Hello World!")

Var p1 As Integer = s.Find("World") // 6
Var p2 As Integer = s.Find("test") // -1
Var p3 As Integer = s.Find("") // -1
Var p4 As Integer = s.Find("Hello") // 0

Break
```

Notes: Search begins at pos.
Returns -1 if not found.
See also:

- 189.4.17 Find(value as StringViewMBS, pos as Integer = 0) as Integer 22980

189.4.17 Find(value as StringViewMBS, pos as Integer = 0) as Integer

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Finds the first substring equal to the given character sequence.
Notes: Search begins at pos.
Returns -1 if not found.
See also:

- 189.4.16 Find(value as String, pos as Integer = 0) as Integer 22979

189.4.18 Join(strings() as StringViewMBS) as StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Joins strings efficiently.
Example:

```
Var strings() As StringViewMBS

strings.Add New StringMBS("Hello")
strings.Add New StringViewMBS(" ")
strings.Add New StringViewMBS("World")

Var j As StringMBS = StringMBS.Join(strings)

MessageBox j.StringValue
```

See also:

- 189.4.19 Join(strings() as Variant) as StringMBS 22981

189.4.19 Join(strings() as Variant) as StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Joins strings efficiently.
Example:

```
Var strings() As Variant

strings.Add New StringMBS("Hello")
strings.Add " "
strings.Add New StringViewMBS("World")

Var j As StringMBS = StringMBS.Join(strings)

MessageBox j.StringValue
```

Notes: Variant can include anything that converts to string or is a StringViewMBS.
See also:

- 189.4.18 Join(strings() as StringViewMBS) as StringMBS 22980

189.4.20 LowerCase as StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts all characters to lower case.
Example:

```
// set locale with German
Call SQLGlobalsMBS.Setlocale(SQLGlobalsMBS.LocaleAll, "de_DE")

// and try with this test sentence
Var s As New StringMBS("√Ñltere √Ñrzte √ºben √fters, indem sie √Ñpfel √ºber √ñfen √len und √§rgern.")

Var l As StringMBS = s.Lowercase
Var u As StringMBS = s.Uppercase

// √§ltere √§rzte √ºben √fters, indem sie √§pfel √ºber √fen √len und √§rgern.
Var ll As String = l.StringValue
// √ÑLTERE √ÑRZTE √úBEN √ñFTERS, INDEM SIE √ÑPFEL √úBER √ñFEN √ñLEN UND √ÑRGERN.
var uu as string = u.StringValue
```

```
Break
```

Notes: Needs the locale set.

189.4.21 Operator_Compare(value as String) as Integer

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compares two strings and returns result.
Example:

```
Var s As New StringMBS("Hello")
Var t As string = "Hello"

If s = t Then
MessageBox "equal"
End If
```

Notes: Returns 0 for equal and 1 if the value is bigger or -1 if it is smaller.
See also:

- 189.4.22 Operator_Compare(value as StringViewMBS) as Integer 22982

189.4.22 Operator_Compare(value as StringViewMBS) as Integer

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compares two strings and returns result.
Example:

```
Var s As New StringMBS("Hello")
Var t As New StringMBS("Hallo")

If s = s Then
// okay, same object
Else
// failed
Break
End If

If s = t Then
// failed
Break
Else
// okay
```

```
end if

If s >t Then
// okay
Else
// failed
Break
End If

Break
```

Notes: Returns 0 for equal and 1 if the value is bigger or -1 if it is smaller.
See also:

- 189.4.21 Operator_Compare(value as String) as Integer 22982

189.4.23 RemovePrefix(Characters as integer)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes characters on the start of the string.
Example:

```
Var s As New StringMBS("Hello World!")

s.RemovePrefix 6

MessageBox s.StringValue
```

Notes: Effectively moves start pointer and reduces length.

189.4.24 RemoveSuffix(Characters as integer)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes characters on the end of the string.
Example:

```
Var s As New StringMBS("Hello World!")

s.RemoveSuffix 6

MessageBox s.StringValue
```

Notes: Effectively reduces length.

189.4.25 StartsWith(value as String) as Boolean

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks if the string begins with the given prefix.
Example:

```
Var s As New StringMBS("Hello World!")

// starts with Hello?
Var b1 As Boolean = s.StartsWith("Hello")
Var b2 As Boolean = s.StartsWith("Hallo")

// ends with World!?
Var b3 As Boolean = s.EndsWith("World!")
Var b4 As Boolean = s.EndsWith("World.")

Break
```

Notes: Returns true if the string begins with the provided prefix, false otherwise.
See also:

- 189.4.26 StartsWith(value as StringViewMBS) as Boolean 22984

189.4.26 StartsWith(value as StringViewMBS) as Boolean

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks if the string begins with the given prefix.
Notes: Returns true if the string begins with the provided prefix, false otherwise.
See also:

- 189.4.25 StartsWith(value as String) as Boolean 22984

189.4.27 SubView(Pos as Integer, Length as Integer = -1) as StringViewMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a sub view on the given range.
Example:

```
Var s As New StringMBS("Hello")
```

```
var v as StringViewMBS = s.SubView(2,2)

MessageBox v.StringValue
```

Notes: The text is not copied, but references.
If length is omitted or -1, we return until the end of the string.

189.4.28 Swap(other as StringViewMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Swaps content of two string objects.

189.4.29 ToData as MemoryBlock

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a MemoryBlock with a copy of the data.
Example:

```
Var v As StringMBS = StringMBS.StringFromString("Hello")
// let's ger characters as MemoryBlock
Var data as MemoryBlock = v.ToData
// inspect in debugger and build to a new string view
Var n As StringMBS = StringMBS.StringFromData(Data)
MessageBox n.StringValue
```

Notes: Copies the data into a new MemoryBlock.
The MemoryBlock must contain UTF-32 characters (4 bytes per character).

189.4.30 UpperCase as StringMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts all characters to upper case.
Example:

```
// set locale with German
Call SQLGlobalsMBS.Setlocale(SQLGlobalsMBS.LocaleAll, "de_DE")

// and try with this test sentence
Var s As New StringMBS("√Ñltere √Ñrzte √ºben √fters, indem sie √Ñpfel √ºber √ñfen √len und √§rgern.")
```

```
Var l As StringMBS = s.Lowercase
Var u As StringMBS = s.Uppercase

// √§ltere √§rzte √ºben √fters, indem sie √§pfel √ºber √fen √len und √§rgern.
Var ll As String = l.StringValue
// √ÑLTERE √ÑRZTE √úBEN √ñFTERS, INDEM SIE √ÑPFEL √úBER √ñFEN √ÑLEN UND √ÑRGERN.
var uu as string = u.StringValue

Break
```

Notes: Needs the locale set.

189.4.31 ViewFromCharacters(Characters() as UInt32) as StringViewMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a StringView from characters.
Example:

```
Var v As StringViewMBS = StringViewMBS.ViewFromString("Hello")
// let's ger characters
Var Characters() As UInt32 = v.Characters
// inspect in debugger and build to a new string view
Var n As StringViewMBS = StringViewMBS.ViewFromCharacters(Characters)
MessageBox n.StringValue
```

Notes: The text is references in the StringView and not copied.

189.4.32 ViewFromData(Data as MemoryBlock) as StringViewMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a StringView from some data.
Example:

```
Var v As StringViewMBS = StringMBS.ViewFromString("Hello")
// let's ger characters as MemoryBlock
Var data as MemoryBlock = v.ToData
// inspect in debugger and build to a new string view
Var n As StringViewMBS = StringMBS.ViewFromData(Data)
MessageBox n.StringValue
```

Notes: The MemoryBlock must contain UTF-32 characters (4 bytes per character).
The text is references in the StringView and not copied.

189.4.33 ViewFromString(s as String) as StringViewMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a StringView from a string.
Example:

```
Var v As StringViewMBS = StringViewMBS.ViewFromString("Hello")

MessageBox v.StringValue
```

Notes: The text is references in the StringView and not copied.

189.4.34 Properties

189.4.35 Back as Integer

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the last character
Notes: Raises OutOfBoundsException in case the string is empty.
(Read only property)

189.4.36 Data as Ptr

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The pointer to the internal data.
Notes: Data is stored in UTF32 in memory.
(Read only property)

189.4.37 Empty as Boolean

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the string is empty.
Notes: (Read only property)

189.4.38 Front as Integer

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the first character.
Notes: Raises OutOfBoundsException in case the string is empty.
(Read only property)

189.4.39 Length as UInt64

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The length of the string.
Notes: (Read only property)

189.4.40 Parent as Variant

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parent object.
Notes: Avoids the string being freed too early.
(Read only property)

189.4.41 StringValue as String

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the content of the string as a Xojo string.
Notes: The string is returned in UTF-8.
(Read only property)

189.4.42 Constants

Constants

Constant	Value	Description
npos	-1	The constant for the not found position.

189.5 class StyledText

189.5.1 class StyledText

Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The built-in class for styled text.

189.5.2 Properties

189.5.3 RTFDataMBS(SkipParagraphs as Boolean = false) as string

MBS Util Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set RTF data for this StyledText.
Example:

```
Var s As New StyledText

s.Text = "Hello World"

s.Bold(0,5) = True
s.size(0,6) = 12
s.size(6,5) = 14

#if TargetDesktop
Var m As String = s.RTFData
#EndIf

Var r As String = s.RTFDataMBS

Break
```

Notes: This is a replacement for the built-in RTFData property.
We tried to make the results exactly like the original.
Speed should be a little bit faster than the official method.

Added SkipParagraphs parameter in version 21.2.
If SkipParagraphs is true, we skip to look on paragraphs, so left/center/right alignment won't be included in the output, but that is much faster.

See also RTFDataMBS and WinRTFDataMBS in TextArea and DesktopTextArea controls and RTFData in NSTextViewMBS class.

(Read and Write computed property)

189.6 class TextConverterMBS

189.6.1 class TextConverterMBS

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for converting text from one text encoding to other one.
Example:

```
Var s as string = "Hello √§√√º"
Var c as new TextConverterMBS

c.Input = s
c.InputEncoding = "UTF-8"
c.OutputEncoding = "WINDOWS-1252"

c.Convert

Var output as string = c.Output

Break // see in debugger
```

Notes: Wraps iconv library. Please use LoadIconvLibrary function to load it. Without the library, we use fallback code, which just passes through data.

- 17.5, page 37: What's New in the MBS Plugins, With the Plugins growing every year, here are new capabilities you may have missed by Stefanie Juchmes
- 17.3, page 11: News

189.6.2 Methods

189.6.3 Canonicalize(name as String) as String

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Canonicalize an encoding name.
Example:

```
MessageBox TextConverterMBS.Canonicalize("utf-8")
MessageBox TextConverterMBS.Canonicalize("Latin1")
```

Notes: The result is either a canonical encoding name, or name itself.

189.6.4 Constructor

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: Currently enables translit and ignore by default.

189.6.5 Convert

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts text.
Example:

```
Var s as string = "Hello √§√√º"
Var c as new TextConverterMBS

c.Input = s
c.InputEncoding = "UTF-8"
c.OutputEncoding = "WINDOWS-1252"

c.Convert

Var output as string = c.Output

Break // see in debugger
```

Notes: Input is read from either Input or InputData properties.
ErrorCode and ErrorMessage are set.
Output is set with output data.

189.6.6 EncodingNames(Mode as Integer = 0) as String()

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries names of text encodings.
Example:

MessageBox Join(TextConverterMBS.EncodingNames(1),EndOfLine)

Notes: Mode 0 returns list of text encoding names.
Mode 1 returns list of text encoding names and alternative names separated by comma.
Mode 2 returns list of text encoding names and alternative names.

e.g. "CP1252,MS-ANSI,WINDOWS-1252" in the list for mode 1.

189.6.7 LoadIconvLibrary(path as String, byref Error as String) as boolean

MBS Util Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the iconv library.
Notes: The TextConverterMBS class uses libiconv for text encoding conversion.
If you explicitly need, you can load the library on start of solution.

MBS Plugin may try to load iconv.dll/dylib/so automatically when first iconv function is called.

189.6.8 Properties

189.6.9 ErrorCode as Integer

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Last error code from Convert method.
Notes: (Read and Write property)

189.6.10 ErrorMessage as String

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Text message for error.
Notes: (Read and Write property)

189.6.11 Ignore as Boolean

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to ignore errors.
Notes: Characters that cannot be represented in the target character set will be silently discarded.
(Read and Write property)

189.6.12 Input as String

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Input text string.
Notes: (Read and Write property)

189.6.13 InputData as MemoryBlock

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Input as memoryblock.
Notes: (Read and Write property)

189.6.14 InputEncoding as String

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Name of input encoding.
Notes: e.g. "UTF-8"
(Read and Write property)

189.6.15 InputPosition as Integer

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The input position on the end of convert.
Notes: If errors are not ignored, this shows error position.

(Read and Write property)

189.6.16 LibVersion as Integer

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The library version for iconv.
Notes: Returns major * 256 + minor, e.g. &h10B for 1.11.
(Read only property)

189.6.17 Output as String

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The output text.
Notes: String may not have an encoding set, if the plugin does not recognize the encoding.
But for e.g. UTF-8, we set the text encoding.
(Read and Write property)

189.6.18 OutputEncoding as String

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Name of output encoding.
Notes: e.g. "UTF-8"
(Read and Write property)

189.6.19 OutputLength as Integer

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The length of the output in bytes.
Notes: (Read and Write property)

189.6.20 Translit as Boolean

MBS Util Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to activate transliteration.
Notes: This means that when a character cannot be represented in the target character set, it can be

approximated through one or several characters that look similar to the original character.
(Read and Write property)

189.7 class TextEncoding

189.7.1 class TextEncoding

Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Built in class from Xojo for text encodings.

189.7.2 Methods

189.7.3 InternetNameMBS as string

MBS Util Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the name of this text encoding.
Notes: We have this method in MBS Plugin as InternetName function does not work on Linux/Windows. (See feedback case 30712)
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.5pr6

Chapter 190

SVG

190.1 class ReSVGMBS

190.1.1 class ReSVGMBS

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: A class to render SVG data to a picture.
Example:

```
// Window1 is a window of the example project.
// we load this file
Var file As FolderItem = SpecialFolder.Desktop.Child("test.svg")

Var p As New ReSVGMBS(file)

// and render them in their normal size:
Var pic As picture = p.RenderToPicture(p.Width, p.Height)

// show in the window
Window1.Backdrop = pic
```

Notes: This uses the ReSVG library written in Rust.
ReSVG is a fast, small, portable SVG library with the goal to support the whole SVG spec.

see
https://github.com/RazrFalcon/resvg

190.1.2 Methods

190.1.3 Constructor(data as MemoryBlock)

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates SVG from data.
Notes: data: SVG data. Can contain SVG string or gzip compressed data. Must not be nil.

Raises exceptions in case of errors.
See also:

- 190.1.4 Constructor(data as String) 23004
- 190.1.5 Constructor(file as FolderItem) 23005

190.1.4 Constructor(data as String)

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates SVG from data.
Notes: data: SVG data. Can contain SVG string or gzip compressed data. Must not be empty.

Raises exceptions in case of errors.
See also:

- 190.1.3 Constructor(data as MemoryBlock) 23004
- 190.1.5 Constructor(file as FolderItem) 23005

190.1.5 Constructor(file as FolderItem)

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates SVG from file.
Example:

```
// Window1 is a window of the example project.
// we load this file
Var file As FolderItem = SpecialFolder.Desktop.Child("test.svg")

Var p As New ReSVGMBS(file)

// and render them in their normal size:
Var pic As picture = p.RenderToPicture(p.Width, p.Height)

// show in the window
Window1.Backdrop = pic
```

Notes: For the files, .svg and .svgz files are supported.

Raises exceptions in case of errors.
See also:

- 190.1.3 Constructor(data as MemoryBlock) 23004
- 190.1.4 Constructor(data as String) 23004

190.1.6 ImageBox(byref x as double, byref y as double, byref width as double, byref height as double) as Boolean

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries the image bounding box.
Notes: Can be smaller or bigger than a view box.

Returns true on success and sets passed variables.
Return false if an image has no elements.

190.1.7 InitLog

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Initializes the library log.
Notes: Use it if you want to see any warnings.
Must be called only once.
All warnings will be printed to the ‘stderr‘.

190.1.8 LoadSystemFonts

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Loads system fonts into the internal fonts database.
Notes: This method is very IO intensive.

This method should be executed only once.

The system scanning is not perfect, so some fonts may be omitted. Please send a bug report in this case.
Prints warnings into the log.

Has no effect when the ‘text‘ feature is not enabled.

190.1.9 NodeBox(id as string, byref x as double, byref y as double, byref width as double, byref height as double) as Boolean

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns node’s bounding box by ID.
Notes: tree Render tree.

id: Node’s ID.

Returns false if a node with such an ID does not exist.
returns false if ID is an empty string.

Returns true on success and sets passed variables.

190.1.10 NodeExists(id as string) as Boolean

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns true if a renderable node with such an ID exists.
Notes: Return false if a node doesn't exist or ID isn't a UTF-8 string.
Return false if a node exists, but not renderable.

190.1.11 Render(width as Integer, Height as Integer, pixmap as Ptr, FitToType as Integer = 0, FitToValue as single = 0.0, transform as Ptr = nil)

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Renders the SVG onto the pixmap.
Notes: FitToType: Specifies into which region SVG should be fit.
transform: A root SVG transform. Can be used to position SVG inside the pixmap. If nil, we use identity transform.
width: Pixmap width.
height: Pixmap height.
pixmap: Pixmap data. Should have width * height * 4 bytes in size and contain premultiplied RGBA8888 pixels.

190.1.12 RenderNode(ID as string, width as Integer, Height as Integer, pixmap as Ptr, FitToType as Integer = 0, FitToValue as single = 0.0, transform as Ptr = nil)

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Renders the SVG onto the pixmap.
Notes: id: Node's ID. Must not be "".
FitToType: Specifies into which region SVG should be fit.
transform: A root SVG transform. Can be used to position SVG inside the pixmap. If nil, we use identity transform.
width: Pixmap width.
height: Pixmap height.
pixmap: Pixmap data. Should have width * height * 4 bytes in size and contain premultiplied RGBA8888 pixels.

190.1.13 RenderNodeToPicture(ID as string, width as Integer, Height as Integer, FitToType as Integer = 0, FitToValue as single = 0.0, transform as Ptr = nil) as Picture

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Renders the SVG as picture.
Notes: id: Node's ID. Must not be "".
FitToType: Specifies into which region SVG should be fit.
transform: A root SVG transform. Can be used to position SVG inside the picture. If nil, we use identity transform.
width: picture width.
height: picture height.

On success, we return the picture with the pixels.
Not supported for macOS 32-bit.

190.1.14 RenderToFile(file as FolderItem, FitToType as Integer = 0, FitToValue as single = 0.0)

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Renders SVG to file.
Notes: Only for macOS 32-bit.

190.1.15 RenderToPicture(width as Integer, Height as Integer, FitToType as Integer = 0, FitToValue as single = 0.0, transform as Ptr = nil) as Picture

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Renders the SVG as picture.
Notes: FitToType: Specifies into which region SVG should be fit.
transform: A root SVG transform. Can be used to position SVG inside the picture. If nil, we use identity transform.
width: picture width.
height: picture height.

On success, we return the picture with the pixels.
Not supported for macOS 32-bit.

190.1.16 ViewBox(byref x as double, byref y as double, byref width as double, byref height as double) as Boolean

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries the image viewbox.
Notes: Returns true on success and sets passed variables.

190.1.17 Properties

190.1.18 Available as Boolean

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether the class is available.
Example:

```
MessageBox "Available: "+ReSVGMBS.Available.ToString
```

Notes: Should return true for all targets except iOS.
(Read only property)

190.1.19 DPI as Double

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The target DPI.
Notes: Impact units conversion.
Default: 96
(Read and Write property)

190.1.20 FontFamily as String

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The default font family.
Notes: Will be used when no ‘font-family‘ attribute is set in the SVG.

Default: Times New Roman
(Read and Write property)

190.1.21 FontSize as Double

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The default font size.
Notes: Will be used when no ‘font-size‘ attribute is set in the SVG.
Default: 12
(Read and Write property)

190.1.22 Handle as Integer

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

190.1.23 Height as Double

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns an image height.
Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("test.svg")
Var p As New ReSVGMBS(file)

MessageBox "width "+p.Width.ToString+" x height "+p.Height.ToString
```

Notes: The size of a canvas that required to render this SVG.
(Read only property)

190.1.24 ImageRendering as Integer

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The default image rendering method.
Example:

ReSVGMBS.ImageRendering = ReSVGMBS.kImageRenderingOptimizeQuality

Notes: Will be used when an SVG element's 'image-rendering' property is set to 'auto'.
Default: kImageRenderingOptimizeQuality
(Read and Write property)

190.1.25 IsEmpty as Boolean

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Checks that tree has any nodes.
Notes: Returns true if tree has no nodes.
(Read only property)

190.1.26 KeepNamedGroups as Boolean

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Keep named groups.
Notes: If set to 'true', all non-empty groups with 'id' attribute will not be removed.
Default: false
(Read and Write property)

190.1.27 Languages as String

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: A comma-separated list of languages.
Example:

ReSVGMBS.Languages = "en,en-US"
MessageBox ReSVGMBS.Languages

Notes: Will be used to resolve a ‘systemLanguage‘ conditional attribute.
Example: en,en-US.
Default: en
(Read and Write property)

190.1.28 ShapeRendering as Integer

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The default shape rendering method.
Example:

ReSVGMBS.ShapeRendering = ReSVGMBS.kShapeRenderingGeometricPrecision

Notes: Will be used when an SVG element’s ‘shape-rendering‘ property is set to ‘auto‘.

Default: kShapeRenderingGeometricPrecision
(Read and Write property)

190.1.29 TextRendering as Integer

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The default text rendering method.
Example:

ReSVGMBS.TextRendering = ReSVGMBS.kTextRenderingOptimizeLegibility

Notes: Will be used when an SVG element’s ‘text-rendering‘ property is set to ‘auto‘.
Default: kTextRenderingOptimizeLegibility
(Read and Write property)

190.1.30 Width as Double

MBS Images Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns an image width.

Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("test.svg")
Var p As New ReSVGMBS(file)

MessageBox "width "+p.Width.ToString+" x height "+p.Height.ToString
```

Notes: The size of a canvas that required to render this SVG.
(Read only property)

190.1.31 Constants

Errors

Constant	Value	Description
kErrorElementsLimitReached	4	We do not allow SVG with more than 1_000_000 elements for security reasons.
kErrorFileOpenFailed	2	Failed to open the provided file.
kErrorInvalidSize	5	SVG doesn't have a valid size. Occurs when width and/or height are <= 0. Also occurs if width, height and viewBox are not set.
kErrorMalformedGZip	3	Compressed SVG must use the GZip algorithm.
kErrorNotAnUTF8String	1	Only UTF-8 content are supported.
kErrorOK	0	Everything is ok.
kErrorParsingFailed	6	Failed to parse an SVG data.

Fit Types

Constant	Value	Description
kFitToTypeHeight	2	Fit an image to a specified height.
kFitToTypeOriginal	0	Use an original image size.
kFitToTypeWidth	1	Fit an image to a specified width.
kFitToTypeZoom	3	Zoom an image using scaling factor.

Image Rendering

Constant	Value	Description
kImageRenderingOptimizeQuality	0	Optimize for quality
kImageRenderingOptimizeSpeed	1	Optimize for speed

Shape Renderings

Constant	Value	Description
kShapeRenderingCrispEdges	1	Crisp Edges
kShapeRenderingGeometricPrecision	2	Geometric precision
kShapeRenderingOptimizeSpeed	0	Optimize speed

Text Renderings

Constant	Value	Description
kTextRenderingGeometricPrecision	2	Geometric precision
kTextRenderingOptimizeLegibility	1	Optimize legibility
kTextRenderingOptimizeSpeed	0	Optimize for speed

Chapter 191

System

191.1 Globals

191.1.1 GetHelpTagDelayMBS as Integer

MBS MacOSX Plugin, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns the delay time for the help tags.
Example:

MessageBox str(GetHelpTagDelayMBS)

Notes: A positive value is for milliseconds and a negative value for microseconds.
It looks like the setting of this property is not recognized always.
This setting is also per application and not saved between sessions.
Blog Entries

- MBS Xojo Plugins, version 20.6pr4

191.1.2 GetHelpTagDisplayedMBS as boolean

MBS MacOSX Plugin, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** whether the help tags are displayed.
Notes: This setting is per application and not saved between sessions.
Blog Entries

- MBS Xojo Plugins, version 20.6pr4

191.1.3 SetHelpTagDelayMBS(value as Integer)

MBS MacOSX Plugin, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Sets the delay time for the help tags.
Example:

```
if GetHelpTagDelayMBS<>5000 then // change to 5 seconds
SetHelpTagDelayMBS 5000
end if
```

Notes: A positive value is for milliseconds and a negative value for microseconds.
It looks like the setting of this property is not recognized always.
This setting is also per application and not saved between sessions.

Xojo 2006r3 does set this value whenever a window comes to front, so if you want to set it really, use some code like in the example above in a timer to change it to your need.
Blog Entries

- MBS Xojo Plugins, version 20.6pr4

191.1.4 SetHelpTagDisplayedMBS(value as boolean)

MBS MacOSX Plugin, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Sets whether the help tags are displayed.
Notes: This setting is per application and not saved between sessions.
Blog Entries

- MBS Xojo Plugins, version 20.6pr4

191.1.5 GetWindowsColorProfileMBS as folderitem

MBS Win Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the path to the color profile for the main screen on Windows.
Example:

```
Var f as folderitem

f=getwindowsColorProfileMBS

MessageBox f.NativePath
```

Notes: Returns nil on any error.
Blog Entries

- MBS Xojo Plugins, version 21.6pr1

191.1.6 GetWindowsDisplayColorProfileMBS(DisplayIndex as Integer) as folderitem

MBS Win Plugin, Plugin Version: 8.6, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the path to the color profile for the given screen on Windows.
Example:

```
Var f as folderitem

f=GetWindowsDisplayColorProfileMBS(1)

MessageBox f.NativePath
```

Notes: Index is zero based.
Returns nil on any error.
See also:

- 191.1.7 GetWindowsDisplayColorProfileMBS(DisplayName as String) as folderitem 23017

191.1.7 GetWindowsDisplayColorProfileMBS(DisplayName as String) as folderitem

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the path to the color profile for the given screen on Windows.
Notes: Same as GetWindowsDisplayColorProfileMBS, but without index and taking a name.
See also:

- 191.1.6 GetWindowsDisplayColorProfileMBS(DisplayIndex as Integer) as folderitem 23017

191.1.8 CrashNiceMBS

MBS Util Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Crashes the application.
Notes: Does a nil object dereference which leads to a crash.

191.1.9 CrashUglyMBS

MBS Util Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Crashes the application.
Notes: This function should hide the stack list so it should be impossible to know what function crashed.

It may take a second to finish it, but CrashReporter (on Mac OS X) and other tools will not be able to show you which function crashed.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr1

191.1.10 DelayMBS(time as Double)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Stopps the application for the given time.
Example:

```
DelayMBS 1.5 // wait one and a half seconds
```

Notes: The application should take nearly 0% CPU Power till time has gone.
If you need more options like blocking other RB threads, check the DelayMBS method with mode parameter.

Another example from Kirk Clendinning:

```
Property: lastupdate as Integer

Sub YieldProcessorTime(periodticks as Integer, widthmilliseconds as Integer)
// use the Monkeybread Software delay to yeild time for a screen update
// every period*ticks for a pulse width of width milliseconds

if ticks>lastupdate+periodTicks then
delayMBS widthmilliseconds/1000
lastupdate=ticks
end if

exception err
ExceptionReport(err, "Utils:Methods:YieldProcessorTime")
end sub
```

YieldProcessorTime(15, 20) gives me a delay of 20ms every 250ms. But,
since the delayMBS yields time more efficiently than using a RB thread, this turns out to be a much more effective way to update progress bars etc.
I don't need the delay per se, but since RB still hasn't written a good yield function (that I know of) your delayMSB works instead.

Please use optional mode flags with DelayDontWaitNextEvent when using on thread.

Using DelayMBS on Web Applications can cause problems as the server is paused than for all clients, a really bad thing.
See also:

- 191.1.11 DelayMBS(time as Double, mode as Integer) 23019

191.1.11 DelayMBS(time as Double, mode as Integer)

MBS Util Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Stopps the application for the given time.
Example:

```
DelayMBS 1.5, 0 // wait one and a half seconds
```

Notes: Like DelayMBS with one parameter but additional mode parameter:

combine the following constants:

```
const DelayDontMPYield = 1              // Don't give additional time for other OS threads
const DelayDontRBYield = 2              // Don't give Xojo time for other Xojo threads
const DelayDontThreadYield = 4          // Don't give addition time for other OS threads
const DelayDontQuickTimeYield = 8       // Don't give time for QuickTime Movieplayer
const DelayDontWait = 16                // Don't give CPU time for other OS threads
const DelayDontWaitNextEvent = 32       // Don't give CPU time to handle events on Mac OS X to avoid beachball
                                        cursor
const DelayDontSleep = 64               // Don't give CPU time for other OS threads (Windows)
```

Using DelayDontWaitNextEvent may show the beach ball cursor, but will have the OpenDocument event working as other AppleEvents. Please use DelayDontWaitNextEvent option for running on threads.

Using DelayMBS on Web Applications can cause problems as the server is paused than for all clients, a really bad thing.

- 19.2, page 33: Shake It!, Shake any window to show an incorrect entry... on any platform, without plugins or declares! by Markus Winter

See also:

- 191.1.10 DelayMBS(time as Double) 23018

191.1.12 SleepMBS(time as Double)

MBS Util Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sleeps the current thread for the given time in seconds.
Example:

```
Var sock as TCPSocket // some socket
Var done as Boolean // some global property

do

SleepMBS(0.1) // 100 ms
sock.poll

loop until done
```

Notes: Sleep does not yield CPU time to other functions, so you really sleep the whole process.
Useful for console projects which sleep for a few milliseconds in a loop polling a socket.

If you need to give CPU time to socket, other threads or for quicktime movie playback, please use DelayMBS.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr9

191.1.13 InstallSystemExceptionHandlerMBS(Message as string = "")

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Targets: All.

Function: Installs an exception handler to show a message dialog with custom message before the app crashes.
Example:

```
InstallSystemExceptionHandlerMBS "My message"
```

Notes: If message is empty, the default message is "An unhandled C++ exception occurred. The application will now quit. A common reason for this is simply running out of memory.".

The plugin allocates some memory which we release later to make sure there is free memory for the message box.

On Windows this method does not work as currently we use static runtime on Windows which does not allow the plugin to access the runtime inside the RB framework.

- About InstallSystemExceptionHandlerMBS

191.1.14 AbortMBS

MBS Util Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The abort function causes abnormal program termination to occur.
Notes: Any open streams are flushed and closed.
The abort function never returns.

191.1.15 ExitMBS(code as Integer)

MBS Util Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform normal program termination.
Notes: See "man 3 exit" on the terminal on Mac OS X or Linux for details.
You define your own error codes. Zero is no error by convention.
Blog Entries

- Tipp of the day: Shell SSH Trouble and Workaround

191.1.16 GlobalIdleTimeMBS as Double

MBS MacOSX Plugin, Plugin Version: 13.2, Platforms: Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries the current global idle time.
Example:

```
MessageBox Format(GlobalIdleTimeMBS,"0.0")+" seconds idle"
```

Notes: The return value is the number of seconds the user did not use mouse or keyboard.
Returns 0 on any error.

Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr5

191.1.17 MacGlobalIdleTimeMBS as UInt64

MBS MacOSX Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Queries the current global idle time on a Mac.
Example:

```
MessageBox Format(MacGlobalIdleTimeMBS/1000000000.0,"0.0")+" seconds idle"
```

Notes: The return value is the number of nanoseconds the user did not use mouse or keyboard.
Returns 0 on any error.

Deprecated in 13.2 plugins in favor of GlobalIdleTimeMBS.

191.1.18 MacMountServerVolumeMBS(URL as string, MountDir as String, User as String, Password as String, byref Disk as FolderItem, flags as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: This routine will mount the server specified by url at mountDir (or the default location if mountDir is empty).
Example:

```
Var flags as Integer = 0
Var disk as FolderItem
Var URL as string = "smb://Test.local"
Var user as string = "root"
Var pass as string = "xxx"

Var e as Integer = MacMountServerVolumeMBS(URL, "", user, pass, disk, flags)

if e = 0 then
MessageBox "OK"
else
MessageBox disk.NativePath
```

```
end if
```

Notes: An optional user and password can be passed in for authentication. If no user or password is provided then the underlying file system will handle authentication if required. This routine returns after the mount is complete.

url: The server to mount.
mountDir: The directory to mount the server to (default if empty).
user: String to pass as user for authentication.
password: String to pass as password for authenticated log in.
Disk: The folderItem of the newly mounted volume.
Flags: Options (such as kFSMountServerMarkDoNotDisplay and kFSMountServerMountOnMountDir).

Constant	Value	Description
kFSMountServerMarkDoNotDisplay	1	Specify this option if you do want the volume displayed as a stand along volume in the UI.
kFSMountServerMountOnMountDir	4	Specify this option if you want the volume mounted on the mountdir passed in instead of in it.
kFSMountServerSuppressConnectionUI	&h40	Specify this option if you want to suppress connection-time UI when mounting the server volume.

Returns Mac OS X error code. Zero for success.

- MBS Xojo / Real Studio Plugins, version 16.1pr5

191.1.19 MacUnmountVolumeMBS(volume as folderItem, Force as Boolean, byref dissenter as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: This routine unmounts the volume specified by FolderItem.
Example:

```
Var u as Integer = VolumeCount-1
for i as Integer = 0 to u
Var v as FolderItem = volume(i)

if v.Name = "TestServer" then
Var dissenter as Integer = 0
Var e as Integer = MacUnmountVolumeMBS(v, false, dissenter)

if e = 0 then
MessageBox "Unmounted"
```

```
else
MessageBox "Failed to unmount with error "+str(e)+". The app with PID "+str(dissenter)+" blocks it."
end if
end if
next
```

Notes: If the volume cannot be unmounted the pid of the process which denied the unmount will be returned in the dissenter parameter. This routine returns after the unmount is complete.

Force: Specify true if you want the volume forcibly unmounted. Force unmounting a volume will very likely result in data loss since the volume will be ejected even if there are open files on it. This option should be reserved for situations such as the backing store for a volume is gone (so the data is lost regardless).

dissenter: pid of the process which denied the unmount if the unmount is denied.

Returns Mac OS X error code. Zero for success.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.1pr5

191.1.20 StartDictationMBS

MBS MacOSX Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Starts dictation.
Notes: This is for Carbon application. For Cocoa use methods on NSApplicationMBS.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr1

191.1.21 BacktraceMBS(MaxFrames as Integer = 0, skip as Integer = 2) as string()

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: Queries the stack trace of the current function.
Example:

```
MessageBox Join(BacktraceMBS, EndOfLine)
```

Notes: MaxFrames: How many steps to show at maximum. Default is 128 currently.
skip: How many entries to skip. Default is 2 to not show this function.
Requires Mac OS X 10.5 or Linux.

Skip is 2 to hide this plugin function in the list.

191.1.22 MillisecondsMBS as Double

MBS Util Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current milliseconds time.
Example:

```
// measure how long some code takes
Var start As Double = MillisecondsMBS
Var s As String
For i As Integer = 1 To 100000
s = Str(i)
Next
MessageBox Format(MillisecondsMBS - start, "0.0") + " ms"
```

Notes: Like Microseconds in Xojo, but queries system functions for milliseconds counter.

191.1.23 ExitWindowsMBS(mode as Integer) as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Shutdown a Windows PC.
Example:

```
Var b as boolean
b=ExitWindowsMBS(0)
```

Notes: Mode constants:

Returns true if successful.

The ExitWindows function returns as soon as it has initiated the shutdown. The shutdown or logoff then proceeds asynchronously.

LOGOFF	0	Shuts down all processes running in the security context of the process that called the ExitWindows function. Then it logs the user off.
SHUTDOWN	1	Shuts down the system to a point at which it is safe to turn off the power. All file buffers have been flushed to disk, and all running processes have stopped.
REBOOT	2	Shuts down the system and then restarts the system.
FORCE	4	Forces processes to terminate. When this flag is set, the system does not send the WM_QUERYENDSESSION and WM_ENDSESSION messages. This can cause the applications to lose data. Therefore, you should only use this flag in an emergency.
POWEROFF	8	Shuts down the system and turns off the power. The system must support the power-off feature.
FORCEIFHUNG	16	(Windows 2000) Forces processes to terminate if they do not respond to the WM_QUERYENDSESSION or WM_ENDSESSION message. This flag is ignored if FORCE is used.

During a shutdown or log-off operation, applications that are shut down are allowed a specific amount of time to respond to the shutdown request. If the time expires, the system displays a dialog box that allows the user to forcibly shut down the application, to retry the shutdown, or to cancel the shutdown request. If the FORCE value is specified, the system always forces applications to close and does not display the dialog box. If the FORCEIFHUNG value is specified, the system forces hung applications to close and does not display the dialog box.

Windows NT: To shut down or restart the system, the calling process must use the AdjustTokenPrivileges function to enable the SE_SHUTDOWN_NAME privilege.

- MBS Real Studio Plugins, version 12.0pr7

191.1.24 GetDoubleClickIntervalMBS as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the time in ticks which makes two clicks to one double click.
Example:

```
sub MouseUp(X as Integer, Y as Integer)
Var currentClickTicks as Integer
currentClickTicks = ticks

if (currentClickTicks - lastClickTicks) <= GetDoubleClickIntervalMBS then
if abs(x - lastClickX) <= 5 and abs (y - lastClickY) <= 5 then
DoubleClick //Fire new Doubleclick event
return
end
end
```

lastClickTicks = currentClickTicks
lastClickX = x
lastClickY = y
MouseUp
End sub

Notes: Time returned in ticks. One tick is 1/60 of a second.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.0pr1

191.1.25 GetMaximumOpenFileCountMacOSXMBS as Integer

MBS MacCF Plugin, Platforms: macOS, Linux, Targets: All.

Function: The number of simultan open files
Example:

MessageBox str(GetMaximumOpenFileCountMacOSXMBS)

Notes: On Mac OS X per default a process can have 256 files open at the same time.
This function allows you to increase the number of open files. It seems that you can't have more than 10240 files open on Mac OS X.
Returns -2 if the function is not available and -1 if the current number of open files is unknown.

191.1.26 GetSystemUIModeMBS as Integer

MBS MacOSX Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Returns the current Mac OS X System UI Mode for your application.
Notes: Returns -1 on any error.
See SetSystemUIModeMBS for more details.
Please use presentationOptions in NSApplicationMBS for Cocoa applications.

191.1.27 GetSystemUIModeOptionsMBS as Integer

MBS MacOSX Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Returns the current Mac OS X System UI Mode options for your application.
Notes: Returns -1 on any error.
See SetSystemUIModeMBS for more details.

Please use presentationOptions in NSApplicationMBS for Cocoa applications.

191.1.28 MacCountryCodeMBS as string

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Returns the country code for
Example:

```
MessageBox MacCountryCodeMBS // Shows DE in Germany.
```

Notes: On any error returns "".
Requires Mac OS 8.6 or newer (or Mac OS X).
Fix in Plugin version 4.0 to no longer return random strings, but now you must accept that this function may fail on Mac if it has nothing to report. (unkown reason)

191.1.29 OpenMacOSXPreferencesPaneMBS(name as string) as Integer

MBS MacOSX Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Opens a named preference pane on Mac OS X.
Example:

```
Var e as Integer
e=OpenMacOSXPreferencesPaneMBS("Network")
```

Notes: Returns a Mac OS X error code. For example -43 if file not found, -1 if function is not available or 0 if successful.

Possible values for Mac OS X:
UniversalAccessPref
StartupDisk
Speech
Sound
Network
MyAccount
Mouse
LoginItems
Localization
Keyboard
Internet
Ink
General
EnergySaver

DigiHubDiscs
DesktopPictures
Dock
ColorSync
QuickTime
Classic
Bluetooth
ARDPref
DateAndTime
Accounts
Displays
SoftwareUpdate
SharingPref
ScreenSaver

See content of /System/Library/PreferencePanes/ folder.

In MacOS 10.10 or newer, better use URL schemes:

191.1.30 RunningOnCarbonXMBS as boolean

MBS MacOSX Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns true if we are running Carbon on Mac OS X.
Example:

```
if RunningOnCarbonXMBS then
' do Stuff for Mac OS X only
end if
```

Notes: Does always return false on Windows and Mac OS Classic.

191.1.31 SetMaximumOpenFileCountMacOSXMBS(Value as Integer)

MBS MacCF Plugin, Platforms: macOS, Linux, Targets: All.

Function: The number of simultan open files
Example:

SetMaximumOpenFileCountMacOSXMBS 500

Notes: On Mac OS X per default a process can have 256 files open at the same time.
This function allows you to increase the number of open files. It seems that you can't have more than 10240 files open on Mac OS X.

191.1.32 SetSystemUIModeMBS(mode as Integer, Options as Integer)

MBS MacOSX Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Sets the current System UI mode for your application.
Notes: Details from Apple's documentation:

Sets the presentation mode for system-provided user interface elements.

The presentation mode of an application determines which system-provided user interface elements are visible on thes screen. When the frontmost application changes its presentation mode, a kEventAppSystemUIModeChanged Carbon event is sent to all applications that have registered for the event. This event is also sent when an application is activated; it contains the newly active application's presentation mode.

Note that the system UI mode is a per-process state. Switching from a process that is suppressing system UI to another processthat is not will cause system UI elements to become visible automatically. Switching back to the first process will suppress system UI elements again.

The modes available:

kUIModeNormal	0	In this mode, all standard system UI elements are visible.
kUIModeContentSuppressed	1	In this mode, system UI elements which cover the "content area" of the screen (the area other than the menu bar) are hidden. However, these elements may automatically show themselves in response to mouse movements or other user activity; specifically, the Dock will still show itself automatically when the mouse moves into the Dock's auto-show region.
kUIModeContentHidden	2	In this mode, system UI elements which cover the "content area" of the screen (the area other than the menu bar) are hidden. Unlike kUIModeContentSuppressed, most UI elements will not automatically show themselves in this mode.
kUIModeAllHidden	3	In this mode, all system UI elements, including the menu bar, are hidden. Most system UI elements will not automatically show themselves in this mode. The application may request that the menu bar automatically show itself while in this mode by passing the kUIOptionAutoShowMenuBar flag to SetSystemUIMode.

The options which you can combine:

kUIOptionAutoShowMenuBar	1	Requests that the menu bar automatically show itself when the user moves the mouse into the screen area that would ordinarily be occupied by the menu bar. Only valid with kUIModeAllHidden.
kUIOptionAnimateMenuBar	2	Requests that the menu bar animate on or offscreen, if the UIMode is also being changed such that the menu bar will change visibility. Unlike other UI options, this option is not stored and only affects the behavior of this call to SetSystemUIMode. Valid for all modes. Available in Mac OS X 10.7 and later.
kUIOptionDisableAppleMenu	4	Disables all items in the Apple menu. Valid for all modes.
kUIOptionDisableProcessSwitch	8	The active application may not be changed while this process is active. Currently disables the Command-Tab and Command-Shift-Tab key sequences to switch the active process, and the global window rotation key sequence selected by the user in the Keyboard preference pane. SetFrontProcess may still be used to explicitly switch the active process. Only valid with modes other than kUIModeNormal.
kUIOptionDisableForceQuit	16	The Force Quit window may not be displayed while this process is active. Currently disables the Command-Option-Escape key sequence to open the Force Quit window and the Force Quit menu item in the Apple menu. Only valid with modes other than kUIModeNormal.
kUIOptionDisableSessionTerminate	32	The current login session may not be terminated while this process is active. Currently disables the Power key and the Restart, Shut Down, and Log Out menu items in the Apple menu. Only valid with modes other than kUIMode-Normal.

Please use presentationOptions in NSApplicationMBS for Cocoa applications.

191.1.33 ShowCharacterPaletteMBS

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Shows the character palette.
Example:

ShowCharacterPaletteMBS

Notes: Works on Mac OS X 10.3 and newer.
We have no way to close this window.

191.1.34 SystemControlByNameMBS(name as string) as memoryblock

MBS MacCF Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Targets: All.

Function: The SystemControlByNameMBS function retrieves system information and allows processes with appropriate privileges to set system information.
Example:

```
Var m1 as MemoryBlock = SystemControlByNameMBS("hw.physicalcpu")
```

```
Var m2 as MemoryBlock = SystemControlByNameMBS("hw.logicalcpu")

MessageBox "physicalcpu: "+str(m1.Long(0))+EndOfLine+"logicalcpu: "+str(m2.Long(0))
```

Notes: The name is given as an ASCII string.
Returns nil on any error.
See also:

- 191.1.35 SystemControlByNameMBS(name as string, input as memoryblock) as memoryblock 23032

191.1.35 SystemControlByNameMBS(name as string, input as memoryblock) as memoryblock

MBS MacCF Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Targets: All.

Function: The SystemControlByNameMBS function retrieves system information and allows processes with appropriate privileges to set system information.
Notes: The name is given as an ASCII string.
Returns nil on any error.
See also:

- 191.1.34 SystemControlByNameMBS(name as string) as memoryblock 23031

191.1.36 SystemControlMBS(name as memoryblock) as memoryblock

MBS MacCF Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Targets: All.

Function: The SystemControlMBS function retrieves system information and allows processes with appropriate privileges to set system information.
Example:

```
Function IsRosetta() As boolean
Const CTL_HW = 6
Const HW_MODEL = 2

Var mib,m as MemoryBlock

mib=newMemoryBlock(8)
mib.Long(0) = CTL_HW
mib.Long(4) = HW_MODEL

m=SystemControlMBS(mib)
if m<>nil then
if m.CString(0)="PowerMac" then
Return true
end if
```

```
end if
End Function
```

Notes: name is a MIB which can be constructed or queried with SystemControlNameToMIBMBS.
Returns nil on any error.
See also:

- 191.1.37 SystemControlMBS(name as memoryblock, input as memoryblock) as memoryblock 23033

191.1.37 SystemControlMBS(name as memoryblock, input as memoryblock) as memoryblock

MBS MacCF Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Targets: All.

Function: The SystemControlMBS function retrieves system information and allows processes with appropriate privileges to set system information.
Notes: Returns nil on any error.
name is a MIB which can be constructed or queried with SystemControlNameToMIBMBS.
Xojo Developer Magazine

See also:

- 191.1.36 SystemControlMBS(name as memoryblock) as memoryblock 23032

191.1.38 SystemControlNameToMIBMBS(name as string) as memoryblock

MBS MacCF Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Targets: All.

Function: Searches the given MIB for the given name.
Notes: Name is an ASCII string.
Returns nil on any error.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr12

191.1.39 WindowsSystemMetricsMBS(what as Integer) as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WindowsSystemMetrics function retrieves various system metrics (widths and heights of display elements) and system configuration settings.
Example:

```
const SM_CYSMICON = 50

MessageBox str(WindowsSystemMetricsMBS(SM_CYSMICON))
```

Notes: All dimensions retrieved by GetSystemMetrics are in pixels.
If the function fails, the return value is zero.

Values for the what parameter:

The SM_ARRANGE setting specifies how the system arranges minimized windows, and consists of a starting position and a direction. The starting position can be one of the following values:

The direction in which to arrange can be one of the following values:

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/ms724385(v=vs.85).aspx

191.1.40 GetQOSClassMBS as Integer

MBS Util Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the Quality Of Service class for the current thread.
Example:

```
// check the quality of service class of the current thread
Var qos As Integer = GetQOSClassMBS
MessageBox "QOS class: &h" + Hex(qos) // &h21 = user interactive, &h19 = user initiated
```

Notes: Returns a number from 1 (background) to highest (5) for the thread.
See also SetQOSClassMBS function to set the QOS class.

Blog Entries

- News from the MBS Xojo Plugins Version 26.1
- Moving background threads to efficient cores
- MBS Xojo Plugins, version 26.1pr7

191.1.41 SetQOSClassMBS(QOS as Integer) as Integer

MBS Util Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the Quality Of Service class for the current thread.
Example:

```
const QOS_CLASS_USER_INTERACTIVE = 5
const QOS_CLASS_USER_INITIATED = 4
const QOS_CLASS_DEFAULT = 3
const QOS_CLASS_UTILITY = 2
const QOS_CLASS_BACKGROUND = 1
const QOS_CLASS_UNSPECIFIED = 0

var e as integer = SetQOSClassMBS(QOS_CLASS_BACKGROUND)
```

Notes: The Quality Of Service class for a thread tells the scheduler how to prioritize the thread and whether to run this on a faster or more efficient CPU core.

MacOS can run threads marked as background on an efficient core to safe battery life.
Linux does not allow to set higher priority (4 or 5) unless you have permissions to do so.

Returns a native error code or zero in case of success.

191.1.42 IsWindows95MBS as boolean

MBS Win Plugin, Plugin Version: 5.4, Platform: Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Checks whether operating system is Windows 95/98/ME.
Example:

```
if IsWindows95MBS then
MessageBox "Windows 95/98/ME"
else
MessageBox "no Windows 95/98/ME"
```

```
end if
```

Notes: Returns true or false on Windows and alway false on other platforms.
Blog Entries

- MBS Xojo Plugins, version 20.6pr4

191.1.43 IsWindowsAdminUserMBS as boolean

MBS Win Plugin, Plugin Version: 5.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Checks whether the current user is an Admin User on Windows.
Example:

```
if IsWindowsAdminUserMBS then
MessageBox "Is admin user."
else
MessageBox "no admin user."
end if
```

Notes: Returns true or false on Windows and alway false on other platforms.

191.1.44 IsWindowsNTMBS as boolean

MBS Win Plugin, Plugin Version: 5.4, Platform: Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Checks whether operating system is Windows NT/2000/XP.
Example:

```
if IsWindowsNTMBS then
MessageBox "Windows NT/2000/XP"
else
MessageBox "no Windows NT/2000/XP"
end if
```

Notes: Returns true or false on Windows and alway false on other platforms.
Blog Entries

- MBS Xojo Plugins, version 20.6pr4

191.1.45 WindowsGetProcessIntegrityLevelMBS as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The function gets the integrity level of the current process.
Example:

MessageBox str(WindowsGetProcessIntegrityLevelMBS)

Notes: Integrity level is only available on Windows Vista and newer operating systems, thus GetProcessIntegrityLevel throws a C++ exception if it is called on systems prior to Windows Vista.

Returns the integrity level of the current process. It is usually one of these values:

191.1.46 WindowsIsApplicationRunAsAdminMBS as boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The function checks whether the current process is run as administrator.
Example:

MessageBox str(WindowsIsApplicationRunAsAdminMBS)

Notes: In other words, it dictates whether the primary access token of the process belongs to user account that is a member of the local Administrators group and it is elevated.

Returns true if the primary access token of the process belongs to user account that is a member of the local Administrators group and it is elevated. Returns false if the token does not.
Blog Entries

- MBS REALbasic Plugins Version 10.4 release notes
- Windows Admin functions
- MBS REALbasic Plugins, version 10.4pr3

191.1.47 WindowsIsProcessElevatedMBS as boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The function gets the elevation information of the current process.
Example:

MessageBox str(WindowsIsProcessElevatedMBS)

Notes: It dictates whether the process is elevated or not. Token elevation is only available on Windows Vista and newer operating systems, thus IsProcessElevated returns always false if it is called on systems prior to Windows Vista. It is not appropriate to use this function to determine whether a process is run as administrator.

Returns true if the process is elevated. Returns false if it is not.

191.2 module BuildConstantsMBS

191.2.1 module BuildConstantsMBS

MBS Main Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A module with build constants for you.
Example:

MessageBox BuildConstantsMBS.DateTime

Notes: This module provides the date and time when the plugin was loaded to the Xojo IDE.
You can use this constant to know in your application when it was built. Not exactly, but within a few hours exact.
The examples above show when this page was rendered with our documentation tool.

- MBS REALbasic Plugins, version 10.6pr8
- Build Time Constants

191.2.2 Constants

Constants

Constant	Value	Description
Date	" 9.11.2026"	The constant for the date. Format is dd.mm.yyyy like 24.12.2010. This is the date when the plugin was loaded to the Xojo IDE. You can use this constant to know in your application when it was built. Not exactly, but within a few hours exact.
DateTime	"Mon Nov 9 07:41:59 2026"	The constant for the date and time. This is the time when the plugin was loaded to the Xojo IDE. You can use this constant to know in your application when it was built. Not exactly, but within a few hours exact.
Day	9	The day.
Hour	7	The hour.
Minute	41	The minute.
Month	11	The month.
Second	59	The second.
Time	" 7:41:59"	The constant for the time. Format is like hh:mm:ss like 11:22:33. This is the time when the plugin was loaded to the Xojo IDE. You can use this constant to know in your application when it was built. Not exactly, but within a few hours exact.
Year	2026	The year.

SM_ARRANGE	56	Flags specifying how the system arranged minimized windows. For more information about minimized windows, see the following Remarks section.
SM_CLEANBOOT	67	Value that specifies how the system was started: 0 Normal boot; 1 Fail-safe boot; 2 Fail-safe with network boot; Fail-safe boot (also called SafeBoot) bypasses the user's startup files.
SM_CMETRICS	83	(Windows 2000 or newer)
SM_CMONITORS	80	Number of display monitors on the desktop. (Windows 2000 or newer)
SM_CMOUSEBUTTONS	43	Number of buttons on mouse, or zero if no mouse is installed.
SM_CXBORDER	5	Width, in pixels, of a window border.
SM_CXCURSOR	13	Width, in pixels, of a cursor. The system cannot create cursors of other sizes.
SM_CXDLGFRAME	7	Thickness, in pixels, of the sizing border around the perimeter of a window that can be resized. (or SM_CXFIXEDFRAME)
SM_CXDOUBLECLK	36	Width, in pixels, of the rectangle around the location of a first click in a double-click sequence. The second click must occur within this rectangle for the system to consider the two clicks a double-click. (The two clicks must also occur within a specified time.)
SM_CXDRAG	68	Width, in pixels, of a rectangle centered on a drag point to allow for limited movement of the mouse pointer before a drag operation begins. This allows the user to click and release the mouse button easily without unintentionally starting a drag operation.
SM_CXEDGE	45	Width, in pixels, of a 3-D border.
SM_CXFRAME	32	Thickness, in pixels, of the sizing border around the perimeter of a window that can be resized. (or SM_CXSIZEFRAME)
SM_CXFULLSCREEN	16	Width of the client area for a full-screen window on the primary display monitor.
SM_CXHSCROLL	21	Width, in pixels, of the arrow bitmap on a horizontal scroll bar.
SM_CXHTHUMB	10	Width, in pixels, of the thumb box in a horizontal scroll bar.
SM_CXICON	11	The default width, in pixels, of an icon. TheLoadIcon function can load only icons of these dimensions.
SM_CXICONSPACING	38	Width, in pixels, of a grid cell for items in large icon view. Each item fits into a rectangle of this size when arranged. These values are always greater than or equal to SM_CXICON and SM_CYICON.
SM_CXMAXIMIZED	61	Default width, in pixels, of a maximized top-level window on the primary display monitor.
SM_CXMAXTRACK	59	Default maximum width, in pixels, of a window that has a caption and sizing borders. This metric refers to the entire desktop. The user cannot drag the window frame to a size larger than these dimensions.
SM_CXMENUCHECK	71	Width, in pixels, of the default menu check-mark bitmap.
SM_CXMENUSIZE	54	Width, in pixels, of menu bar buttons, such as the child window close button used in the multiple document interface.
SM_CXMIN	28	Minimum width, in pixels, of a window.
SM_CXMINIMIZED	57	Width, in pixels, of a normal minimized window.
SM_CXMINSPACING	47	Width, in pixels, of a grid cell for minimized windows. Each minimized window fits into a rectangle this size when arranged. These values are always greater than or equal to SM_CXMINIMIZED and SM_CYMINIMIZED.
SM_CXMINTRACK	34	Minimum tracking width, in pixels, of a window. The user cannot drag the window frame to a size smaller than these dimensions. A window can override these values by processing the WM_GETMINMAXINFO message.
SM_CXSCREEN	0	Width, in pixels, of the screen of the primary display monitor.
SM_CXSIZE	30	Width, in pixels, of a button in a window's caption or title bar.
SM_CXSMICON	49	Recommended width, in pixels, of a small icon. Small icons typically appear in window captions and in small icon view.
SM_CXSMSIZE	52	Width, in pixels, of small caption buttons.
SM_CXVIRTUALSCREEN	78	Width, in pixels, of the virtual screen. The virtual screen is the bounding rectangle of all display monitors. (Windows 98/ME and 2000 or newer)
SM_CXVSCROLL	2	Width, in pixels, of a vertical scroll bar; and height, in pixels, of the arrow bitmap on a vertical scroll bar.
SM_CYBORDER	6	Height, in pixels, of a window border.
SM_CYCAPTION	4	Height, in pixels, of a normal caption area.
SM_CYCURSOR	14	Height, in pixels, of a cursor. The system cannot create cursors of other sizes.
SM_CYDLGFRAME	8	Thickness, in pixels, of the frame around the perimeter of a window that has a caption but is not sizable. (or SM_CYFIXEDFRAME)
SM_CYDOUBLECLK	37	Height, in pixels, of the rectangle around the location of a first click in a double-click sequence. The second click must occur within this rectangle for the system to consider the two clicks a double-click. (The two clicks must also occur within a specified time.)
SM_CYDRAG	69	Height, in pixels, of a rectangle centered on a drag point to allow for limited movement of the mouse pointer before a drag operation begins. This allows the user to click and release the mouse button easily without unintentionally starting a drag operation.
SM_CYEDGE	46	Height, in pixels, of a 3-D border.

ARW_BOTTOMLEFT	0x0000L	Start at the lower-left corner of the screen (default position).
ARW_BOTTOMRIGHT	0x0001L	Start at the lower-right corner of the screen. Equivalent to ARW_STARTRIGHT.
ARW_HIDE	0x0008L	Hide minimized windows by moving them off the visible area of the screen.
ARW_TOPLEFT	0x0002L	Start at the upper-left corner of the screen. Equivalent to ARV_STARTTOP.
ARW_TOPRIGHT	0x0003L	Start at the upper-right corner of the screen. Equivalent to ARW_STARTTOP | SRW_STARTRIGHT.

ARW_DOWN	0x0004L	Arrange vertically, top to bottom.
ARW_LEFT	0x0000L	Arrange horizontally, left to right.
ARW_RIGHT	0x0000L	Arrange horizontally, right to left.
ARW_UP	0x0004L	Arrange vertically, bottom to top.

Name	Value	Description
QOS_CLASS_USER_INTERACTIVE	5	The thread handles user input.
QOS_CLASS_USER_INITIATED	4	The user requested this action.
QOS_CLASS_DEFAULT	3	Default
QOS_CLASS_UTILITY	2	Utility thread running with reduced priority, e.g. menu bar utility app.
QOS_CLASS_BACKGROUND	1	Background thread with reduced priority, e.g. backup.
QOS_CLASS_UNSPECIFIED	0	Unknown level.

Name	Value	Description
QOS_CLASS_USER_INTERACTIVE	5	The thread handles user input.
QOS_CLASS_USER_INITIATED	4	The user requested this action.
QOS_CLASS_DEFAULT	3	Default
QOS_CLASS_UTILITY	2	Utility thread running with reduced priority, e.g. menu bar utility app.
QOS_CLASS_BACKGROUND	1	Background thread with reduced priority, e.g. backup.
QOS_CLASS_UNSPECIFIED	0	Unknown level.

SECURITY_MANDATORY_UNTRUSTED_RID	= &h0	Means untrusted level. It is used by processes started by the Anonymous group. Blocks most write access.
SECURITY_MANDATORY_LOW_RID	= &h1000	Means low integrity level. It is used by Protected Mode Internet Explorer. Blocks write access to most objects (such as files and registry keys) on the system.
SECURITY_MANDATORY_MEDIUM_RID	= &h2000	Means medium integrity level. It is used by normal applications being launched while UAC is enabled.
SECURITY_MANDATORY_HIGH_RID	= &h3000	Means high integrity level. It is used by administrative applications launched through elevation when UAC is enabled, or normal applications if UAC is disabled and the user is an administrator.
SECURITY_MANDATORY_SYSTEM_RID	= &h4000	Means system integrity level. It is used by services and other system-level applications (such as Wininit, Winlogon, Smss, etc.)

191.3 class DCDeviceMBS

191.3.1 class DCDeviceMBS

MBS iOS Plugin, Plugin Version: 23.0, Platforms: macOS, iOS, Targets: All.

Function: A representation of a device that provides a unique, authenticated token.
Notes: Use the shared instance of the DCDevice class to generate a token that identifies a device. Call the generateToken method to get the token, and then send it to your server.

On your server, combine the token with an authentication key that you obtain from Apple, and use the result to request access to two per-device binary digits (bits). After authenticating the device, Apple passes the current values of the bits, along with the date they were last modified, to your server. Your server applies its business logic to this information and communicates the results to your app. For more information about server-side procedures, see Accessing and Modifying Per-Device Data.

To use the DCDevice class, your app must have an app ID that you register on the Apple Developer website.

Apple records the bits for you, and reports the bits back to you, but you,Äôre responsible for keeping track of what the bits mean. You,Äôre also responsible for determining when to reset the bits for a given device; for example, when a user sells the device to someone else.

Xojo Developer Magazine

- 21.3, page 10: News
- 21.2, page 9: News

191.3.2 Methods

191.3.3 available as boolean

MBS iOS Plugin, Plugin Version: 23.0, Platforms: macOS, iOS, Targets: All.

Function: Whether the class is available.
Example:

```
MessageBox "available: "+DCDeviceMBS.available.ToString
```

Notes: Returns true on macOS 10.15 and newer and iOS 11.0 or newer.

191.3.4 Constructor

MBS iOS Plugin, Plugin Version: 23.0, Platforms: macOS, iOS, Targets: All.

Function: The constructor.
Notes: Initializes the object pointing to the current device one internally.

191.3.5 currentDevice as DCDeviceMBS

MBS iOS Plugin, Plugin Version: 23.0, Platforms: macOS, iOS, Targets: All.

Function: A representation of the device for which you want to query the two bits of data.

191.3.6 generateToken(CompleteHandler as GenerateTokenCompletedMBS, tag as variant = nil)

MBS iOS Plugin, Plugin Version: 23.0, Platforms: macOS, iOS, Targets: All.

Function: Generates a token that identifies the current device.
Notes: Calls GenerateTokenCompletedMBS event later when done.

Your server uses the generated token in its requests to get or set the persistent bits for the current device. You should treat the token you receive in the completion block as single-use. Although the token remains valid long enough for your server to retry a specific request if necessary, you should not use a token multiple times. Instead, use this method to generate a new token.

The app you use to generate the token must be associated with your developer account; otherwise, the generation request fails.

191.3.7 Properties

191.3.8 Handle as Integer

MBS iOS Plugin, Plugin Version: 23.0, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

191.3.9 Supported as Boolean

MBS iOS Plugin, Plugin Version: 23.0, Platforms: macOS, iOS, Targets: All.

Function: A Boolean value that indicates whether the device supports the DeviceCheck API.
Example:

MessageBox "Supported: "+DCDeviceMBS.currentDevice.Supported.ToString

Notes: For iOS 11.0 or newer and macOS 10.15 or newer.
(Read only property)

191.3.10 Constants

Errors

Constant	Value	Description
ErrorFeatureUnsupported	1	The feature is not supported on this device.
ErrorInvalidInput	2	Input to the server process was invalid.
ErrorInvalidKey	3	The key used is invalid.
ErrorServerUnavailable	4	The server application to talk to is not available.
ErrorUnknownSystemFailure	0	Unknown error in system.

191.3.11 Delegates

191.3.12 GenerateTokenCompletedMBS(token as MemoryBlock, Error as NSErrorMBS, Tag as Variant)

MBS iOS Plugin, Plugin Version: 23.0, Platforms: macOS, iOS, Targets: All.

Function: The event called asynchronously from generateToken when work is done.
Notes: token: An ephemeral token that identifies the current device.
error: The error that occurred, if any.

Your server uses the generated token in its requests to get or set the persistent bits for the current device. You should treat the token you receive in the completion block as single-use. Although the token remains valid long enough for your server to retry a specific request if necessary, you should not use a token multiple times. Instead, use this method to generate a new token.

The app you use to generate the token must be associated with your developer account; otherwise, the generation request fails.

191.4 class GlobalExceptionHandlerMBS

191.4.1 class GlobalExceptionHandlerMBS

MBS Util Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Installs an exception handler to show a message dialog with custom message before the app crashes.
Notes: The plugin allocates some memory which we release later to make sure there is free memory for the message box.

On Windows this method does not work as currently we use static runtime on Windows which does not allow the plugin to access the runtime inside the RB framework.

See also WinExceptionMBS, NSExceptionHandlerMBS and SignalHandlerMBS classes.

191.4.2 Events

191.4.3 GotException

MBS Util Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Called when an unhandled C++ exception was raised.
Notes: Your application is in a very instable state when this event is called. Don't do much here and quit soon with ExitMBS/AbortMBS.

191.5 class LinuxSysInfoMBS

191.5.1 class LinuxSysInfoMBS

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class to query memory and processor statistics.
Example:

Var l as new LinuxSysInfoMBS

MessageBox str(l.FreeRam)+" bytes free."

- 10.4, page 9: News

191.5.2 Methods

191.5.3 Constructor

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries values and fills properties.

191.5.4 loads(index as Integer) as Double

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: 1, 5, and 15 minute load averages.

191.5.5 Properties

191.5.6 availablePhysicalPages as Integer

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Return number of available physical pages of memory in the system.
Notes: (Read only property)

191.5.7 BufferRam as UInt64

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Memory used by buffers.
Notes: (Read only property)

191.5.8 FreeHigh as UInt64

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Available high memory size.
Notes: (Read only property)

191.5.9 FreeRam as UInt64

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Available memory size.
Example:

```
Var l as new LinuxSysInfoMBS

MessageBox str(l.FreeRam)+" bytes free."
```

Notes: (Read only property)

191.5.10 FreeSwap as UInt64

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Swap space still available.
Notes: (Read only property)

191.5.11 MemoryUnit as UInt64

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Memory unit size in bytes.
Notes: (Read only property)

191.5.12 NumberOfProcesses as Integer

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Number of current processes.
Example:

```
Var l as new LinuxSysInfoMBS

MessageBox str(l.NumberOfProcesses)+" processes"
```

Notes: (Read only property)

191.5.13 NumberOfProcessors as Integer

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Return number of available processors.
Example:

```
Var l as new LinuxSysInfoMBS

MessageBox str(l.NumberOfProcessors)+" processors"
```

Notes: (Read only property)

191.5.14 NumberOfProcessorsConfigured as Integer

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Return number of configured processors.
Notes: (Read only property)

191.5.15 PhysicalPages as Integer

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Return number of physical pages of memory in the system.
Notes: (Read only property)

191.5.16 SharedRam as UInt64

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Amount of shared memory.
Notes: (Read only property)

191.5.17 TotalHigh as UInt64

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Total high memory size.
Notes: (Read only property)

191.5.18 TotalRam as UInt64

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Total usable main memory size.
Notes: (Read only property)

191.5.19 TotalSwap as UInt64

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Total swap space size.
Notes: (Read only property)

191.5.20 upTime as Integer

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Seconds since boot.
Notes: (Read only property)

191.5.21 Valid as Boolean

MBS Linux Plugin, Plugin Version: 12.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Whether constructor got values.
Notes: Should be true on Linux and false on other platforms.
(Read only property)

191.6 class SignalHandlerMBS

191.6.1 class SignalHandlerMBS

MBS Util Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: A signal handler for an unix signal.
Example:

```
// quit a console or server app cleanly when it gets SIGTERM or SIGINT (Ctrl-C)
// MySignalHandler is a subclass of SignalHandlerMBS with the Signal event implemented.
// Handler is a property of the app: Handler As MySignalHandler
Handler = New MySignalHandler
Call Handler.SetEventHandler(15) // SIGTERM
Call Handler.SetEventHandler(2) // SIGINT

// in MySignalHandler:
Sub Signal(n As Integer) Handles Signal
System.DebugLog "Got signal " + n.ToString + ", saving and quitting."
Quit
End Sub
```

Notes: You can use this class to catch signals like SIGALRM oder SIGQUIT.

See
http://en.wikipedia.org/wiki/Signal_(computing)

See also WinExceptionMBS, NSExceptionHandlerMBS and GlobalExceptionHandlerMBS classes.

Xojo Developer Magazine

- 12.2, page 10: News

191.6.2 Methods

191.6.3 alarm(seconds as Integer)

MBS Util Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Targets: All.

Function: Set signal timer alarm.
Example:

SignalHandlerMBS.alarm 1

Notes: The alarm() function sets a timer to deliver the signal SIGALRM to the calling process after the specified number of seconds. If an alarm has already been set with alarm() but has not been delivered, another call to alarm() will supersede the prior call. The request alarm(0) voids the current alarm and the signal SIGALRM will not be delivered.

Due to setitimer restriction the maximum number of seconds allowed is 100000000.

alarm sends signal 14 after the time out.

191.6.4 ClearFlag(signalIndex as Integer)

MBS Util Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the flag with given index.
Notes: Please call this after you got IsFlagSet.

191.6.5 ClearFlags

MBS Util Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears all flags.

191.6.6 ClearStacktrace(signalIndex as Integer)

MBS Util Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Targets: All.

Function: Clears stored stack trace for the signal with given index.

191.6.7 Close

MBS Util Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Targets: All.

Function: Releases this object's resources.

191.6.8 IsFlagSet(signalIndex as Integer) as boolean

MBS Util Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if a given flag was set.

191.6.9 QueryStacktrace(signalIndex as Integer, skip as Integer = 2) as string()

MBS Util Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Targets: All.

Function: Queries stack at the time the signal handler was triggered.
Notes: Useful to know later which code got the signal.
Works for flag handlers and for the event handlers if enabled.

191.6.10 SendSignal(PID as Integer, Signal as Integer) as boolean

MBS Util Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Targets: All.

Function: Sends a signal.
Example:

```
// send signal to a process
// PID is 17779 here
// 9 means kill on Mac OS X
call SignalHandlerMBS.SendSignal(17779, 9)
```

Notes: Returns true on success and false on failure.
Without a signal handler the target app could quit.

Lookup signal.h for the list of signals. They can be different on Mac and Linux.

191.6.11 SendSignalToSelf(Signal as Integer) as boolean

MBS Util Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Targets: All.

Function: Send a signal to the current process
Notes: Returns true on success and false on failure.
Without a signal handler the target app could quit.

191.6.12 SetDefaultHandler(signalIndex as Integer) as boolean

MBS Util Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Targets: All.

Function: Defines to use the default handler for the given signal number.
Example:

```
Const SIGALRM = 14
if SignalHandlerMBS.SetDefaultHandler(SIGALRM) then
MessageBox "Done"
else
MessageBox "Failed"
end if
```

Notes: Returns true on success and false on failure.

191.6.13 SetEventHandler(signalIndex as Integer, CollectStackTrace as boolean = false) as boolean

MBS Util Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Targets: All.

Function: Defines to call the Signal Event whenever a signal with the given number is received.
Notes: Returns true on success and false on failure.
If CollectStackTrace is true, you can later use QueryStacktrace to get the stack trace from the time the signal was captured.

191.6.14 SetFlagHandler(signalIndex as Integer, CollectStackTrace as boolean = false) as boolean

MBS Util Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Targets: All.

Function: Defines to set the flag whenever a signal with the given number is received.
Notes: Returns true on success and false on failure.
Please use IsFlagSet in your app regularly to check if the flag was set.

If CollectStackTrace is true, you can later use QueryStacktrace to get the stack trace from the time the signal was captured.

191.6.15 SetIgnore(signalIndex as Integer) as boolean

MBS Util Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Targets: All.

Function: Defines to ignore the event with the given number.
Example:

```
Const SIGALRM = 14
if SignalHandlerMBS.SetIgnore(SIGALRM) then
MessageBox "Done"
else
MessageBox "Failed"
end if
```

Notes: Returns true on success and false on failure.

191.6.16 SetPrintBacktraceAndAbortHandler(signalIndex as integer) as boolean

MBS Util Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Defines to use the plugin handler for the given signal number.
Example:

```
Call SignalHandlerMBS.SetPrintBacktraceAndAbortHandler(4) // illegal instruction
Call SignalHandlerMBS.SetPrintBacktraceAndAbortHandler(10) // bus error
Call SignalHandlerMBS.SetPrintBacktraceAndAbortHandler(11) // segmentation fault

// now cause a crash
Var p As ptr = Nil
p.Int32(0) = 0
```

Notes: The signal is handled by the plugin. We print the backtrace and abort.
We write details to a crash.txt file in the current folder.

191.6.17 SignalStatus(signalIndex as Integer) as Integer

MBS Util Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Targets: All.

Function: Queries the signal state.
Notes: Returns 0 (unknown), kSignalDefault, kSignalEvent, kSignalFlag or kSignalIgnored.

191.6.18 Events

191.6.19 Signal(n as Integer)

MBS Util Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Targets: All.

Function: A signal was called and you set an event handler.
Example:

```
Sub Signal(n as Integer)
// restore system handler in case we get that crash again!

MySignalHandlerMBS.SetDefaultHandler n

// Mac and Linux can have different signal numbers:

#if TargetMacOS then
Var c as string = "Signal "+str(n)+" on Mac OS X"
#elseif TargetLinux then
Var c as string = "Signal "+str(n)+" on Linux"
#else
Var c as string = "Signal "+str(n)+" on ?"
#endif

Var BackTraceLines() as string
#if mbs.BuildNumber>17662 and not TargetWin32 then // new in 13.0 plugins
BackTraceLines = BacktraceMBS
#endif

// show your bug reporter (or the MBS one)
'dim b as new Bugreporter
'b.ShowExceptionReporter c, BackTraceLines

// quit now without cleaning up the RB runtime which may crash again
ExitMBS 1
End Sub
```

Notes: This function may be called at any time, so you need to use code which is thread safe. (see ThreadMBS class)

191.6.20 Constants

Signal Handler Modes

Constant	Value	Description
kSignalDefault	1	The signal calls default handler.
kSignalEvent	3	The signal raises an event and sets the flag.
kSignalFlag	4	The signal sets a flag.
kSignalIgnored	2	The signal is ignored.
kSignalPrintBacktraceAndAbort	8	The signal is handled by the plugin. We print the backtrace and abort.

191.7 module SystemInformationMBS

191.7.1 module SystemInformationMBS

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A module to collect all the system information functions.
Example:

MessageBox "Welcome "+SystemInformationMBS.Username+"!"

191.7.2 Methods

191.7.3 AvailableRAM as Double

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the size of the available memory.
Example:

MessageBox format(SystemInformationMBS.AvailableRAM/1024/1024,"0")+" MB of RAM free."

Notes: This function is useful if you want to know how much memory you can allocate without the system swapping.

On Windows, Mac OS X and Linux you can normally allocate up to 2 or 3 GB of memory in your address-room. A swap file on disc is used to cache memory which does not fit into physical memory.

So if you need to allocate a buffer to store temporary data, you can use this function to calculate a good size.
For example a file copy function could use something like this:

```
// a quarter of free memory is good to leave room for some OS buffers:
buffersize=SystemInformationMBS.AvailableRAM/4

// minimum 4 MB
if buffersize<1024*1024*4 then
buffersize<1024*1024*4
end if

// maximum 128 MB to make chunks not too big and application too unresponsible
if buffersize<1024*1024*128 then
buffersize<1024*1024*128
end if
```

In older plugins this function was named AvailableRAMMBS.

191.7.4 BusSpeed as Double

MBS Util Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the speed of the System bus in Hz.
Example:

MessageBox "Your main CPU has "+format(SystemInformationMBS.BusSpeed/1000000.0,"0")+" MHz"

191.7.5 Computername as string

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the computer.
Example:

MessageBox "Hi, I'm "+SystemInformationMBS.Computername+"."

Notes: On Mac OS, the name is queried in this order:
1. Try to ask the Mac OS X Corefoundation for the name.
2. Try to ask via AppleEvents the Finder or FileSharing.
3. Read it from the system resources.

On Linux or Windows the system name.

In older plugins this function was named ComputerNameMBS.

191.7.6 CPUBrandString as string

MBS Util Plugin, Plugin Version: 10.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the CPU brand string.
Example:

MessageBox SystemInformationMBS.CPUBrandString

Notes: If it is an Intel x86 Chip or something compatible, you get strings like this: "Intel(R) Core(TM) i7 CPU M 620 @ 2.67GHz" (Same as CPUIDMBS.BrandString). But on PowerPC chips we return strings like "PowerPC G5 (970MP)" (same as CPUInfoMBS.CPUName).

May return "" if the processor is unknown.

191.7.7 CPUSpeed as Double

MBS Util Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns the Speed of the main CPU in Hz.
Example:

MessageBox "Your main CPU has "+format(SystemInformationMBS.CPUSpeed/1000000.0,"0")+" MHz"

191.7.8 DomainName as string

MBS Util Plugin, Plugin Version: 10.1, Platform: Windows, Targets: All.

Function: Returns the domain name of a Windows PC.
Example:

MessageBox SystemInformationMBS.DomainName

Notes: Returns an empty string on any error.

191.7.9 HardDiscSerial as string

MBS Util Plugin, Plugin Version: 10.3, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Returns the hard disc serial number of the first hard disc which has a serial number.
Example:

MessageBox SystemInformationMBS.HardDiscSerial

Notes: This function can return "" if nothing is found.
Seems to return always empty string on Mac OS X 10.4 as the system properties dictionary does not contain the serial number there.

On Windows this function sometimes returns empty string, but later works again on the same machine. Reason unknown.

In Windows 8.1 it looks like WindowsWMIMBS.InitSecurity(false) must be called at app.open time as Xojo will do some things in background when opening first window which block our queries.

191.7.10 HostName as string

MBS Util Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the hostname for this computer.
Example:

MessageBox SystemInformationMBS.HostName

191.7.11 Is64bitWindows as boolean

MBS Util Plugin, Plugin Version: 9.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether the Windows you are using is a 64-bit Windows.
Example:

```
MessageBox str(SystemInformationMBS.Is64bitWindows)
```

Notes: Returns true for x64 Windows editions for 32-bit applications.
This function could also be named isWoW64 for "is Windows on Windows 64 bit."
Only for Intel CPU.
Will return false if used on ARM CPU.

Returns always true on 64bit target.

191.7.12 isARM as Boolean

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether CPU is ARM.
Example:

```
If TargetMacOS Then
If SystemInformationMBS.isARM Then
MessageBox "Running ARM version on ARM CPU."
Elseif SystemInformationMBS.IsTranslated Then
MessageBox "Running Intel version on ARM CPU."
Else
MessageBox "Running Intel version on Intel CPU."
End If
End If
```

Notes: Returns true for:

- Raspberry Pi for Linux ARM
- iOS or Android on device.
- Apple Silicon Mac

Returns false for x86 CPUs, e.g. MacOS as well as iOS/Android in simulator.

191.7.13 isBigSur(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether the operating system is macOS 11 Big Sur or newer.
Notes: Returns 1 if this is Big Sur or newer, otherwise 0.

191.7.14 isCatalina(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 19.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether the operating system is MacOS 10.15 Catalina or newer.
Example:

```
MessageBox str(SystemInformationMBS.isMojave)
```

Notes: Returns true on MacOS 10.15 or newer.

191.7.15 isElCapitan(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Whether the operating system is Mac OS X 10.11 El Capitan or newer.
Example:

```
MessageBox str(SystemInformationMBS.isElCapitan)
```

Notes: Returns true on Mac OS X 10.11.
If orHigher is set, it will also return true on 10.12.

191.7.16 isGoldenGate(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether the operating system is macOS 27 Golden Gate or newer.
Example:

```
If SystemInformationMBS.isGoldenGate Then
MessageBox "Is Golden Gate or heigher"
Else
MessageBox "Is older version"
End If
```

Notes: Returns true if this is Golden Gate or newer, otherwise false.

191.7.17 isHighSierra(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether the operating system is macOS 10.13 High Sierra or newer.
Example:

```
MessageBox str(SystemInformationMBS.isHighSierra)
```

Notes: Returns true on Mac OS X 10.13.
If orHigher is set, it will also return true on 10.14.

191.7.18 isLeopard(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 9.6, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Whether the operating system is Mac OS X 10.5 Leopard or newer.
Example:

```
MessageBox str(SystemInformationMBS.isLeopard)
```

Notes: Returns true on Mac OS X 10.5 or newer.

191.7.19 isLion(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Whether the operating system is Mac OS X 10.7 Lion or newer.
Example:

MessageBox str(SystemInformationMBS.isLion)

Notes: Returns true on Mac OS X 10.7 or newer.

191.7.20 isMacOSX as Boolean

MBS Util Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if being called on Mac OS X.
Example:

MessageBox str(SystemInformationMBS.isMacOSX)

191.7.21 isMavericks(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Whether the operating system is Mac OS X 10.9 Mavericks or newer.
Example:

MessageBox str(SystemInformationMBS.isMavericks)

Notes: Returns true on Mac OS X 10.9 or newer.

191.7.22 isMojave(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether the operating system is MacOS 10.14 Mojave or newer.
Example:

MessageBox str(SystemInformationMBS.isMojave)

Notes: Returns true on MacOS 10.14 or newer.

191.7.23 isMonterey(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether the operating system is macOS 12 Monterey or newer.
Notes: Returns 1 if this is Monterey or newer, otherwise 0.

191.7.24 isMountainLion(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Whether the operating system is Mac OS X 10.8 Mountain Lion or newer.
Example:

```
MessageBox str(SystemInformationMBS.isMountainLion)
```

Notes: Returns true on Mac OS X 10.8 or newer.

191.7.25 isSequoia(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether the operating system is macOS 15 Sequoia or newer.
Example:

```
If SystemInformationMBS.isSequoia Then
MessageBox "Is Sequoia or heigher"
Else
MessageBox "Is older version"
End If
```

Notes: Returns true if this is Sequoia or newer, otherwise false.

191.7.26 isSierra(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Whether the operating

system is macOS 10.12 Sierra or newer.
Example:

MessageBox str(SystemInformationMBS.isSierra)

Notes: Returns true on Mac OS X 10.12.
If orHigher is set, it will also return true on 10.13.

191.7.27 isSnowLeopard(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 9.6, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Whether the operating system is Mac OS X 10.6 Snow Leopard or newer.
Example:

MessageBox str(SystemInformationMBS.isSnowLeopard)

Notes: Returns true on Mac OS X 10.6 or newer.

191.7.28 isSonoma(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether the operating system is macOS 14 Sonoma or newer.
Example:

```
If SystemInformationMBS.isSonoma Then
MessageBox "Is Sonoma or heigher"
Else
MessageBox "Is older version"
End If
```

Notes: Returns true if this is Sonoma or newer, otherwise false.

191.7.29 isTahoe(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 25.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether the operating system is macOS 26 Tahoe or newer.
Example:

```
If SystemInformationMBS.isTahoe Then
MessageBox "Is Tahoe or heigher"
Else
MessageBox "Is older version"
End If
```

Notes: Returns true if this is Tahoe or newer, otherwise false.

191.7.30 IsTranslated as Integer

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries whether application is translated on Apple Silicon Macs.
Example:

```
If TargetMacOS Then
If SystemInformationMBS.isARM Then
MessageBox "Running ARM version on ARM CPU."
Elseif SystemInformationMBS.IsTranslated Then
MessageBox "Running Intel version on ARM CPU."
Else
MessageBox "Running Intel version on Intel CPU."
End If
End If
```

Notes: Returns 1 if Intel code gots translated to ARM code.
Returns 0 for a native ARM application.
Returns -1 if unknown.

191.7.31 isVentura(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether the operating system is macOS 13 Ventura or newer.
Example:

```
If SystemInformationMBS.isVentura(False) Then
MessageBox "Is Ventura exactly."
ElseIf SystemInformationMBS.isVentura(True) Then
MessageBox "Is Ventura or heigher"
Else
```

```
MessageBox "Is older version"
End If
```

Notes: Returns true if this is Ventura or newer, otherwise false.

191.7.32 isWindows10(orHigher as boolean = false) as Boolean

MBS Util Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns true if called on Windows 10.
Example:

```
MessageBox str(SystemInformationMBS.isWindows10)
```

Notes: And False on Mac OS, Linux, Windows 7/Vista/XP/2000/ME/98/95/8/8.1.
If orHigher, than it returns true if OS Version is newer.

191.7.33 isWindows11(orHigher as boolean = false) as Boolean

MBS Util Plugin, Plugin Version: 21.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns true if called on Windows 11.
Example:

```
MessageBox str(SystemInformationMBS.isWindows11)
```

Notes: And False on Mac OS, Linux, Windows 7/Vista/XP/2000/ME/98/95/8/8.1/10.
If orHigher, than it returns true if OS Version is newer.

191.7.34 isWindows2000(orHigher as boolean = false) as Boolean

MBS Util Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns true if called on Windows 2000.
Example:

```
MessageBox str(SystemInformationMBS.isWindows2000)
```

Notes: And False on Mac OS X, Linux, Windows 7/XP/Vista/ME/98/95.
If orHigher, than it returns true if OS Version is newer.

191.7.35 isWindows7(orHigher as boolean = false) as Boolean

MBS Util Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns true if called on Windows 7.
Example:

MessageBox str(SystemInformationMBS.isWindows7)

Notes: And False on Mac OS X, Linux, Windows Vista/XP/2000/ME/98/95.
If orHigher, than it returns true if OS Version is newer.

191.7.36 isWindows8(orHigher as boolean = false) as Boolean

MBS Util Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns true if called on Windows 8.
Example:

MessageBox str(SystemInformationMBS.isWindows8)

Notes: And False on Mac OS X, Linux, Windows 7/Vista/XP/2000/ME/98/95.
If orHigher, than it returns true if OS Version is newer.

191.7.37 isWindows81(orHigher as boolean = false) as Boolean

MBS Util Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns true if called on Windows 8.1
Example:

MessageBox str(SystemInformationMBS.isWindows81)

Notes: And False on Mac OS X, Linux, Windows 7/Vista/XP/2000/ME/98/95/8/10.
If orHigher, than it returns true if OS Version is newer.

191.7.38 isWindowsVista(orHigher as boolean = false) as Boolean

MBS Util Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns true if called on Windows Vista.
Example:

MessageBox str(SystemInformationMBS.isWindowsVista)

Notes: And False on Mac OS X, Linux, Windows 7/XP/2000/ME/98/95.
If orHigher, than it returns true if OS Version is newer.

191.7.39 isWindowsXP(orHigher as boolean = false) as Boolean

MBS Util Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns true if called on Windows XP.
Example:

MessageBox str(SystemInformationMBS.isWindowsXP)

Notes: And False on Mac OS X, Linux, Windows 7/Vista/2000/ME/98/95.
If orHigher, than it returns true if OS Version is newer.

191.7.40 isYosemite(orHigher as boolean = true) as boolean

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Whether the operating system is Mac OS X 10.10 Yosemite or newer.
Example:

MessageBox str(SystemInformationMBS.isYosemite)

Notes: Returns true on Mac OS X 10.10 or newer.

191.7.41 LogicalRAM as Double

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns the size of the logical installed memory.
Example:

```
MessageBox format(SystemInformationMBS.LogicalRAM/1024/1024,"0")+" MB of RAM built in."
```

Notes: On Windows the total virtual memory size.
On Linux always 4 GB.

In older plugins this function was named LogicalRAMMBS.

191.7.42 MACAddress as string

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the hardware ethernet address of the first ethernet card.
Example:

```
MessageBox SystemInformationMBS.MACAddress
```

Notes: It returns a string with 6 bytes.
Works now with MBS Plugin 2.6 for Mac OS Classic, Carbon inside Classic and Mac OS X, but may not work for a Classic application running on Mac OS X. And may fail on some machines if no OpenTransport is running.

On Windows and Mac OS X you can have multiple ethernet cards and you should use a command line tool with the shell class to find what you need.

For example on Windows:

ipconfig /all

or on Mac OS X:

ifconfig -a

You can replace this function with usage of the NetworkInterface class in newer RB versions.

Added Linux support in version 16.4.

191.7.43 MACAddressString as string

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the hardware ethernet address of the first ethernet card.
Example:

MessageBox SystemInformationMBS.MACAddressString

Notes: Same as MACAddress, but with different format of output.

You can replace this function with usage of the NetworkInterface class in newer RB versions.

The plugin asks on Mac OS X the IOKit framework for the primary ethernet interface. We are not sure what Apple really defines for being the primary one, so let's test it:

- Ethernet on and Airport off ->Ethernet MAC Address
- Ethernet off and Airport on ->Ethernet MAC Address

Added Linux support in version 16.4.

191.7.44 MacBoardID as string

MBS Util Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Queries board-id for Mac.
Example:

MessageBox SystemInformationMBS.MacBoardID

Notes: e.g. "Mac-1234567890123456"

191.7.45 MacBugFixVersion as Integer

MBS Util Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The BugFix part of the Mac OS version number.
Example:

MessageBox str(SystemInformationMBS.MacBugFixVersion)

Notes: The bug fix system version number; in 10.4.17 this would be the decimal value 17.

Intel apps running in Rosetta on Apple M1 will report 10.16 instead of 11.x.

191.7.46 MacHasHardwareAcceleratedCoreImage as boolean

MBS Util Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Queries whether hardware acceleration is used for CoreImage.
Example:

```
if SystemInformationMBS.MacHasHardwareAcceleratedCoreImage then
MessageBox "CoreImage should be very fast."
else
MessageBox "CoreImage may be slow."
end if
```

Notes: Queries OpenGL whether programmable fragments are supported.

191.7.47 MachineID(flags as Integer = 15) as string

MBS Util Plugin, Plugin Version: 10.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a Machine ID for the current computer.
Example:

```
// this is how we build it.
Var t as string = "MachineID"+SystemInformationMBS.HardDiscSerial+SystemInformationMBS.MacSerialNumber+SystemInformationMBS.MacModel+SystemInformationMBS.CPUBrandString

// you could extend it with SystemInformationMBS.WinProductKey

Var m as string = MD5StringMBS(t)
```

MessageBox "Machine ID: "+SystemInformationMBS.MachineID+EndOfLine+"My Machine ID: "+m

Notes: Returns a 32 byte long hex string with a Machine ID.
Example value: "EE537483656B25996B51B7F4C99F9083".

This ID is based on the results of the MacSerialNumber, MacModel, CPUBrandString and HardDiscSerial functions. If all 4 functions have no value, the result is always "A2254DEF74A74608D76D1BA49BD2E82A". Also the result could change in future if we fix a bug in one of the functions so that the result values differ.

It is not based on the MACAddressString function as your MAC Address can change when switching between wired and wireless networks. Also we do not check the PhysicalRAM as RAM is a typical thing which changes over time.

You can store this value in some prerences/license file and later compare it agains the current value to see if the machine may have changed. In that case ask user to revalidate license, for example by asking for the serial number.

It can happen that 2 PCs have the same MachineID, typical two virtual machines. So this ID is not unique. But it is very likely that two different computers produce different MachineIDs.

Added flags parameter in 14.1:

flagHardDiscSerial	1	Use hard disk serial.
flagMacSerialNumber	2	Use Mac Serial number (on Mac)
flagMacModel	4	Use Mac Model (on Mac)
flagCPUBrandString	8	Use CPU Brand String.
flagWinProductKey	16	Use Product Key (on Windows only)

The Machine ID may be different if one of the components returns a different result. Result may be different in whether app runs as admin or not on Windows.

In Windows 8.1 it looks like WindowsWMIMBS.InitSecurity(false) must be called at app.open time as Xojo will do some things in background when opening first window which block our queries.

191.7.48 MacMajorVersion as Integer

MBS Util Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The major Mac OS version number.
Example:

```
// show major version number
MessageBox str(SystemInformationMBS.MacMajorVersion)

// and show all three version numbers together:
MessageBox str(SystemInformationMBS.MacMajorVersion)+"."+str(SystemInformationMBS.MacMinorVersion)+"."+str(SystemInformationMBS.MacBugFixVersion)
```

Notes: The major system version number; in 10.4.17 this would be the decimal value 10.

On macOS Big Sur, this returns 11 in Apple Silicon application and 10 in Intel application.
On macOS Monterey this returns 12.
If your Intel application is build with older SDK (e.g. Xojo 2019), the result reported version will still be macOS 10.16.

191.7.49 MacMinorVersion as Integer

MBS Util Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The minor Mac OS version number.
Example:

```
MessageBox str(SystemInformationMBS.MacMinorVersion)
```

Notes: The minor system version number; in 10.4.17 this would be the decimal value 4.

191.7.50 MacModel as string

MBS Util Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the Mac model string.
Example:

```
MessageBox SystemInformationMBS.MacModel
```

Notes: for example "<powermac7,3>".

191.7.51 MacProductName as string

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries the product name of the Mac.
Example:

```
MessageBox _
SystemInformationMBS.MacProductName + EndOfLine + _
SystemInformationMBS.MacProductSOCName + EndOfLine + _
SystemInformationMBS.MacModel + EndOfLine + _
SystemInformationMBS.ComputerName
```

Notes: Only for Apple Silicon Macs.

191.7.52 MacProductSOCName as string

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries the name of the system on chip in a Mac.
Example:

```
MessageBox _
SystemInformationMBS.MacProductName + EndOfLine + _
SystemInformationMBS.MacProductSOCName + EndOfLine + _
SystemInformationMBS.MacModel + EndOfLine + _
SystemInformationMBS.ComputerName
```

Notes: Only for Apple Silicon Macs.

191.7.53 MacROMBootVersion as string

MBS Util Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns boot ROM version string.
Example:

```
MessageBox SystemInformationMBS.MacROMBootVersion
```

Notes: e.g. "220.270.99.0.0 (iBridge: 16.16.6571.0.0,0)"

191.7.54 MacSerialNumber as string

MBS Util Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the serial number of your local Mac.
Example:

MessageBox SystemInformationMBS.MacSerialNumber

Notes: May return an empty string in case of an error.
(e.g. when being user on Windows or if the Mac does not know its serialnumber)

191.7.55 MacUUID as string

MBS Util Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the unique identifier for the given Mac.
Example:

MessageBox SystemInformationMBS.MacUUID

Notes: Returns "" on any error.

191.7.56 MacVRAMSize as Int64

MBS Util Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Queries the size of the main video graphics memory size.
Example:

MessageBox format(SystemInformationMBS.MacVRAMSize,"0")+" Bytes VRAM."

Notes: Walks over the list of displays, asks on each display for its VRAM size and returns the first value found.

For some reason this seems not to return more than 256 MB of memory.

191.7.57 OSName as string

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a string to display which OS Version you have.
Example:

MessageBox SystemInformationMBS.OSName

' may show: Mac OS X

Notes: Return values possible:
Windows NT
Windows 2000
Windows XP
Windows Vista
Mac OS
Mac OS X
Linux

and a few other Windows versions like 6.2 alias 8.

In older plugins this function was named OSNameMBS.

191.7.58 OSVersionString as string

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a string to display which OS Version you have.
Example:

MessageBox SystemInformationMBS.OSVersionString
' may show: Mac OS X 10.1.2

Notes: GetOSVersionStr returns the version string of the OS.
Some Possible values:
"System 7.5.3",
"MacOS 8",
"MacOS 9.1",
"MacOS X 10.4.1",
"Windows NT 3.5",
"Windows 2000 (Service Pack 3)".

In older plugins this function was named OSVersionStrMBS.

On macOS Big Sur, this returns 11.x in Apple Silicon application and 10.6 in Intel application.
On macOS Monterey this returns 12.x.
If your Intel application is build with older SDK (e.g. Xojo 2019), the result reported version will still be macOS 10.16.

191.7.59 PhysicalRAM as Double

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the size of the physical installed memory.
Example:

```
MessageBox format(SystemInformationMBS.PhysicalRAM/1024/1024,"0")+" MB of RAM built in."
```

Notes: On old Windows versions some hundred KBs less for DOS.

Result changed from integer to double in plugin version 3.4 to return correct results on 2 GB RAM. In v5.2 changed to return correct values on Macs with more than 4 GB of RAM.

On Windows the total physical memory size.

In older plugins this function was named PhysicalRAMMBS.

191.7.60 ProcessorCount(Mode as Integer = 0) as Integer

MBS Util Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of processors on the target system.
Example:

```
MessageBox _
str(SystemInformationMBS.ProcessorCount(SystemInformationMBS.kProcessorCountDefault ))+" default"
+ EndOfLine + _
str(SystemInformationMBS.ProcessorCount(SystemInformationMBS.kProcessorCountLogical ))+" logical"
+ EndOfLine + _
str(SystemInformationMBS.ProcessorCount(SystemInformationMBS.kProcessorCountPhysical))+" physical"
```

Notes: With plugin version 18.0, we added mode parameter. Pass 2 for physical CPU (kProcessorCountPhysical) and 1 for logical CPU count (kProcessorCountLogical) on Mac/Win.

On Windows or Mac OS the number of cores.
On Linux the number of configured CPUs.

Returns 1 on any error.

191.7.61 ShortUsername as string

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the short name of the current user.
Example:

MessageBox "Welcome "+SystemInformationMBS.ShortUsername+"!"

Notes: On Linux and Mac OS X the short user name.

On all other cases the same as UserName function.

191.7.62 SystemFont as string

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the name of the used system font.
Example:

MessageBox "You are using the system font "+SystemInformationMBS.SystemFont+"."

Notes: On Windows the system function returns "System" for our tests. Please tell us if this function is not working for you correct on Windows.

On Linux something like "Sans 10" is returned.

In older plugins this function was named SystemFontMBS.

191.7.63 Username as string

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the current user.
Example:

MessageBox "Welcome "+SystemInformationMBS.Username+"!"

Notes: Code for Multiple User on Mac OS 9 is build in, but I can't test it.

This is tried on Mac OS:
1. Mac OS X Username function.
2. AppleEvent to FileSharing.
3. Multiple User Username (Mac OS 9)
4. System username from system resource.

In older plugins this function was named UserNameMBS.

191.7.64 WinBuildNumber as Integer

MBS Util Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The build number of the operating system.
Example:

MessageBox str(SystemInformationMBS.WinBuildNumber)

Notes: For example returns 2600 on Windows XP Build 2600.

191.7.65 WinCSDVersion as string

MBS Util Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** A string, such as "Service Pack 3", that indicates the latest Service Pack installed on the system.
Example:

MessageBox SystemInformationMBS.WinCSDVersion

Notes: Shows here "Service Pack 3" on a Windows XP installation.
If no Service Pack has been installed, the string is empty.

191.7.66 WindowsAero as boolean

MBS Util Plugin, Plugin Version: 10.1, Platform: Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Whether Windows is using the Aero Interface?
Example:

MessageBox str(SystemInformationMBS.WindowsAero)

Notes: True if aero is used. False if the status is unknown (e.g. on Windows XP) or Aero is not used.

191.7.67 WindowsNativeMachine as Integer

MBS Util Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the native machine type.
Notes: This may return ARM64 on a Windows with ARM CPU.

191.7.68 WindowsProcessMachine as Integer

MBS Util Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the machine type of the current process.
Notes: This may return AMD64, while running in emulation on ARM64.

191.7.69 WinMajorVersion as Integer

MBS Util Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The major version number of the operating system.
Example:

MessageBox str(SystemInformationMBS.WinMajorVersion)

Notes: Returns 5 on Windows 2000/XP and 6 on Windows Vista/7/8.

191.7.70 WinMinorVersion as Integer

MBS Util Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The minor version number of the operating system.
Example:

MessageBox str(SystemInformationMBS.WinMinorVersion)

Notes: Returns 0 on Windows 2000/Vista and 1 on Windows XP/7 and 2 on Windows 8.

191.7.71 WinPlatformId as Integer

MBS Util Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The operating system platform.
Example:

MessageBox str(SystemInformationMBS.WinPlatformId)

Notes: This member can be VER_PLATFORM_WIN32_NT (2).
e.g. 2 on Windows XP.

191.7.72 WinProductKey as string

MBS Util Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the product key of the Windows installation.
Notes: Returns "" on any error.
See also:

- 191.7.73 WinProductKey(path as string, name as string, keyStartIndex as Integer = 52) as string 23084

191.7.73 WinProductKey(path as string, name as string, keyStartIndex as Integer = 52) as string

MBS Util Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the product key of the Windows installation.
Notes: Returns "" on any error.
With the right path and name you can read also the office versions.

For Office 10, it looks like you need to use 808 as offset.
See also:

- 191.7.72 WinProductKey as string 23084

191.7.74 WinProductType as Integer

MBS Util Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Any additional information about the system.
Example:

MessageBox str(SystemInformationMBS.WinProductType)

Notes: e.g. 1 on Windows XP.

This member can be one of the following values:

VER_NT_DOMAIN_CONTROLLER	2	The system is a domain controller and the operating system is Windows Server 2008, Windows Server 2003, or Windows 2000 Server.
VER_NT_SERVER	3	The operating system is Windows Server 2008, Windows Server 2003, or Windows 2000 Server. Note that a server that is also a domain controller is reported as VER_NT_DOMAIN_CONTROLLER, not VER_NT_SERVER.
VER_NT_WORKSTATION	1	The operating system is Windows Vista, Windows XP Professional, Windows XP Home Edition, or Windows 2000 Professional.

191.7.75 WinServicePackMajor as Integer

MBS Util Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** The major version number of the latest Service Pack installed on the system.
Example:

MessageBox str(SystemInformationMBS.WinServicePackMajor)

Notes: For example, for Service Pack 3, the major version number is 3. If no Service Pack has been installed, the value is zero.

191.7.76 WinServicePackMinor as Integer

MBS Util Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** The minor version number of the latest Service Pack installed on the system.
Example:

MessageBox str(SystemInformationMBS.WinServicePackMinor)

Notes: For example, for Service Pack 3, the minor version number is 0.

191.7.77 WinSuiteMask as Integer

MBS Util Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A bit mask that identifies the product suites available on the system.
Example:

MessageBox str(SystemInformationMBS.WinSuiteMask)

Notes: e.g. 256 on Windows XP.

This member can be a combination of the following values.

VER_SUITE_BACKOFFICE	4	Microsoft BackOffice components are installed.
VER_SUITE_BLADE	&h0400	Windows Server 2003, Web Edition is installed.
VER_SUITE_COMPUTE_SERVER	&h4000	Windows Server 2003, Compute Cluster Edition is installed.
VER_SUITE_DATACENTER	&h0080	Windows Server 2008 Datacenter, Windows Server 2003, Datacenter Edition, or Windows 2000 Datacenter Server is installed.
VER_SUITE_ENTERPRISE	2	Windows Server 2008 Enterprise, Windows Server 2003, Enterprise Edition, or Windows 2000 Advanced Server is installed. Refer to the Remarks section for more information about this bit flag.
VER_SUITE_EMBEDDEDNT	&h0040	Windows XP Embedded is installed.
VER_SUITE_PERSONAL	&h0200	Windows Vista Home Premium, Windows Vista Home Basic, or Windows XP Home Edition is installed.
VER_SUITE_SINGLEUSERTS	&h0100	Remote Desktop is supported, but only one interactive session is supported. This value is set unless the system is running in application server mode.
VER_SUITE_SMALLBUSINESS	1	Microsoft Small Business Server was once installed on the system, but may have been upgraded to another version of Windows. Refer to the Remarks section for more information about this bit flag.
VER_SUITE_SMALLBUSINESS_RESTRICTED	&h0020	Microsoft Small Business Server is installed with the restrictive client license in force. Refer to the Remarks section for more information about this bit flag.
VER_SUITE_STORAGE_SERVER	&h2000	Windows Storage Server 2003 R2 or Windows Storage Server 2003is installed.
VER_SUITE_TERMINAL	&h0010	Terminal Services is installed. This value is always set. If VER_SUITE_TERMINAL is set but VER_SUITE_SINGLEUSERTS is not set, the system is running in application server mode.
VER_SUITE_WH_SERVER	&h8000	Windows Home Server is installed.

191.7.78 Constants

ProcessorCount Modes

Constant	Value	Description
kProcessorCountDefault	0	Default behavior.
kProcessorCountLogical	1	Logical Processors
kProcessorCountPhysical	2	Physical Processors

Windows Machine Types

Constant	Value	Description
kWindowsMachineAMD64	&h8664	ARM in 64-bit.
kWindowsMachineARM32	&h01c0	ARM in 32-bit.
kWindowsMachineARM64	&hAA64	AMD 64-bit x86.
kWindowsMachineI386	&h014c	Intel 32-bit x86.
kWindowsMachineUnknown	0	Unknown.

Chapter 192

SystemConfiguration

192.1 class SCNetworkReachabilityMBS

192.1.1 class SCNetworkReachabilityMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: A class to check network reachability.
Notes: The SCNetworkReachability class allow an application to determine the status of a system's current network configuration and the reachability of a target host. In addition, the reachability can be monitored with a notification being provided when/if the status has changed.

The term "reachable" reflects whether a data packet, sent by an application into the network stack, can be sent to the target host/address. Please note that there is no guarantee that the data packet will actually be received by the host.

Requires Mac OS X 10.3 or newer.
Subclass of the CFObjectMBS class.

192.1.2 Methods

192.1.3 CreateWithAddress(ip as string) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Creates a reference to the specified network address.
Notes: Returns true on success.

192.1.4 CreateWithAddressPair(LocalIP as string, RemoteIP as string) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Creates a reference to the specified network address.
Notes: Returns true on success.
LocalIP: The local address associated with a network connection.
RemoteIP: The remote address associated with a network connection.
One of the IP addresses can be empty.

192.1.5 CreateWithName(name as string) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Creates a reference to the specified network host/node name.
Notes: Returns true on success.

192.1.6 ErrorString(errorcode as Integer) as string

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Returns an error string for a given SC Error Code.
Notes: A utility function which works at any time.

192.1.7 Properties

192.1.8 Error as Integer

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Returns the last error code.
Notes: A utility function which works with all SystemConfiguration methods.

(Read only property)

192.1.9 Flags as Integer

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Determines if the given target is reachable using the current network configuration.
Notes: Returns 0 on any error.

kSCStatusOK	= 0	Success
kSCStatusFailed	= 1001	Non-specific failure
kSCStatusInvalidArgument	= 1002	Invalid argument
kSCStatusAccessError	= 1003	Permission denied - must be root to obtain lock - could not create access/create preferences
kSCStatusNoKey	= 1004	No such key
kSCStatusKeyExists	= 1005	Key already defined
kSCStatusLocked	= 1006	Lock already held
kSCStatusNeedLock	= 1007	Lock required for this operation
kSCStatusNoStoreSession	= 2001	Configuration daemon session not active
kSCStatusNoStoreServer	= 2002	Configuration daemon not (no longer) available
kSCStatusNotifierActive	= 2003	Notifier is currently active
kSCStatusNoPrefsSession	= 3001	Preference session not active
kSCStatusPrefsBusy	= 3002	Preferences update currently in progress
kSCStatusNoConfigFile	= 3003	Configuration file not found
kSCStatusNoLink	= 3004	No such link
kSCStatusStale	= 3005	Write attempted on stale version of object
kSCStatusMaxLink	= 3006	Maximum link count exceeded
kSCStatusReachabilityUnknown	= 4001	Network reachability cannot be determined

See the event for the flag constants.
(Read only property)

192.1.10 Events

192.1.11 Changed(flags as Integer)

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: The reachability changed.
Notes: useful constants:

kSCNetworkFlagsTransientConnection	= 1
kSCNetworkFlagsReachable	= 2
kSCNetworkFlagsConnectionRequired	= 4
kSCNetworkFlagsConnectionAutomatic	= 8
kSCNetworkFlagsInterventionRequired	= 5
kSCNetworkFlagsIsLocalAddress	= 65536
kSCNetworkFlagsIsDirect	= 131072

Flags that indicate whether the specified network nodename/address is reachable, requires a connection, requires some user intervention in establishing the connection, and whether the calling application must initiate the connection using the (TBD???) API.

kSCNetworkFlagsTransientConnection
This flag indicates that the specified nodename/address can be reached via a transient (e.g. PPP) connection.

kSCNetworkFlagsReachable
This flag indicates that the specified nodename/address can be reached using the current network configuration.

kSCNetworkFlagsConnectionRequired
This flag indicates that the specified nodename/address can be reached using the current network configuration but a connection must first be established.

As an example, this status would be returned for a dialup connection that was not currently active but could handle network traffic for the target system.

kSCNetworkFlagsConnectionAutomatic
This flag indicates that the specified nodename/address can be reached using the current network configuration but a connection must first be established. Any traffic directed to the specified name/address will initiate the connection.

kSCNetworkFlagsInterventionRequired
This flag indicates that the specified nodename/address can be reached using the current network configuration but a connection must first be established. In addition, some form of user intervention will be required to establish this connection (e.g. providing a password, authentication token, etc.).

kSCNetworkFlagsIsLocalAddress
This flag indicates that the specified nodename/address is one associated with a network interface on the current system.

kSCNetworkFlagsIsDirect
This flag indicates that network traffic to the specified nodename/address will not go through a gateway but is routed directly to one of the interfaces in the system.

192.2 class SCPreferencesMBS

192.2.1 class SCPreferencesMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: A class for System Configuration Preferences.
Notes: Please remember that you may need root access to change something.

The SCPreferences classes allow an application to load and store XML configuration data in a controlled manner and provide the necessary notifications to other applications that need to be aware of configuration changes.

The stored XML configuration data is accessed using a prefsID. A
nil value indicates that the default system preferences are to be accessed.
A string which starts with a leading "/" character specifies the path to the file containing te preferences to be accessed. A string which does not start with a leading "/" character specifies a file relative to the default system preferences directory.

The Path APIs make certain assumptions about the layout of the preferences data. These APIs view the data as a collection of dictionaries of key/value pairs and an associated path name. The root path ("/") identifies the top-level dictionary. Additional path components specify the keys for sub-dictionaries.

For example, the following dictionary can be accessed via two paths. The root ("/") path would return a dictionary with all keys and values. The path "/path1" would only return the dictionary with the "key3" and "key4" properties.

```
<dict>
<key>key1</key>
<string>val1</string>
<key>key2</key>
<string>val2</string>
<key>path1</key>
<dict>
<key>key3</key>
<string>val3</string>
<key>key4</key>
<string>val4</string>
</dict>
</dict>
```

Each dictionary can also include the kSCResvLink key. The value associated with this key is interpreted as a "link" to another path. If this key is present, a call to the GetPathValue() API will return the dictionary specified by the link.

Subclass of the CFObjectMBS class.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr7

192.2.2 Methods

192.2.3 AddValue(key as CFStringMBS, value as CFObjectMBS) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Adds data for a preference key.
Notes: This function associates new data with the specified key. In order to commit these changes to permanent storage a call must be made to CommitChanges.

Returns true if the value was added; false if the key already exists or if an error occurred.

192.2.4 ApplyChanges as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Requests that the currently stored configuration preferences be applied to the active configuration.
Notes: Returns true if the lock was obtained; false if an error occurred.

192.2.5 CommitChanges as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Commits changes made to the configuration preferences to persistent storage.
Notes: This function commits any changes to permanent storage. An implicit call to Lock/Unlock will be made if exclusive access has not already been established.

Note: This routine commits changes to persistent storage. Call ApplyChanges to apply the changes to the running system.

Returns true if the lock was obtained; false if an error occurred.

192.2.6 Create(name as CFStringMBS, prefid as CFStringMBS) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Initiates access to the per-system set of configuration preferences.
Notes: name: A string that describes the name of the calling process.
prefsID: A string that identifies the name of the group of preferences to be accessed/updated.

192.2.7 CreateUniquePathChild(prefix as CFStringMBS) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Creates a new path component within the dictionary hierarchy.
Notes: prefix: A string that represents the parent path.
Returns a string representing the new (unique) child path; nil if the specified path does not exist.

192.2.8 CreateWithAuthorization(name as CFStringMBS, prefid as CFStringMBS, AuthorizationHandle as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Initiates access to the per-system set of configuration preferences.
Notes: name: A string that describes the name of the calling process.
prefsID: A string that identifies the name of the group of preferences to be accessed/updated.
AuthorizationHandle: Handle to authorization object for root access.

192.2.9 ErrorString(errorcode as Integer) as string

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Returns an error string for a given SC Error Code.
Notes: A utility function which works at any time.

192.2.10 GetPathLink(path as CFStringMBS) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Returns the link (if one exists) associated with the specified path.
Notes: path: A string that represents the path to be returned.
The dictionary associated with the specified path; nil if the path is not a link or does not exist.

192.2.11 GetPathValue(path as CFStringMBS) as CFDictionaryMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Returns the dictionary associated with the specified path.
Notes: path: A string that represents the path to be returned.
Returns the dictionary associated with the specified path; nil if the path does not exist.

192.2.12 GetValue(key as CFStringMBS) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Returns the data associated with a preference key.
Notes: This function retrieves data associated with a key for the prefsID.

You could read stale data and not know it, unless you first call Lock.

Returns the value associated with the specified preference key; If no value was located, nil is returned.

192.2.13 KeyList as CFArrayMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Returns an array of currently defined preference keys.
Notes: Returns nil on any error.

192.2.14 Lock(wait as boolean) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Locks access to the configuration preferences.
Notes: This function obtains exclusive access to the configuration preferences associated with this prefsID. Clients attempting to obtain exclusive access to the preferences will either receive an kSCStatusPrefsBusy error or block waiting for the lock to be released.

wait: A boolean flag indicating whether the calling process should block waiting for another process to complete its update operation and release its lock.

Returns true if the lock was obtained; false if an error occurred.

192.2.15 RemovePathValue(path as CFStringMBS) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Removes the data associated with the specified path.
Notes: path: A string that represents the path to be returned.
Returns a boolean indicating the success (or failure) of the call.

192.2.16 RemoveValue(key as CFStringMBS) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Removes the data associated with a preference key.
Notes: This function removes the data associated with the specified key. In order to commit these changes to permanent storage a call must be made to CommitChanges.

Returns true if the value was removed; false if the key did not exist or if an error occurred.

192.2.17 SetComputerName(name as CFStringMBS) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Updates the computer/host name in the system preferences.
Notes: In order to commit these changes to permanent storage a call must be made to CommitChanges.
A call to ApplyChanges is also required for the new name to become active.
A boolean indicating the success (or failure) of the call.

192.2.18 SetLocalHostName(name as CFStringMBS) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Updates the local host name in the system preferences.
Notes: In order to commit these changes to permanent storage a call must be made to CommitChanges.

A call to ApplyChanges is also required for the new name to become active.

192.2.19 SetPathLink(path as CFStringMBS, link as CFObjectMBS) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Associates a link to a second dictionary at the specified path.
Notes: path: A string that represents the path to be updated.
link: A string that represents the link to be stored at the specified path.
Returns a boolean indicating the success (or failure) of the call.

192.2.20 SetPathValue(path as CFStringMBS, value as CFDictionaryMBS) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Associates a dictionary with the specified path.
Notes: path: A string that represents the path to be updated.
value: A dictionary that represents the data to be stored at the specified path.
Returns a boolean indicating the success (or failure) of the call.

192.2.21 SetValue(key as CFStringMBS, value as CFObjectMBS) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Updates the data associated with a preference key.
Notes: This function adds or replaces the value associated with the specified key. In order to commit these changes to permanent storage a call must be made to CommitChanges.

Returns true if the value was set; false if an error occurred.

192.2.22 Signature as CFBinaryDataMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Returns a sequence of bytes that can be used to determine if the saved configuration preferences have changed.
Notes: A CFBinaryDataMBS that reflects the signature of the configuration preferences at the time of the call to Create.

192.2.23 Unlock as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Releases exclusive access to the configuration preferences.
Notes: This function releases the exclusive access "lock" for this prefsID. Other clients will be now be able

to establish exclusive access to the preferences.

Returns true if the lock was obtained; false if an error occurred.

192.2.24 Properties

192.2.25 Available as Boolean

MBS MacCF Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on macOS.
(Read only property)

192.2.26 Error as Integer

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Returns the last error code.
Notes: A utility function which works with all SystemConfiguration methods.

kSCStatusOK	= 0	Success
kSCStatusFailed	= 1001	Non-specific failure
kSCStatusInvalidArgument	= 1002	Invalid argument
kSCStatusAccessError	= 1003	Permission denied - must be root to obtain lock - could not create access/create preferences
kSCStatusNoKey	= 1004	No such key
kSCStatusKeyExists	= 1005	Key already defined
kSCStatusLocked	= 1006	Lock already held
kSCStatusNeedLock	= 1007	Lock required for this operation
kSCStatusNoStoreSession	= 2001	Configuration daemon session not active
kSCStatusNoStoreServer	= 2002	Configuration daemon not (no longer) available
kSCStatusNotifierActive	= 2003	Notifier is currently active
kSCStatusNoPrefsSession	= 3001	Preference session not active
kSCStatusPrefsBusy	= 3002	Preferences update currently in progress
kSCStatusNoConfigFile	= 3003	Configuration file not found
kSCStatusNoLink	= 3004	No such link
kSCStatusStale	= 3005	Write attempted on stale version of object
kSCStatusMaxLink	= 3006	Maximum link count exceeded
kSCStatusReachabilityUnknown	= 4001	Network reachability cannot be determined

(Read only property)

192.3 Globals

192.3.1 kSCNetworkReachabilityMBSTypeID as Integer

MBS MacCF Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the CoreFoundation TypeID for SCNetworkReachability.

192.3.2 kSCPreferencesMBSTypeID as Integer

MBS MacCF Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the CoreFoundation TypeID for SCPreferences.

192.4 class SystemConfigurationMBS

192.4.1 class SystemConfigurationMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: A class for the global System Configuration framework functions.
Notes: See the file "SCSchemaDefinitions.h" for details on the constants.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 17.1pr1
- Need Proxy Settings?

192.4.2 Methods

192.4.3 ComputerName as string

MBS MacCF Plugin, Plugin Version: 7.8, Platform: macOS, Targets: All.

Function: Gets the current computer name.
Example:

```
Var s as new SystemConfigurationMBS
MessageBox s.ComputerName
```

Notes: Returns "" on an error.

192.4.4 ComputerNameEncoding as Integer

MBS MacCF Plugin, Plugin Version: 7.8, Platform: macOS, Targets: All.

Function: The encoding of the computer name.

192.4.5 ConsoleUser as string

MBS MacCF Plugin, Plugin Version: 7.8, Platform: macOS, Targets: All.

Function: Gets the name of the currently logged-in user.
Example:

```
Var s as new SystemConfigurationMBS
MessageBox s.ConsoleUser
```

Notes: Returns the user currently logged into the system; "" if no user is logged in or if an error was encountered.

192.4.6 ConsoleUserGID as Integer

MBS MacCF Plugin, Plugin Version: 7.8, Platform: macOS, Targets: All.

Function: Gets the group ID of the currently logged-in user.
Notes: The group ID of the current console user.

192.4.7 ConsoleUserUID as Integer

MBS MacCF Plugin, Plugin Version: 7.8, Platform: macOS, Targets: All.

Function: Gets the user ID of the currently logged-in user.
Notes: The user ID of the current console user.

192.4.8 kSCCompAnyRegex as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.9 kSCCompGlobal as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.10 kSCCompHostNames as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.11 kSCCompInterface as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.12 kSCCompNetwork as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.13 kSCCompService as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.14 kSCCompSystem as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.15 kSCCompUsers as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.16 kSCDynamicStoreDomainFile as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.17 kSCDynamicStoreDomainPlugin as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.18 kSCDynamicStoreDomainPrefs as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.19 kSCDynamicStoreDomainSetup as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.20 kSCDynamicStoreDomainState as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.21 kSCDynamicStorePropNetInterfaces as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.22 kSCDynamicStorePropNetPrimaryInterface as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.23 kSCDynamicStorePropNetPrimaryService as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.24 kSCDynamicStorePropNetServiceIDs as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.25 kSCDynamicStorePropSetupCurrentSet as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.26 kSCDynamicStorePropSetupLastUpdated as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.27 kSCEntNet6to4 as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.28 kSCEntNetAirPort as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.29 kSCEntNetDHCP as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.30 kSCEntNetDNS as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.31 kSCEntNetEthernet as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.32 kSCEntNetFireWire as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.33 kSCEntNetInterface as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.34 kSCEntNetIPv4 as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.35 kSCEntNetIPv6 as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.36 kSCEntNetL2TP as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.37 kSCEntNetLink as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.38 kSCEntNetModem as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.39 kSCEntNetPPP as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.40 kSCEntNetPPPoE as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.41 kSCEntNetPPPSerial as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.42 kSCEntNetPPTP as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.43 kSCEntNetProxies as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.44 kSCEntUsersConsoleUser as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.45 kSCPrefCurrentSet as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.46 kSCPrefNetworkServices as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.47 kSCPrefSets as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.48 kSCPrefSystem as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.49 kSCPropInterfaceName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.50 kSCPropMACAddress as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.51 kSCPropNet6to4Relay as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.52 kSCPropNetAirPortAllowNetCreation as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.53 kSCPropNetAirPortAuthPassword as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.54 kSCPropNetAirPortAuthPasswordEncryption as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.55 kSCPropNetAirPortJoinMode as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.56 kSCPropNetAirPortPowerEnabled as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.57 kSCPropNetAirPortPreferredNetwork as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.58 kSCPropNetAirPortSavePasswords as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.59 kSCPropNetDNSDomainName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.60 kSCPropNetDNSSearchDomains as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.61 kSCPropNetDNSServerAddresses as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.62 kSCPropNetDNSSortList as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.63 kSCPropNetEthernetMediaOptions as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.64 kSCPropNetEthernetMediaSubType as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.65 kSCPropNetEthernetMTU as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.66 kSCPropNetInterfaceDeviceName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.67 kSCPropNetInterfaceHardware as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.68 kSCPropNetInterfaces as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.69 kSCPropNetInterfaceSubType as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.70 kSCPropNetInterfaceSupportsModemOnHold as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.71 kSCPropNetInterfaceType as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.72 kSCPropNetIPv4Addresses as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.73 kSCPropNetIPv4BroadcastAddresses as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.74 kSCPropNetIPv4ConfigMethod as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.75 kSCPropNetIPv4DestAddresses as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.76 kSCPropNetIPv4DHCPClientID as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.77 kSCPropNetIPv4Router as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.78 kSCPropNetIPv4SubnetMasks as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.79 kSCPropNetIPv6Addresses as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.80 kSCPropNetIPv6ConfigMethod as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.81 kSCPropNetIPv6DestAddresses as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.82 kSCPropNetIPv6Flags as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.83 kSCPropNetIPv6PrefixLength as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.84 kSCPropNetIPv6Router as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.85 kSCPropNetL2TPIPSecSharedSecret as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.86 kSCPropNetL2TPIPSecSharedSecretEncryption as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.87 kSCPropNetL2TPTransport as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.88 kSCPropNetLinkActive as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.89 kSCPropNetLinkDetaching as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.90 kSCPropNetLocalHostName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.91 kSCPropNetModemConnectionScript as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.92 kSCPropNetModemConnectSpeed as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.93 kSCPropNetModemDataCompression as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.94 kSCPropNetModemDialMode as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.95 kSCPropNetModemErrorCorrection as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.96 kSCPropNetModemHoldCallWaitingAudibleAlert as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.97 kSCPropNetModemHoldDisconnectOnAnswer as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.98 kSCPropNetModemHoldEnabled as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.99 kSCPropNetModemHoldReminder as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.100 kSCPropNetModemHoldReminderTime as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.101 kSCPropNetModemNote as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.102 kSCPropNetModemPulseDial as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.103 kSCPropNetModemSpeaker as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.104 kSCPropNetModemSpeed as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.105 kSCPropNetOverridePrimary as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.106 kSCPropNetPPPACSPEnabled as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.107 kSCPropNetPPPAuthEAPPlugins as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.108 kSCPropNetPPPAuthName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.109 kSCPropNetPPPAuthPassword as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.110 kSCPropNetPPPAuthPasswordEncryption as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.111 kSCPropNetPPPAuthPrompt as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.112 kSCPropNetPPPAuthProtocol as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.113 kSCPropNetPPPCCPEnabled as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.114 kSCPropNetPPPCommAlternateRemoteAddress as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.115 kSCPropNetPPPCommConnectDelay as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.116 kSCPropNetPPPCommDisplayTerminalWindow as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.117 kSCPropNetPPPCommRedialCount as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.118 kSCPropNetPPPCommRedialEnabled as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.119 kSCPropNetPPPCommRedialInterval as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.120 kSCPropNetPPPCommRemoteAddress as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.121 kSCPropNetPPPCommTerminalScript as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.122 kSCPropNetPPPCommUseTerminalScript as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.123 kSCPropNetPPPConnectTime as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.124 kSCPropNetPPPDeviceLastCause as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.125 kSCPropNetPPPDialOnDemand as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.126 kSCPropNetPPPDisconnectOnIdle as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.127 kSCPropNetPPPDisconnectOnIdleTimer as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.128 kSCPropNetPPPDisconnectOnLogout as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.129 kSCPropNetPPPDisconnectOnSleep as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.130 kSCPropNetPPPDisconnectTime as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.131 kSCPropNetPPPIdleReminder as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.132 kSCPropNetPPPIdleReminderTimer as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.133 kSCPropNetPPPIPCPCompressionVJ as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.134 kSCPropNetPPPLastCause as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.135 kSCPropNetPPPLCPCompressionACField as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.136 kSCPropNetPPPLCPCompressionPField as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.137 kSCPropNetPPPLCPEchoEnabled as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.138 kSCPropNetPPPLCPEchoFailure as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.139 kSCPropNetPPPLCPEchoInterval as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.140 kSCPropNetPPPLCPMRU as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.141 kSCPropNetPPPLCPMTU as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.142 kSCPropNetPPPLCPReceiveACCM as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.143 kSCPropNetPPPLCPTransmitACCM as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.144 kSCPropNetPPPLogfile as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.145 kSCPropNetPPPOverridePrimary as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.146 kSCPropNetPPPPlugins as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.147 kSCPropNetPPPRetryConnectTime as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.148 kSCPropNetPPPSessionTimer as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.149 kSCPropNetPPPStatus as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.150 kSCPropNetPPPUseSessionTimer as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.151 kSCPropNetPPPVerboseLogging as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.152 kSCPropNetProxiesExceptionsList as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.153 kSCPropNetProxiesFTPEnable as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.154 kSCPropNetProxiesFTPPassive as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.155 kSCPropNetProxiesFTPPort as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.156 kSCPropNetProxiesFTPProxy as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.157 kSCPropNetProxiesGopherEnable as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.158 kSCPropNetProxiesGopherPort as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.159 kSCPropNetProxiesGopherProxy as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.160 kSCPropNetProxiesHTTPEnable as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.161 kSCPropNetProxiesHTTPPort as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.162 kSCPropNetProxiesHTTPProxy as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.163 kSCPropNetProxiesHTTPSEnable as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.164 kSCPropNetProxiesHTTPSPort as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.165 kSCPropNetProxiesHTTPSProxy as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.166 kSCPropNetProxiesRTSPEnable as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.167 kSCPropNetProxiesRTSPPort as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.168 kSCPropNetProxiesRTSPProxy as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.169 kSCPropNetProxiesSOCKSEnable as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.170 kSCPropNetProxiesSOCKSPort as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.171 kSCPropNetProxiesSOCKSProxy as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.172 kSCPropNetServiceOrder as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.173 kSCPropSystemComputerName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.174 kSCPropSystemComputerNameEncoding as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.175 kSCPropUserDefinedName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.176 kSCPropVersion as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.177 kSCResvInactive as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.
Notes: Value should be "___INACTIVE___"

192.4.178 kSCResvLink as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.
Notes: Value should be "___LINK___"

192.4.179 kSCValNetAirPortAuthPasswordEncryptionKeychain as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.180 kSCValNetAirPortJoinModeAutomatic as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.181 kSCValNetAirPortJoinModePreferred as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.182 kSCValNetAirPortJoinModeRecent as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.183 kSCValNetAirPortJoinModeStrongest as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.184 kSCValNetInterfaceSubTypeL2TP as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.185 kSCValNetInterfaceSubTypePPPoE as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.186 kSCValNetInterfaceSubTypePPPSerial as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.187 kSCValNetInterfaceSubTypePPTP as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.188 kSCValNetInterfaceType6to4 as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.189 kSCValNetInterfaceTypeEthernet as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.190 kSCValNetInterfaceTypeFireWire as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.191 kSCValNetInterfaceTypePPP as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.192 kSCValNetIPv4ConfigMethodBOOTP as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.193 kSCValNetIPv4ConfigMethodDHCP as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.194 kSCValNetIPv4ConfigMethodINFORM as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.195 kSCValNetIPv4ConfigMethodLinkLocal as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.196 kSCValNetIPv4ConfigMethodManual as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.197 kSCValNetIPv4ConfigMethodPPP as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.198 kSCValNetIPv6ConfigMethod6to4 as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.199 kSCValNetIPv6ConfigMethodAutomatic as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.200 kSCValNetIPv6ConfigMethodManual as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.201 kSCValNetIPv6ConfigMethodRouterAdvertisement as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.202 kSCValNetL2TPIPSecSharedSecretEncryptionKeychain as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.203 kSCValNetL2TPTransportIP as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.204 kSCValNetL2TPTransportIPSec as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.205 kSCValNetModemDialModeIgnoreDialTone as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.206 kSCValNetModemDialModeManual as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.207 kSCValNetModemDialModeWaitForDialTone as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.208 kSCValNetPPPAuthPasswordEncryptionKeychain as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.209 kSCValNetPPPAuthPromptAfter as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.210 kSCValNetPPPAuthPromptBefore as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.211 kSCValNetPPPAuthProtocolCHAP as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.212 kSCValNetPPPAuthProtocolEAP as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.213 kSCValNetPPPAuthProtocolMSCHAP1 as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.214 kSCValNetPPPAuthProtocolMSCHAP2 as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.215 kSCValNetPPPAuthProtocolPAP as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Just a constant for the System Configuation API functions.

192.4.216 LocalHostName as string

MBS MacCF Plugin, Plugin Version: 7.8, Platform: macOS, Targets: All.

Function: Gets the current local host name.
Example:

```
Var s as new SystemConfigurationMBS
MessageBox s.LocalHostName
```

Notes: Returns the current local host name; "" if the name has not been set or if an error was encountered.

192.4.217 Location as string

MBS MacCF Plugin, Plugin Version: 7.8, Platform: macOS, Targets: All.

Function: Gets the current location identifier.
Example:

```
Var s as new SystemConfigurationMBS
MessageBox s.Location
```

Notes: Returns a string representing the current location identifier; "" if no location identifier has been defined or if an error was encountered.

192.4.218 MachineName as string

MBS MacCF Plugin, Plugin Version: 7.8, Platform: macOS, Targets: All.

Function: The local machine name.

192.4.219 NetworkCheckReachabilityByAddress(ip as string, byref flags as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Determines if the given network address is reachable using the current network configuration.
Notes: address: The network address of the desired host.
flags: An integer that will be filled with a set of SCNetworkConnectionFlags detailing the reachability of the specified address.
Returns true if the network connection flags are valid; false if the status could not be determined.
(see the SCNetworkReachabilityMBS class for more details)

192.4.220 NetworkCheckReachabilityByName(nodename as string, byref flags as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Determines if the given network host/node name is reachable using the current network configuration.
Notes: nodename: The node name of the desired host.
flags: An integer that will be filled with a set of SCNetworkConnectionFlags detailing the reachability of the specified node name.
Returns true if the network connection flags are valid; false if the status could not be determined.
(see the SCNetworkReachabilityMBS class for more details)

192.4.221 NetworkInterfaceRefreshConfiguration(ifname as CFStringMBS) as boolean

MBS MacCF Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Sends a notification to interested configuration agents to have them immediately retry their configuration over a particular network interface.
Notes: This API must be invoked by root (uid == 0).
ifName: The BSD name of the network interface e.g. NewCFStringMBS("en0").
Returns true if the notification was sent; false otherwise.

192.4.222 ShortUserName as string

MBS MacCF Plugin, Plugin Version: 7.8, Platform: macOS, Targets: All.

Function: The short user name.

192.4.223 UserName as string

MBS MacCF Plugin, Plugin Version: 7.8, Platform: macOS, Targets: All.

Function: The user name.
Notes: The function UserName returns a string based on the read UID (RUID, as returned by getuid) of the calling process. This can result in unexpected behavior (that is, Name returning different results than ConsoleUser) for processes that manipulate their UID.

Chapter 193

Tapi

193.1 class ITAddressMBS

193.1.1 class ITAddressMBS

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for an address.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

193.1.2 Methods

193.1.3 Calls as ITCallInfoMBS()

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates an array of calls currently active on the address.
Notes: Sets lasterror property.

193.1.4 Constructor

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

193.1.5 CreateCall(DestAddress as string = """, AddressType as Integer = 1, MediaTypes as Integer = 0) as TAPICallControlMBS

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new call.
Notes: Creates a new Call object that can be used to make an outgoing call and returns a TAPICallControlMBS object. The newly created call is in the StateIdle state and has no media or terminals selected.

See also MediaTypes and LineAddressType constants.

193.1.6 Properties

193.1.7 AddressName as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the displayable name of the address.
Notes: Returns the containing a displayable address name.
Sets lasterror property.
(Read only property)

193.1.8 DialableAddress as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the text which can be used to connect to this address.
Notes: The text corresponds to the destination address string that another application would use to connect to this address, such as a phone number or an e-mail name.
You can use this address with the CreateCall method.
Sets lasterror property.
(Read only property)

193.1.9 DoNotDisturb as Boolean

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the current status of the do not disturb feature on the address.
Notes: The do not disturb feature may not be available on all addresses.
If true, the do not disturb feature has been activated. If false, the do not disturb feature is not active.
Sets lasterror property.

(Read and Write property)

193.1.10 Handle as Integer

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: This is an ITAddress* pointer.
(Read and Write property)

193.1.11 Lasterror as Integer

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Set by all the methods to indicate the last error.
Value is 0 if no error.
(Read and Write property)

193.1.12 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The error message for the last error.
Notes: (Read and Write property)

193.1.13 MessageWaiting as Boolean

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Determines if the address has a message waiting.
Notes: Returns true if a message is waiting; false, if no message is waiting.
Sets lasterror property.
(Read and Write property)

193.1.14 ServiceProviderName as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the name of the Telephony Service Provider (TSP) that supports this address.
Notes: For example, Unimdm.tsp for the Unimodem service provider or H323.tsp for the H323 service provider.
Sets lasterror property.
(Read only property)

193.1.15 State as Integer

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the current state of the address.
Notes: Sets lasterror property.
Can be StateInService or StateOutOfService.
(Read only property)

193.1.16 Constants

Line Address Types

Constant	Value	Description
LineAddressTypeDomainName	8	Address type is a domain name.
LineAddressTypeEmailName	4	Address type is an e-mail name.
LineAddressTypeIPAddress	16	Address type is an IP address.
LineAddressTypePhoneNumber	1	Address type is a standard phone number.
LineAddressTypeSDP	2	Address type is Session Description Protocol (SDP) conference.

Media Types

Constant	Value	Description
MediaTypeAudio	8	An audio media stream that is entering or leaving the computer. An entering media stream would typically be played on speakers, or sent to a handset device and a leaving stream would typically be captured through a microphone or handset device.
MediaTypeDataModem	16	A data media stream that is associated with a data modem.
MediaTypeG3Fax	32	A data media stream that is associated with a G3 protocol fax.
MediaTypeMultiTrack	&h10000	A stream is on a multitrack terminal.
MediaTypeVideo	&h8000	A video media stream that is entering or leaving the computer. An entering media stream would typically be rendered in a video window and a leaving media stream would typically be captured with a video camera.

States

Constant	Value	Description
StateInService	0	Normal state; the address can be used.
StateOutOfService	1	The address is temporarily out of service, but may go back into service at some time.

193.2 class ITCallInfoMBS

193.2.1 class ITCallInfoMBS

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for information about a call.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

193.2.2 Methods

193.2.3 Constructor

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes: Lasterror is set.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

193.2.4 Properties

193.2.5 Address as ITAddressMBS

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the address of the call.
Notes: Lasterror is set.
(Read only property)

193.2.6 CalledIDName as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the called location.
Notes: Lasterror is set.
(Read only property)

193.2.7 CalledIDNumber as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of the called location.
Notes: Lasterror is set.
(Read only property)

193.2.8 CalledPartyFriendlyName as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The called party friendly name.
Notes: Lasterror is set.
(Read only property)

193.2.9 CallerIDName as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the caller.
Notes: Lasterror is set.
(Read only property)

193.2.10 CallerIDNumber as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of the caller.
Notes: Lasterror is set.
(Read only property)

193.2.11 CallingPartyID as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The identifier of the calling party.
Notes: Lasterror is set.
(Read only property)

193.2.12 Comment as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A comment about the call provided by the application that originated the call. The call state must be StateIdle when setting the comment.
Notes: Lasterror is set.
(Read only property)

193.2.13 ConnectedIDName as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the connected location.
Notes: Lasterror is set.
(Read only property)

193.2.14 ConnectedIDNumber as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of the connected location.
Notes: Lasterror is set.
(Read only property)

193.2.15 DisplayableAddress as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A displayable version of the called or calling address.
Notes: Lasterror is set.
(Read only property)

193.2.16 Handle as Integer

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: This is an ITCallInfo* pointer.
(Read and Write property)

193.2.17 Lasterror as Integer

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Set by all the methods to indicate the last error.
Value is 0 if no error.
(Read and Write property)

193.2.18 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The error message for the last error.
Notes: (Read and Write property)

193.2.19 RedirectingIDName as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the location that redirected the call.
Notes: Lasterror is set.
(Read only property)

193.2.20 RedirectingIDNumber as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of the location that redirected the call.
Notes: Lasterror is set.
(Read only property)

193.2.21 RedirectionIDName as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the location to which a call has been redirected.
Notes: Lasterror is set.
(Read only property)

193.2.22 RedirectionIDNumber as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of the location to which a call has been redirected.
Notes: Lasterror is set.
(Read only property)

193.2.23 State as Integer

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current state call.
Notes: Can be StateConnected, StateDisconnected, StateHold, StateIdle, StateInProgress, StateOffering or StateQueued.
Lasterror is set.
(Read only property)

193.2.24 Constants

States

Constant	Value	Description
StateConnected	2	Call has been connected to the remote end and communication can take place.
StateDisconnected	3	Call has been disconnected. There are several causes for disconnection. See the table of valid call state transitions below.
StateHold	5	The call is in the hold state.
StateIdle	0	The call has been created, but Connect has not been called yet. A call can never transition into the idle state. This is the initial state for both incoming and outgoing calls.
StateInProgress	1	Connect has been called, and the service provider is working on making a connection. This state is valid only on outgoing calls. This message is optional, because a service provider may have a call transition directly to the connected state.
StateOffering	4	A new call has appeared, and is being offered to an application. If the application has owner privileges on the call, it can either call Answer or Disconnect while the call is in the offering state. Current call privilege can be determined by calling Privilege.
StateQueued	6	The call is queued.

193.3 class TAPICallControlMBS

193.3.1 class TAPICallControlMBS

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The interface used by the application to connect, answer, and perform basic telephony operations on a call object.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

193.3.2 Methods

193.3.3 Answer

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: answers an incoming call.
Notes: This method can succeed only if the call state is StateOffering.
Lasterror is set.

193.3.4 BlindTransfer(DestAddress as String)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: performs a blind or single-step transfer of the specified call to the specified destination address.
Notes: The application must be the owner of the call. After a successful transfer, the call state transitions to StateDisconnected.

DestAddress: Text containing destination address for the transfer.
Lasterror is set.

193.3.5 Conference(otherCall as TAPICallControlMBS, sync as boolean)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds a consultation call to the conference in which the current call is a participant.
Notes: If an associated ITCallHub object does not exist, it is created.

otherCall: The consultation call.
Sync: Indicates whether the call should be conferenced synchronously (true) or asynchronously (false). See

Connect method for additional explanation.
Lasterror is set.

193.3.6 Connect(sync as boolean)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attempts to complete the connection of an outgoing call.
Notes: Sync: Boolean indicating whether connection is to be performed synchronously (true) or asynchronously (false).

If the call is asynchronous, the application will receive information about the call's progress through the TAPIMBS CallStateChanged event. Connect may return no error, but the actual connection may fail (and the application will be notified through the event).
If the call is synchronous, this method will not return until the call is in the connected state or fails.
Lasterror is set.

To make a call, please find the ITAddressMBS for the line, use CreateCall there. Than use TAPICallControlMBS.Connect here.

193.3.7 Constructor

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

193.3.8 Dial(DestAddress as String)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Dials the specified address.
Notes: DestAddress: Representation of address to be dialed. The format must conform to a standard dialable address.
Lasterror is set.

193.3.9 Disconnect(Mode as Integer)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Disconnects the call.

Notes: The call state will transition to StateDisconnected after the method completes successfully.
Pass DisconnectModeNoAnswer, DisconnectModeNormal or DisconnectModeReject.
Lasterror is set.

193.3.10 Finish(Mode as Integer)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called on a consultation call to finish a conference or a transfer.
Notes: Pass FinishModeAsConference or FinishModeAsTransfer.
Lasterror is set.

193.3.11 HandoffDirect(ApplicationName as String)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Hands off the call to another application.
Notes: This indicates that the application no longer requires ownership of the call.

ApplicationName: Text containing the specific application name to hand off call to. Can be full path name or executable name.
Lasterror is set.

193.3.12 HandoffIndirect(MediaType as Integer)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Hands off the call to another application based on the media type of the call.
Notes: If multiple applications have registered as able to handle the types involved, TAPI will hand off to the highest-priority application, which is usually the one that registered first.
This indicates that the application no longer requires ownership of the call.

for media types, please check constants in ITAddressMBS class and this website:
http://msdn.microsoft.com/en-us/library/windows/desktop/ms734210(v=vs.85).aspx
Lasterror is set.

193.3.13 Hold(hold as boolean)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Places or removes the call from the hold.
Notes: If Hold is true and the method succeeds, the call state transitions to the StateHold state. If Hold is false, the call state transitions to StateConnected.
Lasterror is set.

193.3.14 ParkDirect(ParkAddress as String)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Parks the call at a specified address.
Notes: ParkAddress: Text containing the address where the call is to be parked.
Lasterror is set.

193.3.15 ParkIndirect as string

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Parks the call and returns the parked address.
Notes: Returns representation of the address where the call was parked.
Lasterror is set.

193.3.16 Pickup(GroupID as String)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Picks up a call alerting at the specified group identification.
Notes: GroupID: The group identifier to which the alerting station belongs.
Lasterror is set.

193.3.17 RemoveFromConference

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes the call from a conference if it is involved in one.
Notes: Lasterror is set.

193.3.18 SetQOS(MediaType as Integer, ServiceLevel as Integer)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the quality of service level for the call.
Notes: for media types, please check constants in ITAddressMBS class and this website:
http://msdn.microsoft.com/en-us/library/windows/desktop/ms734210(v=vs.85).aspx

Lasterror is set.

193.3.19 SwapHold(otherCall as TAPICallControlMBS)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Swaps the call (which is active) with the specified call on hold.
Notes: Swapping the active call with the call on consultation hold allows the application to toggle between these two calls. This is typical in call waiting.
OtherCall: Call, currently on hold, that is to be made active.
Lasterror is set.

193.3.20 Transfer(otherCall as TAPICallControlMBS, sync as boolean)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Transfers the current call to the destination address.
Notes: otherCall: Other interface of consultation call created for the transfer.
Sync: Indicates whether the method should be completed synchronously (true) or asynchronously (false).
Lasterror is set.

193.3.21 Unpark

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the call from park.
Notes: To unpark a call, CreateCall must be called using as the destination address the current parked location of the call.
Lasterror is set.

193.3.22 Properties

193.3.23 Handle as Integer

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: This is an ITBasicCallControl* pointer.
(Read and Write property)

193.3.24 Lasterror as Integer

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Set by all the methods to indicate the last error.
Value is 0 if no error.
(Read and Write property)

193.3.25 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The error message for the last error.
Notes: (Read and Write property)

193.3.26 Constants

Disconnect Modes

Constant	Value	Description
DisconnectModeNoAnswer	1	The call is being disconnected because it has not been answered. (For example, an application may set a certain amount of time for the user to answer the call. If the user does not answer, the application can call Disconnect with the NOANSWER code.) Lasterror is set.
DisconnectModeNormal	0	The call is being disconnected as part of the normal cycle of the call. Lasterror is set.
DisconnectModeReject	2	The user rejected the offered call. Lasterror is set.

Finish Modes

Constant	Value	Description
FinishModeAsConference	1	A call is being added to a conference call. Lasterror is set.
FinishModeAsTransfer	0	A call transfer is being finished. Lasterror is set.

QOS levels

Constant	Value	Description
QualityOfServerLevelBestEffort	2	Quality of service level desired is "best effort".
QualityOfServerLevelIfAvailable	1	Quality of service level desired if available.
QualityOfServerLevelNeeded	0	Quality of service level required.

193.4 class TAPIMBS

193.4.1 class TAPIMBS

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The central class for TAPI.
Example:

```
// get notified about incoming phone calls with TAPI on Windows and answer them
// MyTAPI is a subclass of TAPIMBS with the IncomingCall event implemented.
// Phone is a property of the window: Phone As MyTAPI
Phone = New MyTAPI
Phone.ListenOnAllAddresses

// in MyTAPI:
Sub IncomingCall(CallInfo As ITCallInfoMBS, BasicCallControl As TAPICallControlMBS) Handles Incom-
ingCall
System.DebugLog "Call from " + CallInfo.CallerIDNumber
BasicCallControl.Answer
End Sub
```

Notes: MBS Plugin implements TAPI (telephone API) on Windows to catch incoming calls, so you can display e.g. customer data for the phone number when customer calls. Also you can create new call objects to dial or query information on calls or addresses.

193.4.2 Methods

193.4.3 Addresses as ITAddressMBS()

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns an array with all addresses.
Notes: Lasterror is set.

193.4.4 Available as boolean

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether TAPI is available.
Notes: Returns true on Windows and false elsewhere.

193.4.5 Constructor

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

193.4.6 Destructor

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

193.4.7 ListenOnAllAddresses

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries list of addresses and registers event handlers to receive events.
Notes: Please call this method to get the IncomingCall event working.
Lasterror is set.

193.4.8 Properties

193.4.9 EventFilter as Integer

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event filter.
Notes: The plugin sets this to EventCallNotification + EventCallState automatically.

See constants:
http://msdn.microsoft.com/en-us/library/windows/desktop/ms734238(v=vs.85).aspx
(Read and Write property)

193.4.10 Handle as Integer

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: This is an ITTAPI* pointer.
(Read and Write property)

193.4.11 Lasterror as Integer

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Set by all the methods to indicate the last error.
Value is 0 if no error.
(Read and Write property)

193.4.12 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The error message for the last error.
Notes: (Read and Write property)

193.4.13 Events

193.4.14 CallStateChanged(CallInfo as ITCallInfoMBS)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The call state changed.
Notes: The Call state has changed.

193.4.15 IncomingCall(CallInfo as ITCallInfoMBS, BasicCallControl as TAPICallControlMBS)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A new call is incoming.

193.4.16 Constants

Event Types

Constant	Value	Description
EventCallNotification	&h4	A new communications session has appeared on the address and the TAPI DLL has created a new call object. This could be a result from an incoming session, a session handed off by another application, or a session being parked on the address.
EventCallState	&h8	The Call state has changed.

Chapter 194

Tidy

194.1 class TidyAttributeMBS

194.1.1 class TidyAttributeMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: An attribute of a node.
Blog Entries

- MBS Xojo Plugins, version 17.4pr3
- MBS REALbasic Plugins, version 10.5pr4

194.1.2 Properties

194.1.3 Document as TidyDocumentMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The document of this attribute.
Notes: (Read only property)

194.1.4 ID as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The attribute ID.
Notes: (Read only property)

194.1.5 IsEvent as Boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this attribute is the Event attribute.
Notes: (Read only property)

194.1.6 Name as string

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the attribute.
Notes: (Read only property)

194.1.7 NextAttribute as TidyAttributeMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The next attribute in the attribute list of the node.
Notes: (Read only property)

194.1.8 Value as string

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the attribute.
Notes: (Read only property)

194.2 module TidyAttrIdMBS

194.2.1 module TidyAttrIdMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A module with constants for use with the Tidy classes.

194.2.2 Constants

Constants

Constant	Value	Description
TidyAttrABBR	1	A constant for use with the Tidy classes.
TidyAttrABOUT	319	A constant for use with the Tidy classes.
TidyAttrACCEPT	2	A constant for use with the Tidy classes.
TidyAttrACCEPT_CHARSET	3	A constant for use with the Tidy classes.
TidyAttrACCESSKEY	4	A constant for use with the Tidy classes.
TidyAttrACTION	5	A constant for use with the Tidy classes.
TidyAttrADD_DATE	6	A constant for use with the Tidy classes.
TidyAttrALIGN	7	A constant for use with the Tidy classes.
TidyAttrALINK	8	A constant for use with the Tidy classes.
TidyAttrALLOWFULLSCREEN	9	A constant for use with the Tidy classes.
TidyAttrALT	10	A constant for use with the Tidy classes.
TidyAttrARCHIVE	11	A constant for use with the Tidy classes.
TidyAttrARIA_ACTIVEDESCENDANT	275	A constant for use with the Tidy classes.
TidyAttrARIA_ATOMIC	276	A constant for use with the Tidy classes.
TidyAttrARIA_AUTOCOMPLETE	277	A constant for use with the Tidy classes.
TidyAttrARIA_BUSY	278	A constant for use with the Tidy classes.
TidyAttrARIA_CHECKED	279	A constant for use with the Tidy classes.
TidyAttrARIA_CONTROLS	280	A constant for use with the Tidy classes.
TidyAttrARIA_DESCRIBEDBY	281	A constant for use with the Tidy classes.
TidyAttrARIA_DISABLED	282	A constant for use with the Tidy classes.
TidyAttrARIA_DROPEFFECT	283	A constant for use with the Tidy classes.
TidyAttrARIA_EXPANDED	284	A constant for use with the Tidy classes.
TidyAttrARIA_FLOWTO	285	A constant for use with the Tidy classes.
TidyAttrARIA_GRABBED	286	A constant for use with the Tidy classes.
TidyAttrARIA_HASPOPUP	287	A constant for use with the Tidy classes.
TidyAttrARIA_HIDDEN	288	A constant for use with the Tidy classes.
TidyAttrARIA_INVALID	289	A constant for use with the Tidy classes.
TidyAttrARIA_LABEL	290	A constant for use with the Tidy classes.
TidyAttrARIA_LABELLEDBY	291	A constant for use with the Tidy classes.
TidyAttrARIA_LEVEL	292	A constant for use with the Tidy classes.
TidyAttrARIA_LIVE	293	A constant for use with the Tidy classes.
TidyAttrARIA_MULTILINE	294	A constant for use with the Tidy classes.
TidyAttrARIA_MULTISELECTABLE	295	A constant for use with the Tidy classes.
TidyAttrARIA_ORIENTATION	296	A constant for use with the Tidy classes.
TidyAttrARIA_OWNS	297	A constant for use with the Tidy classes.
TidyAttrARIA_POSINSET	298	A constant for use with the Tidy classes.
TidyAttrARIA_PRESSED	299	A constant for use with the Tidy classes.
TidyAttrARIA_READONLY	300	A constant for use with the Tidy classes.
TidyAttrARIA_RELEVANT	301	A constant for use with the Tidy classes.
TidyAttrARIA_REQUIRED	302	A constant for use with the Tidy classes.
TidyAttrARIA_SELECTED	303	A constant for use with the Tidy classes.
TidyAttrARIA_SETSIZE	304	A constant for use with the Tidy classes.
TidyAttrARIA_SORT	305	A constant for use with the Tidy classes.
TidyAttrARIA_VALUEMAX	306	A constant for use with the Tidy classes.
TidyAttrARIA_VALUEMIN	307	A constant for use with the Tidy classes.
TidyAttrARIA_VALUENOW	308	A constant for use with the Tidy classes.
TidyAttrARIA_VALUETEXT	309	A constant for use with the Tidy classes.
TidyAttrAS	328	A constant for use with the Tidy classes.
TidyAttrASYNC	173	A constant for use with the Tidy classes.
TidyAttrAUTOCOMPLETE	174	A constant for use with the Tidy classes.
TidyAttrAUTOFOCUS	175	A constant for use with the Tidy classes.
TidyAttrAUTOPLAY	176	A constant for use with the Tidy classes.
TidyAttrAXIS	12	A constant for use with the Tidy classes.
TidyAttrBACKGROUND	13	A constant for use with the Tidy classes.
TidyAttrBASEPROFILE	315	A constant for use with the Tidy classes.
TidyAttrBGCOLOR	14	A constant for use with the Tidy classes.
TidyAttrBGPROPERTIES	15	A constant for use with the Tidy classes.
TidyAttrBORDER	16	A constant for use with the Tidy classes.

194.3 module TidyConfigCategoryMBS

194.3.1 module TidyConfigCategoryMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A module with constants for use with the Tidy classes.

194.3.2 Constants

Constants

Constant	Value	Description
TidyDiagnostics	301	A constant for use with the Tidy classes.
TidyDisplay	302	A constant for use with the Tidy classes.
TidyDocumentIO	303	A constant for use with the Tidy classes.
TidyEncoding	304	A constant for use with the Tidy classes.
TidyFileIO	305	A constant for use with the Tidy classes.
TidyInternalCategory	312	A constant for use with the Tidy classes.
TidyMarkupCleanup	306	A constant for use with the Tidy classes.
TidyMarkupEntities	307	A constant for use with the Tidy classes.
TidyMarkupRepair	308	A constant for use with the Tidy classes.
TidyMarkupTeach	309	A constant for use with the Tidy classes.
TidyMarkupXForm	310	A constant for use with the Tidy classes.
TidyPrettyPrint	311	A constant for use with the Tidy classes.

194.4 module TidyDoctypeModesMBS

194.4.1 module TidyDoctypeModesMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A module with constants for use with the Tidy classes.

194.4.2 Constants

Constants

Constant	Value	Description
TidyDoctypeAuto	2	A constant for use with the Tidy classes.
TidyDoctypeHtml5	0	A constant for use with the Tidy classes.
TidyDoctypeLoose	4	A constant for use with the Tidy classes.
TidyDoctypeOmit	1	A constant for use with the Tidy classes.
TidyDoctypeStrict	3	A constant for use with the Tidy classes.
TidyDoctypeUser	5	A constant for use with the Tidy classes.

194.5 class TidyDocumentMBS

194.5.1 class TidyDocumentMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A document in the tidy library.
Example:

```
Var t as new TidyDocumentMBS

call t.ParseString("<p>Hello World</p>") // pass here bad html
call t.CleanAndRepair

Var s As String=t.SaveString
MessageBox s // show fixed html
```

Notes: The main class for using the tidy library in Xojo.

194.5.2 Methods

194.5.3 AccessWarningCount as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of Tidy accessibility warnings encountered.

194.5.4 Body as TidyNodeMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The body node in the html tree.

194.5.5 CleanAndRepair as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Execute configured cleanup and repair operations on parsed markup.
Example:

```
Var t as new TidyDocumentMBS

call t.ParseString("<p>Hello World</p>") // pass here bad html
call t.CleanAndRepair

Var s As String=t.SaveString
MessageBox s // show fixed html
```

194.5.6 ConfigErrorCount as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of Tidy configuration errors encountered.

194.5.7 CopyConfig(otherDocument as TidyDocumentMBS) as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copy current configuration settings from one document to another.

194.5.8 DetectedGenericXml as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Input is generic XML (not HTML or XHTML)?

194.5.9 DetectedHtmlVersion as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Detected HTML version: 0, 2, 3 or 4.

194.5.10 DetectedXhtml as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Input is XHTML?

194.5.11 ErrorBuffer as string

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the error text save in the error buffer.
Notes: You need to use InstallErrorBuffer before using this function.

194.5.12 ErrorCount as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of Tidy errors encountered.
Notes: If >0, output is suppressed unless ForceOutput is set.

194.5.13 ErrorSummary

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write more complete information about errors to current error sink.

194.5.14 FileExists(filename as string) as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the file with that name exists.

194.5.15 GeneralInfo

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write more general information about markup to current error sink.

194.5.16 GetBooleanOption(OptionID as Integer) as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the value of a boolean option.

194.5.17 GetIntegerOption(OptionID as Integer) as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the value of an integer option.

194.5.18 GetStringOption(OptionID as Integer) as string

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the value of a string option.

194.5.19 Head as TidyNodeMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The head node in the html tree.

194.5.20 Html as TidyNodeMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The html node in the html tree.

194.5.21 InstallErrorBuffer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Installs an error buffer.
Notes: Use ErrorBuffer to get the text later.

194.5.22 LibraryVersion as string

MBS Tools Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version number of the library.

194.5.23 LoadConfigFile(filename as string) as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Load an ASCII Tidy configuration file.

194.5.24 LoadConfigFileWithEncoding(Filename as string, CharacterEncoding as string) as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Load a Tidy configuration file with the specified character encoding.

194.5.25 NextOption(Iterator as TidyIteratorMBS) as TidyOptionMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the next option in the list.

194.5.26 NextRelatedOption(Iterator as TidyIteratorMBS) as TidyOptionMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get next related option.

194.5.27 NextUserDeclaredTag(OptionID as Integer, Iterator as TidyIteratorMBS) as string

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get next declared tag of specified type: TidyInlineTags, TidyBlockTags, TidyEmptyTags or TidyPreTags.
Notes: See TidyOptionIdMBS for constants.

194.5.28 OptionCharcterEncodingName(OptionID as Integer) as String

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get character encoding name.
Notes: Used with TidyCharEncoding, TidyOutCharEncoding, TidyInCharEncoding options.

194.5.29 OptionCurrentPick(OptionID as Integer) as String

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get current pick list value for option by ID.
Notes: Useful for enum types.

194.5.30 OptionForID(OptionID as Integer) as TidyOptionMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds option based on given ID.
Notes: Returns nil on failure.

194.5.31 OptionForName(OptionName as string) as TidyOptionMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds option by name.

194.5.32 OptionIDForName(OptionName as string) as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds Option by name.
Notes: Returns nil on failure.

194.5.33 OptionList as TidyIteratorMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: An iterator running through all the options available.

194.5.34 OptionNames as String()

MBS Tools Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of available options.
Notes: List of options in current version:

- accessibility-check
- alt-text
- anchor-as-name
- ascii-chars
- new-blocklevel-tags
- show-body-only
- break-before-br
- char-encoding
- coerce-endtags

194.5.35 OptionResetToDefault(OptionID as Integer) as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resets the option to default value.

194.5.36 OptionsDifferentThanDefault as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Any settings different than default?

194.5.37 OptionsDifferentThanSnapshot as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Any settings different than snapshot?

194.5.38 OptionsResetAllToDefault as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reset all options to their default values.

194.5.39 OptionsResetToSnapshot as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reset config settings to snapshot (after document processing).

194.5.40 OptionsSnapshot as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Take a snapshot of current config settings.

194.5.41 ParseFile(filename as string) as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse markup in named file.

194.5.42 ParseSource(theInput as TidyInputMBS) as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse markup in given generic input source.

194.5.43 ParseString(data as string) as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse markup in given string.
Example:

```
Var t as new TidyDocumentMBS

call t.ParseString("<p>Hello World</p>") // pass here bad html
call t.CleanAndRepair

Var s As String=t.SaveString
MessageBox s // show fixed html
```

194.5.44 ParseStringOption(OptionName as string, value as string) as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses a string to set an option.
Example:

```
Var t as new TidyDocumentMBS

MessageBox str(t.OptionQuiet)
Var b1 as boolean = t.ParseStringOption("Quiet","true")
MessageBox str(t.OptionQuiet)

Var b2 as boolean = t.ParseStringOption("Quiet","false")
MessageBox str(t.OptionQuiet)
```

Notes: Useful if you don't know the type of the option.
Returns true on success and false on failure.

194.5.45 RelatedOptionsList(Option as TidyOptionMBS) as TidyIteratorMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Iterate over a list of related options.

194.5.46 ReleaseDate as string

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get release date (version) for current library.

194.5.47 ReportDoctype as Integer

MBS Tools Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The report document type.

194.5.48 Root as TidyNodeMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The root node in the html tree.

194.5.49 RunDiagnostics as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Run configured diagnostics on parsed and repaired markup.
Notes: Must call CleanAndRepair first.

194.5.50 SaveConfig(theOutput as TidyOutputMBS) as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Save current settings to given output sink.
Notes: Only non-default values are written.

194.5.51 SaveConfigFile(filename as string) as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Save current settings to named file.
Notes: Only non-default values are written.

194.5.52 SaveFile(filename as string) as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Save to named file.

194.5.53 SaveOutput(theOutput as TidyOutputMBS) as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Save to given generic output.

194.5.54 SaveString as string

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Save to a string.
Example:

```
Var t as new TidyDocumentMBS

call t.ParseString("<p>Hello World</p>") // pass here bad html
call t.CleanAndRepair

Var s As String=t.SaveString
MessageBox s // show fixed html
```

Notes: Returns "" on failure.

The returned string has no encoding set. You need to use DefineEncoding.

194.5.55 SetBooleanOption(OptionID as Integer, value as boolean) as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an option with a given boolean value.
Notes: Returns true on success and false on failure.

194.5.56 SetCharacterEncoding(encodingName as string) as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the input/output character encoding for parsing markup.
Notes: Values include: ascii, latin1, raw, utf8, iso2022, mac, win1252, utf16le, utf16be, utf16, big5 and shiftjis. Case in-sensitive.

194.5.57 SetErrorFile(filename as string) as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Redirects error output to named file.
Notes: Returns true on success.

194.5.58 SetInputCharacterEncoding(encodingName as string) as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the input character encoding for parsing markup.
Example:

```
Var t as new TidyDocumentMBS

MessageBox str(t.OptionInCharEncoding)
call t.SetInputCharacterEncoding "utf8"
MessageBox str(t.OptionInCharEncoding)
```

Notes: Values include: ascii, latin1, raw, utf8, iso2022, mac, win1252, utf16le, utf16be, utf16, big5 and shiftjis. Case in-sensitive.

194.5.59 SetIntegerOption(OptionID as Integer, value as Integer) as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an option with a given integer value.
Notes: Returns true on success and false on failure.

194.5.60 SetOutputCharacterEncoding(encodingName as string) as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the output character encoding for parsing markup.
Notes: Values include: ascii, latin1, raw, utf8, iso2022, mac, win1252, utf16le, utf16be, utf16, big5 and shiftjis. Case in-sensitive.

194.5.61 SetStringOption(OptionID as Integer, value as string) as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an option with a given string value.
Notes: Returns true on success and false on failure.

194.5.62 Status as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get status of current document.

194.5.63 Tidy(Input as string, byref Output as String, byref ErrorLog as String, options as Dictionary) as Integer

MBS Tools Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs tidy with options on the given input.
Example:

```
Var html As String = "<title>Test"

Var optionNames() As String = TidyDocumentMBS.OptionNames
Var optionNamesText As String = Join(optionNames, EndOfLine)

Var errorLog As String
Var output As String
Var options As New Dictionary

// output as xhtml
```

```
'options.Value("output-xhtml") = True

// if you want xml instead of html:
options.Value("output-xml") = True
options.Value("input-xml") = True

Var r As Integer = TidyDocumentMBS.tidy(html, output, errorLog, options)

Break
```

Notes: By default we apply options to use utf-8 for input and output as encoding and we disable the tidy mark for the html header.
Returns error code, zero for success. Negative values are error codes.

194.5.64 UserDeclaredTagList as TidyIteratorMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Iterate over user declared tags.

194.5.65 WarningCount as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of warnings encountered.

194.5.66 Properties

194.5.67 ErrorOutput as TidyOutputMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The output where the error report is written to.
Notes: (Read and Write property)

194.5.68 Handle as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal reference to the tidy document object.

Notes: (Read only property)

194.5.69 OptionAccessibilityCheck as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option accessibility-check.
Notes: This option specifies what level of accessibility checking, if any, that Tidy should perform.
Level 0 (Tidy Classic) is equivalent to Tidy Classic's accessibility checking.
For more information on Tidy's accessibility checking, visit Tidy's Accessibility Page (http://www.html-tidy.org/accessibility/).
(Read and Write property)

194.5.70 OptionAccessibilityCheckLevel as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies what level of accessibility checking, if any, that Tidy should do.
Notes: Level 0 is equivalent to Tidy Classic's accessibility checking. For more information on Tidy's accessibility checking, visit the Adaptive Technology Resource Centre at the University of Toronto. :

http://www.aprompt.ca/Tidy/accessibilitychecks.html
(Read and Write property)

194.5.71 OptionAddXmlDecl as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option add-xml-decl.
Notes: This option specifies if Tidy should add the XML declaration when outputting XML or XHTML.
Note that if the input already includes an <?xml ... ?> declaration then this option will be ignored.
If the encoding for the output is different from ascii, one of the utf* encodings, or raw, then the declaration is always added as required by the XML standard.
(Read and Write property)

194.5.72 OptionAddXmlSpace as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option add-xml-space.
Notes: This option specifies if Tidy should add xml:space="preserve" to elements such as <pre>, <style> and <script> when generating XML.
This is needed if the whitespace in such elements is to be parsed appropriately without having access to the DTD.
(Read and Write property)

194.5.73 OptionAltText as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option alt-text.
Notes: This option specifies the default alt= text Tidy uses for <img> attributes when the alt= attribute is missing.
Use with care, as it is your responsibility to make your documents accessible to people who cannot see the images.
(Read and Write property)

194.5.74 OptionAnchorAsName as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option anchor-as-name.
Notes: This option controls the deletion or addition of the name attribute in elements where it can serve as anchor.
If set to yes a name attribute, if not already existing, is added along an existing id attribute if the DTD allows it.
If set to no any existing name attribute is removed if an id attribute exists or has been added.
(Read and Write property)

194.5.75 OptionAsciiChars as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option ascii-chars.
Notes: Can be used to modify behavior of the clean option when set to yes.
If set to yes when using clean, &emdash;, ”, and other named character entities are downgraded to their closest ASCII equivalents.
(Read and Write property)

194.5.76 OptionAssumeXmlProcins as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option assume-xml-procins.
Notes: This option specifies if Tidy should change the parsing of processing instructions to require ?> as the terminator rather than >.
This option is automatically set if the input is in XML.
(Read and Write property)

194.5.77 OptionBare as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option bare.
Notes: This option specifies if Tidy should strip Microsoft specific HTML from Word 2000 documents, and output spaces rather than non-breaking spaces where they exist in the input.
(Read and Write property)

194.5.78 OptionBlockTags as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies new block-level tags.
Notes: This option takes a space or comma separated list of tag names. Unless you declare new tags, Tidy will refuse to generate a tidied file if the input includes previously unknown tags. Note you can't change the content model for elements such as <TABLE>, <UL>, <OL>and <DL>. This option is ignored in XML mode.
(Read and Write property)

194.5.79 OptionBodyOnly as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should print only the contents of the body tag as an HTML fragment.
Notes: If set to "auto", this is performed only if the body tag has been inferred. Useful for incorporating existing whole pages as a portion of another page. This option has no effect if XML output is requested.

Value is 0 for no, 1 for yes and 2 for auto.
(Read and Write property)

194.5.80 OptionBreakBeforeBr as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option break-before-br.
Notes: This option specifies if Tidy should output a line break before each <br> element.
(Read and Write property)

194.5.81 OptionCharEncoding as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option char-encoding.
Notes: This option specifies the character encoding Tidy uses for both the input and output.
For ascii Tidy will accept Latin-1 (ISO-8859-1) character values, but will use entities for all characters whose value >127.
For raw, Tidy will output values above 127 without translating them into entities.
For latin1, characters above 255 will be written as entities.
For utf8, Tidy assumes that both input and output are encoded as UTF-8.
You can use iso2022 for files encoded using the ISO-2022 family of encodings e.g. ISO-2022-JP.
For mac and win1252, Tidy will accept vendor specific character values, but will use entities for all characters whose value >127.
For unsupported encodings, use an external utility to convert to and from UTF-8.
(Read and Write property)

194.5.82 OptionClean as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option clean.
Notes: This option specifies if Tidy should perform cleaning of some legacy presentational tags (currently <i>, , <center> when enclosed within appropriate inline tags, and <font>). If set to yes then legacy tags will be replaced with CSS <style> tags and structural markup as appropriate.
(Read and Write property)

194.5.83 OptionCoerceEndtags as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option coerce-endtags.
Notes: This option specifies if Tidy should coerce a start tag into an end tag in cases where it looks like an end tag was probably intended; for example, given
foo bar baz

Tidy will output
foo bar baz
(Read and Write property)

194.5.84 OptionCssPrefix as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option css-prefix.
Notes: This option specifies the prefix that Tidy uses for styles rules.
By default, c will be used.
(Read and Write property)

194.5.85 OptionDecorateInferredUl as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option decorate-inferred-ul.
Notes: This option specifies if Tidy should decorate inferred <ul> elements with some CSS markup to avoid indentation to the right.
(Read and Write property)

194.5.86 OptionDoctype as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option doctype.
Notes: This option specifies the DOCTYPE declaration generated by Tidy.
If set to omit the output won't contain a DOCTYPE declaration. Note this this also implies numeric-entities is set to yes.
If set to html5 the DOCTYPE is set to <!DOCTYPE html>.
If set to auto (the default) Tidy will use an educated guess based upon the contents of the document.
If set to strict, Tidy will set the DOCTYPE to the HTML4 or XHTML1 strict DTD.
If set to loose, the DOCTYPE is set to the HTML4 or XHTML1 loose (transitional) DTD.
Alternatively, you can supply a string for the formal public identifier (FPI).
For example:
doctype: "-//ACME//DTD HTML 3.14159//EN"
If you specify the FPI for an XHTML document, Tidy will set the system identifier to an empty string. For an HTML document, Tidy adds a system identifier only if one was already present in order to preserve the processing mode of some browsers. Tidy leaves the DOCTYPE for generic XML documents unchanged.
This option does not offer a validation of document conformance.
(Read and Write property)

194.5.87 OptionDoctypeMode as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option doctype-mode.
Notes: (Read only property)

194.5.88 OptionDropEmptyElements as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option drop-empty-elements.
Notes: This option specifies if Tidy should discard empty elements.
(Read and Write property)

194.5.89 OptionDropEmptyParas as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option drop-empty-paras.
Notes: This option specifies if Tidy should discard empty paragraphs.
(Read and Write property)

194.5.90 OptionDropPropAttrs as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should strip out proprietary attributes, such as MS data binding attributes.
Notes: (Read and Write property)

194.5.91 OptionDropProprietaryAttributes as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option drop-proprietary-attributes.
Notes: This option specifies if Tidy should strip out proprietary attributes, such as Microsoft data binding attributes. Additionally attributes that aren't permitted in the output version of HTML will be dropped if used with strict-tags-attributes.
(Read and Write property)

194.5.92 OptionDuplicateAttrs as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** One of the options.
Notes: (Read and Write property)

194.5.93 OptionEmacs as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should change the format for reporting errors and warnings to a format that is more easily parsed by GNU Emacs.
Notes: (Read and Write property)

194.5.94 OptionEmacsFile as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Used internally.
Notes: (Read and Write property)

194.5.95 OptionEmptyTags as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies new empty inline tags.
Notes: This option takes a space or comma separated list of tag names. Unless you declare new tags, Tidy will refuse to generate a tidied file if the input includes previously unknown tags. Remember to also declare empty tags as either inline or blocklevel. This option is ignored in XML mode.
(Read and Write property)

194.5.96 OptionEncloseBlockText as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option enclose-block-text.
Notes: This option specifies if Tidy should insert a <p> element to enclose any text it finds in any element that allows mixed content for HTML transitional but not HTML strict.

(Read and Write property)

194.5.97 OptionEncloseBodyText as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should enclose any text it finds in the body element within a <P>element.
Notes: This is useful when you want to take existing HTML and use it with a style sheet.
(Read and Write property)

194.5.98 OptionEncloseText as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option enclose-text.
Notes: This option specifies if Tidy should enclose any text it finds in the body element within a <p> element.
This is useful when you want to take existing HTML and use it with a style sheet.
(Read and Write property)

194.5.99 OptionErrFile as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies the error file Tidy uses for errors and warnings.
Notes: Normally errors and warnings are output to ”stderr”.
(Read and Write property)

194.5.100 OptionErrorFile as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option error-file.
Notes: This option specifies the error file Tidy uses for errors and warnings. Normally errors and warnings are output to stderr.
(Read and Write property)

194.5.101 OptionEscapeCdata as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option escape-cdata.
Notes: This option specifies if Tidy should convert <! [CDATA [ ]] > sections to normal text.
(Read and Write property)

194.5.102 OptionEscapeScripts as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option escape-scripts.
Notes: This option causes items that look like closing tags, like </g to be escaped to <\/g. Set this option to 'no' if you do not want this.
(Read and Write property)

194.5.103 OptionFixBackslash as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option fix-backslash.
Notes: This option specifies if Tidy should replace backslash characters \in URLs with forward slashes /.
(Read and Write property)

194.5.104 OptionFixBadComments as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option fix-bad-comments.
Notes: This option specifies if Tidy should replace unexpected hyphens with = characters when it comes across adjacent hyphens.
The default is yes.
This option is provided for users of Cold Fusion which uses the comment syntax: <!— —>.
(Read and Write property)

194.5.105 OptionFixComments as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should replace unexpected hyphens with "=" characters when it comes across adjacent hyphens.
Notes: The default is yes. This option is provided for users of Cold Fusion which uses the comment syntax: <!— —>
(Read and Write property)

194.5.106 OptionFixUri as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option fix-uri.
Notes: This option specifies if Tidy should check attribute values that carry URIs for illegal characters and if such are found, escape them as HTML4 recommends.
(Read and Write property)

194.5.107 OptionForceOutput as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option force-output.
Notes: This option specifies if Tidy should produce output even if errors are encountered.
Use this option with care; if Tidy reports an error, this means Tidy was not able to (or is not sure how to) fix the error, so the resulting output may not reflect your intention.
(Read and Write property)

194.5.108 OptionGdoc as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option gdoc.
Notes: This option specifies if Tidy should enable specific behavior for cleaning up HTML exported from Google Docs.
(Read and Write property)

194.5.109 OptionGnuEmacs as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option gnu-emacs.
Notes: This option specifies if Tidy should change the format for reporting errors and warnings to a format that is more easily parsed by GNU Emacs.
(Read and Write property)

194.5.110 OptionGnuEmacsFile as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option gnu-emacs-file.
Notes: Used internally.
(Read and Write property)

194.5.111 OptionHideComments as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option hide-comments.
Notes: This option specifies if Tidy should print out comments.
(Read and Write property)

194.5.112 OptionHtmlOut as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should generate pretty printed output, writing it as HTML.
Notes: (Read and Write property)

194.5.113 OptionInCharEncoding as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies the character encoding Tidy uses for the input.
Notes: See char-encoding for more info.
(Read and Write property)

194.5.114 OptionIndent as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option indent.
Notes: This option specifies if Tidy should indent block-level tags.
If set to auto Tidy will decide whether or not to indent the content of tags such as <title>, <h1>-<h6>, <li>, <td>, or <p> based on the content including a block-level element.
Setting indent to yes can expose layout bugs in some browsers.
Use the option indent-spaces to control the number of spaces or tabs output per level of indent, and indent-with-tabs to specify whether spaces or tabs are used.
(Read and Write property)

194.5.115 OptionIndentAttributes as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option indent-attributes.
Notes: This option specifies if Tidy should begin each attribute on a new line.
(Read and Write property)

194.5.116 OptionIndentCdata as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option indent-cdata.
Notes: This option specifies if Tidy should indent <! [CDATA [ ]] > sections.
(Read and Write property)

194.5.117 OptionIndentContent as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** One of the options.
Notes: (Read and Write property)

194.5.118 OptionIndentSpaces as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option indent-spaces.
Notes: This option specifies the number of spaces or tabs that Tidy uses to indent content when indent is enabled.
Note that the default value for this option is dependent upon the value of indent-with-tabs (see also).
(Read and Write property)

194.5.119 OptionIndentWithTabs as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option indent-with-tabs.
Notes: This option specifies if Tidy should indent with tabs instead of spaces, assuming indent is yes.
Set it to yes to indent using tabs instead of the default spaces.
Use the option indent-spaces to control the number of tabs output per level of indent. Note that when indent-with-tabs is enabled the default value of indent-spaces is reset to 1.
Note tab-size controls converting input tabs to spaces. Set it to zero to retain input tabs.
(Read and Write property)

194.5.120 OptionInlineTags as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies new non-empty inline tags. This option takes a space or comma separated list of tag names.
Notes: Unless you declare new tags, Tidy will refuse to generate a tidied file if the input includes previously unknown tags. This option is ignored in XML mode.
(Read and Write property)

194.5.121 OptionInputEncoding as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option input-encoding.
Notes: This option specifies the character encoding Tidy uses for the input. See char-encoding for more

info.
(Read and Write property)

194.5.122 OptionInputXml as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option input-xml.
Notes: This option specifies if Tidy should use the XML parser rather than the error correcting HTML parser.
(Read and Write property)

194.5.123 OptionJoinClasses as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option join-classes.
Notes: This option specifies if Tidy should combine class names to generate a single, new class name if multiple class assignments are detected on an element.
(Read and Write property)

194.5.124 OptionJoinStyles as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option join-styles.
Notes: This option specifies if Tidy should combine styles to generate a single, new style if multiple style values are detected on an element.
(Read and Write property)

194.5.125 OptionKeepFileTimes as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should keep the original modification time of files that Tidy modifies in place.
Notes: The default is no. Setting the option to yes allows you to tidy files without causing these files to be uploaded to a web server when using a tool such as SiteCopy. Note this feature is not supported on some platforms.
(Read and Write property)

194.5.126 OptionKeepTime as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option keep-time.
Notes: This option specifies if Tidy should keep the original modification time of files that Tidy modifies in place.
Setting the option to yes allows you to tidy files without changing the file modification date, which may be useful with certain tools that use the modification date for things such as automatic server deployment.
Note this feature is not supported on some platforms.
(Read and Write property)

194.5.127 OptionLiteralAttribs as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should ensure that whitespace characters within attribute values are passed through unchanged.
Notes: (Read and Write property)

194.5.128 OptionLiteralAttributes as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option literal-attributes.
Notes: This option specifies how Tidy deals with whitespace characters within attribute values.
If the value is no Tidy normalizes attribute values by replacing any newline or tab with a single space, and further by replacing any contiguous whitespace with a single space.
To force Tidy to preserve the original, literal values of all attributes and ensure that whitespace within attribute values is passed through unchanged, set this option to yes.
(Read and Write property)

194.5.129 OptionLogicalEmphasis as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option logical-emphasis.
Notes: This option specifies if Tidy should replace any occurrence of <i> with <em> and any occurrence of <b> with <strong>. Any attributes are preserved unchanged.
This option can be set independently of the clean option.
(Read and Write property)

194.5.130 OptionLowerLiterals as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option lower-literals.
Notes: This option specifies if Tidy should convert the value of an attribute that takes a list of predefined values to lower case.
This is required for XHTML documents.
(Read and Write property)

194.5.131 OptionMakeBare as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should strip Microsoft specific HTML from Word 2000 documents, and output spaces rather than non-breaking spaces where they exist in the input.
Notes: (Read and Write property)

194.5.132 OptionMakeClean as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should strip out surplus presentational tags and attributes replacing them by style rules and structural markup as appropriate.
Notes: It works well on the HTML saved by Microsoft Office products.
(Read and Write property)

194.5.133 OptionMark as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should add a meta element to the document head to indicate that the document has been tidied.
Notes: Tidy won't add a meta element if one is already present.
(Read and Write property)

194.5.134 OptionMarkup as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option markup.
Notes: This option specifies if Tidy should generate a pretty printed version of the markup. Note that Tidy won't generate a pretty printed version if it finds significant errors (see force-output).
(Read and Write property)

194.5.135 OptionMergeDivs as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option merge-divs.
Notes: This option can be used to modify the behavior of clean when set to yes.
This option specifies if Tidy should merge nested <div> such as <div><div>...</div></div>.
If set to auto the attributes of the inner <div> are moved to the outer one. Nested <div> with id attributes are not merged.
If set to yes the attributes of the inner <div> are discarded with the exception of class and style.
(Read and Write property)

194.5.136 OptionMergeEmphasis as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option merge-emphasis.
Notes: This option specifies if Tidy should merge nested and <i> elements; for example, for the case
<b class="rtop-2">foo <b class="r2-2">bar baz,
Tidy will output <b class="rtop-2">foo bar baz.
(Read and Write property)

194.5.137 OptionMergeSpans as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option merge-spans.
Notes: This option can be used to modify the behavior of clean when set to yes.
This option specifies if Tidy should merge nested such as ...</span&gt
The algorithm is identical to the one used by merge-divs.
(Read and Write property)

194.5.138 OptionNcr as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option ncr.
Notes: This option specifies if Tidy should allow numeric character references.
(Read and Write property)

194.5.139 OptionNewBlocklevelTags as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option new-blocklevel-tags.
Notes: This option specifies new block-level tags. This option takes a space or comma separated list of tag names.
Unless you declare new tags, Tidy will refuse to generate a tidied file if the input includes previously unknown tags.
Note you can't change the content model for elements such as <table>, <ul>, <ol> and <dl>.
This option is ignored in XML mode.
(Read and Write property)

194.5.140 OptionNewEmptyTags as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option new-empty-tags.
Notes: This option specifies new empty inline tags. This option takes a space or comma separated list of tag names.
Unless you declare new tags, Tidy will refuse to generate a tidied file if the input includes previously unknown tags.
Remember to also declare empty tags as either inline or blocklevel.
This option is ignored in XML mode.
(Read and Write property)

194.5.141 OptionNewInlineTags as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option new-inline-tags.
Notes: This option specifies new non-empty inline tags. This option takes a space or comma separated list of tag names.
Unless you declare new tags, Tidy will refuse to generate a tidied file if the input includes previously unknown tags.
This option is ignored in XML mode.
(Read and Write property)

194.5.142 OptionNewline as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option newline.
Notes: The default is appropriate to the current platform.
Generally CRLF on PC-DOS, Windows and OS/2; CR on Classic Mac OS; and LF everywhere else (Linux, Mac OS X, and Unix).
(Read and Write property)

194.5.143 OptionNewPreTags as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option new-pre-tags.
Notes: This option specifies new tags that are to be processed in exactly the same way as HTML's <pre> element. This option takes a space or comma separated list of tag names.
Unless you declare new tags, Tidy will refuse to generate a tidied file if the input includes previously unknown tags.
Note you cannot as yet add new CDATA elements.
This option is ignored in XML mode.
(Read and Write property)

194.5.144 OptionNumEntities as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should output entities other than the built-in HTML entities (&, <, > and ") in the numeric rather than the named entity form.
Notes: Only entities compatible with the DOCTYPE declaration generated are used. Entities that can be represented in the output encoding are translated correspondingly.
(Read and Write property)

194.5.145 OptionNumericEntities as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option numeric-entities.
Notes: This option specifies if Tidy should output entities other than the built-in HTML entities (&, <, >, and ") in the numeric rather than the named entity form.
Only entities compatible with the DOCTYPE declaration generated are used.
Entities that can be represented in the output encoding are translated correspondingly.

(Read and Write property)

194.5.146 OptionOmitOptionalTags as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option omit-optional-tags.
Notes: This option specifies if Tidy should omit optional start tags and end tags when generating output. Setting this option causes all tags for the <html>, <head>, and <body> elements to be omitted from output, as well as such end tags as </p>, , </dt>, </dd>, </option>, </tr>, </td>, and </th>.
This option is ignored for XML output.
(Read and Write property)

194.5.147 OptionOutCharEncoding as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies the character encoding Tidy uses for the output.
Notes: See char-encoding for more info. May only be different from input-encoding for Latin encodings (ascii, latin0, latin1, mac, win1252, ibm858).
(Read and Write property)

194.5.148 OptionOutFile as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies the output file Tidy uses for markup.
Notes: Normally markup is written to ”stdout”.
(Read and Write property)

194.5.149 OptionOutputBom as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option output-bom.
Notes: This option specifies if Tidy should write a Unicode Byte Order Mark character (BOM; also known as Zero Width No-Break Space; has value of U+FEFF) to the beginning of the output, and only applies to UTF-8 and UTF-16 output encodings.

If set to auto this option causes Tidy to write a BOM to the output only if a BOM was present at the beginning of the input.
A BOM is always written for XML/XHTML output using UTF-16 output encodings.
(Read and Write property)

194.5.150 OptionOutputEncoding as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option output-encoding.
Notes: This option specifies the character encoding Tidy uses for the output.
Note that this may only be different from input-encoding for Latin encodings (ascii, latin0, latin1, mac, win1252, ibm858).
See char-encoding for more information
(Read and Write property)

194.5.151 OptionOutputFile as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option output-file.
Notes: This option specifies the output file Tidy uses for markup. Normally markup is written to stdout.
(Read and Write property)

194.5.152 OptionOutputHtml as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option output-html.
Notes: This option specifies if Tidy should generate pretty printed output, writing it as HTML.
(Read and Write property)

194.5.153 OptionOutputXhtml as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option output-xhtml.
Notes: This option specifies if Tidy should generate pretty printed output, writing it as extensible HTML.
This option causes Tidy to set the DOCTYPE and default namespace as appropriate to XHTML, and will use the corrected value in output regardless of other sources.
For XHTML, entities can be written as named or numeric entities according to the setting of numeric-entities.

The original case of tags and attributes will be preserved, regardless of other options.
(Read and Write property)

194.5.154 OptionOutputXml as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option output-xml.
Notes: This option specifies if Tidy should pretty print output, writing it as well-formed XML.
Any entities not defined in XML 1.0 will be written as numeric entities to allow them to be parsed by an XML parser.
The original case of tags and attributes will be preserved, regardless of other options.
(Read and Write property)

194.5.155 OptionPreserveEntities as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option preserve-entities.
Notes: This option specifies if Tidy should preserve well-formed entities as found in the input.
(Read and Write property)

194.5.156 OptionPreTags as String

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies new tags that are to be processed in exactly the same way as HTML's <PRE>element.
Notes: This option takes a space or comma separated list of tag names. Unless you declare new tags, Tidy will refuse to generate a tidied file if the input includes previously unknown tags. Note you can not as yet add new CDATA elements (similar to <SCRIPT>). This option is ignored in XML mode.
(Read and Write property)

194.5.157 OptionPunctuationWrap as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option punctuation-wrap.
Notes: This option specifies if Tidy should line wrap after some Unicode or Chinese punctuation characters.
(Read and Write property)

194.5.158 OptionQuiet as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option quiet.
Notes: This option specifies if Tidy should output the summary of the numbers of errors and warnings, or the welcome or informational messages.
(Read and Write property)

194.5.159 OptionQuoteAmpersand as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option quote-ampersand.
Notes: This option specifies if Tidy should output unadorned & characters as &.
(Read and Write property)

194.5.160 OptionQuoteMarks as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option quote-marks.
Notes: This option specifies if Tidy should output " characters as " as is preferred by some editing environments.
The apostrophe character ' is written out as ' since many web browsers don't yet support '.
(Read and Write property)

194.5.161 OptionQuoteNbsp as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option quote-nbsp.
Notes: This option specifies if Tidy should output non-breaking space characters as entities, rather than as the Unicode character value 160 (decimal).
(Read and Write property)

194.5.162 OptionRepeatedAttributes as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option repeated-attributes.
Notes: This option specifies if Tidy should keep the first or last attribute, if an attribute is repeated, e.g. has two align attributes.
(Read and Write property)

194.5.163 OptionReplaceColor as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option replace-color.
Notes: This option specifies if Tidy should replace numeric values in color attributes with HTML/XHTML color names where defined, e.g. replace #ffffff with white.
(Read and Write property)

194.5.164 OptionShowBodyOnly as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option show-body-only.
Notes: This option specifies if Tidy should print only the contents of the body tag as an HTML fragment. If set to auto, this is performed only if the body tag has been inferred.
Useful for incorporating existing whole pages as a portion of another page.
This option has no effect if XML output is requested.
(Read and Write property)

194.5.165 OptionShowErrors as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option show-errors.
Notes: This option specifies the number Tidy uses to determine if further errors should be shown. If set to 0, then no errors are shown.
(Read and Write property)

194.5.166 OptionShowInfo as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option show-info.
Notes: This option specifies if Tidy should display info-level messages.

(Read and Write property)

194.5.167 OptionShowMarkup as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should generate a pretty printed version of the markup.
Notes: Note that Tidy won't generate a pretty printed version if it finds significant errors (see force-output).
(Read and Write property)

194.5.168 OptionShowWarnings as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option show-warnings.
Notes: This option specifies if Tidy should suppress warnings. This can be useful when a few errors are hidden in a flurry of warnings.
(Read and Write property)

194.5.169 OptionSkipNested as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option skip-nested.
Notes: This option specifies that Tidy should skip nested tags when parsing script and style data.
(Read and Write property)

194.5.170 OptionSortAttributes as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option sort-attributes.
Notes: This option specifies that Tidy should sort attributes within an element using the specified sort algorithm. If set to alpha, the algorithm is an ascending alphabetic sort.
(Read and Write property)

194.5.171 OptionStrictTagsAttributes as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option strict-tags-attributes.
Notes: This options ensures that tags and attributes are applicable for the version of HTML that Tidy outputs. When set to yes (the default) and the output document type is a strict doctype, then Tidy will report errors. If the output document type is a loose or transitional doctype, then Tidy will report warnings. Additionally if drop-proprietary-attributes is enabled, then not applicable attributes will be dropped, too. When set to no, these checks are not performed.
(Read and Write property)

194.5.172 OptionTabSize as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option tab-size.
Notes: This option specifies the number of columns that Tidy uses between successive tab stops. It is used to map tabs to spaces when reading the input.
(Read and Write property)

194.5.173 OptionTidyMark as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option tidy-mark.
Notes: This option specifies if Tidy should add a meta element to the document head to indicate that the document has been tidied.
Tidy won't add a meta element if one is already present.
(Read and Write property)

194.5.174 OptionUppercaseAttributes as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option uppercase-attributes.
Notes: This option specifies if Tidy should output attribute names in upper case.
The default is no, which results in lower case attribute names, except for XML input, where the original case is preserved.
(Read and Write property)

194.5.175 OptionUpperCaseAttrs as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should output attribute names in upper case.
Notes: The default is no, which results in lower case attribute names, except for XML input, where the original case is preserved.
(Read and Write property)

194.5.176 OptionUppercaseTags as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option uppercase-tags.
Notes: This option specifies if Tidy should output tag names in upper case.
The default is no which results in lower case tag names, except for XML input where the original case is preserved.
(Read and Write property)

194.5.177 OptionVerticalSpace as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option vertical-space.
Notes: This option specifies if Tidy should add some extra empty lines for readability.
The default is no.
If set to auto Tidy will eliminate nearly all newline characters.
(Read and Write property)

194.5.178 OptionVertSpace as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should add some empty lines for readability.
Notes: (Read and Write property)

194.5.179 OptionWord2000 as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option word-2000.
Notes: This option specifies if Tidy should go to great pains to strip out all the surplus stuff Microsoft Word 2000 inserts when you save Word documents as "Web pages". It doesn't handle embedded images or VML.
You should consider using Word's "Save As: Web Page, Filtered".
(Read and Write property)

194.5.180 OptionWrap as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option wrap.
Notes: This option specifies the right margin Tidy uses for line wrapping.
Tidy tries to wrap lines so that they do not exceed this length.
Set wrap to 0(zero) if you want to disable line wrapping.
(Read and Write property)

194.5.181 OptionWrapAsp as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option wrap-asp.
Notes: This option specifies if Tidy should line wrap text contained within ASP pseudo elements, which look like: <% ... %>.
(Read and Write property)

194.5.182 OptionWrapAttributes as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option wrap-attributes.
Notes: This option specifies if Tidy should line-wrap attribute values, meaning that if the value of an attribute causes a line to exceed the width specified by wrap, Tidy will add one or more line breaks to the value, causing it to be wrapped into multiple lines.
Note that this option can be set independently of wrap-script-literals. By default Tidy replaces any newline or tab with a single space and replaces any sequences of whitespace with a single space.
To force Tidy to preserve the original, literal values of all attributes, and ensure that whitespace characters within attribute values are passed through unchanged, set literal-attributes to yes.
(Read and Write property)

194.5.183 OptionWrapAttVals as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should line wrap attribute values, for easier editing.
Notes: This option can be set independently of wrap-script-literals.
(Read and Write property)

194.5.184 OptionWrapJste as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option wrap-jste.
Notes: This option specifies if Tidy should line wrap text contained within JSTE pseudo elements, which look like: <# ... #>.
(Read and Write property)

194.5.185 OptionWrapLen as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies the right margin Tidy uses for line wrapping.
Notes: Tidy tries to wrap lines so that they do not exceed this length. Set wrap to zero if you want to disable line wrapping.
(Read and Write property)

194.5.186 OptionWrapPhp as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option wrap-php.
Notes: This option specifies if Tidy should line wrap text contained within PHP pseudo elements, which look like: <?php ... ?>.
(Read and Write property)

194.5.187 OptionWrapScriptlets as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should line wrap string literals that appear in script attributes.
Notes: Tidy wraps long script string literals by inserting a backslash character before the line break.
(Read and Write property)

194.5.188 OptionWrapScriptLiterals as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option wrap-script-literals.
Notes: This option specifies if Tidy should line wrap string literals that appear in script attributes.
Tidy wraps long script string literals by inserting a backslash character before the line break.
(Read and Write property)

194.5.189 OptionWrapSection as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should line wrap text contained within <! [...] >section tags.
Notes: (Read and Write property)

194.5.190 OptionWrapSections as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option wrap-sections.
Notes: This option specifies if Tidy should line wrap text contained within <! [...] > section tags.
(Read and Write property)

194.5.191 OptionWriteBack as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tidy option write-back.
Notes: This option specifies if Tidy should write back the tidied markup to the same file it read from.
You are advised to keep copies of important files before tidying them, as on rare occasions the result may not be what you expect.
(Read and Write property)

194.5.192 OptionXhtmlOut as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should generate pretty printed output, writing it as extensible HTML.
Notes: This option causes Tidy to set the DOCTYPE and default namespace as appropriate to XHTML. If a DOCTYPE or namespace is given they will checked for consistency with the content of the document. In the case of an inconsistency, the corrected values will appear in the output. For XHTML, entities can be written as named or numeric entities according to the setting of the "numeric-entities" option. The original case of tags and attributes will be preserved, regardless of other options.
(Read and Write property)

194.5.193 OptionXmlDecl as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should add the XML declaration when outputting XML or XHTML.
Notes: Note that if the input already includes an <?xml ... ?>declaration then this option will be ignored. If the encoding for the output is different from "ascii", one of the utf encodings or "raw", the declaration is always added as required by the XML standard.
(Read and Write property)

194.5.194 OptionXmlOut as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should pretty print output, writing it as well-formed XML.
Notes: Any entities not defined in XML 1.0 will be written as numeric entities to allow them to be parsed by a XML parser. The original case of tags and attributes will be preserved, regardless of other options.
(Read and Write property)

194.5.195 OptionXmlPIs as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** One of the options.
Notes: (Read and Write property)

194.5.196 OptionXmlSpace as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** This option specifies if Tidy should add xml:space="preserve" to elements such as <PRE>, <STYLE>and <SCRIPT>when generating XML.
Notes: This is needed if the whitespace in such elements is to be parsed appropriately without having access to the DTD.
(Read and Write property)

194.5.197 OptionXmlTags as Boolean

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Set this option if the input is xml.
Notes: (Read and Write property)

194.5.198 Events

194.5.199 Filter(level as Integer, line as Integer, column as Integer, message as string) as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The filter called for every error and warning.
Notes: Callback to filter messages by diagnostic level: info, warning, etc. Just set diagnostic output handler to redirect all diagnostics output.

Return false to proceed with output, true to cancel.

194.5.200 PrettyPrintProgress(line as Integer, column as Integer, destLine as Integer)

MBS Tools Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reports progress on the print process.

194.6 module TidyDupAttrModesMBS

194.6.1 module TidyDupAttrModesMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A module with constants for use with the Tidy classes.

194.6.2 Constants

Constants

Constant	Value	Description
TidyKeepFirst	0	A constant for use with the Tidy classes.
TidyKeepLast	1	A constant for use with the Tidy classes.

194.7 class TidyInputMBS

194.7.1 class TidyInputMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Delivers raw bytes of input.

194.7.2 Events

194.7.3 EndOfFile as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return true if all your data is processed.
Notes: Return false if more data is available for the GetByte call.

194.7.4 GetByte as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read one byte and returns it to the tidy library.

194.7.5 UngetByte(value as Integer)

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a byte to the buffer for later processing.

194.8 class TidyIteratorMBS

194.8.1 class TidyIteratorMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: An iterator for various uses.

194.8.2 Properties

194.8.3 Handle as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal reference to the tidy iterator object.
Notes: (Read only property)

194.9 module TidyLineEndingMBS

194.9.1 module TidyLineEndingMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A module with constants for use with the Tidy classes.

194.9.2 Constants

Constants

Constant	Value	Description
TidyCR	2	A constant for use with the Tidy classes.
TidyCRLF	1	A constant for use with the Tidy classes.
TidyLF	0	A constant for use with the Tidy classes.

194.10 class TidyNodeMBS

194.10.1 class TidyNodeMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A node in the document parse tree.
Example:

```
// clean up HTML with Tidy and walk the node tree to list all links
Var doc As New TidyDocumentMBS
Call doc.ParseString("<p>See <a href=""https://www.mbsplugins.de""">our blog</a>and <a href=""https://www.monkeybreadsoftware.de""">website")
Call doc.CleanAndRepair

Var links() As String
CollectLinks(doc.Body, links)
MessageBox String.FromArray(links, EndOfLine)

// a method in the window:
Sub CollectLinks(node As TidyNodeMBS, links() As String)
While node <>Nil
If node.Name = "a" Then
Var attr As TidyAttributeMBS = node.FirstAttribute
While attr <>Nil
If attr.Name = "href" Then links.Add attr.Value
attr = attr.NextAttribute
Wend
End If
CollectLinks(node.Child, links)
node = node.NextNode
Wend
End Sub
```

- MBS REALbasic Plugins, version 10.5pr4

194.10.2 Properties

194.10.3 Child as TidyNodeMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The child node of this node.
Example:

```
Var t as TidyDocumentMBS // the tidy document
Var n as TidyNodeMBS
Var c as TidyNodeMBS

// iterating over root and its children (for more children you need recursion)
n=t.Root
while n<>nil
MessageBox n.Text

c=n.Child
while c<>nil
MessageBox c.Text
c=c.NextNode
wend

n=n.NextNode
wend
```

Notes: (Read only property)

194.10.4 Column as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The position of this node.
Notes: (Read only property)

194.10.5 Document as TidyDocumentMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The document of this node.
Notes: (Read only property)

194.10.6 FirstAttribute as TidyAttributeMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The first attribute for this node.
Notes: (Read only property)

194.10.7 Handle as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal reference to the tidy node object.
Notes: (Read only property)

194.10.8 HasText as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether there is text attached to this node.
Notes: Returns true if yes.
(Read only property)

194.10.9 ID as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The node ID.
Notes: (Read only property)

194.10.10 IsProperty as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the node is a property.
Notes: (Read only property)

194.10.11 Line as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The position of this node.
Notes: (Read only property)

194.10.12 Name as string

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of this node.
Notes: (Read only property)

194.10.13 NextNode as TidyNodeMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The next node in the node list of the parent node.
Notes: (Read only property)

194.10.14 NodeIsHeader as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this is a Header node.
Notes: (Read only property)

194.10.15 NodeIsText as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this is a Text node.
Notes: (Read only property)

194.10.16 Parent as TidyNodeMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent node of this node.
Notes: (Read only property)

194.10.17 PrevNode as TidyNodeMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The previous node in the node list of the parent node.
Notes: (Read only property)

194.10.18 Text as string

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The text of this node.
Example:

```
Var t as new TidyDocumentMBS

call t.ParseString("<p>Hello World</p>") // pass here bad html
call t.CleanAndRepair

Var s As TidyNodeMBS=t.Root

MessageBox s.Text
```

Notes: This text has no encoding defined.
(Read only property)

194.10.19 Type as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of this node.
Notes: (Read only property)

194.10.20 Value as string

MBS Tools Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The decoded value of the node as UTF-8 String.
Example:

```
Var t as new TidyDocumentMBS

call t.ParseString("<p>Hello World</p>") // pass here bad html
call t.CleanAndRepair

Var nodes(-1) as TidyNodeMBS
Var root as TidyNodeMBS = t.Root

// we iterate over all child nodes

nodes.Add root.Child
nodes.Add root.NextNode
```

```
while nodes.LastIndex>=0
Var n as TidyNodeMBS = nodes.Pop

if n<>Nil then

nodes.Add n.Child // maybe a child?
nodes.Add n.NextNode // maybe a sibling?

if n.HasText then
MessageBox n.Value // Shows "Hello World"
end if
end if
wend
```

Notes: (Read only property)

194.11 module TidyNodeTypeMBS

194.11.1 module TidyNodeTypeMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A module with constants for use with the Tidy classes.

194.11.2 Constants

Constants

Constant	Value	Description
TidyNodeAsp	10	A constant for use with the Tidy classes.
TidyNodeCDATA	8	A constant for use with the Tidy classes.
TidyNodeComment	2	A constant for use with the Tidy classes.
TidyNodeDocType	1	A constant for use with the Tidy classes.
TidyNodeEnd	6	A constant for use with the Tidy classes.
TidyNodeJste	11	A constant for use with the Tidy classes.
TidyNodePhp	12	A constant for use with the Tidy classes.
TidyNodeProcIns	3	A constant for use with the Tidy classes.
TidyNodeRoot	0	A constant for use with the Tidy classes.
TidyNodeSection	9	A constant for use with the Tidy classes.
TidyNodeStart	5	A constant for use with the Tidy classes.
TidyNodeStartEnd	7	A constant for use with the Tidy classes.
TidyNodeText	4	A constant for use with the Tidy classes.
TidyNodeXmlDecl	13	A constant for use with the Tidy classes.

194.12 module TidyOptionIdMBS

194.12.1 module TidyOptionIdMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A module with constants for use with the Tidy classes.

194.12.2 Constants

Constants

Constant	Value	Description
TidyAccessibilityCheckLevel	1	A constant for use with the Tidy classes.
TidyAltText	2	A constant for use with the Tidy classes.
TidyAnchorAsName	3	A constant for use with the Tidy classes.
TidyAsciiChars	4	A constant for use with the Tidy classes.
TidyBlockTags	5	A constant for use with the Tidy classes.
TidyBodyOnly	6	A constant for use with the Tidy classes.
TidyBreakBeforeBR	7	A constant for use with the Tidy classes.
TidyCharEncoding	8	A constant for use with the Tidy classes.
TidyCoerceEndTags	9	A constant for use with the Tidy classes.
TidyCSSPrefix	10	A constant for use with the Tidy classes.
TidyDecorateInferredUL	12	A constant for use with the Tidy classes.
TidyDoctype	13	A constant for use with the Tidy classes.
TidyDoctypeMode	14	A constant for use with the Tidy classes.
TidyDropEmptyElems	15	A constant for use with the Tidy classes.
TidyDropEmptyParas	16	A constant for use with the Tidy classes.
TidyDropPropAttrs	17	A constant for use with the Tidy classes.
TidyDuplicateAttrs	18	A constant for use with the Tidy classes.
TidyEmacs	19	A constant for use with the Tidy classes.
TidyEmacsFile	20	A constant for use with the Tidy classes.
TidyEmptyTags	21	A constant for use with the Tidy classes.
TidyEncloseBlockText	22	A constant for use with the Tidy classes.
TidyEncloseBodyText	23	A constant for use with the Tidy classes.
TidyErrFile	24	A constant for use with the Tidy classes.
TidyEscapeCdata	25	A constant for use with the Tidy classes.
TidyEscapeScripts	26	A constant for use with the Tidy classes.
TidyFixBackslash	27	A constant for use with the Tidy classes.
TidyFixComments	28	A constant for use with the Tidy classes.
TidyFixUri	29	A constant for use with the Tidy classes.
TidyForceOutput	30	A constant for use with the Tidy classes.
TidyGDocClean	31	A constant for use with the Tidy classes.
TidyHideComments	32	A constant for use with the Tidy classes.
TidyHtmlOut	33	A constant for use with the Tidy classes.
TidyInCharEncoding	34	A constant for use with the Tidy classes.
TidyIndentAttributes	35	A constant for use with the Tidy classes.
TidyIndentCdata	36	A constant for use with the Tidy classes.
TidyIndentContent	37	A constant for use with the Tidy classes.
TidyIndentSpaces	38	A constant for use with the Tidy classes.
TidyInlineTags	39	A constant for use with the Tidy classes.
TidyJoinClasses	40	A constant for use with the Tidy classes.
TidyJoinStyles	41	A constant for use with the Tidy classes.
TidyKeepFileTimes	42	A constant for use with the Tidy classes.
TidyLiteralAttribs	44	A constant for use with the Tidy classes.
TidyLogicalEmphasis	45	A constant for use with the Tidy classes.
TidyLowerLiterals	46	A constant for use with the Tidy classes.
TidyMakeBare	47	A constant for use with the Tidy classes.
TidyMakeClean	48	A constant for use with the Tidy classes.
TidyMark	49	A constant for use with the Tidy classes.
TidyMergeDivs	50	A constant for use with the Tidy classes.
TidyMergeEmphasis	51	A constant for use with the Tidy classes.
TidyMergeSpans	52	A constant for use with the Tidy classes.
TidyNCR	56	A constant for use with the Tidy classes.
TidyNewline	57	A constant for use with the Tidy classes.
TidyNumEntities	58	A constant for use with the Tidy classes.
TidyOmitOptionalTags	59	A constant for use with the Tidy classes.
TidyOutCharEncoding	60	A constant for use with the Tidy classes.
TidyOutFile	61	A constant for use with the Tidy classes.
TidyOutputBOM	62	A constant for use with the Tidy classes.
TidyPPrintTabs	63	A constant for use with the Tidy classes.

194.13 class TidyOptionMBS

194.13.1 class TidyOptionMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: An option in the tidy preferences.
Example:

```
// list all Tidy options with their default values
Var doc As New TidyDocumentMBS
Var it As TidyIteratorMBS = doc.OptionList
Var lines() As String
Var option As TidyOptionMBS = doc.NextOption(it)
While option <>Nil
lines.Add option.Name + " (type " + option.Type.ToString + "), default: " + option.DefaultString
option = doc.NextOption(it)
Wend
System.DebugLog String.FromArray(lines, EndOfLine)
```

194.13.2 Methods

194.13.3 Category as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Category of the option.

194.13.4 DefaultBoolean as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default value for a boolean property.

194.13.5 DefaultInteger as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default value for an integer property.

194.13.6 DefaultString as String

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default value for a string property.

194.13.7 Description as string

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Description of the option.

194.13.8 ID as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get ID of given Option.

194.13.9 IsReadOnly as boolean

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Is Option read-only?

194.13.10 Name as string

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get name of given Option.

194.13.11 Type as Integer

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get datatype of given Option.

194.13.12 Properties

194.13.13 Document as TidyDocumentMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The document of this option.
Notes: (Read only property)

194.13.14 Handle as Integer

MBS Tools Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal reference to the tidy option object.
Notes: (Read only property)

194.14 module TidyOptionTypeMBS

194.14.1 module TidyOptionTypeMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A module with constants for use with the Tidy classes.

194.14.2 Constants

Constants

Constant	Value	Description
TidyBoolean	2	A constant for use with the Tidy classes.
TidyInteger	1	A constant for use with the Tidy classes.
TidyString	0	A constant for use with the Tidy classes.

194.15 class TidyOutputMBS

194.15.1 class TidyOutputMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Accepts raw bytes of output from the tidy library.

194.15.2 Events

194.15.3 WriteByte(value as Integer)

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds one byte to the output buffer.

194.16 module TidyReportLevelMBS

194.16.1 module TidyReportLevelMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A module with constants for use with the Tidy classes.

194.16.2 Constants

Constants

Constant	Value	Description
TidyAccess	353	A constant for use with the Tidy classes.
TidyBadDocument	355	A constant for use with the Tidy classes.
TidyConfig	352	A constant for use with the Tidy classes.
TidyError	354	A constant for use with the Tidy classes.
TidyFatal	356	A constant for use with the Tidy classes.
TidyInfo	350	A constant for use with the Tidy classes.
TidyWarning	351	A constant for use with the Tidy classes.

194.17 module TidyTagIdMBS

194.17.1 module TidyTagIdMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A module with constants for use with the Tidy classes.

194.17.2 Constants

Constants

Constant	Value	Description
TidyTagA	1	A constant for use with the Tidy classes.
TidyTagABBR	2	A constant for use with the Tidy classes.
TidyTagACRONYM	3	A constant for use with the Tidy classes.
TidyTagADDRESS	4	A constant for use with the Tidy classes.
TidyTagALIGN	5	A constant for use with the Tidy classes.
TidyTagAPPLET	6	A constant for use with the Tidy classes.
TidyTagAREA	7	A constant for use with the Tidy classes.
TidyTagARTICLE	123	A constant for use with the Tidy classes.
TidyTagASIDE	124	A constant for use with the Tidy classes.
TidyTagAUDIO	125	A constant for use with the Tidy classes.
TidyTagB	8	A constant for use with the Tidy classes.
TidyTagBASE	9	A constant for use with the Tidy classes.
TidyTagBASEFONT	10	A constant for use with the Tidy classes.
TidyTagBDI	126	A constant for use with the Tidy classes.
TidyTagBDO	11	A constant for use with the Tidy classes.
TidyTagBGSOUND	12	A constant for use with the Tidy classes.
TidyTagBIG	13	A constant for use with the Tidy classes.
TidyTagBLINK	14	A constant for use with the Tidy classes.
TidyTagBLOCKQUOTE	15	A constant for use with the Tidy classes.
TidyTagBODY	16	A constant for use with the Tidy classes.
TidyTagBR	17	A constant for use with the Tidy classes.
TidyTagBUTTON	18	A constant for use with the Tidy classes.
TidyTagCANVAS	127	A constant for use with the Tidy classes.
TidyTagCAPTION	19	A constant for use with the Tidy classes.
TidyTagCENTER	20	A constant for use with the Tidy classes.
TidyTagCITE	21	A constant for use with the Tidy classes.
TidyTagCODE	22	A constant for use with the Tidy classes.
TidyTagCOL	23	A constant for use with the Tidy classes.
TidyTagCOLGROUP	24	A constant for use with the Tidy classes.
TidyTagCOMMAND	128	A constant for use with the Tidy classes.
TidyTagCOMMENT	25	A constant for use with the Tidy classes.
TidyTagDATALIST	130	A constant for use with the Tidy classes.
TidyTagDD	26	A constant for use with the Tidy classes.
TidyTagDEL	27	A constant for use with the Tidy classes.
TidyTagDETAILS	131	A constant for use with the Tidy classes.
TidyTagDFN	28	A constant for use with the Tidy classes.
TidyTagDIALOG	132	A constant for use with the Tidy classes.
TidyTagDIR	29	A constant for use with the Tidy classes.
TidyTagDIV	30	A constant for use with the Tidy classes.
TidyTagDL	31	A constant for use with the Tidy classes.
TidyTagDT	32	A constant for use with the Tidy classes.
TidyTagEM	33	A constant for use with the Tidy classes.
TidyTagEMBED	34	A constant for use with the Tidy classes.
TidyTagFIELDSET	35	A constant for use with the Tidy classes.
TidyTagFIGCAPTION	133	A constant for use with the Tidy classes.
TidyTagFIGURE	134	A constant for use with the Tidy classes.
TidyTagFONT	36	A constant for use with the Tidy classes.
TidyTagFOOTER	135	A constant for use with the Tidy classes.
TidyTagFORM	37	A constant for use with the Tidy classes.
TidyTagFRAME	38	A constant for use with the Tidy classes.
TidyTagFRAMESET	39	A constant for use with the Tidy classes.
TidyTagH1	40	A constant for use with the Tidy classes.
TidyTagH2	41	A constant for use with the Tidy classes.
TidyTagH3	42	A constant for use with the Tidy classes.
TidyTagH4	43	A constant for use with the Tidy classes.
TidyTagH5	44	A constant for use with the Tidy classes.
TidyTagH6	45	A constant for use with the Tidy classes.
TidyTagHEAD	46	A constant for use with the Tidy classes.

194.18 module TidyTriStateMBS

194.18.1 module TidyTriStateMBS

MBS Tools Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A module with constants for use with the Tidy classes.

194.18.2 Constants

Constants

Constant	Value	Description
TidyAutoState	2	A constant for use with the Tidy classes.
TidyNoState	0	A constant for use with the Tidy classes.
TidyYesState	1	A constant for use with the Tidy classes.

Chapter 195

TIFF

195.1 Globals

195.1.1 CombineBitCMYKtoRGBMBS(CyanChannel() as Integer, MagentaChannel() as Integer, YellowChannel() as Integer, BlackChannel() as Integer, Files() as FolderItem, scale as Double, width as Integer, height as Integer, X1 as Integer, Y1 as Integer, X2 as Integer, Y2 as Integer, byref output as picture, CacheSizeRead as Integer) as Integer

MBS Images Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines 1bit raw image files to one 8bit RGB tiff.
Example:

```
Var t(4) as FolderItem
Var dC(4), dM(4), dY(4), dK(4) as Double
Var nC(4), nM(4), nY(4), nK(4) as Integer
Var i as Integer
Var p as Picture

//Cyan
dK(0)=0.0
dC(0)=1.0
dM(0)=0.0
dY(0)=0.0
//Magenta
dK(1)=0.00
dC(1)=0.0
dM(1)=1.0
dY(1)=0.0
//Yellow
```

```
dK(2)=0.00
dC(2)=0.0
dM(2)=0.0
dY(2)=1.0
//Black
dK(3)=1.00
dC(3)=0.0
dM(3)=0.0
dY(3)=0.0
//Pantone, Sonderfarbe, S0
dK(4)=0.00
dC(4)=0.60
dM(4)=0.35
dY(4)=0.15

//Bilder
t(0)=New FolderItem("test.Cyan.bit")
t(1)=New FolderItem("test.Magenta.bit")
t(2)=New FolderItem("test.Yellow.bit")
t(3)=New FolderItem("test.Black.bit")
t(4)=New FolderItem("test.S0.bit")

for i=0 to 4
nC(i)=dC(i)*1000.0
nM(i)=dM(i)*1000.0
nY(i)=dY(i)*1000.0
nK(i)=dK(i)*1000.0
next

// Scale 1/n, 1/3, 1/2, 1, 2, 3, n

Title=str(CombineBitCMYKtoRGBMBS(nC,nM,nY,nK, t, 1, 545,567,0,0,545,567,p,0))
Backdrop=p
Width=p.Width
Height=p.Height
```

Notes: All arrays have the same size specifying for each 1bit grayscale source image the colors to be used in the final image.
Result image is written to the output picture which is created. Error code is returned which is 0 for no error.
CacheSize can be set to a value greater than 0. And it may make the process faster or slower depending on what you do.

195.1.2 TIFFStringToPictureMBS(data as string) as picture

MBS Images Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a tiff string and returns the RGB image for this tiff file.
Example:

```
// decode TIFF data from memory, e.g. a scan stored in a database
Var data As String = BinaryStream.Open(SpecialFolder.Desktop.Child("scan.tif")).Read(100000000)
Var pic As Picture = TIFFStringToPictureMBS(data)
If pic <>Nil Then MessageBox "TIFF has " + pic.Width.ToString + " x " + pic.Height.ToString + " pixels."
```

Notes: Returns nil on any error.

This function works with most Tiff formats, but has problems with some like 16 bit CMYK.
Blog Entries

- Tip of the day: Corrupt pictures

195.1.3 TIFFStringToTiffPictureMBS(data as string) as TiffPictureMBS

MBS Images Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a tiff string and returns a TiffPictureMBS object.
Example:

```
// open TIFF data from memory and count the pages
Var data As String = BinaryStream.Open(SpecialFolder.Desktop.Child("fax.tif")).Read(100000000)
Var tiff As TiffPictureMBS = TIFFStringToTiffPictureMBS(data)
If tiff <>Nil Then MessageBox tiff.ImageCount.ToString + " pages"
```

Notes: if you want to read the picture after this line you need to call ReadBW, ReadRGB or use the Scanline methods.
Returns nil on any error.

195.1.4 CombineTiff1BitCMYKtoTiffMBS(dest as TiffPictureMBS, CyanChannel() as Integer, MagentaChannel() as Integer, YellowChannel() as Integer, BlackChannel() as Integer, TiffData() as TiffPictureMBS, scale as Double, width as Integer, height as Integer, X1 as Integer, Y1 as Integer, X2 as Integer, Y2 as Integer, ditherMode as Integer = 0) as Integer

MBS Images Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines 1bit tiff image files to one CMYK tiff.
Notes: All arrays have the same size specifying for each 1bit grayscale source image the colors to be used in the final image.
Result image is written to the output picture which is created. Error code is returned which is 0 for no error.

Compression can be set before data is written to current tiff which is for output. The tiff object for output must be perfectly setup before using this function.

195.1.5 CombineBitCMYKtoCMYKMBS(dest as TiffPictureMBS, CyanChannel() as Integer, MagentaChannel() as Integer, YellowChannel() as Integer, BlackChannel() as Integer, Files() as FolderItem, scale as Double, width as Integer, height as Integer, X1 as Integer, Y1 as Integer, X2 as Integer, Y2 as Integer, CacheSizeRead as Integer) as Integer

MBS Images Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines 1bit raw image files to one CMYK tiff.
Notes: All arrays have the same size specifying for each 1bit grayscal esource image the colors to be used in the final image.
Result image is written to the output picture which is created. Error code is returned which is 0 for no error. CacheSize can be set to a value greater than 0. And it may make the process faster or slower depending on what you do.

195.1.6 CombineTiffCMYKtoCMYKMBS(dest as TiffPictureMBS, CyanChannel() as Integer, MagentaChannel() as Integer, YellowChannel() as Integer, BlackChannel() as Integer, TiffData() as TiffPictureMBS) as Integer

MBS Images Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines Grayscale tiff images to one CMYK tiff.
Example:

```
// Window1 is a window of the example project.
const PLANARCONFIG_CONTIG=1
const PHOTOMETRIC_RGB=2
const FILLORDER_MSB2LSB=1
const PHOTOMETRIC_SEPARATED=5

Var u,v,ot,t(4) as TiffPictureMBS
Var f as FolderItem
Var pnach as Picture
Var dC(4), dM(4), dY(4), dK(4) as Double
Var nC(4), nM(4), nY(4), nK(4) as Integer
Var i as Integer

//Cyan
dK(0)=0.0
dC(0)=1.0
```

```
dM(0)=0.0
dY(0)=0.0
//Magenta
dK(1)=0.00
dC(1)=0.0
dM(1)=1.0
dY(1)=0.0
//Yellow
dK(2)=0.00
dC(2)=0.0
dM(2)=0.0
dY(2)=1.0
//Black
dK(3)=1.00
dC(3)=0.0
dM(3)=0.0
dY(3)=0.0
//Pantone, S0
dK(4)=0.00
dC(4)=0.60
dM(4)=0.35
dY(4)=0.15

//Bilder
f=New FolderItem("test.Cyan.tif")
t(0)=f.OpenAsTiffMBS

f=New FolderItem("test.Magenta.tif")
t(1)=f.OpenAsTiffMBS

f=New FolderItem("test.Yellow.tif")
t(2)=f.OpenAsTiffMBS

f=New FolderItem("test.Black.tif")
t(3)=f.OpenAsTiffMBS

f=New FolderItem("test.S0.tif")
t(4)=f.OpenAsTiffMBS

for i=0 to 4
nC(i)=dC(i)*1000.0
nM(i)=dM(i)*1000.0
nY(i)=dY(i)*1000.0
nK(i)=dK(i)*1000.0
next

f=New FolderItem("resultCMYK.tif")
ot=new TiffPictureMBS
```

```
if ot.Create(f) then
v=t(0)
u=ot
u.Width=v.Width
u.Height=v.Height
u.RowsPerStrip=v.Height
u.BitsPerSample=8
u.SamplesPerPixel=4
u.ResolutionUnit=v.ResolutionUnit
u.HorizontalPosition=v.HorizontalPosition
u.HorizontalResolution=v.HorizontalResolution
u.VerticalPosition=v.VerticalPosition
u.VerticalResolution=v.VerticalResolution
u.Orientation=v.Orientation
u.PlanarConfig=PLANARCONFIG_CONTIG
u.Photometric=PHOTOMETRIC_SEPARATED
u.FillOrder=FILLORDER_MSB2LSB
Title=str(CombineTiffCMYKtoCMYKMBS(ot, nC,nM,nY,nK,t))
ot.Close
end if

//Neues Bild anzeigen
pnach=f.OpenAsPicture
if pnach<>Nil then
Window1.Width=pNach.Width
Window1.Height=pNach.Height
Window1.Backdrop=pNach
end if
```

Notes: All arrays have the same size specifying for each 8bit grayscal esource image the colors to be used in the final image.
Result image is written to the current tiffpicture. Error code is returned which is 0 for no error.
You need to set yourself all needed tiffpicture parameters for the output image and you must create it before.
The plugin sets width and height for the output tiff.

195.1.7 CombineTiffCMYKtoRGBMBS(dest as TiffPictureMBS, CyanChannel() as Integer, MagentaChannel() as Integer, YellowChannel() as Integer, BlackChannel() as Integer, TiffData() as TiffPictureMBS) as Integer

MBS Images Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines Grayscale tiff images to one RGB tiff.
Example:

```
// Window1 is a window of the example project.
const PLANARCONFIG_CONTIG=1
```

```
const PHOTOMETRIC_RGB=2
const FILLORDER_MSB2LSB=1

Var u,v,ot,t(4) as TiffPictureMBS
Var f as FolderItem
Var pnach as Picture
Var dC(4), dM(4), dY(4), dK(4) as Double
Var nC(4), nM(4), nY(4), nK(4) as Integer
Var i as Integer

//Cyan
dK(0)=0.0
dC(0)=1.0
dM(0)=0.0
dY(0)=0.0
//Magenta
dK(1)=0.00
dC(1)=0.0
dM(1)=1.0
dY(1)=0.0
//Yellow
dK(2)=0.00
dC(2)=0.0
dM(2)=0.0
dY(2)=1.0
//Black
dK(3)=1.00
dC(3)=0.0
dM(3)=0.0
dY(3)=0.0
//Pantone, S0
dK(4)=0.00
dC(4)=0.60
dM(4)=0.35
dY(4)=0.15

//Bilder
f=New FolderItem("test.Cyan.tif")
t(0)=f.OpenAsTiffMBS

f=New FolderItem("test.Magenta.tif")
t(1)=f.OpenAsTiffMBS

f=New FolderItem("test.Yellow.tif")
t(2)=f.OpenAsTiffMBS

f=New FolderItem("test.Black.tif")
t(3)=f.OpenAsTiffMBS
```

```
f=New FolderItem("test.S0.tif")
t(4)=f.OpenAsTiffMBS

for i=0 to 4
nC(i)=dC(i)*1000.0
nM(i)=dM(i)*1000.0
nY(i)=dY(i)*1000.0
nK(i)=dK(i)*1000.0
next

f=New FolderItem("resultRGB.tif")
ot=new TiffPictureMBS
if ot.Create(f) then
v=t(0)
u=ot
u.Width=v.Width
u.Height=v.Height
u.RowsPerStrip=v.Height
u.BitsPerSample=8
u.SamplesPerPixel=3
u.ResolutionUnit=v.ResolutionUnit
u.HorizontalPosition=v.HorizontalPosition
u.HorizontalResolution=v.HorizontalResolution
u.VerticalPosition=v.VerticalPosition
u.VerticalResolution=v.VerticalResolution
u.Orientation=v.Orientation
u.PlanarConfig=PLANARCONFIG_CONTIG
u.Photometric=PHOTOMETRIC_RGB
u.FillOrder=FILLORDER_MSB2LSB
Title=str(CombineTiffCMYKtoRGBMBS(ot, nC,nM,nY,nK,t))
ot.Close
end if

//Neues Bild anzeigen
pnach=f.OpenAsPicture
if pnach<>Nil then
Window1.Width=pNach.Width
Window1.Height=pNach.Height
Window1.Backdrop=pNach
end if
```

Notes: All arrays have the same size specifying for each 8bit grayscal esource image the colors to be used in the final image.
Result image is written to the current tiffpicture. Error code is returned which is 0 for no error.
You need to set yourself all needed tiffpicture parameters for the output image and you must create it before.

195.1.8 CombineTiff1BitCMYKtoTiffMBS(dest as TiffPictureMBS, TiffData as TiffPictureMBS, scalex as Double, scaley as Double, width as Integer, height as Integer, X1 as Integer, Y1 as Integer, X2 as Integer, Y2 as Integer, ditherMode as Integer = 0) as Integer

MBS Images Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines a one bit gray tiff image to one 1 bit gray tiff.
Notes: Basicly only scales the data.
Result image is written to the current tiffpicture. Error code is returned which is 0 for no error.
You need to set yourself all needed tiffpicture parameters for the output image and you must create it before.
The plugin sets width and height for the output tiff.

195.1.9 CombineTiff8BitCMYKtoTiffMBS(dest as TiffPictureMBS, CyanChannel() as Integer, MagentaChannel() as Integer, YellowChannel() as Integer, BlackChannel() as Integer, TiffData() as TiffPictureMBS, scale as Double, width as Integer, height as Integer, X1 as Integer, Y1 as Integer, X2 as Integer, Y2 as Integer, ditherMode as Integer = 0) as Integer

MBS Images Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines 8bit tiff image files to one CMYK tiff.
Notes: All arrays have the same size specifying for each 8bit grayscale source image the colors to be used in the final image.
Result image is written to the output picture which is created. Error code is returned which is 0 for no error.
Compression can be set before data is written to current tiff which is for output. The tiff object for output must be perfectly setup before using this function.

- MBS Xojo / Real Studio Plugins, version 14.3pr11

195.2 class TiffPictureMBS

195.2.1 class TiffPictureMBS

MBS Images Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a Tiff picture.
Example:

```
Var p As Picture = LogoMBS(500)

// save tiff file
```

```
Var t As New TiffPictureMBS
Var file4 As FolderItem = SpecialFolder.Desktop.Child("test4.tif")

t.Pict = p

If t.Create(file4) Then
If t.WriteRGB Then
t.Close
// ok
Else
Break
End If
Else
Break
End If
```

Notes: Bases on libtiff.

195.2.2 Methods

195.2.3 AddCustomTag(Tag as Integer, FieldReadCount as Integer, FieldWriteCount as Integer, FieldType as Integer, FieldBit as Integer, OkToChange as Integer, PassCount as Integer, FieldName as string) as boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a custom tag.
Example:

```
const TIFFTAG_ASCIITAG = 40666
const TIFFTAG_LONGTAG = 40667
const TIFFTAG_SHORTTAG = 40668
const TIFFTAG_RATIONALTAG = 40669
const TIFFTAG_FLOATTAG = 40670
const TIFFTAG_DOUBLETAG = 40671
const TIFFTAG_BYTE = 40672

const TIFFTAG_SOFTWARE=305

const TIFF_BYTE=1
const TIFF_ASCII=2
const TIFF_SHORT=3 // integer 16 bit signed
const TIFF_LONG=4 // integer 32 bit
const TIFF_FLOAT=11
const TIFF_DOUBLE=12

const FIELD_CUSTOM = 65

Var t as new TiffPictureMBS

// open tiff

if not t.AddCustomTag(TIFFTAG_ASCIITAG, -1, -1, TIFF_ASCII, FIELD_CUSTOM, 1, 0, "MyString")
then
MessageBox "AddCustomTag failed1."
end if
```

Notes: See tiff documentation for details.

195.2.4 AddImage as boolean

MBS Images Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes existing picture and header information to file and starts a new one.
Example:

```
Var t as TiffPictureMBS
Var f as FolderItem
Var p as Picture

f=SpecialFolder.Desktop.Child("test.tif")
t=new TiffPictureMBS
if t.Create(f) then

p=New Picture(100,100,32)
p.Graphics.ForeColor=rgb(255,0,0)
p.Graphics.FillOval 0,0,100,100
t.Pict=p
if t.WriteRGB then
if t.AddImage then
p=New Picture(100,100,32)
p.Graphics.ForeColor=rgb(0,0,255)
p.Graphics.FillOval 0,0,100,100
t.Pict=p
if t.WriteRGB then
MessageBox "Written multi picture tiff."
end if
end if
end if
end if
```

Notes: Returns true on success and false on any error.

Calls TIFFWriteDirectory internally.

195.2.5 close

MBS Images Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes the Tiff handle.
Notes: In 5.1 and older the destructor.
In 5.2 and later only closes the tiff handle so you can still read the pictures, the output or input buffer.

195.2.6 CombinePictureWithMask as picture

MBS Images Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a new picture which is created using the picture and it's mask.
Example:

```
Var t as TiffPictureMBS
' ...
Canvas1.backdrop=t.CombinePictureWithMask
```

195.2.7 Create(file as folderitem) as boolean

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new empty tiff file.
Example:

```
Var p as Picture
Var f as FolderItem
Var t as TiffPictureMBS

p=New Picture(100,100,32)

f=SpecialFolder.Desktop.Child("test.tif")

t=new TiffPictureMBS
t.Pict=p

if t.Create(f) then
if t.WriteRGB then
t.Close
MessageBox "Ok"
f.Launch
end if
end if
```

Notes: Returns true on success.
See also:

- 195.2.8 Create(file as folderitem, endian as Integer) as boolean 23253
- 195.2.9 Create(Path as String, endian as integer = 0) as boolean 23254

195.2.8 Create(file as folderitem, endian as Integer) as boolean

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new empty tiff file.
Example:

```
Var t As New TiffPictureMBS
t.Pict = LogoMBS(500)

// try with path
Var f As FolderItem = SpecialFolder.Desktop.Child("test.tif")

If t.Create(f, 0) Then
If t.WriteRGB Then
t.Close

// open in viewer
f.Launch
End If
End If
```

Notes: Returns true on success.

Endian settings:

0	Default (System)
1	BigEndian (Mac)
2	LittleEndian (Win)

See also:

- 195.2.7 Create(file as folderitem) as boolean 23253
- 195.2.9 Create(Path as String, endian as integer = 0) as boolean 23254

195.2.9 Create(Path as String, endian as integer = 0) as boolean

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new empty tiff file.
Example:

```
Var t As New TiffPictureMBS
t.Pict = LogoMBS(500)

// try with path
Var f As FolderItem = SpecialFolder.Desktop.Child("test.tif")
Var p as string = f.NativePath

If t.Create(p) Then
```

```
If t.WriteRGB Then
t.Close

// open in viewer
f.Launch
End If
End If
```

Notes: Returns true on success.

Endian settings:

0	Default (System)
1	BigEndian (Mac)
2	LittleEndian (Win)

See also:

- 195.2.7 Create(file as folderitem) as boolean 23253
- 195.2.8 Create(file as folderitem, endian as Integer) as boolean 23253

195.2.10 CreateString(Size as Integer) as boolean

MBS Images Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new string based tiff writer.
Example:

```
Function PictureToTiffStringMBS(pic as picture) As string
Var t as TiffPictureMBS

t=new TiffPictureMBS
if t.CreateString(&h100000) then
t.Pict=pic
if t.WriteRGB then
t.Close
Return t.OutputBuffer
end if
end if
End Function
```

Notes: Same as the Create() function, but memory based. You can now use functions like Scanline(),

WriteSW() or WriteRGB() to put the picture data.

Returns true on success.
The Warning and Error events may show you reasons why it does not work.

The size parameter you pass in is a guess for the initial size of the memory block used. If more data is written, the memory block is resized, but it is quite slow to resize a memoryblock, so make a good guess!

You can and should use this function to write yourself a PictureToTiffString function. The plugin can not well make such a function as there are thousands of possible parameters combination you may want to use. (compared to the JPEG library where you only have the compression level parameter.)
See also:

- 195.2.11 CreateString(Size as Integer, Mode as string) as boolean 23256

195.2.11 CreateString(Size as Integer, Mode as string) as boolean

MBS Images Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new string based tiff writer.
Notes: Same as the other CreateString method, but you can pass a mode string to the library.

mode="wb" for big endian and mode="wl" for little endian.
See also:

- 195.2.10 CreateString(Size as Integer) as boolean 23255

195.2.12 Flush as boolean

MBS Images Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flush causes any pending writes for the specified file (including writes for the current directory) to be done.
Notes: In normal operation this call is never needed - the library automatically does any flushing required.

195.2.13 FlushData as boolean

MBS Images Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: FlushData flushes any pending image data for the specified file to be written out; directory-related data are not flushed.
Notes: In normal operation this call is never needed √Ö | the library automatically does any flushing required.

195.2.14 GetColorMap(byref red as memoryblock, byref green as memoryblock, byref blue as memoryblock) as boolean

MBS Images Plugin, Plugin Version: 9.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the color map for a paletten image.
Notes: The memoryblock must be 2^bitspersample * 2 bytes big.
Returns true on success and false on failure.

195.2.15 GetColorProfile as string

MBS Images Plugin, Plugin Version: 7.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the color profile data stored in the tiff file.
Example:

```
Var f as FolderItem
Var t as TiffPictureMBS
Var s as string
Var p as LCMS2ProfileMBS

f=SpecialFolder.Desktop.Child("horsehead_steinberg_big.tif")

t=f.OpenAsTiffMBS

s=t.GetColorProfile

p = LCMS2ProfileMBS.OpenProfileFromString(s)

MessageBox p.Name
```

Notes: Returns "" on any error.

195.2.16 GetData(Tag as Integer) as string

MBS Images Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the string stored for this tag.

195.2.17 GetField(Tag as Integer, mem as memoryblock) as boolean

MBS Images Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the value associated with the given tag id.
Notes: Please look for Tag values in the tiff specification.
Returns true on success.
Please make sure to use the correct setter depending on data type associated with the tag.
The memoryblock you pass in must be big enough to hold whatever data the library stores there.

195.2.18 GetFieldByte(Tag as Integer, byref value as Integer) as boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the value associated with the given tag id.
Notes: Please look for Tag values in the tiff specification.
Returns true on success.
Please make sure to use the correct setter depending on data type associated with the tag.

195.2.19 GetFieldCount(Tag as Integer, byref count as Integer, mem as memoryblock) as boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the value associated with the given tag id.
Example:

```
'TIFF Tag ImageID
'
'IFD Image
'Code 32781 (hex 0x800D)
'Name ImageID
'Type ASCII
'Count N
'Default None
'Description
'
'OPI-related.
'
'ImageID is the full pathname of the original, high-resolution image, or any other identifying string that uniquely identifies the original image.
'
'The high-resolution image is not required to be in TIFF format. It can be in any format that an OPI Consumer wishes to support.

Var tiffImport As TiffPictureMBS
Var xx as string

tiffImport = New TiffPictureMBS
```

```
Call tiffImport.Open(SpecialFolder.Desktop.Child("test.tif"))

// the memoryblock is a storage for the data. In this case a pointer to the CString
Var m as MemoryBlock=NewMemoryBlock(4)
Var count as Integer

if tiffImport.GetFieldCount(32781, count, m) then
MessageBox str(count)
MessageBox m.Ptr(0).CString(0)
end if

tiffImport.close
```

Notes: This is the special version using memoryblock so you can use it for reading values with a count value.

Please look for Tag values in the tiff specification.
Returns true on success.
Please make sure to use the correct setter depending on data type associated with the tag.

195.2.20 GetFieldDefaultedByte(Tag as Integer, byref value as Integer) as boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the value associated with the given tag id.
Notes: Please look for Tag values in the tiff specification.
Returns true on success. May return a default value.
Please make sure to use the correct setter depending on data type associated with the tag.

GetFieldDefaulted* is identical to GetField*, except that if a tag is not defined in the current directory and it has a default value, then the default value is returned.

195.2.21 GetFieldDefaultedDouble(Tag as Integer, byref value as Double) as boolean

MBS Images Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the value associated with the given tag id.
Notes: Please look for Tag values in the tiff specification.
Returns true on success. May return a default value.
Please make sure to use the correct setter depending on data type associated with the tag.

GetFieldDefaulted* is identical to GetField*, except that if a tag is not defined in the current directory and

it has a default value, then the default value is returned.

195.2.22 GetFieldDefaultedInteger(Tag as Integer, byref value as Integer) as boolean

MBS Images Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the value associated with the given tag id.
Notes: Please look for Tag values in the tiff specification.
Returns true on success. May return a default value.
Please make sure to use the correct setter depending on data type associated with the tag.

GetFieldDefaulted* is identical to GetField*, except that if a tag is not defined in the current directory and it has a default value, then the default value is returned.

195.2.23 GetFieldDefaultedShort(Tag as Integer, byref value as Integer) as boolean

MBS Images Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the value associated with the given tag id.
Notes: Please look for Tag values in the tiff specification.
Returns true on success. May return a default value.
Please make sure to use the correct setter depending on data type associated with the tag.

GetFieldDefaulted* is identical to GetField*, except that if a tag is not defined in the current directory and it has a default value, then the default value is returned.

195.2.24 GetFieldDefaultedSingle(Tag as Integer, byref value as Single) as boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the value associated with the given tag id.
Notes: Please look for Tag values in the tiff specification.
Returns true on success. May return a default value.
Please make sure to use the correct setter depending on data type associated with the tag.

GetFieldDefaulted* is identical to GetField*, except that if a tag is not defined in the current directory and it has a default value, then the default value is returned.

195.2.25 GetFieldDefaultedString(Tag as Integer, byref value as String) as boolean

MBS Images Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the value associated with the given tag id.
Example:

```
Var t as TiffPictureMBS
Var f as FolderItem
Var s as string

f=SpecialFolder.Desktop.Child("ChristianSchmitz.tif")
t=f.OpenAsTiffMBS

const TIFFTAG_SOFTWARE=305

if t.GetFieldDefaultedString(TIFFTAG_SOFTWARE, s) then
MessageBox "TIFFTAG_SOFTWARE"+EndOfLine+s
end if
```

Notes: Please look for Tag values in the tiff specification.
Returns true on success. May return a default value.
Please make sure to use the correct setter depending on data type associated with the tag.
The string is returned with ascii encoding. You may need to define a different encoding is this is not correct.

GetFieldDefaulted* is identical to GetField*, except that if a tag is not defined in the current directory and it has a default value, then the default value is returned.

195.2.26 GetFieldDouble(Tag as Integer, byref value as Double) as boolean

MBS Images Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the value associated with the given tag id.
Notes: Please look for Tag values in the tiff specification.
Returns true on success.
Please make sure to use the correct setter depending on data type associated with the tag.

195.2.27 GetFieldInteger(Tag as Integer, byref value as Integer) as boolean

MBS Images Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the value associated with the given tag id.
Notes: Please look for Tag values in the tiff specification.
Returns true on success.

Please make sure to use the correct setter depending on data type associated with the tag.

195.2.28 GetFieldMemory(Tag as Integer, byref ItemCount as Integer) as memoryblock

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the value associated with the given tag id.
Notes: This is the special version using memoryblock so you can use it for reading values with a count value.

Please look for Tag values in the tiff specification.
Returns true on success.
Please make sure to use the correct setter depending on data type associated with the tag.

195.2.29 GetFieldShort(Tag as Integer, byref value as Integer) as boolean

MBS Images Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the value associated with the given tag id.
Notes: Please look for Tag values in the tiff specification.
Returns true on success.
Please make sure to use the correct setter depending on data type associated with the tag.

195.2.30 GetFieldSingle(Tag as Integer, byref value as Single) as boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the value associated with the given tag id.
Notes: Please look for Tag values in the tiff specification.
Returns true on success.
Please make sure to use the correct setter depending on data type associated with the tag.

195.2.31 GetFieldString(Tag as Integer, byref value as string) as boolean

MBS Images Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the value associated with the given tag id.
Example:

```
Var t as TiffPictureMBS
Var f as FolderItem
```

```
Var s as string

f=SpecialFolder.Desktop.Child("test.tif")
t=f.OpenAsTiffMBS

const TIFFTAG_SOFTWARE=305

if t.GetFieldString(TIFFTAG_SOFTWARE, s) then
MessageBox "TIFFTAG_SOFTWARE"+EndOfLine+s
end if

const TIFFTAG_HOSTCOMPUTER=316

if t.GetFieldString(TIFFTAG_HOSTCOMPUTER, s) then
MessageBox "TIFFTAG_SOFTWARE"+EndOfLine+s
end if

const TIFFTAG_IMAGEDESCRIPTION=270

if t.GetFieldString(TIFFTAG_IMAGEDESCRIPTION, s) then
MessageBox "TIFFTAG_IMAGEDESCRIPTION"+EndOfLine+s
end if

const TIFFTAG_MAKE=271

if t.GetFieldString(TIFFTAG_MAKE, s) then
MessageBox "TIFFTAG_MAKE"+EndOfLine+s
end if

const TIFFTAG_ARTIST=315

if t.GetFieldString(TIFFTAG_ARTIST, s) then
MessageBox "TIFFTAG_ARTIST"+EndOfLine+s
end if
```

Notes: Please look for Tag values in the tiff specification.
Returns true on success. May return a default value.
Please make sure to use the correct setter depending on data type associated with the tag.
The string is returned with ascii encoding. You may need to define a different encoding is this is not correct.

195.2.32 GetXMP as string

MBS Images Plugin, Plugin Version: 7.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the xmp metadata package stored in the tiff file.

Example:

```
Var f as FolderItem
Var t as TiffPictureMBS
Var s as string

f=SpecialFolder.Desktop.Child("test.tif")

t=f.OpenAsTiffMBS

s=t.GetXMP

MessageBox left(s,500)
```

Notes: Returns "" on any error.

195.2.33 ImageCount as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of images in the TIFF file.
Notes: Returns 0 on any error.

195.2.34 ImageIndex as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current image index.
Notes: 0 based.

195.2.35 IsLastImage as boolean

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the current picture is the last picture.
Notes: Useful if you walk through all pictures using NextImage.

195.2.36 MirrorVertical(output as TiffPictureMBS) as boolean

MBS Images Plugin, Plugin Version: 7.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mirrors the current picture to another tiff object.
Notes: You may be able to pass the current tiff file as the output one if you have it open for read and write.
Returns true on success and false on failure.
Works for any color depth or color mode.

195.2.37 NextImage as boolean

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the next image in the TIFF file.
Notes: Returns true on success and false on any error.
See also:

- 195.2.38 NextImage(HeaderOnly as boolean) as boolean 23265

195.2.38 NextImage(HeaderOnly as boolean) as boolean

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the next image.
Notes: If HeaderOnly is false the current picture is read into the pict&mask properties.
See also:

- 195.2.37 NextImage as boolean 23265

195.2.39 Open(file as folderitem) as boolean

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a tiff file for readonly access.
Notes: You need to use the ReadRGB method or the Scanline property to get data from this file.
Returns true on success.
See also:

- 195.2.40 Open(file as folderitem, Mode as string) as boolean 23265
- 195.2.41 Open(Path as String, Mode as string) as boolean 23266

195.2.40 Open(file as folderitem, Mode as string) as boolean

MBS Images Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a tiff file for read/write access.
Example:

```
Var file as folderitem = SpecialFolder.desktop.child("test.tif")
Var st as new MyTiff

// open for appending
if not st.Open(file,"r+") then
MessageBox "Open Tiff failed!"
else
// change one setting
st.Copyright = "Hello World"

// and save
call st.SaveImage
st.Close
end if
```

Notes: Same as the other Open method, but you can pass a mode string to the library.

The open mode parameter can include the following flags in addition to the "r" (Read), "w" (Write), and "a" (Append) flags. Note however that option flags must follow the read-write-append specification.

See also:

- 195.2.39 Open(file as folderitem) as boolean 23265
- 195.2.41 Open(Path as String, Mode as string) as boolean 23266

195.2.41 Open(Path as String, Mode as string) as boolean

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a tiff file for read/write access.
Example:

```
Var t As New TiffPictureMBS

// try with path
Var f As FolderItem = SpecialFolder.Desktop.Child("test.tif")
Var p As String = f.NativePath

If t.Open(p, "r") Then

If t.ReadRGB Then

Window1.Backdrop = t.Pict

End If
```

```
End If
```

Notes: Same as the other Open method, but you can pass a mode and path as string to the library.

The open mode parameter can include the following flags in addition to the "r" (Read), "w" (Write), and "a" (Append) flags. Note however that option flags must follow the read-write-append specification.

See also:

- 195.2.39 Open(file as folderitem) as boolean 23265
- 195.2.40 Open(file as folderitem, Mode as string) as boolean 23265

195.2.42 OpenString(data as string) as boolean

MBS Images Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a tiff image located in a binary string.
Example:

```
Function TiffStringToPicture(data as string) As picture
Var t as MyTiffPictureMBS

t=new MyTiffPictureMBS

if t.OpenString(data) then
if t.ReadRGB then
return t.Pict
// you could add the mask here.
end if
end if

Return nil // failed
End Function
```

Notes: Same as the Open() function, but memory based. You can now use functions like Scanline(), ReadSW() or ReadRGB() to get the picture data.

Returns true on success.
The Warning and Error events may show you reasons why it does not work.
The string you pass is saved in the data property of the class for later use.

You can and should use this function to write yourself a TiffStringToPicture function.
See also:

• 195.2.43 OpenString(data as string, Mode as string) as boolean 23268

195.2.43 OpenString(data as string, Mode as string) as boolean

MBS Images Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a tiff image located in a binary string.
Notes: Same as the other OpenString method, but you can pass a mode string to the library.
See also:

• 195.2.42 OpenString(data as string) as boolean 23267

195.2.44 RawStripSize(strip as UInt32) as UInt64

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of bytes in a raw strip (i.e. not decoded).

195.2.45 ReadBW as boolean

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the current picture in BW mode.
Example:

```
// This example needs a window with Canvas1.
Var f as FolderItem
Var p as Picture
Var t as TiffPictureMBS

f=SpecialFolder.Desktop.Child("Multipage fax.tif")
t=f.OpenAsTiffMBS(true)

if t.ReadBW then
title=str(t.ImageCount)

p=t.pict
Title=str(p.Depth)
Canvas1.Backdrop=p
end if
```

Notes: Returns true on success and false on any error.
Only if the current picture is a 1bit black&white picture, a new picture is created in the pict property and the data is copied inside.

Data in the TIFF file must be in 1 bit BW mode. Else use ReadRGB which does a lot of converting.

This method uses the YieldTicks property and may yield time to other threads.
See also:

- 195.2.46 ReadBW(left as Integer, top as Integer, width as Integer, height as Integer) as boolean 23269

195.2.46 ReadBW(left as Integer, top as Integer, width as Integer, height as Integer) as boolean

MBS Images Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the current picture in BW mode.
Example:

```
// This example needs a window with Canvas1.
Var f as FolderItem
Var p as Picture
Var t as TiffPictureMBS

f=SpecialFolder.Desktop.Child("Multipage fax.tif")
t=f.OpenAsTiffMBS(true)

if t.ReadBW(0,0,t.width/2,t.height/2) then
title=str(t.ImageCount)

p=t.pict
Title=str(p.Depth)
Canvas1.Backdrop=p
end if
```

Notes: Returns true on success and false on any error.
Only if the current picture is a 1bit black&white picture, a new picture is created in the pict property and the data is copied inside.

Data in the TIFF file must be in 1 bit BW mode. Else use ReadRGB which does a lot of converting.

This method uses the YieldTicks property and may yield time to other threads.
See also:

- 195.2.45 ReadBW as boolean 23268

195.2.47 ReadEncodedStrip(strip as UInt32, byref data as Memoryblock) as UInt32

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read and decode a strip of data from an open TIFF file.
Notes: Read the specified strip of data and place up to size bytes of decompressed information in the (user supplied) data buffer.

The value of strip is a "raw strip number". That is, the caller must take into account whether or not the data are organized in separate planes (PlanarConfiguration=2). To read a full strip of data the data buffer should typically be at least as large as the number returned by StripSize.
The library attempts to hide bit- and byte-ordering differences between the image and the native machine by converting data to the native machine order. Bit reversal is done if the FillOrder tag is opposite to the native machine bit order. 16- and 32-bit samples are automatically byte-swapped if the file was written with a byte order opposite to the native machine byte order,

Returns the actual number of bytes of data that were placed in buf is returned; ReadEncodedStrip returns -1 if an error was encountered.

195.2.48 ReadEncodedTile(tile as UInt32, byref data as Memoryblock) as Integer

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read and decode a tile of data from an open TIFF file.
Notes: Read the specified tile of data and place up to size bytes of decompressed information in the (user supplied) data buffer.

The value of tile is a "raw tile number". That is, the caller must take into account whether or not the data are organized in separate planes (PlanarConfiguration=2). ComputeTile automatically does this when converting an (x,y,z,sample) coordinate quadruple to a tile number. To read a full tile of data the data buffer should be at least as large as the value returned by TileSize.

The library attempts to hide bit- and byte-ordering differences between the image and the native machine by converting data to the native machine order. Bit reversal is done if the FillOrder tag is opposite to the native machine bit order. 16- and 32-bit samples are automatically byte-swapped if the file was written with a byte order opposite to the native machine byte order,

Returns the actual number of bytes of data that were placed in buf is returned; ReadEncodedTile returns ,àí1 if an error was encountered.

195.2.49 ReadPreviewBW as boolean

MBS Images Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the current picture in BW mode as a preview.
Notes: This method is faster than ReadBW, because it reads only every 8th line and every 8th pixel in each row. So the picture you get is much smaller, but may be enough for a preview.

Returns true on success and false on any error.
Only if the current picture is a 1bit black&white picture, a new picture is created in the pict property and the data is copied inside.

Data in the TIFF file must be in 1 bit BW mode. Else use ReadRGB which does a lot of converting.

This method uses the YieldTicks property and may yield time to other threads.
See also:

- 195.2.50 ReadPreviewBW(left as Integer, top as Integer, width as Integer, height as Integer) as boolean 23271

195.2.50 ReadPreviewBW(left as Integer, top as Integer, width as Integer, height as Integer) as boolean

MBS Images Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the current picture in BW mode as a preview.
Notes: This method is faster than ReadBW, because it reads only every 8th line and every 8th pixel in each row. So the picture you get is much smaller, but may be enough for a preview.

Returns true on success and false on any error.
Only if the current picture is a 1bit black&white picture, a new picture is created in the pict property and the data is copied inside.

Data in the TIFF file must be in 1 bit BW mode. Else use ReadRGB which does a lot of converting.

This method uses the YieldTicks property and may yield time to other threads.
See also:

- 195.2.49 ReadPreviewBW as boolean 23271

195.2.51 ReadPreviewRGB(ReduceFactor as Integer) as boolean

MBS Images Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a CMYK or RGB picture and stores it in the pict and name properties.
Notes: This method is faster than ReadRGB, because it reads only every ReduceFactorth line and every ReduceFactorth pixel in each row. So the picture you get is much smaller, but may be enough for a preview.

Returns true on success.
ReadRGB does converting on the picture data if needed so you can read CMYK, RGB, BW and other image data using this function.

This function works with most Tiff formats, but has problems with some like 16 bit CMYK.

195.2.52 ReadRawStrip(strip as UInt32, byref data as Memoryblock) as UInt32

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return the undecoded contents of a strip of data from an open TIFF file.
Notes: Read the contents of the specified strip into the (user supplied) data buffer. Note that the value of strip is a "raw strip number". That is, the caller must take into account whether or not the data is organized in separate planes (PlanarConfiguration=2). To read a full strip of data the data buffer should typically be at least as large as the number returned by StripSize.

Returns the actual number of bytes of data that were placed in buf is returned; ReadEncodedStrip returns -1 if an error was encountered.

195.2.53 ReadRawTile(tile as UInt32, byref data as Memoryblock) as Integer

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return an undecoded tile of data from an open TIFF file.
Notes:

Read the contents of the specified tile into the (user supplied) data buffer. Note that the value of tile is a "raw tile number". That is, the caller must take into account whether or not the data is organized in separate planes (PlanarConfiguration=2). ComputeTile automatically does this when converting an (x,y,z,sample) coordinate quadruple to a tile number. To read a full tile of data the data buffer should typically be at least as large as the value returned by TileSize.

Returns the actual number of bytes of data that were placed in buf is returned; ReadEncodedTile returns ,àí1 if an error was encountered.

195.2.54 ReadRGB as boolean

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a CMYK or RGB picture and stores it in the pict and name properties.
Notes: Returns true on success.
ReadRGB does converting on the picture data if needed so you can read CMYK, RGB, BW and other image data using this function.

This function works with most Tiff formats, but has problems with some like 16 bit CMYK.
See also:

- 195.2.55 ReadRGB(byref ErrorMessage as string, Dest as MemoryBlock = nil) as memoryblock 23273

195.2.55 ReadRGB(byref ErrorMessage as string, Dest as MemoryBlock = nil) as memoryblock

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the image into a memoryblock as RGB.
Notes: The Scanline() array gives you the raw uncompressed data. But this method decodes the data into a RGBA image.

The Memoryblock has the size of 4*width*height. Each pixel has one byte for red, one byte for green, one byte for blue and one byte for alpha. If no alpha is in the file, all pixels have the same alpha of 255.

If the decompression fails the function returns nil. (e.g. out of memory).
If the decoding fails, you also get an error message.

This function works with most Tiff formats, but has problems with some like 16 bit CMYK.

If dest is not nil and big enough, the plugin will use it and return it on success. This can avoid additional memory allocations which can cost CPU time (especially to clear the bytes).
See also:

- 195.2.54 ReadRGB as boolean 23273

195.2.56 ReadRGBMemoryBegin(byref ErrorMessage as string) as boolean

MBS Images Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Starts a RGBA reader for the given TIFF picture.
Notes: Like ReadRGB, but with ReadRGBMemoryBegin, ReadRGBMemoryEnd and ReadRGBMemoryS-

tep you can read the RGBA data in portions.

The Memoryblock returned by ReadRGBMemoryStep has the size of 4*width*height. Each pixel has one byte for red, one byte for green, one byte for blue and one byte for alpha. If no alpha is in the file, all pixels have the same alpha of 255.

If the decompression fails the function returns false. (e.g. out of memory).
If the decoding fails, you also get an error message.

This function works with most Tiff formats, but has problems with some like 16 bit CMYK.

195.2.57 ReadRGBMemoryEnd

MBS Images Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Cleans up the internal data structures created by ReadRGBMemoryBegin.

195.2.58 ReadRGBMemoryStep(x as Integer, y as Integer, width as Integer, height as Integer, Dest as MemoryBlock = nil) as memoryblock

MBS Images Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the image into a memoryblock as RGBA.
Example:

```
Var t as new TiffPictureMBS
Var f as FolderItem = SpecialFolder.Desktop.Child("test.tif")
Var e as string

if t.Open(f) then
if t.ReadRGBMemoryBegin(e) then

Var w as Integer = t.Width
Var h as Integer = t.Height

Var p as new PictureMBS(w, h, PictureMBS.ImageFormatRGB)

for y as Integer = 0 to h-1 step 100

Var m as MemoryBlock = t.ReadRGBMemoryStep(0, y, w, 100)

for i as Integer = 0 to 99
p.RowInFormat(i+y, PictureMBS.ImageFormatRGBA)=m
```

```
next

next

t.ReadRGBMemoryEnd
Backdrop = p.copypicture(0,0,1000,1000) // display a portion
end if

end if
```

Notes: As you see in the example, you can use this method to easily read huge TIFF files into a PictureMBS object.

If the decompression fails the function returns nil. (e.g. out of memory).
Please make sure that the range in x and y, width and height is right.

If dest is not nil and big enough, the plugin will use it and return it on success. This can avoid additional memory allocations which can cost CPU time (especially to clear the bytes).

195.2.59 ReadWithLUT(ColorLookupTable() as color) as boolean

MBS Images Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the current picture with a Color Lookup Table.
Notes: Returns true on success and false on any error.
Works with 8, 16 amd 32 bits per sample. And with 1 or 3 samples per pixels (Gray or RGB). The lookup table has 256 entries for 8 bit and 65536 entries for 16/32 bit.
This method uses the YieldTicks property and may yield time to other threads.
See also:

- 195.2.60 ReadWithLUT(ColorLookupTable() as color, left as Integer, top as Integer, width as Integer, height as Integer) as boolean 23275

195.2.60 ReadWithLUT(ColorLookupTable() as color, left as Integer, top as Integer, width as Integer, height as Integer) as boolean

MBS Images Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the current picture with a Color Lookup Table.
Notes: Returns true on success and false on any error.
Works with 8, 16 amd 32 bits per sample. And with 1 or 3 samples per pixels (Gray or RGB). The lookup table has 256 entries for 8 bit and 65536 entries for 16/32 bit.
This method uses the YieldTicks property and may yield time to other threads.
See also:

- 195.2.59 ReadWithLUT(ColorLookupTable() as color) as boolean 23275

195.2.61 RewriteDirectory as boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes existing picture and header information to file replacing the old data.
Notes: Returns true on success and false on any error.
As the data is added to the file and just the reference to the old data is deleted, the filesize will grow.

Calls TIFFReWriteDirectory internally. Same as SaveImage.

195.2.62 SaveImage as boolean

MBS Images Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes existing picture and header information to file replacing the old data.
Notes: Returns true on success and false on any error.
As the data is added to the file and just the reference to the old data is deleted, the filesize will grow.

Calls TIFFReWriteDirectory internally. Same as RewriteDirectory.

195.2.63 Scanline(mem as Ptr, index as Integer, sample as Integer = 0) as boolean

MBS Images Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads an image scanline in a memoryblock.
Notes: Returns false on any error.
Thee Memoryblock must be big enough. The BytesPerRow functions returns the number of bytes needed.
The first scanline has the index of 0.
This is the fastest way to read scanlines. You provide the memoryblock and you can reuse it for all calls to this method for one tiff.
See also:

- 195.2.139 Scanline(index as Integer, sample as Integer = 0) as memoryblock 23307

195.2.64 ScanlinesScaled(index as integer, count as integer, sample as integer = 0, scaleFactor as Integer = 1) as memoryblock

MBS Images Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get image scanlines scaled down as one memoryblock.
Notes: Returns nil on any error.

The data for this property is stored in the Tiff file.
The first scanline has the index of 0. Count is the number of scanlines you want to read/write.

If scaleFactor is >1, we scale down and return scaleFactor rows reduced to one row.

This scaling down is to quicker get preview pictures.

195.2.65 SetColorMap(red as memoryblock, green as memoryblock, blue as memoryblock) as boolean

MBS Images Plugin, Plugin Version: 9.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color map for a paletten image.
Notes: The memoryblock must be 2^bitspersample * 2 bytes big.
Returns true on success and false on failure.

195.2.66 SetColorProfile(ProfileData as String) as boolean

MBS Images Plugin, Plugin Version: 7.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color profile for this tiff file.
Example:

```
Var p As New Picture(100,100,32)

Var ImageFile As FolderItem = SpecialFolder.Desktop.Child("test.tif")
Var ProfileFile As FolderItem = SpecialFolder.Desktop.Child("Generic RGB Profile.icc")

Var t As New TiffPictureMBS
t.Pict = p

Var ProfileStream As BinaryStream = BinaryStream.Open(ProfileFile)
Var ProfileData As String = ProfileStream.Read(ProfileStream.Length)

If t.Create(ImageFile) Then
// set profile before writing
If t.SetColorProfile(ProfileData) Then
// now write picture
If t.WriteRGB Then
t.Close
```

```
ImageFile.Launch
Else
Break
End If
Else
Break
End If
Else
Break
End If
```

Notes: Returns true on success and false on failure.

195.2.67 SetData(Tag as Integer, data as string) as boolean

MBS Images Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the string for this tag.

195.2.68 SetFieldByte(Tag as Integer, value as Integer) as boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the tiff data field with the given tag to the given value.
Notes: Please look for Tag values in the tiff specification.
Returns true on success.
Please make sure to use the correct setter depending on data type associated with the tag.

195.2.69 SetFieldDouble(Tag as Integer, value as Double) as boolean

MBS Images Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the tiff data field with the given tag to the given value.
Notes: Please look for Tag values in the tiff specification.
Returns true on success.
Please make sure to use the correct setter depending on data type associated with the tag.

195.2.70 SetFieldInteger(Tag as Integer, value as Integer) as boolean

MBS Images Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the tiff data field with the given tag to the given value.
Example:

```
Var t as TiffPictureMBS
Var f as FolderItem

const TIFFTAG_IMAGELENGTH=257 // integer
const TIFFTAG_IMAGEWIDTH=256 // integer

f=GetTemporaryFolderItem
t=new TiffPictureMBS

if t.Create(f) then

if t.SetFieldInteger(TIFFTAG_IMAGELENGTH,100) then
if t.Height=100 then
MessageBox "ok"
end if
end if

end if
```

Notes: Please look for Tag values in the tiff specification.
Returns true on success.
Please make sure to use the correct setter depending on data type associated with the tag.

195.2.71 SetFieldMemory(Tag as Integer, ItemCount as Integer, data as memoryblock) as boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the tiff data field with the given tag to the given value.
Notes: This is the special version of the setter which passes a memoryblock and a count value so you can set an array using this method.

Please look for Tag values in the tiff specification.
Returns true on success.
Please make sure to use the correct setter depending on data type associated with the tag.

195.2.72 SetFieldShort(Tag as Integer, value as Integer) as boolean

MBS Images Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the tiff data field with the given tag to the given value.
Notes: Please look for Tag values in the tiff specification.
Returns true on success.
Please make sure to use the correct setter depending on data type associated with the tag.

195.2.73 SetFieldSingle(Tag as Integer, value as Single) as boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the tiff data field with the given tag to the given value.
Notes: Please look for Tag values in the tiff specification.
Returns true on success.
Please make sure to use the correct setter depending on data type associated with the tag.

195.2.74 SetFieldString(Tag as Integer, value as string) as boolean

MBS Images Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets one of the fields to the value of the string.
Example:

```
Var m,p as Picture
Var f as FolderItem
Var t as TiffPictureMBS
Var g as Graphics
Var s as string

// make pictures
p=New Picture(100,100,32)
m=New Picture(100,100,32)

p.Graphics.ForeColor=Rgb(0,255,0) // fill green
p.Graphics.Fillrect 0,0,100,100

p.Graphics.ForeColor=Rgb(255,0,0) // fill red
p.Graphics.FillOval 0,0,100,100

m.Graphics.ForeColor=Rgb(0,0,0) // fill black (invisible so green not seen)
m.Graphics.Fillrect 0,0,100,100

m.Graphics.ForeColor=Rgb(255,255,255) // fill white (Visible)
```

```
m.Graphics.FillOval 0,0,100,100

// save
f=SpecialFolder.Desktop.Child("test.tif")

t=new TiffPictureMBS
t.Pict=p
t.Mask=m

if t.Create(f) then
if t.WriteRGB then

const TIFFTAG_SOFTWARE=305

s="Example Software"
call t.SetFieldString TIFFTAG_SOFTWARE,s

const TIFFTAG_HOSTCOMPUTER=316

s="Example HostComputer"
call t.SetFieldString TIFFTAG_HOSTCOMPUTER,s

const TIFFTAG_IMAGEDESCRIPTION=270

s="Example ImageDescription"
call t.SetFieldString TIFFTAG_IMAGEDESCRIPTION,s

const TIFFTAG_MAKE=271

s="Example Make"
call t.SetFieldString TIFFTAG_MAKE,s

const TIFFTAG_ARTIST=315

s="Example Artist"
call t.SetFieldString TIFFTAG_ARTIST,s

t.Close
MessageBox "Ok"
f.Launch
end if
end if
```

Notes: Please look for Tag values in the tiff specification.
Returns true on success.
Please make sure to use the correct setter depending on data type associated with the tag.

You have to pass in the string with the correct encoding.

195.2.75 SetImageIndex(index as Integer) as boolean

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the current image index and reads the new image.
Example:

```
// This example needs a window with Canvas1.
Var t as TiffPictureMBS // your tiff picture

if t.SetImageIndex(1) then
Canvas1.Backdrop=t.pict
end if
```

Notes: Reads automatically a RGB picture for you, so the pict property is filled on success.
Returns true on success.
Index is zero based.
See also:

- 195.2.76 SetImageIndex(index as Integer, HeaderOnly as boolean) as boolean 23282

195.2.76 SetImageIndex(index as Integer, HeaderOnly as boolean) as boolean

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the current image index.
Notes: If HeaderOnly is false the current picture is read into the pict&mask properties.
Returns true on success.
See also:

- 195.2.75 SetImageIndex(index as Integer) as boolean 23282

195.2.77 SetXMP(ProfileData as String) as boolean

MBS Images Plugin, Plugin Version: 7.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the xmp metadata package for this tiff file.
Notes: Returns true on success and false on failure.

195.2.78 VStripSize(nrows as UInt32) as UInt64

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of bytes in a strip with nrows rows of data.

195.2.79 VTileSize(nrows as UInt32) as UInt64

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of bytes in a row-aligned tile with nrows of data.

195.2.80 WriteBW as boolean

MBS Images Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write a black & white image.
Example:

```
Var p as Picture
Var f as FolderItem
Var t as TiffPictureMBS

p=New Picture(100,100,32)
p.Graphics.ForeColor=rgb(0,0,0)
p.Graphics.FillOval 0,0,100,100

f=SpecialFolder.Desktop.Child("test.tif")

t=new TiffPictureMBS

if t.Create(f) then
t.Pict=p
if t.WriteBW then
MessageBox "ok"
end if
end if

Backdrop=p
```

Notes: Uses the pictures in the pict property to write a picture.
Currently masks are not supported.

The following settings are made before the image data is written:

PlanarConfig = PLANARCONFIG_CONTIG
Photometric = PHOTOMETRIC_MINISBLACK
BitsPerSample = 1
SamplesPerPixel = 1
FillOrder = FILLORDER_MSB2LSB
VerticalResolution = 72
HorizontalResolution = 72
Orientation = ORIENTATION_TOPLEFT
ResolutionUnit = RESUNIT_INCH
Compression = COMPRESSION_NONE

You may change settings before or later. For example if you set Compression before it should be used for writing image data to the file.
Returns true on success.

This method uses the YieldTicks property and may yield time to other threads.

195.2.81 WriteEncodedStrip(strip as UInt32, data as Memoryblock, size as Integer = 0) as Integer

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compress and write a strip of data to an open TIFF file.
Notes: Compress size bytes of raw data from buf and write the result to the specified strip; replacing any previously written data. Note that the value of strip is a ,Äò,Äòraw strip number." That is, the caller must take into account whether or not the data are organized in separate planes (PlanarConfiguration=2).

The library writes encoded data using the native machine byte order. Correctly implemented TIFF readers are expected to do any necessary byte-swapping to correctly process image data with BitsPerSample greater than 8.

The strip number must be valid according to the current settings of the ImageLength and RowsPerStrip tags. An image may be dynamically grown by increasing the value of ImageLength prior to each call to WriteEncodedStrip.

Returns ,àí1 is returned if an error was encountered. Otherwise, the value of size is returned.
If size is zero, we use the size of memoryblock.

195.2.82 WriteEncodedTile(tile as UInt32, data as Memoryblock, size as Integer = 0) as Integer

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compress and write a tile of data to an open TIFF file.
Notes: Compress size bytes of raw data from buf and append the result to the end of the specified tile. Note that the value of tile is a "raw tile number". That is, the caller must take into account whether or not the data are organized in separate places (PlanarConfiguration=2). ComputeTile automatically does this when converting an (x,y,z,sample) coordinate quadruple to a tile number.

The library writes encoded data using the native machine byte order. Correctly implemented TIFF readers are expected to do any necessary byte-swapping to correctly process image data with BitsPerSample greater than 8.

Returns ,àí1 is returned if an error was encountered. Otherwise, the value of size is returned.

If size is zero, we use the size of memoryblock.

195.2.83 WriteGray as boolean

MBS Images Plugin, Plugin Version: 7.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write a grayscale image with 256 colors.
Example:

```
Var t as TiffPictureMBS
Var f as FolderItem

f=SpecialFolder.Desktop.Child("test.tif")

t=new TiffPictureMBS
if t.Create(f) then
t.Pict=LogoMBS(500)
call t.WriteGray
t.Close
end if
```

Notes: Uses the pictures in the pict property to write a picture.
Currently masks are not supported.

The following settings are made before the image data is written:
PlanarConfig = PLANARCONFIG_CONTIG
Photometric = PHOTOMETRIC_MINISBLACK

BitsPerSample = 8
SamplesPerPixel = 1
FillOrder = FILLORDER_MSB2LSB
VerticalResolution = 72
HorizontalResolution = 72
Orientation = ORIENTATION_TOPLEFT
ResolutionUnit = RESUNIT_INCH
Compression = COMPRESSION_NONE

You may change settings before or later. For example if you set Compression before it should be used for writing image data to the file.
Returns true on success.

This method uses the YieldTicks property and may yield time to other threads.
Version 13.1 of our plugins writes a 16 bit Gray image if you set BitsPerSample to 16 before calling this method.

195.2.84 WriteRawStrip(strip as UInt32, data as Memoryblock, size as Integer = 0) as Integer

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write a strip of raw data to an open TIFF file.
Notes: Append size bytes of raw data to the specified strip.

The strip number must be valid according to the current settings of the ImageLength and RowsPerStrip tags. An image may be dynamically grown by increasing the value of ImageLength prior to each call to WriteRawStrip.

Returns -1 is returned if an error occurred. Otherwise, the value of size is returned.

If size is zero, we use the size of memoryblock.

195.2.85 WriteRawTile(tile as UInt32, data as Memoryblock, size as Integer = 0) as Integer

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write a tile of raw data to an open TIFF file
Notes: Append size bytes of raw data to the specified tile.
Returns ,àí1 is returned if an error occurred. Otherwise, the value of size is returned.

If size is zero, we use the size of memoryblock.

195.2.86 WriteRGB as boolean

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a RGB image.
Example:

```
Var m,p as Picture
Var f as FolderItem
Var t as TiffPictureMBS
Var g as Graphics

p=New Picture(100,100,32)
m=New Picture(100,100,32)

p.Graphics.ForeColor=Rgb(0,255,0) // fill green
p.Graphics.Fillrect 0,0,100,100

p.Graphics.ForeColor=Rgb(255,0,0) // fill red
p.Graphics.FillOval 0,0,100,100

m.Graphics.ForeColor=Rgb(0,0,0) // fill black (invisible so green not seen)
m.Graphics.Fillrect 0,0,100,100

m.Graphics.ForeColor=Rgb(255,255,255) // fill white (Visible)
m.Graphics.FillOval 0,0,100,100

f=SpecialFolder.Desktop.Child("test.tif")

t=new TiffPictureMBS
t.Pict=p
t.Mask=m

if t.Create(f) then
if t.WriteRGB then
t.Close
MessageBox "Ok"
f.Launch
end if
end if
```

Notes: Uses the pictures in the mask and pict properties to write a picture.
If mask is set, the picture is saved with an alpha channel.

The following settings are made before the image data is written:
PlanarConfig = PLANARCONFIG_CONTIG
Photometric = PHOTOMETRIC_RGB
BitsPerSample = 8
SamplesPerPixel = 3
FillOrder = FILLORDER_MSB2LSB
VerticalResolution = 72
HorizontalResolution = 72
Orientation = ORIENTATION_TOPLEFT
ResolutionUnit = RESUNIT_INCH
Compression = COMPRESSION_NONE

You may change settings before or later. For example if you set Compression before it should be used for writing image data to the file.
Returns true on success.

This method uses the YieldTicks property and may yield time to other threads.

195.2.87 Properties

195.2.88 BitsPerSample as Integer

MBS Images Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The count of bits for each pixel component.
Notes: Should normally by 8 for RGB images.
(Read and Write property)

195.2.89 BytesPerRow as Int64

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes needed for each row in a scan line.
Notes: 0 on any error.
(Read only property)

195.2.90 Compression as Integer

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The compression used.

Notes: some constants:

The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.91 Copyright as String

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copyright notice of this image.
Example:

```
Var file as folderitem = SpecialFolder.desktop.child("test.tif")
Var st as new MyTiff

// open for appending
if not st.Open(file,"r+") then
MessageBox "Open Tiff failed!"
else
// change one setting
st.Copyright = "Hello World"

// and save
call st.SaveImage
st.Close
end if
```

Notes: The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.92 CurrentDirOffset as Integer

MBS Images Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current directory offset.
Notes: (Read only property)

195.2.93 CurrentRow as Integer

MBS Images Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return the current row, respectively, that is being read or written.

Notes: These values are updated each time a read or write is done.
(Read only property)

195.2.94 CurrentStrip as Integer

MBS Images Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return the current strip, respectively, that is being read or written.
Notes: These values are updated each time a read or write is done.
(Read only property)

195.2.95 CurrentTile as Integer

MBS Images Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return the current tile, respectively, that is being read or written.
Notes: These values are updated each time a read or write is done.
(Read only property)

195.2.96 DateTime as String

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Date and time of the TIFF file.
Notes: Check some TIFF files for the format used.

The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.97 DocumentName as String

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the document.
Notes: The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.98 ExtraSamples as MemoryBlock

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The settings for the extra samples.
Notes: A memoryblock filled with an array of shorts (16bit integers).

constants:

The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.99 FillOrder as Integer

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The fill order of the bits in a byte.
Notes: constants:

(MSB = Most significant bit, LSB = Least significant bit)

The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.100 HasAlpha as Boolean

MBS Images Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this picture has an alpha channel.
Example:

```
var f as FolderItem = SpecialFolder.Desktop.Child("test alpha.tif")
Var t As New TiffPictureMBS

If t.Open(f) Then

MessageBox "Has alpha: "+t.HasAlpha.ToString

End If
```

Notes: Please check ExtraSamples for more details.
(Read only property)

195.2.101 height as Integer

MBS Images Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the picture.
Notes: (Read and Write property)

195.2.102 HorizontalPosition as Single

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x Offset of this image in the drawing area.
Notes: The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.103 HorizontalResolution as Single

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The horizontal resolution used.
Notes: Value depends on ResolutionUnit value.

The data for this property is stored in the Tiff file.
(Read and Write property)

l When creating a new file force information be written with Little-Endian byte order (but see below). By default the library will create new files using the native CPU byte order.

b When creating a new file force information be written with Big-Endian byte order (but see below). By default the library will create new files using the native CPU byte order.

L Force image data that is read or written to be treated with bits filled from Least Significant Bit (LSB) to Most Significant Bit (MSB). Note that this is the opposite to the way the library has worked from its inception.

B Force image data that is read or written to be treated with bits filled from Most Significant Bit (MSB) to Least Significant Bit (LSB); this is the default.

H Force image data that is read or written to be treated with bits filled in the same order as the native CPU.

M Enable the use of memory-mapped files for images opened read-only. If the underlying system does not support memory-mapped files or if the specific image being opened cannot be memory-mapped then the library will fallback to using the normal system interface for reading information. By default the library will attempt to use memory-mapped files.

m Disable the use of memory-mapped files.

C Enable the use of "strip chopping" when reading images that are comprised of a single strip or tile of uncompressed data. Strip chopping is a mechanism by which the library will automatically convert the single-strip image to multiple strips, each of which has about 8 Kilobytes of data. This facility can be useful in reducing the amount of memory used to read an image because the library normally reads each strip in its entirety. Strip chopping does however alter the apparent contents of the image because when an image is divided into multiple strips it looks as though the underlying file contains multiple separate strips. Finally, note that default handling of strip chopping is a compile-time configuration parameter. The default behaviour, for backwards compatibility, is to enable strip chopping.

c Disable the use of strip chopping when reading images.

FILLORDER_LSB2MSB	2

195.2.104 HostComputer as String

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Name of the machine where the tiff file was created.
Notes: The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.105 ImageDescription as String

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Information about the image.
Notes: The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.106 InputBuffer as String

MBS Images Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The string passed for OpenString.
Notes: Used for the read requests from the Tiff library.
(Read only property)

195.2.107 IsBigEndian as Boolean

MBS Images Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether file is big endian.
Notes: (Read only property)

195.2.108 IsByteSwapped as Boolean

MBS Images Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether bytes are swapped.
Notes: Returns true if the image data was in a different byte-order than the host machine. Zero is returned if the TIFF file and local host byte-orders are the same.
Note that ReadTile(), ReadStrip() and ReadScanline() functions already normally perform byte swapping to local host order if needed.
(Read only property)

195.2.109 IsMSB2LSB as Boolean

MBS Images Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the image data is being returned with bit 0 as the most significant bit.
Notes: (Read only property)

195.2.110 IsTiled as Boolean

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a non-zero value if the image data has a tiled organization.
Notes: Zero is returned if the image data is organized in strips.
(Read only property)

195.2.111 IsUpSampled as Boolean

MBS Images Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether data is upsampled.
Notes: Returns a non-zero value if image data returned through the read interface routines is being upsampled. This can be useful to applications that want to calculate I/O buffer sizes to reflect this usage (though the usual strip and tile size routines already do this).
(Read only property)

195.2.112 JPEGQuality as Integer

MBS Images Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The JPEG quality.
Example:

```
Var logo as Picture = LogoMBS(500)
Var pic as new PictureMBS(logo)

// save tiff with jpeg compression
Var f as FolderItem = SpecialFolder.Desktop.Child("test.tif")
Var t as TiffPictureMBS

if pic <>nil then
t = new TiffPictureMBS

if t.Create(F) then
```

```
t.Height = pic.Height
t.Width = pic.Width

t.RowsPerStrip = 1
t.PlanarConfig = t.kPlanarConfigContig
t.Photometric = t.kPhotometricRGB
t.BitsPerSample = 8
t.SamplesPerPixel = 3
t.FillOrder = t.kFillOrderMSB2LSB
t.Orientation = t.kOrientationTopLeft
t.ResolutionUnit = t.kResUnitInch
t.VerticalResolution = 72.0
t.HorizontalResolution = 72.0
t.Compression = t.kCompressionJPEG
t.RowsPerStrip = 32
t.JPEGQuality = 75

// copy lines
for i as Integer = 0 to t.Height - 1
t.Scanline(i) = pic.RowInFormat(i, PictureMBS.ImageFormatRGB)
next

t.Close
end if
end if
```

Notes: Default is 75.
(Read and Write property)

195.2.113 Make as String

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scanner manufacturer name.
Notes: The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.114 mask as picture

MBS Images Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mask of the picture.
Notes: May be nil.
(Read and Write property)

195.2.115 Model as String

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scanner model name/number.
Notes: The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.116 NumberOfStrips as UInt32

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of strips in the image.
Notes: (Read only property)

195.2.117 NumberOfTiles as UInt32

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of tiles in the image.
Notes: (Read only property)

195.2.118 Orientation as Integer

MBS Images Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The orientation of this image.
Example:

```
// creates a tif file with a horizontal flipped image
// red rectangle is on the left in the image data, but with orientation tag it should be displayed on the right side.
// Mac OS X Preview.app shows it correctly.

Var p as Picture
Var t as TiffPictureMBS
Var f as FolderItem

const ORIENTATION_TOPLEFT = 1 //* row 0 top, col 0 lhs */
const ORIENTATION_TOPRIGHT = 2 //* row 0 top, col 0 rhs */
const ORIENTATION_BOTRIGHT = 3 //* row 0 bottom, col 0 rhs */
```

```
const ORIENTATION_BOTLEFT = 4 //* row 0 bottom, col 0 lhs */
const ORIENTATION_LEFTTOP = 5 //* row 0 lhs, col 0 top */
const ORIENTATION_RIGHTTOP = 6 //* row 0 rhs, col 0 top */
const ORIENTATION_RIGHTBOT = 7 //* row 0 rhs, col 0 bottom */
const ORIENTATION_LEFTBOT = 8 //* row 0 lhs, col 0 bottom */

p=New Picture(150,100,32)

p.Graphics.ForeColor=rgb(255,0,0)
p.Graphics.FillRect 0,0,10,10

t=new TiffPictureMBS
f=SpecialFolder.Desktop.Child("test.tif")

if t.Create(f) then
t.Pict=p

t.Orientation=ORIENTATION_TOPRIGHT
if t.WriteRGB then
end if
t.Orientation=ORIENTATION_TOPRIGHT

t.Close
end if
```

Notes: Orientation:

The orientation of the image with respect to the rows and columns.
Tag = 274 (112.H)
Type = SHORT
N = 1
1 = The 0th row represents the visual top of the image, and the 0th column represents the visual left-hand side.
2 = The 0th row represents the visual top of the image, and the 0th column represents the visual right-hand side.
3 = The 0th row represents the visual bottom of the image, and the 0th column represents the visual right-hand side.
4 = The 0th row represents the visual bottom of the image, and the 0th column represents the visual left-hand side.
5 = The 0th row represents the visual left-hand side of the image, and the 0th column represents the visual top.
6 = The 0th row represents the visual right-hand side of the image, and the 0th column represents the visual top.
7 = The 0th row represents the visual right-hand side of the image, and the 0th column represents the visual bottom.
8 = The 0th row represents the visual left-hand side of the image, and the 0th column represents the visual bottom.

Default is 1.
Support for orientations other than 1 is not a Baseline TIFF requirement.
(This text was sent in by David Austin)
(Read and Write property)

195.2.119 OutputBuffer as String

MBS Images Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current output data from the CreateString function.
Notes: Between CreateString and Close the plugin will record all the output data and you can get a copy using this property.
(Read only property)

195.2.120 PageName as String

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the current page.
Notes: The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.121 Photometric as Integer

MBS Images Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property of the TIFF image.
Example:

```
// read and write a BW fax tiff with compression

Var d as new OpenDialog()
Var f as FolderItem = New FolderItem("myfax.tiff")
if f = nil then
return
end if

Var tiff as new TiffPictureMBS()
if not tiff.Open(f) then
MessageBox("Error while opening.")
return
end if
```

```
if not tiff.ReadBW() then
MessageBox("Error reading.")
end if

Var tiff2 as TiffPictureMBS = new TiffPictureMBS()

Var f2 as FolderItem = SpecialFolder.Desktop.Child("Copy.tiff")
if not tiff2.Create(f2) then
MessageBox("Error creating file.")
end if

const COMPRESSION_CCITTFAX3=3
const WhiteIsZero=0
const BlackIsZero=1

tiff2.Pict = tiff.pict
tiff2.Photometric=WhiteIsZero
tiff2.Compression=COMPRESSION_CCITTFAX3
if not tiff2.WriteBW() then
MessageBox("Error writing.") // Error
end if

tiff2.Close()
```

Notes: PhotometricInterpretation:
The color space of the image data.
Tag = 262 (106.H)
Type = SHORT
N = 1

0 = WhiteIsZero. For bilevel and grayscale images: 0 is imaged as white. 2**BitsPerSample-1 is imaged as black. This is the normal value for Compression=2.

1 = BlackIsZero. For bilevel and grayscale images: 0 is imaged as black. 2**BitsPerSample-1 is imaged as white. If this value is specified for Compression=2, the image should display and print reversed.

2 = RGB. In the RGB model, a color is described as a combination of the three primary colors of light (red, green, and blue) in particular concentrations. For each of the three components, 0 represents minimum intensity, and 2**BitsPerSample - 1 represents maximum intensity. Thus an RGB value of (0,0,0) represents black, and (255,255,255) represents white, assuming 8-bit components. For PlanarConfiguration = 1, the components are stored in the indicated order: first Red, then Green, then Blue. For PlanarConfiguration = 2, the StripOffsets for the component planes are stored in the indicated order: first the Red component plane StripOffsets, then the Green plane StripOffsets, then the Blue plane StripOffsets.

3= Palette color. In this model, a color is described with a single component. The value of the component is used as an index into the red, green and blue curves in the ColorMap field to retrieve an RGB triplet that defines the color. When PhotometricInterpretation=3 is used, ColorMap must be present and SamplesPerPixel must be 1.

4 = Transparency Mask. This means that the image is used to define an irregularly shaped region of another image in the same TIFF file. SamplesPerPixel and BitsPerSample must be 1. PackBits compression is recommended. The 1-bits define the interior of the region; the 0-bits define the exterior of the region. A reader application can use the mask to determine which parts of the image to display. Main image pixels that correspond to 1-bits in the transparency mask are imaged to the screen or printer, but main image pixels that correspond to 0-bits in the mask are not displayed or printed. The image mask is typically at a higher resolution than the main image, if the main image is grayscale or color so that the edges can be sharp.

There is no default for PhotometricInterpretation, and it is required. Do not rely on applications defaulting to what you want.

For more details see:
http://partners.adobe.com/asn/developer/pdfs/tn/TIFF6.pdf
(Read and Write property)

195.2.122 pict as picture

MBS Images Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The picture data of the picture.
Notes: (Read and Write property)

195.2.123 PlanarConfig as Integer

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The storage organization used.
Notes: Value is 1 for a single image plane and 2 for separated planes.

The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.124 RasterScanlineSize as UInt64

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the raster scanline size.
Notes: Returns the size in bytes of a complete decoded and packed raster scanline.
Note that this value may be different from the value returned by ScanlineSize if data is stored as separate planes.
(Read only property)

195.2.125 ResolutionUnit as Integer

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Which unit is used for the Resolution values.
Notes: constants:

RESUNIT_NONE	1	no meaningful units
RESUNIT_INCH	2	english
RESUNIT_CENTIMETER	3	metric

The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.126 RowsPerStrip as Integer

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property of the TIFF image.
Notes: Should be same as the height for our uses. (with one strip)
(Read and Write property)

195.2.127 SampleFormat as Integer

MBS Images Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The data sample format.
Notes: Value is 1 for unsigned integer, 2 for signed integer, 3 for IEEE floating point, 4 for untyped data (e.g. JPEG compressed), 5 for complex signed int and 6 for complex IEEE floating point.
(Read and Write property)

195.2.128 SamplesPerPixel as Integer

MBS Images Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The count of components used for each pixel.
Notes: SamplesPerPixel= 1=Grayscale, 3=RGB, 4=CMYK, ...
Photometric= 0 or 1=Grayscale depending on white point, 2=RGB, 5=CMYK, ...

For other formats see:
http://partners.adobe.com/asn/developer/pdfs/tn/TIFF6.pdf
(Read and Write property)

195.2.129 Software as String

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The software name used to make this image.
Notes: The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.130 StripSize as UInt64

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the equivalent size for a strip of data as it would be returned in a call to ReadEncodedStrip or as it would be expected in a call to WriteEncodedStrip.
Notes: (Read only property)

195.2.131 TileRowSize as UInt64

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of bytes of a row of data in a tile.
Notes: (Read only property)

195.2.132 TileSize as UInt64

MBS Images Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the equivalent size for a tile of data as it would be returned in a call to ReadTile or as it would be expected in a call to WriteTile.

Notes: (Read only property)

195.2.133 Version as Integer

MBS Images Plugin, Plugin Version: 5.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version of the Tiff library used.
Notes: Updated to 3.7.1 in plugin version 5.0.
(Read only property)

195.2.134 VersionString as String

MBS Images Plugin, Plugin Version: 5.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version of the Tiff library used.
Example:

```
Var z as new TiffPictureMBS

MessageBox z.VersionString

// shows for example:
// LIBTIFF, Version 3.9.4
// Copyright (c) 1988-1996 Sam Leffler
// Copyright (c) 1991-1996 Silicon Graphics, Inc.
```

Notes: (Read only property)

195.2.135 VerticalPosition as Single

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y Offset of this image in the drawing area.
Notes: The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.136 VerticalResolution as Single

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The vertical resolution used.

Notes: Value depends on ResolutionUnit value.

The data for this property is stored in the Tiff file.
(Read and Write property)

195.2.137 width as Integer

MBS Images Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the picture.
Notes: (Read and Write property)

195.2.138 YieldTicks as Integer

MBS Images Plugin, Plugin Version: 7.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: How much time is given back to Xojo for other ticks.
Example:

```
Var t as new TiffPictureMBS
t.YieldTicks=6 // only use 1/10th of a second
```

Notes: If value is greater than zero, the application will yield to another RB thread after the given number of ticks have passed. 60 ticks are one second. Using a small value can slow down processing a lot while a big value keeps your application not responding to mouse clicks.
If you use this property with e.g. 6 as the value, you may also want to use this method in a thread so you can handle mouse events or let Xojo redraw a progressbar.
(Read and Write property)

195.2.139 Scanline(index as Integer, sample as Integer = 0) as memoryblock

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An image scanline.
Notes: Returns nil on any error.
If you set the value, make sure the Memoryblock is big enough. The BytesPerRow functions returns the number of bytes needed.

The data for this property is stored in the Tiff file.
The first scanline has the index of 0.
(Read and Write computed property)

• 195.2.63 Scanline(mem as Ptr, index as Integer, sample as Integer = 0) as boolean 23276

195.2.140 Scanlines(index as Integer, count as Integer, sample as Integer = 0, lineStepScanlines as Integer = 1, lineStepReturn as Integer = 1) as memoryblock

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set image scanlines as one memoryblock.
Notes: Returns nil on any error.
If you set the value, make sure the Memoryblock is big enough. The BytesPerRow functions returns the number of bytes needed.

The data for this property is stored in the Tiff file.
The first scanline has the index of 0. Count is the number of scanlines you want to read/write.

If lineStepScanlines is >1, we skip scan lines so we read less data.
If lineStepReturn is >1, we return only every nth row.

If rows can be read with skipping, you should try lineStepScanlines = 2 or more for skipping lines.
If that doesn't work due to tiled data, you can use lineStepReturn = 2 or more.
This skipping is to quicker get preview pictures.
(Read and Write computed property)

195.2.141 Events

195.2.142 Error(libModule as string, message as string)

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An event called whenever an error is to be reported.

195.2.143 Progress(line as Integer, total as Integer)

MBS Images Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reports changes in progress.
Notes: Used in CombineBitCMYKtoCMYK, CombineTiffCMYKtoRGB and CombineTiffCMYKtoCMYK methods.

195.2.144 Warning(libModule as string, message as string)

MBS Images Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An event called whenever a warning is to be reported.

195.2.145 Constants

Compression Constants

Constant	Value	Description
kCompressionAdobeDeflate	8	Deflate compression, as recognized by Adobe
kCompressionCCITTFAX3	3	CCITT Group 3 fax encoding
kCompressionCCITTFAX4	4	CCITT Group 4 fax encoding
kCompressionCCITTRLE	2	CCITT modified Huffman RLE
kCompressionCCITTRLEW	32771	#1 w/ word alignment
kCompressionCCITT_T4	3	CCITT T.4 (TIFF 6 name)
kCompressionCCITT_T6	4	CCITT T.6 (TIFF 6 name)
kCompressionDCS	32947	Kodak DCS encoding
kCompressionDeflate	32946	Deflate compression
kCompressionIT8BL	32898	IT8 Binary line art
kCompressionIT8CTPAD	32895	IT8 CT w/padding
kCompressionIT8LW	32896	IT8 Linework RLE
kCompressionIT8MP	32897	IT8 Monochrome picture
kCompressionJBIG	34661	ISO JBIG
kCompressionJP2000	34712	Leadtools JPEG2000
kCompressionJPEG	7	JPEG DCT compression
kCompressionLZMA	34925	LZMA2
kCompressionLZW	5	Lempel-Ziv & Welch
kCompressionNeXT	32766	NeXT 2-bit RLE
kCompressionNone	1	No compression.
kCompressionOJPEG	6	!6.0 JPEG
kCompressionPackBits	32773	Macintosh RLE
kCompressionPixarFilm	32908	Pixar companded 10bit LZW
kCompressionPixarLog	32909	Pixar companded 11bit ZIP
kCompressionSGILOG	34676	SGI Log Luminance RLE
kCompressionSGILOG24	34677	SGI Log 24-bit packed
kCompressionThunderScan	32809	ThunderScan RLE

Fill Order Constants

Constant	Value	Description
kFillOrderLSB2MSB	2	Least significant ->most
kFillOrderMSB2LSB	1	Most significant ->least

Orientation Constants

Constant	Value	Description
kOrientationBottomLeft	4	row 0 bottom, col 0 lhs
kOrientationBottomRight	3	row 0 bottom, col 0 rhs
kOrientationLeftBottom	8	row 0 lhs, col 0 bottom
kOrientationLeftTop	5	row 0 lhs, col 0 top
kOrientationRightBottom	7	row 0 rhs, col 0 bottom
kOrientationRightTop	6	row 0 rhs, col 0 top
kOrientationTopLeft	1	row 0 top, col 0 lhs
kOrientationTopRight	2	row 0 top, col 0 rhs

Photometric Constants

Constant	Value	Description
kPhotometricCIELab	8	!1976 CIE L*a*b*
kPhotometricICCLab	9	ICC L*a*b* [Adobe TIFF Technote 4]
kPhotometricITULab	10	ITU L*a*b*
kPhotometricLogL	32844	CIE Log2(L)
kPhotometricLogLUV	32845	CIE Log2(L) (u',v')
kPhotometricMask	4	$ holdout mask
kPhotometricMinIsBlack	1	Min value is black.
kPhotometricMinIsWhite	0	Min value is white.
kPhotometricPalette	3	color map indexed
kPhotometricRGB	2	RGB color model
kPhotometricSeparated	5	!color separations
kPhotometricYCBCR	6	!CCIR 601

planar config Constants

Constant	Value	Description
kPlanarConfigContig	1	Single image plane.
kPlanarConfigSeparate	2	Separate planes of data.

Predictor Values

Constant	Value	Description
kPredictorFloatingPoint	3	Floating point predictor
kPredictorHorizontal	2	Horizontal differencing
kPredictorNone	1	no prediction scheme used

Resolution Unit Constants

Constant	Value	Description
kResUnitCentimeter	3	Metric
kResUnitInch	2	English
kResUnitNone	1	no meaningful units

Chapter 196

Timecode

196.1 class LTCDecoderMBS

196.1.1 class LTCDecoderMBS

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for the timecode decoder.
Example:

```
// read linear timecode from 8-bit unsigned audio data, e.g. created by LTCEncoderMBS
// audio is a string with samples at 48000 Hz for 25 frames per second
Var audio As String // your audio data
Var decoder As New LTCDecoderMBS(1920, 32) // 48000 / 25 samples per video frame, queue size
decoder.WriteUInt8(audio)

Var frame As New LTCFrameMBS
While decoder.Read(frame)
Var tc As LTCSMPTETimecodeMBS = frame.TimeCode
System.DebugLog Format(tc.Hours, "00") + ":" + Format(tc.Mins, "00") + ":" + Format(tc.Secs, "00") +
":" + Format(tc.Frame, "00")
Wend
```

196.1.2 Methods

196.1.3 Constructor(apv as Integer, queueSize as Integer)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a new LTC decoder.

Notes: apv: audio-frames per video frame. This is just used for initial settings, the speed is tracked dynamically. setting this in the right ballpark is needed to properly decode the first LTC frame in a sequence. queueSize: length of the internal queue to store decoded frames to SMPTEDecoderWrite.

Raises an out of memory exception if initialization fails.

196.1.4 Destructor

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

196.1.5 FlushQueue

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove all LTC frames from the internal queue.

196.1.6 Read as LTCFrameMBS

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decoded LTC frames are placed in a queue.
Notes: This function retrieves a frame from the queue, and stores it a new LTCFrameMBS object.
See also:

- 196.1.7 Read(frame as LTCFrameMBS) as Boolean 23312

196.1.7 Read(frame as LTCFrameMBS) as Boolean

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decoded LTC frames are placed in a queue.
Notes: This function retrieves a frame from the queue, and stores it the given LTCFrameMBS object.
You should prefer this method and reuse frame objects.
See also:

- 196.1.6 Read as LTCFrameMBS 23312

196.1.8 WriteSingle(data as MemoryBlock, posinfo as UInt64 = 0)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Feed the LTC decoder with new audio samples.
Notes: Wrapper around WriteUInt8 that accepts floating point audio samples.
Note: internally libltc uses 8 bit only.

Data: Buffer with data
size: number of samples to parse. Calculated from data.size by dividing by 4.
posinfo: (optional, recommended) sample-offset in the audio-stream.
See also:

- 196.1.9 WriteSingle(data as Ptr, Count as Integer, posinfo as UInt64 = 0) 23313
- 196.1.10 WriteSingle(data as String, posinfo as UInt64 = 0) 23313

196.1.9 WriteSingle(data as Ptr, Count as Integer, posinfo as UInt64 = 0)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Feed the LTC decoder with new audio samples.
Notes: Wrapper around WriteUInt8 that accepts floating point audio samples.
Note: internally libltc uses 8 bit only.

Data: Buffer with data
size: number of samples to parse.
posinfo: (optional, recommended) sample-offset in the audio-stream.
See also:

- 196.1.8 WriteSingle(data as MemoryBlock, posinfo as UInt64 = 0) 23313
- 196.1.10 WriteSingle(data as String, posinfo as UInt64 = 0) 23313

196.1.10 WriteSingle(data as String, posinfo as UInt64 = 0)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Feed the LTC decoder with new audio samples.
Notes: Wrapper around WriteUInt8 that accepts floating point audio samples.
Note: internally libltc uses 8 bit only.

Data: Buffer with data
size: number of samples to parse. Calculated from data.lenb by dividing by 4.
posinfo: (optional, recommended) sample-offset in the audio-stream.
See also:

- 196.1.8 WriteSingle(data as MemoryBlock, posinfo as UInt64 = 0) 23313
- 196.1.9 WriteSingle(data as Ptr, Count as Integer, posinfo as UInt64 = 0) 23313

196.1.11 WriteSInt16(data as MemoryBlock, posinfo as UInt64 = 0)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Feed the LTC decoder with new audio samples.
Notes: Wrapper around WriteUInt8 that accepts SInt16 audio samples.
Note: internally libltc uses 8 bit only.

Data: Buffer with data
size: number of samples to parse. Calculated from data.size by dividing by 2.
posinfo: (optional, recommended) sample-offset in the audio-stream.
See also:

- 196.1.12 WriteSInt16(data as Ptr, Count as Integer, posinfo as UInt64 = 0) 23314
- 196.1.13 WriteSInt16(data as String, posinfo as UInt64 = 0) 23314

196.1.12 WriteSInt16(data as Ptr, Count as Integer, posinfo as UInt64 = 0)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Feed the LTC decoder with new audio samples.
Notes: Wrapper around WriteUInt8 that accepts SInt16 audio samples.
Note: internally libltc uses 8 bit only.

Data: Buffer with data
size: number of samples to parse.
posinfo: (optional, recommended) sample-offset in the audio-stream.
See also:

- 196.1.11 WriteSInt16(data as MemoryBlock, posinfo as UInt64 = 0) 23314
- 196.1.13 WriteSInt16(data as String, posinfo as UInt64 = 0) 23314

196.1.13 WriteSInt16(data as String, posinfo as UInt64 = 0)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Feed the LTC decoder with new audio samples.
Notes: Wrapper around WriteUInt8 that accepts SInt16 audio samples.
Note: internally libltc uses 8 bit only.

Data: Buffer with data
size: number of samples to parse. Calculated from data.lenb by dividing by 2.
posinfo: (optional, recommended) sample-offset in the audio-stream.
See also:

- 196.1.11 WriteSInt16(data as MemoryBlock, posinfo as UInt64 = 0) 23314
- 196.1.12 WriteSInt16(data as Ptr, Count as Integer, posinfo as UInt64 = 0) 23314

196.1.14 WriteUInt16(data as MemoryBlock, posinfo as UInt64 = 0)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Feed the LTC decoder with new audio samples.
Notes: Wrapper around WriteUInt8 that accepts UInt16 audio samples.
Note: internally libltc uses 8 bit only.

Data: Buffer with data
size: number of samples to parse. Calculated from data.size by dividing by 2.
posinfo: (optional, recommended) sample-offset in the audio-stream.
See also:

- 196.1.15 WriteUInt16(data as Ptr, Count as Integer, posinfo as UInt64 = 0) 23315
- 196.1.16 WriteUInt16(data as String, posinfo as UInt64 = 0) 23315

196.1.15 WriteUInt16(data as Ptr, Count as Integer, posinfo as UInt64 = 0)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Feed the LTC decoder with new audio samples.
Notes: Wrapper around WriteUInt8 that accepts UInt16 audio samples.
Note: internally libltc uses 8 bit only.

Data: Buffer with data
size: number of samples to parse.
posinfo: (optional, recommended) sample-offset in the audio-stream.
See also:

- 196.1.14 WriteUInt16(data as MemoryBlock, posinfo as UInt64 = 0) 23315
- 196.1.16 WriteUInt16(data as String, posinfo as UInt64 = 0) 23315

196.1.16 WriteUInt16(data as String, posinfo as UInt64 = 0)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Feed the LTC decoder with new audio samples.
Notes: Wrapper around WriteUInt8 that accepts UInt16 audio samples.
Note: internally libltc uses 8 bit only.

Data: Buffer with data
size: number of samples to parse. Calculated from data.lenb by dividing by 2.
posinfo: (optional, recommended) sample-offset in the audio-stream.
See also:

- 196.1.14 WriteUInt16(data as MemoryBlock, posinfo as UInt64 = 0) 23315
- 196.1.15 WriteUInt16(data as Ptr, Count as Integer, posinfo as UInt64 = 0) 23315

196.1.17 WriteUInt8(data as MemoryBlock, posinfo as UInt64 = 0)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Feed the LTC decoder with new audio samples.
Notes: Parse raw audio for LTC timestamps. Once a complete LTC frame has been decoded it is pushed into a queue (see Read function).

Data: Buffer with data
Count: number of samples to parse. Taken from data.size.
posinfo: (optional, recommended) sample-offset in the audio-stream.
See also:

- 196.1.18 WriteUInt8(data as Ptr, Count as Integer, posinfo as UInt64 = 0) 23316
- 196.1.19 WriteUInt8(data as String, posinfo as UInt64 = 0) 23317

196.1.18 WriteUInt8(data as Ptr, Count as Integer, posinfo as UInt64 = 0)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Feed the LTC decoder with new audio samples.
Notes: Parse raw audio for LTC timestamps. Once a complete LTC frame has been decoded it is pushed into a queue (see Read function).

Data: Buffer with data
Count: number of samples to parse.
posinfo: (optional, recommended) sample-offset in the audio-stream.
See also:

- 196.1.17 WriteUInt8(data as MemoryBlock, posinfo as UInt64 = 0) 23316
- 196.1.19 WriteUInt8(data as String, posinfo as UInt64 = 0) 23317

196.1.19 WriteUInt8(data as String, posinfo as UInt64 = 0)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Feed the LTC decoder with new audio samples.
Notes: Parse raw audio for LTC timestamps. Once a complete LTC frame has been decoded it is pushed into a queue (see Read function).

Data: Buffer with data
Count: number of samples to parse. Taken from data.lenb.
posinfo: (optional, recommended) sample-offset in the audio-stream.
See also:

- 196.1.17 WriteUInt8(data as MemoryBlock, posinfo as UInt64 = 0) 23316
- 196.1.18 WriteUInt8(data as Ptr, Count as Integer, posinfo as UInt64 = 0) 23316

196.1.20 Properties

196.1.21 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

196.1.22 QueueLength as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Count number of LTC frames currently in the queue.
Notes: Returns number of queued frames.
(Read only property)

196.2 class LTCEncoderMBS

196.2.1 class LTCEncoderMBS

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The timecode encoder.
Example:

```
// generate one second of linear timecode audio starting at 10:00:00:00
Var encoder As New LTCEncoderMBS(48000, 25, LTCMBS.LTC_TV_625_50, LTCMBS.LTC_USE_DATE)

Var tc As New LTCSMPTETimecodeMBS
tc.Hours = 10
tc.Mins = 0
tc.Secs = 0
tc.Frame = 0
encoder.TimeCode = tc

Var audio As String
For i As Integer = 1 To 25 // 25 frames = one second
encoder.EncodeFrame
audio = audio + encoder.CopyBufferString // 8-bit unsigned samples
encoder.FlushBuffer
Call encoder.IncrementTimecode
Next

MessageBox audio.Bytes.ToString + " bytes of audio data"
```

196.2.2 Methods

196.2.3 Constructor(SampleRate as Double, FPS as Double, TVStandard as Integer, Flags as Integer)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allocate and initialize LTC audio encoder.
Notes: EncoderReinit internally see, see notes there.

SampleRate: audio sample rate (eg. 48000)
FPS: video-frames per second (e.g. 25.0)
TVStandard: the TV standard to use for Binary Group Flag bit position
flags: binary combination of flags like LTC_NO_PARITY and LTC_BGF_DONT_TOUCH.

196.2.4 CopyBuffer as MemoryBlock

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copy the accumulated encoded audio to the given sample-buffer and flush the internal buffer.
Notes: Allocates new MemoryBlock and puts bytes inside.
Returns nil if there is no data.

196.2.5 CopyBufferString as String

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copy the accumulated encoded audio to the given sample-buffer and flush the internal buffer.
Notes: Allocates new memory for string and puts bytes inside.

196.2.6 DecrementTimecode as Boolean

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Move the encoder to the previous timecode frame.
Notes: This is useful for encoding reverse LTC.

196.2.7 Destructor

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

196.2.8 EncodeByte(byte as UInt8, speed as Double) as boolean

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generate LTC audio for given byte of the LTC-frame and place it into the internal buffer.
Notes: see also GetBuffer and BufferPtr

LTC has 10 bytes per frame: 0 <= bytecnt <10 use TimeCode property to set the current frame before Encoding.

The default output signal is @ -3dBFS (38..218 at 8 bit unsigned). see also SetVolume

if speed is <0, the bits are encoded in reverse.
slowdown >10.0 requires custom buffer sizes; see \ref SetBufferSize.

byte: byte of the LTC-frame to encode 0..9
speed: vari-speed, <1.0 faster, >1.0 slower ; must be != 0

Returns true on success, -1 if byte is invalid or buffer overflow (speed >10.0)

196.2.9 EncodeFrame

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Encode a full LTC frame at fixed speed.
Notes: This is equivalent to calling EncodeByte 10 times for bytes 0..9 with speed 1.0.

Note: The internal buffer must be empty before calling this function.
Otherwise it may overflow. This is usually the case if it is read with GetBuffer after calling this function.

The default internal buffersize is exactly one full LTC frame at speed 1.0.
See also:

- 196.2.10 EncodeFrame(Speed as Double) 23320

196.2.10 EncodeFrame(Speed as Double)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Encode a full LTC frame at fixed speed.
Notes: This is equivalent to calling EncodeByte 10 times for bytes 0..9 with given speed.
Speed should be around 1.0 for normal speed.

Note: The internal buffer must be empty before calling this function.
Otherwise it may overflow. This is usually the case if it is read with GetBuffer after calling this function.

The default internal buffersize is exactly one full LTC frame at speed 1.0.
See also:

- 196.2.9 EncodeFrame 23320

196.2.11 EncoderReinit(SampleRate as Double, FPS as Double, TVStandard as Integer, Flags as Integer) as Boolean

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Change the encoder settings without re-allocating any library internal data structure (realtime safe).
Notes: Changing the fps and or sample-rate implies a buffer flush, and biphase state reset.

This call will fail if the internal buffer is too small to hold one full LTC frame. Use SetBufferSize to prepare an internal buffer large enough to accommodate all SampleRate, fps combinations that you would like to re-init to.

The LTC frame payload data is not modified by this call, however, the flag-bits of the LTC-Frame are updated:
If fps equals to 29.97 or 30000.0/1001.0, the LTCFrame's 'dfbit' bit is set to 1 to indicate drop-frame timecode.

Unless the LTC_BGF_DONT_TOUCH flag is set the BGF1 is set or cleared depending on LTC_TC_CLOCK and BGF0,2 according to LTC_USE_DATE and the given standard.
ColFrame is cleared and the parity recomputed (unless LTC_NO_PARITY is given).

SampleRate: audio sample rate (eg. 48000)
FPS: video-frames per second (e.g. 25.0)
TVStandard: the TV standard to use for Binary Group Flag bit position
Flags: binary combination of flags.

Returns 0 on success.

196.2.12 FlushBuffer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reset the write-pointer of the encoder-buffer.

196.2.13 GetBuffer(byref size as Integer, flush as boolean) as Ptr

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve a pointer to the accumulated encoded audio-data.
Notes: size: if set, the number of valid bytes in the buffer is stored in the buffer.
Flush: call FlushBuffer - reset the buffer write-pointer.

Returns pointer to encoder-buffer.

196.2.14 IncrementTimecode as Boolean

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Move the encoder to the next timecode frame.

196.2.15 Reset

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resets ecoder state.
Notes: Flushes buffer, reset biphase state.

196.2.16 SetBufferSize(SampleRate as Double, FPS as Double) as boolean

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configure a custom size for the internal buffer.
Notes: This is needed if you are planning to call EncoderReinit or if you want to keep more than one LTC frame's worth of data in the library's internal buffer.

The buffer-size is (1 + sample_rate / fps) bytes. resizing the internal buffer will flush all existing data in it - alike \ref FlushBuffer.

SampleRate: audio sample rate (eg. 48000)
FPS: video-frames per second (e.g. 25.0)

Returns 0 on success, -1 if allocation fails (which makes the encoder unusable, call discard the object or realloc the buffer)

196.2.17 SetFilter(RiseTime as Double)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set encoder signal rise-time / signal filtering.
Notes: LTC signal should have a rise time of 40us +/- 10 us. by default the encoder honors this and low-pass filters the output depending on the sample-rate.

If you want a perfect square wave, set 'rise_time' to 0.

Note EncoderReinit resets the filter-time-constant to use the default 40us for the given sample-rate, overriding any value previously set with SetFilter.

RiseTime the signal rise-time in us (10^(-6) sec), set to 0 for perfect square wave, default 40.0

196.2.18 SetVolume(dBFS as double) as boolean

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the volume of the generated LTC signal.
Notes: Typically LTC is sent at 0dBu ; in EBU callibrated systems that corresponds to -18dBFS. - by default libltc creates -3dBFS

since libltc generated 8bit audio-data, the minimum dBFS is about -42dB which corresponds to 1 bit.

0dB corresponds to a signal range of 127
1..255 with 128 at the center.

dBFS: the volume in dB full-scale (<= 0.0)

Returns true on success, false if the value was out of range

196.2.19 Properties

196.2.20 BufferPtr as Ptr

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve a pointer to the accumulated encoded audio-data.
Notes: (Read only property)

196.2.21 BufferSize as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Query the length of the internal buffer.
Notes: It is allocated to hold audio-frames for exactly one LTC frame for the given sample-rate and frame-

rate. ie. (1 + sample-rate / fps) bytes

Note this returns the total size of the buffer, not the used/free part. See also BufferPtr.

Returns size of the allocated internal buffer.
(Read only property)

196.2.22 Filter as Double

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current filter setting.
Notes: (Read and Write property)

196.2.23 Flags as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The flags used to create the encoder.
Notes: (Read only property)

196.2.24 FPS as Double

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The FPS setting.
Notes: (Read only property)

196.2.25 Frame as LTCFrameMBS

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Low-level access to the internal LTCFrame data.
Notes: Note: be careful to about dfbit flag in LTCFrameMBS object, the encoder sets this [only] upon initialization.
(Read and Write property)

196.2.26 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

196.2.27 SampleRate as Double

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current sample rate.
Notes: (Read only property)

196.2.28 Standard as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The TV Standard.
Notes: (Read only property)

196.2.29 TimeCode as LTCSMPTETimecodeMBS

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set the SMPTETimecode for the encoder LTC-frame.
Notes: The next call to EncodeByte or EncodeFrame will encode this time to LTC audio-samples.
Internally this call uses TimeToFrame because the LTCEncoder operates on LTCframes only.
(Read and Write property)

196.2.30 UserBits as UInt32

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set a 32-bits unsigned integer from the user-data bits.
Notes: It is written LSB first continiously int the eight user fields.
(Read and Write property)

196.3 class LTCFrameExtMBS

196.3.1 class LTCFrameExtMBS

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extended LTC frame - includes audio-sample position offsets, volume, etc.
Notes: Note: For TV systems, the sample in the LTC audio data stream where the LTC Frame starts is not necessarily at the same time as the video-frame which is described by the LTC Frame.

offStart denotes the time of the first transition of bit 0 in the LTC frame.

For 525/60 Television systems, the first transition shall occur at the beginning of line 5 of the frame with which it is associated. The tolerance is ¬± 1.5 lines.

For 625/50 systems, the first transition shall occur at the beginning of line 2 ¬± 1.5 lines of the frame with which it is associated.

Only for 1125/60 systems, the first transition occurs exactly at the vertical sync timing reference of the frame. ¬± 1 line.
Subclass of the LTCFrameMBS class.

196.3.2 Properties

196.3.3 OffEnd as Int64

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: OffEnd the sample in the stream corresponding to the end of the LTC frame.
Notes: (Read and Write property)

196.3.4 OffStart as Int64

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: OffStart the approximate sample in the stream corresponding to the start of the LTC frame.
Notes: (Read and Write property)

196.3.5 Reverse as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: If non-zero, a reverse played LTC frame was detected.
Notes: Since the frame was reversed, it started at offEnd and finishes as offStart (offEnd >offStart). (Note: in reverse playback the (reversed) sync-word of the next/previous frame is detected, this offset is corrected).
(Read and Write property)

196.3.6 SampleMax as UInt8

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum input sample signal for this frame (0..255).
Notes: (Read and Write property)

196.3.7 SampleMin as UInt8

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minimum input sample signal for this frame (0..255).
Notes: (Read and Write property)

196.3.8 Volume as Double

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The volume of the input signal in dbFS.
Notes: (Read and Write property)

196.3.9 biphaseTics(index as Integer) as Single

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Detailed timing info.
Notes: Phase of the LTC signal; the time between each bit in the LTC-frame in audio-frames. Summing all 80 values in the array will yield audio-frames/LTC-frame = (offEnd - offStart + 1).
Range of index is 0 to 79.
(Read and Write computed property)

196.4 class LTCFrameMBS

196.4.1 class LTCFrameMBS

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor for a new empty frame.
Example:

```
// create an LTC frame for a timecode and step it forward by one frame
Var tc As New LTCSMPTETimecodeMBS
tc.Hours = 1
tc.Mins = 0
tc.Secs = 59
tc.Frame = 24

Var frame As New LTCFrameMBS(tc, LTCMBS.LTC_TV_625_50)
Call frame.FrameIncrement(25, LTCMBS.LTC_TV_625_50)
Var nextTC As LTCSMPTETimecodeMBS = frame.TimeCode
MessageBox Format(nextTC.Hours, "00") + ":" + Format(nextTC.Mins, "00") + ":" + Format(nextTC.Secs,
"00") + ":" + Format(nextTC.Frame, "00") // 01:01:00:00
```

196.4.2 Methods

196.4.3 Clone as LTCFrameExtMBS

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones the frame.
Notes: Returns always LTCFrameExtMBS object.
Extended fields may not be set if LTCFrameMBS is cloned.

196.4.4 Constructor

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create a new frame.
Notes: Internally calls Reset to set soem default values.
See also:

- 196.4.5 Constructor(InputTimecode as LTCSMPTETimecodeMBS, TVStandard as Integer, Flags as Integer = 0) 23329
- 196.4.6 Constructor(other as LTCFrameMBS) 23329

196.4.5 Constructor(InputTimecode as LTCSMPTETimecodeMBS, TVStandard as Integer, Flags as Integer = 0)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Translate SMPTETimecode into its binary LTC representation and set the LTC frame's parity bit accordingly.
Notes: InputTimecode: timecode input
TVStandard: the TV standard to use for parity bit assignment
Flags: flags binary combination of flag values - here only LTC_USE_DATE and LTC_NO_PARITY are relevant.
If LTC_USE_DATE is given, user-fields in LTCFrame will be set from the date in SMPTETimecode, otherwise the user-bits are not modified. All non-timecode fields remain untouched - except for the parity bit unless LTC_NO_PARITY is given.
See also:

- 196.4.4 Constructor 23328
- 196.4.6 Constructor(other as LTCFrameMBS) 23329

196.4.6 Constructor(other as LTCFrameMBS)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes a frame with copying data from existing frame.
See also:

- 196.4.4 Constructor 23328
- 196.4.5 Constructor(InputTimecode as LTCSMPTETimecodeMBS, TVStandard as Integer, Flags as Integer = 0) 23329

196.4.7 FrameAlignment(samples_per_frame as Double, TVStandard as Integer) as UInt64

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: LTCFrame sample alignment offset.
Notes: There is a relative offset of the LTC-Frame start and the TV-frame.
The first bit of a LTC frame corresponds to a specific line in the actual video frame. When decoding this offset needs to be subtracted from the LTC-frame's audio-sample-time to match the TV-frame's start position.

For film frames or HDV the offset is zero.

samples_per_frame: audio-samples per timecode-frame (eg. 1920 = 48000/25)
TVStandard: the TV standard

Returns the offset in samples.

196.4.8 FrameDecrement(fps as integer, TVStandard as integer, Flags as integer = 0) as Boolean

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decrement the timecode by one Frame (1/framerate seconds) and set the Frame's parity bit accordingly (see SetParity)
Notes: fps: integer framerate (for drop-frame-timecode set frame->dfbit and round-up the fps).
TVStandard: the TV standard to use for parity bit assignment. If set to 1 the 25fps standard is enabled and LTC Frame bit 59 instead of 27 is used for the parity. It only has only has effect flag bit 4 (LTC_NO_PARITY) is cleared.
Flags: binary combination of flags - here only LTC_USE_DATE and LTC_NO_PARITY are relevant.

If the bit 0 is set (1) interpret user-data as date and decrement date if timecode wraps at 24h.
(Note: leap-years are taken into account, but since the year is two-digit only, the 100,400yr rules are ignored. "00" is assumed to be year 2000 which was a leap year.) bit 3 (8) indicates that the parity bit should not be touched.

Returns true if timecode was wrapped around at 23:59:59:ff, false otherwise.

196.4.9 FrameIncrement(fps as integer, TVStandard as integer, Flags as integer = 0) as Boolean

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Increment the timecode by one Frame (1/framerate seconds) and set the Frame's parity bit accordingly (see SetParity)
Notes: fps integer framerate (for drop-frame-timecode set frame->dfbit and round-up the fps).
TVStandard: the TV standard to use for parity bit assignment. If set to 1 the 25fps standard is enabled and LTC Frame bit 59 instead of 27 is used for the parity. It only has only has effect flag bit 4 (LTC_NO_PARITY) is cleared.
flags: binary combination of LTC_BG_FLAGS - here only LTC_USE_DATE and LTC_NO_PARITY are relevant.

If the bit 0 (1) is set (1) interpret user-data as date and increment date if timecode wraps after 24h.
(Note: leap-years are taken into account, but since the year is two-digit only, the 100,400yr rules are ignored. "00" is assumed to be year 2000 which was a leap year.)

Returns true if timecode was wrapped around after 23:59:59:ff, false otherwise

196.4.10 ParseBCGFlags(TVStandard as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse Binary Group Flags into standard independent format.
Notes: bit 0 (1) - BGF 0,
bit 1 (2) - BGF 1,
bit 2 (4) - BGF 2

TVStandard: the TV standard to use – see LTCFrameMBS class for BGF assignment.
Returns LTC Binary Group Flags.

196.4.11 Reset

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reset all values of a LTC FRAME to zero, except for the sync-word (0x3FFD) at the end.
Notes: The sync word is set according to architecture (big/little endian).
Also set the Frame's parity bit accordingly (see SetParity)

196.4.12 SetParity(TVStandard as Integer)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the parity of the LTC frame.
Notes: Bi-Phase Mark Phase Correction bit (bit 27 - or 59) may be set or cleared so that that every 80-bit word contains an even number of zeroes. This means that the phase in every Sync Word will be the same.

This is merely cosmetic; the motivation to keep the polarity of the waveform constant is to make finding the Sync Word visibly (on a scope) easier.

There is usually no need to call this function directly. The encoder utility functions TimeToFrame, FrameIncrement and FrameDecrement include a call to it.

Standard: If 1 (aka LTC_TV_625_50) , the 25fps mode (bit 59 - aka binary_group_flag_bit2) is used, otherwise the 30fps, 24fps mode (bit 27 – biphase_mark_phase_correction) is set or cleared.

196.4.13 Properties

196.4.14 BinaryGroupFlagBit0 as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: indicate user-data char encoding, see table above - bit 43.
Notes: 1 bit value, so only 0 or 1.
(Read and Write property)

196.4.15 BinaryGroupFlagBit1 as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: indicate timecode is local time wall-clock, see table above - bit 58.
Notes: 1 bit value, so only 0 or 1.
(Read and Write property)

196.4.16 BinaryGroupFlagBit2 as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: indicate user-data char encoding (or parity with 25fps), see table above - bit 59.
Notes: 1 bit value, so only 0 or 1.
(Read and Write property)

196.4.17 BiphaseMarkPhaseCorrection as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Bi-Phase Mark Phase Correction Bit.
Notes: The Bi-Phase Mark Phase Correction Bit (Bit 27 or 59) may be set or cleared so that that every 80-bit word contains an even number of zeroes. This means that the phase of the pulse train in every Sync Word will be the same.
(Read and Write property)

196.4.18 ColFrame as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colour-frame: timecode intentionally synchronized to a colour TV field sequence

Notes: 1 bit value, so only 0 or 1.
(Read and Write property)

196.4.19 Data as MemoryBlock

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The raw frame data as memoryblock.
Notes: When setting you can either pass 368 or 364 bytes (LTCFrameExt) or 10 bytes (LTCFrame)
(Read and Write property)

196.4.20 DFBit as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: indicated drop-frame timecode.
Notes: 1 bit value, so only 0 or 1.
(Read and Write property)

196.4.21 Frames as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set frames field.
Notes: Computed by the MBS Plugin for you as a convenience from both frames_tens and frames_unit.
(Read and Write property)

196.4.22 FrameTens as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: SMPTE framenumber BCD tens 0..3.
Notes: (Read and Write property)

196.4.23 FrameUnits as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: SMPTE framenumber BCD unit 0..9.
Notes: (Read and Write property)

196.4.24 Hours as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set hours field.
Notes: Computed by the MBS Plugin for you as a convenience from both hours_tens and hours_unit.
(Read and Write property)

196.4.25 HoursTens as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: SMPTE hours BCD tens 0..2.
Notes: (Read and Write property)

196.4.26 HoursUnits as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: SMPTE hours BCD unit 0..9.
Notes: (Read and Write property)

196.4.27 Mins as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set minutes field.
Notes: Computed by the MBS Plugin for you as a convenience from both minutes_tens and minutes_unit.
(Read and Write property)

196.4.28 MinsTens as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: SMPTE minutes BCD tens 0..6.
Notes: (Read and Write property)

196.4.29 MinsUnits as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: SMPTE minutes BCD unit 0..9.
Notes: (Read and Write property)

196.4.30 Secs as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set seconds field.
Notes: Computed by the MBS Plugin for you as a convenience from both seconds_tens and seconds_unit. (Read and Write property)

196.4.31 SecsTens as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: SMPTE seconds BCD tens 0..6
Notes: (Read and Write property)

196.4.32 SecsUnits as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: SMPTE seconds BCD unit 0..9
Notes: (Read and Write property)

196.4.33 SyncWord as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sync word file.
Notes: (Read and Write property)

196.4.34 TimeCode as LTCSMPTETimecodeMBS

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert binary LTCFrame into a SMPTETimecode.
Notes: (Read only property)

196.4.35 User1 as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: User defined bits.
Notes: You can set them as you like, but be aware you only have 4 bits here (value 0 to 15).
Usually set as a block of 32-bit using UserBits property in encoder.
(Read and Write property)

196.4.36 User2 as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: User defined bits.
Notes: You can set them as you like, but be aware you only have 4 bits here (value 0 to 15).
Usually set as a block of 32-bit using UserBits property in encoder.
(Read and Write property)

196.4.37 User3 as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: User defined bits.
Notes: You can set them as you like, but be aware you only have 4 bits here (value 0 to 15).
Usually set as a block of 32-bit using UserBits property in encoder.
(Read and Write property)

196.4.38 User4 as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: User defined bits.
Notes: You can set them as you like, but be aware you only have 4 bits here (value 0 to 15).
Usually set as a block of 32-bit using UserBits property in encoder.
(Read and Write property)

196.4.39 User5 as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: User defined bits.
Notes: You can set them as you like, but be aware you only have 4 bits here (value 0 to 15).
Usually set as a block of 32-bit using UserBits property in encoder.
(Read and Write property)

196.4.40 User6 as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: User defined bits.
Notes: You can set them as you like, but be aware you only have 4 bits here (value 0 to 15).
Usually set as a block of 32-bit using UserBits property in encoder.
(Read and Write property)

196.4.41 User7 as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: User defined bits.
Notes: You can set them as you like, but be aware you only have 4 bits here (value 0 to 15).
Usually set as a block of 32-bit using UserBits property in encoder.
(Read and Write property)

196.4.42 User8 as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: User defined bits.
Notes: You can set them as you like, but be aware you only have 4 bits here (value 0 to 15).
Usually set as a block of 32-bit using UserBits property in encoder.
(Read and Write property)

196.4.43 UserBits as UInt32

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all user bits as one 32-bit value.
Notes: (Read only property)

196.5 module LTCMBS

196.5.1 module LTCMBS

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The central module for global LTC methods.
Example:

```
// load the libltc library for SMPTE linear timecode
If LTCMBS.LibraryLoaded Then Return
If Not LTCMBS.LoadLibrary(SpecialFolder.Resources.Child("libltc.dylib")) Then
MessageBox "Can't load libltc: " + LTCMBS.LibraryLoadErrorMessage
End If
```

Notes: This plugin part can load libltc, a library to encode and decode linear timecode.

Linear (or Longitudinal) Timecode (LTC) is an encoding of timecode data as a Manchester-Biphase encoded audio signal.
The audio signal is commonly recorded on a VTR track or other storage media.

libltc facilitates decoding and encoding of LTC from/to timecode, including SMPTE date support.

see
https://github.com/x42/libltc

196.5.2 Methods

196.5.3 FrameToTime(OutputTimecode as LTCSMPTETimecodeMBS, InputFrame as LTCFrameMBS, Flags as Integer = 0)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert binary LTCFrame into a SMPTETimecode.
Notes: Binary combination of flags - here only LTC_USE_DATE is relevant.

if LTC_USE_DATE is set, the user-fields in LTCFrame will be parsed into the date variable of SMPTE-Timecode. otherwise the date information in the SMPTETimecode is set to zero.

196.5.4 LoadLibrary(file as folderitem) as boolean

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads LTC library from a file.
Notes: Please get a libltc.dll/so/dylib for your platform and tell the plugin where to load it here.

Returns true on success and false on failure.
See LibraryLoadErrorMessage and LibraryLoadError in case of error.
See also:

- 196.5.5 LoadLibrary(path as string) as boolean 23340

196.5.5 LoadLibrary(path as string) as boolean

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads LTC library from a file path.
Notes: Please get a libltc.dll/so/dylib for your platform and tell the plugin where to load it here.

Returns true on success and false on failure.
See LibraryLoadErrorMessage and LibraryLoadError in case of error.
See also:

- 196.5.4 LoadLibrary(file as folderitem) as boolean 23340

196.5.6 TimeToFrame(OutputFrame as LTCFrameMBS, InputTimecode as LTC-SMPTETimecodeMBS, TVStandard as Integer, Flags as Integer = 0)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Translate SMPTETimecode into its binary LTC representation and set the LTC frame's parity bit accordingly.
Notes: OutputFrame: the frame to be set
InputTimecode: timecode input
TVStandard: the TV standard to use for parity bit assignment
Flags: flags binary combination of flag values - here only LTC_USE_DATE and LTC_NO_PARITY are relevant.
If LTC_USE_DATE is given, user-fields in LTCFrame will be set from the date in SMPTETimecode, otherwise the user-bits are not modified. All non-timecode fields remain untouched - except for the parity bit

unless LTC_NO_PARITY is given.

196.5.7 Properties

196.5.8 LibraryLoaded as Boolean

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the library is loaded.
Notes: (Read only property)

196.5.9 LibraryLoadError as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The load error code.
Notes: (Read only property)

196.5.10 LibraryLoadErrorMessage as String

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The load error message.
Notes: (Read only property)

196.5.11 Constants

Constants

Constant	Value	Description
LTC_FRAME_BIT_COUNT	80	The bit count for a raw 80 bit LTC frame

Encoder and LTCframe flags

Constant	Value	Description
LTC_BGF_DONT_TOUCH	4	Encoder init or re-init does not touch the BGF bits (initial values after initialization is zero)
LTC_NO_PARITY	8	Parity bit is left untouched when setting or in/decrementing the encoder frame-number
LTC_TC_CLOCK	2	The Timecode is wall-clock aka freerun. This also sets BGF1 (unless LTC_BGF_DONT_TOUCH is given)
LTC_USE_DATE	1	LTCFrame <>SMPTETimecode converter and LTCFrame increment/decrement use date, also set BGF2 to '1' when encoder is initialized or re-initialized (unless LTC_BGF_DONT_TOUCH is given)

TV Standards

Constant	Value	Description
LTC_TV_1125_60	2	30fps
LTC_TV_525_60	0	30fps
LTC_TV_625_50	1	25fps
LTC_TV_FILM_24	3	24fps

196.6 class LTCSMPTETimecodeMBS

196.6.1 class LTCSMPTETimecodeMBS

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a human readable time representation, decimal values.
Example:

```
// build a timecode with date and convert it for display
Var tc As New LTCSMPTETimecodeMBS
tc.Years = 25 // two digit year
tc.Months = 6
tc.Days = 15
tc.Hours = 14
tc.Mins = 30
tc.Secs = 5
tc.Frame = 12
tc.TimeZone = "+0200"

MessageBox Format(tc.Hours, "00") + ":" + Format(tc.Mins, "00") + ":" + Format(tc.Secs, "00") + ":" +
Format(tc.Frame, "00")
// use it with LTCEncoderMBS.TimeCode to generate audio, see there
```

196.6.2 Methods

196.6.3 Constructor

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create a new empty timecode.
See also:

- 196.6.4 Constructor(other as LTCSMPTETimecodeMBS) 23343

196.6.4 Constructor(other as LTCSMPTETimecodeMBS)

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Constructors a new time object with copying given values.
See also:

- 196.6.3 Constructor 23343

196.6.5 Properties

196.6.6 Data as MemoryBlock

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets or sets data of this smtp timecode with a memoryblock.
Notes: (Read and Write property)

196.6.7 Date as Date

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set time stamp via date.
Notes: When setting we take the year mod 100 to fill years field and frame field is set to zero.

When querying we return year + 2000 if year <67 and otherwise year + 1900, so we can have a year range of 1967 to 2066.
(Read and Write property)

196.6.8 DateTime as DateTime

MBS Tools Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set time stamp via date.
Notes: When setting we take the year mod 100 to fill years field and frame field is set to zero.

When querying we return year + 2000 if year <67 and otherwise year + 1900, so we can have a year range of 1967 to 2066.
(Read and Write property)

196.6.9 Days as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The days field.
Notes: day of month 1..31
(Read and Write property)

196.6.10 Frame as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The frame field.
Notes: sub-second frame 0..(FPS - 1)
(Read and Write property)

196.6.11 Hours as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The hours field.
Notes: hour 0..23
(Read and Write property)

196.6.12 Mins as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minutes field.
Notes: minute 0..60
(Read and Write property)

196.6.13 Months as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The month field.
Notes: valid months are 1..12
(Read and Write property)

196.6.14 Secs as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The seconds field.
Notes: second 0..60
(Read and Write property)

196.6.15 TimeZone as String

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time zone field.
Notes: the timezone is maximum 5 characters: "+HHMM" textual representation
(Read and Write property)

196.6.16 Years as Integer

MBS Tools Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The years field.
Notes: LTC-date uses 2-digit year 00.99.
(Read and Write property)

Chapter 197

TimeZone

197.1 class TimeZoneMBS

197.1.1 class TimeZoneMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use TimeZone instead.
Function: Allows you to access information about the current time zone.
Example:

```
Var t as new TimeZoneMBS
MessageBox str(t.GmtDeltaTotalseconds)
```

Notes: on Mac OS Cocoa applications, better use newer NSTimezoneMBS class.
Blog Entries

- Cleanup Xojo Plugins
- MBS Xojo Plugins, version 20.2pr7
- MBS Xojo / Real Studio Plugins, version 14.2pr5

197.1.2 Properties

197.1.3 DaylightName as String

MBS Util Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A description for daylight saving time.
Example:

```
Var t as new TimeZoneMBS
MessageBox t.DaylightName
```

Notes: For example, "PDT" could indicate Pacific Daylight Time. This string can be empty.
e.g. "Mitteleurop√§ische Sommerzeit"
On Mac, please use NSTimeZoneMBS class.
(Read only property)

197.1.4 GmtDeltaHours as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Returns the GMT offset in hours.
Example:

```
Var t as TimeZoneMBS

t=new TimeZoneMBS

MessageBox format(t.GmtDeltaHours,"+00")+ ":" +format(t.GmtDeltaminutes,"00")+ ":" +format(t.GmtDeltaseconds,"00")
```

Notes: On Windows this information is not available.
(Read only property)

197.1.5 GmtDeltaMinutes as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Returns the GMT offset in minutes.
Example:

```
Var t as TimeZoneMBS

t=new TimeZoneMBS

MessageBox format(t.GmtDeltaHours,"+00")+ ":" +format(t.GmtDeltaminutes,"00")+ ":" +format(t.GmtDeltaseconds,"00")
```

Notes: On Windows this information is not available.
(Read only property)

197.1.6 GmtDeltaSeconds as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Returns the GMT offset in seconds.
Example:

```
Var t as TimeZoneMBS

t=new TimeZoneMBS

MessageBox format(t.GmtDeltaHours,"+00")+ ":" +format(t.GmtDeltaminutes,"00")+ ":" +format(t.GmtDeltaseconds,"00")
```

Notes: (Read only property)

197.1.7 GmtDeltaTotalseconds as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Returns the GMT offset in seconds.
Example:

```
Var t as new TimeZoneMBS

MessageBox str(t.GmtDeltaTotalseconds)
```

Notes: (Read only property)

197.1.8 Latitude as Double

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the latitude of the current position on earth.
Example:

```
Var longdeg,longmin as Integer
Var t as TimeZoneMBS

t=new TimeZoneMBS

longdeg=floor(t.longitude*90)
longmin=floor((t.longitude*90-longdeg)*60)

StaticText1.text=format(longdeg,"0")+"¬∞"
```

```
StaticText2.text=format(longmin,"0")+"'"
```

Notes: On Windows this information is not available.
(Read only property)

197.1.9 Longitude as Double

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the longitude of the current position on earth.
Example:

```
Var latdeg,latmin as Integer
Var t as TimeZoneMBS

t=new TimeZoneMBS

latdeg=floor(t.latitude*90)
latmin=floor((t.latitude*90-latdeg)*60)

StaticText1.text=format(latdeg,"0")+"¬∞"
StaticText2.text=format(latmin,"0")+"'"
```

Notes: On Windows this information is not available.
(Read only property)

197.1.10 StandardName as String

MBS Util Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A description for standard time.
Example:

```
Var t as new TimeZoneMBS
MessageBox t.StandardName
```

Notes: For example, "EST" could indicate Eastern Standard Time. This string can be empty.
e.g. "Mitteleurop√§ische Zeit"
On Mac, please use NSTimeZoneMBS class.
(Read only property)

Chapter 198

TouchBar

198.1 class LAContextMBS

198.1.1 class LAContextMBS

MBS Mac64bit Plugin, Plugin Version: 17.0, Platform: macOS, Targets: All.

Function: The class for local authentication via password or TouchID.
Example:

```
// ask the user to authenticate with Touch ID or the account password
// MyLAContext is a subclass of LAContextMBS with the evaluatePolicyResult event implemented.
// Context is a property of the window: Context As MyLAContext
Context = New MyLAContext

Var error As NSErrorMBS
If Context.canEvaluatePolicy(LAContextMBS.PolicyDeviceOwnerAuthentication, error) Then
Context.evaluatePolicy(LAContextMBS.PolicyDeviceOwnerAuthentication, "unlock your notes")
Else
MessageBox "Authentication not available: " + error.localizedDescription
End If

// in MyLAContext:
Sub evaluatePolicyResult(Success As Boolean, error As NSErrorMBS, Policy As Integer, localizedReason As
String, tag As Variant) Handles evaluatePolicyResult
If Success Then
System.DebugLog "Authenticated"
Else
System.DebugLog "Failed: " + error.localizedDescription
End If
End Sub
```

198.1.2 Methods

198.1.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.0, Platform: macOS, Targets: All.

Function: Whether the class is available.
Notes: Returns true on OS X 10.10 and newer in 64-bit application.

198.1.4 canEvaluatePolicy(Policy as Integer, byref Error as NSErrorMBS) as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.0, Platform: macOS, Targets: All.

Function: Determines if a particular policy can be evaluated.
Example:

```
try
Var e as NSErrorMBS

if lc.canEvaluatePolicy(lc.PolicyDeviceOwnerAuthenticationWithBiometrics, e) then
List.AddRow "Can authenticate with biometrics."
else
List.AddRow "Can't authenticate with biometrics."
```

```
end if
if e <>nil then
List.AddRow "Error: "+e.LocalizedDescription
end if

catch ex as NSExceptionMBS

List.AddRow "Exception: "+ex.Message

end try
```

Notes: Policies can have certain requirements which, when not satisfied, would always cause the policy evaluation to fail. Examples can be a passcode set or a fingerprint enrolled with Touch ID. This method allows easy checking for such conditions.

Applications should consume the returned value immediately and avoid relying on it for an extensive period of time. At least, it is guaranteed to stay valid until the application enters background.

policy: Policy for which the preflight check should be run.

error: contains error information if policy evaluation is not possible.

Returns true if the policy can be evaluated, false otherwise.

198.1.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 17.0, Platform: macOS, Targets: All.

Function: The constructor.

198.1.6 evaluatePolicy(Policy as Integer, localizedReason as String, Tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 17.0, Platform: macOS, Targets: All.

Function: Evaluates the specified policy.
Example:

```
Var lc as LAContextMBS // your context

try
```

```
lc.evaluatePolicy(lc.PolicyDeviceOwnerAuthenticationWithBiometrics, "We need to test.")

catch ex as NSExceptionMBS

List.AddRow "Exception: "+ex.Message

end try
```

Notes: Policy evaluation may involve prompting user for various kinds of interaction or authentication. Actual behavior is dependent on evaluated policy, device type, and can be affected by installed configuration profiles.

Be sure to keep a strong reference to the context while the evaluation is in progress. Otherwise, an evaluation would be canceled when the context is being deallocated.

The method does not block. Instead the event is called asynchronously when evaluation finishes.

Implications of successful policy evaluation are policy specific. In general, this operation is not idempotent. Policy evaluation may fail for various reasons, including user cancel, system cancel and others, see error codes.

policy: Policy to be evaluated.
localizedReason: Application reason for authentication. This string must be provided in correct localization and should be short and clear. It will be eventually displayed in the authentication dialog subtitle. A name of the calling application will be already displayed in title, so it should not be duplicated here.

198.1.7 invalidate

MBS Mac64bit Plugin, Plugin Version: 17.0, Platform: macOS, Targets: All.

Function: Invalidates the context.
Notes: The context is invalidated automatically when it is (auto)released. This method allows invalidating it manually while it is still in scope.

Invalidation terminates any existing policy evaluation and the respective call will fail with LAErrorAppCancel. After the context has been invalidated, it can not be used for policy evaluation and an attempt to do so will fail with LAErrorInvalidContext.

Invalidating a context that has been already invalidated has no effect.

198.1.8 isCredentialSet(CredentialType as Integer) as Boolean

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: macOS, Targets: All.

Function: Reveals if credential was set with this context.
Notes: type: Type of credential we are asking for.

Return true on success, false otherwise.

198.1.9 setCredential(credential as MemoryBlock, Type as Integer) as Boolean

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: macOS, Targets: All.

Function: Sets a credential to this context.
Notes: Some policies allow to bind application-provided credential with them.
This method allows credential to be passed to the right context.

credential: Credential to be used with subsequent calls. Setting this parameter to nil will remove any existing credential of the specified type.

Type: Type of the provided credential.

Return true if the credential was set successfully, false otherwise.

198.1.10 TouchIDAuthenticationMaximumAllowableReuseDuration as Double

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: macOS, Targets: All.

Function: The maximum value for LAContext touchIDAuthenticationAllowableReuseDuration property.
Notes: Returns -1 if value is not available.

198.1.11 Properties

198.1.12 biometryType as Integer

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: macOS, Targets: All.

Function: Indicates the type of the biometry supported by the device.
Notes: This property is set when canEvaluatePolicy has been called for a biometric policy.
The default value is BiometryTypeNone.

(Read only property)

198.1.13 evaluatedPolicyDomainState as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 17.0, Platform: macOS, Targets: All.

Function: Contains policy domain state.
Notes: This property is set only when evaluatePolicy is called and succesful Touch ID authentication was performed, or when canEvaluatePolicy succeeds for a biometric policy. It stays nil for all other cases. If finger database was modified (fingers were removed or added), evaluatedPolicyDomainState data will change. Nature of such database changes cannot be determined but comparing data of evaluatedPolicyDomainState after different evaluatePolicy will reveal the fact database was changed between calls.
(Read only property)

198.1.14 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 17.0, Platform: macOS, Targets: All.

Function: The internal object handle.
Notes: (Read and Write property)

198.1.15 interactionNotAllowed as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Allows running authentication in non-interactive mode.
Notes: If the context is used in a keychain query by the means of kSecUseAuthenticationContext, then setting this property to YES has the same effect as passing kSecUseNoAuthenticationUI in the query, i.e. the keychain call will eventually fail with errSecInteractionNotAllowed instead of displaying the authentication UI.

If this property is used with a LocalAuthentication evaluation, it will eventually fail with kErrorNotInteractive instead of displaying the authentication UI.
(Read and Write property)

198.1.16 localizedCancelTitle as String

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Cancel button title.
Notes: Allows cancel button title customization. A default title "Cancel" is used when this property is set

to empty string.
Requires MacOS 10.13 or newer.
(Read and Write property)

198.1.17 localizedFallbackTitle as String

MBS Mac64bit Plugin, Plugin Version: 17.0, Platform: macOS, Targets: All.

Function: Fallback button title.
Example:

```
Var lc as new MyLAContextMBS
lc.localizedFallbackTitle = "Just a test"
```

Notes: Allows fallback button title customization. A default title "Enter Password" is used when this property is left nil. If set to empty string, the button will be hidden.
(Read and Write property)

198.1.18 localizedReason as String

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Allows setting the default localized authentication reason on context.
Notes: A localized string from this property is displayed in the authentication UI if the caller didn't specify its own authentication reason (e.g. a keychain operation with kSecUseAuthenticationContext). This property is ignored if the authentication reason was provided by caller.
Requires MacOS 10.13 or newer.
(Read and Write property)

198.1.19 touchIDAuthenticationAllowableReuseDuration as Double

MBS Mac64bit Plugin, Plugin Version: 17.0, Platform: macOS, Targets: All.

Function: Time interval for accepting a successful Touch ID unlock from the past.
Notes: This property can be set with a time interval in seconds. If the device was successfully unlocked by Touch ID within this time interval, then Touch ID authentication on this context will succeed automatically and the reply block will be called without prompting user for Touch ID.

The default value is 0, meaning that no previous TouchID authentication can be reused.

The maximum supported interval is 5 minutes and setting the value beyond 5 minutes does not increase the accepted interval.

(Read and Write property)

198.1.20 Events

198.1.21 evaluatePolicyResult(Success as Boolean, error as NSErrorMBS, Policy as Integer, localizedReason as String, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 17.0, Platform: macOS, Targets: All.

Function: The event called for the result of evaluatePolicy method.
Notes: success: Reply parameter that is true if the policy has been evaluated successfully or false if the evaluation failed.

error: Reply parameter that is nil if the policy has been evaluated successfully, or it contains error information about the evaluation failure.

Typical error codes returned by this call are:
ErrorUserFallback if user tapped the fallback button
ErrorUserCancel if user has tapped the Cancel button
ErrorSystemCancel if some system event interrupted the evaluation (e.g. Home button pressed).

198.1.22 Constants

Constants

Constant	Value	Description
kLAErrorDomain	"com.apple.LocalAuthentication"	The error domain for Local Authentication.

Biometry Types

Constant	Value	Description
BiometryTypeFaceID	2	The device supports Face ID.
BiometryTypeNone	0	The device does not support biometry.
BiometryTypeTouchID	1	The device supports Touch ID.

Credential Types

Constant	Value	Description
CredentialTypeApplicationPassword	0	The credential type for an application password.
CredentialTypeSmartCardPIN	1	Smart card PIN provided by application. If not set, LocalAuthentication will ask users for the smart card PIN w necessary. Applications can provide the PIN using setCredential method. such case, LocalAuthentication will not show the smart card PIN user interf When entered from the LocalAuthentication user interface, the PIN is sto as UTF-8 encoded string.

Error Codes

Constant	Value	Description
kErrorAppCancel	-9	Authentication was canceled by application (e.g. invalidate was called while authentication was in progress).
kErrorAuthenticationFailed	-1	Authentication was not successful, because user failed to provide valid credentials.
kErrorBiometryLockout	-8	Authentication was not successful, because there were too many failed Biometry attempts and Biometry is now locked. Passcode is required to unlock Biometry, e.g. evaluating PolicyDeviceOwnerAuthenticationWithBiometrics will ask for passcode as a prerequisite.
kErrorBiometryNotAvailable	-6	Authentication could not start, because Biometry is not available on the device.
kErrorBiometryNotEnrolled	-7	Authentication could not start, because Biometry has no enrolled fingers.
kErrorInvalidContext	-10	LAContext passed to this call has been previously invalidated.
kErrorPasscodeNotSet	-5	Authentication could not start, because passcode is not set on the device.
kErrorSystemCancel	-4	Authentication was canceled by system (e.g. another application went to foreground).
kErrorTouchIDLockout	-8	Authentication was not successful, because there were too many failed Touch ID attempts and Touch ID is now locked. Passcode is required to unlock Touch ID, e.g. evaluating PolicyDeviceOwnerAuthenticationWithBiometrics will ask for passcode as a prerequisite.
kErrorTouchIDNotAvailable	-6	Authentication could not start, because Touch ID is not available on the device.
kErrorTouchIDNotEnrolled	-7	Authentication could not start, because Touch ID has no enrolled fingers.
kErrorUserCancel	-2	Authentication was canceled by user (e.g. tapped Cancel button).
kErrorUserFallback	-3	Authentication was canceled, because the user tapped the fallback button (Enter Password).

Policies

Constant	Value	Description
PolicyDeviceOwnerAuthentication	2	Device owner is going to be authenticated by biome Touch ID or user password authentication is requ available, not enrolled or locked out, then the user i away. Touch ID authentication dialog behaves similarly cyDeviceOwnerAuthenticationWithBiometrics. How button does not end the authentication. Instead, it s mechanism to user password.
PolicyDeviceOwnerAuthenticationWithBiometrics	1	The policy for owner authentication with biometrics
PolicyDeviceOwnerAuthenticationWithBiometricsOrWatch	4	Device owner is going to be authenticated by biome Watch or biometric authentication is required. If no can be found, it behaves as PolicyDeviceOwnerAuth Similarly, if biometry is unavailable it behaves as P ticationWithWatch. Watch authentication dialog looks and behaves simi When both mechanisms are available, user is asked authentication will run in parallel.
PolicyDeviceOwnerAuthenticationWithWatch	3	Watch authentication is required. If no nearby pa found, kErrorWatchNotAvailable is returned. Watch authentication dialog looks and behaves simi ant. Users can confirm authentication by double-c their watch.

198.2 class NSColorPickerTouchBarItemMBS

198.2.1 class NSColorPickerTouchBarItemMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The class for a TouchBar item showing a color picker.
Example:

```
// a color picker in the Touch Bar for the text color
// MyColorItem is a subclass of NSColorPickerTouchBarItemMBS with the Action event implemented.
// ColorItem is a property of the window: ColorItem As MyColorItem
// Bar is a property of the window: Bar As NSTouchBarMBS
ColorItem = New MyColorItem("com.example.color")
ColorItem.showsAlpha = False
ColorItem.color = NSColorMBS.blueColor

Var items() As NSTouchBarItemMBS
items.Add ColorItem
Var ids() As String = Array("com.example.color")
Bar = New NSTouchBarMBS
Bar.setTemplateItems items
Bar.setDefaultItemIdentifiers ids
Bar.AssignToWindow Self

// in MyColorItem:
Sub Action() Handles Action
Var c As Color = Me.color.colorValue
System.DebugLog "Picked color: " + c.Red.ToString + ", " + c.Green.ToString + ", " + c.Blue.ToString
End Sub
```

Notes: Subclass of the NSTouchBarItemMBS class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.5pr5

Xojo Developer Magazine

- 15.5, page 35: Touch√©, Using Apple's Touch Bar with Xojo by Marc Zeedar

198.2.2 Methods

198.2.3 colorPicker(identifier as string) as NSColorPickerTouchBarItemMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Creates a bar item containing a button with the standard color picker icon that invokes the color picker.
Example:

```
Var t as NSColorPickerTouchBarItemMBS = NSColorPickerTouchBarItemMBS.colorPicker("test")
t.customizationLabel = "Drawing Color"
```

Notes: You may want to use AddHandler method to add an event handler to this object.
See also:

- 198.2.4 colorPicker(identifier as string, buttonImage as NSImageMBS) as NSColorPickerTouchBarItemMBS 23362

198.2.4 colorPicker(identifier as string, buttonImage as NSImageMBS) as NSColorPickerTouchBarItemMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Creates a bar item containing a button with the provided image that invokes the color picker.
Notes: You may want to use AddHandler method to add an event handler to this object.
See also:

- 198.2.3 colorPicker(identifier as string) as NSColorPickerTouchBarItemMBS 23361

198.2.5 Constructor(identifier as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The designated initializer.
Example:

```
Var t as new NSColorPickerTouchBarItemMBS("test")
t.customizationLabel = "Drawing Color"
```

Notes: This instantiates a new touch bar item with the specified initializer.

198.2.6 strokeColorPicker(identifier as string) as NSColorPickerTouchBarItemMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Creates a bar item containing a button with the standard stroke color picker icon that invokes the color picker.
Notes: You may want to use AddHandler method to add an event handler to this object.
Should be used when the item is used for picking stroke colors.

198.2.7 textColorPicker(identifier as string) as NSColorPickerTouchBarItemMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Creates a bar item containing a button with the standard text color picker icon that invokes the color picker.
Notes: You may want to use AddHandler method to add an event handler to this object.
Should be used when the item is used for picking text colors.

198.2.8 Properties

198.2.9 color as NSColorMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The selected color of the picker.
Notes: (Read and Write property)

198.2.10 colorList as NSColorListMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The color list displayed in the list color picker.
Notes: Defaults to the standard system color list. Setting a custom color list will disable the additional tints/shades that appear on long-press.
(Read and Write property)

198.2.11 customizationLabel as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The localized string labelling this item during user customization.
Example:

```
Var t as new NSColorPickerTouchBarItemMBS("test")
t.customizationLabel = "Drawing Color"
```

Notes: The default value is empty string.
(Read and Write property)

198.2.12 enabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Enables or disabled the color picker.
Notes: If it is currently being shown in a popover, it will be dismissed.
(Read and Write property)

198.2.13 showsAlpha as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Whether or not the picker should allow picking a color with non-1.0 alpha.
Notes: Defaults to "not NSColor.ignoresAlpha".
(Read and Write property)

198.2.14 Events

198.2.15 Action

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The color picker changed color.

198.3 class NSCustomTouchBarItemMBS

198.3.1 class NSCustomTouchBarItemMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The class for a TouchBar item showing a custom view.
Notes: Subclass of the NSTouchBarItemMBS class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.5pr5

Xojo Developer Magazine

- 15.5, page 35: Touch√©, Using Apple's Touch Bar with Xojo by Marc Zeedar

198.3.2 Methods

198.3.3 Constructor(identifier as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The designated initializer.
Example:

```
Var t as new NSCustomTouchBarItemMBS("test")
t.customizationLabel = "My Test"
```

Notes: This instantiates a new touch bar item with the specified initializer.

198.3.4 Properties

198.3.5 customizationLabel as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The localized string labelling this item during user customization.
Example:

```
Var t as new NSCustomTouchBarItemMBS("test")
t.customizationLabel = "Drawing Color"
```

Notes: The default value is empty string.
(Read and Write property)

198.3.6 view as NSViewMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: A view to be displayed in the touch bar in the location corresponding to this item.
Notes: By default, the getter for this property will return this item's view controller's view. If this property is set explicitly, the view controller will be set to nil.
(Read and Write property)

198.3.7 viewController as NSViewControllerMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: A view controller whose view is to be displayed in the touch bar in the location corresponding to this item.
Notes: By default, this property is nil.
When set, this item's view property will automatically return the view associated with this view controller.
(Read and Write property)

198.4 class NSGroupTouchBarItemMBS

198.4.1 class NSGroupTouchBarItemMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The class for a TouchBar item showing a group.
Notes: Subclass of the NSTouchBarItemMBS class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.5pr5

198.4.2 Methods

198.4.3 Constructor(identifier as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The designated initializer.
Example:

```
Var t as new NSGroupTouchBarItemMBS("test")
t.customizationLabel = "My Group"
```

Notes: This instantiates a new touch bar item with the specified initializer.

198.4.4 groupItemWithIdentifier(identifier as string, items() as NSTouchBarItemMBS) as NSGroupTouchBarItemMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Returns an autoreleased NSGroupTouchBarItem with a groupTouchBar built from the given items array.
Example:

```
Var t as NSGroupTouchBarItemMBS = NSGroupTouchBarItemMBS.groupItemWithIdentifier("test")
t.customizationLabel = "My Group"
```

Notes: Customization is not enabled by default when creating a NSGroupTouchBarItem this way.

198.4.5 Properties

198.4.6 customizationLabel as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The localized string labelling this item during user customization.
Notes: The default value is empty string.
(Read and Write property)

198.4.7 groupTouchBar as NSViewControllerMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: A touch bar, presented seamlessly as part of the touch bar this item is hosted in.
Notes: This touch bar may have its own principal item, and can be customized (or not) per the normal touch bar customization rules.
By default this is an empty touch bar that cannot be customized.
(Read and Write property)

198.5 class NSPopoverTouchBarItemMBS

198.5.1 class NSPopoverTouchBarItemMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The class for a TouchBar item showing a popover.
Example:

```
// a Touch Bar button that opens more controls
// Bar is a property of the window: Bar As NSTouchBarMBS
// Popover is a property of the window: Popover As NSPopoverTouchBarItemMBS
// Brightness is a property of the window: Brightness As NSSliderTouchBarItemMBS
Brightness = New NSSliderTouchBarItemMBS("com.example.brightness")
Brightness.label = "Brightness"

Var inner As New NSTouchBarMBS
Var innerItems() As NSTouchBarItemMBS
innerItems.Add Brightness
Var innerIDs() As String = Array("com.example.brightness")
inner.setTemplateItems innerItems
inner.setDefaultItemIdentifiers innerIDs

Popover = New NSPopoverTouchBarItemMBS("com.example.adjust")
Popover.collapsedRepresentationLabel = "Adjust"
Popover.popoverTouchBar = inner
Popover.showsCloseButton = True

Var items() As NSTouchBarItemMBS
items.Add Popover
Var ids() As String = Array("com.example.adjust")
Bar = New NSTouchBarMBS
Bar.setTemplateItems items
Bar.setDefaultItemIdentifiers ids
Bar.AssignToWindow Self
```

Notes: Subclass of the NSTouchBarItemMBS class.

Xojo Developer Magazine

- 15.5, page 35: Touch√©, Using Apple's Touch Bar with Xojo by Marc Zeedar

198.5.2 Methods

198.5.3 Constructor(identifier as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The designated initializer.
Notes: This instantiates a new touch bar item with the specified initializer.

198.5.4 dismissPopover

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: This method will restore the previously visible main touch bar.
Notes: This method can be invoked explicitly to order out a popover if interacting with an item inside it should close it.

198.5.5 showPopover

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Replaces the main touch bar with this item's popover touch bar.
Notes: If this item is not visible, this method will have no effect. If this item ceases to be visible, the popover touch bar will automatically be ordered out.

198.5.6 Properties

198.5.7 collapsedRepresentation as NSViewMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The view displayed when the item is in its hosted touch bar.
Notes: By default, this is an NSButton whose target is this popover item, whose action is showPopover, and whose image and title are bound to this item's collapsedRepresentationImage and collapsedRepresentationLabel respectively.
(Read and Write property)

198.5.8 collapsedRepresentationImage as NSImageMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The image displayed by the button used by default for the default collapsed representation.
Notes: If the collapsedRepresentation button has been replaced by a different view, this property may not have any effect.
(Read and Write property)

198.5.9 collapsedRepresentationLabel as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The localized string displayed by the button used by default for the default collapsed representation.
Notes: If the collapsedRepresentation button has been replaced by a different view, this property may not have any effect. This property is archived.
(Read and Write property)

198.5.10 customizationLabel as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The localized string labelling this item during user customization.
Notes: The default value is empty string.
(Read and Write property)

198.5.11 popoverTouchBar as NSTouchBarMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The touch bar displayed when this item is "popped."
Notes: By default this is an empty touch bar that cannot be customized. This property is archived.
(Read and Write property)

198.5.12 pressAndHoldTouchBar as NSTouchBarMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: A touchbar to be used exclusively for press-and-hold popovers.
Notes: This touch bar can be the same as the one used for "popoverTouchBar" property, but does not have to be. When non-nil this touch bar will be displayed while the user holds their finger down on the collapsed representation and released when the user raises their finger. This tracking behavior is automatic, but popovers with custom collapsed representations will still need to send showPopover to start tracking.

(Read and Write property)

198.5.13 showsCloseButton as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: When true, automatically displays a close button in the popover.
Notes: When false it is the responsibility of the client to dismiss the popover.
(Read and Write property)

198.6 class NSSliderTouchBarItemMBS

198.6.1 class NSSliderTouchBarItemMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The class for a TouchBar item showing a slider.
Example:

```
// a Touch Bar slider to zoom between 50 and 200 percent
// MySliderItem is a subclass of NSSliderTouchBarItemMBS with the Action event implemented.
// ZoomItem is a property of the window: ZoomItem As MySliderItem
// Bar is a property of the window: Bar As NSTouchBarMBS
ZoomItem = New MySliderItem("com.example.zoom")
ZoomItem.label = "Zoom"
ZoomItem.customizationLabel = "Zoom Slider"
ZoomItem.minValue = 50
ZoomItem.maxValue = 200
ZoomItem.value = 100

Var items() As NSTouchBarItemMBS
items.Add ZoomItem
Var ids() As String = Array("com.example.zoom")
Bar = New NSTouchBarMBS
Bar.setTemplateItems items
Bar.setDefaultItemIdentifiers ids
Bar.AssignToWindow Self

// in MySliderItem:
Sub Action() Handles Action
System.DebugLog "Zoom: " + Format(Me.value, "0") + "%"
End Sub
```

Notes: Subclass of the NSTouchBarItemMBS class.
Blog Entries

Xojo Developer Magazine

- 15.5, page 35: Touch√©, Using Apple's Touch Bar with Xojo by Marc Zeedar

198.6.2 Methods

198.6.3 Constructor(identifier as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The designated initializer.
Example:

```
Var t as NSSliderTouchBarItemMBS = new NSSliderTouchBarItemMBS("test")
t.customizationLabel = "My Slider"
```

Notes: This instantiates a new touch bar item with the specified initializer.

198.6.4 Properties

198.6.5 customizationLabel as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The localized string labelling this item during user customization.
Notes: The default value is empty string.
(Read and Write property)

198.6.6 label as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The text label displayed along with the slider.
Example:

```
Var t as NSSliderTouchBarItemMBS = new NSSliderTouchBarItemMBS("test")
t.label = "Pen Size"
```

Notes: If set to nil, the label will not have space reserved in the item.
(Read and Write property)

198.6.7 maxValue as Double

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The maximum value of the slider.
Example:

```
Var t as NSSliderTouchBarItemMBS = new NSSliderTouchBarItemMBS("test")
t.minValue = 0.0
t.maxValue = 1.0
t.value = 0.5
```

Notes: (Read and Write property)

198.6.8 minValue as Double

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The minimum value of the slider.
Example:

```
Var t as NSSliderTouchBarItemMBS = new NSSliderTouchBarItemMBS("test")
t.minValue = 0.0
t.maxValue = 1.0
t.value = 0.5
```

Notes: (Read and Write property)

198.6.9 slider as NSSliderMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The slider displayed by the bar item.
Example:

```
Var t as NSSliderTouchBarItemMBS = new NSSliderTouchBarItemMBS("test")
t.minValue = 0.0
t.maxValue = 1.0
t.value = 0.5
```

Notes: It is automatically created, but can be set to a custom subclass.
Value, minValue, maxValue, etc can all be read and set through the slider.
(Read and Write property)

198.6.10 value as Double

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The current value of the slider.
Notes: (Read and Write property)

198.6.11 Events

198.6.12 Action

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The slider changed.

198.7 class NSTouchBarItemMBS

198.7.1 class NSTouchBarItemMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The class for a touch bar item.

- 15.5, page 37: Touch√©, Using Apple's Touch Bar with Xojo by Marc Zeedar

198.7.2 Methods

198.7.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Whether this class is available.
Example:

```
if NSTouchBarItemMBS.Available then
MessageBox "This Mac may have a TouchBar or not."
else
MessageBox "This Mac is too old for a TouchBar."
end if
```

Notes: Returns true on macOS 10.12.1 and newer, if the version with TouchBar support is installed.

198.7.4 Constructor(identifier as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The designated initializer.
Notes: This instantiates a new touch bar item with the specified initializer.

198.7.5 NSTouchBarItemIdentifierFixedSpaceLarge as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The identifier of an item appropriate for use as a large space in the touch bar.
Example:

```
// create flexible space item
Var t as new NSTouchBarItemMBS(NSTouchBarItemMBS.NSTouchBarItemIdentifierFixedSpaceLarge)
```

Notes: Generally, you can use this identifier in a touch bar's itemIdentifiers array, and it will instantiate that space for you.

198.7.6 NSTouchBarItemIdentifierFixedSpaceSmall as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The identifier of an item appropriate for use as a small space in the touch bar.
Example:

```
// create fixed space item
Var t as new NSTouchBarItemMBS(NSTouchBarItemMBS.NSTouchBarItemIdentifierFixedSpaceSmall)
```

Notes: Generally, you can use this identifier in a touch bar's itemIdentifiers array, and it will instantiate that space for you.

198.7.7 NSTouchBarItemIdentifierFlexibleSpace as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The identifier of an item appropriate for use as a flexible space in the touch bar.
Example:

```
// create flexible space item
Var t as new NSTouchBarItemMBS(NSTouchBarItemMBS.NSTouchBarItemIdentifierFlexibleSpace)
```

Notes: Generally, you can use this identifier in a touch bar's itemIdentifiers array, and it will instantiate that space for you.

198.7.8 NSTouchBarItemIdentifierOtherItemsProxy as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The identifier of the special "other items proxy."
Example:

```
// create proxy item
Var t as new NSTouchBarItemMBS(NSTouchBarItemMBS.NSTouchBarItemIdentifierOtherItemsProxy)
```

Notes: Generally, you can use this identifier in a touch bar's itemIdentifiers array, and a special proxy item will be instantiated for you. When the touch bar containing this item is visible, touch bars provided by items closer to the first responder will be nested inside the space denoted for this item. Space items on either side of this item will be automatically massaged to handle cases where the touch bar containing this identifier is itself the bar closest to the first responder (or closer bars are empty.)
Note that a touch bar lacking this item identifier will be replaced in its entirety by touch bars closer to the first responder.

198.7.9 Properties

198.7.10 customizationLabel as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The localized string labelling this item during user customization.
Notes: The default value is empty string.
(Read only property)

198.7.11 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

198.7.12 identifier as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The identifier of this item.
Notes: Apart from spaces, item identifiers should be globally unique.
(Read only property)

198.7.13 view as NSViewMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Intended for subclassing.
Notes: By default, this method returns this item's view controller's view.
(Read only property)

198.7.14 viewController as NSViewControllerMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Intended for subclassing.
Notes: By default, this method returns nil.
(Read only property)

198.7.15 visibilityPriority as Single

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: If there are more items in the touch bar than can be displayed, some will be hidden.
Example:

```
Var t as NSSliderTouchBarItemMBS = new NSSliderTouchBarItemMBS("test")
t.visibilityPriority = t.PriorityLow
```

Notes: Items with high visibility priority will be hidden after items with low visibility priority.
(Read and Write property)

198.7.16 visible as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: When true, this item is attached to a visible touch bar, and is being displayed.
Notes: Note that some types of items are never considered visible, for example spaces, other items proxys, and groups.
This property is key value observable.
(Read only property)

198.7.17 Events

198.7.18 Hidden

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the item is hidden.

198.7.19 Shown

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the item is shown.

198.7.20 Constants

Visibility Priority

Constant	Value	Description
PriorityHigh	1000	nItems with high visibility priority will be hidden after items with low visibility priority.one
PriorityLow	-1000	nItems with high visibility priority will be hidden after items with low visibility priority.one
PriorityNormal	0	nItems with high visibility priority will be hidden after items with low visibility priority.one

198.8 class NSTouchBarMBS

198.8.1 class NSTouchBarMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The class for a TouchBar on a new MacBook Pro.
Example:

```
// show a slider in the Touch Bar while this window is active
// MySliderItem is a subclass of NSSliderTouchBarItemMBS with the Action event implemented.
// VolumeItem is a property of the window: VolumeItem As MySliderItem
// Bar is a property of the window: Bar As NSTouchBarMBS
VolumeItem = New MySliderItem("com.example.volume")
VolumeItem.label = "Volume"
VolumeItem.minValue = 0
VolumeItem.maxValue = 100
VolumeItem.value = 50

Var items() As NSTouchBarItemMBS
items.Add VolumeItem
Var ids() As String = Array("com.example.volume")

Bar = New NSTouchBarMBS
Bar.setTemplateItems items
Bar.setDefaultItemIdentifiers ids
Bar.AssignToWindow Self

// in MySliderItem:
Sub Action() Handles Action
System.DebugLog "Volume: " + Me.value.ToString
End Sub
```

198.8.2 Methods

198.8.3 AssignToApp

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Assigns the TouchBar to be the main TouchBar for the whole app.

198.8.4 AssignToWindow(window as DesktopWindow)

MBS Mac64bit Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Assigns the TouchBar to be the given window.
Notes: The TouchBar on MacBook Pro will show this entries, if the given window is the front window.
See also:

- 198.8.5 AssignToWindow(window as NSWindowMBS) 23383
- 198.8.6 AssignToWindow(window as window) 23383

198.8.5 AssignToWindow(window as NSWindowMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Assigns the TouchBar to be the given window.
Notes: The TouchBar on MacBook Pro will show this entries, if the given window is the front window.
See also:

- 198.8.4 AssignToWindow(window as DesktopWindow) 23383
- 198.8.6 AssignToWindow(window as window) 23383

198.8.6 AssignToWindow(window as window)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Assigns the TouchBar to be the given window.
Notes: The TouchBar on MacBook Pro will show this entries, if the given window is the front window.
See also:

- 198.8.4 AssignToWindow(window as DesktopWindow) 23383
- 198.8.5 AssignToWindow(window as NSWindowMBS) 23383

198.8.7 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Whether this class is available.
Example:

```
if NSTouchBarMBS.Available then
MessageBox "This Mac may have a TouchBar or not."
else
MessageBox "This Mac is too old for a TouchBar."
end if
```

Notes: Returns true on macOS 10.12.1 and newer, if the version with TouchBar support is installed.

198.8.8 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The constructor.

198.8.9 customizationAllowedItemIdentifiers as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The items that are presented in the customization palette for the user to add to the touch bar.
Notes: These items will be presented to the user in the order specified in this array.

198.8.10 customizationRequiredItemIdentifiers as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Some items are too important to be removed.
Notes: The corresponding item identifiers should be listed here. During customization the user will be prevented from removing these items from the touch bar.

198.8.11 defaultItemIdentifiers as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: An array of identifiers specifying the items in this touch bar.

Notes: When constructing the instantiated items array, the identifiers in this array will be fed through the itemForIdentifier method.
Item identifiers should be globally unique, excepting NSTouchBarItemIdentifierFixedSpaceSmall, NSTouchBarItemIdentifierFixedSpaceLarge, NSTouchBarItemIdentifierFlexibleSpace, and NSTouchBarItemIdentifierOtherItemsProxy.

This array also corresponds to the item ordering for the receiver in the ‚Äúdefault set‚Äù in the customization palette.

198.8.12 itemForIdentifier(identifier as string) as NSTouchBarItemMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Returns an instantiated NSTouchBarItem for the given identifier.
Notes: Items are resolved from the following locations, in order:

- items already in the instantiated items array
- items in the defaultTouchBarItems set
- items returned from the delegate's -touchBar:makeItemForIdentifier: method
- some special identifiers are handled automatically

NSTouchBarItemIdentifierFixedSpaceSmall ->NSTouchBar will automatically create a standard small space
NSTouchBarItemIdentifierFixedSpaceLarge ->NSTouchBar will automatically create a standard large space
NSTouchBarItemIdentifierFlexibleSpace ->NSTouchBar will automatically create a standard flexible space
NSTouchBarItemIdentifierOtherItemsProxy ->NSTouchBar will automatically create a special item that acts as a proxy for the items of touch bars closer to the first responder.

198.8.13 itemIdentifiers as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The resolved array of item identifiers. If the bar has not been customized this will match the defaultItemIdentifiers.

198.8.14 RemoveTouchBarFromApp

MBS Mac64bit Plugin, Plugin Version: 17.3, Platform: macOS, Targets: Desktop only.

Function: Removes TouchBar for app.

198.8.15 RemoveTouchBarFromWindow(window as NSWindowMBS)

MBS Mac64bit Plugin, Plugin Version: 17.3, Platform: macOS, Targets: Desktop only.

Function: Removes TouchBar for window.
See also:

- 198.8.16 RemoveTouchBarFromWindow(window as window) 23386

198.8.16 RemoveTouchBarFromWindow(window as window)

MBS Mac64bit Plugin, Plugin Version: 17.3, Platform: macOS, Targets: Desktop only.

Function: Removes TouchBar for window.
See also:

- 198.8.15 RemoveTouchBarFromWindow(window as NSWindowMBS) 23386

198.8.17 setCustomizationAllowedItemIdentifiers(Identifiers() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Sets the items that are presented in the customization palette for the user to add to the touch bar.
Notes: These items will be presented to the user in the order specified in this array.

198.8.18 setCustomizationRequiredItemIdentifiers(Identifiers() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Sets the items are too important to be removed.
Notes: The corresponding item identifiers should be listed here. During customization the user will be prevented from removing these items from the touch bar.

198.8.19 setDefaultItemIdentifiers(Identifiers() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Sets the array of identifiers specifying the items in this touch bar.

198.8.20 setTemplateItems(Identifiers() as NSTouchBarItemMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Sets the template item identifiers.
Notes: Items in this set are the first step in resolving instantiated items from their identifiers.
If an item identifier is specified in the itemIdentifiers array, and an item with that identifier is in this set, it will be added to the items array in the corresponding location.

198.8.21 templateItems as NSTouchBarItemMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Items in this set are the first step in resolving instantiated items from their identifiers.
Notes: If an item identifier is specified in the itemIdentifiers array, and an item with that identifier is in this set, it will be added to the items array in the corresponding location.

198.8.22 toggleTouchBarCustomizationPalette

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Show or dismiss the customization palette for the currently displayed touch bars.
Notes: NSApplication validates this selector against whether the current touch bars are customizable and, if configured on a menu item, will standardize and localize the title. If the current system does not have touch bar support, the menu item will be automatically hidden.

198.8.23 Properties

198.8.24 automaticCustomizeTouchBarMenuItemEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Whether or not a menu item to customize the touch bar can be automatically added to the main menu.
Notes: It will only actually be added when a touch bar hardware or simulator is present. Defaults to false. Setting this property to True is the recommended way to add the customization menu item. But if non-standard placement of the menu item is needed, creating a menu item with an action of toggleTouchBarCustomizationPalette can be used instead.
(Read and Write property)

198.8.25 customizationIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: A string uniquely identifying this bar for customization purposes.
Notes: All bars with this identifier will have their items coordinated automatically during customization or instantiation.
Touch bars lacking a customizationIdentifier are not customizable.
(Read and Write property)

198.8.26 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

198.8.27 principalItemIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Specifying a principal item identifier communicates that the item with that identifier has special significance to this touch bar.
Notes: Currently, that item will be placed in the center of the resolved touch row. Note that multiple visible bars may each specify a principal item identifier - but only one of them can have the request honored.
(Read and Write property)

198.8.28 visible as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: When true, the touch bar is attached to an eligible touch bar provider, and its items are displayable, assuming adequate space.
Notes: (Read only property)

198.8.29 Events

198.8.30 DidEnterCustomization

MBS Mac64bit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The customization did start.

198.8.31 DidExitCustomization

MBS Mac64bit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The customization did exit.

198.8.32 Hidden

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bar is hidden.

198.8.33 makeItemForIdentifier(identifier as string) as NSTouchBarItemMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: When constructing the items array, this event will be invoked to construct a touch bar item if that item cannot be found in the defaultItems set.

198.8.34 Shown

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bar is shown.

198.8.35 WillEnterCustomization

MBS Mac64bit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The customization will start soon.

198.8.36 WillExitCustomization

MBS Mac64bit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The customization will exit soon.

Chapter 199

Translation

199.1 class TranslationRequestMBS

199.1.1 class TranslationRequestMBS

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: A translation request containing a single item of text to translate.
Example:

```
var r as new TranslationRequestMBS("Hello World")
```

Notes: Create a translation request to translate a string of text.
Initialize the request using "init(sourceText:clientIdentifier:)".
Set the 'sourceText' to the string of text you want to translate.
Then pass that request in an array to one of the batch translation functions.

Keep track of the correspondence between the responses and requests by setting the clientIdentifier on the sent request, then matching it with the Response/clientIdentifier of the received response when the translation completes.
Blog Entries

- Translation Framework in Xojo

- MBS Xojo Plugins, version 25.6pr1

199.1.2 Methods

199.1.3 Constructor(sourceText as String, clientIdentifier as String = "")

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Creates a request for translating a single string of text.

199.1.4 Properties

199.1.5 clientIdentifier as String

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: An optional unique identifier to associate a translation request with its response.
Notes: When you set this identifier, it returns the same value in the corresponding TranslationResponseMBS object.
(Read and Write property)

199.1.6 sourceText as String

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The input text the framework translates.
Notes: (Read and Write property)

199.2 class TranslationResponseMBS

199.2.1 class TranslationResponseMBS

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The response to a translation request.
Notes: You get a single response structure after you translate a string, or when you call one of the batch translation methods passing in an array of translation requests.

When the translation completes, a response instance returns with the translation result along with properties the framework used to perform the translation.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

199.2.2 Methods

199.2.3 Constructor

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

199.2.4 Properties

199.2.5 clientIdentifier as String

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The unique identifier matching the client identifier set in the translation request.
Notes: Use this identifier to associate a translation request with its response.
If you set a client identifier in the translation request, that same identifier returns in the response.
If the request contained no identifier, this value is empty.
(Read only property)

199.2.6 sourceLanguage as String

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The language identifier that the framework translated the text from.
Notes: (Read only property)

199.2.7 sourceText as String

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The original text to translate from.
Notes: (Read only property)

199.2.8 targetLanguage as String

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The language identifier that the framework translated the text into.
Notes: (Read only property)

199.2.9 targetText as String

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The result of the translation.
Notes: (Read only property)

199.3 class TranslationSessionMBS

199.3.1 class TranslationSessionMBS

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The class for a translation session.
Example:

```
Var session as new TranslationSessionMBS("en", "de")
Var Translation as TranslationResponseMBS = session.translateString("Hello World")
MessageBox "Translation of Hello World to German: "+Translation.targetText
```

Notes: Requires macOS or iOS in version 26. Or for older code path the macOS 15 and iOS 18 versions.

You can use NSLinguisticTaggerMBS class to detect which language a text has.
Blog Entries

- MBS Xojo Plugins, version 26.1pr1

- MBS Xojo Plugins, version 25.6pr1

199.3.2 Methods

199.3.3 Cancel

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Attempts to stop all ongoing work for the translation session.
Notes: Future requests will throw an error that the session is already cancelled.
Requires macOS 26.0 or iOS 26.0 or later.

199.3.4 Constructor(fromLanguageIdentifier as String, toLanguageIdentifier as String = "")

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Creates a translation session to translate between a given source and target language already installed on device.
Example:

```
// translate from German to English
var session as new TranslationSessionMBS("de", "en")
```

```
if session.isReady then
messageBox "Ready to translate"
else
messageBox "Not ready. User may need to download languages."
end if
```

Notes: If one or both of the languages aren't installed on the device already, attempting to translate will throw errors.

toLanguageIdentifier is optional and if empty will default to the users current locale.

199.3.5 isReady as Boolean

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Synchronous version of isReady.
Notes: Waits for callback and returns result.
Requires macOS 26.0 or iOS 26.0 or later.
See also:

- 199.3.6 isReady(completed as TranslationReadyCompletedMBS, Tag as Variant = nil) 23396

199.3.6 isReady(completed as TranslationReadyCompletedMBS, Tag as Variant = nil)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Queries a boolean value that indicates whether the system has installed the source and target languages of the session and is ready to begin translation.
Example:

```
// translate from German to English
var session as new TranslationSessionMBS("de", "en")

if session.isReady then
messageBox "Ready to translate"
else
messageBox "Not ready. User may need to download languages."
end if
```

Notes: Use this property to check whether a translation is likely to succeed. In a session that can request downloads, it prompts the person to approve downloads if languages aren't ready yet. In a session that can't

request downloads, it will throw an error if the person calls any functions when languages aren't ready.

Note: This value returns whether the languages are currently installed. The person or system can still delete the downloaded languages after calling this, so make sure you handle the appropriate errors when calling one of the translate functions.

The tag value is passed through to the delegate.

Requires macOS 26.0 or iOS 26.0 or later.
See also:

- 199.3.5 isReady as Boolean 23396

199.3.7 prepareTranslation(completed as TranslationPrepareTranslationCompletedMBS, Tag as Variant = nil)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Asks for permission to download translation languages without doing any translations.
Notes: If you know ahead of time which languages the person needs to translate, you can prompt them to download those languages in advance by calling this method.

When you call this method, the framework asks the person for permission to download the sourceLanguage and targetLanguage. If the languages are already installed or in the middle of downloading, the function returnswithout prompting them.

If you call this function when the sourceLanguage is empty, it unableToIdentifyLanguage error, since there's no sample text to identify which source language to use for translation.

The tag value is passed through to the delegate.

199.3.8 Status(FromLanguageIdentifier as String, ToLanguageIdentifier as String = "") as String

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Synchronous version of Status method.
Example:

```
Var Status_en_de as String = TranslationSessionMBS.Status("en", "de")
MessageBox "en ->de: "+Status_en_de
```

Notes: Waits for callback and returns result.
Returns installed, supported, unsupported, unknown or an error.
See also:

- 199.3.9 Status(FromLanguageIdentifier as String, ToLanguageIdentifier as String = """, completed as TranslationStatusCompletedMBS, Tag as Variant = nil) 23398

199.3.9 Status(FromLanguageIdentifier as String, ToLanguageIdentifier as String = """, completed as TranslationStatusCompletedMBS, Tag as Variant = nil)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Checks for the installation of a specific language pairing and whether it's ready for translation.
Notes: Use this function to check whether the system has installed the required language assets and the languages are ready to use for translation.

Note: The framework doesn't support translating from and to the same language. For example, you can't translate from English (US) to English (UK).

FromLanguageIdentifier: The source language of the content.
ToLanguageIdentifier: The target language you want to translate content into. When set to empty text, the system picks an appropriate target based on the person's preferred languages and returns the status for those languages.

Provides the availability status for a language pairing via the delegate later.
Value may be installed, supported, unsupported, unknown or an error.

The tag value is passed through to the delegate.

Installed languages models are stored in the mobile assets folder:
/System/Library/AssetsV2/com_apple_MobileAsset_SpeechTranslationAssets7
See also:

- 199.3.8 Status(FromLanguageIdentifier as String, ToLanguageIdentifier as String = """) as String 23397

199.3.10 StatusForText(SourceText as String, ToLanguageIdentifier as String = """) as String

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Synchronous version of StatusForText.
Notes: Waits for callback and returns result.

Returns installed, supported, unsupported, unknown or an error.
See also:

- 199.3.11 StatusForText(SourceText as String, ToLanguageIdentifier as String = """, completed as TranslationStatusCompletedMBS, Tag as Variant = nil) 23399

199.3.11 StatusForText(SourceText as String, ToLanguageIdentifier as String = """, completed as TranslationStatusCompletedMBS, Tag as Variant = nil)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Checks to see if the framework supports the language pairing based off a string of sample text.
Notes: Use this function when you don't know the source language and want the framework to attempt a translation based on the sample text you pass in.

Pass in a string of sample text representing the language you want to translate from. When you do, the system automatically tries to detect the language of the text you pass in. If it can't, it throws a TranslationError.

If it can detect the source language of the text, it checks for necessary language asset downloads and whether they're ready for use.

Note: For best results in automatic language detection, pass in a sample string of at least 20 characters in length.

SourceText: A sample string of text representing the source language you want to translation from.
ToLanguageIdentifier: The target language you want to translate content into. When set to empty, the system picks an appropriate target based on the person's preferred languages and returns the status for those languages.

Provides the availability status for a language pairing via the delegate later.
Value may be installed, supported, unsupported, unknown or an error.

The tag value is passed through to the delegate.
See also:

- 199.3.10 StatusForText(SourceText as String, ToLanguageIdentifier as String = "") as String 23398

199.3.12 SupportedLanguages as String()

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Synchronous version of SupportedLanguages.
Example:

```
Var SupportedLanguages() as String = TranslationSessionMBS.SupportedLanguages
MessageBox string.FromArray(SupportedLanguages, ", ")
```

Notes: Waits for callback and returns result.

Currently this list contains: vi, pt, uk, it, zh-TW, ko, en-GB, de, zh, ja, id, nl, fr, th, es, tr, pl, ar-AE, ru, en, and hi.
See also:

- 199.3.13 SupportedLanguages(completed as SupportedLanguagesCompletedMBS, Tag as Variant = nil) 23400

199.3.13 SupportedLanguages(completed as SupportedLanguagesCompletedMBS, Tag as Variant = nil)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Queries the list of translation languages the framework supports.
Notes: A language must download before it can be used in a translation.

The tag value is passed through to the delegate.
See also:

- 199.3.12 SupportedLanguages as String() 23399

199.3.14 translateBatch(Requests() as TranslationRequestMBS, completedOne as TranslateStringCompletedMBS, completed as TranslationsCompletedMBS, Tag as Variant = nil)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Translates multiple strings of text of the same language, returning a sequence of responses as they're available.
Notes: This function translates multiple strings of text incrementally and might display different UI depending on the state of the translation. The required languages for translation don't have to be installed before calling this method.

/ Pass in the strings of text you want to translate as an array of the Request type. Set the Request/clientIdentifier on each request so you can match the request with the response as the translations incrementally return.

If the required languages for translation have already downloaded and the source language is clear, this function returns results without showing any UI to the person.

If the source or target language aren't installed, the framework asks the person for permission to download the languages. During the download a progress indicator displays. After it completes, the framework performs the translation.

If the sourceLanguage is empty and the framework can't detect the source language from the content, the framework prompts the person to choose the source language.

The framework only supports string translations of the same language. The strings must either match the sourceLanguage you set in the configuration, or if the sourceLanguage is nil, be of the same language.

This function throws an Error if:

- The person doesn't agree to downloading the languages
- The person dismisses the progress view during language downloads
- TranslationSession fails system validation
- The session doesn't allow requesting downloads and languages aren't installed
- You already cancelled the session
- Something goes wrong during translation

If a person dismisses the progress view while the languages download, the system throws a usercancelled error, and the languages continue to download in the background.

Note: Calls to this function can take several minutes while languages download.

Calls the completedOne delegate (if not nil) for each translation as they are ready in random order. Then later calls completed event (if not nil)

The tag value is passed through to the delegate.

199.3.15 translateString(text as String) as TranslationResponseMBS

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Synchronous version of translateString.
Example:

```
Var session as new TranslationSessionMBS("en", "de")
Var Translation as TranslationResponseMBS = session.translateString("Hello World")
MessageBox "Translation of Hello World to German: "+Translation.targetText
```

Notes: Waits for callback and returns result.
See also:

- 199.3.16 translateString(text as String, completed as TranslateStringCompletedMBS, Tag as Variant = nil) 23402

199.3.16 translateString(text as String, completed as TranslateStringCompletedMBS, Tag as Variant = nil)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Translates a single string of text.
Example:

```
Var session as new TranslationSessionMBS("en", "de")
Var Translation as TranslationResponseMBS = session.translateString("Hello World")
MessageBox "Translation of Hello World to German: "+Translation.targetText
```

Notes: This function translates a single line of text and might display different UI depending on the state of the translation. The required languages for translation don't have to be installed before calling this method.

If the required languages for translation have already downloaded and the source language is clear, this function returns results without showing any UI to the person.

If the source or target language aren't installed, the framework asks the person for permission to download the languages. During the download a progress indicator displays. After it completes, the framework performs the translation.

If the sourceLanguage is empty and the framework can't detect the source language from the content, the framework prompts the person to choose the source language.

This function throws an Error if:

- The person doesn't agree to downloading the languages
- The person dismisses the progress view during language downloads
- TranslationSession fails system validation - The session doesn't allow requesting downloads and languages aren't installed

- You already cancelled the session - Something goes wrong during translation

If a person dismisses the progress view while the languages download, the system throws a usercancelled error, and the languages continue to download in the background.

Note: This function call can take several minutes while languages download.

The tag value is passed through to the delegate.
See also:

- 199.3.15 translateString(text as String) as TranslationResponseMBS 23401

199.3.17 translations(Requests() as TranslationRequestMBS) as TranslationResponseMBS()

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Synchronous version of translations.
Example:

```
// we translate from English to German
var session as new TranslationSessionMBS("en", "de")

// build an array of requests
var r1 as new TranslationRequestMBS("Hello World", "1")
var r2 as new TranslationRequestMBS("Just a test", "2")
var requests() as TranslationRequestMBS = array(r1, r2)

// we ask for translation
var responses() as TranslationResponseMBS = session.translations(requests)

// collect result and show
var texts() as string
for each response as TranslationResponseMBS in responses
texts.add response.clientIdentifier + ": " + response.targetText
next
MessageBox string.FromArray(texts, EndOfLine)
```

Notes: Waits for callback and returns result.
See also:

- 199.3.18 translations(Requests() as TranslationRequestMBS, completed as TranslationsCompletedMBS, Tag as Variant = nil) 23404

199.3.18 translations(Requests() as TranslationRequestMBS, completed as TranslationsCompletedMBS, Tag as Variant = nil)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Translates multiple strings of text of the same language, returning the results all at once when complete.
Notes: This function translates multiple strings as a batch and might display different UI depending on the state of the translation. The languages the framework requires for the translation don't have to be installed before calling this method.

Pass in the strings of text you want to translate as an array of the Request type. This method takes longer to return than translateBatch, but it has the advantage of not having to map translation requests to responses. The responses return in the same order the requests are sent.

If the required languages for translation have already downloaded and the source language is clear, this function returns results without showing any further prompts to the person.

If the source or target language aren't installed, the framework asks the person for permission to download the languages. During download a progress indicator displays. After the download completes, the framework performs the translation.

If the sourceLanguage is empty and the framework can't detect the source language from the content, the framework prompts the person to choose the source language.

The framework only supports string translations of the same language. The strings must either match the sourceLanguage you set in the configuration, or if the sourceLanguage is empty, be of the same language.

This function throws an Error if: - The person doesn't agree to downloading the languages - The person dismisses the progress view during language downloads - TranslationSession fails system validation - The session doesn't allow requesting downloads and languages aren't installed - You already cancelled the session - Something goes wrong during translation

If a person dismisses the progress view while the languages download, the system throws a usercancelled error, and the languages continue to download in the background.

Note: Calls to this function can take several minutes while languages download.

The tag value is passed through to the delegate.
See also:

- 199.3.17 translations(Requests() as TranslationRequestMBS) as TranslationResponseMBS() 23403

199.3.19 Properties

199.3.20 Available as Boolean

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Returns true when the framework is available.
Example:

```
if TranslationSessionMBS.Available then
// okay
else
MessageBox "This example needs macOS 26."
end if
```

Notes: Basically checks for macOS/iOS 26.

Or for the older code path to macOS 15 and iOS 18.
(Read only property)

199.3.21 canRequestDownloads as Boolean

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: A boolean value that indicates whether a translation session can request language downloads.
Notes: If this property is true, then the system prompts the person to authorize downloading additional languages if they aren't already installed.

If this property is false, then the session cannot request language downloads and will throw the error TranslationError/notInstalled if you attempt to translate and the languages aren't installed.

Requires macOS 26.0 or iOS 26.0 or later.
(Read only property)

199.3.22 sourceLanguage as String

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The input language to translate from.
Notes: If this value is set to empty, the session tries to identify the source language automatically. If it can't identify the language, it prompts the person to choose the source language to use for the translation.

Note: This value doesn't update after translation. To see what source language the session uses for a particular translation, check the response sourceLanguage property.
(Read only property)

199.3.23 targetLanguage as String

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The output language to translate into.
Notes: If this value is set to nil, the session chooses an optimal language to translate into based on the sourceLanguage and the person's preferred languages.

Note: This value doesn't update after translation. To see what target language the session uses for a particular translation, check the response targetLanguage property.
(Read only property)

199.3.24 Constants

Languages

Constant	Value	Description
LanguageArabicUAE	"ar-AE"	Arabic (United Arab Emirates)
LanguageChinese	"zh"	Chinese
LanguageChineseTraditional	"zh-TW"	Traditional Chinese
LanguageDutch	"nl"	Dutch
LanguageEnglish	"en"	English
LanguageEnglishUK	"en-GB"	English (United Kingdom)
LanguageFrench	"fr"	French
LanguageGerman	"de"	German
LanguageHindi	"hi"	Hindi
LanguageIndonesian	"id"	Indonesian
LanguageItalian	"it"	Italian
LanguageJapanese	"ja"	Japanese
LanguageKorean	"ko"	Korean
LanguagePolish	"pl"	Polish
LanguagePortuguese	"pt"	Portuguese
LanguageRussian	"ru"	Russian
LanguageSpanish	"es"	Spanish
LanguageThai	"th"	Thai
LanguageTurkish	"tr"	Turkish
LanguageUkrainian	"uk"	Ukrainian
LanguageVietnamese	"vi"	Vietnamese

199.3.25 Delegates

199.3.26 SupportedLanguagesCompletedMBS(errorMessage as String, identifiers() as String, Tag as Variant)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The call to querySupportedLanguages completes.
Notes: Provides an array of languages the framework supports.

If an error occurred, we report it in errorMessage. So if errorMessage is empty, we had no error.

199.3.27 TranslateStringCompletedMBS(errorMessage as String, Response as TranslationResponseMBS, Tag as Variant)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The translation of one string finished.
Notes: If an error occurred, we report it in errorMessage. So if errorMessage is empty, we had no error.
Blog Entries

- Translation Framework in Xojo

199.3.28 TranslationPrepareTranslationCompletedMBS(errorMessage as String, Tag as Variant)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The delegate called when prepareTranslation method finished.
Notes: If an error occurred, we report it in errorMessage. So if errorMessage is empty, we had no error.

199.3.29 TranslationReadyCompletedMBS(errorMessage as String, ready as Boolean, Tag as Variant)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The delegate called when isReady got the answer.
Notes: If an error occurred, we report it in errorMessage. So if errorMessage is empty, we had no error.

199.3.30 TranslationsCompletedMBS(errorMessage as String, Responses() as TranslationResponseMBS, Tag as Variant)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The delegate called when translations are completed.
Notes: Provides an array of responses containing the text translations matching the order they were sent.

If an error occurred, we report it in errorMessage. So if errorMessage is empty, we had no error.
Blog Entries

- Translation Framework in Xojo

199.3.31 TranslationStatusCompletedMBS(errorMessage as String, Status as String, Tag as Variant)

MBS Swift Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The status result came back.
Notes: Status is installed, supported, unsupported or unknown.

If an error occurred, we report it in errorMessage. So if errorMessage is empty, we had no error.

Chapter 200

Twain

200.1 class TwainIdentityMBS

200.1.1 class TwainIdentityMBS

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: Provides identification information about a TWAIN entity.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

200.1.2 Methods

200.1.3 Constructor

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: The private constructor.

200.1.4 Properties

200.1.5 Id as Integer

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: A unique, internal identifier for the TWAIN entity.
Notes: This field is only filled by the Source Manager. Neither an application nor a Source should fill this field. The Source uses the contents of this field to "identify" which application is invoking the operation sent

to the Source.
(Read and Write property)

200.1.6 Manufacturer as String

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: String identifying the manufacturer of the application or Source. e.g. "Aldus".
Notes: (Read and Write property)

200.1.7 ProductFamily as String

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: Tells an application that performs device-specific operations which product family the Source supports.
Notes: This is useful when a new Source has been released and the application doesn't know about the particular Source but still wants to perform Custom operations with it. e.g. "ScanMan".
(Read and Write property)

200.1.8 ProductName as String

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: A string uniquely identifying the Source.
Notes: This is the string that will be displayed to the user at Source select-time. This string must uniquely identify your Source for the user, and should identify the application unambiguously for Sources that care. e.g. "ScanJet IIc".
(Read and Write property)

200.1.9 ProtocolMajor as Integer

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: Major number of latest TWAIN version that this element supports.
Notes: (Read and Write property)

200.1.10 ProtocolMinor as Integer

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: Minor number of latest TWAIN version that this element supports.
Notes: (Read and Write property)

200.1.11 SupportedGroups as Integer

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: Supported grosups.
Notes: The application will normally set this field to specify which Data Group(s) it wants the Source Manager to sort Sources by when presenting the Select Source dialog, or returning a list of available Sources. The application sets this prior to invoking a SelectDS operation.

- The application may also set this field to specify which Data Group(s) it wants the Source to be able to acquire and transfer. The application must do this prior to sending the Source its EnableDS operation.
- The Source must set this field to specify which Data Group(s) it can acquire. It will do this in response to a OpenDS.
- Beginning with TWAIN 2.0 the Source Manager reserves the most significant two byes in the SupportedGroups for the Data Flags (&h0001000 to &hFFFF0000).

DF_DSM2–identifies the Source Manager as TWAIN 2.0 compliant DF_APP2 –is set by an Application that is TWAIN 2.0 compliant DF_DS2–is set by a Source that is TWAIN 2.0 compliant
(Read and Write property)

200.1.12 Version as TwainVersionMBS

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: The version information.
Notes: (Read and Write property)

200.2 class TwainImageInfoMBS

200.2.1 class TwainImageInfoMBS

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: Describes the "real" image data, that is, the complete image being transferred between the Source and application.
Notes: The Source may transfer the data in a different format–the information may be transferred in "strips" or "tiles" in either compressed or uncompressed form. See the TW_IMAGEMEMXFER structure for more information.
The term "sample" is referred to a number of times in this structure. It holds the same meaning as in the TIFF specification. A sample is a contiguous body of image data that can be categorized by the channel or "ink color" it was captured to describe. In an R-G-B (Red-Green-Blue) image, such as on your TV or computer's CRT, each color channel is composed of a specific color. There are 3 samples in an R-G-B; Red, Green, and Blue. A C-Y-M-K image has 4 samples. A Grayscale or Black and White image has a single sample.
Note: The value -1 in ImageWidth and ImageLength are special cases. It is possible for a Sourcetonot-knoweitheritsWidthorLength. Applicationsneedtoconsiderthiswhen allocating memory or otherwise dealing with the size of the Image.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

200.2.2 Methods

200.2.3 BitsPerSample(index as Integer) as Integer

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: For each sample, the number of bits of information.
Notes: 24-bit R-G-B will typically have 8 bits of information in each sample (8+8+8). Some 8-bit color is sampled at 3 bits Red, 3 bits Green, and 2 bits Blue. Such a scheme would put 3, 3, and 2 into the first 3 elements of this array. The supplied array allows up to 8 samples. Samples are not limited to 8 bits. However, both the application and Source must simultaneously support sample sizes greater than 8 bits per color.

Index from 0 to 7.

200.2.4 Constructor

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: The private constructor.

200.2.5 Properties

200.2.6 BitsPerPixel as Integer

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: The number of bits in each image pixel (or bit depth).
Notes: This value is invariant across the image. 24-bit R-G-B has BitsPerPixel = 24. 40-bit C-M-Y-K has BitsPerPixel=40. 8-bit Grayscale has BitsPerPixel = 8. Black and White has BitsPerPixel = 1.
(Read and Write property)

200.2.7 Compression as Integer

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: The compression method used to process the data being transferred.
Notes: Default is no compression.
(plugin currently only supports no compression)
(Read and Write property)

200.2.8 ImageLength as Integer

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: How tall/long, in pixels, the image to be transferred is.
Notes: If the Source doesn't know, set this field to -1 (hand scanners may do this).
-1 can only be used if the application has set ICAP_UNDEFINEDIMAGESIZE to TRUE.
(the plugin doesn't support undefined image size)
(Read and Write property)

200.2.9 ImageWidth as Integer

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: How wide, in pixels, the entire image to be transferred is.
Notes: If the Source doesn't know, set this field to -1 (hand scanners may do this).
-1 can only be used if the application has set ICAP_UNDEFINEDIMAGESIZE to TRUE.
(the plugin doesn't support undefined image size)
(Read and Write property)

200.2.10 PixelType as Integer

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: This is the highest categorization for how the data being transferred should be interpreted by the application.
Notes: This is how the application can tell if the data is Black and White, Grayscale, or Color. Currently, the only color type defined is "tri-stimulus", or color described by three characteristics. Most popular color description methods use tri- stimulus descriptors. For simplicity, the constant used to identify tri-stimulus color is called TWPT_RBG, for R-G-B color. There is no default for this value. Fill this field with the appropriate TWPT_xxxx constant.

The plugin does currently only support RGB, GRAY, BW and PALETTE.
(Read and Write property)

200.2.11 Planar as Boolean

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: Whether image is planar.
Notes: If SamplesPerPixel >1, indicates whether the samples follow one another on a pixel-by-pixel basis (R-G-B-R-G-B-R-G-B...) as is common with a one-pass scanner or all the pixels for each sample are grouped together (complete group of R, complete group of G, complete group of B) as is common with a three-pass scanner. If the pixel-by-pixel method (also known as "chunky") is used, the Source should set Planar = false. If the grouped method (also called "planar") is used, the Source should set Planar = true.
(Read and Write property)

200.2.12 RowBytes as Integer

MBS Picture Plugin, Plugin Version: 12.5, Platforms: macOS, Windows, Targets: All.

Function: The number of bytes in a row.
Notes: This is not exactly the value as you may expect as Twain needs some rounding.
(Read and Write property)

200.2.13 SamplesPerPixel as Integer

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: The number of samples being returned.
Notes: For R-G-B, this field would be set to 3. For C-M-Y-K, 4. For Grayscale or Black and White, 1.
(Read and Write property)

200.2.14 XResolution as Double

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: Horizontal resolution.
Notes: In pixels per inch.
(Read and Write property)

200.2.15 YResolution as Double

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: Vertical resolution.
Notes: In pixels per inch.
(Read and Write property)

200.3 class TwainImageLayoutMBS

200.3.1 class TwainImageLayoutMBS

MBS Picture Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: All.

Function: The class for an image layout.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr4

200.3.2 Methods

200.3.3 Constructor

MBS Picture Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: All.

Function: The private constructor.

200.3.4 Properties

200.3.5 Bottom as Double

MBS Picture Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: All.

Function: The bottom coordinate of the item.
Notes: (Read and Write property)

200.3.6 DocumentNumber as Integer

MBS Picture Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: All.

Function: The document number.
Notes: (Read and Write property)

200.3.7 FrameNumber as Integer

MBS Picture Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: All.

Function: The frame number.
Notes: (Read and Write property)

200.3.8 Height as Double

MBS Picture Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: All.

Function: The height of the item.
Notes: (Read only property)

200.3.9 Left as Double

MBS Picture Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: All.

Function: The left coordinate of the item.
Notes: (Read and Write property)

200.3.10 PageNumber as Integer

MBS Picture Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: All.

Function: The page number.
Notes: (Read and Write property)

200.3.11 Right as Double

MBS Picture Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: All.

Function: The right coordinate of the item.
Notes: (Read and Write property)

200.3.12 Top as Double

MBS Picture Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: All.

Function: The top coordinate of the item.
Notes: (Read and Write property)

200.3.13 Width as Double

MBS Picture Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: All.

Function: The width of the item.
Notes: (Read only property)

200.4 class TwainMBS

200.4.1 class TwainMBS

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: The plugin class for scanning with TWAIN compatible scanners.
Example:

```
// let the user choose a scanner and scan one page into a picture on Windows
Var twain As New TwainMBS(TwainMBS.TWCY_USA, TwainMBS.TWLG_USA)
twain.OpenDSM
twain.SelectDS // shows the device selection dialog
twain.OpenDS

Var pic As Picture = twain.Acquire(True, True) // modal, with scanner dialog
If pic <>Nil Then
// show pic in a Canvas or ImageViewer, or save it
End If

twain.CloseDS
twain.CloseDSM
```

Notes: Use is like this:

- Declare subclass of TwainMBS so you can get events.
- Create new instance of your subclass and store object in some window/app/module property.
- For Windows call InstallEvent.
- To scan, call Acquire method.
- If driver runs synchronously, a modal window shows and you get back a picture object right away when scanning is done.
- If driver runs asynchronously, it shows a non modal window and you receive events.
- In TransferReady event you can call TransferImage method. In example a timer is triggered so this runs in the window.
- To cleanup, use DisableDS and CloseDS methods.
- We recommend only to have one instance of the TwainMBS object.

When Xojo or Xojo is used (32 bit), we can of course only see and use devices with 32 bit drivers.
Once Xojo will be ported to 64bit, we can only talk to 64bit drivers.

For 64-bit on Windows you can find 64-bit TwainDSM.dll here:
https://github.com/twain/twain-dsm

200.4.2 Methods

200.4.3 Acquire(modal as boolean = false, showUI as boolean = true) as picture

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Acquires a new picture.
Notes: Lasterror is set.
Plugin asks for asynchronously operation, so this function returns nil and success in lasterror.
If data source must be used with modal UI, this function returns with picture.

Modal can be true to ask for modal dialog. Seems to be only supported on Mac.

200.4.4 AllDevices as TwainIdentityMBS()

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns array with all devices.
Example:

```
Var twain as TwainMBS // your twain object
Var devices() as TwainIdentityMBS = twain.AllDevices
Var found as Boolean
Var NameToFind as string = "MyScanner123"
```

```
for each device as TwainIdentityMBS in devices

if device.ProductName = NameToFind then
found = true

// lets use this one
twain.SelectDS(device)

if twain.Lasterror <>0 then
MessageBox "Failed to select "+device.ProductName
else
'MessageBox "OK"
exit
end if
end if
next

if not found then
MessageBox "No scanner found named: "+NameToFind
end if
```

200.4.5 AppIdentity as TwainIdentityMBS

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries app identity.
Notes: That's the identity the plugin used to register with twain library.

200.4.6 CanBW as boolean

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether device supports black and white pixel type.
Notes: Lasterror is set.

200.4.7 CanGray as boolean

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether device supports gray pixel type.
Notes: Lasterror is set.

200.4.8 CanPalette as boolean

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether current device supports palette pixel type.
Notes: Lasterror is set.

200.4.9 CanRGB as boolean

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether current device supports RGB pixel type.
Notes: Lasterror is set.

200.4.10 CloseDS

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Close data source.
Notes: Lasterror is set.

200.4.11 CloseDSM

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Closes the data source manager.
Notes: Lasterror is set.

200.4.12 Constructor(Country as Integer, Language as Integer)

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Initializes Twain engine with given localization.
Notes: Lasterror is set.

200.4.13 DisableDS

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Diables data source.
Notes: Lasterror is set.

200.4.14 DontUnload

MBS Picture Plugin, Plugin Version: 12.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: Informs the plugin to not unload the twain library.
Notes: This avoids a crash for some people.

200.4.15 DSIdentity as TwainIdentityMBS

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the details on the data source.
Notes: Lasterror is set.

200.4.16 GetEnumerationCapability(ID as Integer, byref ItemType as Integer, byref Count as Integer, byref CurrentIndex as Integer, byref DefaultIndex as Integer) as Integer()

MBS Picture Plugin, Plugin Version: 15.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries an enum capability.
Example:

```
Var t as TwainMBS // your twain object

// check supported sizes

const ICAP_SUPPORTEDSIZES = &h1122
Var type5 as Integer
Var EnumCount as Integer = 0
Var EnumItemType as Integer = 0
Var EnumCurrentIndex as Integer = 0
Var EnumDefaultIndex as Integer = 0
Var EnumValues() as Integer = t.GetEnumerationCapability(ICAP_SUPPORTEDSIZES, EnumItemType,
EnumCount, EnumCurrentIndex, EnumDefaultIndex)
Var e5 as Integer = t.Lasterror
Var c5 as Integer = t.ConditionCode
```

Notes: Please review Twain Documentation for details.

Please open data source before via OpenDS method.
This should work fine for all integer enum types like boolean, 8, 16 or 32 bit integers.
Sets lasterror and condition code.
(if lasterror is 1 and condition code is 13, the capability is not supported)

200.4.17 GetIntegerCapability(ID as Integer, byref Type as Integer) as Integer

MBS Picture Plugin, Plugin Version: 15.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries an integer capability.
Example:

```
Var t as TwainMBS // your twain object

t.OpenDS

if t.Lasterror <>0 then
MessageBox "Failed to open device: "+str(t.Lasterror)
Return
end if

const CAP_FEEDERENABLED = &h1002
const CAP_FEEDERLOADED = &h1003
const TWRC_FAILURE = 1
const TWCC_CAPUNSUPPORTED = 13

// query before
Var type1 as Integer
Var n1 as Integer = t.GetIntegerCapability(CAP_FEEDERENABLED, type1)
Var e1 as Integer = t.Lasterror
Var c1 as Integer = t.ConditionCode

// set on
t.SetBoolCapability CAP_FEEDERENABLED, true
Var e2 as Integer = t.Lasterror
Var c2 as Integer = t.ConditionCode

// query after
Var type3 as Integer
Var n3 as Integer = t.GetIntegerCapability(CAP_FEEDERENABLED, type3)
Var e3 as Integer = t.Lasterror
Var c3 as Integer = t.ConditionCode

// now query loaded?
Var type4 as Integer
Var n4 as Integer = t.GetIntegerCapability(CAP_FEEDERLOADED, type4)
Var e4 as Integer = t.Lasterror
```

```
Var c4 as Integer = t.ConditionCode

if e4 = TWRC_FAILURE AND c4 = TWCC_CAPUNSUPPORTED then
// not supported!
Break
end if
```

Notes: Please review Twain Documentation for details.
Please open data source before via OpenDS method.
This should work fine for all integer types like boolean, 8, 16 or 32 bit integers.
Sets lasterror and condition code.
(if lasterror is 1 and condition code is 13, the capability is not supported)

200.4.18 ImageInfo as TwainImageInfoMBS

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries information about current image.
Notes: Lasterror is set.

200.4.19 IsDSEnabled as boolean

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether data source is enabled.

200.4.20 OpenDS

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Opens the data source.

200.4.21 OpenDSM

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Opens Data source Manager.
Notes: Lasterror is set.

200.4.22 ProcessEvents

MBS Picture Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop only.

Function: Process events in plugin.
Notes: Only for Windows needed for some Twain drivers. You call it after you run Acquire to let the plugin wait for the events to start the transfer.
When transfer is ready or dialog is cancelled, this method ends.
On Mac OS X or Linux this method does nothing so it's no problem calling it.

200.4.23 SelectDS

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries dialog to ask the user to select a data source.
Notes: Lasterror is set.
See also:

- 200.4.24 SelectDS(device as TwainIdentityMBS) 23426

200.4.24 SelectDS(device as TwainIdentityMBS)

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Selects the given device without dialog.
Example:

```
Var twain as TwainMBS // your twain object
Var devices() as TwainIdentityMBS = twain.AllDevices
Var found as Boolean
Var NameToFind as string = "MyScanner123"

for each device as TwainIdentityMBS in devices

if device.ProductName = NameToFind then
found = true

// lets use this one
twain.SelectDS(device)

if twain.Lasterror <>0 then
MessageBox "Failed to select "+device.ProductName
else
'MessageBox "OK"
exit
end if
```

```
end if
next

if not found then
MessageBox "No scanner found named: "+NameToFind
end if
```

Notes: Lasterror is set.
See also:

- 200.4.23 SelectDS 23426

200.4.25 SetBoolCapability(ID as Integer, Value as Boolean)

MBS Picture Plugin, Plugin Version: 15.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with boolean.
Example:

```
Var t as TwainMBS // your twain object

t.OpenDS

if t.Lasterror <>0 then
MessageBox "Failed to open device: "+str(t.Lasterror)
Return
end if

const CAP_FEEDERENABLED = &h1002
const CAP_FEEDERLOADED = &h1003
const TWRC_FAILURE = 1
const TWCC_CAPUNSUPPORTED = 13

// query before
Var type1 as Integer
Var n1 as Integer = t.GetIntegerCapability(CAP_FEEDERENABLED, type1)
Var e1 as Integer = t.Lasterror
Var c1 as Integer = t.ConditionCode

// set on
t.SetBoolCapability CAP_FEEDERENABLED, true
Var e2 as Integer = t.Lasterror
Var c2 as Integer = t.ConditionCode

// query after
Var type3 as Integer
Var n3 as Integer = t.GetIntegerCapability(CAP_FEEDERENABLED, type3)
```

```
Var e3 as Integer = t.Lasterror
Var c3 as Integer = t.ConditionCode

// now query loaded?
Var type4 as Integer
Var n4 as Integer = t.GetIntegerCapability(CAP_FEEDERLOADED, type4)
Var e4 as Integer = t.Lasterror
Var c4 as Integer = t.ConditionCode

if e4 = TWRC_FAILURE AND c4 = TWCC_CAPUNSUPPORTED then
// not supported!
Break
end if
```

Notes: Please review Twain Documentation for details.
Please open data source before via OpenDS method.
You may see problems if you use this method on a capability which is not a boolean.
Sets lasterror and condition code.
(if lasterror is 1 and condition code is 13, the capability is not supported)

200.4.26 SetFloatCapability(ID as Integer, Value as Double)

MBS Picture Plugin, Plugin Version: 15.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with floating point value.
Notes: Please review Twain Documentation for details.
Please open data source before via OpenDS method.
You may see problems if you use this method on a capability which is not a floating point value (FIX32).
Sets lasterror and condition code.
(if lasterror is 1 and condition code is 13, the capability is not supported)

200.4.27 SetInt32Capability(ID as Integer, Value as Int32)

MBS Picture Plugin, Plugin Version: 15.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with 32 bit integer.
Notes: Please review Twain Documentation for details.
Please open data source before via OpenDS method.
You may see problems if you use this method on a capability which is not a 32 bit integer.
Sets lasterror and condition code.
(if lasterror is 1 and condition code is 13, the capability is not supported)

200.4.28 SetUInt16Capability(ID as Integer, Value as UInt16)

MBS Picture Plugin, Plugin Version: 15.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with 16 bit integer.
Notes: Please review Twain Documentation for details.
Please open data source before via OpenDS method.
You may see problems if you use this method on a capability which is not a 16 bit integer.
Sets lasterror and condition code.
(if lasterror is 1 and condition code is 13, the capability is not supported)

200.4.29 SupportsMemoryTransfer as boolean

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether the twain data source supports memory transfers.
Notes: As our plugin uses only memory transfers, the source must support this in order to work with our plugin.

200.4.30 TransferImage as picture

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Transfers an image.
Notes: Lasterror is set.
Image data is converted to a normal RGB picture.
Can return nil on any error.
The events TransferStarted, TransferEnded and TransferProgress are called when a transfer is running.

200.4.31 Properties

200.4.32 AutoFeed as Integer

MBS Picture Plugin, Plugin Version: 13.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether plugin should auto feed (if feeder is enabled).
Notes: Value is -1 if you didn't set it before.
This value is stored and next time you call Acquire the plugin will ask the scanner to enable/disable auto feed. If the scanner does not support auto feeding, the scanner will ignore this setting.
(Read and Write property)

200.4.33 AutomaticBorderDetection as Integer

MBS Picture Plugin, Plugin Version: 13.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether plugin should enable automatic border detection.
Notes: Value is -1 if you didn't set it before.
This value is stored and next time you call Acquire the plugin will ask the scanner to enable/disable auto border detection. If the scanner does not support this feature, the scanner will ignore this setting.
0 = off, 1 = on, -1 = default/undefined.
(Read and Write property)

200.4.34 AutomaticBrightness as Integer

MBS Picture Plugin, Plugin Version: 13.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: Enables or disables the Source's Auto-brightness function (if any).
Notes: The plugin will apply this setting on the next scan.
Value is 0 to disable, 1 to enable or -1 if undefined/default.
(Read and Write property)

200.4.35 AutomaticRotate as Integer

MBS Picture Plugin, Plugin Version: 13.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether to enable automatic rotation when next scan starts.
Notes: Value is -1 if you didn't set it before.
This value is stored and next time you call Acquire the plugin will ask the scanner to enable/disable automatic rotation. If the scanner does not support this feature, the scanner will ignore this setting.
(Read and Write property)

200.4.36 Brightness as Double

MBS Picture Plugin, Plugin Version: 13.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: The brightness setting to use.
Notes: The plugin will apply this setting on the next scan.
Source should normalize the values into the range. Make sure that a '0' value is available as the Current Value when the Source starts up. If the Source's ¬± range is asymmetric about the '0' value, set range maxima to ¬±1000 and scale homogeneously from the '0' value in each direction. This will yield a positive range whose step size differs from the negative range's step size.
Plugin uses value -10000 for undefined/default.
(Read and Write property)

200.4.37 ConditionCode as Integer

MBS Picture Plugin, Plugin Version: 14.2, Platforms: macOS, Windows, Targets: Desktop only.

Function: The condition code.
Notes: If error code in Lasterror is 1, this Condition value is set.
(-1 if unknown)

Possible codes:

TWCC_SUCCESS	0	Success
TWCC_BUMMER	1	Failure due to unknown causes
TWCC_LOWMEMORY	2	Not enough memory to perform operation
TWCC_NODS	3	No Data Source
TWCC_MAXCONNECTIONS	4	DS is connected to max possible applications
TWCC_OPERATIONERROR	5	DS or DSM reported error, application shouldn't
TWCC_BADCAP	6	Unknown capability
TWCC_BADPROTOCOL	9	Unrecognized MSG DG DAT combination
TWCC_BADVALUE	10	Data parameter out of range
TWCC_SEQERROR	11	DG DAT MSG out of expected sequence
TWCC_BADDEST	12	Unknown destination Application/Source in DSM_Entry
TWCC_CAPUNSUPPORTED	13	Capability not supported by source
TWCC_CAPBADOPERATION	14	Operation not supported by capability
TWCC_CAPSEQERROR	15	Capability has dependancy on other capability
TWCC_DENIED	16	File System operation is denied (file is protected)
TWCC_FILEEXISTS	17	Operation failed because file already exists.
TWCC_FILENOTFOUND	18	File not found
TWCC_NOTEMPTY	19	Operation failed because directory is not empty
TWCC_PAPERJAM	20	The feeder is jammed
TWCC_PAPERDOUBLEFEED	21	The feeder detected multiple pages
TWCC_FILEWRITEERROR	22	Error writing the file (meant for things like disk full conditions)
TWCC_CHECKDEVICEONLINE	23	The device went offline prior to or during this operation

(Read and Write property)

200.4.38 Contrast as Double

MBS Picture Plugin, Plugin Version: 13.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: The contrast setting to use.
Notes: The plugin will apply this setting on the next scan.
Scale the values available internally into a homogeneous range between -1000 and 1000. Make sure that a '0' value is available as the Current value when the Source starts up. If the Source's ¬± range is asymmetric about the '0' value, set range maxima to ¬±1000 and scale homogeneously from the '0' value in each direction. This will yield a positive range whose step size differs from the negative range's step size.
(Read and Write property)

200.4.39 DiscardBlankPages as Integer

MBS Picture Plugin, Plugin Version: 13.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether to have the scanner ask to discard blank pages.
Notes: Value is -1 if you didn't set it before.
This value is stored and next time you call Acquire the plugin will ask the scanner to enable/disable blank pages discarding. If the scanner does not support this feature, the scanner will ignore this setting.
(Read and Write property)

200.4.40 Duplex as Integer

MBS Picture Plugin, Plugin Version: 13.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether to enable duplex when next scan starts.
Notes: This value is stored and next time you call Acquire the plugin will ask the scanner to enable/disable duplex. If the scanner does not support duplex, the scanner will ignore this setting.
Value is -1 if not set, 0 to disable and 1 to enable.
(Read and Write property)

200.4.41 FeederEnabled as Integer

MBS Picture Plugin, Plugin Version: 13.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether to enable feeder when next scan starts.
Notes: This value is stored and next time you call Acquire the plugin will ask the scanner to enable/disable feeder. If the scanner does not support the feeder, the scanner will ignore this setting.
Value is -1 if not set, 0 to disable and 1 to enable.
(Read and Write property)

200.4.42 Gamma as Double

MBS Picture Plugin, Plugin Version: 13.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: Gamma correction value for the image data.
Notes: The plugin will apply this setting on the next scan.
Default value 2.2. The setting is -10000 if not set.
(Read and Write property)

200.4.43 Highlight as Double

MBS Picture Plugin, Plugin Version: 13.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: Specifies which value in an image should be interpreted as the lightest highlight.
Notes: The plugin will apply this setting on the next scan.
All values lighter than this value will be clipped to this value. Whether lighter values are smaller or larger can be determined by examining the Current value of PixelFlavor.
If more or less than 8 bits are used to describe the image, the actual data values should be normalized to fit within the 0-255 range. The normalization need not result in a homogeneous distribution if the original distribution was not homogeneous.
Value can be between 0 and 255.

Value can be between 0 and 255.
Plugin uses value -10000 for undefined/default.
(Read and Write property)

200.4.44 Lasterror as Integer

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: The last error code.
Notes: (Read and Write property)

200.4.45 Orientation as Integer

MBS Picture Plugin, Plugin Version: 13.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: The orientation for the scanner.
Notes: This value is stored and next time you call Acquire the plugin will ask the scanner to enable/disable feeder. If the scanner does not support the feeder, the scanner will ignore this setting.

Value can be:

0	0 degree
1	90 degree
2	180 degree
3	270 degree
0	Portrait
3	Landscape

(Read and Write property)

200.4.46 Parent as Variant

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: The parent window.
Notes: Can reference a Window or DesktopWindow object.
(Read and Write property)

200.4.47 PendingTransferCount as Integer

MBS Picture Plugin, Plugin Version: 13.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: How many pages are pending.
Notes: So when you transfer you can make a loop and run until PendingTransferCount is zero.
PendingTransferCount may be -1 or 65535 for unknown number of pages.
(Read and Write property)

200.4.48 PixelType as Integer

MBS Picture Plugin, Plugin Version: 13.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: The pixel type requested.
Notes: Value can be 0 for BW, 1 for Gray, 2 for RGB, 3 for Palette.
The plugin can request als CMY (4), CMYK (5), YUV (6), YUVK (7) and CIEXYZ (8), but can't currently decode those.

Value is -1 if you didn't set it before.
This value is stored and next time you call Acquire the plugin will ask the scanner to use the given pixel type. If the scanner does not support this feature, the scanner will ignore this setting.
(Read and Write property)

200.4.49 ProvideSliceData as Boolean

MBS Picture Plugin, Plugin Version: 12.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether to pass Memoryblock with data with Progress event for new rows arrived.
Notes: (Read and Write property)

200.4.50 ProvideSlicePicture as Boolean

MBS Picture Plugin, Plugin Version: 12.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether to pass picture with Progress event for new rows arrived.
Notes: (Read and Write property)

200.4.51 ResX as Double

MBS Picture Plugin, Plugin Version: 13.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: The horizontal resolution for scanning.
Notes: This value is stored and next time you call Acquire the plugin will ask the scanner to use this resolution. If the scanner does not support the resolution, the scanner will use the last valid setting.
Use -1 to use the default setting.
(Read and Write property)

200.4.52 ResY as Double

MBS Picture Plugin, Plugin Version: 13.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: The vertical resolution for scanning.
Notes: This value is stored and next time you call Acquire the plugin will ask the scanner to use this resolution. If the scanner does not support the resolution, the scanner will use the last valid setting.
Use -1 to use the default setting.
(Read and Write property)

200.4.53 Shadow as Double

MBS Picture Plugin, Plugin Version: 13.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: Specifies which value in an image should be interpreted as the darkest shadow.
Notes: The plugin will apply this setting on the next scan.
All values darker than this value will be clipped to this value.

Whether darker values are smaller or larger can be determined by examining the Current value of PixelFlavor.
Source

If more or less than 8 bits are used to describe the image, the actual data values should be normalized to fit within the 0-255 range. The normalization need not result in a homogeneous distribution if the original distribution was not homogeneous.

(Read and Write property)

200.4.54 DefaultDevice as TwainIdentityMBS

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: The default device.
Notes: (Read and Write computed property)

200.4.55 Imagelayout as TwainImageLayoutMBS

MBS Picture Plugin, Plugin Version: 15.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Get/Set the image layout.
Notes: Lasterror is set. DataSource must be open.
(Read and Write computed property)

200.4.56 Events

200.4.57 CloseRequest

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Closes a request.
Notes: Lasterror is set.

200.4.58 TransferEnded(pic as picture, ImageInfo as TwainImageInfoMBS, sliced as boolean, layout as TwainImageLayoutMBS)

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: The transfer finished.
Notes: Pic: The final picture. Nil if sliced is true.
ImageInfo: Details about the image format.
Sliced: Whether the image was transferred in slices.

200.4.59 TransferProgress(percent as Double, dataRead as Int64, DataSize as Int64, ImageInfo as TwainImageInfoMBS, NewDataSize as Integer, NewData as Memoryblock, NewPicture as Picture, layout as TwainImageLayoutMBS, Columns as Integer, Rows as Integer, XOffset as Integer, YOffset as Integer)

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: The progress event.
Notes: Percent: The percent value (0 to 100) of the progress.
dataRead: Number of bytes read.
DataSize: Total size of image in bytes.
ImageInfo: Details about the image format.
NewDataSize: The number of bytes received.
NewData: The memoryblock for the new data. Use NewDataSize to copy right amount of data as this memoryblock has no size value set.
NewPicture: The picture for the new data.
Layout: The image layout.
Columns: Number of columns got in this slice.
Rows: Number of rows got in this slice.
XOffset: Column start for this slice.
YOffset: Row start for this slice.

NewData is only valid if you set ProvideSliceData to true.
NewPicture is only valid if you set ProvideSlicePicture to true.

200.4.60 TransferReady

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Called to tell you that a transfer is waiting.
Notes: The user pressed button to start scan.
Please call TransferImage method when you are ready.

200.4.61 TransferStarted(DataSize as Int64, ImageInfo as TwainImageInfoMBS, layout as TwainImageLayoutMBS) as boolean

MBS Picture Plugin, Plugin Version: 12.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: A transfer started.
Notes: DataSize total numnber of bytes expected.
ImageInfo: details on the image we receive.

You can return true to have the plugin not created one big picture.
A 42 inch scanner normally creates huge images, so you only can process them in slices.

Error codes

Constant	Value	Description
TWRC_CANCEL	3	Operation has been canceled.
TWRC_CHECKSTATUS	2	Intended for use with Capability and ImageLayout. Operation failed to com pletely perform the desired operation. For example, setting Brightness to when its range is -1000 to 1000 with a step of 200. The data source may op to set the value to 0 and return this status. The application should confirm its last setting, if it depends on getting th exact value it requested.
TWRC_DATANOTAVAILABLE	9	Intended for use with extended ImageInfo. There is no data available for th requested item. Scanning may continue. The decision to continue with scanning is at the di cretion of the application, depending on which field reported this status.
TWRC_DSEVENT	4	Intended for use with DAT_EVENT. The data source processed the event. The application must not take any further action on this message.
TWRC_ENDOFLIST	7	Intended for use with DAT_IDENTITY and DAT_FILESYSTEM. There are no more items to enumerate in this list. If a call is needed to clos the list, it must be called next.
TWRC_FAILURE	1	May be returned by any operation. An error has occurred. The application must call status functions, and refer to the condition code fo more information.
TWRC_INFONOTSUPPORTED	8	Intended for use with DAT_EXTIMAGEINFO. The requested TWEI_ data either not supported by this data source, or is not supported for this particula image. Scanning may continue. The decision to continue with scanning is at the di cretion of the application, depending on which field reported this status.
TWRC_NOTDSEVENT	5	Intended for use with DAT_EVENT. The data source did not process th event. The application passes the message to its own dialogs.
TWRC_SUCCESS	0	Operation was successful. The application continues as normal.
TWRC_XFERDONE	6	Intended for use with the Image Transfer operations. The image has been full transferred. The application must be in state 7. It should call GetImageInfo, if it needs t collect metadata for this image.

200.5 class TwainVersionMBS

200.5.1 class TwainVersionMBS

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: The class for version details.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

200.5.2 Methods

200.5.3 Constructor

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: The private constructor.

200.5.4 Properties

200.5.5 Country as Integer

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: The primary country where your Source or application is intended to be distributed.
Notes: e.g. Germany.
(Read and Write property)

200.5.6 Info as String

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: General information string - fill in as needed.
Notes: e.g. "1.0b3 Beta release".
(Read and Write property)

200.5.7 Language as Integer

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: The primary language for your Source or application.
Notes: e.g. TWLG_GER.
(Read and Write property)

200.5.8 MajorNum as Integer

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: This refers to your application or Source's major revision number.
Notes: e.g. The 2 in "version 2.1".
(Read and Write property)

200.5.9 MinorNum as Integer

MBS Picture Plugin, Plugin Version: 12.2, Platforms: macOS, Windows, Targets: All.

Function: The incremental revision number of your application or Source.
Notes: e.g. The 1 in "version 2.1".
(Read and Write property)

Chapter 201

UIAutomation

201.1 class UIAutomationActiveTextPositionChangedEventHandlerMBS

201.1.1 class UIAutomationActiveTextPositionChangedEventHandlerMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes a method to handle Microsoft UI Automation events that occur when the active text position changes.

201.1.2 Methods

201.1.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

201.1.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.1.5 Properties

201.1.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.1.7 Events

201.1.8 HandleActiveTextPositionChangedEvent(sender as UIAutomationElementMBS, range as UIAutomationTextRangeMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Handles a Microsoft UI Automation active text position change event.
Notes: sender: A pointer to the UI Automation element that raised the event.
range: A span of continuous text in a container that supports the IUIAutomationTextPattern interface.

201.2 class UIAutomationAndConditionMBS

201.2.1 class UIAutomationAndConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes properties and methods that Microsoft UI Automation client applications can use to retrieve information about an AND-based property condition.
Notes: Subclass of the UIAutomationConditionMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.2.2 Methods

201.2.3 Child(Index as Integer) as UIAutomationConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries a condition used for this AND condition.
Notes: Index is zero-based.
Raises OutOfBoundsException if the index is out of bounds.

201.2.4 Children as UIAutomationConditionMBS()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the conditions that make up this "and" condition.

201.2.5 Properties

201.2.6 Child0 as UIAutomationConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Child(0) as property visible in the debugger.
Notes: (Read only property)

201.2.7 Child1 as UIAutomationConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Child(1) as property visible in the debugger.
Notes: (Read only property)

201.2.8 Child2 as UIAutomationConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Child(2) as property visible in the debugger.
Notes: (Read only property)

201.2.9 ChildCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the number of conditions that make up this ”and” condition.
Notes: (Read only property)

201.3 class UIAutomationAnnotationPatternMBS

201.3.1 class UIAutomationAnnotationPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to the properties of an annotation in a document.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.3.2 Methods

201.3.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.3.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.3.5 Properties

201.3.6 CachedAnnotationTypeId as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that identifies this annotation's type.
Notes: (Read only property)

201.3.7 CachedAnnotationTypeName as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached localized name of this annotation's type.
Notes: The name of the annotation type can correspond to one of the annotation type identifiers (for example, ,ÄúComment,Äù for AnnotationType_Comment), but it is not required to.

(Read only property)

201.3.8 CachedAuthor as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached name of the annotation author.
Notes: (Read only property)

201.3.9 CachedDateTime as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached date and time that this annotation was created.
Notes: (Read only property)

201.3.10 CachedTarget as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached element that is being annotated.
Notes: (Read only property)

201.3.11 CurrentAnnotationTypeId as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a value that identifies the annotation's type.
Notes: (Read only property)

201.3.12 CurrentAnnotationTypeName as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the localized name of this annotation's type.
Notes: The name of the annotation type can correspond to one of the annotation type identifiers (for example, ,ÄúComment,Äù for AnnotationType_Comment), but it is not required to.
(Read only property)

201.3.13 CurrentAuthor as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the name of the annotation author.
Notes: (Read only property)

201.3.14 CurrentDateTime as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the date and time that this annotation was created.
Notes: (Read only property)

201.3.15 CurrentTarget as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the element that is being annotated.
Notes: (Read only property)

201.3.16 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

201.4 class UIAutomationBoolConditionMBS

201.4.1 class UIAutomationBoolConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a condition that can be either TRUE (selects all elements) or FALSE (selects no elements).
Example:

```
Var u As New UIAutomationMBS

Var bt As UIAutomationBoolConditionMBS = u.CreateBoolCondition(True)
Var bf As UIAutomationBoolConditionMBS = u.CreateBoolCondition(False)

MessageBox bt.BooleanValue.ToString+" "+bf.BooleanValue.ToString
```

Notes: Subclass of the UIAutomationConditionMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.4.2 Properties

201.4.3 BooleanValue as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of the condition: either TRUE or FALSE.
Notes: (Read only property)

201.5 class UIAutomationCacheRequestMBS

201.5.1 class UIAutomationCacheRequestMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes properties and methods of a cache request.
Notes: Client applications use this interface to specify the properties and control patterns to be cached when a Microsoft UI Automation element is obtained.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.5.2 Methods

201.5.3 AddPattern(PatternId as Integer)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds a control pattern to the cache request.
Notes: PatternId: The identifier of the control pattern to add to the cache request.

201.5.4 AddProperty(PropertyId as Integer)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds a property to the cache request.

201.5.5 Clone as UIAutomationCacheRequestMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a copy of the cache request.

201.5.6 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.5.7 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.5.8 Properties

201.5.9 AutomationElementMode as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether returned elements contain full references to the underlying UI, or only cached information.
Notes: AutomationElementModeFull is the default value, and specifies that returned elements contain a full reference to the underlying UI. AutomationElementModeNone specifies that the returned elements have no reference to the underlying UI, and contain only cached information.

Certain operations on elements, including GetCurrentPropertyValue, and SetFocus, require a full reference; attempting to perform these on an element that has none results in an error.

Using AutomationElementModeNone can be more efficient when only properties are needed, as it avoids the overhead involved in setting up full references.
(Read and Write property)

201.5.10 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

201.5.11 TreeFilter as UIAutomationConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the view of the UI Automation element tree that is used when caching.
Notes: (Read and Write property)

201.5.12 TreeScope as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the scope of caching.
Notes: When an element is retrieved, caching can be performed for only the element itself (the default behavior), or for the element and its children or descendants. This property describes the scope of the request. (Read and Write property)

201.5.13 Constants

AutomationElementMode

Constant	Value	Description
AutomationElementModeFull	1	Specifies that returned elements have a full reference to the underlying UI.
AutomationElementModeNone	0	Specifies that returned elements have no reference to the underlying UI and contain only cached information.

TreeScope

Constant	Value	Description
TreeScopeAncestors	16	The scope includes the parent and more distant ancestors of the element.
TreeScopeChildren	2	The scope includes children of the element.
TreeScopeDescendants	4	The scope includes children and more distant descendants of the element.
TreeScopeElement	1	The scope includes the element itself.
TreeScopeNone	0	The scope excludes the subtree from the search.
TreeScopeParent	8	The scope includes the parent of the element.
TreeScopeSubtree	7	The scope includes the element and all its descendants. This flag is a combination of the TreeScopeElement and TreeScopeDescendants values.

201.6 class UIAutomationChangeInfoMBS

201.6.1 class UIAutomationChangeInfoMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Contains data about a UI Automation change that occurred.

201.6.2 Properties

201.6.3 ExtraInfo as Variant

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Detailed information about the change that occurred.
Notes: (Read and Write property)

201.6.4 Id as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Identifies the type of change info.
Notes: Possible values are all the values of Change Identifiers, Property Identifiers, Text Attribute Identifiers, Annotation Type Identifiers and Style Identifiers.
(Read and Write property)

201.6.5 Payload as Variant

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Information about the type of change that occurred.
Notes: (Read and Write property)

201.7 class UIAutomationChangesEventHandlerMBS

201.7.1 class UIAutomationChangesEventHandlerMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes a method to handle one or more Microsoft UI Automation change events.
Notes: This interface is implemented by the application to handle events that it has subscribed to by calling AddChangesEventHandler.

201.7.2 Methods

201.7.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

201.7.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.7.5 Properties

201.7.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.7.7 Events

201.7.8 HandleChangesEvent(sender as UIAutomationElementMBS, changes() as UIAutomationChangeInfoMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Handles one or more Microsoft UI Automation change events.
Notes: sender: A pointer to the element that raised the event.
changes: A collection of pointers to UiaChangeInfo structures.

This method is implemented by the application to handle events that it has subscribed to by calling AddChangesEventHandler.

201.8 class UIAutomationConditionMBS

201.8.1 class UIAutomationConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: This is the primary interface for conditions used in filtering when searching for elements in the UI Automation tree.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.8.2 Methods

201.8.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.8.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.8.5 Properties

201.8.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.9 class UIAutomationCustomNavigationPatternMBS

201.9.1 class UIAutomationCustomNavigationPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes a method to support access by a Microsoft UI Automation client to controls that support a custom navigation order.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.9.2 Methods

201.9.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.9.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.9.5 Navigate(NavigateDirection as Integer)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the next element in the specified direction within the logical UI tree.

201.9.6 Properties

201.9.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.9.8 Constants

NavigateDirection

Constant	Value	Description
NavigateDirectionFirstChild	3	The navigation direction is to the first child.
NavigateDirectionLastChild	4	The navigation direction is to the last child.
NavigateDirectionNextSibling	1	The navigation direction is to the next sibling.
NavigateDirectionParent	0	The navigation direction is to the parent.
NavigateDirectionPreviousSibling	2	The navigation direction is to the previous sibling.

201.10 class UIAutomationDockPatternMBS

201.10.1 class UIAutomationDockPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a control that enables child elements to be arranged horizontally and vertically, relative to each other.
Notes: Microsoft UI Automation client applications use this interface to access the dock properties of UI Automation elements that function as controls within a docking container. A docking container is a control that allows the arrangement of child elements, both horizontally and vertically, relative to the boundaries of the docking container and other elements within the container. Controls are docked relative to each other based on their current z-order; the higher their z-order placement the farther they are placed from the specified edge of the docking container.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.10.2 Methods

201.10.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.10.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.10.5 SetDockPosition(DockPosition as Integer)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the dock position of this element.
Notes: DockPosition: The new dock position.

201.10.6 Properties

201.10.7 CachedDockPosition as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached dock position of this element within its docking container.
Notes: (Read only property)

201.10.8 CurrentDockPosition as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the dock position of this element within its docking container.
Notes: (Read only property)

201.10.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.10.10 Constants

DockPosition

Constant	Value	Description
DockPositionBottom	2	The window is docked at the bottom.
DockPositionFill	4	The window is docked on all four sides.
DockPositionLeft	1	The window is docked at the left.
DockPositionNone	5	The window is not docked.
DockPositionRight	3	The window is docked at the right.
DockPositionTop	0	The window is docked at the top.

201.11 class UIAutomationDragPatternMBS

201.11.1 class UIAutomationDragPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to information exposed by a UI Automation provider for an element that can be dragged as part of a drag-and-drop operation.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.11.2 Methods

201.11.3 CachedDropEffects as String()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached array of localized strings that enumerate the full set of effects that can happen when the user drops this element as part of a drag-and-drop operation.
Notes: Some drag operations support a set of different drop effects. For example, a drag operation that is initiated with a right-click might display a menu of options for the action that occurs when the element is dropped. In the source-only style of Microsoft UI Automation drag-and-drop, no elements implement the DropTarget pattern. To find out the set of effects that can happen when the grabbed element is dropped, a client can query the DropEffects property of the dragged element. This property can contain short strings such as "move", or longer ones such as "insert into Main group". The strings are always localized.

201.11.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.11.5 CurrentDropEffects as String()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves an array of localized strings that enumerate the full set of effects that can happen when this element as part of a drag-and-drop operation.
Notes: Some drag operations support a set of different drop effects. For example, a drag operation that is initiated with a right-click might display a menu of options for the action that occurs when the element is dropped. In the source-only style of Microsoft UI Automation drag-and-drop, no elements implement the DropTarget pattern. To find out the set of effects that can happen when the grabbed element is dropped, a

client can query the DropEffects property of the dragged element. This property can contain short strings such as "move", or longer ones such as "insert into Main group". The strings are always localized.

201.11.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.11.7 Properties

201.11.8 CachedDropEffect as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached localized string that indicates what happens when the user drops this element as part of a drag-and-drop operation.
Notes: In the source-only style of Microsoft UI Automation drag-and-drop, no elements implement the DropTarget pattern. To find out what effect dropping the dragged element will have, a client can query the DropEffect property of the dragged element. This property can be a short string such as "move", or a longer one, such as "insert into Main group". The string is always localized.
(Read only property)

201.11.9 CachedGrabbedItems as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached collection of elements that represent the full set of items that the user is dragging as part of a drag operation.
Notes: Returns the cached collection of elements that the user is dragging. This property is nil or an empty array if only a single item is being dragged. The default value is an empty array.

If the user is dragging multiple items, the items are represented by a single master element with an associated set of grabbed elements. The master item fires the appropriate events, to avoid having a large set of duplicate events. The client can query the GrabbedItems property to get the full list of grabbed items.
(Read only property)

201.11.10 CachedIsGrabbed as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether this element has been grabbed as part of a drag-and-drop operation.
Notes: (Read only property)

201.11.11 CurrentDropEffect as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a localized string that indicates what happens when the user drops this element as part of a drag-drop operation.
Notes: In the source-only style of Microsoft UI Automation drag-and-drop, no elements implement the DropTarget pattern. To find out what effect dropping the dragged element will have, a client can query the DropEffect property of the dragged element. This property can be a short string such as "move", or a longer one, such as "insert into Main group". The string is always localized.
(Read only property)

201.11.12 CurrentGrabbedItems as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a collection of elements that represent the full set of items that the user is dragging as part of a drag operation.
Notes: Returns the collection of elements that the user is dragging. This property is nil or an empty array if only a single item is being dragged. The default value is an empty array.

If the user is dragging multiple items, the items are represented by a single master element with an associated set of grabbed elements. The master item fires the appropriate events, to avoid having a large set of duplicate events. The client can query the GrabbedItems property to get the full list of grabbed items.
(Read only property)

201.11.13 CurrentIsGrabbed as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the user has grabbed this element as part of a drag-and-drop operation.
Notes: (Read only property)

201.11.14 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.12 class UIAutomationDropTargetPatternMBS

201.12.1 class UIAutomationDropTargetPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to drag-and-drop information exposed by a Microsoft UI Automation provider for an element that can be the drop target of a drag-and-drop operation.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.12.2 Methods

201.12.3 CachedDropTargetEffects as String()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached array of localized strings that enumerate the full set of effects that can happen when the user drops a grabbed element on this drop target as part of a drag-and-drop operation.
Notes: Some drag operations support a set of different drop effects. For example, a drag operation that is initiated with a right-click might display a menu of options for the action that occurs when the element is dropped. To find out the set of effects that can happen when the grabbed element is dropped, a client can query the DropEffects property of the dragged element. This property can contain short strings such as "move", or longer ones such as "insert into Main group". The strings are always localized.

201.12.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.12.5 CurrentDropTargetEffects as String()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves an array of localized strings that enumerate the full set of effects that can happen when the user drops a grabbed element on this drop target as part of a drag-and-drop operation.
Notes: Some drag operations support a set of different drop effects. For example, a drag operation that is initiated with a right-click might display a menu of options for the action that occurs when the element is dropped. To find out the set of effects that can happen when the grabbed element is dropped, a client can query the DropEffects property of the dragged element. This property can contain short strings such as

”move”, or longer ones such as ”insert into Main group”. The strings are always localized.

201.12.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.12.7 Properties

201.12.8 CachedDropTargetEffect as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached localized string that describes what happens when the user drops the grabbed element on this drop target.
Notes: This property describes the default effect that happens when the user drops a grabbed element on a target, such as moving or copying the element. This property can be a short string such as ”move”, or a longer one such as ”insert into Main group”. The string is always localized.
(Read only property)

201.12.9 CurrentDropTargetEffect as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a localized string that describes what happens when the user drops the grabbed element on this drop target.
Notes: This property describes the default effect that happens when the user drops a grabbed element on a target, such as moving or copying the element. This property can be a short string such as ”move”, or a longer one such as ”insert into Main group”. The string is always localized.
(Read only property)

201.12.10 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.13 class UIAutomationElementArrayMBS

201.13.1 class UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a collection of UI Automation elements.
Example:

```
// walk through the result of a UI Automation search on Windows
Var automation As New UIAutomationMBS
Var found As UIAutomationElementArrayMBS = automation.RootElement.FindAll(UIAutomationMBS.TreeScopeChil-
dren, automation.CreateTrueCondition)

For i As Integer = 0 To found.Length - 1
System.DebugLog found.Element(i).CurrentName
Next
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Introducing UIAutomation Support in MBS Xojo Plugins

201.13.2 Methods

201.13.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.13.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.13.5 Element(Index as Integer) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a Microsoft UI Automation element from the collection.
Notes: Index: The zero-based index of the element.

201.13.6 Elements as UIAutomationElementMBS()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all elements.

201.13.7 Properties

201.13.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.13.9 Length as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the number of elements in the collection.
Notes: (Read only property)

201.14 class UIAutomationElementMBS

201.14.1 class UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes methods and properties for a UI Automation element, which represents a UI item.
Example:

```
// find all buttons in the focused window of another app with UI Automation on Windows
Var automation As New UIAutomationMBS
Var focused As UIAutomationElementMBS = automation.FocusedElement
If focused = Nil Then Return

Var all As UIAutomationElementArrayMBS = focused.FindAll(UIAutomationMBS.TreeScopeDescendants,
automation.CreateTrueCondition)
Var lines() As String
For Each e As UIAutomationElementMBS In all.Elements
lines.Add e.CurrentClassName + ": " + e.CurrentName + " (id " + e.CurrentAutomationId + ")"
Next
MessageBox all.Length.ToString + " elements" + EndOfLine + String.FromArray(lines, EndOfLine)
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Introducing UIAutomation Support in MBS Xojo Plugins

201.14.2 Methods

201.14.3 BuildUpdatedCache(cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a new UI Automation element with an updated cache.
Notes: cacheRequest: A cache request that specifies the control patterns and properties to include in the cache.

Returns the new UI Automation element.

The original UI Automation element is unchanged. The new UIAutomationElementMBS interface refers to the same element and has the same runtime identifier.

201.14.4 CachedAnnotationTypes as Integer()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the cached list of annotation types associated with this element, such as comment, header, footer, and so on.

201.14.5 CachedBoundingRectangle as UIAutomationRectMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached coordinates of the rectangle that completely encloses the element.

201.14.6 CachedPattern(patternId as Integer) as Variant

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves from the cache the interface of the specified control pattern of this UI Automation element.
Notes: patternId: The identifier of the control pattern.

201.14.7 CachedPropertyValue(propertyId as Integer) as Variant

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a property value from the cache for this UI Automation element.
Notes: propertyId: The identifier of the property.

Microsoft UI Automation properties of the double type support Not a Number (NaN) values. When retrieving a property of the double type, a client can use the IsNan function to determine whether the property is a NaN value.
See also:

- 201.14.8 CachedPropertyValue(propertyId as Integer, ignoreDefaultValue as Boolean) as Variant 23475

201.14.8 CachedPropertyValue(propertyId as Integer, ignoreDefaultValue as Boolean) as Variant

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a property value from the cache for this UI Automation element, optionally ignoring any default value.

Notes: propertyId: The identifier of the property.
ignoreDefaultValue: A value that specifies whether a default value should be ignored if the specified property is not supported: TRUE if the default value is not to be returned, or FALSE if it is to be returned.

This method retrieves the specified property from the cache for the UI Automation element. To retrieve the current property, call the other CurrentPropertyValue variant.

Passing FALSE in the ignoreDefaultValue parameter is equivalent to calling CachedPropertyValue.

If the Microsoft UI Automation provider for the element itself supports the property, the value of the property is returned. Otherwise, if ignoreDefaultValue is FALSE, a default value specified by UI Automation is returned.

This method returns a failure code if the requested property was not previously cached.
UI Automation properties of the double type support Not a Number (NaN) values. When retrieving a property of the double type, a client can use the IsNan function to determine whether the property is a NaN value.
See also:

- 201.14.7 CachedPropertyValue(propertyId as Integer) as Variant 23475

201.14.9 ClickablePoint(byref point as UIAutomationRectMBS, byref gotClickable as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a point on the element that can be clicked.
Notes: clickable: Receives the physical screen coordinates of a point that can be used by a client to click this element.
gotClickable: Receives TRUE if a clickable point was retrieved, or FALSE otherwise.

A client application can use this method to simulate clicking the left or right mouse button. For example, to simulate clicking the right mouse button to display the context menu for a control:

- Call the GetClickablePoint method to find a clickable point on the control.
- Call the SendInput function to send a right-mouse-down, right-mouse-up sequence.

201.14.10 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.14.11 CurrentAnnotationTypes as Integer()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the current list of annotation types associated with this element, such as comment, header, footer, and so on.

201.14.12 CurrentBoundingRectangle as UIAutomationRectMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the coordinates of the rectangle that completely encloses the element.

201.14.13 CurrentMetadataValue(targetId as Integer, metadataId as Integer) as Variant

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets metadata from the UI Automation element that indicates how the information should be interpreted.
Notes: For example, should the string "1/4" be interpreted as a fraction or a date?

targetId: The ID of the property to retrieve.
metadataId: Specifies the type of metadata to retrieve.

Requires Windows 10, version 1703 or later.

201.14.14 CurrentPattern(patternId as Integer) as Variant

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the control pattern interface of the specified pattern on this UI Automation element.
Notes: patternId: The identifier of the control pattern.

201.14.15 CurrentPropertyValue(propertyId as Integer) as Variant

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the current value of a property for this UI Automation element.
Notes: propertyId: The identifier of the property.

Microsoft UI Automation properties of the double type support Not a Number (NaN) values. When retrieving a property of the double type, a client can use the IsNan function to determine whether the property is a NaN value.
See also:

- 201.14.16 CurrentPropertyValue(propertyId as Integer, ignoreDefaultValue as Boolean) as Variant 23478

201.14.16 CurrentPropertyValue(propertyId as Integer, ignoreDefaultValue as Boolean) as Variant

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a property value for this UI Automation element, optionally ignoring any default value.
Notes: propertyId: The identifier of the property.
ignoreDefaultValue: A value that specifies whether a default value should be ignored if the specified property is not supported: TRUE if the default value is not to be returned, or FALSE if it is to be returned.

Passing FALSE in the ignoreDefaultValue parameter is equivalent to calling CurrentPropertyValue.

If the Microsoft UI Automation provider for the element itself supports the property, the value of the property is returned. Otherwise, if ignoreDefaultValue is FALSE, a default value specified by UI Automation is returned.

This method returns a failure code if the requested property was not previously cached.
UI Automation properties of the double type support Not a Number (NaN) values. When retrieving a property of the double type, a client can use the _isnan function to determine whether the property is a NaN value.
See also:

- 201.14.15 CurrentPropertyValue(propertyId as Integer) as Variant 23478

201.14.17 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.14.18 FindAll(TreeScope as Integer, condition as UIAutomationConditionMBS) as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns all UI Automation elements that satisfy the specified condition.
Notes: scope: A combination of values specifying the scope of the search.
condition: A condition that represents the criteria to match.

Returns an array of matching elements. Returns an empty array if no matching element is found.

The scope of the search is relative to the element on which the method is called. Elements are returned in the order in which they are encountered in the tree.

This function cannot search for ancestor elements in the Microsoft UI Automation tree; that is, TreeScopeAncestors is not a valid value for the scope parameter.

When searching for top-level windows on the desktop, be sure to specify TreeScopeChildren in the scope parameter, not TreeScopeDescendants. A search through the entire subtree of the desktop could iterate through thousands of items and lead to a stack overflow.

If your client application might try to find elements in its own user interface, you must make all UI Automation calls on a separate thread.
See also:

- 201.14.19 FindAll(TreeScope as Integer, condition as UIAutomationConditionMBS, traversalOptions as Integer, root as UIAutomationElementMBS) as UIAutomationElementArrayMBS 23479

201.14.19 FindAll(TreeScope as Integer, condition as UIAutomationConditionMBS, traversalOptions as Integer, root as UIAutomationElementMBS) as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Find all matching elements in the specified order.
Notes: scope: A combination of values specifying the scope of the search.
condition: a condition that represents the criteria to match.
traversalOptions: Enumeration value specifying the tree navigation order.
root: A pointer to the element with which to begin the search.

Returns an array of matching elements. Returns an empty array if no matching element is found.

Requires Windows 10, version 1703 or later.
See also:

- 201.14.18 FindAll(TreeScope as Integer, condition as UIAutomationConditionMBS) as UIAutomationElementArrayMBS 23479

201.14.20 FindAllBuildCache(TreeScope as Integer, condition as UIAutomationConditionMBS, cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns all UI Automation elements that satisfy the specified condition, prefetches the requested properties and control patterns, and stores the prefetched items in the cache.
Notes: scope: A combination of values specifying the scope of the search.
condition: a condition that represents the criteria to match.
cacheRequest: a cache request that specifies the control patterns and properties to include in the cache.

Returns an array of matching elements. If there are no matches, nil is returned.

The scope of the search is relative to the element on which the method is called. Elements are returned in the order in which they were encountered in the tree.

This function cannot search for ancestor elements in the Microsoft UI Automation tree; that is, TreeScopeAncestors is not a valid value for the scope parameter.

When searching for top-level windows on the desktop, be sure to specify TreeScopeChildren in the scope parameter, not TreeScopeDescendants. A search through the entire subtree of the desktop could iterate through thousands of items and lead to a stack overflow.

If your client application might try to find elements in its own user interface, you must make all UI Automation calls on a separate thread.
See also:

- 201.14.21 FindAllBuildCache(TreeScope as Integer, condition as UIAutomationConditionMBS, cacheRequest as UIAutomationCacheRequestMBS, traversalOptions as Integer, root as UIAutomationElementMBS) as UIAutomationElementArrayMBS 23481

201.14.21 FindAllBuildCache(TreeScope as Integer, condition as UIAutomationConditionMBS, cacheRequest as UIAutomationCacheRequestMBS, traversalOptions as Integer, root as UIAutomationElementMBS) as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns all UI Automation elements that satisfy the specified condition, prefetches the requested properties and control patterns, and stores the prefetched items in the cache.
Notes: Requires Windows 10, version 1703 or later.
See also:

- 201.14.20 FindAllBuildCache(TreeScope as Integer, condition as UIAutomationConditionMBS, cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementArrayMBS 23480

201.14.22 FindFirst(TreeScope as Integer, condition as UIAutomationConditionMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the first child or descendant element that matches the specified condition.
Notes: scope: A combination of values specifying the scope of the search.
condition: a condition that represents the criteria to match.

Returns the element. Nil is returned if no matching element is found.

The scope of the search is relative to the element on which the method is called. Elements are returned in the order in which they were encountered in the tree.

This function cannot search for ancestor elements in the Microsoft UI Automation tree; that is, TreeScope_Ancestors is not a valid value for the scope parameter.

When searching for top-level windows on the desktop, be sure to specify TreeScopeChildren in the scope parameter, not TreeScopeDescendants. A search through the entire subtree of the desktop could iterate through thousands of items and lead to a stack overflow.

If your client application might try to find elements in its own user interface, you must make all UI Automation calls on a separate thread.

This function ignores elements in the raw tree. Call FindFirstBuildCache to search the raw tree by specifying the appropriate TreeScope on the UIAutomationCacheRequestMBS passed to that function.
See also:

- 201.14.23 FindFirst(TreeScope as Integer, condition as UIAutomationConditionMBS, traversalOptions as Integer, root as UIAutomationElementMBS) as UIAutomationElementMBS 23482

201.14.23 FindFirst(TreeScope as Integer, condition as UIAutomationConditionMBS, traversalOptions as Integer, root as UIAutomationElementMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the first child or descendant element that matches the specified condition.
Notes: Requires Windows 10, version 1703 or later.
See also:

- 201.14.22 FindFirst(TreeScope as Integer, condition as UIAutomationConditionMBS) as UIAutomationElementMBS 23481

201.14.24 FindFirstBuildCache(TreeScope as Integer, condition as UIAutomationConditionMBS, cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the first child or descendant element that matches the specified condition, prefetches the requested properties and control patterns, and stores the prefetched items in the cache.
Notes: scope: A combination of values specifying the scope of the search.
condition: a condition that represents the criteria to match.
cacheRequest: a cache request that specifies the control patterns and properties to include in the cache.

Returns the matching element, or nil if no matching element is found.

The scope of the search is relative to the element on which the method is called. Elements are returned in the order in which they were encountered in the tree.

This function cannot search for ancestor elements in the Microsoft UI Automation tree; that is, TreeScope_Ancestors is not a valid value for the scope parameter.

When searching for top-level windows on the desktop, be sure to specify TreeScopeChildren in the scope parameter, not TreeScopeDescendants. A search through the entire subtree of the desktop could iterate through thousands of items and lead to a stack overflow.

If your client application might try to find elements in its own user interface, you must make all UI Automation calls on a separate thread.

To search the raw tree, specify the appropriate TreeScope in the cacheRequest parameter.
See also:

- 201.14.25 FindFirstBuildCache(TreeScope as Integer, condition as UIAutomationConditionMBS, cacheRequest as UIAutomationCacheRequestMBS, traversalOptions as Integer, root as UIAutomationElementMBS) as UIAutomationElementMBS 23483

201.14.25 FindFirstBuildCache(TreeScope as Integer, condition as UIAutomationConditionMBS, cacheRequest as UIAutomationCacheRequestMBS, traversalOptions as Integer, root as UIAutomationElementMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Finds the first matching element in the specified order, but also caches its properties and pattern.
Notes: scope: A combination of values specifying the scope of the search.
condition: a condition that represents the criteria to match.
cacheRequest: A cache request that specifies the control patterns and properties to include in the cache.
traversalOptions: Enumeration value specifying the tree navigation order.
root: the element with which to begin the search.

Returns the element. Nil is returned if no matching element is found.

Requires Windows 10, version 1703 or later.
See also:

- 201.14.24 FindFirstBuildCache(TreeScope as Integer, condition as UIAutomationConditionMBS, cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS 23482

201.14.26 GetRuntimeId as Integer()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the unique identifier assigned to the UI element.
Notes: The identifier is only guaranteed to be unique to the UI of the desktop on which it was generated. Identifiers can be reused over time.

The format of run-time identifiers might change in the future. The returned identifier should be treated as an opaque value and used only for comparison; for example, to determine whether a Microsoft UI Automation element is in the cache.

201.14.27 SetFocus

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the keyboard focus to this UI Automation element.

201.14.28 ShowContextMenu

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Programmatically invokes a context menu on the target element.
Notes: This method returns an error code if the context menu could not be invoked. If no context menu is available directly on the element on which it was invoked, calling this method might invoke a context menu on the Microsoft UI Automation parent of the current item.

The context menus themselves fire menu opened / closed events when they are invoked and dismissed.

201.14.29 Properties

201.14.30 CachedAcceleratorKey as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached accelerator key for the element.
Notes: (Read only property)

201.14.31 CachedAccessKey as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached access key character for the element.
Notes: An access key is a character in the text of a menu, menu item, or label of a control such as a button that activates the attached menu function. For example, the letter "O" is often used to invoke the Open file common dialog box from a File menu. Microsoft UI Automation elements that have the access key property set always implement the Invoke control pattern.
(Read only property)

201.14.32 CachedAnnotationObjects as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the cached list of annotation objects associated with this element, such as comment, header, footer, and so on.
Notes: (Read only property)

201.14.33 CachedAriaProperties as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached Accessible Rich Internet Applications (ARIA) properties of the element.
Notes: (Read only property)

201.14.34 CachedAriaRole as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached Accessible Rich Internet Applications (ARIA) role of the element.
Notes: (Read only property)

201.14.35 CachedAutomationId as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached Microsoft UI Automation identifier of the element.
Notes: The UI Automation identifier is unique among sibling elements in a container, and is the same in all instances of the application.
(Read only property)

201.14.36 CachedChildren as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached child elements of this UI Automation element.
Notes: The view of the returned collection is determined by the TreeFilter property of the UIAutomationCacheRequestMBS that was active when this element was obtained.

Children are cached only if the scope of the cache request included TreeScopeSubtree, TreeScopeChildren, or TreeScopeDescendants.

If the cache request specified that children were to be cached at this level, but there are no children, the value of this property is 0. However, if no request was made to cache children at this level, an attempt to

retrieve the property returns an error.
(Read only property)

201.14.37 CachedClassName as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached class name of the element.
Notes: (Read only property)

201.14.38 CachedControllerFor as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached array of UI Automation elements for which this element serves as the controller.
Notes: (Read only property)

201.14.39 CachedControlType as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates the control type of the element.
Notes: Control types describe a known interaction model for UI Automation elements without relying on a localized control type or combination of complex logic rules. This property cannot change at run time unless the control supports the UIAutomationMultipleViewPatternMBS interface. An example is the Win32 ListView control, which can change from a data grid to a list, depending on the current view.
(Read only property)

201.14.40 CachedCulture as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates the culture associated with the element.
Notes: (Read only property)

201.14.41 CachedDescribedBy as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached array of elements that describe this element.
Notes: This property maps to the Accessible Rich Internet Applications (ARIA) describedby property.
(Read only property)

201.14.42 CachedFlowsFrom as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached array of elements that indicate the reading order before the current element.
Notes: This property maps to the Microsoft Accessible Rich Internet Applications (ARIA) x-ms-aria-flowfrom property.
(Read only property)

201.14.43 CachedFlowsTo as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached array of elements that indicate the reading order after the current element.
Notes: This property maps to the Accessible Rich Internet Applications (ARIA) flowto property.
(Read only property)

201.14.44 CachedFrameworkId as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached name of the underlying UI framework associated with the element.
Notes: (Read only property)

201.14.45 CachedFullDescription as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the cached full description of the automation element.
Notes: Requires Windows 10, version 1703 or later.
(Read only property)

201.14.46 CachedHasKeyboardFocus as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A cached value that indicates whether the element has keyboard focus.
Notes: (Read only property)

201.14.47 CachedHeadingLevel as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the cached heading level of the automation element.
Notes: For Windows 10, version 1803 or newer.
(Read only property)

201.14.48 CachedHelpText as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached help text for the element.
Notes: This information is typically obtained from ToolTips.
(Read only property)

201.14.49 CachedIsContentElement as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A cached value that indicates whether the element is a content element.
Notes: A content element contains data that is presented to the user. Examples of content elements are the items in a list box or a button in a dialog box. Non-content elements, also called peripheral elements, are typically used to manipulate the content in a composite control; for example, the button on a drop-down control.
(Read only property)

201.14.50 CachedIsControlElement as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the element is a control element.
Notes: Controls are elements in the UI that display information, or that can be manipulated by the user to perform an action.
(Read only property)

201.14.51 CachedIsDataValidForForm as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the element contains valid data for the form.
Notes: (Read only property)

201.14.52 CachedIsDialog as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached dialog window indicator for the element.
Notes: When the CachedIsDialog property is TRUE, a client application can assume the cached window is a dialog.

For Windows 10 Build 20348 or later.
(Read only property)

201.14.53 CachedIsEnabled as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the element is enabled.
Notes: (Read only property)

201.14.54 CachedIsKeyboardFocusable as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the element can accept keyboard focus.
Notes: (Read only property)

201.14.55 CachedIsOffscreen as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the element is off-screen.
Notes: (Read only property)

201.14.56 CachedIsPassword as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the element contains a disguised password.
Notes: This property enables applications such as screen-readers to determine whether the text content of a control should be read aloud.
(Read only property)

201.14.57 CachedIsPeripheral as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached peripheral UI indicator for the element.
Notes: Peripheral UI appears and supports user interaction, but does not take keyboard focus when it appears. Examples of peripheral UI includes popups, flyouts, context menus, or floating notifications.

When the IsPeripheral property is TRUE, a client application can't assume that focus was taken by the element even if it's currently keyboard-interactive.

This property is relevant for these control types:

- ControlTypeIdGroup
- ControlTypeIdMenu
- ControlTypeIdPane
- ControlTypeIdToolBar
- ControlTypeIdToolTip
- ControlTypeIdWindow
- ControlTypeIdCustom

The appearance of peripheral UI often triggers one of these events, if the peripheral UI supports one of the relevant patterns:

- WindowOpened (EventIdWindowWindowOpened)
- MenuOpened (EventIdMenuOpened)
- ToolTipOpened (EventIdToolTipOpened)

(Read only property)

201.14.58 CachedIsRequiredForForm as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the element is required to be filled out on a form.
Notes: (Read only property)

201.14.59 CachedItemStatus as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached description of the status of an item within an element.
Notes: This property enables a client to ascertain whether an element is conveying status about an item. For example, an item associated with a contact in a messaging application might be "Busy" or "Connected"
(Read only property)

201.14.60 CachedItemType as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached string that describes the type of item represented by the element.
Notes: This property is used to obtain information about items in a list, tree view, or data grid. For example, an item in a file directory view might be a "Document File" or a "Folder".
(Read only property)

201.14.61 CachedLabeledBy as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached element that contains the text label for this element.
Notes: This property could be used to retrieve, for example, the static text label for a combo box.
This property maps to the Accessible Rich Internet Applications (ARIA) labeledby property.
(Read only property)

201.14.62 CachedLandmarkType as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the cached landmark type ID for the automation element.
Notes: (Read only property)

201.14.63 CachedLevel as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the cached 1-based integer for the level (hierarchy) for the element.
Notes: (Read only property)

201.14.64 CachedLiveSetting as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates the type of notifications, if any, that the element sends when the content of the element changes.
Notes: This property maps to the Accessible Rich Internet Applications (ARIA) live property.

The LiveSetting property is supported by provider elements that are part of a live region. When the content of a live region changes, the provider element can raise a notification. A client application determines whether to notify the user of the changes based on the value of the LiveSetting property.
(Read only property)

201.14.65 CachedLocalizedControlType as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached localized description of the control type of the element.
Notes: (Read only property)

201.14.66 CachedLocalizedLandmarkType as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a string containing the cached localized landmark type for the automation element.
Notes: (Read only property)

201.14.67 CachedName as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached name of the element.
Notes: The name of an element can be used to find the element in the element tree when the automation ID property is not supported on the element.

(Read only property)

201.14.68 CachedNativeWindowHandle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached window handle of the element.
Notes: (Read only property)

201.14.69 CachedOptimizeForVisualContent as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the provider exposes only elements that are visible.
Notes: A value of TRUE indicates that the provider optimizes for visual content, while FALSE indicates that the provider optimizes for virtual content.
(Read only property)

201.14.70 CachedOrientation as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates the orientation of the element.
Notes: This property is supported by controls such as scroll bars and sliders that can have either a vertical or a horizontal orientation.
(Read only property)

201.14.71 CachedParent as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves from the cache the parent of this UI Automation element.
Notes: (Read only property)

201.14.72 CachedPositionInSet as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the cached 1-based integer for the ordinal position in the set for the element.
Notes: (Read only property)

201.14.73 CachedProcessId as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached ID of the process that hosts the element.
Notes: (Read only property)

201.14.74 CachedProviderDescription as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached description of the provider for this element.
Notes: (Read only property)

201.14.75 CachedSizeOfSet as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the cached 1-based integer for the size of the set where the element is located.
Notes: (Read only property)

201.14.76 CurrentAcceleratorKey as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the accelerator key for the element.
Notes: (Read only property)

201.14.77 CurrentAccessKey as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the access key character for the element.
Notes: An access key is a character in the text of a menu, menu item, or label of a control such as a button that activates the attached menu function. For example, the letter "O" is often used to invoke the Open file common dialog box from a File menu. Microsoft UI Automation elements that have the access key property set always implement the Invoke control pattern.

(Read only property)

201.14.78 CurrentAnnotationObjects as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the current list of annotation objects associated with this element, such as comment, header, footer, and so on.
Notes: (Read only property)

201.14.79 CurrentAriaProperties as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Accessible Rich Internet Applications (ARIA) properties of the element.
Notes: (Read only property)

201.14.80 CurrentAriaRole as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Accessible Rich Internet Applications (ARIA) role of the element.
Notes: (Read only property)

201.14.81 CurrentAutomationId as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Microsoft UI Automation identifier of the element.
Notes: The identifier is unique among sibling elements in a container, and is the same in all instances of the application.
(Read only property)

201.14.82 CurrentClassName as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the class name of the element.
Notes: The value of this property is implementation-defined. The property is useful in testing environments.

(Read only property)

201.14.83 CurrentControllerFor as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves an array of elements for which this element serves as the controller.
Notes: (Read only property)

201.14.84 CurrentControlType as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the control type of the element.
Notes: Control types describe a known interaction model for UI Automation elements without relying on a localized control type or combination of complex logic rules. This property cannot change at run time unless the control supports the UIAutomationMultipleViewPatternMBS interface. An example is the Win32 ListView control, which can change from a data grid to a list, depending on the current view.
(Read only property)

201.14.85 CurrentCulture as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the culture identifier for the element.
Notes: (Read only property)

201.14.86 CurrentDescribedBy as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves an array of elements that describe this element.
Notes: This property maps to the Accessible Rich Internet Applications (ARIA) describedby property.
(Read only property)

201.14.87 CurrentFlowsFrom as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves an array of elements that indicates the reading order before the current element.
Notes: This property maps to the Microsoft Accessible Rich Internet Applications (ARIA) x-ms-aria-flowfrom property.
(Read only property)

201.14.88 CurrentFlowsTo as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves an array of elements that indicates the reading order after the current element.
Notes: This property maps to the Accessible Rich Internet Applications (ARIA) flowto property.
(Read only property)

201.14.89 CurrentFrameworkId as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the name of the underlying UI framework.
Notes: (Read only property)

201.14.90 CurrentFullDescription as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the current full description of the automation element.
Notes: Requires Windows 10, version 1703 or later.
(Read only property)

201.14.91 CurrentHasKeyboardFocus as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the element has keyboard focus.
Notes: (Read only property)

201.14.92 CurrentHeadingLevel as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the current heading level of the automation element.
Notes: For Windows 10, version 1803 or newer.
(Read only property)

201.14.93 CurrentHelpText as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the help text for the element.
Notes: This information is typically obtained from tooltips.
(Read only property)

201.14.94 CurrentIsContentElement as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the element is a content element.
Notes: A content element contains data that is presented to the user. Examples of content elements are the items in a list box or a button in a dialog box. Non-content elements, also called peripheral elements, are typically used to manipulate the content in a composite control; for example, the button on a drop-down control.
(Read only property)

201.14.95 CurrentIsControlElement as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the element is a control element.
Notes: (Read only property)

201.14.96 CurrentIsDataValidForForm as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the element contains valid data for a form.
Notes: (Read only property)

201.14.97 CurrentIsDialog as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the current dialog window indicator for the element.
Notes: When the CurrentIsDialog property is TRUE, a client application can assume the current window is a dialog.

For Windows 10 Build 20348 or later.
(Read only property)

201.14.98 CurrentIsEnabled as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the element is enabled.
Notes: (Read only property)

201.14.99 CurrentIsKeyboardFocusable as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the element can accept keyboard focus.
Notes: (Read only property)

201.14.100 CurrentIsOffscreen as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the element is off-screen.
Notes: (Read only property)

201.14.101 CurrentIsPassword as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the element contains a disguised password.
Notes: This property enables applications such as screen-readers to determine whether the text content of a control should be read aloud.
(Read only property)

201.14.102 CurrentIsPeripheral as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the current peripheral UI indicator for the element.
Notes: When the IsPeripheral property is TRUE, a client application can't assume that focus was taken by the element even if it's currently keyboard-interactive.

This property is relevant for these control types:

- ControlTypeIdGroup
- ControlTypeIdMenu
- ControlTypeIdPane
- ControlTypeIdToolBar
- ControlTypeIdToolTip
- ControlTypeIdWindow
- ControlTypeIdCustom

The appearance of peripheral UI often triggers one of these events, if the peripheral UI supports one of the relevant patterns:

WindowOpened (EventIdWindow_WindowOpened)
MenuOpened (EventIdMenuOpened)
ToolTipOpened (EventIdToolTipOpened)

When client applications that are assistive technologies handle one of these events, the client should check the value of CurrentIsPeripheral. If the value is TRUE, the client may need to provide an alternative representation of the peripheral UI that the user can reach with a single action, because the client can't use changed focus as an indicator of new UI or a UI of interest. The peripheral UI won't otherwise exist in the control view, tab sequence and so on. A client is guaranteed that only one peripheral UI item exists in the overall tree at any one time, opening another would close the first one automatically.
(Read only property)

201.14.103 CurrentIsRequiredForForm as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the element is required to be filled out on a form.
Notes: (Read only property)

201.14.104 CurrentItemStatus as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the description of the status of an item in an element.
Notes: This property enables a client to ascertain whether an element is conveying status about an item. For example, an item associated with a contact in a messaging application might be "Busy" or "Connected".
(Read only property)

201.14.105 CurrentItemType as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of the type of UI item represented by the element.
Notes: This property is used to obtain information about items in a list, tree view, or data grid. For example, an item in a file directory view might be a "Document File" or a "Folder".
(Read only property)

201.14.106 CurrentLabeledBy as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the element that contains the text label for this element.
Notes: This property could be used to retrieve, for example, the static text label for a combo box.
This property maps to the Accessible Rich Internet Applications (ARIA) labeledby property.
(Read only property)

201.14.107 CurrentLandmarkType as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the current landmark type ID for the automation element.
Notes: (Read only property)

201.14.108 CurrentLevel as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the current 1-based integer for the level (hierarchy) for the element.
Notes: (Read only property)

201.14.109 CurrentLiveSetting as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the type of notifications, if any, that the element sends when the content of the element changes.
Notes: This property maps to the Accessible Rich Internet Applications (ARIA) live property.

The LiveSetting property is supported by provider elements that are part of a live region. When the content of a live region changes, the provider element can raise a notification. A client application determines whether to notify the user of the changes based on the value of the LiveSetting property.
(Read only property)

201.14.110 CurrentLocalizedControlType as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a localized description of the control type of the element.
Notes: (Read only property)

201.14.111 CurrentLocalizedLandmarkType as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a string containing the current localized landmark type for the automation element.
Notes: (Read only property)

201.14.112 CurrentName as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the name of the element.
Notes: The name of an element can be used to find the element in the element tree when the automation ID property is not supported on the element.
(Read only property)

201.14.113 CurrentNativeWindowHandle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the window handle of the element.
Notes: (Read only property)

201.14.114 CurrentOptimizeForVisualContent as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the provider exposes only elements that are visible.
Notes: A value of TRUE indicates that the provider optimizes for visual content, while FALSE indicates that the provider optimizes for virtual content.
(Read only property)

201.14.115 CurrentOrientation as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a value that indicates the orientation of the element.
Notes: This property is supported by controls such as scroll bars and sliders that can have either a vertical or a horizontal orientation.
(Read only property)

201.14.116 CurrentPositionInSet as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the current 1-based integer for the ordinal position in the set for the element.
Notes: (Read only property)

201.14.117 CurrentProcessId as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the identifier of the process that hosts the element.
Notes: (Read only property)

201.14.118 CurrentProviderDescription as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of the provider for this element.
Notes: (Read only property)

201.14.119 CurrentSizeOfSet as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the current 1-based integer for the size of the set where the element is located.
Notes: (Read only property)

201.14.120 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.14.121 Constants

Annotation Type Identifiers

Constant	Value	Description
AnnotationTypeAdvancedProofingIssue	60020	An advanced proofing issue.
AnnotationTypeAuthor	60019	The author of the document.
AnnotationTypeCircularReferenceError	60022	A circular reference error that occurred.
AnnotationTypeComment	60003	A comment. Comments can take different forms depending on the appl
AnnotationTypeConflictingChange	60018	A conflicting change that was made to the document.
AnnotationTypeDataValidationError	60021	A data validation error that occurred.
AnnotationTypeDeletionChange	60012	A deletion change that was made to the document.
AnnotationTypeEditingLockedChange	60016	An editing locked change that was made to the document.
AnnotationTypeEndnote	60009	The endnote for a document.
AnnotationTypeExternalChange	60017	An external change that was made to the document.
AnnotationTypeFooter	60007	The footer for a page in a document.
AnnotationTypeFootnote	60010	The footnote for a page in a document.
AnnotationTypeFormatChange	60014	A format change that was made.
AnnotationTypeFormulaError	60004	An error in a formula. Formula errors typically include red text and ex tion marks.
AnnotationTypeGrammarError	60002	A grammatical error, often denoted by a green squiggly line.
AnnotationTypeHeader	60006	The header for a page in a document.
AnnotationTypeHighlighted	60008	Highlighted content, typically denoted by a contrasting background col
AnnotationTypeInsertionChange	60011	An insertion change that was made to the document.
AnnotationTypeMathematics	60023	A text range containing mathematics.
AnnotationTypeMoveChange	60013	A move change that was made to the document.
AnnotationTypeSensitive	60024	Sensitive
AnnotationTypeSpellingError	60001	A spelling error, often denoted by a red squiggly line.
AnnotationTypeTrackChanges	60005	A change that was made to the document.
AnnotationTypeUnknown	60000	The annotation type is unknown.
AnnotationTypeUnsyncedChange	60015	An unsynced change that was made to the document.

Control Types

Constant	Value	Description
ControlTypeAppBar	50040	Identifies the AppBar control type. Supported starting with Windows 8.1.
ControlTypeButton	50000	Identifies the Button control type.
ControlTypeCalendar	50001	Identifies the Calendar control type.
ControlTypeCheckBox	50002	Identifies the CheckBox control type.
ControlTypeComboBox	50003	Identifies the ComboBox control type.
ControlTypeCustom	50025	Identifies the Custom control type. For more information, see Custom Properties, Events, and Control Patterns.
ControlTypeDataGrid	50028	Identifies the DataGrid control type.
ControlTypeDataItem	50029	Identifies the DataItem control type.
ControlTypeDocument	50030	Identifies the Document control type.
ControlTypeEdit	50004	Identifies the Edit control type.
ControlTypeGroup	50026	Identifies the Group control type.
ControlTypeHeader	50034	Identifies the Header control type.
ControlTypeHeaderItem	50035	Identifies the HeaderItem control type.
ControlTypeHyperlink	50005	Identifies the Hyperlink control type.
ControlTypeImage	50006	Identifies the Image control type.
ControlTypeList	50008	Identifies the List control type.
ControlTypeListItem	50007	Identifies the ListItem control type.
ControlTypeMenu	50009	Identifies the Menu control type.
ControlTypeMenuBar	50010	Identifies the menu bar control type.
ControlTypeMenuItem	50011	Identifies the MenuItem control type.
ControlTypePane	50033	Identifies the Pane control type.
ControlTypeProgressBar	50012	Identifies the ProgressBar control type.
ControlTypeRadioButton	50013	Identifies the RadioButton control type.
ControlTypeScrollBar	50014	Identifies the ScrollBar control type.
ControlTypeSemanticZoom	50039	Identifies the SemanticZoom control type. Supported starting with Windows 8.
ControlTypeSeparator	50038	Identifies the Separator control type.
ControlTypeSlider	50015	Identifies the Slider control type.
ControlTypeSpinner	50016	Identifies the Spinner control type.
ControlTypeSplitButton	50031	Identifies the SplitButton control type.
ControlTypeStatusBar	50017	Identifies the StatusBar control type.
ControlTypeTab	50018	Identifies the Tab control type.
ControlTypeTabItem	50019	Identifies the TabItem control type.
ControlTypeTable	50036	Identifies the Table control type.
ControlTypeText	50020	Identifies the Text control type.
ControlTypeThumb	50027	Identifies the Thumb control type.
ControlTypeTitleBar	50037	Identifies the TitleBar control type.
ControlTypeToolBar	50021	Identifies the ToolBar control type.
ControlTypeToolTip	50022	Identifies the ToolTip control type.
ControlTypeTree	50023	Identifies the Tree control type.
ControlTypeTreeItem	50024	Identifies the TreeItem control type.
ControlTypeWindow	50032	Identifies the Window control type.

Heading Levels

Constant	Value	Description
HeadingLevel1	80051	Heading level 1.
HeadingLevel2	80052	Heading level 2.
HeadingLevel3	80053	Heading level 3.
HeadingLevel4	80054	Heading level 4.
HeadingLevel5	80055	Heading level 5.
HeadingLevel6	80056	Heading level 6.
HeadingLevel7	80057	Heading level 7.
HeadingLevel8	80058	Heading level 8.
HeadingLevel9	80059	Heading level 9.
HeadingLevelNone	80050	No heading level specified.

Landmark Type Identifiers

Constant	Value	Description
LandmarkTypeIdCustom	80000	Indicates a custom string should be used to describe the landmark using the value from PropertyIdLocalizedLandmarkType.
LandmarkTypeIdForm	80001	Indicates that the landmark is related to form type elements typically used for data entry.
LandmarkTypeIdMain	80002	Indicates that the landmark is for the primary content and not secondary or a lesser priority.
LandmarkTypeIdNavigation	80003	Indicates that the landmark is related to navigation type elements.
LandmarkTypeIdSearch	80004	Indicates that the landmark is related to search type elements.

Live Settings

Constant	Value	Description
LiveSettingAssertive	2	Assertive
LiveSettingOff	0	Off
LiveSettingPolite	1	Polite

Orientation Types

Constant	Value	Description
OrientationTypeHorizontal	1	The control has horizontal orientation.
OrientationTypeNone	0	The control has no orientation.
OrientationTypeVertical	2	The control has vertical orientation.

Pattern IDs

Constant	Value	Description
PatternIdAnnotation	10023	Identifies the Annotation control pattern. Supported starting with Windows 8.
PatternIdCustomNavigation	10033	Identifies the CustomNavigation control pattern. Supported starting with Windows 10.
PatternIdDock	10011	Identifies the Dock control pattern.
PatternIdDrag	10030	Identifies the Drag control pattern. Supported starting with Windows 8.
PatternIdDropTarget	10031	Identifies the DropTarget control pattern. Supported starting with Windows 8.
PatternIdExpandCollapse	10005	Identifies the ExpandCollapse control pattern.
PatternIdGrid	10006	Identifies the Grid control pattern.
PatternIdGridItem	10007	Identifies the GridItem control pattern.
PatternIdInvoke	10000	Identifies the Invoke control pattern.
PatternIdItemContainer	10019	Identifies the ItemContainer control pattern.
PatternIdLegacyIAccessible	10018	Identifies the LegacyIAccessible control pattern.
PatternIdMultipleView	10008	Identifies the MultipleView control pattern.
PatternIdObjectModel	10022	Identifies the ObjectModel control pattern. Supported starting with Windows 8.
PatternIdRangeValue	10003	Identifies the RangeValue control pattern.
PatternIdScroll	10004	Identifies the Scroll control pattern.
PatternIdScrollItem	10017	Identifies the ScrollItem control pattern.
PatternIdSelection	10001	Identifies the Selection control pattern.
PatternIdSelection	10034	Identifies the Selection control pattern.
PatternIdSelectionItem	10010	Identifies the SelectionItem control pattern.
PatternIdSpreadsheet	10026	Identifies the Spreadsheet control pattern. Supported starting with Windows 8.
PatternIdSpreadsheetItem	10027	Identifies the SpreadsheetItem control pattern. Supported starting with Windows 8.
PatternIdStyles	10025	Identifies the Styles control pattern. Supported starting with Windows 8.
PatternIdSynchronizedInput	10021	Identifies the SynchronizedInput control pattern.
PatternIdTable	10012	Identifies the Table control pattern.
PatternIdTableItem	10013	Identifies the TableItem control pattern.
PatternIdText	10014	Identifies the Text control pattern.
PatternIdText2	10024	Identifies the second version of the Text control pattern. Supported starting with Windows 8.
PatternIdTextChild	10029	Identifies the TextChild control pattern. Supported starting with Windows 8.
PatternIdTextEdit	10032	Identifies the TextEdit control pattern. Supported starting with Windows 8.1.
PatternIdToggle	10015	Identifies the Toggle control pattern.
PatternIdTransform	10016	Identifies the Transform control pattern.
PatternIdTransform2	10028	Identifies the second version of the Transform control pattern. Supported starting with Windows 8.
PatternIdValue	10002	Identifies the Value control pattern.
PatternIdVirtualizedItem	10020	Identifies the VirtualizedItem control pattern.
PatternIdWindow	10009	Identifies the Window control pattern.

Property Ids

Constant	Value	Description
PropertyIdAcceleratorKey	30006	Identifies the AcceleratorKey property, which is a string conta erator key (also called shortcut key) combinations for the auto Shortcut key combinations invoke an action. For example, CT used to invoke the Open file common dialog box. An automati has the AcceleratorKey property can implement the Invoke co the action that is equivalent to the shortcut command. Variant type: String Default value: empty string
PropertyIdAccessKey	30007	Identifies the AccessKey property, which is a string containin character for the automation element. An access key (sometimes called a mnemonic) is a character menu, menu item, or label of a control such as a button, th associated menu function. For example, to open the File men access key is typically F, the user would press ALT+F. Variant type: String Default value: empty string
PropertyIdAnnotationAnnotationTypeId	30113	Identifies the AnnotationTypeId property of the Annotation Supported starting with Windows 8. This property indicates the type of an annotation. For a list of see Annotation Type Identifiers. Variant type: Int32 Default value: 0
PropertyIdAnnotationAnnotationTypeName	30114	Identifies the AnnotationTypeName property of the Annotat tern. Supported starting with Windows 8. This property is a localized string that contains the name o type. The name can correspond to one of the annotation typ example, Comment for AnnotationType_Comment), but it is Variant type: String Default value: empty string
PropertyIdAnnotationAuthor	30115	Identifies the Author property of the Annotation control patt starting with Windows 8. This property is a string that contains the name of the perso the annotation. Variant type: String Default value: empty string
PropertyIdAnnotationDateTime	30116	Identifies the DateTime property of the Annotation control pat starting with Windows 8. This property is a string that contains the date and time when was created. Variant type: String Default value: empty string
PropertyIdAnnotationObjects	30156	Identifies the AnnotationObjects property, which is a list of an in a document, such as comment, header, footer, and so on. Variant type: Int32 array Default value: empty array
PropertyIdAnnotationTarget	30117	Identifies the Target property of the Annotation control patt starting with Windows 8. This property is the IUIAutomationElement interface of the being annotated. Variant type: Object Default value: NULL
PropertyIdAnnotationTypes	30155	Identifies the AnnotationTypes property, which is a list of the tations in a document, such as comment, header, footer, and s Variant type: Int32 array Default value: empty array
PropertyIdAriaProperties	30102	Identifies the AriaProperties property, which is a formatted s the Accessible Rich Internet Application (ARIA) property info automation element. For more information about mapping A

TreeScope

Constant	Value	Description
TreeScopeAncestors	16	The scope includes the parent and more distant ancestors of the element.
TreeScopeChildren	2	The scope includes children of the element.
TreeScopeDescendants	4	The scope includes children and more distant descendants of the element.
TreeScopeElement	1	The scope includes the element itself.
TreeScopeNone	0	The scope excludes the subtree from the search.
TreeScopeParent	8	The scope includes the parent of the element.
TreeScopeSubtree	7	The scope includes the element and all its descendants. This flag is a combination of the TreeScopeElement and TreeScopeDescendants values.

Tree Traversal

Constant	Value	Description
TreeTraversalOptionsDefault	0	Pre-order, visit children from first to last.
TreeTraversalOptionsLastToFirstOrder	2	Visit children from last to first.
TreeTraversalOptionsPostOrder	1	Post-order, see Remarks for more info.

201.15 class UIAutomationEventHandlerGroupMBS

201.15.1 class UIAutomationEventHandlerGroupMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes methods for adding one or more events to a collection for bulk registration through the CreateEventHandlerGroup and AddEventHandlerGroup methods defined in UIAutomationMBS.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.15.2 Methods

201.15.3 AddActiveTextPositionChangedEventHandler(TreeScope as Integer, cacheRequest as UIAutomationCacheRequestMBS, handler as UIAutomationActiveTextPositionChangedEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a method (in an event handler group) that handles when the active text position changes.
Notes: Microsoft UI Automation clients should use the handler group methods to register event listeners instead of individual event registration methods defined in the various UIAutomationMBS namespaces.

scope: The scope of events to be handled; that is, whether they are on the element itself, or on its ancestors and descendants.
cacheRequest: a cache request, or nil if no caching is wanted.
handler: the object that handles the active text position changed event.

Before implementing an event handler, you should be familiar with the threading issues described in Understanding Threading Issues.

Active text position is indicated by a navigation event within or between read-only text elements (such as web browsers, Portable Document Format (PDF) documents, or EPUB documents) using bookmarks (or fragment identifiers to refer to a location within a resource). Examples include:

- Navigating to a bookmark within the same web page
- Navigating to a bookmark on a different web page
- Activating a link to a different location within the same PDF
- Activating a link to a different location within the same EPUB

Use this event handler to sync the visual location of the bookmark/target with the focus location in a read-only text element, which can diverge when using bookmarks or fragment identifiers.

For example, when a same page anchor (Jump to Chapter 4... <h1>Chapter 4</h1>) is invoked, the visual location is updated, but the UI Automation client remains at the original location. This results in actions such as text reading or move next item commands starting from the original location, not the new location.

Similarly, activating a new page URI (with a fragment identifier: (Jump to Chapter 4)) loads the new page and jumps to the specified bookmark, but leaves the UI Automation clients at the top of the page.

For editable text elements, such as Edit and Rich Edit controls, you can listen for a SelectionChanged event.

201.15.4 AddAutomationEventHandler(eventId as Integer, TreeScope as Integer, cacheRequest as UIAutomationCacheRequestMBS, handler as UIAutomationEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a method that handles Microsoft UI Automation events.
Notes: UI Automation clients should use the handler group methods to register event listeners instead of individual event registration methods defined in the various IUIAutomation namespaces.

eventId: The identifier of the event that the method handles. For a list of event IDs, see Event Identifiers.
scope: The scope of events to be handled; that is, whether they are on the element itself, or on its ancestors and descendants.
cacheRequest: a cache request, or nil if no caching is wanted.
handler: the object that handles the event.

201.15.5 AddChangesEventHandler(TreeScope as Integer, changeTypes() as Integer, cacheRequest as UIAutomationCacheRequestMBS, handler as UIAutomationChangesEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a method that handles change events.
Notes: Microsoft UI Automation clients should use the handler group methods to register event listeners instead of individual event registration methods defined in the various IUIAutomation namespaces.

scope: The scope of events to be handled; that is, whether they are on the element itself, or on its ancestors

and descendants.
changeTypes: a list of integers that indicate the change types the event represents.
cacheRequest: a cache request, or nil if no caching is wanted.
handler: the object that handles the changes event.

201.15.6 AddNotificationEventHandler(TreeScope as Integer, cacheRequest as UIAutomationCacheRequestMBS, handler as UIAutomationNotificationEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a method that handles notification events.
Notes: Microsoft UI Automation clients should use the handler group methods to register event listeners instead of individual event registration methods defined in the various IUIAutomation namespaces.

scope: The scope of events to be handled; that is, whether they are on the element itself, or on its ancestors and descendants.
cacheRequest: A cache request, or nil if no caching is wanted.
handler: the object that handles the notification event.

201.15.7 AddPropertyChangedEventHandler(TreeScope as Integer, propertyArray() as Integer, cacheRequest as UIAutomationCacheRequestMBS, handler as UIAutomationPropertyChangedEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a method that handles a property-changed event.
Notes: Microsoft UI Automation clients should use the handler group methods to register event listeners instead of individual event registration methods defined in the various IUIAutomation namespaces.

scope: The scope of events to be handled; that is, whether they are on the element itself, or on its ancestors and children.
cacheRequest: a cache request, or nil if no caching is wanted.
handler: the object that handles the event.
propertyArray: the UI Automation properties of interest.

201.15.8 AddStructureChangedEventHandler(TreeScope as Integer, cacheRequest as UIAutomationCacheRequestMBS, handler as UIAutomationStructureChangedEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a method that handles structure-changed events.
Notes: Microsoft UI Automation clients should use the handler group methods to register event listeners instead of individual event registration methods defined in the various IUIAutomation namespaces.

scope: The scope of events to be handled; that is, whether they are on the element itself, or on its ancestors and descendants.
cacheRequest: a cache request, or nil if no caching is wanted.
handler: the object that handles the structure-changed event.

201.15.9 AddTextEditTextChangedEventHandler(TreeScope as Integer, textEditChangeType as Integer, cacheRequest as UIAutomationCacheRequestMBS, handler as UIAutomationTextEditTextChangedEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a method that handles programmatic text-edit events.
Notes: Microsoft UI Automation clients should use the handler group methods to register event listeners instead of individual event registration methods defined in the various IUIAutomation namespaces.

scope: The scope of events to be handled; that is, whether they are on the element itself, or on its ancestors and descendants.
textEditChangeType: The specific change type to listen for. Clients register for each text-edit change type separately, so that the UI Automation system can check for registered listeners at run-time and avoid raising events for particular text-edit changes when there are no listeners.
cacheRequest: a cache request, or nil if no caching is wanted.
handler: the object that handles the programmatic text-edit event.

201.15.10 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.15.11 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.15.12 Properties

201.15.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.15.14 Constants

TextEditChangeTypes

Constant	Value	Description
TextEditChangeTypeAutoComplete	4	Auto complete
TextEditChangeTypeAutoCorrect	1	Change is from an auto-correct action performed by a control.
TextEditChangeTypeComposition	2	Change is from an IME active composition within a control.
TextEditChangeTypeCompositionFinalized	3	Change is from an IME composition going from active to finalized st a control. The finalized string may be empty if composition was c deleted.
TextEditChangeTypeNone	0	Not related to a specific change type.

201.16 class UIAutomationEventHandlerMBS

201.16.1 class UIAutomationEventHandlerMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes a method to handle Microsoft UI Automation events.
Notes: This interface is implemented by the application to handle events that it has subscribed to by using AddAutomationEventHandler.

201.16.2 Methods

201.16.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

201.16.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.16.5 Properties

201.16.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.16.7 Events

201.16.8 HandleAutomationEvent(sender as UIAutomationElementMBS, eventId as Integer)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Handles a Microsoft UI Automation event.
Notes: sender: the element that raised the event.
eventId: The event identifier.

This method is implemented by the application to handle events that it has subscribed to by using AddAutomationEventHandler.
Adjusting an event handler from within this method is not supported.

201.17 class UIAutomationExceptionMBS

201.17.1 class UIAutomationExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for errors with the UIAutomation classes.
Notes: Subclass of the RuntimeException class.

201.18 class UIAutomationExpandCollapsePatternMBS

201.18.1 class UIAutomationExpandCollapsePatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a control that can visually expand to display content, and collapse to hide content.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.18.2 Methods

201.18.3 Collapse

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Hides all child nodes, controls, or content of the element.
Notes: This is a blocking method that returns after the element has been collapsed.
There are cases when a element that is marked as a leaf node might not know whether it has children until either the Collapse or the Expand method is called. This behavior is possible with a tree view control that does delayed loading of its child items. For example, Microsoft Windows Explorer might display the expand icon for a node even though there are currently no child items; when the icon is clicked, the control polls for child items, finds none, and removes the expand icon. In these cases clients should listen for a property-changed event on the CurrentExpandCollapseState property.

201.18.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.18.5 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.18.6 Expand

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Displays all child nodes, controls, or content of the element.
Notes: This is a blocking method that returns after the element has been expanded.

There are cases when a element that is marked as a leaf node might not know whether it has children until either the Collapse or the Expand method is called. This behavior is possible with a tree view control that does delayed loading of its child items. For example, Microsoft Windows Explorer might display the expand icon for a node even though there are currently no child items; when the icon is clicked, the control polls for child items, finds none, and removes the expand icon. In these cases clients should listen for a property-changed event on the CurrentExpandCollapseState property.

201.18.7 Properties

201.18.8 CachedExpandCollapseState as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates the state, expanded or collapsed, of the element.
Notes: (Read only property)

201.18.9 CurrentExpandCollapseState as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a value that indicates the state, expanded or collapsed, of the element.
Notes: (Read only property)

201.18.10 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

201.18.11 Constants

ExpandCollapseState

Constant	Value	Description
ExpandCollapseStateCollapsed	0	No children are visible.
ExpandCollapseStateExpanded	1	All children are visible.
ExpandCollapseStateLeafNode	3	The element does not expand or collapse.
ExpandCollapseStatePartiallyExpanded	2	Some, but not all, children are visible.

201.19 class UIAutomationFocusChangedEventHandlerMBS

201.19.1 class UIAutomationFocusChangedEventHandlerMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes a method to handle events that are raised when the keyboard focus moves to another UI Automation element.
Notes: This interface is implemented by the application to handle events that were subscribed to by using AddFocusChangedEventHandler.

201.19.2 Methods

201.19.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

201.19.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.19.5 Properties

201.19.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.19.7 Events

201.19.8 HandleFocusChangedEvent(sender as UIAutomationElementMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Handles the event raised when the keyboard focus moves to a different UI Automation element.
Notes: sender: the element that has received the focus.

This method is implemented by the application to handle events that were subscribed to by using AddFocusChangedEventHandler.

The UI Automation element represented by sender might not have any cached properties or control patterns, depending on whether the application subscribed to this event while a cache request was active.

Adjusting an event handler from within this method is not supported.

201.20 class UIAutomationGridItemPatternMBS

201.20.1 class UIAutomationGridItemPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a child control in a grid-style container that supports the UIAutomationGridPatternMBS interface.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.20.2 Methods

201.20.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.20.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.20.5 Properties

201.20.6 CachedColumn as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached zero-based index of the column that contains the grid item.
Notes: (Read only property)

201.20.7 CachedColumnSpan as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached number of columns spanned by the grid item.
Notes: (Read only property)

201.20.8 CachedContainingGrid as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached element that contains the grid item.
Notes: (Read only property)

201.20.9 CachedRow as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached zero-based index of the row that contains the item.
Notes: (Read only property)

201.20.10 CachedRowSpan as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached number of rows spanned by a grid item.
Notes: (Read only property)

201.20.11 CurrentColumn as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the zero-based index of the column that contains the item.
Notes: (Read only property)

201.20.12 CurrentColumnSpan as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the number of columns spanned by the grid item.
Notes: (Read only property)

201.20.13 CurrentContainingGrid as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the element that contains the grid item.
Notes: (Read only property)

201.20.14 CurrentRow as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the zero-based index of the row that contains the grid item.
Notes: (Read only property)

201.20.15 CurrentRowSpan as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the number of rows spanned by the grid item.
Notes: (Read only property)

201.20.16 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.21 class UIAutomationGridPatternMBS

201.21.1 class UIAutomationGridPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a control that acts as a container for a collection of child controls that are organized in a two-dimensional logical coordinate system that can be traversed by row and column.
Notes: The children of this element support the UIAutomationGridItemPatternMBS interface.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.21.2 Methods

201.21.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.21.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.21.5 Item(row as Integer, column as Integer) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a UI Automation element representing an item in the grid.
Notes: Row: The zero-based index of the row.
Column: The zero-based index of the column.

201.21.6 Properties

201.21.7 CachedColumnCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached number of columns in the grid.
Notes: Hidden rows and columns, depending on the provider implementation, may be loaded in the Microsoft UI Automation tree and will therefore be reflected in the row count and column count properties. If the hidden rows and columns have not yet been loaded they are not counted.
(Read only property)

201.21.8 CachedRowCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached number of rows in the grid.
Notes: Hidden rows and columns, depending on the provider implementation, may be loaded in the Microsoft UI Automation tree and will therefore be reflected in the row count and column count properties. If the hidden rows and columns have not yet been loaded they are not counted.
(Read only property)

201.21.9 CurrentColumnCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of columns in the grid.
Notes: Hidden rows and columns, depending on the provider implementation, may be loaded in the Microsoft UI Automation tree and will therefore be reflected in the row count and column count properties. If the hidden rows and columns have not yet been loaded they are not counted.
(Read only property)

201.21.10 CurrentRowCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the number of rows in the grid.
Notes: Hidden rows and columns, depending on the provider implementation, may be loaded in the Microsoft UI Automation tree and will therefore be reflected in the row count and column count properties. If the hidden rows and columns have not yet been loaded they are not counted.
(Read only property)

201.21.11 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.

Notes: (Read and Write property)

201.22 class UIAutomationInvokePatternMBS

201.22.1 class UIAutomationInvokePatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes a method that enables a client application to invoke the action of a control (typically a button).
Notes: A control should support this interface if it initiates or performs a single, unambiguous action and does not maintain state when activated.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.22.2 Methods

201.22.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.22.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.22.5 Invoke

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Invokes the action of a control, such as a button click.
Notes: Calls to this method should return immediately without blocking. However, this behavior depends on the implementation.

201.22.6 Properties

201.22.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.23 class UIAutomationItemContainerPatternMBS

201.23.1 class UIAutomationItemContainerPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes a method that retrieves an item from a container, such as a virtual list.
Notes: This interface is not limited to use by virtualized containers. Any container that can implement efficient name lookup can support this control pattern, enabling clients to look up names more quickly than by using methods such as FindFirst, which must traverse the Microsoft UI Automation tree.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.23.2 Methods

201.23.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.23.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.23.5 FindItemByProperty(StartAfter as UIAutomationElementMBS, propertyId as Integer, value as Variant) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves an element within a containing element, based on a specified property value.
Notes: StartAfter: the element after which the search begins, or NULL to search all elements.
propertyId: The property identifier.
Value: The property value.

Returns to the matching element.

The provider may return an actual UIAutomationElementMBS interface or a placeholder if the matching element is virtualized.

This method returns E_INVALIDARG if the property requested is not one that the container supports searching over. It is expected that most containers will support Name property, and if appropriate for the container, AutomationId and IsSelected.

This method can be slow, because it may need to traverse multiple objects to find a matching one. When used in a loop to return multiple items, no specific order is defined so long as each item is returned only once (that is, the loop should terminate). This method is also item-centric, not UI-centric, so items with multiple UI representations need to be hit only once.

When the propertyId parameter is specified as 0 (zero), the provider is expected to return the next item after pStartAfter. If pStartAfter is specified as nil with a propertyId of 0, the provider should return the first item in the container. When propertyId is specified as 0, the value parameter should be empty.

201.23.6 Properties

201.23.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.24 class UIAutomationLegacyIAccessiblePatternMBS

201.24.1 class UIAutomationLegacyIAccessiblePatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes methods and properties that enable Microsoft UI Automation clients to retrieve UI information from Microsoft Active Accessibility (MSAA) servers..
Notes: This interface is obtained just like any other control pattern. It enables UI Automation clients to gather MSAA properties more efficiently, taking advantage of the caching system, and also enables UI Automation clients to interact with native Microsoft Active Accessibility servers that support the IAccessible interface.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.24.2 Methods

201.24.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.24.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.24.5 DoDefaultAction

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs the Microsoft Active Accessibility default action for the element.

201.24.6 SelectItem(flagsSelect as Integer)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a Microsoft Active Accessibility selection.
Notes: Specifies which selection or focus operations are to be performed. This parameter must have a

combination of the values described in Selection Flag Constants.

201.24.7 SetValue(Value as String)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the Microsoft Active Accessibility value property for the element.
Notes: Value: A localized string that contains the object's value.

This method is supported only for some elements (usually edit controls).

201.24.8 Properties

201.24.9 CachedChildId as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached Microsoft Active Accessibility child identifier for the element.
Notes: If the element is not a child element, CHILDID_SELF (0) is returned.
(Read only property)

201.24.10 CachedDefaultAction as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Microsoft Active Accessibility cached default action for the element.
Notes: (Read only property)

201.24.11 CachedDescription as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached Microsoft Active Accessibility description of the element.
Notes: (Read only property)

201.24.12 CachedHelp as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached Microsoft Active Accessibility help string for the element.
Notes: (Read only property)

201.24.13 CachedKeyboardShortcut as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached Microsoft Active Accessibility keyboard shortcut property for the element.
Notes: (Read only property)

201.24.14 CachedName as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached Microsoft Active Accessibility name property of the element.
Notes: (Read only property)

201.24.15 CachedRole as UInt32

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached Microsoft Active Accessibility role of the element.
Notes: (Read only property)

201.24.16 CachedSelection as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached Microsoft Active Accessibility property that identifies the selected children of this element.
Notes: (Read only property)

201.24.17 CachedState as UInt32

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached Microsoft Active Accessibility state identifier for the element.
Notes: (Read only property)

201.24.18 CachedValue as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached Microsoft Active Accessibility value property.
Notes: (Read only property)

201.24.19 CurrentChildId as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Microsoft Active Accessibility child identifier for the element.
Notes: (Read only property)

201.24.20 CurrentDefaultAction as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Microsoft Active Accessibility current default action for the element.
Notes: (Read only property)

201.24.21 CurrentDescription as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Microsoft Active Accessibility description of the element.
Notes: (Read only property)

201.24.22 CurrentHelp as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Microsoft Active Accessibility help string for the element.
Notes: (Read only property)

201.24.23 CurrentKeyboardShortcut as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Microsoft Active Accessibility keyboard shortcut property for the element.
Notes: (Read only property)

201.24.24 CurrentName as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Microsoft Active Accessibility name property of the element.
Notes: The name of an element can be used to find the element in the element tree when the automation ID property is not supported on the element.
(Read only property)

201.24.25 CurrentRole as UInt32

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Microsoft Active Accessibility role identifier of the element.
Notes: (Read only property)

201.24.26 CurrentSelection as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Microsoft Active Accessibility property that identifies the selected children of this element.
Notes: Returns the collection of the selected child elements.
(Read only property)

201.24.27 CurrentState as UInt32

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Microsoft Active Accessibility state identifier for the element.
Notes: (Read only property)

201.24.28 CurrentValue as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Microsoft Active Accessibility value property.
Notes: (Read only property)

201.24.29 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.24.30 Constants

Selection Flags

Constant	Value	Description
SelectonFlagAddSelection	8	Adds the object to the current selection; possible result is a noncontiguous selection. Unless it is combined with SelectonFlagTakeFocus, this flag does not change the focus or the selection anchor. The SelectonFlagAddSelection / SelectonFlagTakeFocus combination is equivalent to adding an item to a selection manually by holding down the CTRL key and clicking an unselected object in Windows Explorer. This flag is not combined with SelectonFlagRemoveSelection or SelectonFlagTakeSelection.
SelectonFlagExtendSelection	4	Alters the selection so that all objects between the selection anchor and this object take on the anchor object's selection state. If the anchor object is not selected, the objects are removed from the selection. If the anchor object is selected, the selection is extended to include this object and all the objects in between. Set the selection state by combining this flag with SelectonFlagAddSelection or SelectonFlagRemoveSelection. Unless it is combined with SelectonFlagTakeFocus, this flag does not change the focus or the selection anchor. The SelectonFlagExtendSelection / SelectonFlagTakeFocus combination is equivalent to adding an item to a selection manually by holding down the SHIFT key and clicking an unselected object in Windows Explorer. This flag is not combined with SelectonFlagTakeSelection.
SelectonFlagNone	0	Performs no action. Microsoft Active Accessibility does not change the selection or focus.
SelectonFlagRemoveSelection	&h10	Removes the object from the current selection; possible result is a noncontiguous selection. Unless it is combined with SelectonFlagTakeFocus, this flag does not change the focus or the selection anchor. The SelectonFlagRemoveSelection / SelectonFlagTakeFocus combination is equivalent to removing an item from a selection manually, by holding down the CTRL key while clicking a selected object in Windows Explorer. This flag is not combined with SelectonFlagAddSelection or SelectonFlagTakeSelection.
SelectonFlagTakeFocus	1	Sets the focus to the object and makes it the selection anchor. Used by itself, this flag does not alter the selection. The effect is similar to moving the focus manually by pressing an ARROW key while holding down the CTRL key in Windows Explorer or in any multiple-selection list box. With objects that have the STATE_SYSTEM_MULTISELECTABLE, SelectonFlagTakeFocus is combined with the following values: * SelectonFlagTakeSelection * SelectonFlagExtendSelection * SelectonFlagAddSelection * SelectonFlagRemoveSelection * SelectonFlagAddSelection * SelectonFlagExtendSelection * SelectonFlagRemoveSelection * SelectonFlagExtendSelection If you call IAccessible::accSelect with the SelectonFlagTakeFocus flag on an object that has an HWND, the flag will take effect only if the object's parent already has the focus.
SelectonFlagTakeSelection	2	Selects the object and removes the selection from all other objects in the container. Unless it is combined with SELFLAG_TAKEFOCUS, this flag does not change the focus or the selection anchor. The SELFLAG_TAKESELECTION / SELFLAG_TAKEFOCUS combination is equivalent to single-clicking an item in Windows Explorer. This flag must not be combined with the following flags: * SelectonFlagAddSelection * SelectonFlagRemoveSelection

201.25 class UIAutomationMBS

201.25.1 class UIAutomationMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes methods that enable Microsoft UI Automation client applications to discover, access, and filter UI Automation elements.
Example:

```
Var UIAutomation As New UIAutomationMBS
Var appElement As UIAutomationElementMBS = UIAutomation.RootElement

// list windows to console to find names
var ea as UIAutomationElementArrayMBS = appElement.FindAll(UIAutomationMBS.TreeScopeChildren,
UIAutomation.CreateTrueCondition)
for each e as UIAutomationElementMBS in ea.Elements
System.DebugLog e.CurrentName
next

// put in exact name of window!
Var value1 As Variant = "Hello.txt –Notepad"
Var cond1 As UIAutomationPropertyConditionMBS = UIAutomation.CreatePropertyCondition(UIAutoma-
tionElementMBS.PropertyIdName, value1)
Var notepad As UIAutomationElementMBS = appElement.FindFirst(UIAutomationMBS.TreeScopeSub-
tree, cond1)

If notepad <>Nil Then
MessageBox("Found Notepad window!")

var ControlTypeDocument as int32 = UIAutomationElementMBS.ControlTypeDocument
Var value2 As Variant = ControlTypeDocument // must be int32
Var cond2 As UIAutomationPropertyConditionMBS = UIAutomation.CreatePropertyCondition(UIAutoma-
tionElementMBS.PropertyIdControlType, value2)
Var docControl As UIAutomationElementMBS = notepad.FindFirst(UIAutomationMBS.TreeScopeSubtree,
cond2)

If docControl <>Nil Then
Var textPattern As UIAutomationTextPatternMBS = docControl.CurrentPattern(docControl.PatternId-
Text)
If textPattern <>Nil Then
// shows text from notepad window
MessageBox(textPattern.DocumentRange.Text)
End If
Else
MessageBox("Document control not found.")
End If
else
```

```
MessageBox("Notepad window not found!")
End If
```

Notes: UI Automation exposes every element of the UI Automation as an object represented by the IUIAutomation interface. The members of this interface are not specific to a particular element.

All methods in the UIAutomation* classes raise an UIAutomationExceptionMBS in case of an error.

For the properties there are often cached and current values.
With current value, you send a request to the host application to query the value. With cached values you have the chance, that values could come from a cache if they have been recently read. This is increases performance.

We route events to main thread, if they are called on a different thread. Please keep the main thread responsive for event processing.

- Introducing UIAutomation Support in MBS Xojo Plugins

201.25.2 Methods

201.25.3 AddActiveTextPositionChangedEventHandler(element as UIAutomationElementMBS, TreeScope as Integer, cacheRequest as UIAutomationCacheRequestMBS, handler as UIAutomationActiveTextPositionChangedEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a method that handles when the active text position changes.
Notes: element: the UI Automation element associated with the event handler.
scope: The scope of events to be handled; that is, whether they are on the element itself, or on its ancestors and descendants.
cacheRequest: a cache request, or nil if no caching is wanted.
handler: the object that handles the active text position changed event.

Active text position is indicated by a navigation event within or between read-only text elements (such as web browsers, Portable Document Format (PDF) documents, or EPUB documents) using bookmarks (or fragment identifiers to refer to a location within a resource). Examples include:

- Navigating to a bookmark within the same web page
- Navigating to a bookmark on a different web page

- Activating a link to a different location within the same PDF
- Activating a link to a different location within the same EPUB

Use this event handler to sync the visual location of the bookmark/target with the focus location in a read-only text element, which can diverge when using bookmarks or fragment identifiers.

For example, when a same page anchor (Jump to Chapter 4...<h1>Chapter 4</h1>) is invoked, the visual location is updated, but the UI Automation client remains at the original location. This results in actions such as text reading or move next item commands starting from the original location, not the new location.

Similarly, activating a new page URI (with a fragment identifier: (Jump to Chapter 4) loads the new page and jumps to the specified bookmark, but leaves the UI Automation clients at the top of the page.

For editable text elements, such as Edit and Rich Editcontrols, you can listen for a SelectionChanged event.

It is possible for an event to be delivered to an event handler after the handler has been unsubscribed, if the event is received simultaneously with the request to unsubscribe the event. The best practice is to follow the Component Object Model (COM) standard and avoid destroying the event handler object until its reference count has reached zero. Destroying an event handler immediately after unsubscribing for events may result in an access violation if an event is delivered late.

For Windows 10, version 1809 or later.

201.25.4 AddAutomationEventHandler(eventId as Integer, element as UIAutomationElementMBS, TreeScope as Integer, cacheRequest as UIAutomationCacheRequestMBS, handler as UIAutomationEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a method that handles Microsoft UI Automation events.
Notes: eventId: The identifier of the event that the method handles. For a list of event IDs, see Event Identifiers.
element: the UI Automation element to associate with the event handler.
scope: The scope of events to be handled; that is, whether they are on the element itself, or on its ancestors and descendants.
cacheRequest: a cache request, or nil if no caching is wanted.
handler: the object that handles the event.

A UI Automation client should not use multiple threads to add or remove event handlers. Unexpected behavior can result if one event handler is being added or removed while another is being added or removed

in the same client process.

201.25.5 AddChangesEventHandler(element as UIAutomationElementMBS, TreeScope as Integer, changeTypes() as Integer, cacheRequest as UIAutomationCacheRequestMBS, handler as UIAutomationChangesEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a method that handles change events.
Notes: element: the UI Automation element associated with the event handler.
scope: The scope of events to be handled; that is, whether they are on the element itself, or on its ancestors and descendants.
changeTypes: a list of integers that indicate the change types the event represents.
CacheRequest: a cache request, or nil if no caching is wanted.
handler: the object that handles the changes event.

A Microsoft UI Automation client should not use multiple threads to add or remove event handlers. Unexpected behavior can result if one event handler is being a

For Windows 10, version 1607 or later.

201.25.6 AddEventHandlerGroup(element as UIAutomationElementMBS, handlerGroup as UIAutomationEventHandlerGroupMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a collection of event handler methods specified with the CreateEventHandlerGroup.
Notes: element: the UI Automation element associated with the event handler group.
handlerGroup: A collection of UI Automation event listeners.

It is possible for an event to be delivered to an event handler after the handler has been unsubscribed, if the event is received simultaneously with the request to unsubscribe the event. The best practice is to follow the Component Object Model (COM) standard and avoid destroying the event handler object until its reference count has reached zero. Destroying an event handler immediately after unsubscribing for events may result in an access violation if an event is delivered late.

For Windows 10, version 1809 or later.

201.25.7 AddFocusChangedEventHandler(cacheRequest as UIAutomationCacheRequestMB handler as UIAutomationFocusChangedEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a method that handles focus-changed events.
Notes: cacheRequest: a cache request, or nil if no caching is wanted.
handler: the object that handles the event.

Focus-changed events are system-wide; you cannot set a narrower scope.
A UI Automation client should not use multiple threads to add or remove event handlers. Unexpected behavior can result if one event handler is being added or removed while another is being added or removed in the same client process.

201.25.8 AddNotificationEventHandler(element as UIAutomationElementMBS, TreeScope as Integer, cacheRequest as UIAutomationCacheRequestMBS, handler as UIAutomationNotificationEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a method that handles notification events.
Notes: element: the UI Automation element associated with the event handler.
scope: The scope of events to be handled; that is, whether they are on the element itself, or on its ancestors and descendants.
cacheRequest: a cache request, or nil if no caching is wanted.
handler: the object that handles the notification event.

For Windows 10, version 1709 or later.

201.25.9 AddPropertyChangedEventHandler(element as UIAutomationElementMBS, TreeScope as Integer, propertyArray() as Integer, cacheRequest as UIAutomationCacheRequestMBS, handler as UIAutomationPropertyChangedEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a method that handles and array of property-changed events.
Notes: element: the UI Automation element associated with the event handler.
scope: The scope of events to be handled; that is, whether they are on the element itself, or on its ancestors and children.
cacheRequest: a cache request, or nil if no caching is wanted.
handler: the object that handles the event.

propertyArray: the UI Automation properties of interest.

The UI item specified by element might not support the properties specified by the propertyArray parameter.

A UI Automation client should not use multiple threads to add or remove event handlers. Unexpected behavior can result if one event handler is being added or removed while another is being added or removed in the same client process.

201.25.10 AddStructureChangedEventHandler(element as UIAutomationElementMBS, TreeScope as Integer, cacheRequest as UIAutomationCacheRequestMBS, handler as UIAutomationStructureChangedEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a method that handles structure-changed events.
Notes: element: the UI Automation element associated with the event handler.
scope: The scope of events to be handled; that is, whether they are on the element itself, or on its ancestors and descendants.
cacheRequest: a cache request, or nil if no caching is wanted.
handler: the object that handles the structure-changed event.

A UI Automation client should not use multiple threads to add or remove event handlers. Unexpected behavior can result if one event handler is being added or removed while another is being added or removed in the same client process.

201.25.11 AddTextEditTextChangedEventHandler(element as UIAutomationElementMBS, TreeScope as Integer, textEditChangeType as Integer, cacheRequest as UIAutomationCacheRequestMBS, handler as UIAutomationNotificationEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a method that handles programmatic text-edit events.
Notes: element: the UI Automation element associated with the event handler.
scope: The scope of events to be handled; that is, whether they are on the element itself, or on its ancestors and descendants.
textEditChangeType: The specific change type to listen for. Clients register for each text-edit change type separately, so that the UI Automation system can check for registered listeners at run-time and avoid raising events for particular text-edit changes when there are no listeners.
cacheRequest: a cache request, or nil if no caching is wanted.
handler: the object that handles the programmatic text-edit event.

A UI Automation client should not use multiple threads to add or remove event handlers. Unexpected behavior can result if one event handler is being added or removed while another is being added or removed in the same client process.

For Windows 8.1 or later.

201.25.12 CompareElements(element1 as UIAutomationElementMBS, element2 as UIAutomationElementMBS) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Compares two UI Automation elements to determine whether they represent the same underlying UI element.
Notes: element1: the first element to compare.
element2: the second element to compare.

Returns TRUE if the run-time identifiers of the elements are the same, or FALSE otherwise.

201.25.13 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

201.25.14 CreateAndCondition(condition1 as UIAutomationConditionMBS, condition2 as UIAutomationConditionMBS) as UIAutomationAndConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a condition that selects elements that match both of two conditions.
Notes: condition1: the first condition to match.
condition2: the second condition to match.

A condition that combines more than two simple conditions can be created by using CreateAndCondition with an array.
See also:

- 201.25.15 CreateAndCondition(conditions() as UIAutomationConditionMBS) as UIAutomationAndConditionMBS

201.25.15 CreateAndCondition(conditions() as UIAutomationConditionMBS) as UIAutomationAndConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a condition that selects elements based on multiple conditions, all of which must be true.
Notes: conditions: the conditions to be combined.
See also:

- 201.25.14 CreateAndCondition(condition1 as UIAutomationConditionMBS, condition2 as UIAutomationConditionMBS) as UIAutomationAndConditionMBS 23547

201.25.16 CreateBoolCondition(value as boolean) as UIAutomationBoolConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a boolean condition.

201.25.17 CreateCacheRequest as UIAutomationCacheRequestMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a cache request.
Notes: After obtaining the UIAutomationCacheRequestMBS interface, use its methods to specify properties and control patterns to be cached when a UI Automation element is obtained.

201.25.18 CreateEventHandlerGroup as UIAutomationEventHandlerGroupMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers one or more event listeners in a single method call.
Notes: handlerGroup: A collection of UI Automation event listeners.

For Windows 10, version 1809 or later.

201.25.19 CreateFalseCondition as UIAutomationBoolConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a condition that is always false.
Notes: This method exists only for symmetry with CreateTrueCondition. A false condition will never en-

able a match with UI Automation elements, and it cannot usefully be combined with any other condition.

201.25.20 CreateNotCondition(condition as UIAutomationConditionMBS) as UIAutomationNotConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a condition that is the negative of a specified condition.
Example:

```
Var u As New UIAutomationMBS

Var bt As UIAutomationConditionMBS = u.CreateTrueCondition
Var bn As UIAutomationConditionMBS = u.CreateNotCondition(bt)

Break
```

201.25.21 CreateOrCondition(condition1 as UIAutomationConditionMBS, condition2 as UIAutomationConditionMBS) as UIAutomationOrConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a combination of two conditions where a match exists if either of the conditions is true.
See also:

- 201.25.22 CreateOrCondition(conditions() as UIAutomationConditionMBS) as UIAutomationOrConditionMBS 23549

201.25.22 CreateOrCondition(conditions() as UIAutomationConditionMBS) as UIAutomationOrConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a combination of two or more conditions where a match exists if any of the conditions is true.
See also:

- 201.25.21 CreateOrCondition(condition1 as UIAutomationConditionMBS, condition2 as UIAutomationConditionMBS) as UIAutomationOrConditionMBS 23549

201.25.23 CreatePropertyCondition(propertyId as Integer, value as Variant) as UIAutomationPropertyConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a condition that selects elements that have a property with the specified value.
Notes: propertyId: The property identifier.
value: The property value.
See also:

- 201.25.24 CreatePropertyCondition(propertyId as Integer, value as Variant, PropertyConditionFlags as Integer) as UIAutomationPropertyConditionMBS 23550

201.25.24 CreatePropertyCondition(propertyId as Integer, value as Variant, PropertyConditionFlags as Integer) as UIAutomationPropertyConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a condition that selects elements that have a property with the specified value, using optional flags.
Notes: propertyId: The property identifier.
value: The property value.
flags: The attributes of the condition. Use PropertyConditionFlagsIgnoreCase to create a property condition that is not case-sensitive
See also:

- 201.25.23 CreatePropertyCondition(propertyId as Integer, value as Variant) as UIAutomationPropertyConditionMBS 23550

201.25.25 CreateProxyFactoryEntry(factory as UIAutomationProxyFactoryMBS) as UIAutomationProxyFactoryEntryMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new instance of a proxy factory object.
Notes: Factory: the proxy factory object.

Use the UIAutomationProxyFactoryMappingMBS interface to enter the proxy factory into the table of available proxies.

201.25.26 CreateTreeWalker(Condition as UIAutomationConditionMBS) as UIAutomationTreeWalkerMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a tree walker object that can be used to traverse the Microsoft UI Automation tree.
Notes: Condition: a condition that specifies the elements of interest.

201.25.27 CreateTrueCondition as UIAutomationBoolConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a predefined condition that selects all elements.

201.25.28 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.25.29 ElementFromHandle(Handle as Integer) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a UI Automation element for the specified window.

201.25.30 ElementFromHandleBuildCache(Handle as Integer, cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a UI Automation element for the specified window, prefetches the requested properties and control patterns, and stores the prefetched items in the cache.
Notes: cacheRequest: the cache request, which specifies the properties and control patterns to store in the cache.

201.25.31 ElementFromPoint(point as UIAutomationPointMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the UI Automation element at the specified point on the desktop.
Notes: Point: The desktop coordinates of the UI Automation element.

The ElementFromPoint method returns the UIA_E_ELEMENTNOTAVAILABLE error code if the element under the point is already removed by the time the method returns. Clients should handle errors from this method gracefully; for example, by trying the call again.
See also:

- 201.25.32 ElementFromPoint(x as Integer, y as Integer) as UIAutomationElementMBS 23552

201.25.32 ElementFromPoint(x as Integer, y as Integer) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the UI Automation element at the specified point on the desktop.
Notes: x/y: The desktop coordinates of the UI Automation element.

The ElementFromPoint method returns the UIA_E_ELEMENTNOTAVAILABLE error code if the element under the point is already removed by the time the method returns. Clients should handle errors from this method gracefully; for example, by trying the call again.
See also:

- 201.25.31 ElementFromPoint(point as UIAutomationPointMBS) as UIAutomationElementMBS 23552

201.25.33 ElementFromPointBuildCache(point as UIAutomationPointMBS, cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the UI Automation element at the specified point on the desktop, prefetches the requested properties and control patterns, and stores the prefetched items in the cache.
Notes: Point: The desktop coordinates of the UI Automation element.
CacheRequest: A pointer to the cache request, which specifies the properties and control patterns to store in the cache.
See also:

- 201.25.34 ElementFromPointBuildCache(x as Integer, y as Integer, cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS 23553

201.25.34 ElementFromPointBuildCache(x as Integer, y as Integer, cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the UI Automation element at the specified point on the desktop, prefetches the requested properties and control patterns, and stores the prefetched items in the cache.
Notes: x/y: The desktop coordinates of the UI Automation element.
CacheRequest: A pointer to the cache request, which specifies the properties and control patterns to store in the cache.
See also:

- 201.25.33 ElementFromPointBuildCache(point as UIAutomationPointMBS, cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS 23552

201.25.35 ElementFromWindow(c as Control) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop only.

Function: Retrieves a UI Automation element for the specified control.
See also:

- 201.25.36 ElementFromWindow(c as DesktopUIControl) as UIAutomationElementMBS 23553
- 201.25.37 ElementFromWindow(win as DesktopWindow) as UIAutomationElementMBS 23553
- 201.25.38 ElementFromWindow(win as Window) as UIAutomationElementMBS 23554

201.25.36 ElementFromWindow(c as DesktopUIControl) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop only.

Function: Retrieves a UI Automation element for the specified control.
See also:

- 201.25.35 ElementFromWindow(c as Control) as UIAutomationElementMBS 23553
- 201.25.37 ElementFromWindow(win as DesktopWindow) as UIAutomationElementMBS 23553
- 201.25.38 ElementFromWindow(win as Window) as UIAutomationElementMBS 23554

201.25.37 ElementFromWindow(win as DesktopWindow) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop only.

Function: Retrieves a UI Automation element for the specified window.
See also:

- 201.25.35 ElementFromWindow(c as Control) as UIAutomationElementMBS 23553
- 201.25.36 ElementFromWindow(c as DesktopUIControl) as UIAutomationElementMBS 23553
- 201.25.38 ElementFromWindow(win as Window) as UIAutomationElementMBS 23554

201.25.38 ElementFromWindow(win as Window) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop only.

Function: Retrieves a UI Automation element for the specified window.
See also:

- 201.25.35 ElementFromWindow(c as Control) as UIAutomationElementMBS 23553
- 201.25.36 ElementFromWindow(c as DesktopUIControl) as UIAutomationElementMBS 23553
- 201.25.37 ElementFromWindow(win as DesktopWindow) as UIAutomationElementMBS 23553

201.25.39 ElementFromWindowBuildCache(c as Control, CacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop only.

Function: Retrieves a UI Automation element for the specified control, prefetches the requested properties and control patterns, and stores the prefetched items in the cache.
Notes: cacheRequest: the cache request, which specifies the properties and control patterns to store in the cache.
See also:

- 201.25.40 ElementFromWindowBuildCache(c as DesktopUIControl, CacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS 23554
- 201.25.41 ElementFromWindowBuildCache(win as DesktopWindow, CacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS 23555
- 201.25.42 ElementFromWindowBuildCache(win as Window, CacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS 23555

201.25.40 ElementFromWindowBuildCache(c as DesktopUIControl, CacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop only.

Function: Retrieves a UI Automation element for the specified control, prefetches the requested properties and control patterns, and stores the prefetched items in the cache.
Notes: cacheRequest: the cache request, which specifies the properties and control patterns to store in the cache.
See also:

- 201.25.39 ElementFromWindowBuildCache(c as Control, CacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS 23554
- 201.25.41 ElementFromWindowBuildCache(win as DesktopWindow, CacheRequest as UIAutomation-CacheRequestMBS) as UIAutomationElementMBS 23555
- 201.25.42 ElementFromWindowBuildCache(win as Window, CacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS 23555

201.25.41 ElementFromWindowBuildCache(win as DesktopWindow, CacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop only.

Function: Retrieves a UI Automation element for the specified window, prefetches the requested properties and control patterns, and stores the prefetched items in the cache.
Notes: cacheRequest: the cache request, which specifies the properties and control patterns to store in the cache.
See also:

- 201.25.39 ElementFromWindowBuildCache(c as Control, CacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS 23554

201.25.42 ElementFromWindowBuildCache(win as Window, CacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop only.

Function: Retrieves a UI Automation element for the specified window, prefetches the requested properties and control patterns, and stores the prefetched items in the cache.
Notes: cacheRequest: the cache request, which specifies the properties and control patterns to store in the cache.
See also:

- 201.25.39 ElementFromWindowBuildCache(c as Control, CacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS 23554

- 201.25.41 ElementFromWindowBuildCache(win as DesktopWindow, CacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS 23555

201.25.43 FocusedElementBuildCache(CacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the UI Automation element that has the input focus, prefetches the requested properties and control patterns, and stores the prefetched items in the cache.
Notes: cacheRequest: the cache request, which specifies the properties and control patterns to store in the cache.

201.25.44 PatternProgrammaticName(patternId as Integer) as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the registered programmatic name of a control pattern.
Notes: patternId: The identifier of the control pattern.

The programmatic name is intended for debugging and diagnostic purposes only. The string is not localized.

This property should not be used in string comparisons. To determine whether two control patterns are the same, compare the control pattern identifiers directly.

201.25.45 PropertyProgrammaticName(propertyId as Integer) as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the registered programmatic name of a property.
Notes: proepertyId: The property identifier.

The programmatic name is intended for debugging and diagnostic purposes only. The string is not localized.

This property should not be used in string comparisons. To determine whether two properties are the same, compare the property identifiers directly.

201.25.46 RemoveActiveTextPositionChangedEventHandler(element as UIAutomationElementMBS, handler as UIAutomationActiveTextPositionChangedEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes an active text position changed event handler.
Notes: element: A pointer to the UI Automation element associated with the event handler.
handler: the object that handles the active text position changed event.

Active text position is indicated by a navigation event within or between read-only text elements (such as web browsers, Portable Document Format (PDF) documents, or EPUB documents) using bookmarks (or fragment identifiers to refer to a location within a resource). Examples include:

- Navigating to a bookmark within the same web page
- Navigating to a bookmark on a different web page
- Activating a link to a different location within the same PDF
- Activating a link to a different location within the same EPUB

Use this event handler to sync the visual location of the bookmark/target with the focus location in a read-only text element, which can diverge when using bookmarks or fragment identifiers.

For example, when a same page anchor (Jump to Chapter 4...<h1>Chapter 4</h1>) is invoked, the visual location is updated, but the UI Automation client remains at the original location. This results in actions such as text reading or move next item commands starting from the original location, not the new location.

Similarly, activating a new page URI (with a fragment identifier: (Jump to Chapter 4) loads the new page and jumps to the specified bookmark, but leaves the UI Automation clients at the top of the page.
For editable text elements, such as Edit and Rich Edit controls, you can listen for a SelectionChanged event.

It is possible for an event to be delivered to an event handler after the handler has been unsubscribed, if the event is received simultaneously with the request to unsubscribe the event. The best practice is to follow the Component Object Model (COM) standard and avoid destroying the event handler object until its reference count has reached zero. Destroying an event handler immediately after unsubscribing for events may result in an access violation if an event is delivered late.

For Windows 10, version 1809 or later.

201.25.47 RemoveAllEventHandlers

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes all registered Microsoft UI Automation event handlers.
Notes: A UI Automation client should not use multiple threads to add or remove event handlers. Unexpected behavior can result if one event handler is being added or removed while another is being added or removed in the same client process.

It is possible for an event to be delivered to an event handler after the handler has been unsubscribed, if the event is received simultaneously with the request to unsubscribe the event. The best practice is to follow the Component Object Model (COM) standard and avoid destroying the event handler object until its reference count has reached zero. Destroying an event handler immediately after unsubscribing for events may result in an access violation if an event is delivered late.

201.25.48 RemoveAutomationEventHandler(eventId as Integer, element as UIAutomationElementMBS, handler as UIAutomationEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes the specified UI Automation event handler.
Notes: eventId: The identifier of the event being handled. For a list of event IDs, see Event Identifiers.
element: the UI Automation element that is handling the event.
handler: the handler method that was passed to AddAutomationEventHandler for the specified event identifier and UI Automation element.

A UI Automation client should not use multiple threads to add or remove event handlers. Unexpected behavior can result if one event handler is being added or removed while another is being added or removed in the same client process.

It is possible for an event to be delivered to an event handler after the handler has been unsubscribed, if the event is received simultaneously with the request to unsubscribe the event. The best practice is to follow the Component Object Model (COM) standard and avoid destroying the event handler object until its reference count has reached zero. Destroying an event handler immediately after unsubscribing for events may result in an access violation if an event is delivered late.

201.25.49 RemoveChangesEventHandler(element as UIAutomationElementMBS, handler as UIAutomationChangesEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes a changes event handler.
Notes: element: the UI Automation element from which to remove the handler.

handler: the interface that was passed to AddChangesEventHandler.

For Windows 10, version 1607 or later.

201.25.50 RemoveEventHandlerGroup(element as UIAutomationElementMBS, handlerGroup as UIAutomationEventHandlerGroupMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Asynchronously removes the specified UI Automation event handler group.
Notes: element: the UI Automation element associated with the event handler group.
handlerGroup: A collection of UI Automation event listeners.

It is possible for an event to be delivered to an event handler after the handler has been unsubscribed, if the event is received simultaneously with the request to unsubscribe the event. The best practice is to follow the Component Object Model (COM) standard and avoid destroying the event handler object until its reference count has reached zero. Destroying an event handler immediately after unsubscribing for events may result in an access violation if an event is delivered late.

For Windows 10, version 1809 or later.

201.25.51 RemoveFocusChangedEventHandler(handler as UIAutomationFocusChangedEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes a focus-changed event handler.
Notes: handler: the event handler that was passed to AddFocusChangedEventHandler.

A UI Automation client should not use multiple threads to add or remove event handlers. Unexpected behavior can result if one event handler is being added or removed while another is being added or removed in the same client process.

It is possible for an event to be delivered to an event handler after the handler has been unsubscribed, if the event is received simultaneously with the request to unsubscribe the event. The best practice is to follow the Component Object Model (COM) standard and avoid destroying the event handler object until its reference count has reached zero. Destroying an event handler immediately after unsubscribing for events may result in an access violation if an event is delivered late.

201.25.52 RemoveNotificationEventHandler(element as UIAutomationElementMBS, handler as UIAutomationNotificationEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes a notification event handler.
Notes: element: the UI Automation element from which to remove the handler.
handler: the interface that was passed to AddNotificationEventHandler.

For Windows 10, version 1709 or later.

201.25.53 RemovePropertyChangedEventHandler(element as UIAutomationElementMBS, handler as UIAutomationPropertyChangedEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes a property-changed event handler.
Notes: element: the UI Automation element from which to remove the handler.
handler: the interface that was passed to AddPropertyChangedEventHandler.

A UI Automation client should not use multiple threads to add or remove event handlers. Unexpected behavior can result if one event handler is being added or removed while another is being added or removed in the same client process.

It is possible for an event to be delivered to an event handler after the handler has been unsubscribed, if the event is received simultaneously with the request to unsubscribe the event. The best practice is to follow the Component Object Model (COM) standard and avoid destroying the event handler object until its reference count has reached zero. Destroying an event handler immediately after unsubscribing for events may result in an access violation if an event is delivered late.

201.25.54 RemoveStructureChangedEventHandler(element as UIAutomationElementMBS, handler as UIAutomationStructureChangedEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes a structure-changed event handler.
Notes: element: the UI Automation element from which to remove the handler.
handler: the interface that was passed to AddStructureChangedEventHandler.

A UI Automation client should not use multiple threads to add or remove event handlers. Unexpected behavior can result if one event handler is being added or removed while another is being added or removed in the same client process.

It is possible for an event to be delivered to an event handler after the handler has been unsubscribed, if the event is received simultaneously with the request to unsubscribe the event. The best practice is to follow the Component Object Model (COM) standard and avoid destroying the event handler object until its reference count has reached zero. Destroying an event handler immediately after unsubscribing for events may result in an access violation if an event is delivered late.

201.25.55 RemoveTextEditTextChangedEventHandler(element as UIAutomationElementMBS, handler as UIAutomationNotificationEventHandlerMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes a programmatic text-edit event handler.
Notes: element: the UI Automation element from which to remove the handler.
handler: the interface that was passed to AddTextEditTextChangedEventHandler.

A Microsoft UI Automation client should not use multiple threads to add or remove event handlers. Unexpected behavior can result if one event handler is being added or removed while another is being added or removed in the same client process.

It is possible for an event to be delivered to an event handler after the handler has been unsubscribed, if the event is received simultaneously with the request to unsubscribe the event. The best practice is to follow the Component Object Model (COM) standard and avoid destroying the event handler object until its reference count has reached zero. Destroying an event handler immediately after unsubscribing for events may result in an access violation if an event is delivered late.

For Windows 8.1 or later.

201.25.56 RootElementBuildCache(CacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the UI Automation element that represents the desktop, prefetches the requested properties and control patterns, and stores the prefetched items in the cache.
Notes: cacheRequest: the cache request, which specifies the properties and control patterns to store in the cache.

You can use the root element as a starting point for finding other elements, using the FindAll and FindFirst methods.

When searching from the root element, be sure to specify TreeScopeChildren in the scope of the search, not TreeScopeDescendants. A search through the entire subtree of the desktop could iterate through thousands of items and lead to a stack overflow.

201.25.57 Properties

201.25.58 AutoSetFocus as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies whether calls to UI Automation control pattern methods automatically set focus to the target element.
Notes: By default, most UI Automation methods that perform an action on an element, such as Invoke and SetValue, set focus to the element before performing the action. For most applications, setting the focus results in a more consistent user experience. In situations where setting the focus would be disruptive, such as automating a drop-down menu, you can set AutoSetFocus to FALSE to prevent UI Automation methods from setting the focus.
(Read and Write property)

201.25.59 CoalesceEvents as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets whether an accessible technology client receives all events, or a subset where duplicate events are detected and filtered.
Notes: coalesceEventsOptions: Value indicating whether events are filtered. The default is CoalesceEventsOptionsDisabled.

For Windows 10, version 1809 or later.
(Read and Write property)

201.25.60 ConnectionRecoveryBehavior as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether an accessible technology client adjusts provider request timeouts when the provider is non-responsive.
Notes: For Windows 10, version 1809 or later.
(Read and Write property)

201.25.61 ConnectionTimeout as UInt32

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the length of time that UI Automation will wait for a provider to respond to a client request for an automation element.
Notes: The duration of the time-out period, in milliseconds.
(Read and Write property)

201.25.62 ContentViewCondition as UIAutomationTreeWalkerMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a predefined UIAutomationCondition interface that selects content elements.
Notes: (Read only property)

201.25.63 ContentViewWalker as UIAutomationTreeWalkerMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves an UIAutomationTreeWalker interface used to discover control elements.
Notes: (Read only property)

201.25.64 ControlViewCondition as UIAutomationConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a predefined UIAutomationCondition interface that selects control elements.
Notes: (Read only property)

201.25.65 ControlViewWalker as UIAutomationTreeWalkerMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves an UIAutomationTreeWalker interface used to discover control elements.
Notes: (Read only property)

201.25.66 FocusedElement as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the UI Automation element that has the input focus.
Notes: The GetFocusedElement method returns the UIA_E_ELEMENTNOTAVAILABLE error code if the focused element is already removed by the time the method returns. Clients should handle errors from this method gracefully; for example, by trying the call again.
(Read only property)

201.25.67 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.25.68 ProxyFactoryMapping as UIAutomationProxyFactoryMappingMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves an object that represents the mapping of Window classnames and associated data to individual proxy factories.
Notes: (Read only property)

201.25.69 RawViewCondition as UIAutomationConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a predefined UIAutomationCondition interface that selects all UI elements in an unfiltered view.
Notes: Used by itself, the condition is functionally identical to the one retrieved by CreateTrueCondition.
(Read only property)

201.25.70 RawViewWalker as UIAutomationTreeWalkerMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a tree walker object used to traverse an unfiltered view of the Microsoft UI Automation tree.
Notes: (Read only property)

201.25.71 RootElement as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the UI Automation element that represents the desktop.
Notes: You can use the root element as a starting point for finding other elements, using the FindAll and FindFirst methods.

When searching from the root element, be sure to specify TreeScopeChildren in the scope of the search, not TreeScopeDescendants. A search through the entire subtree of the desktop could iterate through thousands of items and lead to a stack overflow.
(Read only property)

201.25.72 TransactionTimeout as UInt32

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the length of time that UI Automation will wait for a provider to respond to a client request for information about an automation element.
Notes: The duration of the time-out period, in milliseconds.
(Read and Write property)

201.25.73 Constants

CoalesceEventsOptions

Constant	Value	Description
CoalesceEventsOptionsDisabled	0	Event coalescing is disabled.
CoalesceEventsOptionsEnabled	1	Event coalescing is enabled.

ConnectionRecoveryBehaviorOptions

Constant	Value	Description
ConnectionRecoveryBehaviorOptionsDisabled	0	Connection recovery is disabled.
ConnectionRecoveryBehaviorOptionsEnabled	1	Connection recovery is enabled.

Event IDs

Constant	Value	Description
EventIdActiveTextPositionChanged	20036	Identifies the event that is raised when the active text p cated by a navigation event within or between read-only web browsers, PDF documents, or EPUB documents) u ment identifiers that refer to a location within a resourc
EventIdAsyncContentLoaded	20006	Identifies the event that is raised when asynchronous co This event is used mainly by providers to indicate that loading events have occurred.
EventIdAutomationFocusChanged	20005	Identifies the event that is raised when the focus has char to another.
EventIdAutomationPropertyChanged	20004	Identifies the event that is raised when the value of a pr
EventIdChanges	20034	Identifies the event that is raised when a provider calls sEvent function.
EventIdDrag_DragCancel	20027	Identifies the event that is raised when the user ends a dropping an element on a drop target. This event is being dragged. Supported starting with Windows 8.
EventIdDrag_DragComplete	20028	Identifies the event that is raised when the user drops target. This event is raised by the element being dragge with Windows 8.
EventIdDrag_DragStart	20026	Identifies the event that is raised when the user starts This event is raised by the element being dragged. Su Windows 8.
EventIdDropTarget_DragEnter	20029	Identifies the event that is raised when the user drags a target's boundary. This event is raised by the drop targ starting with Windows 8.
EventIdDropTarget_DragLeave	20030	Identifies the event that is raised when the user drags an target's boundary. This event is raised by the drop targ starting with Windows 8.
EventIdDropTarget_Dropped	20031	Identifies the event that is raised when the user drops target. This event is raised by the drop target elemen with Windows 8.
EventIdHostedFragmentRootsInvalidated	20025	Identifies the event that is raised when a change is made UI Automation fragment that is hosted in another elemen with Windows 8.
EventIdInputDiscarded	20022	Identifies the event that is raised when the specified in otherwise failed to reach any element.
EventIdInputReachedOtherElement	20021	Identifies the event that is raised when the specified inp other than the element for which the StartListening met
EventIdInputReachedTarget	20020	Identifies the event that is raised when the specified mo reaches the element for which the StartListening method
EventIdInvoke_Invoked	20009	Identifies the event that is raised when a control is invol
EventIdLayoutInvalidated	20008	Identifies the event that is raised when the layout of child has changed. This event is also used for Auto-suggest ac
EventIdLiveRegionChanged	20024	Identifies the event that is raised when the content of a li Supported starting with Windows 8.
EventIdMenuClosed	20007	Identifies the event that is raised when a menu is closed
EventIdMenuModeEnd	20019	Identifies the event that is raised when a menu mode is
EventIdMenuModeStart	20018	Identifies the event that is raised when a menu mode is
EventIdMenuOpened	20003	Identifies the event that is raised when a menu is opened
EventIdNotification	20035	Identifies the event that is raised when a provider calls tionEvent method.
EventIdSelectionItem_ElementAddedToSelection	20010	Identifies the event raised when an item is added to a items.
EventIdSelectionItem_ElementRemovedFromSelection	20011	Identifies the event raised when an item is removed from items.
EventIdSelectionItem_ElementSelected	20012	Identifies the event that is raised when a call to the Selec RemoveFromSelection method results in a single item be
EventIdSelection_Invalidated	20013	Identifies the event that is raised when a selection in a significantly.

PropertyConditionFlags

Constant	Value	Description
PropertyConditionFlagsIgnoreCase	1	Comparison of string properties is not case-sensitive.
PropertyConditionFlagsMatchSubstring	2	Comparison of substring properties is enabled.
PropertyConditionFlagsNone	0	No flags.

TextEditChangeTypes

Constant	Value	Description
TextEditChangeTypeAutoComplete	4	Auto complete
TextEditChangeTypeAutoCorrect	1	Change is from an auto-correct action performed by a control.
TextEditChangeTypeComposition	2	Change is from an IME active composition within a control.
TextEditChangeTypeCompositionFinalized	3	Change is from an IME composition going from active to finalized st a control. The finalized string may be empty if composition was c deleted.
TextEditChangeTypeNone	0	Not related to a specific change type.

TreeScope

Constant	Value	Description
TreeScopeAncestors	16	The scope includes the parent and more distant ancestors of the element.
TreeScopeChildren	2	The scope includes children of the element.
TreeScopeDescendants	4	The scope includes children and more distant descendants of the element.
TreeScopeElement	1	The scope includes the element itself.
TreeScopeNone	0	The scope excludes the subtree from the search.
TreeScopeParent	8	The scope includes the parent of the element.
TreeScopeSubtree	7	The scope includes the element and all its descendants. This flag is a combination of the TreeScopeElement and TreeScopeDescendants values.

201.26 class UIAutomationMultipleViewPatternMBS

201.26.1 class UIAutomationMultipleViewPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a control that can switch between multiple representations of the same information or set of child controls.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.26.2 Methods

201.26.3 CachedSupportedViews as String()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a collection of control-specific view identifiers from the cache.

201.26.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.26.5 CurrentSupportedViews as String()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a collection of control-specific view identifiers.

201.26.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.26.7 SetCurrentView(view as Integer)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the view of the control.
Notes: view: The control-specific view identifier.

201.26.8 ViewName(index as Integer) as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the name of a control-specific view.
Notes: view: The identifier of the view.

Returns a localized view name.

201.26.9 Properties

201.26.10 CachedCurrentView as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached control-specific identifier of the current view of the control.
Notes: (Read only property)

201.26.11 CurrentCurrentView as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the control-specific identifier of the current view of the control.
Notes: (Read only property)

201.26.12 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

201.27 class UIAutomationNotConditionMBS

201.27.1 class UIAutomationNotConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a condition that is the negative of another condition.
Example:

```
Var u As New UIAutomationMBS

Var bt As UIAutomationConditionMBS = u.CreateTrueCondition
Var bn As UIAutomationConditionMBS = u.CreateNotCondition(bt)

Break
```

Notes: Subclass of the UIAutomationConditionMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.27.2 Properties

201.27.3 Child as UIAutomationConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the condition of which this condition is the negative.
Notes: (Read only property)

201.28 class UIAutomationNotificationEventHandlerMBS

201.28.1 class UIAutomationNotificationEventHandlerMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes a method to handle Microsoft UI Automation notification events.
Notes: This interface is implemented by the application to handle events that it has subscribed to by calling AddNotificationEventHandler.

201.28.2 Methods

201.28.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

201.28.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.28.5 Properties

201.28.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.28.7 Events

201.28.8 HandleNotificationEvent(sender as UIAutomationElementMBS, notificationKind as Integer, notificationProcessing as Integer, displayString as String, activityId as String)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Handles a Microsoft UI Automation notification event.
Notes: sender: the element that raised the event.
notificationKind: The type of notification.
notificationProcessing: Indicates how to process notifications.
displayString: A string to display in the notification message.
activityId: A unique non-localized string to identify an action or group of actions. This is used to pass additional information to the event handler.

This method is implemented by the application to handle events that it has subscribed to by calling AddNotificationEventHandler.

201.29 class UIAutomationObjectModelPatternMBS

201.29.1 class UIAutomationObjectModelPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to the underlying object model implemented by a control or application.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.29.2 Methods

201.29.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.29.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.29.5 Properties

201.29.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

201.30 class UIAutomationOrConditionMBS

201.30.1 class UIAutomationOrConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a condition made up of multiple conditions, at least one of which must be true.
Notes: Subclass of the UIAutomationConditionMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.30.2 Methods

201.30.3 Child(Index as Integer) as UIAutomationConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries a condition used for this OR condition.
Notes: Index is zero-based.
Raises OutOfBoundsException if the index is out of bounds.

201.30.4 Children as UIAutomationConditionMBS()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the conditions that make up this "or" condition.

201.30.5 Properties

201.30.6 Child0 as UIAutomationConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Child(0) as property visible in the debugger.
Notes: (Read only property)

201.30.7 Child1 as UIAutomationConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Child(1) as property visible in the debugger.
Notes: (Read only property)

201.30.8 Child2 as UIAutomationConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Child(2) as property visible in the debugger.
Notes: (Read only property)

201.30.9 ChildCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the number of conditions that make up this ”or” condition.
Notes: (Read only property)

201.31 class UIAutomationPointMBS

201.31.1 class UIAutomationPointMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a point.

201.31.2 Methods

201.31.3 Constructor(other as UIAutomationPointMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The copy constructor.
See also:

- 201.31.4 Constructor(x as integer = 0, y as integer = 0) 23576

201.31.4 Constructor(x as integer = 0, y as integer = 0)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor for a new point.
See also:

- 201.31.3 Constructor(other as UIAutomationPointMBS) 23576

201.31.5 Properties

201.31.6 X as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The X coordinate.
Notes: (Read and Write property)

201.31.7 Y as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Y coordinate.
Notes: (Read and Write property)

201.32 class UIAutomationPropertyChangedEventHandlerMBS

201.32.1 class UIAutomationPropertyChangedEventHandlerMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes a method to handle Microsoft UI Automation events that occur when a property is changed.
Notes: This interface is implemented by the application to handle events that it has subscribed to by using AddPropertyChangedEventHandler.

201.32.2 Methods

201.32.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

201.32.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.32.5 Properties

201.32.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.32.7 Events

201.32.8 HandlePropertyChangedEvent(sender as UIAutomationElementMBS, propertyId as Integer, newValue as Variant)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Handles a Microsoft UI Automation property-changed event.
Notes: sender: the element that raised the event.
propertyId: The identifier of the property whose value has changed. For a list of property IDs, see Property Identifiers.
newValue: The new property value.

This method is implemented by the application to handle events that it has subscribed to by using AddPropertyChangedEventHandler.
Adjusting an event handler from within this method is not supported.

201.33 class UIAutomationPropertyConditionMBS

201.33.1 class UIAutomationPropertyConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a condition based on a property value that is used to find UI Automation elements.
Notes: Subclass of the UIAutomationConditionMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Introducing UIAutomation Support in MBS Xojo Plugins

201.33.2 Methods

201.33.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.33.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.33.5 Properties

201.33.6 PropertyConditionFlags as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a set of flags that specify how the condition is applied.
Notes: (Read only property)

201.33.7 PropertyId as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the identifier of the property on which this condition is based.
Notes: (Read only property)

201.33.8 PropertyValue as Variant

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the property value that must be matched for the condition to be true.
Notes: (Read only property)

201.33.9 Constants

PropertyConditionFlags

Constant	Value	Description
PropertyConditionFlagsIgnoreCase	1	Comparison of string properties is not case-sensitive.
PropertyConditionFlagsMatchSubstring	2	Comparison of substring properties is enabled.
PropertyConditionFlagsNone	0	No flags.

201.34 class UIAutomationProxyFactoryEntryMBS

201.34.1 class UIAutomationProxyFactoryEntryMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a proxy factory in the table maintained by Microsoft UI Automation, and exposes properties and methods that can be used by client applications to interact with UIAutomationProxyFactoryMBS objects.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.34.2 Methods

201.34.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.34.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.34.5 Properties

201.34.6 AllowSubstringMatch as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets or retrieves a value that specifies whether the proxy allows substring matching.
Notes: (Read and Write property)

201.34.7 CanCheckBaseClass as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets or retrieves a value that specifies whether the base class can be checked when searching for a proxy factory.
Notes: (Read and Write property)

201.34.8 ClassName as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets or retrieves the name of the window class served by the proxy factory.
Notes: (Read and Write property)

201.34.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.34.10 ImageName as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets or retrieves the name of the image of the proxy factory.
Notes: (Read and Write property)

201.34.11 NeedsAdviseEvents as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets or retrieves a value that specifies whether the proxy must be notified when an application has registered for events.
Notes: (Read and Write property)

201.34.12 ProxyFactory as UIAutomationProxyFactoryMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the proxy factory associated with this entry.
Notes: (Read only property)

201.35 class UIAutomationProxyFactoryMappingMBS

201.35.1 class UIAutomationProxyFactoryMappingMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes properties and methods for a table of proxy factories.
Notes: Each table entry is represented by an UIAutomationProxyFactoryEntryMBS interface. The entries are in the order in which the system will attempt to use the proxies.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.35.2 Methods

201.35.3 ClearTable

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes all entries from the proxy factory table.

201.35.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.35.5 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.35.6 Entry(Index as Integer) as UIAutomationProxyFactoryEntryMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves an entry from the proxy factory table.
Notes: Index: The zero-based index of the item to retrieve.

201.35.7 InsertEntry(index as integer, factory as UIAutomationProxyFactoryEntryMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Insert an entry into the table of proxy factories.
Notes: Index: The zero-based index at which to insert the entry.
Factory: The address of the entry to insert.

201.35.8 RemoveEntry(index as integer)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes an entry from the table of proxy factories.
Notes: Index: The zero-based index of the entry to remove.

201.35.9 RestoreDefaultTable

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Restores the default table of proxy factories.

201.35.10 Table as UIAutomationProxyFactoryEntryMBS()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves all entries in the proxy factory table.

201.35.11 Properties

201.35.12 Count as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the number of entries in the proxy factory table.
Notes: (Read only property)

201.35.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.36 class UIAutomationProxyFactoryMBS

201.36.1 class UIAutomationProxyFactoryMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes properties and methods of an object that creates a Microsoft UI Automation provider for UI elements that do not have native support for UI Automation.
Notes: This interface is implemented by proxies.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.36.2 Methods

201.36.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.36.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.36.5 Properties

201.36.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.36.7 ProxyFactoryId as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the identifier of the proxy factory.
Notes: (Read only property)

201.37 class UIAutomationRangeValuePatternMBS

201.37.1 class UIAutomationRangeValuePatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a control that presents a range of values.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.37.2 Methods

201.37.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.37.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.37.5 SetValue(value as double)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the value of the control.

201.37.6 Properties

201.37.7 CachedIsReadOnly as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the value of the element can be changed.
Notes: (Read only property)

201.37.8 CachedLargeChange as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves, from the cache, the value that is added to or subtracted from the value of the control when a large change is made, such as when the PAGE DOWN key is pressed.
Notes: The LargeChange property can support a Not a Number (NaN) value. When retrieving this property, a client can use the isNan function to determine whether the property is a NaN value.
(Read only property)

201.37.9 CachedMaximum as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached maximum value of the control.
Notes: (Read only property)

201.37.10 CachedMinimum as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached minimum value of the control.
Notes: (Read only property)

201.37.11 CachedSmallChange as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves, from the cache, the value that is added to or subtracted from the value of the control when a small change is made, such as when an arrow key is pressed.
Notes: The SmallChange property can support a Not a Number (NaN) value. When retrieving this property, a client can use the IsNan function to determine whether the property is a NaN value.
(Read only property)

201.37.12 CachedValue as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached value of the control.
Notes: (Read only property)

201.37.13 CurrentIsReadOnly as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the value of the element can be changed.
Notes: (Read only property)

201.37.14 CurrentLargeChange as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value that is added to or subtracted from the value of the control when a large change is made, such as when the PAGE DOWN key is pressed.
Notes: The LargeChange property can support a Not a Number (NaN) value. When retrieving this property, a client can use the IsNan function to determine whether the property is a NaN value.
(Read only property)

201.37.15 CurrentMaximum as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum value of the control.
Notes: (Read only property)

201.37.16 CurrentMinimum as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the minimum value of the control.
Notes: (Read only property)

201.37.17 CurrentSmallChange as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value that is added to or subtracted from the value of the control when a small change is made, such as when an arrow key is pressed.
Notes: The SmallChange property can support a Not a Number (NaN) value. When retrieving this property, a client can use the IsNan function to determine whether the property is a NaN value.
(Read only property)

201.37.18 CurrentValue as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of the control.
Notes: (Read only property)

201.37.19 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.38 class UIAutomationRectMBS

201.38.1 class UIAutomationRectMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a rectangle.
Example:

```
// show the position of the first top level window with UI Automation on Windows
Var automation As New UIAutomationMBS
Var first As UIAutomationElementMBS = automation.ControlViewWalker.FirstChildElement(automation.RootElement)
If first = Nil Then Return

Var r As UIAutomationRectMBS = first.CurrentBoundingRectangle
MessageBox first.CurrentName + ": " + r.X.ToString + "/" + r.Y.ToString + ", " + r.Width.ToString + " x " + r.Height.ToString
```

201.38.2 Methods

201.38.3 Constructor(other as UIAutomationRectMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The copy constructor.
See also:

- 201.38.4 Constructor(x as integer = 0, y as integer = 0, w as integer = 0, h as integer = 0) 23593

201.38.4 Constructor(x as integer = 0, y as integer = 0, w as integer = 0, h as integer = 0)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor to create a new rectangle.
See also:

- 201.38.3 Constructor(other as UIAutomationRectMBS) 23593

201.38.5 Properties

201.38.6 Height as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height of the rectangle.
Notes: (Read and Write property)

201.38.7 Width as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the rectangle.
Notes: (Read and Write property)

201.38.8 X as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The X coordinate.
Notes: (Read and Write property)

201.38.9 Y as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Y coordinate.
Notes: (Read and Write property)

201.39 class UIAutomationScrollItemPatternMBS

201.39.1 class UIAutomationScrollItemPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes a method that enables an item in a scrollable view to be placed in a visible portion of the view.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.39.2 Methods

201.39.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.39.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.39.5 ScrollIntoView

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scrolls the content area of a container object to display the UI Automation element within the visible region (viewport) of the container.
Notes: This method does not provide the ability to specify the position of the element within the viewport.

201.39.6 Properties

201.39.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.40 class UIAutomationScrollPatternMBS

201.40.1 class UIAutomationScrollPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a control that acts as a scrollable container for a collection of child elements.
Notes: The children of this element support UIAutomationScrollItemPatternMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.40.2 Methods

201.40.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.40.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.40.5 Scroll(horizontalAmount as Integer, verticalAmount as Integer)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scrolls the visible region of the content area horizontally and vertically.
Notes: horizontalAmount: A value indicating the size of the horizontal scroll increment, or ScrollPatternNoScroll (-1) if the horizontal position is not to be set.
verticalAmount: A value from the ScrollAmount enumerated type indicating the size of the vertical scroll increment, or ScrollPatternNoScroll (-1) if the vertical position is not to be set.

201.40.6 SetScrollPercent(horizontalPercent as double, verticalPercent as double)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the horizontal and vertical scroll positions as a percentage of the total content area within the UI Automation element.

Notes: horizontalPercent: The percentage of the total horizontal content area, or ScrollPatternNoScroll if the horizontal position is not to be set.
verticalPercent: The percentage of the total vertical content area, or ScrollPatternNoScroll if the vertical position is not to be set.

201.40.7 Properties

201.40.8 CachedHorizontallyScrollable as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the element can scroll horizontally.
Notes: This property can be dynamic. For example, the content area of the element might not be larger than the current viewable area, meaning that the property is FALSE. However, resizing the element or adding child items can increase the bounds of the content area beyond the viewable area, making the property TRUE.
(Read only property)

201.40.9 CachedHorizontalScrollPercent as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached horizontal scroll position.
Notes: (Read only property)

201.40.10 CachedHorizontalViewSize as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached horizontal size of the viewable region of a scrollable element.
Notes: (Read only property)

201.40.11 CachedVerticallyScrollable as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the element can scroll vertically.
Notes: This property can be dynamic. For example, the content area of the element might not be larger than the current viewable area, meaning that the property is FALSE. However, resizing the element or adding child items can increase the bounds of the content area beyond the viewable area, making the property TRUE.

(Read only property)

201.40.12 CachedVerticalScrollPercent as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached vertical scroll position.
Notes: (Read only property)

201.40.13 CachedVerticalViewSize as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached vertical size of the viewable region of a scrollable element.
Notes: (Read only property)

201.40.14 CurrentHorizontallyScrollable as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the element can scroll horizontally.
Notes: This property can be dynamic. For example, the content area of the element might not be larger than the current viewable area, meaning that the property is FALSE. However, resizing the element or adding child items can increase the bounds of the content area beyond the viewable area, making the property TRUE.
(Read only property)

201.40.15 CurrentHorizontalScrollPercent as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the horizontal scroll position.
Notes: (Read only property)

201.40.16 CurrentHorizontalViewSize as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the horizontal size of the viewable region of a scrollable element.
Notes: (Read only property)

201.40.17 CurrentVerticallyScrollable as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the element can scroll vertically.
Notes: This property can be dynamic. For example, the content area of the element might not be larger than the current viewable area, meaning that the property is FALSE. However, resizing the element or adding child items can increase the bounds of the content area beyond the viewable area, making the property TRUE.
(Read only property)

201.40.18 CurrentVerticalScrollPercent as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the vertical scroll position.
Notes: (Read only property)

201.40.19 CurrentVerticalViewSize as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the vertical size of the viewable region of a scrollable element.
Notes: (Read only property)

201.40.20 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.40.21 Constants

Constants

Constant	Value	Description
ScrollPatternNoScroll	-1	The constant to indicate no scroll.

ScrollAmount

Constant	Value	Description
ScrollAmountLargeDecrement	0	Scrolling is done in large decrements, equivalent to pressing the PAGE UP key or clicking on a blank part of a scroll bar. If one page up is not a relevant amount for the control and no scroll bar exists, the value represents an amount equal to the current visible window.
ScrollAmountLargeIncrement	3	Scrolling is done in large increments, equivalent to pressing the PAGE DOWN or PAGE UP key or clicking on a blank part of a scroll bar. If one page is not a relevant amount for the control and no scroll bar exists, the value represents an amount equal to the current visible window.
ScrollAmountNoAmount	2	No scrolling is done.
ScrollAmountSmallDecrement	1	Scrolling is done in small decrements, equivalent to pressing an arrow key or clicking the arrow button on a scroll bar.
ScrollAmountSmallIncrement	4	Scrolling is done in small increments, equivalent to pressing an arrow key or clicking the arrow button on a scroll bar.

201.41 class UIAutomationSelectionItemPatternMBS

201.41.1 class UIAutomationSelectionItemPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to the selectable child items of a container control that supports UIAutomationSelectionPatternMBS.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.41.2 Methods

201.41.3 AddToSelection

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds the current element to the collection of selected items.

201.41.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.41.5 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.41.6 RemoveFromSelection

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes this element from the selection.
Notes: An error code is returned if this element is the only one in the selection and the selection container requires at least one element to be selected.

201.41.7 SelectItem

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Clears any selected items and then selects the current element.

201.41.8 Properties

201.41.9 CachedIsSelected as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A cached value that indicates whether this item is selected.
Notes: (Read only property)

201.41.10 CachedSelectionContainer as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached element that supports UIAutomationSelectionPatternMBS and acts as the container for this item.
Notes: (Read only property)

201.41.11 CurrentIsSelected as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether this item is selected.
Notes: (Read only property)

201.41.12 CurrentSelectionContainer as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the element that supports UIAutomationSelectionPatternMBS and acts as the container for this item.
Notes: (Read only property)

201.41.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.42 class UIAutomationSelectionPatternMBS

201.42.1 class UIAutomationSelectionPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a control that contains selectable child items. The children of this element support UIAutomationSelectionItemPatternMBS.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.42.2 Methods

201.42.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.42.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.42.5 Properties

201.42.6 CachedCanSelectMultiple as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether more than one item in the container can be selected at one time.
Notes: (Read only property)

201.42.7 CachedCurrentSelectedItem as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a cached UIAutomationElementMBS object representing the currently selected item.
Notes: (Read only property)

201.42.8 CachedFirstSelectedItem as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a cached UIAutomationElementMBS object representing the first item in a group of selected items.
Notes: (Read only property)

201.42.9 CachedIsSelectionRequired as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether at least one item must be selected at all times.
Notes: This property can be dynamic. For example, the initial state of a control might not have any items selected by default, but after an item is selected, the control must always have at least one item selected.
(Read only property)

201.42.10 CachedItemCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a cached integer value indicating the number of selected items.
Notes: (Read only property)

201.42.11 CachedLastSelectedItem as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a cached UIAutomationElementMBS object representing the last item in a group of selected items.
Notes: (Read only property)

201.42.12 CachedSelection as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached selected elements in the container.
Notes: (Read only property)

201.42.13 CurrentCanSelectMultiple as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether more than one item in the container can be selected at one time.
Notes: (Read only property)

201.42.14 CurrentCurrentSelectedItem as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets an UIAutomationElementMBS object representing the currently selected item.
Notes: (Read only property)

201.42.15 CurrentFirstSelectedItem as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets an UIAutomationElementMBS object representing the first item in a group of selected items.
Notes: (Read only property)

201.42.16 CurrentIsSelectionRequired as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether at least one item must be selected at all times.
Notes: This property can be dynamic. For example, the initial state of a control might not have any items selected by default, but after an item is selected, the control must always have at least one item selected.
(Read only property)

201.42.17 CurrentItemCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets an integer value indicating the number of selected items.
Notes: (Read only property)

201.42.18 CurrentLastSelectedItem as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets an UIAutomationElementMBS object representing the last item in a group of selected items.
Notes: (Read only property)

201.42.19 CurrentSelection as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the selected elements in the container.
Notes: (Read only property)

201.42.20 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.43 class UIAutomationSpreadsheetItemPatternMBS

201.43.1 class UIAutomationSpreadsheetItemPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Enables a client application to retrieve information about an item (cell) in a spreadsheet.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.43.2 Methods

201.43.3 CachedAnnotationTypes as Integer()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached array of annotation type identifiers indicating the types of annotations that are associated with this spreadsheet cell.

201.43.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.43.5 CurrentAnnotationTypes as Integer()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves an array of annotation type identifiers indicating the types of annotations that are associated with this spreadsheet cell.

201.43.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.43.7 Properties

201.43.8 CachedAnnotationObjects as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached array of elements representing the annotations associated with this spreadsheet cell.
Notes: (Read only property)

201.43.9 CachedFormula as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached formula for this cell.
Notes: (Read only property)

201.43.10 CurrentAnnotationObjects as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves an array of elements representing the annotations associated with this spreadsheet cell.
Notes: (Read only property)

201.43.11 CurrentFormula as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the formula for this cell.
Notes: (Read only property)

201.43.12 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.43.13 Constants

Annotation Type Identifiers

Constant	Value	Description
AnnotationTypeAdvancedProofingIssue	60020	An advanced proofing issue.
AnnotationTypeAuthor	60019	The author of the document.
AnnotationTypeCircularReferenceError	60022	A circular reference error that occurred.
AnnotationTypeComment	60003	A comment. Comments can take different forms depending on the appl
AnnotationTypeConflictingChange	60018	A conflicting change that was made to the document.
AnnotationTypeDataValidationError	60021	A data validation error that occurred.
AnnotationTypeDeletionChange	60012	A deletion change that was made to the document.
AnnotationTypeEditingLockedChange	60016	An editing locked change that was made to the document.
AnnotationTypeEndnote	60009	The endnote for a document.
AnnotationTypeExternalChange	60017	An external change that was made to the document.
AnnotationTypeFooter	60007	The footer for a page in a document.
AnnotationTypeFootnote	60010	The footnote for a page in a document.
AnnotationTypeFormatChange	60014	A format change that was made.
AnnotationTypeFormulaError	60004	An error in a formula. Formula errors typically include red text and ex tion marks.
AnnotationTypeGrammarError	60002	A grammatical error, often denoted by a green squiggly line.
AnnotationTypeHeader	60006	The header for a page in a document.
AnnotationTypeHighlighted	60008	Highlighted content, typically denoted by a contrasting background col
AnnotationTypeInsertionChange	60011	An insertion change that was made to the document.
AnnotationTypeMathematics	60023	A text range containing mathematics.
AnnotationTypeMoveChange	60013	A move change that was made to the document.
AnnotationTypeSensitive	60024	Sensitive
AnnotationTypeSpellingError	60001	A spelling error, often denoted by a red squiggly line.
AnnotationTypeTrackChanges	60005	A change that was made to the document.
AnnotationTypeUnknown	60000	The annotation type is unknown.
AnnotationTypeUnsyncedChange	60015	An unsynced change that was made to the document.

201.44 class UIAutomationSpreadsheetPatternMBS

201.44.1 class UIAutomationSpreadsheetPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Enables a client application to access the items (cells) in a spreadsheet.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.44.2 Methods

201.44.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.44.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.44.5 GetItemByName(name as string) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a UI Automation element that represents the spreadsheet cell that has the specified name.
Notes: name: The name of the target cell.
element: Receives the element that represents the target cell.

201.44.6 Properties

201.44.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.45 class UIAutomationStructureChangedEventHandlerMBS

201.45.1 class UIAutomationStructureChangedEventHandlerMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes a method to handle events that occur when the Microsoft UI Automation tree structure is changed.
Notes: This interface is implemented by the application to handle events that it has subscribed to by using AddStructureChangedEventHandler.

201.45.2 Methods

201.45.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

201.45.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.45.5 Properties

201.45.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.45.7 Events

201.45.8 HandleStructureChangedEvent(sender as UIAutomationElementMBS, changeType as Integer, runtimeId() as Integer)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Handles an event that is raised when the Microsoft UI Automation tree structure has changed.
Notes: sender: the element that raised the event.
changeType: A value indicating the type of tree structure change that took place.
runtimeId: Receives the runtime identifier of the element. This parameter is used only when changeType is StructureChangeTypeChildRemoved; it is nil for all other structure-change events.

This method is implemented by the application to handle events that it has subscribed to by using AddStructureChangedEventHandler
Adjusting an event handler from within this method is not supported.

201.45.9 Constants

StructureChangeType

Constant	Value	Description
StructureChangeTypeChildAdded	0	A child element was added to the UI Automation element tree.
StructureChangeTypeChildRemoved	1	A child element was removed from the UI Automation element tre
StructureChangeTypeChildrenBulkAdded	3	Child elements were added in bulk to the UI Automation element
StructureChangeTypeChildrenBulkRemoved	4	Child elements were removed in bulk from the UI Automation ele
StructureChangeTypeChildrenInvalidated	2	Child elements were invalidated in the UI Automation element tree. mean that one or more child elements were added or removed, or a of both. This value can also indicate that one subtree in the UI was for another. For example, the entire contents of a dialog box chan or the view of a list changed because an Explorer-type application another location. The exact meaning depends on the UI Automat implementation.
StructureChangeTypeChildrenReordered	5	The order of child elements has changed in the UI Automation e Child elements may or may not have been added or removed.

201.46 class UIAutomationStylesPatternMBS

201.46.1 class UIAutomationStylesPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Enables Microsoft UI Automation clients to retrieve the visual styles associated with an element in a document.
Notes: For Windows 8 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.46.2 Methods

201.46.3 CachedExtendedProperties as Dictionary

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a dictionary that contains the list of cached extended properties for an element in a document.

201.46.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.46.5 CurrentExtendedProperties as Dictionary

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a dictionary that contains the list of extended properties for an element in a document.

201.46.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.46.7 Properties

201.46.8 CachedExtendedPropertiesList as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached localized string that contains the list of extended properties for an element in a document.
Notes: (Read only property)

201.46.9 CachedFillColor as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached fill color of an element in a document.
Notes: (Read only property)

201.46.10 CachedFillPatternColor as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached color of the pattern used to fill an element in a document.
Notes: (Read only property)

201.46.11 CachedFillPatternStyle as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The cached fill pattern style.
Notes: (Read only property)

201.46.12 CachedShape as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached shape of an element in a document.
Notes: (Read only property)

201.46.13 CachedStyleId as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached identifier of the visual style associated with an element in a document.
Notes: (Read only property)

201.46.14 CachedStyleName as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached name of the visual style associated with an element in a document.
Notes: The style name typically indicates the role of the element in the document, such as ‚ÄúHeading 1.‚Äù
(Read only property)

201.46.15 CurrentExtendedPropertiesList as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a localized string that contains the list of extended properties for an element in a document.
Notes: (Read only property)

201.46.16 CurrentFillColor as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the fill color of an element in a document.
Notes: (Read only property)

201.46.17 CurrentFillPatternColor as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the color of the pattern used to fill an element in a document.
Notes: (Read only property)

201.46.18 CurrentFillPatternStyle as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current fill pattern style.
Notes: (Read only property)

201.46.19 CurrentShape as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the shape of an element in a document.
Notes: (Read only property)

201.46.20 CurrentStyleId as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the identifier of the visual style associated with an element in a document.
Notes: (Read only property)

201.46.21 CurrentStyleName as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the name of the visual style associated with an element in a document.
Notes: The style name typically indicates the role of the element in the document, such as ,ÄúHeading 1.,Äù
(Read only property)

201.46.22 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.46.23 Constants

Style Identifiers

Constant	Value	Description
StyleIdBulletedList	70015	A list with bulleted items. Supported starting with Windows 8.1.
StyleIdCustom	70000	A custom style.
StyleIdEmphasis	70013	Text that is emphasized.
StyleIdHeading1	70001	A first level heading.
StyleIdHeading2	70002	A second level heading.
StyleIdHeading3	70003	A third level heading.
StyleIdHeading4	70004	A fourth level heading.
StyleIdHeading5	70005	A fifth level heading.
StyleIdHeading6	70006	A sixth level heading.
StyleIdHeading7	70007	A seventh level heading.
StyleIdHeading8	70008	An eighth level heading.
StyleIdHeading9	70009	A ninth level heading.
StyleIdNormal	70012	Normal style.
StyleIdNumberedList	70016	A list with numbered items. Supported starting with Windows 8.1.
StyleIdQuote	70014	A quotation.
StyleIdSubtitle	70011	A subtitle.
StyleIdTitle	70010	A title.

201.47 class UIAutomationSynchronizedInputPatternMBS

201.47.1 class UIAutomationSynchronizedInputPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to the keyboard or mouse input of a control.
Notes: The IUIAutomationSynchronizedInputPattern interface inherits from the IUnknown interface. IUIAutomationSynchronizedInputPattern also has these types of members:
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.47.2 Methods

201.47.3 Cancel

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Causes the Microsoft UI Automation provider to stop listening for mouse or keyboard input.

201.47.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.47.5 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.47.6 StartListening(inputType as Integer)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Causes the Microsoft UI Automation provider to start listening for mouse or keyboard input.
Notes: inputType: A combination of values specifying the type of input to listen for.

When matching input is found, the provider checks whether the target element matches the current element. If they match, the provider raises the UIA_InputReachedTargetEventId event; otherwise it raises the

UIA_InputReachedOtherElementEventId or UIA_InputDiscardedEventId event.

After receiving input of the specified type, the provider stops checking for input and continues as normal.

If the provider is already listening for input, this method returns E_INVALIDOPERATION.

201.47.7 Properties

201.47.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.47.9 Constants

SynchronizedInputType

Constant	Value	Description
SynchronizedInputTypeKeyDown	2	A key has been pressed.
SynchronizedInputTypeKeyUp	1	A key has been released.
SynchronizedInputTypeLeftMouseDown	8	The left mouse button has been pressed.
SynchronizedInputTypeLeftMouseUp	4	The left mouse button has been released.
SynchronizedInputTypeRightMouseDown	32	The right mouse button has been pressed.
SynchronizedInputTypeRightMouseUp	16	The right mouse button has been released.

201.48 class UIAutomationTableItemPatternMBS

201.48.1 class UIAutomationTableItemPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a child element in a container that supports UIAutomationTablePatternMBS.
Notes: Elements that support this interface must also support UIAutomationGridItemPatternMBS, to provide properties that are not specific to tables.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.48.2 Methods

201.48.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.48.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.48.5 Properties

201.48.6 CachedColumnHeaderItems as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached column headers associated with a table item or cell.
Notes: (Read only property)

201.48.7 CachedRowHeaderItems as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached row headers associated with a table item or cell.
Notes: (Read only property)

201.48.8 CurrentColumnHeaderItems as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the column headers associated with a table item or cell.
Notes: (Read only property)

201.48.9 CurrentRowHeaderItems as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached row headers associated with a table item or cell.
Notes: Retrieves the row headers associated with a table item or cell.
(Read only property)

201.48.10 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.49 class UIAutomationTablePatternMBS

201.49.1 class UIAutomationTablePatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a control that acts as a container for a collection of child elements. #
Notes: The children of this element support IUIAutomationTableItemPattern and are organized in a two-dimensional logical coordinate system that can be traversed by row and column.

This control pattern is analogous to IUIAutomationGridPattern with the distinction that any control that supports IUIAutomationTablePattern also exposes a column or row header relationship, or both, for each child element. Controls that support the Table control pattern also support the Grid control pattern in order to provide access to the inherent grid functionality of a table.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.49.2 Methods

201.49.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.49.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.49.5 Properties

201.49.6 CachedColumnHeaders as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached collection of UI Automation elements representing all the column headers in a table.
Notes: Returns the collection of cached column headers. The default is an empty array.
(Read only property)

201.49.7 CachedRowHeaders as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached collection of UI Automation elements representing all the row headers in a table.
Notes: Returns the collection of cached row headers. The default is an empty array.
(Read only property)

201.49.8 CachedRowOrColumnMajor as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached primary direction of traversal for the table.
Notes: (Read only property)

201.49.9 CurrentColumnHeaders as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a collection of UI Automation elements representing all the column headers in a table.
Notes: (Read only property)

201.49.10 CurrentRowHeaders as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a collection of UI Automation elements representing all the row headers in a table.
Notes: (Read only property)

201.49.11 CurrentRowOrColumnMajor as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the primary direction of traversal for the table.
Notes: (Read only property)

201.49.12 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.49.13 Constants

RowOrColumnMajor

Constant	Value	Description
RowOrColumnMajorColumnMajor	1	Data in the table should be read column by column.
RowOrColumnMajorIndeterminate	2	The best way to present the data is indeterminate.
RowOrColumnMajorRowMajor	0	Data in the table should be read row by row.

201.50 class UIAutomationTextChildPatternMBS

201.50.1 class UIAutomationTextChildPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access a text-based control (or an object embedded in text) that is a child or descendant of another text-based control.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.50.2 Methods

201.50.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.50.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.50.5 Properties

201.50.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.50.7 TextContainer as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves this element's nearest ancestor element that supports the Text control pattern.
Notes: (Read only property)

201.50.8 TextRange as UIAutomationTextRangeMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a text range that encloses this child element.
Notes: This property is equivalent to specifying this child element in a call to the RangeFromChild method. (Read only property)

201.51 class UIAutomationTextEditPatternMBS

201.51.1 class UIAutomationTextEditPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a control that modifies text, for example a control that performs auto-correction or enables input composition through an Input Method Editor (IME).
Notes: Subclass of the UIAutomationTextPatternMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.51.2 Methods

201.51.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.51.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.51.5 Properties

201.51.6 ActiveComposition as UIAutomationTextRangeMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the active composition.
Notes: Active composition is relevant to Input Method Editors (IMEs).
(Read only property)

201.51.7 ConversionTarget as UIAutomationTextRangeMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the current conversion target range.
Notes: (Read only property)

201.52 class UIAutomationTextEditTextChangedEventHandlerMBS

201.52.1 class UIAutomationTextEditTextChangedEventHandlerMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes a method to handle events that occur when Microsoft UI Automation reports a text-changed event from text edit controls.

201.52.2 Methods

201.52.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

201.52.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.52.5 Properties

201.52.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.52.7 Events

201.52.8 HandleTextEditTextChangedEvent(sender as UIAutomationElementMBS, textEditChangeType as Integer, eventStrings() as String)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Handles an event that is raised when a Microsoft UI Automation provider for a text-edit control reports a programmatic text change.
Notes: sender: The element that raised the event.
TextEditChangeType: The type of text-edit change that occurred.
eventStrings: Event data passed by the event.

This method is implemented by the application to handle events that it has subscribed to by using AddTextEditTextChangedEventHandler.

The event data contains different payloads for each text-edit change type:

- TextEditChangeTypeAutoCorrect: Data is the new corrected string .
- TextEditChangeTypeComposition: Data is the updated string in the composition (only the part that changed).
- TextEditChangeTypeCompositionFinalized: Data is the finalized string of the completed composition (this may be empty if composition was canceled or deleted).

201.52.9 Constants

TextEditChangeTypes

Constant	Value	Description
TextEditChangeTypeAutoComplete	4	Auto complete
TextEditChangeTypeAutoCorrect	1	Change is from an auto-correct action performed by a control.
TextEditChangeTypeComposition	2	Change is from an IME active composition within a control.
TextEditChangeTypeCompositionFinalized	3	Change is from an IME composition going from active to finalized st a control. The finalized string may be empty if composition was c deleted.
TextEditChangeTypeNone	0	Not related to a specific change type.

201.53 class UIAutomationTextPatternMBS

201.53.1 class UIAutomationTextPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a control that contains text.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Introducing UIAutomation Support in MBS Xojo Plugins

201.53.2 Methods

201.53.3 CaretRange(byref isActive as boolean) as UIAutomationTextRangeMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a zero-length text range at the location of the caret that belongs to the text-based control.
Notes: isActive: True the text-based control that contains the caret has keyboard focus, otherwise false.
range: a text range that represents the current location of the caret that belongs to the text-based control.

If the isActive parameter is false, the caret that belongs to the text-based control might not be at the same location as the system caret.

This method retrieves a text range that a client can use to find the bounding rectangle of the caret belonging to the text-based control, or to find the text near the caret.

201.53.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.53.5 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.53.6 RangeFromAnnotation(annotation as UIAutomationElementMBS) as UIAutomationTextRangeMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a text range containing the text that is the target of the annotation associated with the specified annotation element.
Notes: annotation: The annotation element for which to retrieve the target text.
range: Receives a text range that contains the target text of the annotation.

201.53.7 RangeFromChild(child as UIAutomationElementMBS) as UIAutomationTextRangeMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a text range enclosing a child element such as an image, hyperlink, Microsoft Excel spreadsheet, or other embedded object.
Notes: child: the child element to be enclosed in the text range.
range: a text range that encloses the child element.

If there is no text in the range that encloses the child element, a degenerate (empty) range is returned.

The child parameter is either a child of the element associated with a IUIAutomationTextPatternMBS or from the array of children of a IUIAutomationTextRangeMBS.

201.53.8 RangeFromPoint(point as UIAutomationPointMBS) as UIAutomationTextRangeMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the degenerate (empty) text range nearest to the specified screen coordinates.
Notes: point: A structure that contains the location, in screen coordinates.
range: the degenerate text range nearest the specified location.

A text range that wraps a child object is returned if the screen coordinates are within the coordinates of an image, hyperlink, Microsoft Excel spreadsheet, or other embedded object.

Because hidden text is not ignored, this method retrieves a degenerate range from the visible text closest to the specified coordinates.

The implementation of RangeFromPoint in Windows Internet Explorer 9 does not return the expected result.

Instead, clients should:

- Call the GetVisibleRanges method to retrieve an array of visible text ranges.
- For each text range in the array, call GetBoundingRectangles to retrieve the bounding rectangles.
- Check the bounding rectangles to find the text range that occupies the particular screen coordinates.

201.53.9 Properties

201.53.10 DocumentRange as UIAutomationTextRangeMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a text range that encloses the main text of a document.
Notes: Some auxiliary text such as headers, footnotes, or annotations might not be included.
(Read only property)

201.53.11 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.53.12 Selection as UIAutomationTextRangeArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a collection of text ranges that represents the currently selected text in a text-based control.
Notes: If the control supports the selection of multiple, non-contiguous spans of text, the ranges collection receives one text range for each selected span.

If the control contains only a single span of selected text, the ranges collection receives a single text range.

If the control contains a text insertion point but no text is selected, the ranges collection receives a degenerate (empty) text range at the position of the text insertion point.

If the control does not contain a text insertion point or does not support text selection, ranges is set to nil.

Use the SupportedTextSelection property to test whether a control supports text selection.
(Read only property)

201.53.13 SupportedTextSelection as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a value that specifies the type of text selection that is supported by the control.
Notes: (Read only property)

201.53.14 VisibleRanges as UIAutomationTextRangeArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves an array of disjoint text ranges from a text-based control where each text range represents a contiguous span of visible text.
Notes: If the visible text consists of one contiguous span of text, the ranges array will contain a single text range that represents all of the visible text.

If the visible text consists of multiple, disjoint spans of text, the ranges array will contain one text range for each visible span, beginning with the first visible span, and ending with the last visible span. Disjoint spans of visible text can occur when the content of a text-based control is partially obscured by an overlapping window or other object, or when a text-based control with multiple pages or columns has content that is partially scrolled out of view.

GetVisibleRanges retrieves a degenerate (empty) text range if no text is visible, if all text is scrolled out of view, or if the text-based control contains no text.
(Read only property)

201.53.15 Constants

SupportedTextSelection

Constant	Value	Description
SupportedTextSelectionMultiple	2	Supports multiple, disjoint text selections.
SupportedTextSelectionNone	0	Does not support text selections.
SupportedTextSelectionSingle	1	Supports a single, continuous text selection.

201.54 class UIAutomationTextRangeArrayMBS

201.54.1 class UIAutomationTextRangeArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a collection of UIAutomationTextRangeMBS objects.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.54.2 Methods

201.54.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.54.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.54.5 Element(Index as Integer) as UIAutomationTextRangeMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a text range from the collection.

201.54.6 Elements as UIAutomationTextRangeMBS()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves all text ranges from the collection.

201.54.7 Properties

201.54.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.54.9 Length as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the number of text ranges in the collection.
Notes: (Read only property)

201.55 class UIAutomationTextRangeMBS

201.55.1 class UIAutomationTextRangeMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a span of continuous text in a container that supports the UIAutomationTextPatternMBS interface.
Notes: Client applications can use the UIAutomationTextRangeMBS interface to select, compare, and retrieve embedded objects from the text span. The interface uses two endpoints to delimit where the text span starts and ends. Disjoint spans of text are represented by an UIAutomationTextRangeArrayMBS interface. This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.55.2 Methods

201.55.3 AddToSelection

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds the text range to the collection of selected text ranges in a control that supports multiple, disjoint spans of selected text.
Notes: The text insertion point moves to the newly selected text. If AddToSelection is called on a text range object that represents a degenerate (empty) text range, the text insertion point moves to the starting endpoint of the text range.

201.55.4 AttributeValue(AttributeId as Integer) as Variant

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of the specified text attribute across the entire text range.
Notes: AttributeId: The identifier of the text attribute.

201.55.5 AttributeValues(AttributeIds() as Integer) as String()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns all of the requested text attribute values for a text range in a single cross-process call.
Notes: This is equivalent to calling GetAttributeValue, except it can retrieve multiple values instead of just one.

attributeIds: A list of text attribute identifiers.

GetAttributeValues only gets the text attributes that are supplied in the call.

201.55.6 BoundingRectangles as UIAutomationRectMBS()

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a collection of bounding rectangles for each fully or partially visible line of text in a text range.
Notes: Returns an array of bounding rectangles for each fully or partially visible line of text in a text range. An empty array is returned for a degenerate (empty) text range or for a text range that is completely off-screen, scrolled out of view, or obscured by an overlapping window.

201.55.7 ChildrenBuildCache(cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the children and supplied properties and patterns for elements in a text range in a single cross-process call.
Notes: This is equivalent to calling GetChildren, but adds the standard build cache pattern.

cacheRequest: An UIAutomationCacheRequestMBS specifying the properties and control patterns to be cached.

Returns the children, and each child,Äôs properties or patterns, of the text range that meet the criteria of the supplied cacheRequest.

Following the design of GetChildren:

- Children that overlap with the text range, but are not entirely enclosed by it will also be included.
- When no children exist, an empty collection is returned.

As a result of a successful call, UI Automation clients are able call "Cached" APIs of IUIAutomationElement that are provided in the cacheRequest, for example, GetCachedPropertyValue.

201.55.8 Clone as UIAutomationTextRangeMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a new UIAutomationTextRangeMBS identical to the original and inheriting all properties of the original.
Notes: The new range can be manipulated independently of the original.

201.55.9 Compare(other as UIAutomationTextRangeMBS) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a value that specifies whether this text range has the same endpoints as another text range.
Notes: Receives TRUE if the text ranges have the same endpoints, or FALSE if they do not.

This method compares the endpoints of the two text ranges, not the text in the ranges. The ranges are identical if they share the same endpoints. If two text ranges have different endpoints, they are not identical even if the text in both ranges is exactly the same.

201.55.10 CompareEndpoints(srcEndPoint as Integer, Range as UIAutomationTextRangeMBS, targetEndPoint as Integer) as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a value that specifies whether the start or end endpoint of this text range is the same as the start or end endpoint of another text range.
Notes: srcEndPoint: A value indicating whether the start or end endpoint of this text range is to be compared.
range: the text range to compare.
targetEndPoint: A value indicating whether the start or end endpoint of range is to be compared.

Receives a negative value if the caller's endpoint occurs earlier in the text than the target endpoint; 0 if the caller's endpoint is at the same location as the target endpoint; or a positive value if the caller's endpoint occurs later in the text than the target endpoint.

201.55.11 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.55.12 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.55.13 EnclosingElementBuildCache(cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the children and supplied properties and patterns for elements in a text range in a single cross-process call.
Notes: This is equivalent to calling GetChildren, but adds the standard build cache pattern.

cacheRequest: An UIAutomationCacheRequestMBS specifying the properties and control patterns to be cached.

Returns the children, and each child,Äôs properties or patterns, of the text range that meet the criteria of the supplied cacheRequest.

Following the design of GetChildren:

- Children that overlap with the text range, but are not entirely enclosed by it will also be included.
- When no children exist, an empty collection is returned.

As a result of a successful call, UI Automation clients are able call "Cached" APIs of UIAutomationElementMBS that are provided in the cacheRequest, for example, GetCachedPropertyValue.

201.55.14 ExpandToEnclosingUnit(textUnit as Integer)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Normalizes the text range by the specified text unit.
Notes: The range is expanded if it is smaller than the specified unit, or shortened if it is longer than the specified unit.

textUnit: The text unit, such as line or paragraph.

Client applications such as screen readers use this method to retrieve the full word, sentence, or paragraph that exists at the insertion point or caret position.

201.55.15 FindAttribute(AttributeId as Integer, Value as Variant, backward as Boolean) as UIAutomationTextRangeMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a text range subset that has the specified text attribute value.
Notes: AttributeId: The identifier of the text attribute for the text range subset being retrieved. For a list of text attribute IDs, see Text Attribute Identifiers.
Value: The value of the attribute. This value must match the type specified for the attribute.
backward: TRUE if the last occurring text range should be returned instead of the first; otherwise FALSE.

Returns the text range having a matching attribute and attribute value; otherwise nil.

The FindAttribute method retrieves matching text regardless of whether the text is hidden or visible. Use UIA_IsHiddenAttributeId to check text visibility.

201.55.16 FindText(text as String, backward as Boolean, ignoreCase as Boolean) as UIAutomationTextRangeMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a text range subset that contains the specified text.
Notes: text: The text to find.
backward: TRUE if the last occurring text range should be returned instead of the first; otherwise FALSE.
ignoreCase: TRUE if case should be ignored; otherwise FALSE.

Returns the text range, or nil if no match is found.

There is no differentiation between hidden and visible text.

201.55.17 Move(textUnit as Integer, count as Integer) as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Moves the text range forward or backward by the specified number of text units .
Notes: textUnit: A value specifying the type of text units, such as character, word, paragraph, and so on.
Count: The number of text units to move. A positive value moves the text range forward. A negative value

moves the text range backward. Zero has no effect.

Returns the number of text units actually moved. This can be less than the number requested if either of the new text range endpoints is greater than or less than the endpoints retrieved by the DocumentRange method. This value can be negative if navigation is happening in the backward direction.

see also
https://learn.microsoft.com/en-us/windows/win32/api/uiautomationclient/nf-uiautomationclient-iuiautomationtextrange-move

201.55.18 MoveEndpointByRange(srcEndPoint as Integer, Range as UIAutomationTextRangeMBS, targetEndPoint as Integer)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Moves one endpoint of the current text range to the specified endpoint of a second text range.
Notes: srcEndPoint: An endpoint (either start or end) of the current text range. This is the endpoint to be moved.
range: A second text range from the same text provider as the current text range.
targetEndPoint: An endpoint (either start or end) of the second text range. The srcEndPoint of the current text range is moved to this endpoint.

If the endpoint being moved crosses the other endpoint of the same text range, that other endpoint is moved also, resulting in a degenerate (empty) range and ensuring the correct ordering of the endpoints (that is, the start is always less than or equal to the end).

201.55.19 MoveEndpointByUnit(endpoint as Integer, textUnit as Integer, count as Integer) as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Moves one endpoint of the text range the specified number of text units within the document range.
Notes: endpoint: A value specifying the endpoint (start or end) to move.
unit: A value specifying the textual unit for moving, such as line or paragraph.
count: The number of units to move. A positive count moves the endpoint forward. A negative count moves backward. A count of 0 has no effect.

Returns the count of units actually moved. This value can be less than the number requested if moving the endpoint runs into the beginning or end of the document.

https://learn.microsoft.com/en-us/windows/win32/api/uiautomationclient/nf-uiautomationclient-iuiautomationtextrange-moveendpointbyunit

201.55.20 RemoveFromSelection

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes the text range from an existing collection of selected text in a text container that supports multiple, disjoint selections.
Notes: The text insertion point moves to the area of the removed highlight. Providing a degenerate text range also moves the insertion point.

201.55.21 ScrollIntoView(alignToTop as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Causes the text control to scroll until the text range is visible in the viewport.
Notes: alignToTop: TRUE if the text control should be scrolled so that the text range is flush with the top of the viewport; FALSE if it should be flush with the bottom of the viewport.

The method respects both hidden and visible text. If the text range is hidden, the text control will scroll only if the hidden text has an anchor in the viewport.
A Microsoft UI Automation client can check text visibility by calling GetAttributeValue with the attr parameter set to UIA_IsHiddenAttributeId.

201.55.22 SelectText

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Selects the span of text that corresponds to this text range, and removes any previous selection.
Notes: If the Select method is called on a text range object that represents a degenerate (empty) text range, the text insertion point moves to the starting endpoint of the text range.

201.55.23 ShowContextMenu

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Programmatically invokes a context menu on the target text range.
Notes: This method returns an error code if the context menu could not be invoked. If no context menu is available directly on the text range on which it was invoked, the Microsoft UI Automation system might

attempt to invoke a context menu on the UI Automation parent of the current item.

The context menus themselves fire menu opened / closed events when they are invoked and dismissed.

Requires Windows 8.1.

201.55.24 Text(maxLength as Integer = -1) as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the plain text of the text range.
Notes: maxLength: The maximum length of the string to return, or -1 if no limit is required.

Returns the string, possibly truncated at the specified maxLength.

201.55.25 Properties

201.55.26 Children as UIAutomationElementArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a collection of all embedded objects that fall within the text range.
Notes: Returns the collection of all child objects that fall within the range. Children that overlap with the range but are not entirely enclosed by it are also included in the collection. An empty collection is returned if there are no child objects.
(Read only property)

201.55.27 EnclosingElement as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the innermost UI Automation element that encloses the text range.
Notes: Returns the enclosing element, which is typically the text provider that supplies the text range. However, if the text provider supports child elements such as tables or hyperlinks, the enclosing element could be a descendant of the text provider.
(Read only property)

201.55.28 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.55.29 Constants

Text Attribute IDs

Constant	Value	Description
AttributeIdAfterParagraphSpacing	40042	Identifies the AfterParagraphSpacing text attribute, which specifies the si spacing after the paragraph. Variant type: double Default value: 0
AttributeIdAnimationStyle	40000	Identifies the AnimationStyle text attribute, which specifies the type of imation applied to the text. This attribute is specified as a value from AnimationStyle enumerated type. Variant type: Integer Default value: AnimationStyle_None
AttributeIdAnnotationObjects	40032	Identifies the AnnotationObjects text attribute, which maintains an arra IUIAutomationElement2 interfaces, one for each element in the current range that implements the Annotation control pattern. Each element m also implement other control patterns as needed to describe the annota For example, an annotation that is a comment would also support the control pattern. Supported starting with Windows 8. Variant type: Object Default value: empty array
AttributeIdAnnotationTypes	40031	Identifies the AnnotationTypes text attribute, which maintains a list of notation type identifiers for a range of text. For a list of possible values Annotation Type Identifiers. Supported starting with Windows 8. Variant type: array Integer Default value: empty array
AttributeIdBackgroundColor	40001	Identifies the BackgroundColor text attribute, which specifies the backgr color of the text. This attribute is specified as a COLORREF; a 32-bit used to specify an RGB or RGBA color. Variant type: Integer Default value: 0
AttributeIdBeforeParagraphSpacing	40041	Identifies the BeforeParagraphSpacing text attribute, which specifies the of spacing before the paragraph. Variant type: double Default value: 0
AttributeIdBulletStyle	40002	Identifies the BulletStyle text attribute, which specifies the style of bullets in the text range. This attribute is specified as a value from the Bullet enumerated type. Variant type: Integer Default value: BulletStyle_None
AttributeIdCapStyle	40003	Identifies the CapStyle text attribute, which specifies the capitalization styl the text. This attribute is specified as a value from the CapStyle enumer type. Variant type: Integer Default value: CapStyle_None
AttributeIdCaretBidiMode	40039	Identifies the CaretBidiMode text attribute, which indicates the directio text flow in the text range. This attribute is specified as a value from CaretBidiMode enumerated type. Supported starting with Windows 8. Variant type: Integer Default value: CaretBidiMode_LTR
AttributeIdCaretPosition	40038	Identifies the CaretPosition text attribute, which indicates whether the is at the beginning or the end of a line of text in the text range. This attri is specified as a value from the CaretPosition enumerated type. Suppo starting with Windows 8. Variant type: Integer Default value: CaretPosition_Unknown
AttributeIdCulture	40004	Identifies the Culture text attribute, which specifies the locale of the tex locale identifier (LCID). Variant type: Integer Default value: locale of the application UI
AttributeIdFontName	40005	Identifies the FontName text attribute, which specifies the name of the

TextPatternRangeEndpoint

Constant	Value	Description
TextPatternRangeEndpointEnd	1	The ending endpoint of the range.
TextPatternRangeEndpointStart	0	The starting endpoint of the range.

TextUnit

Constant	Value	Description
TextUnitCharacter	0	Character.
TextUnitDocument	6	Document.
TextUnitFormat	1	Format.
TextUnitLine	3	Line.
TextUnitPage	5	Page.
TextUnitParagraph	4	Paragraph.
TextUnitWord	2	Word.

201.56 class UIAutomationTogglePatternMBS

201.56.1 class UIAutomationTogglePatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a control that can cycle through a set of states, and maintain a state after it is set.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.56.2 Methods

201.56.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.56.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.56.5 Toggle

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Cycles through the toggle states of the control.
Notes: A control cycles through its states in this order: ToggleStateOn, ToggleStateOff and, if supported, ToggleStateIndeterminate.

201.56.6 Properties

201.56.7 CachedToggleState as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached state of the control.
Notes: (Read only property)

201.56.8 CurrentToggleState as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the state of the control.
Notes: (Read only property)

201.56.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.56.10 Constants

ToggleState

Constant	Value	Description
ToggleStateIndeterminate	2	The UI Automation element is in an indeterminate state. The Indeterminate property can be used to indicate whether the user has acted on a control. For example, a check box can appear checked and dimmed, indicating an indeterminate state. Creating an indeterminate state is different from disabling the control. Consequently, a check box in the indeterminate state can still receive the focus. When the user clicks an indeterminate control the ToggleState cycles to its next value.
ToggleStateOff	0	The UI Automation element is not selected, checked, marked or otherwise activated.
ToggleStateOn	1	The UI Automation element is selected, checked, marked or otherwise activated.

201.57 class UIAutomationTransformPatternMBS

201.57.1 class UIAutomationTransformPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a control that can be moved, resized, or rotated.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.57.2 Methods

201.57.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.57.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.57.5 Move(x as double, y as double)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Moves the UI Automation element.
Notes: X: Absolute screen coordinates of the left side of the control.
Y: Absolute screen coordinates of the top of the control.

An element cannot be moved, resized or rotated such that its resulting screen location would be completely outside the coordinates of its container and inaccessible to the keyboard or mouse. For example, when a top-level window is moved completely off-screen or a child object is moved outside the boundaries of the container's viewport, the object is placed as close to the requested screen coordinates as possible with the top or left coordinates overridden to be within the container boundaries.

201.57.6 Resize(width as double, height as double)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Resizes the UI Automation element.
Notes: width: The new width of the window, in pixels.
height: The new height of the window, in pixels.

When called on a control that supports split panes, this method can have the side effect of resizing other contiguous panes.

An object cannot be moved, resized, or rotated such that its resulting screen location would be completely outside the coordinates of its container and inaccessible to the keyboard or mouse. For example, when a top-level window is moved completely off-screen or a child object is moved outside the boundaries of the container's viewport. In these cases the object is placed as close to the requested screen coordinates as possible with the top or left coordinates overridden to be within the container boundaries.

201.57.7 Rotate(degree as double)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Rotates the UI Automation element.
Notes: degree: The number of degrees to rotate the element. A positive number rotates clockwise; a negative number rotates counterclockwise.

An object cannot be moved, resized, or rotated such that its resulting screen location would be completely outside the coordinates of its container and inaccessible to the keyboard or mouse. For example, when a top-level window is moved completely off-screen or a child object is moved outside the boundaries of the container's viewport, the object is placed as close to the requested screen coordinates as possible with the top or left coordinates overridden to be within the container boundaries.

201.57.8 Zoom(zoomValue as double)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Zooms the viewport of the control.
Notes: zoomValue: The amount to zoom the viewport, specified as a percentage. Positive values increase the zoom level, and negative values decrease it. The control zooms its viewport to the nearest supported value.

201.57.9 ZoomByUnit(zoomUnit as Integer)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Zooms the viewport of the control by the specified unit.
Notes: zoomUnit: The unit by which to increase or decrease the zoom of the viewport.

See ScrollAmount constants.

201.57.10 Properties

201.57.11 CachedCanMove as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the element can be moved.
Notes: (Read only property)

201.57.12 CachedCanResize as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the element can be resized.
Notes: (Read only property)

201.57.13 CachedCanRotate as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the element can be rotated.
Notes: (Read only property)

201.57.14 CachedCanZoom as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the control supports zooming of its viewport.
Notes: (Read only property)

201.57.15 CachedZoomLevel as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached zoom level of the control's viewport.
Notes: (Read only property)

201.57.16 CachedZoomMaximum as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached maximum zoom level of the control's viewport.
Notes: (Read only property)

201.57.17 CachedZoomMinimum as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached minimum zoom level of the control's viewport.
Notes: (Read only property)

201.57.18 CurrentCanMove as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the element can be moved.
Notes: (Read only property)

201.57.19 CurrentCanResize as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the element can be resized.
Notes: (Read only property)

201.57.20 CurrentCanRotate as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the element can be rotated.
Notes: (Read only property)

201.57.21 CurrentCanZoom as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the control supports zooming of its viewport.
Notes: (Read only property)

201.57.22 CurrentZoomLevel as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the zoom level of the control's viewport.
Notes: (Read only property)

201.57.23 CurrentZoomMaximum as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum zoom level of the control's viewport.
Notes: (Read only property)

201.57.24 CurrentZoomMinimum as Double

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the minimum zoom level of the control's viewport.
Notes: (Read only property)

201.57.25 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.57.26 Constants

ScrollAmount

Constant	Value	Description
ScrollAmountLargeDecrement	0	Scrolling is done in large decrements, equivalent to pressing the PAGE UP key or clicking on a blank part of a scroll bar. If one page up is not a relevant amount for the control and no scroll bar exists, the value represents an amount equal to the current visible window.
ScrollAmountLargeIncrement	3	Scrolling is done in large increments, equivalent to pressing the PAGE DOWN or PAGE UP key or clicking on a blank part of a scroll bar. If one page is not a relevant amount for the control and no scroll bar exists, the value represents an amount equal to the current visible window.
ScrollAmountNoAmount	2	No scrolling is done.
ScrollAmountSmallDecrement	1	Scrolling is done in small decrements, equivalent to pressing an arrow key or clicking the arrow button on a scroll bar.
ScrollAmountSmallIncrement	4	Scrolling is done in small increments, equivalent to pressing an arrow key or clicking the arrow button on a scroll bar.

201.58 class UIAutomationTreeWalkerMBS

201.58.1 class UIAutomationTreeWalkerMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Exposes properties and methods that UI Automation client applications use to view and navigate the UI Automation elements on the desktop.
Example:

```
// list the top level windows on Windows with UI Automation
Var automation As New UIAutomationMBS
Var walker As UIAutomationTreeWalkerMBS = automation.ControlViewWalker
Var root As UIAutomationElementMBS = automation.RootElement

Var lines() As String
Var child As UIAutomationElementMBS = walker.FirstChildElement(root)
While child <>Nil
lines.Add child.CurrentName
child = walker.NextSiblingElement(child)
Wend
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: UI Automation clients view the elements on the desktop as a set of IUIAutomation objects arranged in a tree structure. Using the IUIAutomationTreeWalker interface, a client application can navigate by selecting a view of the tree and stepping from one element to another in a specified direction using methods such as GetFirstChildElement and GetNextSiblingElement.

Navigating the tree using IUIAutomationTreeWalker can result in cross-process calls and is not as efficient as locating an element using the FindAll or FindFirst methods.

If your client application might try to find elements in its own user interface, you must make all UI Automation calls on a separate thread.

201.58.2 Methods

201.58.3 Constructor(Automation as UIAutomationMBS, condition as UIAutomationConditionMBS)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a tree walker object that can be used to traverse the Microsoft UI Automation tree.

201.58.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.58.5 FirstChildElement(element as UIAutomationElementMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the first child element of the specified UI Automation element.
Notes: element: the element for which to retrieve the first child.

Returns the first child element or nil if there is no child element.

An element can have additional child elements that do not match the current view condition and thus are not returned when navigating the element tree.

The structure of the Microsoft UI Automation tree changes as the visible UI elements on the desktop change. It is not guaranteed that an element returned as the first child element will be returned as the first child on subsequent passes.

201.58.6 FirstChildElementBuildCache(element as UIAutomationElementMBS, cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the first child element of the specified UI Automation element, and caches properties and control patterns.
Notes: element: the element for which to retrieve the first child.
cacheRequest: a cache request that specifies the properties and control patterns to cache on the returned element.

Returns the first child element or nil if there is no child element.

An element can have additional child elements that do not match the current view condition and thus are not returned when navigating the element tree.

The structure of the Microsoft UI Automation tree changes as the visible UI elements on the desktop change.

It is not guaranteed that an element returned as the first child element will be returned as the first child on subsequent passes.

201.58.7 LastChildElement(element as UIAutomationElementMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the last child element of the specified UI Automation element.
Notes: Element: The element for which to retrieve the last child.

An element can have additional child elements that do not match the current view condition and thus are not returned when navigating the element tree.

The structure of the Microsoft UI Automation tree changes as the visible UI elements on the desktop change. It is not guaranteed that an element returned as the last child element will be returned as the last child on subsequent passes.

201.58.8 LastChildElementBuildCache(element as UIAutomationElementMBS, cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the last child element of the specified UI Automation element, and caches properties and control patterns.
Notes: Element: the element for which to retrieve the last child.
cacheRequest: a cache request that specifies the properties and control patterns to cache on the returned element.

Receives the last child element, or nil if there is no child element.

An element can have additional child elements that do not match the current view condition and thus are not returned when navigating the element tree.

The structure of the Microsoft UI Automation tree changes as the visible UI elements on the desktop change. It is not guaranteed that an element returned as the last child element will be returned as the last child on subsequent passes.

201.58.9 NextSiblingElement(element as UIAutomationElementMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the next sibling element of the specified UI Automation element.
Notes: Element: the element for which to retrieve the next sibling.

Returns the next sibling element, or nil if there is no sibling element.

An element can have additional sibling elements that do not match the current view condition and thus are not returned when navigating the element tree.

The structure of the Microsoft UI Automation tree changes as the visible UI elements on the desktop change. It is not guaranteed that an element returned as the next sibling element will be returned as the next sibling on subsequent passes.

201.58.10 NextSiblingElementBuildCache(element as UIAutomationElementMBS, cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the next sibling element of the specified UI Automation element, and caches properties and control patterns.
Notes: Element: the element for which to retrieve the next sibling.
cacheRequest: a cache request that specifies the properties and control patterns to cache on the returned element.

Returns the next sibling element, or nil if there is no sibling element.

An element can have additional sibling elements that do not match the current view condition and thus are not returned when navigating the element tree.

The structure of the Microsoft UI Automation tree changes as the visible UI elements on the desktop change. It is not guaranteed that an element returned as the next sibling element will be returned as the next sibling on subsequent passes.

201.58.11 NormalizeElement(element as UIAutomationElementMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the ancestor element nearest to the specified Microsoft UI Automation element in the tree view.
Notes: element: the element from which to start the normalization.

Returns the ancestor element nearest to the specified element in the tree view.

The element is normalized by navigating up the ancestor chain in the tree until an element that satisfies the view condition (specified by a previous call to Condition) is reached. But first, the passed element is tested to see if it matches a normalization condition. If so, the passed element is returned, even though it is not an ancestor.

The method returns UIA_E_ELEMENTNOTAVAILABLE if no matching element has been found.

This method is useful for applications that obtain references to UI Automation elements by hit-testing. The application might want to work only with specific types of elements, and can use Normalize to make sure that no matter what element is initially retrieved (for example, when a scroll bar gets the input focus), only the element of interest (such as a content element) is ultimately retrieved.

201.58.12 NormalizeElementBuildCache(element as UIAutomationElementMBS, cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the ancestor element nearest to the specified Microsoft UI Automation element in the tree view, prefetches the requested properties and control patterns, and stores the prefetched items in the cache.
Notes: element: the element from which to start the normalization.
cacheRequest: a cache request that specifies the properties and control patterns to cache on the returned element.

Return the ancestor element nearest to the specified element in the tree view.

The element is normalized by navigating up the ancestor chain in the tree until an element that satisfies the view condition (specified by a previous call to Condition) is reached. If the root element is reached, the root element is returned, even if it does not satisfy the view condition.

This method is useful for applications that obtain references to UI Automation elements by hit-testing. The application might want to work only with specific types of elements, and can use NormalizeElement to make sure that no matter what element is initially retrieved (for example, when a scroll bar gets the input focus), only the element of interest (such as a content element) is ultimately retrieved.

201.58.13 ParentElement(element as UIAutomationElementMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the parent element of the specified UI Automation element.
Notes: Element: the element for which to retrieve the parent.

Returns the parent element, or nil if there is no parent element.

The structure of the Microsoft UI Automation tree changes as the visible UI elements on the desktop change. It is not guaranteed that an element returned as the parent element will be returned as the parent on subsequent passes.

201.58.14 ParentElementBuildCache(element as UIAutomationElementMBS, cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the parent element of the specified UI Automation element, and caches properties and control patterns.
Notes: Element: the element for which to retrieve the parent.
cacheRequest: a cache request that specifies the properties and control patterns to cache on the returned element.

Returns the parent element, or nil if there is no parent element.

The structure of the Microsoft UI Automation tree changes as the visible UI elements on the desktop change. It is not guaranteed that an element returned as the parent element will be returned as the parent on subsequent passes.

201.58.15 PreviousSiblingElement(element as UIAutomationElementMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the previous sibling element of the specified UI Automation element.
Notes: Element: the element for which to retrieve the previous sibling.

Returns the previous sibling element, or nil if there is no sibling element.

An element can have additional sibling elements that do not match the current view condition and thus are not returned when navigating the element tree.

The structure of the Microsoft UI Automation tree changes as the visible UI elements on the desktop change. It is not guaranteed that an element returned as the previous sibling element will be returned as the previous sibling on subsequent passes.

201.58.16 PreviousSiblingElementBuildCache(element as UIAutomationElementMBS, cacheRequest as UIAutomationCacheRequestMBS) as UIAutomationElementMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the previous sibling element of the specified UI Automation element, and caches properties and control patterns.
Notes: element: the element for which to retrieve the previous sibling.
cacheRequest: a cache request that specifies the properties and control patterns to cache on the returned element.

Returns the previous sibling element, or nil if there is no sibling element.

An element can have additional sibling elements that do not match the current view condition and thus are not returned when navigating the element tree.

The structure of the Microsoft UI Automation tree changes as the visible UI elements on the desktop change. It is not guaranteed that an element returned as the previous sibling element will be returned as the previous sibling on subsequent passes.

201.58.17 Properties

201.58.18 Condition as UIAutomationConditionMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the condition that defines the view of the UI Automation tree.

Notes: (Read only property)

201.58.19 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.59 class UIAutomationValuePatternMBS

201.59.1 class UIAutomationValuePatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a control that contains a value that does not span a range and that can be represented as a string.
Notes: This string may or may not be editable, depending on the control and its settings.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.59.2 Methods

201.59.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.59.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.59.5 SetValue(value as String)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the value of the element.

201.59.6 Properties

201.59.7 CachedIsReadOnly as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the value of the element is read-only.
Notes: (Read only property)

201.59.8 CachedValue as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the cached value of the element.
Notes: Single-line edit controls support programmatic access to their contents through UIAutomationValuePatternMBS. However, multiline edit controls do not support this control pattern, and their contents must be retrieved by using UIAutomationTextPatternMBS.

This property does not support the retrieval of formatting information or substring values. UIAutomationTextPatternMBS must be used in these scenarios as well.
(Read only property)

201.59.9 CurrentIsReadOnly as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the value of the element is read-only.
Notes: is property must be TRUE for SetValue to succeed.
(Read only property)

201.59.10 CurrentValue as String

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of the element.
Notes: Single-line edit controls support programmatic access to their contents through UIAutomationValuePatternMBS. However, multiline edit controls do not support this control pattern, and their contents must be retrieved by using UIAutomationTextPatternMBS.

This property does not support the retrieval of formatting information or substring values. UIAutomationTextPatternMBS must be used in these scenarios as well.
(Read only property)

201.59.11 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.60 class UIAutomationVirtualizedItemPatternMBS

201.60.1 class UIAutomationVirtualizedItemPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a virtualized item, which is an item that is represented by a placeholder automation element in the Microsoft UI Automation tree.
Notes: A virtualized item can be an item retrieved from a control that supports the ItemContainer control pattern, or a virtualized embedded object retrieved from a control that supports the Text control pattern.

The placeholder automation element for a virtualized item might not have loaded data for all UI Automation properties, and may return UIA_E_ELEMENTNOTAVAILABLE in response to queries for properties that are not available.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.60.2 Methods

201.60.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.60.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.60.5 Realize

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a full UI Automation element for a virtualized item.
Notes: A virtualized item is represented by a placeholder automation element in the UI Automation tree. The Realize method causes the provider to make full information available for the item so that a full UI Automation element can be created for the item.

201.60.6 Properties

201.60.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.61 class UIAutomationWindowPatternMBS

201.61.1 class UIAutomationWindowPatternMBS

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to the fundamental functionality of a window.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

201.61.2 Methods

201.61.3 Close

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Closes the window.
Notes: When called on a split pane control, this method closes the pane and removes the associated split. This method may also close all other panes, depending on implementation.

201.61.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

201.61.5 Destructor

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

201.61.6 SetWindowVisualState(WindowVisualState as Integer)

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Minimizes, maximizes, or restores the window.

201.61.7 WaitForInputIdle(milliseconds as Integer) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Causes the calling code to block for the specified time or until the associated process enters an idle state, whichever completes first.
Notes: milliseconds: The amount of time, in milliseconds, to wait for the associated process to become idle.

Returns TRUE if the window has entered the idle state, or FALSE if the time-out occurred.

201.61.8 Properties

201.61.9 CachedCanMaximize as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the window can be maximized.
Notes: (Read only property)

201.61.10 CachedCanMinimize as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the window can be minimized.
Notes: (Read only property)

201.61.11 CachedIsModal as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the window is modal.
Notes: (Read only property)

201.61.12 CachedIsTopmost as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates whether the window is the topmost element in the z-order.
Notes: (Read only property)

201.61.13 CachedWindowInteractionState as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates the current state of the window for the purposes of user interaction.
Notes: (Read only property)

201.61.14 CachedWindowVisualState as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a cached value that indicates the visual state of the window; that is, whether it is in the normal, maximized, or minimized state.
Notes: (Read only property)

201.61.15 CurrentCanMaximize as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the window can be maximized.
Notes: (Read only property)

201.61.16 CurrentCanMinimize as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the window can be minimized.
Notes: (Read only property)

201.61.17 CurrentIsModal as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the window is modal.
Notes: (Read only property)

201.61.18 CurrentIsTopmost as Boolean

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the window is the topmost element in the z-order.
Notes: (Read only property)

201.61.19 CurrentWindowInteractionState as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the current state of the window for the purposes of user interaction.
Notes: (Read only property)

201.61.20 CurrentWindowVisualState as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a current value that indicates the visual state of the window; that is, whether it is in the normal, maximized, or minimized state.
Notes: (Read only property)

201.61.21 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 26.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

201.61.22 Constants

WindowInteractionState

Constant	Value	Description
WindowInteractionStateBlockedByModalWindow	3	The window is blocked by a modal window.
WindowInteractionStateClosing	1	The window is closing.
WindowInteractionStateNotResponding	4	The window is not responding.
WindowInteractionStateReadyForUserInteraction	2	The window is ready for user interaction.
WindowInteractionStateRunning	0	The window is running. This does not guarantee that the wi user interaction or is responding.

WindowVisualState

Constant	Value	Description
WindowVisualStateMaximized	1	The window is maximized.
WindowVisualStateMinimized	2	The window is normal (restored).
WindowVisualStateNormal	0	The window is normal (restored).

Chapter 202

USB

202.1 class HIDAPIDeviceInfoMBS

202.1.1 class HIDAPIDeviceInfoMBS

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The class for device information.
Example:

```
// list all HID devices (keyboards, mice, game controllers, ...) with HIDAPI
If Not HIDAPIDeviceMBS.LoadLibrary(SpecialFolder.Resources.Child("libhidapi.dylib")) Then Return
Call HIDAPIDeviceMBS.Init

Var lines() As String
Var info As HIDAPIDeviceInfoMBS = HIDAPIDeviceMBS.Enumerate // all devices
While info <>Nil
lines.Add Hex(info.VendorID) + ":" + Hex(info.ProductID) + " " + info.ManufacturerString + " " +
info.ProductString + _
" (usage page " + Hex(info.UsagePage) + ", usage " + Hex(info.Usage) + ")"
info = info.NextDevice
Wend
MessageBox String.FromArray(lines, EndOfLine)
```

202.1.2 Properties

202.1.3 BusType as Integer

MBS USB Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Underlying bus type.
Notes: Not all bus types are actually implemented for all platforms.
(Read only property)

202.1.4 InterfaceNumber as Integer

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The USB interface which this logical device represents.
Notes: Valid on both Linux implementations in all cases, and valid on the Windows implementation only if the device contains more than one interface.
(Read only property)

202.1.5 ManufacturerString as String

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Manufacturer String.
Notes: (Read only property)

202.1.6 NextDevice as HIDAPIDeviceInfoMBS

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Next device.
Notes: (Read only property)

202.1.7 Path as String

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Platform-specific device path.
Notes: (Read only property)

202.1.8 ProductID as Integer

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Device Product ID.
Notes: (Read only property)

202.1.9 ProductString as String

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Product string.
Notes: (Read only property)

202.1.10 ReleaseNumber as Integer

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Device Release Number in binary-coded decimal, also known as Device Version Number.
Notes: (Read only property)

202.1.11 SerialNumber as String

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Serial Number.
Notes: (Read only property)

202.1.12 Usage as Integer

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Usage for this Device/Interface.
Notes: (Read only property)

202.1.13 UsagePage as Integer

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Usage Page for this Device/Interface.
Notes: (Read only property)

202.1.14 VendorID as Integer

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Device Vendor ID.
Notes: (Read only property)

202.1.15 Constants

Bus Types

Constant	Value	Description
BusTypeBluetooth	2	Bluetooth or Bluetooth LE bus
BusTypeI2C	3	I2C bus
BusTypeSPI	4	SPI bus
BusTypeUnknown	0	Unknown bus type
BusTypeUSB	1	USB bus

202.2 class HIDAPIDeviceMBS

202.2.1 class HIDAPIDeviceMBS

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The class for a HIDAPI device.
Example:

```
// list all connected HID devices like keyboards, mice and game controllers
Var lines() As String
Var info As HIDAPIDeviceInfoMBS = HIDAPIDeviceMBS.Enumerate
While info <>Nil
lines.Add Hex(info.VendorID) + ":" + Hex(info.ProductID) + " " + info.ManufacturerString + " " +
info.ProductString
info = info.NextDevice
Wend

MessageBox String.FromArray(lines, EndOfLine)

// open a device by vendor and product ID and read a report
// Var device As HIDAPIDeviceMBS = HIDAPIDeviceMBS.Open(&h046D, &hC52B)
// Var data As MemoryBlock = device.ReadTimeOut(64, 1000)
```

Notes: For HIDAPI see website:
https://github.com/signal11/hidapi

The MBS Plugin includes a copy of hidapi for Mac, Windows and Linux.
The Linux version needs libudev installed.

You can optionally load a different version of hidapi with LoadLibrary methods.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

202.2.2 Methods

202.2.3 Close

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Close a HID device.

202.2.4 Constructor

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

202.2.5 Enumerate(VendorID as Integer = 0, ProduceID as Integer = 0) as HIDAPIDeviceInfoMBS

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enumerate the HID Devices.
Notes: This function returns a linked list of all the HID devices attached to the system which match VendorID and ProduceID. If VendorID is set to 0 then any vendor matches. If ProduceID is set to 0 then any product matches. If VendorID and ProduceID are both set to 0, then all HID devices will be returned.

202.2.6 GetFeatureReport(ReportID as Integer, MaxLength as Integer) as MemoryBlock

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get a feature report from a HID device.
Notes: Set the first byte of Data to the Report ID of the report to be read. Make sure to allow space for this extra byte in data. Upon return, the first byte will still contain the Report ID, and the report data will start in data.UInt8(1).

ReportID: The report ID to read.

This function returns the number of bytes read plus one for the report ID (which is still in the first byte), or -1 on error.

202.2.7 GetInputReport(ReportID as Integer, MaxLength as Integer) as MemoryBlock

MBS USB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get a input report from a HID device.
Notes: MaxLength is how many bytes we allocate for receiving buffer.

Returns the data read, which has the report ID as first byte.

202.2.8 GetReportDescriptor as MemoryBlock

MBS USB Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get a report descriptor from a HID device.
Notes: Returns the data or nil in case of an error.

202.2.9 IndexedString(Index as Integer, MaxLen as Integer = 1024) as String

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get a string from a HID device, based on its string index.
Notes: Index: The index of the string to get.
maxlen: The maximum length for read buffer.
Returns text read.

202.2.10 Init as Integer

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Initialize the HIDAPI library.
Notes: This function initializes the HIDAPI library. Calling it is not strictly necessary, as it will be called automatically by Enumerate() and any of the Open*() functions if it is needed. This function should be called at the beginning of execution however, if there is a chance of HIDAPI handles being opened by different threads simultaneously.
This function returns 0 on success and -1 on error.

202.2.11 LoadError as String

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The load error message.

202.2.12 LoadLibrary(File as FolderItem) as boolean

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Loads the library.
Notes: Returns true on success.
You can load a custom libhidapi.dylib (Mac), libhidapi.so (Linux) or libhidapi.dll (Windows).

But since MBS Plugin contains the code, you may not need to load a custom library.
See also:

- 202.2.13 LoadLibrary(Path as string) as boolean 23684

202.2.13 LoadLibrary(Path as string) as boolean

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Loads the library.
Notes: Returns true on success.
You can load a custom libhidapi.dylib (Mac), libhidapi.so (Linux) or libhidapi.dll (Windows).

But since MBS Plugin contains the code, you may not need to load a custom library.
See also:

- 202.2.12 LoadLibrary(File as FolderItem) as boolean 23684

202.2.14 Open(VendorID as Integer, ProduceID as Integer, SerialNumber as String = "") as HIDAPIDeviceMBS

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Open a HID device using a Vendor ID (VID), Product ID (PID) and optionally a serial number.
Notes: If SerialNumber is "", the first device with the specified VID and PID is opened.
VendorID: The Vendor ID (VID) of the device to open.

ProduceID: The Product ID (PID) of the device to open.
SerialNumber: The Serial Number of the device to open (Optionally "").

This function returns a pointer to a HIDAPIDeviceMBS object on success or nil on failure.

202.2.15 OpenPath(path as string) as HIDAPIDeviceMBS

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Open a HID device by its path name.
Notes: The path name be determined by calling Enumerate(), or a platform-specific path name can be used (eg: /dev/hidraw0 on Linux).
Path: The path name of the device to open
This function returns a pointer to a HIDAPIDeviceMBS object on success or nil on failure.

For macOS path must be one of:

- in format 'DevSrvsID:<RegistryEntryID>' (as returned by Enumerate().
- a valid path to an IOHIDDevice in the IOService plane (as returned by Path property in IORegistryMBS class, e.g.: "IOService:/AppleACPIPlatformExpert/PCI0@0/AppleACPIPCI/EHC1@1D,7/AppleUSBEHCI/PLAYSTATION(R)3 Controller@fd120000/IOUSBInterface@0/IOUSBHIDDriver");

Second format is for compatibility with paths accepted by older versions of HIDAPI.

202.2.16 Read(MaxLength as Integer) as MemoryBlock

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Read an Input report from a HID device.
Notes: Input reports are returned to the host through the INTERRUPT IN endpoint. The first byte will contain the Report number if the device uses numbered reports.

MaxLength: The number of bytes to read. For devices with multiple reports, make sure to read an extra byte for the report number.

This function returns the actual number of bytes read and -1 on error. If no packet was available to be read and the handle is in non-blocking mode, this function returns 0.

202.2.17 ReadTimeOut(MaxLength as Integer, TimeoutMS as Integer) as MemoryBlock

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Read an Input report from a HID device with timeout.
Notes: Input reports are returned to the host through the INTERRUPT IN endpoint. The first byte will contain the Report number if the device uses numbered reports.

MaxLength: The number of bytes to read. For devices with multiple reports, make sure to read an extra byte for the report number.

TimeoutMS: timeout in milliseconds or -1 for blocking wait.

This function returns the actual number of bytes read and -1 on error. If no packet was available to be read within the timeout period, this function returns 0.

202.2.18 SendFeatureReport(data as MemoryBlock) as Integer

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Send a Feature report to the device.
Notes: Feature reports are sent over the Control endpoint as a Set_Report transfer. The first byte of Data must contain the Report ID. For devices which only support a single report, this must be set to 0. The remaining bytes contain the report data. Since the Report ID is mandatory, calls to SendFeatureReport() will always contain one more byte than the report contains. For example, if a hid report is 16 bytes long, 17 bytes must be passed to SendFeatureReport(): the Report ID (or 0, for devices which do not use numbered reports), followed by the report data (16 bytes). In this example, the length passed in would be 17.

dat:a The data to send, including the report number as the first byte.

This function returns the actual number of bytes written and -1 on error.
See also:

- 202.2.19 SendFeatureReport(data as String) as Integer 23686

202.2.19 SendFeatureReport(data as String) as Integer

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Send a Feature report to the device.
Notes: Feature reports are sent over the Control endpoint as a Set_Report transfer. The first byte of Data must contain the Report ID. For devices which only support a single report, this must be set to 0. The remaining bytes contain the report data. Since the Report ID is mandatory, calls to SendFeatureReport() will always contain one more byte than the report contains. For example, if a hid report is 16 bytes long, 17 bytes must be passed to SendFeatureReport(): the Report ID (or 0, for devices which do not use numbered reports), followed by the report data (16 bytes). In this example, the length passed in would be 17.

dat:a The data to send, including the report number as the first byte.

This function returns the actual number of bytes written and -1 on error.
See also:

- 202.2.18 SendFeatureReport(data as MemoryBlock) as Integer 23686

202.2.20 Shutdown as Integer

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Finalize the HIDAPI library.
Notes: This function frees all of the static data associated with HIDAPI. It should be called at the end of execution to avoid memory leaks.
This function returns 0 on success and -1 on error.

202.2.21 VersionString as String

MBS USB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries version number of the library.
Example:

```
// shows 0.10.1
MessageBox HIDAPIDeviceMBS.VersionString
```

202.2.22 Write(data as MemoryBlock) as Integer

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Write an Output report to a HID device.
Notes: The first byte of data must contain the Report ID. For devices which only support a single report,

this must be set to 0x0. The remaining bytes contain the report data. Since the Report ID is mandatory, calls to Write() will always contain one more byte than the report contains. For example, if a hid report is 16 bytes long, 17 bytes must be passed to Write(), the Report ID (or 0x0, for devices with a single report), followed by the report data (16 bytes). In this example, the length passed in would be 17.
Write() will send the data on the first OUT endpoint, if one exists. If it does not, it will send the data through the Control Endpoint (Endpoint 0).

data: The data to send, including the report number as the first byte.

This function returns the actual number of bytes written and -1 on error.
Length of data to send is data.size.
See also:

- 202.2.23 Write(data as String) as Integer 23688

202.2.23 Write(data as String) as Integer

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Write an Output report to a HID device.
Notes: The first byte of data must contain the Report ID. For devices which only support a single report, this must be set to 0x0. The remaining bytes contain the report data. Since the Report ID is mandatory, calls to Write() will always contain one more byte than the report contains. For example, if a hid report is 16 bytes long, 17 bytes must be passed to Write(), the Report ID (or 0x0, for devices with a single report), followed by the report data (16 bytes). In this example, the length passed in would be 17.
Write() will send the data on the first OUT endpoint, if one exists. If it does not, it will send the data through the Control Endpoint (Endpoint 0).

data: The data to send, including the report number as the first byte.

This function returns the actual number of bytes written and -1 on error.
Length of data to send is LenB(data).
See also:

- 202.2.22 Write(data as MemoryBlock) as Integer 23687

202.2.24 Properties

202.2.25 DeviceHandle as Integer

MBS USB Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The device handle used.
Notes: For Windows a HANDLE to the open device, for Mac a IOHIDDeviceRef reference and Linux the handle from open function.
(Read only property)

202.2.26 DeviceInfo as HIDAPIDeviceInfoMBS

MBS USB Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries the device info for this device.
Notes: Returns nil in case of errors.
(Read only property)

202.2.27 Error as String

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get a string describing the last error which occurred.
Notes: This function returns a string containing the last error which occurred or "" if none has occurred.

This provides errors per device.
(Read only property)

202.2.28 FeatureReportLength as Integer

MBS USB Plugin, Plugin Version: 16.1, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The length of a feature report.
Notes: Not implemented for Linux.
Returns -1 if unknown.
On Mac this is more the maximum report length.
(Read only property)

202.2.29 GlobalError as String

MBS USB Plugin, Plugin Version: 24.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get a string describing the last error which occurred.
Notes: This function returns a string containing the last error which occurred or "" if none has occurred.

GlobalError allows to catch errors without having an instance with an Error property.
Like errors from opening a device.
(Read only property)

202.2.30 Handle as Integer

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

202.2.31 InputReportLength as Integer

MBS USB Plugin, Plugin Version: 16.1, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The length of an input report.
Notes: Not implemented for Linux.
Returns -1 if unknown.
On Mac this is more the maximum report length.
(Read only property)

202.2.32 ManufacturerString as String

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Manufacturer String from a HID device.
Notes: (Read only property)

202.2.33 NonBlocking as Boolean

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Set the device handle to be non-blocking.
Notes: In non-blocking mode calls to Read() will return immediately with a value of 0 if there is no data to be read. In blocking mode, Read() will wait (block) until there is data to read before returning.

Nonblocking can be turned on and off at any time.

Value true: enable or not the nonblocking reads.
Value false: to disable nonblocking.
(Read and Write property)

202.2.34 OutputReportLength as Integer

MBS USB Plugin, Plugin Version: 16.1, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The length of an output report.
Notes: Not implemented for Linux.
Returns -1 if unknown.
On Mac this is more the maximum report length.
(Read only property)

202.2.35 ProductString as String

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Product String from a HID device.
Notes: (Read only property)

202.2.36 SerialNumber as String

MBS USB Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Serial Number String from a HID device.
Notes: (Read only property)

202.3 class LibUSBConfigDescriptorMBS

202.3.1 class LibUSBConfigDescriptorMBS

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: A class representing the standard USB configuration descriptor.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

202.3.2 Methods

202.3.3 Constructor

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

202.3.4 GetInterface(index as Integer) as LibUSBInterfaceMBS

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries interface by index.

202.3.5 Properties

202.3.6 AttributesBitmap as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Configuration characteristics.
Notes: (Read only property)

202.3.7 Configuration as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Index of string descriptor describing this configuration.
Notes: (Read only property)

202.3.8 ConfigurationValue as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Identifier value for this configuration.
Notes: (Read only property)

202.3.9 DescriptorType as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Descriptor type.
Notes: (Read only property)

202.3.10 extra as MemoryBlock

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Extra descriptors.
Notes: (Read only property)

202.3.11 extraLength as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Length of the extra descriptors, in bytes.
Notes: (Read only property)

202.3.12 InterfaceDescriptors as Variant

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Array of interfaces supported by this configuration.
Notes: (Read only property)

202.3.13 Length as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Size of this descriptor (in bytes)
Notes: (Read only property)

202.3.14 MaxPower as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Maximum power consumption of the USB device from this bus in this configuration when the device is fully opreation.
Notes: Expressed in units of 2 mA when the device is operating in high-speed mode and in units of 8 mA when the device is operating in super-speed mode.
(Read only property)

202.3.15 NumInterfaces as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Number of interfaces supported by this configuration.
Notes: (Read only property)

202.3.16 TotalLength as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Total length of data returned for this configuration.
Notes: (Read only property)

202.4 class LibUSBDeviceDescriptorMBS

202.4.1 class LibUSBDeviceDescriptorMBS

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: A class representing the standard USB device descriptor.
Example:

```
// show the device descriptor of a USB device with libusb
// The libusb library must be loaded and initialized, see LibUSBDeviceMBS.
For Each device As LibUSBDeviceMBS In LibUSBDeviceMBS.Devices
Var d As LibUSBDeviceDescriptorMBS = device.GetDeviceDescriptor
Var kind As String = "class " + d.DeviceClass.ToString
If d.DeviceClass = LibUSBDeviceDescriptorMBS.kClassHID Then kind = "HID"
If d.DeviceClass = LibUSBDeviceDescriptorMBS.kClassHUB Then kind = "hub"
System.DebugLog Hex(d.VendorID) + ":" + Hex(d.ProductID) + " " + kind + ", USB " + Hex(d.USBReleaseNumber) + ", " + d.NumConfigurations.ToString + " configurations"
Next
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

202.4.2 Methods

202.4.3 Constructor

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

202.4.4 Properties

202.4.5 DescriptorType as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Descriptor type.
Notes: (Read only property)

202.4.6 DeviceClass as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: USB-IF class code for the device.
Notes: (Read only property)

202.4.7 DeviceProtocol as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: USB-IF protocol code for the device, qualified by the DeviceClass and DeviceSubClass values.
Notes: (Read only property)

202.4.8 DeviceReleaseNumber as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Device release number in binary-coded decimal.
Notes: (Read only property)

202.4.9 DeviceSubClass as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: USB-IF subclass code for the device, qualified by the DeviceClass value.
Notes: (Read only property)

202.4.10 IndexManufacturer as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Index of string descriptor describing manufacturer.
Notes: (Read only property)

202.4.11 IndexProduct as Integer

MBS USB Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.
