
MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Negates the number.
Example:

```
Var n As New Int128MBS("1234")
// calls Operator_Negate
n = -n
Var s As String = n // -1234

Break
```

127.6.43 Operator_Subtract(other as Int128MBS) as Int128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Subtracts the other number from this number.
Example:

```
Var n As New Int128MBS("1234")
// calls Operator_Subtract
n = n - Int128MBS.one
Var s As String = n // 1233

Break
```

See also:

- 127.6.44 Operator_Subtract(other as Int64) as Int128MBS 18120

127.6.44 Operator_Subtract(other as Int64) as Int128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Subtracts the other number from this number.
Example:

```
Var n As New Int128MBS("1234")
// calls Operator_Subtract
n = n - 1
Var s As String = n // 1233

Break
```

See also:

- 127.6.43 Operator_Subtract(other as Int128MBS) as Int128MBS 18120

127.6.45 Operator_SubtractRight(other as Int64) as Int128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Subtracts the number as right side.
Example:

```
Var n As New Int128MBS("1234")
// calls Operator_SubtractRight
n = 1 - n
Var s As String = n // -1233

Break
```

127.6.46 Pow(exp as UInt64) as Int128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Calculates the power of the value with given exponent.
Example:

```
Var Exp As Int64 = 5
Var num As Int128MBS = 2

var p as Int128MBS = num.Pow(exp)
var s as string = p // 25

Var Exp2 As Int128MBS = 90
Var p2 As Int128MBS = num.Pow(Exp2)
Var s2 As String = p2 // 1237940039285380274899124224

Break
```

127.6.47 ShiftLeft(other as Int128MBS) as Int128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise shift to the left.
See also:

- 127.6.48 ShiftLeft(other as Int64) as Int128MBS 18121

127.6.48 ShiftLeft(other as Int64) as Int128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise shift to the left.
Example:

```
Var n As Int128MBS = 12
var u as Int64 = 1
Var m As Int128MBS = n.ShiftLeft(u)
var s as string = m

Break
```

See also:

- 127.6.47 ShiftLeft(other as Int128MBS) as Int128MBS 18121

127.6.49 ShiftRight(other as Int128MBS) as Int128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise shift to the right.
Example:

```
Var n As Int128MBS = 12
Var u As Int64 = 1
Var m As Int128MBS = n.ShiftRight(u)
Var s As String = m

Break
```

See also:

- 127.6.50 ShiftRight(other as Int64) as Int128MBS 18122

127.6.50 ShiftRight(other as Int64) as Int128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise shift to the right.
See also:

- 127.6.49 ShiftRight(other as Int128MBS) as Int128MBS 18122

127.6.51 Sqrt as Int128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Calculates the square root.
Example:

```
Var n As UInt128MBS = 85
Var m As UInt128MBS = n.Sqrt
Var s As String = m

Break // 9
```

Notes: Returns the rounded down square root without using floating point math.

127.6.52 supported as Boolean

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether Int128 is supported.
Example:

```
If Int128MBS.supported Then
MessageBox "Int128 available"
Else
MessageBox "Int128 not supported"
End If
```

Notes: Not supported for 32-bit Linux.

127.6.53 two as Int128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns two as a constant.
Example:

```
MessageBox Int128MBS.two
```

Notes: We cache the object, so calling this multiple times will return the same object.

127.6.54 zero as Int128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns zero as a constant.

Example:

```
MessageBox Int128MBS.zero
```

Notes: We cache the object, so calling this multiple times will return the same object.

127.6.55 Properties

127.6.56 Abs as Int128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Calculates the absolute value.
Example:

```
Var n As Int128MBS = -123
Var m As Int128MBS = n.Abs
Var s As String = m

Break
```

Notes: (Read only property)

127.6.57 BitWidth as Integer

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the bit width of the value.
Example:

```
Var n2 As UInt128MBS = 2
Var n36 As UInt128MBS = 36
Var n100 as UInt128MBS = UInt128MBS.two.Pow(100)

Var BitWidth2 As Integer = n2.BitWidth
Var BitWidth36 As Integer = n36.BitWidth
Var BitWidth100 As Integer = n100.BitWidth

Break
```

Notes: (Read only property)

127.6.58 CountLeftZeros as Integer

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Counts how many bits are zero from the left side.
Example:

```
Var n2 As Int128MBS = 2
Var n36 As Int128MBS = 36
Var n100 as Int128MBS = Int128MBS.two.Pow(100)

Var CountLeftZeros2 As Integer = n2.CountLeftZeros
Var CountLeftZeros36 As Integer = n36.CountLeftZeros
Var CountLeftZeros100 As Integer = n100.CountLeftZeros

Var CountRightZeros2 As Integer = n2.CountRightZeros
Var CountRightZeros36 As Integer = n36.CountRightZeros
Var CountRightZeros100 As Integer = n100.CountRightZeros

Break
```

Notes: (Read only property)

127.6.59 CountRightZeros as Integer

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Counts how many bits are zero from the right side.
Example:

```
Var n2 As Int128MBS = 2
Var n36 As Int128MBS = 36
Var n100 as Int128MBS = Int128MBS.two.Pow(100)

Var CountLeftZeros2 As Integer = n2.CountLeftZeros
Var CountLeftZeros36 As Integer = n36.CountLeftZeros
Var CountLeftZeros100 As Integer = n100.CountLeftZeros

Var CountRightZeros2 As Integer = n2.CountRightZeros
Var CountRightZeros36 As Integer = n36.CountRightZeros
Var CountRightZeros100 As Integer = n100.CountRightZeros

Break
```

Notes: (Read only property)

127.6.60 Data as Ptr

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the data pointer of a number.
Notes: The size of the memory is 16 bytes.
(Read only property)

127.6.61 doubleValue as Double

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the value as double.
Example:

```
Var n2 As Int128MBS = 2
Var n100 As Int128MBS = Int128MBS.two.Pow(100)
n100 = n100 + 5

Var value2 As Double = n2.doubleValue
Var value100 As Double = n100.doubleValue
Var string100 As String = n100.stringValue

Break // string and value don't match!
```

Notes: Since double has only 53 bits of precision, you loose precision when doing this.
(Read only property)

127.6.62 HighValue as Int64

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The higher 64 bit half of the 128 bits.
Example:

```
Var n As New Int128MBS("100000000000000000000000000000000")

Var l As Int64 = n.LowValue
Var h As Int64 = n.HighValue
var s as string = n

Break
```

Notes: (Read and Write property)

127.6.63 LowValue as UInt64

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The lower 64 bit half of the 128 bits.
Example:

```
Var n As New Int128MBS("100000000000000000000000000000000")

Var l As UInt64 = n.LowValue
Var h As Int64 = n.HighValue
var s as string = n

Break
```

Notes: (Read and Write property)

127.6.64 PopCount as Integer

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Counts how many bits are set.
Example:

```
Var n2 As UInt128MBS = 2
Var n36 As UInt128MBS = 36
Var n100 as UInt128MBS = UInt128MBS.two.Pow(100)

Var PopCount2 As Integer = n2.PopCount
Var PopCount36 As Integer = n36.PopCount
Var PopCount100 As Integer = n100.PopCount

Break
```

Notes: (Read only property)

127.6.65 Sign as Integer

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the sign of the value.
Example:

```
Var n As Int128MBS = -123
Var s1 As Integer = n.Sign
Var m As Int128MBS = 123
Var s2 As Integer = m.Sign

Break
```

Notes: (Read only property)

127.6.66 stringValue as String

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries or assigns the string value to the Int128MBS class.
Example:

```
Var n As New Int128MBS("1234")
Var s1 As String = n.stringValue
n.stringValue = "2345"
Var s2 As String = n.stringValue
Break
```

Notes: (Read and Write property)

127.7 class LargeNumberErrorExceptionMBS

127.7.1 class LargeNumberErrorExceptionMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception class used to report with problems in LargeNumberMBS class.
Notes: Subclass of the RuntimeException class.
Blog Entries

- MBS Xojo Plugins, version 19.1pr5

127.8 class LargeNumberMBS

127.8.1 class LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: An 4128 bit integer number.
Example:

```
Var n1 As Int64 = 10000000000
Var n2 As Int64 = 10000000000
Var n3 As Int64 = n1 * n2 // overflow, so wrong result

Var l1 As LargeNumberMBS = LargeNumberMBS.NumberWithInt64(n1)
Var l2 As LargeNumberMBS = LargeNumberMBS.NumberWithInt64(n2)
Var l3 As LargeNumberMBS = l1 * l2

Var s4 As String = l3.StringValue // this is correct

Break
```

Notes: Can be useful to calculate with more than Int64.
This class works with up to 1224 digits.

See BigNumberMBS for a 320 bit floating point number.

127.8.2 Methods

127.8.3 Add(other as LargeNumberMBS)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds other number.
See also:

- 127.8.4 Add(other as LargeNumberMBS) as LargeNumberMBS 18131

127.8.4 Add(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds other number and returns result.
See also:

- 127.8.3 Add(other as LargeNumberMBS) 18131

127.8.5 AddMod(v as LargeNumberMBS, Modulo as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Addition with modulo.
Example:

```
Var v As New LargeNumberMBS(100)
Var o As New LargeNumberMBS(200)
Var n As New LargeNumberMBS(&hFF)

Var r As LargeNumberMBS = v.AddMod(o, n)

MessageBox r.StringValue // shows 45 = (100+200) mod 255
```

127.8.6 CheckBit(bit as integer) as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether a bit is set.
Notes: Returns true if bit is set.

127.8.7 Clone as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the number.

127.8.8 Constructor

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new instance with value zero.
Example:

```
Var l1 As New LargeNumberMBS
MessageBox l1.StringValue
```

See also:

- 127.8.9 Constructor(other as LargeNumberMBS) 18133
- 127.8.10 Constructor(value as Int32) 18133

- 127.8.11 Constructor(value as Int64) 18134
- 127.8.12 Constructor(value as String) 18134
- 127.8.13 Constructor(value as UInt32) 18134
- 127.8.14 Constructor(value as UInt64) 18135

127.8.9 Constructor(other as LargeNumberMBS)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the number.
Example:

```
Var l1 As New LargeNumberMBS(123456789)
Var l2 As New LargeNumberMBS(l1)

MessageBox l2.StringValue
```

See also:

- 127.8.8 Constructor 18132
- 127.8.10 Constructor(value as Int32) 18133
- 127.8.11 Constructor(value as Int64) 18134
- 127.8.12 Constructor(value as String) 18134
- 127.8.13 Constructor(value as UInt32) 18134
- 127.8.14 Constructor(value as UInt64) 18135

127.8.10 Constructor(value as Int32)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new instance with an 32-bit integer.
See also:

- 127.8.8 Constructor 18132
- 127.8.9 Constructor(other as LargeNumberMBS) 18133
- 127.8.11 Constructor(value as Int64) 18134
- 127.8.12 Constructor(value as String) 18134
- 127.8.13 Constructor(value as UInt32) 18134
- 127.8.14 Constructor(value as UInt64) 18135

127.8.11 Constructor(value as Int64)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new instance with an 64-bit integer.
See also:

- 127.8.8 Constructor 18132
- 127.8.9 Constructor(other as LargeNumberMBS) 18133
- 127.8.10 Constructor(value as Int32) 18133
- 127.8.12 Constructor(value as String) 18134
- 127.8.13 Constructor(value as UInt32) 18134
- 127.8.14 Constructor(value as UInt64) 18135

127.8.12 Constructor(value as String)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new number based on a string.
Notes: Raises OutOfBoundsExceptionMBS if your string is too long.
See also:

- 127.8.8 Constructor 18132
- 127.8.9 Constructor(other as LargeNumberMBS) 18133
- 127.8.10 Constructor(value as Int32) 18133
- 127.8.11 Constructor(value as Int64) 18134
- 127.8.13 Constructor(value as UInt32) 18134
- 127.8.14 Constructor(value as UInt64) 18135

127.8.13 Constructor(value as UInt32)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new instance with an unsigned 32-bit integer.
See also:

- 127.8.8 Constructor 18132
- 127.8.9 Constructor(other as LargeNumberMBS) 18133
- 127.8.10 Constructor(value as Int32) 18133

- 127.8.11 Constructor(value as Int64) 18134
- 127.8.12 Constructor(value as String) 18134
- 127.8.14 Constructor(value as UInt64) 18135

127.8.14 Constructor(value as UInt64)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new instance with an unsigned 64-bit integer.
See also:

- 127.8.8 Constructor 18132
- 127.8.9 Constructor(other as LargeNumberMBS) 18133
- 127.8.10 Constructor(value as Int32) 18133
- 127.8.11 Constructor(value as Int64) 18134
- 127.8.12 Constructor(value as String) 18134
- 127.8.13 Constructor(value as UInt32) 18134

127.8.15 Decrement(value as UInt32 = 1)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decrement number with an integer.
Example:

```
Var o As New LargeNumberMBS(5)
MessageBox o.StringValue
o.Increment
MessageBox o.StringValue
o.Decrement
MessageBox o.StringValue
```

Notes: This is faster than building a new LargeNumberMBS, just to subtract some small number.

127.8.16 Divide(other as LargeNumberMBS)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides value with by value.
See also:

- 127.8.17 Divide(other as LargeNumberMBS) as LargeNumberMBS 18136
- 127.8.18 Divide(value as UInt32) as LargeNumberMBS 18136

127.8.17 Divide(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides value with by value.
See also:

- 127.8.16 Divide(other as LargeNumberMBS) 18135
- 127.8.18 Divide(value as UInt32) as LargeNumberMBS 18136

127.8.18 Divide(value as UInt32) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divide by given integer and return result.
Example:

```
Var o As New LargeNumberMBS(63)
Var r1 As LargeNumberMBS = o.Divide(8)
Var r2 As UInt32 = o.Modulo(8)

MessageBox r1.StringValue+" "+str(r2) // shows 7 and 7
```

Notes: For small numbers this is more efficient than creating new LargeNumberMBS to store value.
See also:

- 127.8.16 Divide(other as LargeNumberMBS) 18135
- 127.8.17 Divide(other as LargeNumberMBS) as LargeNumberMBS 18136

127.8.19 DivMod(other as LargeNumberMBS, byref DivResult as LargeNumberMBS, byref ModResult as LargeNumberMBS)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs divide and modulo together.
Example:

```
Var d As New LargeNumberMBS(100)
Var n As New LargeNumberMBS(13)

Var x As LargeNumberMBS
```

```
Var y As LargeNumberMBS

d.DivMod n, x, y

MessageBox d.StringValue + " = " + x.StringValue + " * " + n.StringValue + " + " + y.StringValue
```

Notes: Puts result into both byref parameters.

127.8.20 Equals(other as LargeNumberMBS) as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares if two numbers are equal.
Notes: Returns true if equal.

127.8.21 ExpMod(e as LargeNumberMBS, Modulo as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates an exponent.
Example:

```
Var o As New LargeNumberMBS(2)
Var e As New LargeNumberMBS(11)
Var m As New LargeNumberMBS(255)
Var r As LargeNumberMBS = o.ExpMod(e,m)

MessageBox r.StringValue // shows 8 = 2^11 mod 255
```

Notes: Returns x^e mod n where x is the current number, e a parameter and n the modulo parameter.

127.8.22 FindGCD(v as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds greatest common divisor for two positive numbers.

127.8.23 GetStringValue(Base as Integer = 10, ThousandsDelimiter as String = "") as String

MBS DataTypes Plugin, Plugin Version: 24.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number with a given base and delimiter.
Example:

```
Var l As New LargeNumberMBS(1234567890)

Var s0 As String = l.StringValue
Var s1 As String = l.GetStringValue
// 1234567890
Var s2 As String = l.GetStringValue(10, ",")
// 1,234,567,890
Var s4 As String = l.GetStringValue(8, "")
// 499602d2
Var s3 As String = l.GetStringValue(16, "")
// 11145401322

Break // check in debugger
```

Notes: With all default parameter, this is same as StringValue property.

127.8.24 Increment(value as UInt32 = 1)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Increment number with an integer.
Example:

```
Var o As New LargeNumberMBS(5)
MessageBox o.StringValue
o.Increment
MessageBox o.StringValue
o.Decrement
MessageBox o.StringValue
```

Notes: This is faster than building a new LargeNumberMBS, just to add some small number.

127.8.25 IsPrime(iter as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if number is a prime number.
Example:

```
Var lines() As String

For i As Integer = 61 To 69 Step 2
Var a As New LargeNumberMBS(i)
lines.Add a.StringValue+": "+Str(a.IsPrime(5))
Next

MessageBox Join(lines, EndOfLine)
```

Notes: Returns 1 if prime and 0 if not.
Returns -1 in case of error.

Iter is the factor between 1 and 680 about how deep to iterate. The bigger the this factor, the more exact the check is.

Miller-Rabin Algorithm (ret=1 .. n is composit)

127.8.26 LeftShift(bits as integer) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shifts value to left by given number of bits.
Notes: Bits must be <= 32.

127.8.27 MaxInt32 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum value which can be represented as Int32.

127.8.28 MaxInt64 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum value which can be represented as Int64.

127.8.29 MaxUInt32 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum value which can be represented as UInt32.

127.8.30 MaxUInt64 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum value which can be represented as UInt64.

127.8.31 MinInt32 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Minimum value which can be represented as Int32.

127.8.32 MinInt64 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Minimum value which can be represented as Int64.

127.8.33 MinUInt32 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Minimum value which can be represented as UInt32.

127.8.34 MinUInt64 as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Minimum value which can be represented as UInt64.

127.8.35 ModInverse(Modulo as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function calculates modular multiplicative inverse of an given integer a modulo m.
Example:

```
Var l As New LargeNumberMBS(3)
Var n As New LargeNumberMBS(26)

Var r As LargeNumberMBS = l.ModInverse(n)

MessageBox r.StringValue
```

127.8.36 Modulo(other as LargeNumberMBS)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Modulo value.
Notes: Divides value and returns the rest.
See also:

- 127.8.37 Modulo(other as LargeNumberMBS) as LargeNumberMBS 18141
- 127.8.38 Modulo(value as UInt32) as UInt32 18141

127.8.37 Modulo(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Modulo value.
Notes: Divides value and returns the rest.
See also:

- 127.8.36 Modulo(other as LargeNumberMBS) 18141
- 127.8.38 Modulo(value as UInt32) as UInt32 18141

127.8.38 Modulo(value as UInt32) as UInt32

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divide by given integer and return remainder.
Example:

```
Var o As New LargeNumberMBS(63)
Var r1 As LargeNumberMBS = o.Divide(8)
```

```
Var r2 As UInt32 = o.Modulo(8)

MessageBox r1.StringValue+" "+str(r2) // shows 7 and 7
```

Notes: For small numbers this is more efficient than creating new LargeNumberMBS to store value.
See also:

- 127.8.36 Modulo(other as LargeNumberMBS) 18141
- 127.8.37 Modulo(other as LargeNumberMBS) as LargeNumberMBS 18141

127.8.39 MulMod(v as LargeNumberMBS, Modulo as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiply with modulo.
Example:

```
Var o As New LargeNumberMBS(50)
Var f As New LargeNumberMBS(80)
Var m As New LargeNumberMBS(255)
Var r As LargeNumberMBS = o.MulMod(f, m)

MessageBox r.StringValue // shows 175 = (50 * 80) mod 255
```

127.8.40 Multiply(other as LargeNumberMBS)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies value with other value.
See also:

- 127.8.41 Multiply(value as UInt32) as LargeNumberMBS 18142

127.8.41 Multiply(value as UInt32) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiply by given integer and return result.
Example:

```
Var o As New LargeNumberMBS(5)
Var r As LargeNumberMBS = o.Multiply(8)
```

MessageBox r.StringValue // shows 40

Notes: For small numbers this is more efficient than creating new LargeNumberMBS to store value.
See also:

- 127.8.40 Multiply(other as LargeNumberMBS) 18142

127.8.42 Negate as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negates the value.
Notes: Returns new value with different sign.

127.8.43 NumberWithInt32(value as Int32) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given Int32 value.
Example:

```
Var l1 As LargeNumberMBS = LargeNumberMBS.NumberWithInt32(123456789)
MessageBox l1.StringValue
```

127.8.44 NumberWithInt64(value as Int64) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given Int64 value.
Example:

```
Var d1 As LargeNumberMBS = LargeNumberMBS.NumberWithInt64(0)
Var d2 As LargeNumberMBS = LargeNumberMBS.NumberWithInt64(123)
Var d3 As LargeNumberMBS = LargeNumberMBS.NumberWithInt64(123456789012345)

MessageBox d1.StringValue+EndOfLine+d1.HexString+EndOfLine+_
d2.StringValue+EndOfLine+d2.HexString+EndOfLine+_
d3.StringValue+EndOfLine+d3.HexString
```

127.8.45 NumberWithInteger(value as Integer) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given integer value.
Example:

```
Var l1 As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(123456789)
MessageBox l1.StringValue
```

127.8.46 NumberWithString(value as String) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given string.
Example:

```
Var l1 As LargeNumberMBS = LargeNumberMBS.NumberWithString("123456789")
MessageBox l1.StringValue
```

127.8.47 NumberWithUInt32(value as UInt32) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given UInt32 value.
Example:

```
Var l1 As LargeNumberMBS = LargeNumberMBS.NumberWithUInt32(123456789)
MessageBox l1.StringValue
```

127.8.48 NumberWithUInt64(value as UInt64) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given UInt64 value.
Example:

```
Var l1 As LargeNumberMBS = LargeNumberMBS.NumberWithUInt64(123456789)
MessageBox l1.StringValue
```

127.8.49 NumberWithUInteger(value as UInteger) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given unsigned integer value.
Example:

```
Var l1 As LargeNumberMBS = LargeNumberMBS.NumberWithUInteger(123456789)
MessageBox l1.StringValue
```

127.8.50 NumberWithVariant(value as variant) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a number with the given variant value.
Example:

```
Var l1 As LargeNumberMBS = LargeNumberMBS.NumberWithVariant(123456789)
MessageBox l1.StringValue
```

Notes: Variant can be integer or string.

127.8.51 Operator_Add(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds other number and returns result.
Example:

```
Var l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(20)
Var o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(10)

Var r As LargeNumberMBS = l+o
Var s As LargeNumberMBS = o+l

MessageBox r.StringValue+" "+s.StringValue
```

127.8.52 Operator_AddRight(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds other number and returns result.

127.8.53 Operator_And(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs bitwise AND operator on the values.
Example:

```
Var l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(16+4)
Var o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(4+2)

Var ra As LargeNumberMBS = l And o
Var ro As LargeNumberMBS = l Or o

MessageBox ra.StringValue +" "+ro.StringValue
```

Notes: Returns new value.

127.8.54 Operator_Compare(other as LargeNumberMBS) as Integer

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares two values.
Example:

```
Var l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(20)
Var o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(10)

If l >o Then
MessageBox "l is bigger"
Else
MessageBox "o is bigger"
end if
```

Notes: Returns -1, 1 or 0.

127.8.55 Operator_Convert as String

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts the number to string.
Example:

```
Var l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(23)
MessageBox l
```

See also:

- 127.8.56 Operator_Convert(value as String)

127.8.56 Operator_Convert(value as String)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts string to large number.
Example:

```
Var l As LargeNumberMBS = "123"
MessageBox l
```

See also:

- 127.8.55 Operator_Convert as String 18146

127.8.57 Operator_Divide(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides value by other value.
Example:

```
Var l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(21)
Var o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(3)
Var r As LargeNumberMBS = l / o

MessageBox r.stringValue
```

127.8.58 Operator_DivideRight(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides value by other value.
Example:

```
Var o As New LargeNumberMBS(5)

// "10" is auto converted to LargeNumberMBS and Operator_DivideRight is called
Var r As LargeNumberMBS = "10" / o

MessageBox r.StringValue
```

127.8.59 Operator_Modulo(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Modulo value.
Example:

```
Var l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(23)
Var o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(3)
Var r As LargeNumberMBS = l Mod o

MessageBox r.stringValue
```

Notes: Divides value and returns the rest.

127.8.60 Operator_ModuloRight(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Modulo value.
Notes: Divides value and returns the rest.

127.8.61 Operator_Multiply(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies value with other value.
Example:

```
Var l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(4)
Var o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(5)
Var r As LargeNumberMBS = o*l

MessageBox r.stringValue
```

127.8.62 Operator_MultiplyRight(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies value with other value.
Example:

```
Var o As New LargeNumberMBS(5)

// "10" is auto converted to LargeNumberMBS and Operator_MultiplyRight is called
```

```
Var r As LargeNumberMBS = "10" * o

MessageBox r.StringValue
```

127.8.63 Operator_Negate as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negates the value.
Example:

```
Var l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(20)
Var r As LargeNumberMBS = -l

MessageBox r.StringValue
```

127.8.64 Operator_Or(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs bitwise OR operator on the values.
Example:

```
Var l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(16+4)
Var o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(4+2)

Var ra As LargeNumberMBS = l And o
Var ro As LargeNumberMBS = l Or o

MessageBox ra.StringValue +" "+ro.StringValue
```

Notes: Returns new value.

127.8.65 Operator_Subtract(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts other number and returns result.
Example:

```
Var l As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(20)
Var o As LargeNumberMBS = LargeNumberMBS.NumberWithInteger(10)

Var r As LargeNumberMBS = l-o
```

```
Var s As LargeNumberMBS = o-l

MessageBox r.StringValue+" "+s.StringValue
```

127.8.66 Operator_SubtractRight(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts other number and returns result.
Example:

```
Var o As New LargeNumberMBS(5)

// "10" is auto converted to LargeNumberMBS and Operator_SubtractRight is called
Var r As LargeNumberMBS = "10" - o

MessageBox r.StringValue
```

127.8.67 Prime(byte as Integer) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new big prime number.
Example:

```
Var lines() As String
For i As Integer = 1 To 10

Var r As LargeNumberMBS = LargeNumberMBS.Prime(i)
lines.Add r.StringValue

Next
MessageBox Join(lines,EndOfLine)
```

Notes: Byte defines how big the prime number becomes. Range 1 to 680.

127.8.68 RightShift(bits as integer) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shifts value to right by given number of bits.
Notes: Bits must be <= 32.

127.8.69 SetStringValue(Text As String, Base as Integer, byref AfterText as String, Byref ValueRead as boolean)

MBS DataTypes Plugin, Plugin Version: 24.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets number from text.
Notes: Returns the text after the given text following the number in AfterText parameter.
Sets ValueRead if a value was read.

127.8.70 SetZero

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets number to zero.
Example:

```
Var l1 As LargeNumberMBS = LargeNumberMBS.NumberWithInt32(12345)
MessageBox l1.StringValue

// set to zero
l1.SetZero
MessageBox l1.StringValue
```

127.8.71 SqrMod(Modulo as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiply with itself and modulo.
Example:

```
Var o As New LargeNumberMBS(90)
Var m As New LargeNumberMBS(255)
Var r As LargeNumberMBS = o.SqrMod(m)

MessageBox r.StringValue // shows 195 = (90 * 90) mod 255
```

127.8.72 sqrt as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates square root of value.
Example:

```
Var l As New LargeNumberMBS(1234567890123456)

// let's multiple first and then
Var q As LargeNumberMBS = l * l
Var root As LargeNumberMBS = q.Sqrt

If l = root Then
Break // okay
Else
Break // failed
End If
```

Notes: Get nearly square root of a. The answer will be a >= ret^2.

127.8.73 Square as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates square of current value.
Notes: Return x^2.

127.8.74 SubMod(v as LargeNumberMBS, Modulo as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtraction with modulo.
Example:

```
Var v As New LargeNumberMBS(100)
Var o As New LargeNumberMBS(200)
Var n As New LargeNumberMBS(&hFF)

Var r As LargeNumberMBS = v.SubMod(o, n)

MessageBox r.StringValue // shows 155 = (100-200) mod 255

// -100 is too small, so 255 is added to bring to range.
```

127.8.75 Subtract(other as LargeNumberMBS)

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts other number.
See also:

- 127.8.76 Subtract(other as LargeNumberMBS) as LargeNumberMBS 18153

127.8.76 Subtract(other as LargeNumberMBS) as LargeNumberMBS

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts other number and returns result.
See also:

- 127.8.75 Subtract(other as LargeNumberMBS) 18153

127.8.77 Properties

127.8.78 BitSize as Integer

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries bit size of the number.
Notes: Up to 4128 bits.
(Read only property)

127.8.79 Bytes as MemoryBlock

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Provides raw bytes of number in memory.
Example:

```
Var o As New LargeNumberMBS(&h12345678)
Var m As MemoryBlock = o.Bytes

Break
```

Notes: Without sign as number is always positive.
(Read only property)

127.8.80 ByteSize as Integer

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries byte size of the number.
Notes: Up to 516 bytes.
(Read only property)

127.8.81 DoubleValue as Double

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries value as double.
Notes: Result is not correct if value is not in range of a double.
(Read only property)

127.8.82 HexString as String

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries value as hex string.
Notes: (Read only property)

127.8.83 Int64Value as Int64

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries value as Int64.
Notes: Result is not correct if value is not in range of a double.
(Read and Write property)

127.8.84 IntegerValue as Integer

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries value as integer.
Example:

```
Var l As New LargeNumberMBS(123)

Var u As UInteger = l.UIntegerValue
Var i As Integer = l.IntegerValue
```

Break

Notes: Result is not correct if value is not in range of a double.
(Read and Write property)

127.8.85 IsDouble as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this value fits in double range.
Notes: (Read only property)

127.8.86 IsInt32 as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this value fits in Int32 range.
Notes: (Read only property)

127.8.87 IsInt64 as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this value fits in Int64 range.
Notes: (Read only property)

127.8.88 IsNegate as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether value is negative.
Notes: (Read and Write property)

127.8.89 IsUInt32 as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this value fits in UInt32 range.
Notes: (Read only property)

127.8.90 IsUInt64 as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this value fits in UInt64 range.
Notes: (Read only property)

127.8.91 IsZero as Boolean

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether value is zero.
Notes: (Read only property)

127.8.92 StringValue as String

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries value as string.
Notes: Result is not correct if value is not in range of a double.
(Read and Write property)

127.8.93 UInt64Value as UInt64

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries value as UInt64.
Notes: Result is not correct if value is not in range of a double.
(Read and Write property)

127.8.94 UIntegerValue as UInteger

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries value as unsigned integer.
Example:

```
Var l As New LargeNumberMBS(123)

Var u As UInteger = l.UIntegerValue
Var i As Integer = l.IntegerValue

Break
```

Notes: Result is not correct if value is not in range of a double.
(Read and Write property)

127.8.95 VariantValue as Variant

MBS DataTypes Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries value as variant.
Notes: Result is can be string, integer or double.
(Read and Write property)

127.9 class SplineMBS

127.9.1 class SplineMBS

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This class calculates a 2D cubic spline.
Example:

```
// interpolate values between some points with a cubic spline
Var xs() As Double = Array(0.0, 1.0, 2.0, 3.0, 4.0)
Var ys() As Double = Array(0.0, 2.0, 1.0, 3.0, 2.0)
Var s As New SplineMBS(xs, ys)

Var lines() As String
For px As Double = 0 To 4 Step 0.5
lines.Add px.ToString + " ->" + Format(s.calc(px), "0.000")
Next

MessageBox String.FromArray(lines, EndOfLine)
```

Notes: The curve goes smooth through all points.

- MBS Xojo / Real Studio Plugins, version 15.3pr3

127.9.2 Methods

127.9.3 a(index as Integer) as Double

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constant part of the coefficient.

127.9.4 b(index as Integer) as Double

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The 1st order coefficient.

127.9.5 c(index as Integer) as Double

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The 2nd order coefficient.

127.9.6 calc(x as Double) as Double

MBS Util Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the Y value on the spline for a given X value.

127.9.7 Constructor(X() as Double, Y() as Double)

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: Raises an exception for invalid arrays passed, e.g. different size.
Calculates the spline curve coefficients and sets count property.

127.9.8 d(index as Integer) as Double

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The 3rd order coefficient.

127.9.9 x(index as Integer) as Double

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x value for this coefficent.

127.9.10 y(index as Integer) as Double

MBS Util Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y value for this coefficent.

127.9.11 Properties

127.9.12 count as Integer

MBS Util Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of coefficients.
Notes: (Read and Write property)

127.10 module SunTimesMBS

127.10.1 module SunTimesMBS

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A helper module to calculate sunset/sunrise times.
Example:

```
// may be an hour off due to daylight saving time

Var d as new date

Var jd as Double = SunTimesMBS.CalcJulianDate(d.day, d.Month, d.Year)

// Koblenz, Germany
const latitude = 50.356667
const longitude = 7.593889

// Miami, FL
'const latitude = 25.787778
'const longitude = -80.224167

Var sr as Double = SunTimesMBS.CalcSunriseUTC(jd, latitude, longitude)
Var ss as Double = SunTimesMBS.CalcSunsetUTC (jd, latitude, longitude)

d.gmtoffset = 0
d.hour = 0
d.minute = 0
d.second = 0

Var base as Double = d.totalseconds
d.totalseconds = sr*60 + base

MessageBox "Sunrise: "+d.longdate+" "+d.longtime

d.totalseconds = ss*60 + base

MessageBox "Sunset: "+d.longdate+" "+d.longtime
```

Notes: The example code above works well, but seems not to take into account the daylight saving time.

- MBS Real Studio Plugins, version 12.4pr3

127.10.2 Methods

127.10.3 CalcJulianDate(day as Integer, month as Integer, year as Integer) as Double

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a julian date from given date values.

127.10.4 CalcSunriseUTC(JD as Double, latitude as Double, longitude as Double) as Double

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates sunrise time.
Notes: Returns time on date in minutes.
Use CalcJulianDate to calculate the JD parameter.

127.10.5 CalcSunsetUTC(JD as Double, latitude as Double, longitude as Double) as Double

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates sunset time.
Notes: Returns time on date in minutes.
Use CalcJulianDate to calculate the JD parameter.

127.11 class UInt128MBS

127.11.1 class UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class to wrap an unsigned 128-bit number for Xojo.
Example:

```
Var n As New UInt128MBS(123)
MessageBox n
```

Notes: Not supported for 32-bit Linux targets.
We cache small numbers.

127.11.2 Methods

127.11.3 BitwiseAnd(Value as UInt128MBS) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise AND operation on two numbers.
Example:

```
Var n As New UInt128MBS("1234")
var u as UInt64 = 211

n = n.BitwiseAnd(u)

Var s As String = n.stringValue
Break // shows 210
```

See also:

- 127.11.4 BitwiseAnd(Value as UInt64) as UInt128MBS 18164

127.11.4 BitwiseAnd(Value as UInt64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise AND operation on two numbers.
Example:

```
Var n As New UInt128MBS("1234")
Var x As UInt128MBS = 211

n = n.BitwiseAnd(x)

Var s As String = n.stringValue
Break // shows 210
```

See also:

- 127.11.3 BitwiseAnd(Value as UInt128MBS) as UInt128MBS 18163

127.11.5 BitwiseOr(Value as UInt128MBS) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise OR operation on two numbers.
Example:

```
Var n As New UInt128MBS("1234")

// or one bit
n = n.BitwiseOr(UInt128MBS.one)

Var s As String = n.stringValue
Break // shows 1235
```

See also:

- 127.11.6 BitwiseOr(Value as UInt64) as UInt128MBS 18165

127.11.6 BitwiseOr(Value as UInt64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise OR operation on two numbers.
Example:

```
Var n As New UInt128MBS("1234")
var u as UInt64 = 1

// or one bit
n = n.BitwiseOr(u)

Var s As String = n.stringValue
Break // shows 1235
```

See also:

- 127.11.5 BitwiseOr(Value as UInt128MBS) as UInt128MBS 18164

127.11.7 BitwiseXOr(Value as UInt128MBS) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise XOR operation on two numbers.
Example:

```
Var n As New UInt128MBS("1234")

var u as UInt64 = 211
n = n.BitwiseXor(u)

Var s As String = n.stringValue
Break // shows 1025
```

See also:

- 127.11.8 BitwiseXOr(Value as UInt64) as UInt128MBS 18166

127.11.8 BitwiseXOr(Value as UInt64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise XOR operation on two numbers.
Example:

```
Var n As New UInt128MBS("1234")
var o as UInt128MBS = 211

n = n.BitwiseXor(o)

Var s As String = n.stringValue
Break // shows 1025
```

See also:

- 127.11.7 BitwiseXOr(Value as UInt128MBS) as UInt128MBS 18165

127.11.9 Constructor

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor to create a null value.
Example:

```
Var n As New UInt128MBS
n.stringValue = "1234"
Break
```

See also:

- 127.11.10 Constructor(Data as Ptr, Size as Integer, isUnsigned as boolean = false) 18166
- 127.11.11 Constructor(value as Int128MBS) 18167
- 127.11.12 Constructor(value as Int64) 18167
- 127.11.13 Constructor(value as String) 18168
- 127.11.14 Constructor(value as UInt128MBS) 18169
- 127.11.15 Constructor(value as UInt64) 18169

127.11.10 Constructor(Data as Ptr, Size as Integer, isUnsigned as boolean = false)

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new number based on data in memory.
Notes: Size should be 1, 2, 4, 8 or 16 bytes.
See also:

- 127.11.9 Constructor 18166
- 127.11.11 Constructor(value as Int128MBS) 18167
- 127.11.12 Constructor(value as Int64) 18167
- 127.11.13 Constructor(value as String) 18168
- 127.11.14 Constructor(value as UInt128MBS) 18169
- 127.11.15 Constructor(value as UInt64) 18169

127.11.11 Constructor(value as Int128MBS)

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new 128-bit integer from an existing unsigned 128-bit integer.
Example:

```
Var n As New Int128MBS("1234")
var c as new UInt128MBS(n)
Var s As String = c
Break
```

Notes: Raises exception if the Int128MBS is out of range.
See also:

- 127.11.9 Constructor 18166
- 127.11.10 Constructor(Data as Ptr, Size as Integer, isUnsigned as boolean = false) 18166

- 127.11.13 Constructor(value as String) 18168
- 127.11.14 Constructor(value as UInt128MBS) 18169
- 127.11.15 Constructor(value as UInt64) 18169

127.11.12 Constructor(value as Int64)

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new 128-bit integer from an Int64.
Example:

```
var u as Int64 = 1234
Var n As New UInt128MBS(u)
Var s As String = n
Break
```

See also:

- 127.11.9 Constructor 18166
- 127.11.10 Constructor(Data as Ptr, Size as Integer, isUnsigned as boolean = false) 18166
- 127.11.11 Constructor(value as Int128MBS) 18167
- 127.11.13 Constructor(value as String) 18168
- 127.11.14 Constructor(value as UInt128MBS) 18169
- 127.11.15 Constructor(value as UInt64) 18169

127.11.13 Constructor(value as String)

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new 128-bit integer from a string.
Example:

```
Var n As New UInt128MBS("1234")
Var s As String = n
Break
```

Notes: Ignores any non digit numbers.
See also:

- 127.11.9 Constructor 18166
- 127.11.10 Constructor(Data as Ptr, Size as Integer, isUnsigned as boolean = false) 18166

- 127.11.12 Constructor(value as Int64) 18167
- 127.11.14 Constructor(value as UInt128MBS) 18169
- 127.11.15 Constructor(value as UInt64) 18169

127.11.14 Constructor(value as UInt128MBS)

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new 128-bit integer from an existing 128-bit integer.
Example:

```
Var n As New UInt128MBS("1234")
var c as new UInt128MBS(n)
Var s As String = c
Break
```

Notes: The copy constructor.
See also:

- 127.11.9 Constructor 18166

- 127.11.12 Constructor(value as Int64) 18167
- 127.11.13 Constructor(value as String) 18168
- 127.11.15 Constructor(value as UInt64) 18169

127.11.15 Constructor(value as UInt64)

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new 128-bit integer from an UInt64.
Example:

```
var u as UInt64 = 1234
Var n As New UInt128MBS(u)
Var s As String = n
Break
```

See also:

- 127.11.14 Constructor(value as UInt128MBS) 18169

127.11.16 Dec

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Decreases the number by one.
Example:

```
var n As UInt128MBS = 123

n.Dec

var v as String = n // 122

Break
```

See also:

- 127.11.17 Dec as UInt128MBS 18170

127.11.17 Dec as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Decreases the number by one.
Example:

```
var n As UInt128MBS = 123
var o as UInt128MBS = n.Dec
var v as String = o // 122

Break
```

Notes: Returns the new value.
See also:

- 127.11.16 Dec 18170

127.11.18 Equals(other as Int128MBS) as Boolean

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if two numbers are equal.
Example:

```
Var o As Int128MBS = -1
Var i As UInt128MBS = 123
Var u As UInt128MBS = 123
```

```
If i.Equals(u) Then
Break // <- goes here
Else
Break
End If

If o.Equals(u) Then
Break
Else
Break // <- goes here
End If
```

See also:

- 127.11.19 Equals(other as UInt128MBS) as Boolean 18171
- 127.11.20 Equals(other as UInt64) as Boolean 18172

127.11.19 Equals(other as UInt128MBS) as Boolean

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if two numbers are equal.
Example:

```
Var o As Int128MBS = -1
Var i As UInt128MBS = 123
Var u As UInt128MBS = 123

If i.Equals(u) Then
Break // <- goes here
Else
Break
End If

If o.Equals(u) Then
Break
Else
Break // <- goes here
End If
```

See also:

- 127.11.18 Equals(other as Int128MBS) as Boolean 18170
- 127.11.20 Equals(other as UInt64) as Boolean 18172

127.11.20 Equals(other as UInt64) as Boolean

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if two numbers are equal.
See also:

- 127.11.18 Equals(other as Int128MBS) as Boolean 18170
- 127.11.19 Equals(other as UInt128MBS) as Boolean 18171

127.11.21 Inc

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Increases the number by one.
Example:

```
Var n As UInt128MBS = 123

n.inc

Var v As String = n // 124

Break
```

See also:

- 127.11.22 Inc as UInt128MBS 18172

127.11.22 Inc as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Increases the number by one.
Example:

```
var n As UInt128MBS = 123
var o as UInt128MBS = n.inc
var v as String = o // 124

Break
```

Notes: Returns the new value.
See also:

- 127.11.21 Inc 18172

127.11.23 one as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns one as a constant.
Example:

```
MessageBox UInt128MBS.one
```

Notes: We cache the object, so calling this multiple times will return the same object.

127.11.24 Operator_Add(other as UInt128MBS) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a number.
Example:

```
Var n As New UInt128MBS("1234")
// calls Operator_Add
n = n + UInt128MBS.one

Break
```

See also:

- 127.11.25 Operator_Add(other as UInt64) as UInt128MBS 18173

127.11.25 Operator_Add(other as UInt64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a number.
Example:

```
Var n As New UInt128MBS("1234")
// calls Operator_Add

var u as UInt64 = 1
n = n + u

Break
```

See also:

• 127.11.24 Operator_Add(other as UInt128MBS) as UInt128MBS 18173

127.11.26 Operator_AddRight(other as UInt128MBS) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a number.

127.11.27 Operator_Compare(other as Int128MBS) as Integer

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compares two numbers.
Example:

```
var u as UInt128MBS = 5
Var x As New Int128MBS(-6)
Var v As Int128MBS = 5

// calls Operator_Compare

If u >x Then
// okay, negative number is always smaller
Break
Else
// failed?
Break
End If

If u = v Then
// okay
Break
Else
// failed?
Break
End If
```

See also:

• 127.11.28 Operator_Compare(other as UInt128MBS) as Integer 18175

• 127.11.29 Operator_Compare(other as UInt64) as Integer 18175

127.11.28 Operator_Compare(other as UInt128MBS) as Integer

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compares two numbers.
Example:

```
var u as UInt128MBS = 5
Var x As UInt128MBS = 12345
Var v As UInt128MBS = 5

// calls Operator_Compare

If u <x Then
// okay
Break
Else
// failed?
Break
End If

If u = v Then
// okay
Break
Else
// failed?
Break
End If
```

See also:

- 127.11.27 Operator_Compare(other as Int128MBS) as Integer 18174
- 127.11.29 Operator_Compare(other as UInt64) as Integer 18175

127.11.29 Operator_Compare(other as UInt64) as Integer

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compares two numbers.
Example:

```
Var v As UInt128MBS = 5
var u as UInt64 = 5

If u = v Then
// okay
Break
```

```
Else
// failed?
Break
End If
```

See also:

- 127.11.27 Operator_Compare(other as Int128MBS) as Integer 18174
- 127.11.28 Operator_Compare(other as UInt128MBS) as Integer 18175

127.11.30 Operator_Convert as String

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts the 128-bit integer to a string.
Example:

```
var n As UInt128MBS = "123"

// convert to UInt64
Var v As UInt64 = n
// convert to string
Var s As String = n
// convert to double via UInt64
var d as Double = n

Break
```

See also:

- 127.11.31 Operator_Convert as UInt64 18176
- 127.11.32 Operator_Convert(value as String) 18177
- 127.11.33 Operator_Convert(value as UInt64) 18177

127.11.31 Operator_Convert as UInt64

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts an 128-bit number to an UInt64.
Example:

```
Var n As New Int128MBS("1234")

// auto convert
```

```
var s as UInt64 = n

Break
```

Notes: Raises an exception if the number is out of range for an UInt64.
See also:

- 127.11.30 Operator_Convert as String 18176
- 127.11.32 Operator_Convert(value as String) 18177
- 127.11.33 Operator_Convert(value as UInt64) 18177

127.11.32 Operator_Convert(value as String)

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts a string to an 128-bit integer.
Example:

```
var n As UInt128MBS = "123"
```

See also:

- 127.11.30 Operator_Convert as String 18176
- 127.11.31 Operator_Convert as UInt64 18176
- 127.11.33 Operator_Convert(value as UInt64) 18177

127.11.33 Operator_Convert(value as UInt64)

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts an UInt64 to an 128-bit integer.
Example:

```
var n As UInt128MBS = 123
```

See also:

- 127.11.30 Operator_Convert as String 18176
- 127.11.31 Operator_Convert as UInt64 18176
- 127.11.32 Operator_Convert(value as String) 18177

127.11.34 Operator_Divide(other as UInt128MBS) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Divides a number.
Example:

```
Var n As New UInt128MBS("1234")
// calls Operator_Divide
var x as UInt128MBS = 2
n = n / x
Var s As String = n // 617

Break
```

See also:

- 127.11.35 Operator_Divide(other as UInt64) as UInt128MBS 18178

127.11.35 Operator_Divide(other as UInt64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Divides the number by the other one.
Example:

```
Var n As New UInt128MBS("1234")
// calls Operator_Divide
var u as UInt64 = 2
n = n / u
Var s As String = n // 617

Break
```

See also:

- 127.11.34 Operator_Divide(other as UInt128MBS) as UInt128MBS 18178

127.11.36 Operator_DivideRight(other as UInt64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Divides a number.
Example:

```
Var n As New UInt128MBS("1234")
// calls Operator_DivideRight
```

```
n = 2468 / n
Var s As String = n // 2

Break
```

127.11.37 Operator_Modulo(other as UInt128MBS) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Calculates modulo operation.
Example:

```
Var u5 As UInt64 = 5
Var u33 As UInt64 = 33
Var n As New UInt128MBS(u33)
Var x As New UInt128MBS(u5)
// calls Operator_Modulo
n = n Mod x
Var s As String = n // 3

Break
```

Notes: Performs division and returns the left over.
See also:

- 127.11.38 Operator_Modulo(other as UInt64) as UInt128MBS 18179

127.11.38 Operator_Modulo(other as UInt64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Calculates modulo operation.
Example:

```
Var n As New UInt128MBS(33)
// calls Operator_Modulo
var u as UInt64 = 5
n = n Mod u
Var s As String = n // 3

Break
```

Notes: Performs division and returns the left over.
See also:

- 127.11.37 Operator_Modulo(other as UInt128MBS) as UInt128MBS 18179

127.11.39 Operator_ModuloRight(other as UInt64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Calculates modulo operation.
Example:

```
var u5 as UInt64 = 5
Var n As New UInt128MBS(u5)
// calls Operator_ModuloRight
n = 33 Mod n
Var s As String = n // 3

Break
```

Notes: Performs division and returns the left over.

127.11.40 Operator_Multiply(other as UInt128MBS) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Multiplies the number with the other one.
Example:

```
Var n As New UInt128MBS(6)
Var x As New UInt128MBS(5)
// calls Operator_Multiply
n = n * x
Var s As String = n // 30

Break
```

See also:

- 127.11.41 Operator_Multiply(other as UInt64) as UInt128MBS 18180

127.11.41 Operator_Multiply(other as UInt64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Multiplies the number with the other one.
Example:

```
Var u5 As UInt64 = 5
var u6 as UInt64 = 6
Var n As New UInt128MBS(u6)
// calls Operator_Multiply
n = n * u5
Var s As String = n // 30

Break
```

See also:

- 127.11.40 Operator_Multiply(other as UInt128MBS) as UInt128MBS 18180

127.11.42 Operator_MultiplyRight(other as UInt64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Multiplies the number with the other one.
Example:

```
Var n As New UInt128MBS("6")
// calls Operator_MultiplyRight
n = 5 * n
Var s As String = n // 30

Break
```

127.11.43 Operator_Negate as Int128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Negates the number.
Example:

```
Var n As New UInt128MBS("1234")
// calls Operator_Negate
var x as Int128MBS = -n
Var s As String = x // -1234

Break
```

127.11.44 Operator_Subtract(other as UInt128MBS) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Subtracts the other number from this number.
Example:

```
Var n As New UInt128MBS("1234")
// calls Operator_Subtract
n = n - UInt128MBS.one
Var s As String = n // 1233

Break
```

See also:

- 127.11.45 Operator_Subtract(other as UInt64) as UInt128MBS 18182

127.11.45 Operator_Subtract(other as UInt64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Subtracts the other number from this number.
Example:

```
Var n As New UInt128MBS("1234")
// calls Operator_Subtract
var u as UInt64 = 1
n = n - u
Var s As String = n // 1233

Break
```

See also:

- 127.11.44 Operator_Subtract(other as UInt128MBS) as UInt128MBS 18181

127.11.46 Operator_SubtractRight(other as UInt64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Subtracts the number as right side.
Example:

```
Var n As New UInt128MBS("1234")
// calls Operator_SubtractRight
n = 2000 - n
Var s As String = n // 766

Break
```

127.11.47 Pow(exp as UInt64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Calculates the power of the value with given exponent.
Example:

```
Var Exp As Int64 = 5
Var num As UInt128MBS = 2

var p as UInt128MBS = num.Pow(exp)
var s as string = p // 25

Var Exp2 As UInt128MBS = 90
Var p2 As UInt128MBS = num.Pow(Exp2)
Var s2 As String = p2 // 1237940039285380274899124224

Break
```

127.11.48 ShiftLeft(other as Int64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise shift to the left.
Example:

```
Var n As UInt128MBS = 12
Var m As UInt128MBS = n.ShiftLeft(1)
Var s As String = m

Break
```

See also:

- 127.11.49 ShiftLeft(other as UInt128MBS) as UInt128MBS 18183
- 127.11.50 ShiftLeft(other as UInt64) as UInt128MBS 18184

127.11.49 ShiftLeft(other as UInt128MBS) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise shift to the left.
See also:

- 127.11.48 ShiftLeft(other as Int64) as UInt128MBS 18183

• 127.11.50 ShiftLeft(other as UInt64) as UInt128MBS 18184

127.11.50 ShiftLeft(other as UInt64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise shift to the left.
Example:

```
Var n As UInt128MBS = 12
var u as UInt64 = 1
Var m As UInt128MBS = n.ShiftLeft(u)
var s as string = m

Break
```

See also:

• 127.11.48 ShiftLeft(other as Int64) as UInt128MBS 18183
• 127.11.49 ShiftLeft(other as UInt128MBS) as UInt128MBS 18183

127.11.51 ShiftRight(other as Int64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise shift to the right.
Example:

```
Var n As UInt128MBS = 12
Var m As UInt128MBS = n.ShiftRight(1)
Var s As String = m

Break
```

See also:

• 127.11.52 ShiftRight(other as UInt128MBS) as UInt128MBS 18184
• 127.11.53 ShiftRight(other as UInt64) as UInt128MBS 18185

127.11.52 ShiftRight(other as UInt128MBS) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise shift to the right.
See also:

- 127.11.51 ShiftRight(other as Int64) as UInt128MBS 18184
- 127.11.53 ShiftRight(other as UInt64) as UInt128MBS 18185

127.11.53 ShiftRight(other as UInt64) as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a bitwise shift to the right.
Example:

```
Var n As UInt128MBS = 12
Var u As UInt64 = 1
Var m As UInt128MBS = n.ShiftRight(u)
Var s As String = m

Break
```

See also:

- 127.11.51 ShiftRight(other as Int64) as UInt128MBS 18184
- 127.11.52 ShiftRight(other as UInt128MBS) as UInt128MBS 18184

127.11.54 Sqrt as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Calculates the square root.
Example:

```
Var n As UInt128MBS = 85
Var m As UInt128MBS = n.Sqrt
Var s As String = m

Break // 9
```

Notes: Returns the rounded down square root without using floating point math.

127.11.55 supported as Boolean

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether UInt128 is supported.
Example:

```
If UInt128MBS.supported Then
MessageBox "UInt128 available"
Else
MessageBox "UInt128 not supported"
End If
```

Notes: Not supported for 32-bit Linux.

127.11.56 two as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns two as a constant.
Example:

```
MessageBox UInt128MBS.two
```

Notes: We cache the object, so calling this multiple times will return the same object.

127.11.57 zero as UInt128MBS

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns zero as a constant.
Example:

```
MessageBox UInt128MBS.zero
```

Notes: We cache the object, so calling this multiple times will return the same object.

127.11.58 Properties

127.11.59 BitWidth as Integer

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the bit width of the value.
Example:

```
Var n2 As UInt128MBS = 2
Var n36 As UInt128MBS = 36
Var n100 as UInt128MBS = UInt128MBS.two.Pow(100)
```

```
Var BitWidth2 As Integer = n2.BitWidth
Var BitWidth36 As Integer = n36.BitWidth
Var BitWidth100 As Integer = n100.BitWidth

Break
```

Notes: (Read only property)

127.11.60 CountLeftZeros as Integer

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Counts how many bits are zero from the left side.
Example:

```
Var n2 As UInt128MBS = 2
Var n36 As UInt128MBS = 36
Var n100 as UInt128MBS = UInt128MBS.two.Pow(100)

Var CountLeftZeros2 As Integer = n2.CountLeftZeros
Var CountLeftZeros36 As Integer = n36.CountLeftZeros
Var CountLeftZeros100 As Integer = n100.CountLeftZeros

Var CountRightZeros2 As Integer = n2.CountRightZeros
Var CountRightZeros36 As Integer = n36.CountRightZeros
Var CountRightZeros100 As Integer = n100.CountRightZeros

Break
```

Notes: (Read only property)

127.11.61 CountRightZeros as Integer

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Counts how many bits are zero from the right side.
Example:

```
Var n2 As UInt128MBS = 2
Var n36 As UInt128MBS = 36
Var n100 as UInt128MBS = UInt128MBS.two.Pow(100)

Var CountLeftZeros2 As Integer = n2.CountLeftZeros
```

```
Var CountLeftZeros36 As Integer = n36.CountLeftZeros
Var CountLeftZeros100 As Integer = n100.CountLeftZeros

Var CountRightZeros2 As Integer = n2.CountRightZeros
Var CountRightZeros36 As Integer = n36.CountRightZeros
Var CountRightZeros100 As Integer = n100.CountRightZeros

Break
```

Notes: (Read only property)

127.11.62 Data as Ptr

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the data pointer of a number.
Notes: The size of the memory is 16 bytes.
(Read only property)

127.11.63 doubleValue as Double

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the value as double.
Example:

```
Var n2 As UInt128MBS = 2
Var n100 As UInt128MBS = UInt128MBS.two.Pow(100)
n100 = n100 + UInt64(5)

Var value2 As Double = n2.doubleValue
Var value100 As Double = n100.doubleValue
Var string100 As String = n100.stringValue

Break // string and value don't match!
```

Notes: Since double has only 53 bits of precision, you loose precision when doing this.
(Read only property)

127.11.64 HighValue as UInt64

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The higher 64 bit half of the 128 bits.
Example:

```
Var n As New UInt128MBS("100000000000000000000000000000000")

Var l As UInt64 = n.LowValue
Var h As UInt64 = n.HighValue
var s as string = n

Break
```

Notes: (Read and Write property)

127.11.65 LowValue as UInt64

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The lower 64 bit half of the 128 bits.
Example:

```
Var n As New UInt128MBS("100000000000000000000000000000000")

Var l As UInt64 = n.LowValue
Var h As UInt64 = n.HighValue
var s as string = n

Break
```

Notes: (Read and Write property)

127.11.66 PopCount as Integer

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Counts how many bits are set.
Example:

```
Var n2 As UInt128MBS = 2
Var n36 As UInt128MBS = 36
Var n100 as UInt128MBS = UInt128MBS.two.Pow(100)

Var PopCount2 As Integer = n2.PopCount
Var PopCount36 As Integer = n36.PopCount
Var PopCount100 As Integer = n100.PopCount
```

```
Break
```

Notes: (Read only property)

127.11.67 stringValue as String

MBS Util Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries or assigns the string value to the UInt128MBS class.
Example:

```
Var n As New UInt128MBS("1234")
Var s1 As String = n.stringValue
n.stringValue = "2345"
Var s2 As String = n.stringValue
Break
```

Notes: (Read and Write property)

Chapter 128

Media Keys

128.1 class MediaKeysMBS

128.1.1 class MediaKeysMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Catch some special keys with this class.
Example:

```
Var m as MediaKeysMBS // global property!

// app initialization
m = new MediaKeysMBS

// set which keys to watch for
m.Keys(MediaKeysMBS.kMediaKeyEject) = MediaKeysMBS.kModeEventAndBlock

// and start
m.startWatchingMediaKeys
```

Notes: First written to catch play, fast and rewind keys from Apple keyboards.
Later extended to also catch other keys.
Still not all keys are available on all keyboards.

Please have only instance of this class running your application.
Blog Entries

- MBS Real Studio Plugins, version 11.2pr12
- MBS Real Studio Plugins, version 11.2pr11

- MBS Real Studio Plugins, version 11.2pr9

- MBS Real Studio Plugins, version 11.2pr9

128.1.2 Methods

128.1.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Initializes the key watcher.

128.1.4 startWatchingMediaKeys

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Starts watching for keys.
Example:

```
Var m as MediaKeysMBS // global property!

// app initialization
m = new MediaKeysMBS

m.Keys(MediaKeysMBS.kMediaKeyEject) = MediaKeysMBS.kModeEventAndBlock
m.startWatchingMediaKeys
```

128.1.5 stopWatchingMediaKeys

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Stops watching for keys.
Example:

```
Var m as MediaKeysMBS // global property

// when closing media window
m.stopWatchingMediaKeys
```

Notes: The destructor calls this for cleanup.

128.1.6 Properties

128.1.7 Keys(keyCode as Integer) as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Which keys should be intercepted and handled by your application.
Example:

```
Var m as new MediaKeysMBS // your MediaKeys object

// watch for this key
m.Keys(MediaKeysMBS.kMediaKeyEject) = MediaKeysMBS.kModeEventAndBlock
```

Notes: (Read and Write computed property)

128.1.8 Events

128.1.9 receivedMediaKeyEvent(e as NSEventMBS, keyCode as Integer, keyFlags as Integer, keyState as Integer, keyRepeat as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The event called when the user uses one of the special keys we listen for.
Notes: If you don't get the event, did you make sure all conditions are right?

- Requires Mac OS X 10.5
- Keys(x) set to kModeEventAndBlock or kModeEventAndPass for the keys you need?
- startWatchingMediaKeys called?
- your object is still alive in your application?

128.1.10 Constants

Key Constants

Constant	Value	Description
kMediaKeyBrightnessDown	3	
kMediaKeyBrightnessUp	2	
kMediaKeyCapsLock	4	Caps Lock
kMediaKeyContrastDown	12	
kMediaKeyContrastUp	11	
kMediaKeyDownArrow	9	
kMediaKeyEject	14	Eject key
kMediaKeyFast	19	Fast key. On by default.
kMediaKeyHelp	5	
kMediaKeyIlluminationDown	22	
kMediaKeyIlluminationToggle	23	
kMediaKeyIlluminationUp	21	
kMediaKeyLaunchPanel	13	
kMediaKeyMute	7	Sound Mute
kMediaKeyNext	17	
kMediaKeyNumLock	10	Num Lock key
kMediaKeyPlay	16	Play key. On by default.
kMediaKeyPower	6	Power Key
kMediaKeyPrevious	18	Previous key
kMediaKeyRewind	20	Rewind Key. On by default.
kMediaKeySoundDown	1	Sound down
kMediaKeySoundUp	0	Sound up
kMediaKeyUpArrow	8	
kMediaKeyVideoMirror	15	

Mode Constants

Constant	Value	Description
kModeBlock	1	Block the event.
kModeEventAndBlock	2	Call the receivedMediaKeyEvent event and block the event.
kModeEventAndPass	3	Call the receivedMediaKeyEvent event and pass the event to other applications.
kModePass	0	Pass event to other applications.

Chapter 129

MediaLibrary

129.1 class MLMediaGroupMBS

129.1.1 class MLMediaGroupMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The MLMediaGroup class provides groupings for media objects from a single source of media, such as iTunes or Aperture.
Example:

```
// list the albums of the Photos library through the media library
// Library is a property of the window: Library As MLMediaLibraryMBS
Library = New MLMediaLibraryMBS(Nil)
For Each entry As DictionaryEntry In Library.mediaSources
Var source As MLMediaSourceMBS = entry.Value
Var root As MLMediaGroupMBS = source.rootMediaGroup
If root = Nil Then Continue // loads in the background, try again later
For Each group As MLMediaGroupMBS In root.childGroups
System.DebugLog source.mediaSourceIdentifier + ": " + group.Name + " (" + group.mediaObjects.Count.ToString
+ " items)"
Next
Next
```

Notes: The media objects—individual files containing a piece of media such as a photo, song, or movie—are referenced by one or more groups within each media source. These groupings serve as filters, providing hierarchical structure to the collection of objects in each source.

The structure of the group hierarchy is specific to each media source, but all sources have certain commonalities. For example, every source has a single root media group, which contains all groups and objects within that source. It is the highest-level parent group in the hierarchy and each of its descendant groups contains

its own subgroups and their objects. All groups have a reference to their parent within the hierarchy. A group with no descendants contains only its own objects. If a media group does not contain any objects, it is not visible in the hierarchy.

A media group has an array of attributes which can change at any point. For example, a media group may have certain attributes that describe its objects, but these attributes appear only after the objects for that group have been loaded. When any media group attribute changes, observers are notified via KVO notification. For information about handling attributes that change, see Cocoa Bindings Programming Topics.

Every media group has a unique identifier as well as a type identifier. In certain cases, multiple groups within a source can have the same type identifier. For descriptions of group type identifiers, see MediaLibrary Constants.
All MLMediaGroup properties are read-only, so this information can be accessed but not altered.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 18.2pr1

129.1.2 Methods

129.1.3 childGroups as MLMediaGroupMBS()

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A list of child groups contained in the media group.

129.1.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

129.1.5 mediaObjects as MLMediaObjectMBS()

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A list of media objects in the media group.
Notes: This accessor property is nonblocking. If there is no data yet, it returns nil and automatically triggers an internal asynchronous request. A KVO notification will be sent via the main thread when data arrives.

129.1.6 MLApertureAllPhotosTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents all photos in Aperture.

129.1.7 MLApertureAllProjectsTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents all projects in Aperture.

129.1.8 MLApertureFacebookAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Facebook album that is visible in Aperture.

129.1.9 MLApertureFacebookGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Facebook user account in Aperture. A Facebook user account contains one or more Facebook albums.

129.1.10 MLApertureFacesAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Faces album in Aperture. Individual Faces albums are nested in the main Faces album.

129.1.11 MLApertureFlaggedTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents the album of flagged media in Aperture.

129.1.12 MLApertureFlickrAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Flickr album that is visible in Aperture.

129.1.13 MLApertureFlickrGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Flickr user account in Aperture. A Flickr user account contains one or more Flickr albums.

129.1.14 MLApertureFolderAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a folder in Aperture.

129.1.15 MLApertureLastImportAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents the last import album in Aperture.

129.1.16 MLApertureLastNMonthsAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents the recent content album in Aperture, known as the Last N Months album. The value for N is usually 12 (settable in Aperture >Preferences >General).

129.1.17 MLApertureLastViewedEventAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents the last viewed event in Aperture.

129.1.18 MLApertureLightTableTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a light table in Aperture.

129.1.19 MLAperturePhotoStreamAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a photo stream in Aperture.

129.1.20 MLAperturePlacesAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents the Places album in Aperture.

129.1.21 MLAperturePlacesCityAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Places album for a city in Aperture. A city album is nested in a province or state album.

129.1.22 MLAperturePlacesCountryAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Places album for a country in Aperture. A country album is nested in the main Places album.

129.1.23 MLAperturePlacesPointOfInterestAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Places album for a point-of-interest in Aperture. A point of interest album is nested in a city album.

129.1.24 MLAperturePlacesProvinceAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a Places album for a province or state in Aperture. A province or state album is nested in a country album.

129.1.25 MLApertureProjectAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a project in Aperture.

129.1.26 MLApertureProjectFolderAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a folder within a project in Aperture.

129.1.27 MLApertureRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The root media group for Aperture.

129.1.28 MLApertureSlideShowTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: The media group that represents a slideshow in Aperture.

129.1.29 MLApertureSmugMugAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a SmugMug album that is visible in Aperture.

129.1.30 MLApertureSmugMugGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a SmugMug user account in Aperture. A SmugMug user account contains one or more SmugMug albums.

129.1.31 MLApertureUserAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a user-created album in Aperture.

129.1.32 MLApertureUserSmartAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Aperture media source.
Notes: A media group that represents a user-created smart album in Aperture.

129.1.33 MLFinalCutEventCalendarGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Final Cut Pro media source.
Notes: A media group that represents a collection of events from a specific time period in Final Cut Pro.

129.1.34 MLFinalCutEventGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Final Cut Pro media source.
Notes: A media group that represents an event in Final Cut Pro.

129.1.35 MLFinalCutEventLibraryGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Final Cut Pro media source.
Notes: The media group that represents the event library in Final Cut Pro. The event library contains all event calendar groups.

129.1.36 MLFinalCutFolderGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Final Cut Pro media source.
Notes: A media group that represents a folder in Final Cut Pro.

129.1.37 MLFinalCutProjectGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Final Cut Pro media source.
Notes: A media group that represents a project in Final Cut Pro.

129.1.38 MLFinalCutRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Final Cut Pro media source.
Notes: The root media group for Final Cut Pro.

129.1.39 MLFolderGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in folder-based media sources.
Notes: A media group that represents a folder in folder-based media.

129.1.40 MLFolderRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in folder-based media sources.
Notes: The root media group for folder-based media.

129.1.41 MLGarageBandFolderGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the GarageBand media source.
Notes: A media group that represents a folder in GarageBand.

129.1.42 MLGarageBandRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the GarageBand media source.
Notes: The root media group for GarageBand.

129.1.43 MLiMovieEventCalendarGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iMovie media source.
Notes: A media group that represents a collection of events from a specific time period in iMovie.

129.1.44 MLiMovieEventGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iMovie media source.
Notes: A media group that represents an event in iMovie.

129.1.45 MLiMovieEventLibraryGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iMovie media source.
Notes: The media group that represents the event library in iMovie. The event library contains all event calendar groups.

129.1.46 MLiMovieFolderGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iMovie media source.
Notes: A media group that represents a folder in iMovie.

129.1.47 MLiMovieProjectGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iMovie media source.
Notes: A media group that represents a project in iMovie.

129.1.48 MLiMovieRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iMovie media source.
Notes: The root media group for iMovie.

129.1.49 MLiPhotoAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents an album in iPhoto.

129.1.50 MLiPhotoEventAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents an event in iPhoto.

129.1.51 MLiPhotoEventsFolderTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The media group that represents the Events album in iPhoto.

129.1.52 MLiPhotoFacebookAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Facebook album that is visible in iPhoto.

129.1.53 MLiPhotoFacebookGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Facebook user account in iPhoto. A Facebook user account contains one or more Facebook albums.

129.1.54 MLiPhotoFacesAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Faces album in iPhoto. Individual Faces albums are nested in the main Faces album.

129.1.55 MLiPhotoFlaggedAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The media group that represents the album of flagged media in iPhoto.

129.1.56 MLiPhotoFlickrAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Flickr album that is visible in iPhoto.

129.1.57 MLiPhotoFlickrGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Flickr user account in iPhoto. A Flickr user account contains one or more Flickr albums.

129.1.58 MLiPhotoFolderAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a folder in iPhoto.

129.1.59 MLiPhotoLastImportAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The media group that represents the Last Import album in iPhoto.

129.1.60 MLiPhotoLastNMonthsAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The media group that represents the recent content album in iPhoto, known as the Last N Months album. The value for N is usually 12 (settable in iPhoto >Preferences >General).

129.1.61 MLiPhotoLastViewedEventAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The media group that represents the last viewed event in iPhoto.

129.1.62 MLiPhotoLibraryAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The media group that represents the Photos album in iPhoto.

129.1.63 MLiPhotoPhotoStreamAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a photo stream in iPhoto.

129.1.64 MLiPhotoPlacesAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The media group that represents the Places album in iPhoto.

129.1.65 MLiPhotoPlacesCityAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Places album for a city in iPhoto. A city album is nested in a province or state album.

129.1.66 MLiPhotoPlacesCountryAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Places album for a country in iPhoto. A country album is nested in the main Places album.

129.1.67 MLiPhotoPlacesPointOfInterestAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Places album for a point-of-interest in iPhoto. A point of interest album is nested in a city album.

129.1.68 MLiPhotoPlacesProvinceAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a Places album for a province or state in iPhoto. A province or state album is nested in a country album.

129.1.69 MLiPhotoRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: The root media group for iPhoto.

129.1.70 MLiPhotoSlideShowAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a slideshow album in iPhoto.

129.1.71 MLiPhotoSmartAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a smart album in iPhoto.

129.1.72 MLiPhotoSubscribedAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iPhoto media source.
Notes: A media group that represents a subscribed album in iPhoto.

129.1.73 MLiTunesAudioBooksPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The media group that represents the Audio Books playlist in iTunes.

129.1.74 MLiTunesFolderPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: A media group that represents a folder in iTunes.

129.1.75 MLiTunesGeniusPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: A media group that represents a genius playlist in iTunes.

129.1.76 MLiTunesiTunesUPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The media group that represents the iTunes U playlist in iTunes.

129.1.77 MLiTunesMoviesPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The media group that represents the Movies playlist in iTunes.

129.1.78 MLiTunesMusicPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The media group that represents the Music playlist in iTunes.

129.1.79 MLiTunesMusicVideosPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Logic media source.
Notes: Musicvideos playlist

129.1.80 MLiTunesPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: A media group that represents a user-created playlist in iTunes.

129.1.81 MLiTunesPodcastPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The media group that represents the Podcast playlist in iTunes.

129.1.82 MLiTunesPurchasedPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The media group that represents the Purchased playlist in iTunes.

129.1.83 MLiTunesRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The root media group for iTunes.

129.1.84 MLiTunesSavedGeniusPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: A media group that represents a saved genius playlist in iTunes.

129.1.85 MLiTunesSmartPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: A media group that represents a smart playlist in iTunes.

129.1.86 MLiTunesTVShowsPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the iTunes media source.
Notes: The media group that represents the TV Shows playlist in iTunes.

129.1.87 MLiTunesVideoPlaylistTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Logic media source.
Notes: Video Playlist

129.1.88 MLLogicBouncesGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Logic media source.
Notes: The media group that represents all bounces in Logic.

129.1.89 MLLogicProjectsGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Logic media source.
Notes: The media group that represents all projects in Logic.

129.1.90 MLLogicProjectTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Logic media source.
Notes: A media group that represents a project in Logic. Projects may be nested.

129.1.91 MLLogicRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Logic media source.
Notes: The root media group for Logic.

129.1.92 MLPhotosAlbumsGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.93 MLPhotosAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.
Notes: A media group that represents an album in Photos.

129.1.94 MLPhotosAllCollectionsGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.95 MLPhotosAllMomentsGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.96 MLPhotosAllPhotosAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.97 MLPhotosAllYearsGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.98 MLPhotosAnimatedGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.99 MLPhotosBurstGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.100 MLPhotosCollectionGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.101 MLPhotosDepthEffectGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.102 MLPhotosFacesAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.103 MLPhotosFavoritesGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.104 MLPhotosFolderTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.105 MLPhotosFrontCameraGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.106 MLPhotosLastImportGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.107 MLPhotosLivePhotosGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.108 MLPhotosLongExposureGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.109 MLPhotosMomentGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.110 MLPhotosMyPhotoStreamTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.111 MLPhotosPanoramasGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.112 MLPhotosPublishedAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.113 MLPhotosRootGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.
Notes: The root media group for Photos.

129.1.114 MLPhotosScreenshotGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.115 MLPhotosSharedGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.116 MLPhotosSharedPhotoStreamTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.117 MLPhotosSloMoGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.118 MLPhotosSmartAlbumTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.
Notes: A media group that represents a smart album in Photos.

129.1.119 MLPhotosTimelapseGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.120 MLPhotosVideosGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.121 MLPhotosYearGroupTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for media group types in the Photos media source.

129.1.122 Properties

129.1.123 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Internet object reference.
Notes: (Read and Write property)

129.1.124 IconImage as NSImageMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The media group,Äôs icon.
Notes: (Read only property)

129.1.125 Identifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: An identifier for the media group.
Notes: Each group,Äôs identifier is unique within a media source.
(Read only property)

129.1.126 MediaLibrary as MLMediaLibraryMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A pointer to the media library instance that loaded the media group,Äôs source.
Notes: (Read only property)

129.1.127 MediaSourceIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: An identifier for the source that loaded the media group.
Notes: (Read only property)

129.1.128 ModificationDate as Date

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time when the media group was last altered.
Notes: (Read only property)

129.1.129 ModificationDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time when the media group was last altered.
Notes: (Read only property)

129.1.130 Name as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the media group.
Notes: This string is human-readable. It is either user created (such as the name of an iTunes playlist) or already localized.
(Read only property)

129.1.131 Parent as MLMediaGroupMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The media group,Äôs parent group.
Notes: (Read only property)

129.1.132 Properties as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A dictionary of attributes describing the media group.
Notes: These attributes are usually defined by the source app, such as iTunes. For example, an iTunes playlist is represented as a group. iTunes attaches attributes such as "Playlist Persistent ID" to the group in its attributes. The attribute names vary based on the media source. Attributes common to all sources are called out as separate properties.
(Read only property)

129.1.133 TypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: An identifier for the media group,Äôs type.
Notes: Multiple groups within a media source can have the same type identifier. For descriptions of group type identifiers, see MediaLibrary Constants.
(Read only property)

129.1.134 URL as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The location of the media group.
Notes: Some groups do not have a URL, in which case this returns nil. For example, a group that represents a filesystem folder on disk has a URL, but a group that represents a named face in iPhoto does not.
(Read only property)

129.2 class MLMediaLibraryMBS

129.2.1 class MLMediaLibraryMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The MLMediaLibrary class provides an interface for accessing a collection of media objects from various sources.
Notes: It serves as the initial access point of the Media Library framework.

The media library structure is defined by MLMediaSource, MLMediaGroup, and MLMediaObject classes. At the highest level, all content within a media library instance is categorized by media source. Conceptually, a media source represents a single app, such as iTunes or Aperture. Each source contains a hierarchy of media groups that originates from a root group. These groups consist of media objects—individual files containing a piece of media such as a photo, song, or movie. Only one copy of each object exists within a media library instance, but an object can be referenced by multiple groups from a single source. The structure of the group hierarchy is specific to each media source.

A media library is initialized using the Constructor. The options argument to this method serves as a filter. By specifying which folders or sources to include or exclude during load, you can view a particular subset of groups and objects from your collection. All objects provided are thread-safe. For descriptions of possible load options, see Load Options Keys.
The typical and most efficient use case is to create and use one instance of MLMediaLibrary for the lifetime of an app. When the underlying media files and metadata on the user,Äôs system change, the corresponding data model objects (media groups and media objects) are automatically updated and KVO notifications are sent to notify the calling code of any changes. Multiple instances of MLMediaLibrary can be created and used, but their sources, groups, and objects will be independent of those provided by other instances of MLMediaLibrary.

- MBS Xojo Plugins, version 18.2pr1

129.2.2 Methods

129.2.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether this class available.
Notes: Returns true on Mac OS 10.7 or newer in 64-bit app.

129.2.4 Constructor(options as Dictionary)

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes the media library based on the specified load options.
Notes: options: A dictionary of load options.

Returns a new media library.

For descriptions of possible load options, see Load Options Keys.

129.2.5 MLMediaLoadAppFoldersKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the option keys.
Notes: Specifies one or more relative paths inside the caller,Äôs app bundle in which to search for media files. The value for this key is an array of strings (relative paths inside the caller,Äôs app bundle).

129.2.6 MLMediaLoadAppleLoops as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for well-known media folders used to specify the value for MLMediaLoadFoldersKey.
Notes: Identifies the folder containing audio loops from Apple.

129.2.7 MLMediaLoadExcludeSourcesKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the option keys.
Notes: Defines which media sources to exclude when loading. This option is processed after MLMediaLoadIncludeSourcesKey. The value for this key is an array of strings (media source identifiers). For a list of valid media source identifiers, see Media Source Identifiers.

129.2.8 MLMediaLoadFoldersKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the option keys.
Notes: Specifies the well-known folders that should be searched for media files. If this key is not present, none of the well-known folders will be provided. The value for this key is an array of strings (identifiers that correspond to well-known folder locations). For a list of well-known folder identifiers, see MLMediaLoadMoviesFolder and MLMediaLoadAppleLoops.

129.2.9 MLMediaLoadIncludeSourcesKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the option keys.
Notes: Defines which media sources to include when loading. If not present, load all available media sources. This option is processed after MLMediaLoadSourceTypesKey. If MLMediaLoadIncludeSourcesKey is present but MLMediaLoadSourceTypesKey is not, then only those sources specified here will be loaded. This is useful for loading a single media source. When both keys are present, this is useful for adding one or more media sources that normally would not appear for the requested library type. The value for this key is an array of strings (media source identifiers). For a list of valid media source identifiers, see Media Source Identifiers.

129.2.10 MLMediaLoadMoviesFolder as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the identifiers for well-known media folders used to specify the value for MLMediaLoadFoldersKey.
Notes: Identifies the user,Äôs Movies folder.

129.2.11 MLMediaLoadSourceTypesKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the option keys.
Notes: Defines which sources to load based on library type. If not present, this will load all sources. The value for this key is a media source type.

129.2.12 Properties

129.2.13 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Internet object reference.
Notes: (Read and Write property)

129.2.14 mediaSources as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a dictionary of media sources by identifier.
Notes: Returns nil the first time, beginning an asynchronous load of the media sources. A KVO notification is sent when all media sources have been loaded. If there are no objects in a media source, the source does not appear in this dictionary.
(Read only property)

129.3 class MLMediaObjectMBS

129.3.1 class MLMediaObjectMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The MLMediaObject class describes a single media file, such as a photo, song, or movie.
Example:

```
// list the files in a media library group
// group is an MLMediaGroupMBS, see there
Var group As MLMediaGroupMBS // your group
If group = Nil Then Return

For Each o As MLMediaObjectMBS In group.mediaObjects
Var kind As String = "other"
If o.MediaType = MLMediaObjectMBS.kTypeImage Then kind = "image"
If o.MediaType = MLMediaObjectMBS.kTypeMovie Then kind = "movie"
System.DebugLog o.Name + " (" + kind + ", " + o.FileSize.ToString + " bytes): " + o.URL
Next
```

Notes: Each media object contains basic metadata including a name, media type, URL, and so on. Additional information about each object is stored in its list of attributes. For a list of possible object attribute keys, see Media Object Attribute Keys.

A media object belongs to a single media source but can be referenced by several groups within that source. In other words, an object can appear in multiple places in the group hierarchy under a single media source. In iTunes, a movie that was purchased through the iTunes Store is referenced by both the Purchased playlist and the Movies playlist. If a user adds the movie to his own playlist, the group respresenting that playlist will also reference the movie. All three groups reference the same media object.

All MLMediaObject properties are read-only, so this information can be accessed but not altered.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 18.2pr1

129.3.2 Methods

129.3.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

129.3.4 MLMediaObjectAlbumKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys for a media object.
Notes: Specifies the media object,Äôs album. The value for this key is a string.

129.3.5 MLMediaObjectArtistKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys for a media object.
Notes: Specifies the media object,Äôs artist. The value for this key is a string.

129.3.6 MLMediaObjectBitRateKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys for a media object.
Notes: Specifies the media object,Äôs bit rate, in kilobits per second. The value for this key is a number.

129.3.7 MLMediaObjectChannelCountKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys for a media object.
Notes: Specifies the media object,Äôs channel count. The value for this key is a number.

129.3.8 MLMediaObjectCommentsKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys for a media object.
Notes: Specifies the contents of the comments field associated with the media object. The value for this key is a string.

129.3.9 MLMediaObjectDurationKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys for a media object.
Notes: Specifies the media object,Äôs duration, in seconds. The value for this key is a number.

129.3.10 MLMediaObjectGenreKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys for a media object.
Notes: Specifies the media object,Äôs genre. The value for this key is a string.

129.3.11 MLMediaObjectKeywordsKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys for a media object.
Notes: Specifies the keywords associated with the media object. The value for this key is an array of strings.

129.3.12 MLMediaObjectKindKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys for a media object.
Notes: Used by iTunes only. Specifies the media object,Äôs file format (shown in the ,ÄúKind,Äù column in iTunes). The value for this key is a string.

129.3.13 MLMediaObjectProtectedKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys for a media object.
Notes: Specifies whether the media object is protected by DRM (Digital Rights Management). The value for this key is a boolean value.

129.3.14 MLMediaObjectResolutionStringKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys for a media object.
Notes: Specifies the media object,Äôs resolution. The value for this key is a string with size.

129.3.15 MLMediaObjectSampleRateKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys for a media object.
Notes: Specifies the media object,Äôs sample rate, in samples per second (Hz). The value for this key is a number.

129.3.16 MLMediaObjectTrackNumberKey as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys for a media object.
Notes: Specifies the media object,Äôs track number. The value for this key is a number.

129.3.17 Properties

129.3.18 ArtworkImage as NSImageMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Album artwork associated with the media object.
Notes: Applies to iTunes media only. Returns nil if not applicable or not available.
(Read only property)

129.3.19 ContentType as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The UTI associated with the media object.
Notes: (Read only property)

129.3.20 File as FolderItem

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The location of the media object.
Notes: For your convenience, the plugin provides here a folderitem for the URL.
(Read only property)

129.3.21 FileSize as UInt64

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The size, in bytes, of the media object.
Notes: (Read only property)

129.3.22 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Internet object reference.
Notes: (Read and Write property)

129.3.23 Identifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: An identifier for the media object.
Notes: Each object,Äôs identifier is unique within a media source.
(Read only property)

129.3.24 MediaLibrary as MLMediaLibraryMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A pointer to the media library instance that loaded the media object,Äôs source.
Notes: (Read only property)

129.3.25 MediaSourceIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: An identifier for the source that loaded the media object.
Notes: For a list of possible media source identifiers, see MLMediaLibraryMBS.
(Read only property)

129.3.26 MediaType as Integer

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The media object,Äôs type of media (image, audio, or movie).
Notes: For a list of possible media types, see kType* constants.
(Read only property)

129.3.27 ModificationDate as Date

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time when the media object was last altered.
Notes: (Read only property)

129.3.28 ModificationDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time when the media object was last altered.
Notes: (Read only property)

129.3.29 Name as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the media object.
Notes: (Read only property)

129.3.30 OriginalFile as FolderItem

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The location of the original media object, if URL is not the original (master).
Notes: For your convenience, the plugin provides here a folderitem for the URL.
(Read only property)

129.3.31 OriginalURL as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The location of the original media object, if URL is not the original (master).
Notes: This property is provided as a security-scoped URL. In order to gain access to the file that this

URL refers to, the caller must call startAccessingSecurityScopedResource before and stopAccessingSecurityScopedResource after using the URL to access the file. For more information about security-scoped URLs, see NSURL.
(Read only property)

129.3.32 Properties as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A dictionary of attributes describing the media object.
Notes: For a list of possible object attribute keys, see Media Object Attribute Keys.
(Read only property)

129.3.33 ThumbnailFile as FolderItem

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The location of the media object,Äôs thumbnail image.
Notes: For your convenience, the plugin provides here a folderitem for the URL.
(Read only property)

129.3.34 ThumbnailURL as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The location of the media object,Äôs thumbnail image.
Notes: This property is provided as a security-scoped URL. In order to gain access to the file that this URL refers to, the caller must call startAccessingSecurityScopedResource before and stopAccessingSecurityScopedResource after using the URL to access the file. For more information about security-scoped URLs, see NSURL.
(Read only property)

129.3.35 URL as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The location of the media object.
Notes: This property is provided as a security-scoped URL. In order to gain access to the file that this URL refers to, the caller must call startAccessingSecurityScopedResource before and stopAccessingSecurityScopedResource after using the URL to access the file. For more information about security-scoped URLs, see NSURL.

(Read only property)

129.3.36 Constants

Types

Constant	Value	Description
kTypeAudio	1	Audio
kTypeImage	2	Image
kTypeMovie	4	Movie

129.4 class MLMediaSourceMBS

129.4.1 class MLMediaSourceMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The MLMediaSource class identifies a specific provider of media.
Example:

```
// list the media sources the media library knows, e.g. Photos and Music
// Library is a property of the window: Library As MLMediaLibraryMBS
Library = New MLMediaLibraryMBS(Nil)
For Each entry As DictionaryEntry In Library.mediaSources
Var source As MLMediaSourceMBS = entry.Value
Var kind As String = source.mediaSourceIdentifier
If kind = MLMediaSourceMBS.MLMediaSourcePhotosIdentifier Then kind = "Photos"
System.DebugLog entry.Key.StringValue + ": " + kind
Next
```

Notes: Conceptually, a media source respresents a single app, such as iTunes or Aperture. Each media source contains multiple groups of media objects—individual files containing a piece of media such as a photo, song, or movie.

The structure of the group hierarchy is specific to each media source, but all sources have certain commonalities. For example, every source has a single root media group, which contains all groups and objects within that source. It is the highest-level parent group in the hierarchy and each of its descendant groups contains its own subgroups and their objects. All groups have a reference to their parent within the hierarchy. A group with no descendants contains only its own objects. If a media group does not contain any objects, it is not visible in the hierarchy.
Every media source has a unique media source identifier within a single media library instance. For a list of possible media source identifiers, see Media Source Identifiers.
All MLMediaSourceMBS properties are read-only, so this information can be accessed but not altered.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 18.2pr1

129.4.2 Methods

129.4.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

129.4.4 mediaGroupForIdentifier(mediaGroupIdentifier as string) as MLMediaGroupMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the media group with the specified identifier.
Notes: mediaGroupIdentifier: The media group identifier to search for in the source.

The media source must have finished loading before this method returns valid data. Specifically, the root media group must be available before the lookup methods will succeed. Otherwise, the return value is undefined.

129.4.5 mediaGroupsForIdentifiers(mediaGroupIdentifiers() as string) as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the media groups with the specified identifiers.
Notes: mediaGroupIdentifiers: An array of media group identifiers to search for in the source.

Returns a dictionary of media groups matching the specified identifiers.

The media source must have finished loading before this method returns valid data. Specifically, the root media group must be available before the lookup methods will succeed. Otherwise, the return value is undefined.

129.4.6 mediaObjectForIdentifier(mediaObjectIdentifier as string) as MLMediaObjectMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the media object with the specified identifier.
Notes: mediaObjectIdentifier: The media object identifier to search for in the media source.

The media source must have finished loading before this method returns valid data. Specifically, the root media group must be available before the lookup methods will succeed. Otherwise, the return value is undefined.

129.4.7 mediaObjectsForIdentifiers(mediaObjectIdentifiers() as string) as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the media objects with the specified identifiers.
Notes: mediaObjectIdentifiers: An array of media object identifiers to search for in the source.

Returns a dictionary of media objects matching the specified identifiers.

The media source must have finished loading before this method returns valid data. Specifically, the root media group must be available before the lookup methods will succeed. Otherwise, the return value is undefined.

129.4.8 MLMediaSourceApertureIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The identifier for the media source providing content from Aperture.

129.4.9 MLMediaSourceAppDefinedFoldersIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The identifier for the media source providing content from app defined folder.

129.4.10 MLMediaSourceCustomFoldersIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The identifier for the media source providing content from a custom folder.

129.4.11 MLMediaSourceFinalCutIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The identifier for the media source providing content from Final Cut Pro.

129.4.12 MLMediaSourceGarageBandIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The identifier for the media source providing content from GarageBand.

129.4.13 MLMediaSourceiMovieIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The identifier for the media source providing content from iMovie.

129.4.14 MLMediaSourceiPhotoIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The identifier for the media source providing content from iPhoto.

129.4.15 MLMediaSourceiTunesIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The identifier for the media source providing content from iTunes.

129.4.16 MLMediaSourceLogicIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The identifier for the media source providing content from Logic.

129.4.17 MLMediaSourceMoviesFolderIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The identifier for the media source providing content from movies folder.

129.4.18 MLMediaSourcePhotoBoothIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The identifier for the media source providing content from Photo Booth.

129.4.19 MLMediaSourcePhotosIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The identifier for the media source providing content from photos folder.

129.4.20 Properties

129.4.21 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Internet object reference.
Notes: (Read and Write property)

129.4.22 MediaLibrary as MLMediaLibraryMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A pointer to the media library instance that loaded this media source.
Notes: (Read only property)

129.4.23 mediaSourceIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A unique identifier for the media source.
Notes: For a list of possible media source identifiers, see shared methods.
(Read only property)

129.4.24 Properties as Dictionary

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A list of attributes describing the media source.
Notes: (Read only property)

129.4.25 rootMediaGroup as MLMediaGroupMBS

MBS Mac64bit Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The base media group in the media source that contains all other groups within the source as descendant elements.
Notes: This accessor property is nonblocking. If there is no data yet, it returns nil and automatically triggers an internal asynchronous request. When data arrives, a KVO notification is sent via the main thread. (Read only property)

129.4.26 Constants

Source Types

Constant	Value	Description
kSourceTypeAudio	1	Audio
kSourceTypeImage	2	Images
kSourceTypeMovie	4	Movies

129.5 class NSMediaLibraryBrowserControllerMBS

129.5.1 class NSMediaLibraryBrowserControllerMBS

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: An instance of an NSMediaLibraryBrowserController configures and displays a Media Library Browser Panel.
Example:

```
// show the media browser panel with photos and movies, so the user can drag them into the app
Var browser As NSMediaLibraryBrowserControllerMBS = NSMediaLibraryBrowserControllerMBS.shared-
MediaLibraryBrowserController
browser.mediaLibraries = NSMediaLibraryBrowserControllerMBS.NSMediaLibraryImage + NSMediaLibrary-
BrowserControllerMBS.NSMediaLibraryMovie
browser.Visible = True
```

Notes: A User can drag and drop media files from the Media Library Browser into views in their application. Requires Mac OS X 10.9.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.5pr1

129.5.2 Methods

129.5.3 available as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9 and false on other platforms.

129.5.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Creates a new object for the shared library browser.

129.5.5 orderFront

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Orders window to front.

129.5.6 orderOut

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Orders window out.
Notes: Hides window.

129.5.7 sharedMediaLibraryBrowserController as NSMediaLibraryBrowserControllerMBS

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Returns a new object for the shared library browser.

129.5.8 togglePanel

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Toggles the panel to hide/show.

129.5.9 Properties

129.5.10 Frame as NSRectMBS

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The bounds of the panel.
Notes: (Read and Write property)

129.5.11 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

129.5.12 mediaLibraries as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Which media library to show: audio, video or image.
Notes: (Read and Write property)

129.5.13 Visible as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The visible state of the browser panel.
Notes: (Read and Write property)

129.5.14 Constants

Library Types

Constant	Value	Description
NSMediaLibraryAudio	1	Audio
NSMediaLibraryImage	2	Image
NSMediaLibraryMovie	4	Movie

Chapter 130

MediaPlayer

130.1 class MPMediaItemArtworkMBS

130.1.1 class MPMediaItemArtworkMBS

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: A graphical image, such as music album cover art, associated with a media item.
Blog Entries

- News from the MBS Xojo Plugins Version 25.0
- MonkeyBread Software Releases the MBS Xojo Plugins in version 25.0
- MBS Xojo Plugins, version 24.6pr3

130.1.2 Methods

130.1.3 Constructor(Pic as Picture)

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: Creates a new image from existing artwork with the specified bounds.

130.1.4 Properties

130.1.5 Handle as Integer

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

130.1.6 Height as Integer

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: The maximum size, in points, of the image associated with the media item artwork.
Notes: (Read only property)

130.1.7 Width as Integer

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: The maximum size, in points, of the image associated with the media item artwork.
Notes: (Read only property)

130.2 class MPNowPlayingInfoCenterMBS

130.2.1 class MPNowPlayingInfoCenterMBS

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: An object for setting the Now Playing information for media that your app plays.
Example:

```
// show what your app is playing in the Now Playing widget of macOS
Var info As New Dictionary
info.Value(MPNowPlayingInfoCenterMBS.MediaItemPropertyTitle) = "My Song"
info.Value(MPNowPlayingInfoCenterMBS.MediaItemPropertyArtist) = "My Band"
info.Value(MPNowPlayingInfoCenterMBS.MediaItemPropertyPlaybackDuration) = 215.0
info.Value(MPNowPlayingInfoCenterMBS.NowPlayingInfoPropertyElapsedPlaybackTime) = 0.0

Var center As MPNowPlayingInfoCenterMBS = MPNowPlayingInfoCenterMBS.defaultCenter
center.nowPlayingInfo = info
center.playbackState = MPNowPlayingInfoCenterMBS.PlaybackStatePlaying
```

Notes: If your app also provides Now Playing information containing information about the current track, use this object to update that information at appropriate times. This object contains a nowPlayingInfo dictionary describing the playing item.

Your application may need com.apple.mediaremote.set-playback-state entitlement to use the nowPlayingInfo property.
Blog Entries

- News from the MBS Xojo Plugins Version 25.0
- MonkeyBread Software Releases the MBS Xojo Plugins in version 25.0
- MBS Xojo Plugins, version 24.6pr3

130.2.2 Methods

130.2.3 Constructor

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: The constructor.
Notes: Sets the singleton Now Playing info center.

130.2.4 defaultCenter as MPNowPlayingInfoCenterMBS

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: Returns the singleton Now Playing info center.
Notes: The default now playing info center holds Now Playing information for the app that,Äôs designated to receive remote control events.

130.2.5 MediaItemPropertyAlbumTitle as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the media property keys.
Notes: The title of an album.
This value property contains the album title, such as ,ÄúLive On Mars,Äù, as opposed to the title of an individual song on the album, such as ,ÄúCrater Dance (radio edit),Äù (which you specify using the MP-MediaItemPropertyTitle property). Value is a string.

130.2.6 MediaItemPropertyAlbumTrackCount as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the media property keys.
Notes: The number of tracks for the album that contains the media item.
This value is an UInteger. For an audio streaming app, the system provides a default value of 1 for this property.

130.2.7 MediaItemPropertyAlbumTrackNumber as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the media property keys.
Notes: The track number of the media item, for a media item that is part of an album.
This value is an UInteger.

130.2.8 MediaItemPropertyArtist as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the media property keys.
Notes: The performing artists for a media item —which may vary from the primary artist for the album

that a media item belongs to.

For example, if the album artist is ‚ÄúJoseph Fable,,Äù the artist for one of the songs in the album may be ‚ÄúJoseph Fable featuring Thomas Smithson,Äù. Value is a string.

130.2.9 MediaItemPropertyArtwork as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the media property keys.
Notes: The artwork image for the media item.
This value is a media item image, described in MPMediaItemArtworkMBS.

130.2.10 MediaItemPropertyComposer as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the media property keys.
Notes: The musical composer for the media item.
This value is a string.

130.2.11 MediaItemPropertyDiscCount as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the media property keys.
Notes: The number of discs for the album that contains the media item.
This value is an UInteger.

130.2.12 MediaItemPropertyDiscNumber as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the media property keys.
Notes: The disc number of the media item, for a media item that is part of a multidisc album.
This value is an UInteger.

130.2.13 MediaItemPropertyGenre as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the media property keys.
Notes: The music or film genre of the media item.
This value is a string.

130.2.14 MediaItemPropertyMediaType as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the media property keys.
Notes: The media type of the media item.
This value is an Integer. The integer value represents a bit field flag, or set of flags, from MPMediaType.

130.2.15 MediaItemPropertyPersistentID as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the media property keys.
Notes: The key for the persistent identifier for the media item.

The corresponding value is a number that contains a MPMediaEntityPersistentID. The value of the MP-MediaItemPropertyPersistentID identifier persists across application launches and across syncs that do not change the sync status of the media item. The value is not guaranteed to persist across a sync/unsync/sync cycle.

130.2.16 MediaItemPropertyPlaybackDuration as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the media property keys.
Notes: The duration. Value is a double.

130.2.17 MediaItemPropertyTitle as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the media property keys.
Notes: The title or name of the media item.

This property is unrelated to the MPMediaItemPropertyAlbumTitle property. Value is a string.

130.2.18 NowPlayingInfoCollectionIdentifier as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: An identifier that represents the collection to which the now playing item belongs. This can refer to an artist, album, playlist, etc. This can be used to ask the now playing app to resume playback of the collection.

130.2.19 NowPlayingInfoPropertyAdTimeRanges as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: A list of ad breaks in the now playing item.

130.2.20 NowPlayingInfoPropertyAssetURL as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: A URL pointing to the now playing item's underlying audio/video asset. This property is used by system UI when video thumbnails or audio waveform visualizations are applicable.

130.2.21 NowPlayingInfoPropertyAvailableLanguageOptions as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: A list of available language option groups in the now playing item Only one language option in a given group can be played at once.

130.2.22 NowPlayingInfoPropertyChapterCount as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: The total number of chapters in the now playing item.

130.2.23 NowPlayingInfoPropertyChapterNumber as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: The chapter currently being played. Note that this is zero-based.

130.2.24 NowPlayingInfoPropertyCreditsStartTime as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: Represents the credits start time (without ads) in seconds for the now playing item.
A replacement for MPNowPlayingInfoPropertyPlaybackProgress.

130.2.25 NowPlayingInfoPropertyCurrentLanguageOptions as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: A list of currently active language options in the now playing item.

130.2.26 NowPlayingInfoPropertyCurrentPlaybackDate as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: Represents the real-time date associated with the current elapsed playback time.

The value of an AVPlayerItem,Äôs currentDate property can be used to populate this property (see AVFoundation framework.) Note the current playback date will be automatically extrapolated from the previously provided current playback date, so updating this property frequently is not required (nor recommended.) For example, a sports broadcast can map an elapsed playback time (i.e 12 minutes and 30 seconds) to a real-time date (i.e "10:30:00 9/14/2017")

130.2.27 NowPlayingInfoPropertyDefaultPlaybackRate as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: The "default" playback rate of the now playing item. You should set this property if your app is playing a media item at a rate other than 1.0 in a default playback state. e.g., if you are playing back content at a rate of 2.0 and your playback state is not fast-forwarding, then the default playback rate should also be 2.0. Conversely, if you are playing back content at a normal rate (1.0) but the user is fast-forwarding your content at a rate greater than 1.0, then the default playback rate should be set to 1.0.

130.2.28 NowPlayingInfoPropertyElapsedPlaybackTime as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: The elapsed time of the now playing item, in seconds.
Note the elapsed time will be automatically extrapolated from the previously provided elapsed time and playback rate, so updating this property frequently is not required (or recommended.)

130.2.29 NowPlayingInfoPropertyExcludeFromSuggestions as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: A boolean denoting whether the now playing item should be excluded from content suggestions.

130.2.30 NowPlayingInfoPropertyExternalContentIdentifier as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: An opaque identifier that uniquely represents the now playing item, even across app relaunches. This can be in any format and is only used to reference this item back to the now playing app.

130.2.31 NowPlayingInfoPropertyExternalUserProfileIdentifier as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: An optional opaque identifier that uniquely represents the profile that the now playing item is being played from, even across app relauches. This can be in any format and is only used to reference this profile back to the now playing app.

130.2.32 NowPlayingInfoPropertyInternationalStandardRecordingCode as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: Represents the International Standard Recording Code (ISRC) for a song, if available. This will be used by system services that leverage now playing data, such as Music Haptics.

130.2.33 NowPlayingInfoPropertyIsLiveStream as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: A boolean denoting whether the now playing item is a live stream.

130.2.34 NowPlayingInfoPropertyMediaType as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: Indicates the media type of the now playing item This can be used to determine what kind of user interface the system displays.

130.2.35 NowPlayingInfoPropertyPlaybackProgress as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: Represents the current playback progress of the now playing item. 0.0 = not watched/listened/viewed, 1.0 = fully watched/listened/viewed This value is different that ElapsedPlaybackTime and does not need to be exact as it is used as a high level indicator as to how far along the user is. For example, a movie may wish to set the now playing item as fully watched when the credits begin to roll.

130.2.36 NowPlayingInfoPropertyPlaybackQueueCount as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: The total number of items in the application's playback queue.

130.2.37 NowPlayingInfoPropertyPlaybackQueueIndex as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: The index of the now playing item in the application's playback queue. Note that the queue uses zero-based indexing, so the index of the first item would be 0 if the item should be displayed as "item 1 of 10".

130.2.38 NowPlayingInfoPropertyPlaybackRate as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: The playback rate of the now playing item, with 1.0 representing normal playback. For example, 2.0 would represent playback at twice the normal rate.
If not specified, assumed to be 1.0.

130.2.39 NowPlayingInfoPropertyServiceIdentifier as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: One of the dictionary keys for now playing.
Notes: A unique string that identifies a service provider. If the now playing item belongs to a channel or subscription service, this key can be used to coordinate various types of now playing content from a particular service provider.

130.2.40 Properties

130.2.41 Handle as Integer

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

130.2.42 nowPlayingInfo as Dictionary

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: The current Now Playing information for the default Now Playing info center.
Notes: To clear the now playing info center dictionary, set it to nil.

(Read and Write property)

130.2.43 playbackState as Integer

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: The current playback state of the app.
Notes: This property only applies to macOS. You must set this property every time the app begins or halts playback, otherwise remote control functionality may not work as expected.
(Read and Write property)

130.2.44 Constants

Media Types

Constant	Value	Description
MediaTypeAudio	1	The now playing media item is an audio item.
MediaTypeNone	0	There is no now playing media item.
MediaTypeVideo	2	The now playing media item is a video item.

Playback states

Constant	Value	Description
PlaybackStateInterrupted	4	The app has been interrupted during playback.
PlaybackStatePaused	2	The app is currently paused.
PlaybackStatePlaying	1	The app is currently playing a media item.
PlaybackStateStopped	3	The app has stopped playing.
PlaybackStateUnknown	0	The current state of the app is unknown.

Chapter 131

MemoryBlock

131.1 Globals

131.1.1 NewMemoryBlockWithBytesMBS(Data as Ptr, size as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new memoryblock with a copy of the given data.
Example:

```
// copy bytes from a pointer into a new MemoryBlock, e.g. from a declare result
Var source As New MemoryBlock(5)
source.StringValue(0, 5) = "Hello"
Var p As Ptr = source // pointer to the bytes
Var copy As MemoryBlock = NewMemoryBlockWithBytesMBS(p, 5)
MessageBox copy.StringValue(0, 5)
```

131.1.2 NewMemoryBlockFromPtrMBS(ptr as Integer) as memoryblock

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a memoryblock for a given address in memory.
Notes: The memory for the ptr is not freed as you have to do this yourself (or via the library that allocated it).

131.1.3 Memoryblock2ptrMBS(mem as memoryblock) as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the memory address of the memoryblock

131.1.4 ptr2MemoryblockMBS(Value as Integer) as memoryblock

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a memoryblock with the bytes at position mem in memory.

131.2 class Memoryblock

131.2.1 class Memoryblock

Platforms: macOS, Linux, Windows, Targets: All.

Function: Extends Xojo's Memoryblock class.
Example:

```
// some of the MemoryBlock extensions from the plugin
Var m As New MemoryBlock(16)
m.FillBytesMBS(0, 16, &hFF)
m.StringValue(0, 5) = "Hello"

Var crc As UInt32 = m.CRC_32MBS(0, m.Size)
Var pos As Integer = m.FindStringMBS(0, m.Size, "llo")
m.SetBitMBS(100, False) // bit 4 of byte 12

MessageBox "CRC32: " + Hex(crc) + EndOfLine + _
"Found at: " + pos.ToString + EndOfLine + _
"Bit 100 set: " + m.IsBitSetMBS(100).ToString
```

131.2.2 Methods

131.2.3 AddressMBS(offset as Int64 = 0) as UInt64

MBS Util Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the address of the byte at offset inside the memoryblock.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr5

Xojo Developer Magazine

- 11.3, page 8: News

131.2.4 AddressPtrMBS(offset as Int64 = 0) as Ptr

MBS Util Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the address of the byte at offset inside the memoryblock.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr5

131.2.5 AndBitsMBS(Second as memoryblock, Dest as memoryblock=nil) as memoryblock

MBS Util Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a And on the bits in the memoryblock.
Example:

```
Var m1 as MemoryBlock = NewMemoryBlock(20)
Var m2 as MemoryBlock = NewMemoryBlock(20)
Var m3 as MemoryBlock = NewMemoryBlock(20)

m1.Int32Value(0)=&b10000001
m2.Int32Value(0)=&b10000000

MessageBox bin(m1.Int32Value(0))+EndOfLine+bin(m2.Int32Value(0))+EndOfLine+bin(m3.Int32Value(0))

call m1.AndBitsMBS(m2,m3)

MessageBox bin(m1.Int32Value(0))+EndOfLine+bin(m2.Int32Value(0))+EndOfLine+bin(m3.Int32Value(0))
```

Notes: Dest is first and second memoryblock combine with a bitwiseand.
And first and second memoryblock are filled with the difference between them.

If dest is nil, a new memoryblock is created. You can speed up processing with reusing the same memoryblock in iterations. If you pass a memoryblock, the plugin does not check the size of the memoryblock.

Returns nil on any error. For example if source is a memoryblock without a known size.
See also:

- 131.2.6 AndBitsMBS(Second as memoryblock, Mask as Integer, Dest as memoryblock=nil) as memoryblock 18258

131.2.6 AndBitsMBS(Second as memoryblock, Mask as Integer, Dest as memoryblock=nil) as memoryblock

MBS Util Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a And on the bits in the memoryblock.
Example:

```
Var m1 as MemoryBlock = NewMemoryBlock(20)
Var m2 as MemoryBlock = NewMemoryBlock(20)
Var m3 as MemoryBlock = NewMemoryBlock(20)

m1.Int32Value(0)=&b11110001
m2.Int32Value(0)=&b11110000

const mask = &b11001111

MessageBox bin(m1.Int32Value(0))+EndOfLine+bin(m2.Int32Value(0))+EndOfLine+bin(m3.Int32Value(0))

call m1.AndBitsMBS(m2,mask,m3)

MessageBox bin(m1.Int32Value(0))+EndOfLine+bin(m2.Int32Value(0))+EndOfLine+bin(m3.Int32Value(0))
```

Notes: The mask is always 8 bit. Use the &b notation to specify it.
Dest is first and second memoryblock combine with a bitwiseand.
And first and second memoryblock are filled with the difference between them. Only bits set int he given mask are used.

If dest is nil, a new memoryblock is created. You can speed up processing with reusing the same memoryblock in iterations. If you pass a memoryblock, the plugin does not check the size of the memoryblock.

Returns nil on any error. For example if source is a memoryblock without a known size.
See also:

- 131.2.5 AndBitsMBS(Second as memoryblock, Dest as memoryblock=nil) as memoryblock 18257

131.2.7 AppendMBS(other as memoryblock) as memoryblock

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a new memoryblock with the bytes of the two given memoryblocks.
Example:

```
Var m1 As MemoryBlock = "Hello "
Var m2 As MemoryBlock = "World!"

Var m3 As MemoryBlock = m1.AppendMBS(m2)
Var s As String = m3

MessageBox s
```

Notes: This function will not work if the memoryblock has an unknown size.
If one memoryblock is nil than you get a copy of the other memoryblock.
Blog Entries

- MBS Xojo Plugins, version 25.0pr9

131.2.8 BitwiseAndMBS(Second as MemoryBlock, Dest as MemoryBlock = nil) as MemoryBlock

MBS Util Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Bitwise AND for a Memoryblock.
Example:

```
Var m1 As New MemoryBlock(555)
Var m2 As New MemoryBlock(555)
Var r As New Random

For i As Integer = 0 To 555-1
m1.Byte(i) = r.InRange(0,255)
m2.Byte(i) = r.InRange(0,255)
Next

Var mAND As MemoryBlock = m1.BitwiseAndMBS(m2)
Var mOR As MemoryBlock = m1.BitwiseOrMBS(m2)
Var mXOR As MemoryBlock = m1.BitwiseXOrMBS(m2)

// check value
For i As Integer = 0 To 555-1
If BitwiseAnd(m1.Byte(i), m2.Byte(i)) <>mAND.Byte(i) Then
Break
End If
If BitwiseOr(m1.Byte(i), m2.Byte(i)) <>mOR.Byte(i) Then
Break
End If
If BitwiseXor(m1.Byte(i), m2.Byte(i)) <>mXOR.Byte(i) Then
Break
End If
```

Next

Break

Notes: We walk over all values in current and second MemoryBlock and apply a bitwise AND to each byte and store that in the destination block.

If dest is nil, a new memoryblock is created. You can speed up processing with reusing the same memoryblock in iterations. If you pass a memoryblock, the plugin does not check the size of the memoryblock.

Returns nil on any error. For example if source is a memoryblock without a known size.

131.2.9 BitwiseOrMBS(Second as MemoryBlock, Dest as MemoryBlock = nil) as MemoryBlock

MBS Util Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Bitwise OR for a Memoryblock.
Example:

```
Var m1 As New MemoryBlock(555)
Var m2 As New MemoryBlock(555)
Var r As New Random

For i As Integer = 0 To 555-1
m1.Byte(i) = r.InRange(0,255)
m2.Byte(i) = r.InRange(0,255)
Next

Var mAND As MemoryBlock = m1.BitwiseAndMBS(m2)
Var mOR As MemoryBlock = m1.BitwiseOrMBS(m2)
Var mXOR As MemoryBlock = m1.BitwiseXOrMBS(m2)
```

```
// check value
For i As Integer = 0 To 555-1
If BitwiseAnd(m1.Byte(i), m2.Byte(i)) <>mAND.Byte(i) Then
Break
End If
If BitwiseOr(m1.Byte(i), m2.Byte(i)) <>mOR.Byte(i) Then
Break
End If
If BitwiseXor(m1.Byte(i), m2.Byte(i)) <>mXOR.Byte(i) Then
Break
End If

Next

Break
```

Notes: We walk over all values in current and second MemoryBlock and apply a bitwise OR to each byte and store that in the destination block.

If dest is nil, a new memoryblock is created. You can speed up processing with reusing the same memoryblock in iterations. If you pass a memoryblock, the plugin does not check the size of the memoryblock.

Returns nil on any error. For example if source is a memoryblock without a known size.

131.2.10 BitwiseXOrMBS(Second as MemoryBlock, Dest as MemoryBlock = nil) as MemoryBlock

MBS Util Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Bitwise XOR for a Memoryblock.
Example:

```
Var m1 As New MemoryBlock(555)
Var m2 As New MemoryBlock(555)
Var r As New Random

For i As Integer = 0 To 555-1
m1.Byte(i) = r.InRange(0,255)
m2.Byte(i) = r.InRange(0,255)
Next

Var mAND As MemoryBlock = m1.BitwiseAndMBS(m2)
Var mOR As MemoryBlock = m1.BitwiseOrMBS(m2)
Var mXOR As MemoryBlock = m1.BitwiseXOrMBS(m2)

// check value
For i As Integer = 0 To 555-1
If BitwiseAnd(m1.Byte(i), m2.Byte(i)) <>mAND.Byte(i) Then
Break
End If
If BitwiseOr(m1.Byte(i), m2.Byte(i)) <>mOR.Byte(i) Then
Break
End If
If BitwiseXor(m1.Byte(i), m2.Byte(i)) <>mXOR.Byte(i) Then
Break
End If

Next

Break
```

Notes: We walk over all values in current and second MemoryBlock and apply a bitwise XOR to each byte and store that in the destination block.

If dest is nil, a new memoryblock is created. You can speed up processing with reusing the same memoryblock in iterations. If you pass a memoryblock, the plugin does not check the size of the memoryblock.

Returns nil on any error. For example if source is a memoryblock without a known size.

131.2.11 BytesEqualMBS(srcOfs as Integer, numBytes as Integer, destBlk as memoryBlock, destOfs as Integer) as Boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if equal byte data.
Example:

```
Var m1 as MemoryBlock = NewMemoryBlock(100)
Var m2 as MemoryBlock = NewMemoryBlock(100)

// try with 2 different strings
m1.CString(0)="Hello"
m2.CString(0)="Hallo"

if m1.BytesEqualMBS(0, 100, m2, 0) then
MessageBox "equal"
else
MessageBox "not equal"
end if

// try with 2 equal strings
m1.CString(0)="Hello"
m2.CString(0)="Hello"

if m1.BytesEqualMBS(0, 100, m2, 0) then
MessageBox "equal"
else
MessageBox "not equal"
end if
```

Notes: Fixed in 10.1 to return true on equal bytes and false on non equal bytes. Older plugin versions returned the wrong value.

Does not check the bounds of the memoryblock, so it can crash with wrong parameters.
Returns false if one of the memoryblocks is nil.

131.2.12 BytesZeroMBS(srcOfs as Integer, numBytes as Integer) as Boolean

MBS Util Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if all bytes in the memoryblock in the given range are zero.
Example:

```
Var m as MemoryBlock = NewMemoryBlock(100)
```

```
if m.BytesZeroMBS(0,100) then
MessageBox "all zero"
else
MessageBox "error"
end if

m.Byte(50)=1

if m.BytesZeroMBS(0,100) then
MessageBox "error"
else
MessageBox "okay"
end if
```

Notes: Returns false on any error.
Bounds are not checked with the memoryblock, so be careful.

- MBS Xojo Plugins, version 22.4pr2

131.2.13 ClearBitMBS(Bit as UInt64)

MBS Util Plugin, Plugin Version: 21.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the given bit in the MemoryBlock.
Example:

```
Var m As New MemoryBlock(100)

m.SetBitMBS(123)
Var v1 As Boolean = m.IsBitSetMBS(123)
m.ClearBitMBS(123)
Var v2 As Boolean = m.IsBitSetMBS(123)
Break // see debugger
```

Notes: Sets value of the bit to zero.

Raises exception is MemoryBlock is nil.
If MemoryBlock has a known size and Bit is out of range, we raise an OutOfBoundsException.

- MBS Xojo Plugins, version 20.6pr5

131.2.14 ConvertRGB12BitTo8BitMBS(Width as Integer)

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a memoryblock with 12 bit RGB data into 8 bit RGB data.
Notes: Width is number of pixels.

Please make sure the memoryblock is 9 bytes bigger than input to avoid errors.
Plugin converts each 9 bytes (72 bits) with 2 RGB triple. So first 12 bits are red, next 12 bits green and last 12 bits blue.
Plugin removes last 4 bits.

131.2.15 CopyBytesFromMacHandleMBS(srcHandle as Integer, numBytes as Integer, destOfs as Integer)

MBS Util Plugin, Platform: macOS, Targets: All.

Function: Copies bytes from Mac Handle into your memoryblock.
Notes: Same as CopyBytesFromMacPtr, only that the memory address is a so-called Handle (see documentation about the MacOS memory Manager), which is double-referenced.

131.2.16 CopyBytesFromMacPtrMBS(srcPtr as Ptr, numBytes as Integer, destOfs as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the given amount of bytes from the given address in the Mac's memory address space into the memoryBlock.
Notes: Make sure that the destination block is large enough to hold the copied bytes (if not, your application or even the whole system can crash).

131.2.17 CopyBytesMBS(srcOfs as Integer, numBytes as Integer, destBlk as memoryBlock, destOfs as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the specified amount of bytes into a second memoryBlock.
Example:

```
Var m as MemoryBlock
Var n as MemoryBlock
```

```
m=NewMemoryBlock(100)
n=NewMemoryBlock(100)

m.Long(0)=12345

m.CopyBytesMBS(0,4,n,0)

MessageBox str(n.long(0))
```

Notes: You must make sure that the destination block is large enough to hold the copied bytes (if not, your application or even the whole system can crash).
See also:

- 131.2.18 CopyBytesMBS(srcOfs as Integer, numBytes as Integer, destOfs as Integer) 18266

131.2.18 CopyBytesMBS(srcOfs as Integer, numBytes as Integer, destOfs as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the specified amount of bytes inside the memoryBlock.
Notes: You must make sure that the copied bytes fit inside the block (if they don't, your application or even the whole system can crash).
See also:

- 131.2.17 CopyBytesMBS(srcOfs as Integer, numBytes as Integer, destBlk as memoryBlock, destOfs as Integer) 18265

131.2.19 CopyBytesToMacHandleMBS(srcOfs as Integer, numBytes as Integer, destHandle as Integer)

MBS Util Plugin, Platform: macOS, Targets: All.

Function: Copies byte data from the memoryblock into the memory the handle is pointing to.
Notes: Same as CopyBytesToMacPtr, only that the memory address is a so-called Handle (see documentation about the MacOS memory Manager), which is double-referenced.

131.2.20 CopyBytesToMacPtrMBS(srcOfs as Integer, numBytes as Integer, destPtr as Ptr)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the given amount of bytes from the memoryBlock to the given address in the Mac's memory address space.
Notes: Be careful where you copy the data to - you can easily crash your computer if you write to the wrong address space.

131.2.21 CopyByteToUShortMBS(dest as memoryblock, SourceOffset as Integer, DestinationOffset as Integer, ByteCount as Integer, divisor as Integer)

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies bytes in a memoryblock to another memoryblock converting the 8bit values to 16bit values.
Notes: Common values for divisor are 256 and 257.
No bound checking. Crashes with invalid values. Optimized for special divisor values.

131.2.22 CopyNthBitsMBS(source as memoryblock, SourceOffsetBits as Integer, DestinationOffsetBits as Integer, BitCount as Integer, StepCount as Integer, NumberOfSteps as Integer) as boolean

MBS Util Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies every nth bits in the source memoryblock to the current memoryblock.
Notes: BitCount = the number of bits to copy from each step.
StepCount = the number of bits to not copy.
NumberOfSteps = the number of rounds to do.
There is no bound checking. The function will crash with invalid parameters!

131.2.23 CopyNthBytesMBS(source as memoryblock, SourceOffsetBytes as Integer, DestinationOffsetBytes as Integer, ByteCount as Integer, StepCount as Integer, NumberOfSteps as Integer) as boolean

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies every nth bytes in the source memoryblock to the current memoryblock.
Example:

```
Var s,d as memoryBlock

s=NewmemoryBlock(100)
d=NewmemoryBlock(100)
```

```
s.CString(0)="Hello World!"

call d.CopyNthBytesMBS(s,0,0,2,4,3)

MessageBox d.CString(0) // "Heo rl"
```

Notes: ByteCount = the number of bytes to copy from each step.
StepCount = the number of bytes to move for each step forward in source.
NumberOfSteps = the number of steps to do.
There is no bound checking. The function will crash with invalid parameters!

131.2.24 CopyUShortToByteMBS(dest as memoryblock, SourceOffset as Integer, DestinationOffset as Integer, ByteCount as Integer, divisor as Integer)

MBS Util Plugin, Plugin Version: 4.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies shorts in a memoryblock to another memoryblock converting the 16bit values to 8bit values.
Notes: Common values for divisor are 256 and 257.
No bound checking. Crashes with invalid values. Optimized for special divisor values.

131.2.25 CRC_32ContMBS(offset as Integer, numBytes as Integer, prevCRC as UInt32) as UInt32

MBS Util Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 32bit Checksum about the provided block of data.

131.2.26 CRC_32MBS(offset as Integer, numBytes as Integer) as UInt32

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 32bit Checksum about the provided block of data.

131.2.27 CRC_CCITTContMBS(offset as Integer, numBytes as Integer, prevCRC as UInt32) as UInt32

MBS Util Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 16bit Checksum about the provided string.

131.2.28 CRC_CCITTMBS(offset as Integer, numBytes as Integer) as UInt32

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 16bit Checksum about the provided block of data.
Notes: See the text "About-CRC" for details about this Checksum things.
This function is also available for strings.

See the CRC_32 for more details on Checksums.

131.2.29 CRC_DillonMBS(bitWidth as Integer, offset as Integer, numBytes as Integer) as String

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 16 to 64bit Checksum about the provided block of data.
Notes: This function is also available for strings.

See the CRC_32 for more details on Checksums.

131.2.30 EndianS16_BtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianS16_BtoLMBS(0,mem.size/2)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.31 EndianS16_BtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianS16_BtoNMBS(0,mem.size/2)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.32 EndianS16_LtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianS16_LtoBMBS(0,mem.size/2)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.33 EndianS16_LtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianS16_LtoNMBS(0,mem.size/2)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.34 EndianS16_NtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianS16_NtoBMBS(0,mem.size/2)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.35 EndianS16_NtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianS16_NtoLMBS(0,mem.size/2)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.36 EndianS32_BtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianS32_BtoLMBS(0,mem.size/4)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.37 EndianS32_BtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianS32_BtoNMBS(0,mem.size/4)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.38 EndianS32_LtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianS32_LtoBMBS(0,mem.size/4)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.39 EndianS32_LtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianS32_LtoNMBS(0,mem.size/4)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.40 EndianS32_NtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianS32_NtoBMBS(0,mem.size/4)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.41 EndianS32_NtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianS32_NtoLMBS(0,mem.size/4)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.42 EndianSwap16MBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Swaps several 16 bit integers inside a memoryblock.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianSwap16MBS(0,mem.size/2)
```

131.2.43 EndianSwap32MBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Swaps several 32 bit integers inside a memoryblock.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianSwap32MBS(0,mem.size/4)
```

131.2.44 EndianU16_BtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianU16_BtoLMBS(0,mem.size/2)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.45 EndianU16_BtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianU16_BtoNMBS(0,mem.size/2)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.46 EndianU16_LtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianU16_LtoBMBS(0,mem.size/2)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.47 EndianU16_LtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianU16_LtoNMBS(0,mem.size/2)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.48 EndianU16_NtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianU16_NtoBMBS(0,mem.size/2)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.49 EndianU16_NtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianU16_NtoLMBS(0,mem.size/2)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.50 EndianU32_BtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianU32_BtoLMBS(0,mem.size/4)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.51 EndianU32_BtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianU32_BtoNMBS(0,mem.size/4)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.52 EndianU32_LtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianU32_LtoBMBS(0,mem.size/4)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.53 EndianU32_LtoNMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianU32_LtoNMBS(0,mem.size/4)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.54 EndianU32_NtoBMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianU32_NtoBMBS(0,mem.size/4)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.55 EndianU32_NtoLMBS(offset as Integer,count as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: All.

Function: Converts between BigEndian, LowEndian and Native byte encoding.
Example:

```
Var mem as memoryblock // your memoryblock
mem.EndianU32_NtoLMBS(0,mem.size/4)
```

Notes: e.g.:
EndianS32_BtoNMBS(offset as Integer,count as Integer)
EndianU16_LtoBMBS(offset as Integer,count as Integer)

Details:
S for signed or U for unsigned.
16 for short and 32 for integer.
B for BigEndian (Mac), L for LowEndian (x86) and N for the native form of the current platform.

Note that count is not the size of the block, but the count of the integers to change.

131.2.56 ExpandBitsMBS(dest as memoryblock, SourceByteCount as Integer, LowValue as Integer = 0, HighValue as Integer = 255) as boolean

MBS Util Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Expands bits into bytes.
Example:

```
Var m1 as new MemoryBlock(200)
Var m2 as new MemoryBlock(1600)

for i as Integer = 0 to 127
m1.Int8Value(i) = i
next

Var n as Integer = 128
Var b as Boolean = m1.ExpandBitsMBS(m2, n)

break // see result in debugger
```

Notes: Takes a bit from the source memoryblock and writes a byte for it to destination. Uses LowValue (default 0) if the bit is not set and HighValue (Default 255) if the bit is set.
Works only on x86 CPUs (no PPC).
Reads source memoryblock in 32 bit blocks and writes the destination in 32 byte blocks.

- MBS REALbasic Plugins, version 10.6pr9

131.2.57 ExtractBitsMBS(Mask as Integer, Dest as memoryblock=nil) as memoryblock

MBS Util Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies bits from a memoryblock to another.
Example:

```
Var mask as Integer = &b01010101
Var m as MemoryBlock = "Hello World"

Var r as MemoryBlock = m.ExtractBitsMBS(mask)

MessageBox r.StringValue(0,r.size) // shows "@EDDE UEPDD"
```

Notes: The mask is always 8 bit. Use the &b notation to specify it.

If dest is nil, a new memoryblock is created. You can speed up processing with reusing the same memoryblock in iterations. If you pass a memoryblock, the plugin does not check the size of the memoryblock.

Returns nil on any error. For example if source is a memoryblock without a known size.

131.2.58 FillBytesMBS(offset as Integer, count as Integer, value as Integer)

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fills memory with a specific byte value.
Example:

```
var m as new MemoryBlock(20)

// write X over all values
m.FillBytesMBS(0, m.size, 88)
```

Notes: Caution: No bounds checking.

131.2.59 FindByteMBS(srcOfs as Integer, numBytes as Integer, byteValue as Integer) as Integer

MBS Util Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the position of the first byte which has the given value.
Example:

```
Var m as MemoryBlock = NewMemoryBlock(100)
Var n as Integer

n = m.FindByteMBS(0, 100, 0)

MessageBox str(n) // shows 0 as the byte at offset 0 is zero

m.Byte(0)=1

n = m.FindByteMBS(0, 100, 0)

MessageBox str(n) // shows 1 as the byte at offset 1 is zero

m.FillBytesMBS(0,100,5)

n = m.FindByteMBS(0, 100, 6)
```

```
MessageBox str(n) // shows -1 as there is no byte with value 6
```

Notes: Returns -1 if the byte is not found.
See also:

- 131.2.60 FindByteMBS(values() as UInt8, StartByteOffset as Integer = 0) as Integer 18284

131.2.60 FindByteMBS(values() as UInt8, StartByteOffset as Integer = 0) as Integer

MBS Util Plugin, Plugin Version: 21.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds position of a given value.
Example:

```
Var m As MemoryBlock = "Hello World"

Var u() As UInt8
u.Add Asc("e")
u.Add Asc("o")

Var pos1 As Integer = m.FindByteMBS(u)
Var pos2 As Integer = m.FindByteMBS(u, pos1+1)

// shows 1 and 4
MessageBox "Found position: "+Str(pos1)+" and "+Str(pos2)
```

Notes: Values is an array of possible values to find.
For best performance avoid duplicates in that array.

Returns zero based byte offset.
Result is -1 if not found.

131.2.61 FindBytesMBS(srcOfs as Integer, maxBytes as Integer, target as memoryBlock, targOfs as Integer, targLen as Integer) as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds some bytes from the target memoryblock inside the current memoryblock.

131.2.62 FindNotByteMBS(srcOfs as Integer, numBytes as Integer, byteValue as Integer) as Integer

MBS Util Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the position of the first byte which has no the given value.
Example:

```
Var m as MemoryBlock = NewMemoryBlock(100)
Var n as Integer

n = m.FindNotByteMBS(0, 100, 0)

MessageBox str(n) // -1 as no value is not zero

m.Byte(30)=1

n = m.FindNotByteMBS(0, 100, 0)

MessageBox str(n) // shows 30 as the byte at offset 30 is not zero

m.Byte(0)=255

n = m.FindNotByteMBS(0, 100, 255)

MessageBox str(n) // shows 1 as the byte at offset 1 is not 255
```

Notes: Returns -1 if the no byte was found which has not the given value.

131.2.63 FindStringMBS(srcOfs as Integer, maxBytes as Integer, target as String) as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds a string inside a memoryblock.

131.2.64 Float16ToFloat32MBS(Source as Ptr, Count as Integer, SourceOffset as Integer = 0, DestinationOffset as Integer = 0)

MBS Util Plugin, Plugin Version: 26.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a block of 16-bit floating point numbers to 32-bit.
Example:

```
// we fill a memoryblock and convert 64 ->32 ->16 ->32 ->64 to try all combinations

Var m1 As New MemoryBlock(100 * 8)
Var m2 As New MemoryBlock(100 * 4)
Var m3 As New MemoryBlock(100 * 2)
Var m4 As New MemoryBlock(100 * 4)
Var m5 As New MemoryBlock(100 * 8)

var o as integer
For i As Integer = 1 To 100
m1.DoubleValue(o) = i / 10.0
o = o + 8
Next

m2.Float64ToFloat32MBS(m1, 100)
m3.Float32ToFloat16MBS(m2, 100)
m4.Float16ToFloat32MBS(m3, 100)
m5.Float32ToFloat64MBS(m4, 100)

MessageBox m5.DoubleValue(8 * 49).ToString // should be 5
```

Notes: We read Count * 2 bytes from source and write 4 * Count bytes to destination.

131.2.65 Float16ValueMBS(offset as integer) as Single

MBS Util Plugin, Plugin Version: 26.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a 16 bit float from a memoryblock.
Notes: A floating point number in 2 bytes to save space. One bit for sign, 5 for exponent and 11 for mantissa. About 3 digits precision.
See also:

- 131.2.66 Float16ValueMBS(offset as integer, assigns value as Single)

131.2.66 Float16ValueMBS(offset as integer, assigns value as Single)

MBS Util Plugin, Plugin Version: 26.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a floating point value to 16 bit float in the memoryblock.
Example:

```
// write values and read them

Var m As New MemoryBlock(16)

m.DoubleValue(0) = 123.456789
m.Float16ValueMBS(8) = 123.456789
m.SingleValue(12) = 123.456789

MessageBox _
m.Float16ValueMBS(8).ToString("0.000000")+_
EndOfLine+_
m.SingleValue(12).ToString("0.000000")+_
EndOfLine+_
m.DoubleValue(0).ToString("0.000000")
```

131.2.67 Float32ToFloat16MBS(Source as Ptr, Count as Integer, SourceOffset as Integer = 0, DestinationOffset as Integer = 0)

MBS Util Plugin, Plugin Version: 26.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a block of 32-bit floating point numbers to 16-bit.
Example:

```
// we fill a memoryblock and convert 64 ->32 ->16 ->32 ->64 to try all combinations

Var m1 As New MemoryBlock(100 * 8)
Var m2 As New MemoryBlock(100 * 4)
Var m3 As New MemoryBlock(100 * 2)
Var m4 As New MemoryBlock(100 * 4)
Var m5 As New MemoryBlock(100 * 8)

var o as integer
```

```
For i As Integer = 1 To 100
m1.DoubleValue(o) = i / 10.0
o = o + 8
Next

m2.Float64ToFloat32MBS(m1, 100)
m3.Float32ToFloat16MBS(m2, 100)
m4.Float16ToFloat32MBS(m3, 100)
m5.Float32ToFloat64MBS(m4, 100)

MessageBox m5.DoubleValue(8 * 49).ToString // should be 5
```

Notes: We read Count * 4 bytes from source and write 2 * Count bytes to destination.

131.2.68 Float32ToFloat64MBS(Source as Ptr, Count as Integer, SourceOffset as Integer = 0, DestinationOffset as Integer = 0)

MBS Util Plugin, Plugin Version: 26.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a block of 32-bit floating point numbers to 64-bit.
Example:

```
// we fill a memoryblock and convert 64 ->32 ->16 ->32 ->64 to try all combinations

Var m1 As New MemoryBlock(100 * 8)
Var m2 As New MemoryBlock(100 * 4)
Var m3 As New MemoryBlock(100 * 2)
Var m4 As New MemoryBlock(100 * 4)
Var m5 As New MemoryBlock(100 * 8)

var o as integer
For i As Integer = 1 To 100
m1.DoubleValue(o) = i / 10.0
o = o + 8
Next

m2.Float64ToFloat32MBS(m1, 100)
m3.Float32ToFloat16MBS(m2, 100)
m4.Float16ToFloat32MBS(m3, 100)
m5.Float32ToFloat64MBS(m4, 100)

MessageBox m5.DoubleValue(8 * 49).ToString // should be 5
```

Notes: We read Count * 4 bytes from source and write 8 * Count bytes to destination.

- MBS Xojo Plugins, version 26.5pr3

131.2.69 Float64ToFloat32MBS(Source as Ptr, Count as Integer, SourceOffset as Integer = 0, DestinationOffset as Integer = 0)

MBS Util Plugin, Plugin Version: 26.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a block of 64-bit floating point numbers to 32-bit.
Example:

```
// we fill a memoryblock and convert 64 ->32 ->16 ->32 ->64 to try all combinations

Var m1 As New MemoryBlock(100 * 8)
Var m2 As New MemoryBlock(100 * 4)
Var m3 As New MemoryBlock(100 * 2)
Var m4 As New MemoryBlock(100 * 4)
Var m5 As New MemoryBlock(100 * 8)

var o as integer
For i As Integer = 1 To 100
m1.DoubleValue(o) = i / 10.0
o = o + 8
Next

m2.Float64ToFloat32MBS(m1, 100)
m3.Float32ToFloat16MBS(m2, 100)
m4.Float16ToFloat32MBS(m3, 100)
m5.Float32ToFloat64MBS(m4, 100)

MessageBox m5.DoubleValue(8 * 49).ToString // should be 5
```

Notes: We read Count * 8 bytes from source and write 4 * Count bytes to destination.

- MBS Xojo Plugins, version 26.5pr3

131.2.70 GetBitMBS(Bit as UInt64) as Integer

MBS Util Plugin, Plugin Version: 21.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries value of the given bit in the MemoryBlock.
Example:

```
Var m As New MemoryBlock(100)

m.SetBitMBS(123)
Var v1 As Integer = m.GetBitMBS(123)
Break // see debugger
```

Notes: Returns 1 if bit is set or 0 if not.

Raises exception is MemoryBlock is nil.
If MemoryBlock has a known size and Bit is out of range, we raise an OutOfBoundsException.

- MBS Xojo Plugins, version 20.6pr5

131.2.71 GetStringMBS(offset as Integer, numBytes as Integer) as String

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a string from the memoryblock.
Notes: With newer RB versions you may better use StringValue.

131.2.72 InvertBytesMBS(offset as Integer, count as Integer)

MBS Util Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inverts the given number of bytes in a memoryblock.
Example:

```
Var m as memoryblock
m=newmemoryblock(100)
' do something
m.InvertBytesMBS(0,100) // invert all bytes
```

Notes: Does work faster if count is a multiply of 4.

131.2.73 IsBitSetMBS(Bit as UInt64) as Boolean

MBS Util Plugin, Plugin Version: 21.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries value of the given bit in the MemoryBlock.
Example:

```
Var m As New MemoryBlock(100)

m.SetBitMBS(123)

Var v1 As Boolean = m.IsBitSetMBS(123)
Break // see debugger
```

Notes: Returns true if bit is set or false if not.

Raises exception is MemoryBlock is nil.
If MemoryBlock has a known size and Bit is out of range, we raise an OutOfBoundsException.

131.2.74 LeftMBS(length as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a memoryblock with the first given number of bytes.
Notes: If length is greater than the size of the memoryblock then then length is set to size.
Returns nil if length<=0 or on low memory.
This function will not work if the memoryblock has an unknown size.

131.2.75 MaxMBS(firstMem as Ptr, secondMem as Ptr, BitSize as Integer = 8, Signed as Boolean = false, offsetByte as Integer = 0, lengthBytes as Integer = 0) as boolean

MBS Util Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates max values of values in memory.
Example:

```
Var m1 as new MemoryBlock(12)
Var m2 as new MemoryBlock(12)
Var mr1 as new MemoryBlock(12)
Var mr2 as new MemoryBlock(12)

for i as Integer = 0 to 11
m1.UInt8Value(i) = i
m2.UInt8Value(11-i) = i
next
```

```
if mr1.minMBS(m1, m2) then
if mr2.maxMBS(m1, m2) then

MessageBox EncodeHex(m1)+" first"+EndOfLine+_
EncodeHex(m2)+" second"+EndOfLine+_
EncodeHex(mr1)+" min"+EndOfLine+_
EncodeHex(mr2)+" max"

end if
end if
```

Notes: firstMem and secondMem can be ptr or memoryblock with some values. Can be same as destination (the memoryblock the method is called at)
BitSize defines integer bit depth 8, 16, 32 or 64. Signed defines if to expect signed or unsigned integers.
offsetByte defines offset in destination memoryblock. lengthBytes is length of memory. If zero, we use size of destination memoryblock.
Passing bad parameters can easily lead to crash. Return true on success and false on failure and raises exceptions for invalid parameters.

131.2.76 MidMBS(offset as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a memoryblock with the bytes of the given memoryblock from the given offset on.
Notes: Offset is 0 based.
Returns nil if offset<0 or on low memory.
This function will not work if the memoryblock has an unknown size.
See also:

- 131.2.77 MidMBS(offset as Integer, length as Integer) as memoryblock 18292

131.2.77 MidMBS(offset as Integer, length as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a memoryblock with the given bytes from the middle of the memoryblock.
Notes: Offset is 0 based.
Returns nil if offset<0 or on low memory.
If length is too long then length is set to a lower value.
This function will not work if the memoryblock has an unknown size.
See also:

- 131.2.76 MidMBS(offset as Integer) as memoryblock 18292

131.2.78 MinMBS(firstMem as Ptr, secondMem as Ptr, BitSize as Integer = 8, Signed as Boolean = false, offsetByte as Integer = 0, lengthBytes as Integer = 0) as boolean

MBS Util Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates min values of values in memory.
Example:

```
Var m1 as new MemoryBlock(24)
Var m2 as new MemoryBlock(24)
Var mr1 as new MemoryBlock(24)
Var mr2 as new MemoryBlock(24)

for i as Integer = 0 to 11
m1.UInt16Value(2*i) = i
m2.UInt16Value(2*(11-i)) = i
next

if mr1.minMBS(m1, m2, 16, false, 0, 24) then
if mr2.maxMBS(m1, m2, 16, false, 0, 24) then

MessageBox EncodeHex(m1)+" first"+EndOfLine+_
EncodeHex(m2)+" second"+EndOfLine+_
EncodeHex(mr1)+" min"+EndOfLine+_
EncodeHex(mr2)+" max"

end if
end if
```

Notes: firstMem and secondMem can be ptr or memoryblock with some values. Can be same as destination (the memoryblock the method is called at)
BitSize defines integer bit depth 8, 16, 32 or 64. Signed defines if to expect signed or unsigned integers.
offsetByte defines offset in destination memoryblock. lengthBytes is length of memory. If zero, we use size of destination memoryblock.
Passing bad parameters can easily lead to crash. Return true on success and false on failure and raises exceptions for invalid parameters.

131.2.79 MirrorBitsInBytesMBS(offsetByte as Integer, lengthByte as Integer)

MBS Util Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mirrors bits in each byte.
Example:

```
Var m as new MemoryBlock(12)

m.CString(0)="HelloHello"

m.MirrorBitsInBytesMBS(0,5)

MessageBox EncodingToHexMBS(m.StringValue(5,5))+" ->"+EncodingToHexMBS(m.StringValue(0,5))
```

Notes: offsetByte: where to start in the memoryblock
lengthByte: number of bytes to swap

Mirror means in this case, that if you a byte with bits 11001100, after the mirror, you have 00110011. So bit 0 and 7 exchange values. Same for 1 and 6, 2 and 5, 3 and 4.

131.2.80 MirrorBitsMBS(offsetBit as Integer, lengthBit as Integer)

MBS Util Plugin, Plugin Version: 7.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mirrors the bits in a memoryblock.
Notes: e.g. "111100001" in the memoryblock would give "100001111"
This function is certainly not the fastest one, but faster than anything you can get written in Xojo.
And make sure the bounds are matched, because on memory access outside the valid ranges, the function will crash.
0 ,â§ offsetBit <mem.size*8 and 0 ,â§ lengthBit ,â§ mem.size*8 - offsetBit

131.2.81 MirrorBytesMBS(offsetByte as Integer = 0, lengthByte as Integer = -1)

MBS Util Plugin, Plugin Version: 7.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mirrors the bytes in the given range.
Notes: e.g. "abcdefgh" in the memoryblock would give "hgfedcba"
This function is certainly not the fastest one, but faster than anything you can get written in Xojo.
And make sure the bounds are matched, because on memory access outside the valid ranges, the function will crash.
0 ,â§ offsetByte <mem.size and 0 ,â§ lengthByte ,â§ mem.size - offsetByte

If lengthByte is -1, we query memoryblock for size. If size is unknown or negative, the function does nothing.

131.2.82 MultiplyUInt16MBS(Factor as Double, offsetByte as Integer = 0, lengthBytes as Integer = 0, MultiplyOnlyOver as Integer = -1)

MBS Util Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplied UInt16 values in the memoryblock.
Example:

```
Var myMemOut3 as new MemoryBlock(500)
myMemOut3.MultiplyUInt16MBS(0.9)
```

Notes: Values bigger than 65535 are set to 65535.
lengthBytes is in bytes, so 2 times the number of values.
Factor must be >= 0.0.
Offset is the offset in bytes from the beginning of the memoryblock to start. Wrong offsets (e.g. negative) can lead to crashes. lengthBytes is optional, if not specified or zero uses the length of memoryblock.

Added MultiplyOnlyOver parameter in version 18.4. If negative, we multiply all values. If positive, we multiply only values >the given value.

- MBS Xojo Plugins, version 18.4pr7

131.2.83 MultiplyUInt8MBS(Factor as Double, offsetByte as Integer = 0, lengthBytes as Integer = 0, MultiplyOnlyOver as Integer = -1)

MBS Util Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies UInt8 values in the memoryblock.
Example:

```
Var myMemOut3 as new MemoryBlock(500)
myMemOut3.MultiplyUInt8MBS(0.9)
```

Notes: Values bigger than 255 are set to 255.
lengthBytes is in bytes, so 2 times the number of values.
Factor must be >= 0.0.
Offset is the offset in bytes from the beginning of the memoryblock to start. Wrong offsets (e.g. negative) can lead to crashes. lengthBytes is optional, if not specified or zero uses the length of memoryblock.

Added MultiplyOnlyOver parameter in version 18.4. If negative, we multiply all values. If positive, we multiply only values >the given value.

- MBS Xojo Plugins, version 18.4pr7

131.2.84 RightMBS(length as Integer) as memoryblock

MBS Util Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a memoryblock with the given number of bytes from the right side of the memoryblock.
Example:

```
Var mem,m as MemoryBlock
mem=m.RightMBS(5)
```

Notes: If length is more than the memoryblock's size, than length is set to size.
Returns nil if length<=0 or on low memory.
This function will not work if the memoryblock has an unknown size.

131.2.85 SetBitMBS(Bit as UInt64)

MBS Util Plugin, Plugin Version: 21.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets value of the given bit in the MemoryBlock.
Example:

```
Var m As New MemoryBlock(100)

m.SetBitMBS(123)

Var v1 As Boolean = m.IsBitSetMBS(123)
Break // see debugger
```

Notes: Sets bit to 1.

Raises exception is MemoryBlock is nil.
If MemoryBlock has a known size and Bit is out of range, we raise an OutOfBoundsException.
See also:

- 131.2.86 SetBitMBS(Bit as UInt64, Value as Boolean) 18297
- 131.2.87 SetBitMBS(Bit as UInt64, Value as Integer) 18297

131.2.86 SetBitMBS(Bit as UInt64, Value as Boolean)

MBS Util Plugin, Plugin Version: 21.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets value of the given bit in the MemoryBlock.
Example:

```
Var m As New MemoryBlock(100)

m.SetBitMBS(123, true)

Var v1 As Boolean = m.IsBitSetMBS(123)
Break // see debugger
```

Notes: Pass true to set bit or false to clear bit.

Raises exception is MemoryBlock is nil.
If MemoryBlock has a known size and Bit is out of range, we raise an OutOfBoundsException.
See also:

- 131.2.85 SetBitMBS(Bit as UInt64) 18296
- 131.2.87 SetBitMBS(Bit as UInt64, Value as Integer) 18297

131.2.87 SetBitMBS(Bit as UInt64, Value as Integer)

MBS Util Plugin, Plugin Version: 21.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets value of the given bit in the MemoryBlock.
Example:

```
Var m As New MemoryBlock(100)

m.SetBitMBS(123, 1)

Var v1 As Boolean = m.IsBitSetMBS(123)
Break // see debugger
```

Notes: Pass 1 to set bit or 0 to clear bit.

Raises exception is MemoryBlock is nil.
If MemoryBlock has a known size and Bit is out of range, we raise an OutOfBoundsException.

131.2.88 SetStringMBS(str as String, offset as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a string inside the memoryblock.
Notes: With newer RB versions you may better use StringValue.

131.2.89 SwapBytes16MBS(offset as Integer, numBytes as Integer)

MBS Util Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Swaps words inside the given bounds inside the memoryblock.
Example:

```
Var numbytes as Integer // number of bytes in MemoryBlock
Var m as MemoryBlock // your memoryblock
Var i as Integer

for i=0 to numbytes step 2
m.UShort(i)=EndianSwap16MBS(m.UShort(i))
next
```

131.2.90 SwapBytes32MBS(offset as Integer, numBytes as Integer)

MBS Util Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Swaps longs inside the given bounds inside the memoryblock.
Example:

```
// Test SwapBytes32MBS and SwapBytes16MBS:

const h11223344=&h11223344
const h22114411=&h22114433 // 16bit swap
const h44332211=&h44332211 // 32bit swap

Var m as memoryBlock
Var ok as Integer

m=NewmemoryBlock(20)
```

```
m.Long(00)=h11223344
m.Long(04)=h11223344
m.Long(08)=h11223344
m.Long(12)=h11223344
m.Long(16)=h11223344

m.SwapBytes16MBS(4,4)
m.SwapBytes32MBS(12,4)

if m.Long(00)=h11223344 then
ok=ok+1
else
MessageBox "00: "+hex(m.Long(00))
end if

if m.Long(04)=h22114411 then
ok=ok+1
else
MessageBox "04: "+hex(m.Long(04))
end if

if m.Long(08)=h11223344 then
ok=ok+1
else
MessageBox "08: "+hex(m.Long(08))
end if

if m.Long(12)=h44332211 then
ok=ok+1
else
MessageBox "12: "+hex(m.Long(12))
end if

if m.Long(16)=h11223344 then
ok=ok+1
else
MessageBox "16: "+hex(m.Long(16))
end if

if ok=5 then
MessageBox "OK"
else
MessageBox "Fail"
end if
```

Notes: It should do something like this:

```
Var m as memoryBlock

for i=0 to numbytes step 2
m.long(i)=EndianSwap32MBS(m.long(i))
next
```

131.2.91 SwapBytesMBS(offset as Integer, numBytes as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Swaps bytes inside the given bounds inside the memoryblock.
Notes: Reverses the order of the bytes at the given offset and length in the memoryBlock. This is helpful to change representation of values from Little Endian (used in Windows) to Big Endian (used in Mac OS) and vice versa. Thanks to Franco Vaccari for the code of this routine.

131.2.92 Properties

131.2.93 OSTypeMBS(offset as Integer) as String

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read/Write an OSType.
Notes: Interprets 4 bytes starting at the given offset as a OSType value.
(Read and Write computed property)

131.3 class MemoryBlockMBS

131.3.1 class MemoryBlockMBS

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to hold a memoryblock.
Example:

```
Var m as new MemoryBlockMBS

if m.Create(2000) then

// copy struing into memory
m.Memory.StringValue(0,5)="Hello"

// and read again
MessageBox m.Memory.StringValue(0,5)

end if
```

Notes: Xojo's memoryblocks have two bad things:
- they are limited to 1 GB on Mac OS X and Mac OS Classic
- they take a lot of time to create them
- they take a lot of real memory

Xojo allocates the memory and fills it with zeros.

The plugin in contrast uses zero filled pages to create the memoryblock which nearly take no time to create them and it does only need virtual memory until the memory is really used which saved swapping space.

131.3.2 Methods

131.3.3 Close

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without

waiting for Xojo to do it for you.

131.3.4 Constructor

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: This constructor does nothing, so you can call Create yourself.
See also:

- 131.3.5 Constructor(Mem as MemoryBlock) 18302
- 131.3.6 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0) 18303
- 131.3.7 Constructor(Size as Int64) 18303
- 131.3.8 Constructor(Str as String) 18303
- 131.3.9 Constructor(Str as String, Size as Int64, Offset as Int64 = 0) 18304

131.3.5 Constructor(Mem as MemoryBlock)

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new MemoryBlockMBS with content of memoryblock.
Example:

```
Var s as string = "Hello World"
Var m as MemoryBlock = s

Var x as new MemoryBlockMBS(m)

MessageBox str(x.Size)
```

Notes: Raises exception is size is invalid or no memory is available.
See also:

- 131.3.4 Constructor 18302
- 131.3.6 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0) 18303

- 131.3.8 Constructor(Str as String) 18303
- 131.3.9 Constructor(Str as String, Size as Int64, Offset as Int64 = 0) 18304

131.3.6 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0)

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new MemoryBlockMBS with given size and copies content of memoryblock.
Example:

```
Var s as string = "Hello World"
Var m as MemoryBlock = s

Var x as new MemoryBlockMBS(m, 9)

MessageBox str(x.Size)
```

Notes: Raises exception is size is invalid or no memory is available.
See also:

- 131.3.4 Constructor 18302
- 131.3.5 Constructor(Mem as MemoryBlock) 18302
- 131.3.7 Constructor(Size as Int64) 18303
- 131.3.8 Constructor(Str as String) 18303
- 131.3.9 Constructor(Str as String, Size as Int64, Offset as Int64 = 0) 18304

131.3.7 Constructor(Size as Int64)

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new MemoryBlockMBS with given size.
Notes: Raises exception is size is invalid or no memory is available.
See also:

- 131.3.4 Constructor 18302
- 131.3.5 Constructor(Mem as MemoryBlock) 18302
- 131.3.6 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0) 18303
- 131.3.8 Constructor(Str as String) 18303
- 131.3.9 Constructor(Str as String, Size as Int64, Offset as Int64 = 0) 18304

131.3.8 Constructor(Str as String)

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new MemoryBlockMBS with content of string.
Example:

```
Var s as string = "Hello World"
Var x as new MemoryBlockMBS(s)

MessageBox str(x.Size)
```

Notes: Text encoding is ignored and bytes copied as they are.
Raises exception is size is invalid or no memory is available.
See also:

- 131.3.4 Constructor 18302
- 131.3.5 Constructor(Mem as MemoryBlock) 18302
- 131.3.6 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0) 18303
- 131.3.7 Constructor(Size as Int64) 18303
- 131.3.9 Constructor(Str as String, Size as Int64, Offset as Int64 = 0) 18304

131.3.9 Constructor(Str as String, Size as Int64, Offset as Int64 = 0)

MBS Util Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new MemoryBlockMBS with given size and copies content of string.
Example:

```
Var s as string = "Hello World"
Var x as new MemoryBlockMBS(s, 9)

MessageBox str(x.Size)
```

Notes: Text encoding is ignored and bytes copied as they are.
Raises exception is size is invalid or no memory is available.
See also:

- 131.3.4 Constructor 18302
- 131.3.5 Constructor(Mem as MemoryBlock) 18302
- 131.3.6 Constructor(Mem as MemoryBlock, Size as Int64, Offset as Int64 = 0) 18303
- 131.3.7 Constructor(Size as Int64) 18303
- 131.3.8 Constructor(Str as String) 18303

131.3.10 Create(size as Int64) as boolean

MBS Util Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new memoryblock.
Example:

```
Var m as MemoryBlockMBS
Var n as MemoryBlock
Var t as Integer

const size=2200000000

// RB: up to 1 GigaByte
// Plugin: up to 2 GigaByte - 1 Byte

m=New MemoryBlockMBS

t=ticks
if m.Create(size) then
n=m.Memory

MessageBox str(ticks-t)

end if

t=ticks
n=NewMemoryBlock(size)
if n<>nil then
MessageBox str(ticks-t)
end if
```

Notes: Returns true on success and false on failure.
Size can be any positive value up to &h7FFFFFFF (=2^31-1).

Size became 64bit to avoid integer overflows.

131.3.11 Resize(Size as Int64) as boolean

MBS Util Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tries to resize the memorybock to the new size.
Example:

```
Var m as new MemoryBlockMBS
```

```
if m.Create(1000) then
MessageBox str(m.Size)

if m.Resize(2000) then
MessageBox str(m.Size)
end if
end if
```

Notes: Returns true on success.
If false is returned, the memoryblockMBS is not touched.

If the new size is smaller, data is lost as the memoryblock is cut.
If the new size is bigger, the memoryblock is resized. Or if that does not work, a new memoryblock is created and data is copied. New bytes will be zero.

131.3.12 Properties

131.3.13 Address as Int64

MBS Util Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The address of the memory.
Notes: This value became 64bit to avoid integer overflows.
(Read only property)

131.3.14 Memory as Memoryblock

MBS Util Plugin, Plugin Version: 5.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The memoryblock to access this memory.
Notes: Keep a reference to the MemoryBlockMBS object as long as you use this memoryblock object.
(Read only property)

131.3.15 Size as Int64

MBS Util Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of this memoryblock.
Notes: This value became 64bit to avoid integer overflows.
(Read only property)

131.4 class MemoryStorageMBS

131.4.1 class MemoryStorageMBS

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to store stuff in memory outside of the app memory.
Example:

```
// keep a big buffer outside the normal app memory and access parts of it
Var storage As New MemoryStorageMBS(100 * 1024 * 1024) // 100 MB

storage.StringValue(0) = "Header"
storage.StringValue(1000) = "Some data at offset 1000"

Var header As String = storage.StringValue(0, 6)
Var part As String = storage.StringValue(1000, 24)
MessageBox header + EndOfLine + part + EndOfLine + "Size: " + storage.Size.ToString
```

Notes: The memory is stored using mapped memory in the system address space outside of the 32bit app memory of your app.

Normally a 32-bit app can only use 2 to 4 GB of memory. Using blocks of memory outside this address space, you can easily keep 10 GB of data in memory.

Be aware that a some point creating more storages may fail due to out of memory.
The system may decide to swap memory to disk if you run out of physical memory.

Please have your app check free space on boot disk regularly and avoid running out of disk space for swap!

131.4.2 Methods

131.4.3 Constructor(Size as Int64 = 0)

MBS Util Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: If size >0, we allocate the memory for this size right away.

131.4.4 Destructor

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

131.4.5 MemoryValue(Offset as Int64, Assigns s as MemoryBlock)

MBS Util Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets part of memory storage as string.
Notes: Offset and Size are checked for range and an OutOfBoundsException can be raised.
Please use constructor before to create memory storage with given size.
See also:

- 131.4.10 MemoryValue as MemoryBlock 18309
- 131.4.6 MemoryValue(Offset as Int64, Size as Int64) as MemoryBlock 18308

131.4.6 MemoryValue(Offset as Int64, Size as Int64) as MemoryBlock

MBS Util Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries part of memory storage as memory block.
Notes: Offset and Size are checked for range and an OutOfBoundsException can be raised.
See also:

- 131.4.10 MemoryValue as MemoryBlock 18309
- 131.4.5 MemoryValue(Offset as Int64, Assigns s as MemoryBlock) 18308

131.4.7 StringValue(Offset as Int64, Assigns s as String)

MBS Util Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries part of memory storage as string.
Notes: Offset and Size are checked for range and an OutOfBoundsException can be raised.
Please use constructor before to create memory storage with given size.
See also:

- 131.4.13 StringValue as String 18310
- 131.4.8 StringValue(Offset as Int64, Size as Int64) as String 18309

131.4.8 StringValue(Offset as Int64, Size as Int64) as String

MBS Util Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries part of memory storage as string.
Notes: Offset and Size are checked for range and an OutOfBoundsException can be raised.
See also:

- 131.4.13 StringValue as String 18310
- 131.4.7 StringValue(Offset as Int64, Assigns s as String) 18308

131.4.9 Properties

131.4.10 MemoryValue as MemoryBlock

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The content of this memory storage as a memoryblock.
Notes: (Read and Write property)
See also:

- 131.4.5 MemoryValue(Offset as Int64, Assigns s as MemoryBlock) 18308
- 131.4.6 MemoryValue(Offset as Int64, Size as Int64) as MemoryBlock 18308

131.4.11 Size as Integer

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of the data in bytes.
Notes: (Read and Write property)

131.4.12 SizeAllocated as Integer

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of memory allocated.
Notes: (Read and Write property)

131.4.13 StringValue as String

MBS Util Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The content of this memory storage as a string.
Notes: (Read and Write property)
See also:

- 131.4.7 StringValue(Offset as Int64, Assigns s as String) 18308
- 131.4.8 StringValue(Offset as Int64, Size as Int64) as String 18309

Chapter 132

Messages

132.1 class MFMailComposeViewControllerMBS

132.1.1 class MFMailComposeViewControllerMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A standard view controller, whose interface lets the user manage, edit, and send email messages.
Notes: Use this view controller to display a standard email interface inside your app. Before presenting the interface, populate the fields with initial values for the subject, email recipients, body text, and attachments of the email. After presenting the interface, the person can edit your initial values before sending the email.

The composition interface doesn,Äôt guarantee the delivery of your email message; it only lets you construct the initial message and present it for user approval. The person may opt to cancel the composition interface which discards the message and its contents. If the person opts to send the message, the message queues in the user,Äôs Mail app outbox. The Mail app is ultimately responsible for sending the message.

An alternate way to compose emails is to create and open a URL that uses the mailto scheme. URLs of that type go directly to the built-in Mail app, which uses your URL to configure a message. For information about the structure of mailto URLs, see Apple URL Scheme Reference.

132.1.2 Methods

132.1.3 addAttachmentData(attachment as MemoryBlock, mimeType as String, fileName as String)

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Adds the specified data as an attachment to the message.
Notes: attachment: The data to attach. Typically, this is the contents of a file that you want to include. This parameter must not be nil.
mimeType: The MIME type of the specified data. (For example, the MIME type for a JPEG image is image/jpeg.) For a list of valid MIME types, see http://www.iana.org/assignments/media-types/. This parameter is set to "application/octet-stream" if passed empty.
filename: The preferred filename to associate with the data. This is the default name applied to the file when it is transferred to its destination. Any path separator (/) characters in the filename are converted to underscore (_) characters prior to transmission.

This method attaches the specified data after the message body, but before the user,Äôs signature. You may attach multiple files (using different file names), but must do so prior to displaying the mail composition interface. Don,Äôt call this method after presenting the interface to the user.

132.1.4 canSendMail as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a Boolean that indicates whether the current device is able to send email.
Notes: True if the device is configured for sending email or false if it is not.

You should call this method before attempting to display the mail composition interface. If it returns false, you must not display the mail composition interface.

132.1.5 Constructor

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The constructor.

132.1.6 Destructor

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The destructor.

132.1.7 Dismiss

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Dismisses the controller.

132.1.8 MFMailComposeErrorDomain as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The domain used for error objects that are associated with the mail composition interface.

132.1.9 Present

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Presents the controller.

132.1.10 setBccRecipients(bccRecipients() as String)

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Sets the initial recipients to include in the email,Äôs Bcc field.
Notes: bccRecipients: An array of strings, each containing the email address of a single recipient.

This method replaces the previous blind carbon-copy (Bcc) recipients with the new ones listed in the bccRecipients parameter. This method doesn,Äôt filter out duplicate email addresses, so if duplicates are present, the recipient may receive multiple copies of the email message.
Only call this method before you display the mail composition interface. Don,Äôt call it after presenting the interface to the user.

132.1.11 setCcRecipients(ccRecipients() as String)

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Sets the initial recipients to include in the email,Äôs Cc field.
Notes: ccRecipients: An array of strings, each containing the email address of a single recipient.

This method replaces the previous carbon-copy (Cc) recipients with the new ones listed in the ccRecipients parameter. This method doesn,Äôt filter out duplicate email addresses, so if duplicates are present, multiple copies of the email message may be sent to the same address.
Only call this method before you display the mail composition interface. Don,Äôt call it after presenting the interface to the user.

132.1.12 setMessageBody(body as String, isHTML as Boolean)

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Sets the initial body text to include in the email.
Notes: body: The initial body text of the message. The text is interpreted as either plain text or HTML, depending on the value of the isHTML parameter.
isHTML: Specify true if the body parameter contains HTML content or specify false if it contains plain text.

This method replaces the previous body content with the new content. If the user has a signature file, the body content is inserted immediately before the signature. If you want to include images with your content, you must attach the images separately using the addAttachmentData method.
Only call this method before you display the mail composition interface. Don,Äôt call it after presenting the interface to the user.

132.1.13 setToRecipients(toRecipients() as String)

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Sets the initial recipients to include in the email,Äôs To field.
Notes: toRecipients: An array of strings, each containing the email address of a single recipient.

This method replaces the previous recipients with the new ones listed in the toRecipients parameter. This method doesn,Äôt filter out duplicate email addresses, so if duplicates are present, multiple copies of the email message may be sent to the same address.
Only call this method before you display the mail composition interface. Don,Äôt call it after presenting the interface to the user.

132.1.14 Properties

132.1.15 Handle as Integer

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

132.1.16 isBeingPresented as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Whether the controller is presented.
Notes: Returns true if the dialog is visible.
(Read only property)

132.1.17 isHTML as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Whether message body is html.
Notes: (Read only property)

132.1.18 messageBody as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The message body.
Notes: (Read only property)

132.1.19 preferredSendingEmailAddress as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The preferred email address to use in the From field, if such an address is available.
Notes: emailAddress: The preferred email address used to send this message.

If the user doesn,Äôt have an account with a preferred address set up, the default account is used instead. Only set this method before you display the mail composition interface. Don,Äôt call it after presenting the interface to the user.
(Read and Write property)

132.1.20 subject as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The initial text for the subject line of the email.
Notes: This method replaces the previous subject text with the new text. Only set this property before you display the mail composition interface. Don,Äôt set it after presenting the interface to the user.
(Read and Write property)

132.1.21 Events

132.1.22 didFinishWithResult(result as Integer, error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Tells you that the user wants to dismiss the mail composition view.
Notes: result: The result of the user,Äôs action. See constants
error: If an error occurred, this parameter contains an error object with information about the type of failure.

Your implementation of this method should dismiss the mail composition view. Implementation of this method is optional, but expected.

If the user has opted to send the email created by this interface, that email should be queued in the user,Äôs Mail program by the time this method is called. If an error occurred while queueing the email message, the error parameter contains an error object that indicates the type of failure that occurred.

132.1.23 dismissed

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The dialog got dismissed.

132.1.24 Constants

Error Codes

Constant	Value	Description
MailComposeErrorCodeSaveFailed	0	An error occurred while trying to save the email message to the Drafts fold
MailComposeErrorCodeSendFailed	1	An error occurred while trying to queue or send the email message.

Result Codes

Constant	Value	Description
MailComposeResultCancelled	0	The user canceled the operation.
MailComposeResultFailed	3	The email message was not saved or queued, possibly due to an error.
MailComposeResultSaved	1	The email message was saved in the user,Äôs drafts folder.
MailComposeResultSent	2	The email message was queued in the user,Äôs outbox.

132.2 class MFMessageComposeViewControllerMBS

132.2.1 class MFMessageComposeViewControllerMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A standard view controller whose interface lets the user compose and send SMS or MMS messages.
Notes: Use an MFMessageComposeViewController object to display the standard message composition interface inside your app. Before presenting the interface, populate the fields with the set of initial recipients and the message you want to send. After presenting the interface, a person can edit your initial values before sending the message.

The composition interface doesn,Äôt guarantee the delivery of your message; it only lets you construct the initial message and present it for a person,Äôs approval. The person may opt to cancel the composition interface which discards the message and its contents. If the person opts to send the message, the Messages app takes on the responsibility of sending the message.

An alternate way to compose SMS messages is to create and open a URL that uses the sms scheme. URLs of that type go directly to the Messages app, which uses your URL to configure the message. For information about the structure of sms URLs, see Apple URL Scheme Reference.

132.2.2 Methods

132.2.3 addAttachmentData(attachment as MemoryBlock, typeIdentifier as String, fileName as String) as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Attaches arbitrary content to the message.
Notes: attachment: Content in the form of an NSData object to attach to the message. Must not be nil.

typeIdentifier: A valid Uniform Type Identifier (UTI) appropriate for the attachment data. See Uniform Type Identifiers Reference.
filename: The name to present to the user, in the message UI, for the data attachment.

Returns true if the attachment data was successfully added to the message, or false otherwise.

This method is especially useful when the attachment you want to add to a message does not have a file system representation. This can be the case, for example, for programmatically composed audiovisual content.

132.2.4 addAttachmentFile(attachmentFile as FolderItem, alternateFilename as String) as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Attaches a specified file to the message.
Notes: attachmentFile: The file URL for the attachment. Must not be nil.
alternateFilename: If you supply a string here, the message UI uses it for the attachment. Use an alternate filename to better describe the attachment or to make the name more readable. OK to use a "" value, in which case the attachment,Äôs actual filename is displayed in the message UI.

Returns true if the attachment at the specified URL was successfully added to the message, or false otherwise.

You can add zero or more attachments to a message before you display the message to the user. To access information about a message,Äôs attachments, access the attachments property.

132.2.5 canSendAttachments as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Indicates whether or not messages can include attachments.
Notes: True if the device can send attachments in MMS or iMessage messages, or false otherwise.

132.2.6 canSendSubject as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Indicates whether or not messages can include subject lines, according to the user,Äôs configuration in Settings.
Notes: True if the device can include subject lines in messages, or false otherwise.

132.2.7 canSendText as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a Boolean value that indicates whether the current device is capable of sending text messages.
Notes: True if the device can send text messages or false if it cannot.

Always call this method before attempting to present the message compose view controller. A device may be unable to send messages if it does not support messaging or if it is not currently configured to send messages. This method applies only to the ability to send text messages via iMessage, SMS, and MMS.
To be notified of changes in the availability of sending text messages, register as an observer of the MFMessageComposeViewControllerTextMessageAvailabilityDidChangeNotification notification.

132.2.8 Constructor

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The constructor.

132.2.9 Destructor

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The destructor.

132.2.10 disableUserAttachments

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Disables the camera/attachment button in the message composition view.
Notes: In iOS 7.0 and later, call this method to disable the camera/attachment button in the message composition view. In an app linked against an older version of iOS, the camera/attachment button is not available in any case.

132.2.11 Dismiss

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Dismisses the controller.

132.2.12 isSupportedAttachmentUTI(uti as String) as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Indicates whether or not the message can accept a file, with the specified UTI, as an attachment.
Notes: uti: The UTI (Uniform Type Identifier) in question. See Uniform Type Identifiers Reference

Returns treu if a file with the specified UTI can be attached to the message, or false otherwise.

132.2.13 MFMessageComposeViewControllerAttachmentAlternateFilename as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The key for the alternate filename for the file-based item attached to the message.
Notes: Use this constant with the attachments property to retrieve the optional, more descriptive name for a message attachment.

132.2.14 MFMessageComposeViewControllerAttachmentURL as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The URL for the item that is attached to the message.

132.2.15 MFMessageComposeViewControllerTextMessageAvailabilityDidChangeNotification as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Posted when the value returned by the canSendText class method has changed.
Notes: Upon receiving this notification, query its userInfo dictionary with the MFMessageComposeViewControllerTextMessageAvailabilityKey key. If the availability of text message sending has changed, your app should invalidate caches and update its user interface as appropriate.

You can receive this notification with NSNotificationObserverMBS class.

132.2.16 MFMessageComposeViewControllerTextMessageAvailabilityKey as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The value of this key is a number object that contains a Boolean value.
Notes: This value matches the result of the canSendText class method.The userInfo dictionary for the MFMessageComposeViewControllerTextMessageAvailabilityDidChangeNotification notification includes this key. The value of this key is a Boolean value. This value matches the result of the canSendText class method.

132.2.17 Present

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Presents the controller.

132.2.18 Recipients as String()

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: An array of strings that contains the initial recipients of the message.

132.2.19 setRecipients(Recipients() as String)

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Sets an array of strings that contains the initial recipients of the message.
Notes: If you want to provide an initial array of one or more recipients for a message, do so before you display it. After the message is displayed you cannot change the value of this property.
Each string in the array should contain the phone number of the intended recipient.

132.2.20 Properties

132.2.21 attachments as Variant

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns an array of dictionaries that describe the properties of an attachment.
Notes: Each attachment is described by an dictionary object in the attachments array. To retrieve the alternate file name for an attachment from its dictionary, use the MFMessageComposeViewControllerAttachmentAlternateFilename key.
(Read only property)

132.2.22 body as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The initial content of the message.
Notes: If you want to provide initial content in the body of a message, do so before you display it. After the message is displayed you cannot change the value of this property.
(Read and Write property)

132.2.23 Handle as Integer

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

132.2.24 isBeingPresented as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Whether the controller is presented.
Notes: Returns true if the dialog is visible.
(Read only property)

132.2.25 subject as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The initial subject of the message.
Notes: If you want to provide an initial subject for a message, do so before you display it. After the message is displayed you cannot change the value of this property.
(Read and Write property)

132.2.26 Events

132.2.27 didFinishWithResult(result as Integer)

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Tells you that the user finished composing the message.
Notes: result: A result code that indicates how the user chose to complete the composition.

This method is called when the user taps one of the buttons to dismiss the message composition interface. Your implementation of this method should dismiss the view controller and perform any additional actions needed to process the sending of the message. The result parameter lets you know whether the user chose to cancel or send the message, or whether sending the message failed.
Implementation of this method is required.

132.2.28 dismissed

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The dialog got dismissed.

132.2.29 Constants

Result Codes

Constant	Value	Description
MessageComposeResultCancelled	0	The user canceled the composition.
MessageComposeResultFailed	2	The user,Äôs attempt to save or send the message was unsuccessful.
MessageComposeResultSent	1	The user successfully queued or sent the message.

Chapter 133

MIDI

133.1 class AVMIDIPlayerMBS

133.1.1 class AVMIDIPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: The AVMIDIPlayer class is a player for music file formats such as MIDI and iMelody.
Example:

```
// play a MIDI file
// MyMIDIPlayer is a subclass of AVMIDIPlayerMBS with the Completed event implemented.
// Player is a property of the window: Player As MyMIDIPlayer
Var error As NSErrorMBS
Player = New MyMIDIPlayer(SpecialFolder.Desktop.Child("song.mid"), Nil, error) // Nil = default sound
bank
If error <>Nil Then
MessageBox error.localizedDescription
Return
End If

Player.Rate = 1.2 // a bit faster
Player.prepareToPlay
Player.play

// in MyMIDIPlayer:
Sub Completed() Handles Completed
System.DebugLog "MIDI playback finished."
End Sub
```

Notes: Requires Mac OS X 10.10.

See also MidiPlaybackMBS class for playing notes.

133.1.2 Methods

133.1.3 Constructor(Data as MemoryBlock, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Initializes a newly allocated MIDI player with the contents of the String, using the specified sound bank.
Notes: Data: The data to play.
SoundBankFile: The folderitem of the sound bank. The sound bank must be a SoundFont2 or DLS bank.
Error: Returns, by-reference, a description of the error, if an error occurs.

For OS X the bank folderitem can be set to nil to use the default sound bank. However, iOS must always refer to a valid bank file.
See also:

- 133.1.4 Constructor(Data as String, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS) 18326
- 133.1.5 Constructor(File as FolderItem, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS) 18327

133.1.4 Constructor(Data as String, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Initializes a newly allocated MIDI player with the contents of the String, using the specified sound bank.
Notes: Data: The data to play.
SoundBankFile: The folderitem of the sound bank. The sound bank must be a SoundFont2 or DLS bank.
Error: Returns, by-reference, a description of the error, if an error occurs.

For OS X the bank folderitem can be set to nil to use the default sound bank. However, iOS must always refer to a valid bank file.
See also:

- 133.1.3 Constructor(Data as MemoryBlock, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS) 18326
- 133.1.5 Constructor(File as FolderItem, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS) 18327

133.1.5 Constructor(File as FolderItem, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Initializes a newly allocated MIDI player with the contents of the file, using the specified sound bank.
Notes: File: The file to play.
SoundBankFile: The folderitem of the sound bank. The sound bank must be a SoundFont2 or DLS bank.
Error: Returns, by-reference, a description of the error, if an error occurs.

For OS X the bank folderitem can be set to nil to use the default sound bank. However, iOS must always refer to a valid bank file.
See also:

- 133.1.3 Constructor(Data as MemoryBlock, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS) 18326
- 133.1.4 Constructor(Data as String, SoundBankFile as FolderItem = nil, byref error as NSErrorMBS) 18326

133.1.6 Destructor

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: The destructor.

133.1.7 play

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Plays the sequence.
Notes: If prepareToPlay has not been invoked, play may be delayed while the events are prerolled.

133.1.8 prepareToPlay

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Prepares to play the sequence by prerolling all events.
Notes: This happens automatically on play if it has not already been called, but may produce a delay in startup.

133.1.9 stop

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Stops playing the sequence.

133.1.10 Properties

133.1.11 CurrentPosition as Double

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: The current playback position, in seconds.
Notes: You can set the currentPosition of the player while the player is playing, in which case playback will resume at the new time.

Note: No range checking on the currentPosition value is done when you set it to a new value. It is your responsibility to ensure the position is valid relative to the duration.
(Read and Write property)

133.1.12 Duration as Double

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: The length of the currently loaded file, in seconds.
Notes: (Read only property)

133.1.13 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

133.1.14 Playing as Boolean

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Whether the sequence is playing.
Notes: The player may have reached the end of all the events in any of its tracks, but it will return true until it is stopped.
(Read only property)

133.1.15 Rate as Double

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: The playback rate of the player.
Notes: The default value is 1.0, normal playback rate.
(Read and Write property)

133.1.16 Events

133.1.17 Completed

MBS AVFoundation Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Called when a MIDI playback request is completed.

133.2 class MidiClientMBS

133.2.1 class MidiClientMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: A class for the global MIDI stuff on Mac OS X.
Example:

```
// list the MIDI sources and destinations on the Mac
// Client is a property of the window: Client As MidiClientMBS
Client = New MidiClientMBS
Client.Init NewCFStringMBS("MyApp")

Var lines() As String
For i As Integer = 0 To Client.NumberOfSources - 1
lines.Add "Source: " + Client.GetSource(i).DisplayName
Next
For i As Integer = 0 To Client.NumberOfDestinations - 1
lines.Add "Destination: " + Client.GetDestination(i).DisplayName
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Only make one instance of this class in your application.

From Apple's documentation:

History:

Apple's MIDI Manager (ca. 1990) had a simple model of the world. There were application and driver clients, which had MIDI in/out ports, which could be interconnected in arbitrary ways. This model failed to provide a way for applications to make reasonable assumptions about how to make bi-directional connections to a MIDI device. MIDI Manager also had limitations on the number of ports per client, and became very unwieldy with the advent of large studios and multi-port MIDI interfaces such as the MIDI Time Piece and Studio 5.

Opcode's OMS (1991) addressed some of the shortcomings of MIDI Manager. There was the concept of a studio setup document, where drivers detected their devices, and the user could define the characteristics of additional devices connected to the MIDI ports. Applications could view the studio both as a collection of MIDI source and destination "nodes", but also as a collection of devices. OMS collected information about, and made available to its clients, useful characteristics of the devices in the studio, such as their system-exclusive IDs, MIDI channels on which they were listening, which were controllers (as opposed to simple tone generators), etc.

API Overview:
This design expands slightly on OMS's device/node hierarchy, inspired by the USB MIDI spec.

Drivers own and control devices, e.g. USB interfaces, PCI cards, etc. A device is defined as a physical object that would be represented by a single icon if there were a graphical view of the studio.

Devices may have multiple logically distinct sub-components, e.g. a MIDI synthesizer and a pair of MIDI ports, both addressable via a USB port. These are called Entities.

Entities have any number of Endpoints, sources and destinations of 16-channel MIDI streams. By grouping a device's endpoints into entities, the system has enough information for an application to make reasonable assumptions about how to communicate in a bi-directional manner with each entity, as is necessary in MIDI librarian applications.

Third-party services like FreeMIDI or OMS can collect and report interesting properties of a device by attaching those properties to the devices' entities – CoreMIDI provides a central database, but no user interfaces.. It's worth noting that some device characteristics are dynamic (e.g. MIDI receive channel and system-exclusive ID's), or a matter of user preference (choice of icon, whether the device should appear in lists of possible controllers), while other properties are static and could be looked up in a database, using the device's manufacturer and model names as a key.

Persistent configurations / Device Information:
There are a number of reasons why CoreMIDI has a persistent state.

Endpoints must have persistent ID's. When a user assigns events in a sequencing application to an endpoint, the application needs a way to retain a permanent reference to the selected endpoint. A brute-force method of generating a persistent ID would be to combine the driver name, device name, entity name, and endpoint type and index into a string, but this is not very friendly to clients even if the system provides services to generate and decode these strings.

Consider a USB MIDI interface driver, in the case where there are two instances of one model of interface present. The driver needs a way to permanently distinguish, to the system and its clients, between the two interfaces. Which is #1 and which is #2? If #1 gets unplugged, #2 should not automatically become #1; the user's documents may be referring to devices which were attached to #2.

The system needs a persistent concept of which driver's device is attached to a serial port.

Some drivers will need to store configuration information about the devices they control. For example, the driver for a standard MIDI interface on a serial port needs to remember which external clocking speed to use (this is a simple, slightly obscure, but hardly unique example). The Alesis QS7 is capable of communicating at a variety of speeds, so its driver needs to remember the correct speed.

These needs for persistent configuration information provide a rationale for having something akin to OMS's studio setup document, a saved configuration for the system. Mobile users who work in multiple environments could select between multiple saved configurations in a Location Manager-compatible manner.

Given services with which to store driver configuration information, we then have built the groundwork for a client studio setup editor application.
Such an application can define external MIDI devices (not to be confused with the driver-owned cards/interfaces/etc whose presence in the configuration is determined by the driver).

Moreover, since a driver knows exactly what device it is communicating with, it is capable of supplying information to the system about the characteristics of the device, such as its system-exclusive ID, whether it is General MIDI or DLS-compatible, etc.

But unlike OMS, the system is able to begin functioning immediately, using only the MIDI devices/endpoints detected by the drivers, without forcing the user to go through a somewhat lengthy and confusing intial configuration process. Definition of external MIDI devices can be a completely optional step, only made possible when a client application requests that they be added to the configuration.

Implementation overview:
The client API is implemented as the CoreMIDI framework, which uses IPC to communicate with a server process, MIDIServer.

The server process loads, and manages all communication with, MIDI drivers. Most of its implementation is in the CoreMIDIServer framework, which drivers may import in order to access the API.

"Drivers" are not I/O Kit drivers. They are dynamic libraries, using CFPlugin.

Many MIDI drivers can simply be user-side I/O Kit clients (probably for serial, USB, Firewire).

PCI card drivers will need their MIDI drivers to communicate with a separate kernel extension.

If you have an old file named EmagicUSBMIDIDriver.plugin in your /Library/Audio/MIDI Drivers folder, please remove it. It makes trouble with our Midi classes.

See also macOS specific classes AVMIDIPlayerMBS and MidiPlaybackMBS for playback. For Windows see also WindowsMidiMBS class.
See also PortMidiMBS class for cross platform Midi handling.
Subclass of the MidiObjectMBS class.

133.2.2 Methods

133.2.3 Available as boolean

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: True if the MIDI stuff was successful loaded.

133.2.4 close

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

133.2.5 CreateDestination(name as CFStringMBS, TargetEndpointObject as MidiEndpointMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: Create a virtual destination in a client.
Notes: Clients may use this to create virtual destinations.
Lasterror is set.
You must pass a valid new MidiEndpointMBS for TargetEndpointObject. Best is if you make a subclass from MidiEndpointMBS and fill the event. You can add there additional methods and properties. CreateDestination will than fill the handle property on success.

133.2.6 CreateInputPort(name as CFStringMBS, targetportobject as MidiPortMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Create an input port through which the client may receive incoming MIDI messages from any MIDI source.
Example:

```
Var mc as MidiClientMBS
Var mp as MidiPortMBS

mc=new MidiClientMBS
mc.Init NewCFStringMBS("Testapp")

mp=new MidiPortMBS
mc.CreateInputPort NewCFStringMBS("Testport"), mp

if mp.Handle=0 then
MessageBox "There was an error: "+str(mc.Lasterror)
else
MessageBox "ok"
end if
```

Notes: After creating a port, use MIDIPortConnectSource to establish an input connection from any number of sources to your port.

Lasterror is set.

As you can subclass the MidiPortMBS class you must pass to this function a valid MidiPortMBS object so it can be filled.

133.2.7 CreateOutputPort(name as CFStringMBS, targetportobject as MidiPortMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Create an output port through which the client may send outgoing MIDI messages to any MIDI destination.
Example:

```
Var mc as MidiClientMBS
Var mp as MidiPortMBS

mc=new MidiClientMBS
mc.Init NewCFStringMBS("Testapp")

mp=new MidiPortMBS
mc.CreateOutputPort NewCFStringMBS("Testport"), mp

if mp.Handle=0 then
MessageBox "There was an error: "+str(mc.Lasterror)
else
MessageBox "ok"
```

```
end if
```

Notes: Output ports provide a mechanism for MIDI merging. The system assumes that each output port will be responsible for sending only a single MIDI stream to each destination, although a single port may address all of the destinations in the system.

Lasterror is set.

As you can subclass the MidiPortMBS class you must pass to this function a valid MidiPortMBS object so it can be filled.

133.2.8 CreateSource(name as CFStringMBS) as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Creates a new virtual Midi source.
Example:

```
Var m as MidiClientMBS
Var e as MidiEndpointMBS

m=new MidiClientMBS

// Initialize
m.Init NewCFStringMBS("Hallo")

// Create device:
e=m.CreateSource(NewCFStringMBS("Hallo"))

// if error is 0 and handle is not 0, it's okay
MessageBox "error: "+str(m.Lasterror)+", handle: "+str(e.Handle)
```

Notes: Lasterror is set.
Returns nil on any error.

Clients may use this to create virtual sources.

After creating a virtual source, use Received to transmit MIDI messages from your virtual source to any clients connected to the virtual source.

133.2.9 FindObjectByUniqueID(id as Integer) as MidiObjectMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Locate a device, typedefal device, entity, or endpoint by its uniqueID.
Notes: New for CoreMIDI 1.3.
You may cast the returned object to MidiEndpointMBS, MidiEntityMBS or MidiDeviceMBS. RB's "isa" command may help you.
Returns nil on any error. Lasterror is set.

133.2.10 GetDestination(index as Integer) as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return one of the destinations in the system.
Notes: The index goes from 0 to NumberOfDestinations-1.
Lasterror is set.
Returns nil on any error.

133.2.11 GetDevice(index as Integer) as MidiDeviceMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return one of the devices in the system.
Notes: To enumerate the entities in the system, you can walk through the devices, then walk through the devices' entities.

Note: If a client iterates through the devices and entities in the system, it will not ever visit any virtual sources and destinations created by other clients. Also, a device iteration will return devices which are "offline" (were present in the past but are not currently present), while iterations through the system's sources and destinations will not include the endpoints of offline devices.

Thus clients should usually prefer NumberOfSources, GetSource, NumberOfDestinations and GetDestination to iterating through devices and entities to locate endpoints.

Lasterror is set.
Returns nil on any error.

133.2.12 GetExternalDevice(index as Integer) as MidiDeviceMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return one of the external devices in the system.
Notes: The index goes from 0 to NumberOfDevices-1.
Lasterror is set.
Returns nil on any error.

133.2.13 GetSource(index as Integer) as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return one of the sources in the system.
Notes: The index goes from 0 to NumberOfSources-1.
Lasterror is set.
Returns nil on any error.

133.2.14 Init(name as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Creates a new Client object with the given client name.
Notes: Lasterror is set.

133.2.15 NumberOfDestinations as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Returns the number of destinations in the system.
Example:

```
Var m as new MidiClientMBS
Var n as Integer = m.NumberOfDestinations

MessageBox "NumberOfDestinations: "+str(n)
```

Notes: Returns 0 on any error.
Lasterror is set.

133.2.16 NumberOfDevices as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Returns the number of devices in the system.
Example:

```
Var m as new MidiClientMBS
Var n as Integer = m.NumberOfDevices

MessageBox "NumberOfDevices: "+str(n)
```

Notes: Returns 0 on any error.
Lasterror is set.

133.2.17 NumberOfExternalDevices as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Returns the number of typedefal MIDI devices in the system.
Example:

```
Var m as new MidiClientMBS
Var n as Integer = m.NumberOfExternalDevices

MessageBox "NumberOfExternalDevices: "+str(n)
```

Notes: External MIDI devices are MIDI devices connected to endpoints via a standard MIDI cable. Their presence is completely optional, only when a UI somewhere adds them.

New for CoreMIDI 1.1.

Returns 0 on any error.
Lasterror is set.

133.2.18 NumberOfSources as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Returns the number of sources in the system.
Example:

```
Var m as new MidiClientMBS
Var n as Integer = m.NumberOfSources

MessageBox "NumberOfSources: "+str(n)
```

Notes: Returns 0 on any error.
Lasterror is set.

133.2.19 Restart as Integer

MBS MacCF Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Stops and restarts MIDI I/O.
Notes: This is useful for forcing CoreMIDI to ask its drivers to rescan for hardware.
Returns the Mac OS X error code.

133.2.20 Send(port as MidiPortMBS, endpoint as MidiEndpointMBS, packets as MidiPacketListMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Sends midi data using the port to the given endpoint.
Example:

```
// Not 100% if this example works:
Var client as MIDIClientMBS
Var outport as MIDIPortMBS
Var dest as MIDIEndpointMBS
Var pack as MIDIPacketMBS
Var list as MIDIPacketListMBS
Var packs(-1) as MIDIPacketMBS

client = new MidiClientMBS

if client <>nil then
client.Init newcfstringmbs("CoreMIDI")
outport = new MIDIPortMBS
client.CreateOutputPort(NewCFStringMBS("outport"), outport)
dest = client.getDestination(0)
outport.connectSource dest

pack = new MIDIPacketMBS
list = new MIDIPacketListMBS
pack.timeStamp = nil
pack.datastring = chrb(&h90)+chrb(&h5A)+chrb(&h7C)
packs.Add pack
if not list.FillList(packs) then
MessageBox "bad"
end
```

client.Send(outport, dest, list)
end

Notes: Events with future timestamps are scheduled for future delivery. The system performs any needed MIDI merging.

Lasterror is set.

133.2.21 Events

133.2.22 ObjectAdded(parent as MidiObjectMBS, child as MidiObjectMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Called when an object is added to a MidiObject.

133.2.23 ObjectRemoved(parent as MidiObjectMBS, child as MidiObjectMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Called when an object is removed from a MidiObject.

133.2.24 PropertyChanged(target as MidiObjectMBS, theProperty as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Called when a property was changed.

133.2.25 SerialPortOwnerChanged

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: A persistent MIDI Thru connection was created or destroyed.
Notes: New for CoreMIDI 1.3.

133.2.26 SetupChanged

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Some aspect of the current MIDISetup has changed.
Notes: You should ignore this message if you handle the other messages.

133.2.27 ThruConnectionsChanged

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: A persistent MIDI Thru connection was created or destroyed.
Notes: New for CoreMIDI 1.3.

133.2.28 Constants

Constants

Constant	Value	Description
kMIDIIDNotUnique	-10843	One of the type constants for a MIDI error. Attempt to set a non-unique kMIDIPropertyUniqueID on an object.
kMIDIInvalidClient	-10830	One of the type constants for a MIDI error. An invalid MIDIClientRef was passed.
kMIDIInvalidPort	-10831	One of the type constants for a MIDI error. An invalid MIDIPortRef was passed.
kMIDIInvalidUniqueID	0	A constant for an invalid unique ID.
kMIDIMessageSendErr	-10838	One of the type constants for a MIDI error. Communication with MIDIServer failed.
kMIDIMsgIOError	7	One of the type constants for a MIDI Notification. A driver I/O error occurred.
kMIDIMsgObjectAdded	2	One of the type constants for a MIDI Notification. A device, entity or endpoint was added.
kMIDIMsgObjectRemoved	3	One of the type constants for a MIDI Notification. A device, entity or endpoint was removed.
kMIDIMsgPropertyChanged	4	One of the type constants for a MIDI Notification. An object's property was changed.
kMIDIMsgSerialPortOwnerChanged	6	One of the type constants for a MIDI Notification. A persistent MIDI Thru connection was created or destroyed. No data. for CoreMIDI 1.3.
kMIDIMsgSetupChanged	1	One of the type constants for a MIDI Notification. Some aspect of the current MIDISetup has changed. No data. Should ig this message if messages 2-6 are handled.
kMIDIMsgThruConnectionsChanged	5	One of the type constants for a MIDI Notification. A persistent MIDI Thru connection was created or destroyed. No data. for CoreMIDI 1.3.
kMIDINoConnection	-10833	One of the type constants for a MIDI error. Attempt to close a non-existent connection.
kMIDINoCurrentSetup	-10837	One of the type constants for a MIDI error. Internal error; there is no current MIDI setup object.
kMIDIObjectNotFound	-10842	One of the type constants for a MIDI error. The requested object does not exist.
kMIDIServerStartErr	-10839	One of the type constants for a MIDI error. Unable to start MIDIServer.
kMIDISetupFormatErr	-10840	One of the type constants for a MIDI error. Unable to read the saved state.
kMIDIUnknownEndpoint	-10834	One of the type constants for a MIDI error. An invalid MIDIEndpointRef was passed.
kMIDIUnknownProperty	-10835	One of the type constants for a MIDI error. Attempt to query a property not set on the object.
kMIDIWrongEndpointType	-10832	One of the type constants for a MIDI error. A source endpoint was passed to a function expecting a destination, or versa.
kMIDIWrongPropertyType	-10836	One of the type constants for a MIDI error. Attempt to set a property with a value not of the correct type.
kMIDIWrongThread	-10841	One of the type constants for a MIDI error. A driver is calling a non-I/O function in the server from a thread other the server's main thread.

133.3 class MidiDeviceMBS

133.3.1 class MidiDeviceMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: A class for a MIDI device.
Notes: A MIDI device, which either attaches directly to the computer and is controlled by a MIDI driver, or which is "external," meaning that it is connected to a driver-controlled device via a standard MIDI cable.
Subclass of the MidiObjectMBS class.

133.3.2 Methods

133.3.3 GetEntity(index as Integer) as MidiEntityMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return one of a given device's entities.
Notes: The index goes from 0 to NumberOfEntities-1.
Lasterror is set.
Returns nil on any error.

133.3.4 NumberOfEntities as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Returns the number of entilities for this device.
Notes: Returns nil on any error.
Lasterror is set.

133.4 class MidiEndpointMBS

133.4.1 class MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the CoreMidi classes.
Notes: Entities have any number of MIDIEndpointRef's, sources and destinations of 16-channel MIDI streams.
Subclass of the MidiObjectMBS class.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr1

133.4.2 Methods

133.4.3 close

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The destructor.
Notes: Frees the endpoint handle.
There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

133.4.4 Entity as MidiEntityMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Returns an endpoint's entity.
Notes: Returns nil on any error.
Lasterror is set.
New for CoreMIDI 1.3.

133.4.5 FlushOutput

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Unschedule previously-sent packets.
Notes: Clients may use MIDIFlushOutput to cancel the sending of
packets that were previously scheduled for future delivery.
New for CoreMIDI 1.1.

Lasterror is set.

133.4.6 Received(packets as MidiPacketListMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: Distribute MIDI from a source to the client input ports which are connected to that source.
Notes: Drivers should call this function when receiving MIDI from a source.
Clients which have created virtual sources, using MIDICreateSource, should call this function when the source is generating MIDI.
Lasterror is set.

133.4.7 Events

133.4.8 Read(endpoint as MidiEndpointMBS, list as MidiPacketListMBS)

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Called when data arrives at an endpoint.
Notes: If more than 256 bytes of data is received, it may be splitted and send in several events.

For some devices a Note Off is just a Note On with a zero velocity.

133.5 class MidiEntityMBS

133.5.1 class MidiEntityMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the CoreMidi classes.
Notes: Devices may have multiple logically distinct sub-components, e.g. a MIDI synthesizer and a pair of MIDI ports, both addressable via a USB port.

By grouping a device's endpoints into entities, the system has enough information for an application to make reasonable assumptions about how to communicate in a bi-directional manner with each entity, as is desirable in MIDI librarian applications.

These sub-components are MIDIEntityRef's.
Subclass of the MidiObjectMBS class.

133.5.2 Methods

133.5.3 Device as MidiDeviceMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Returns an entity's device.
Notes: Returns nil on any error.
Lasterror is set.
New for CoreMIDI 1.3.

133.5.4 GetDestination(index as Integer) as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return one of a given entity's destinations.
Notes: Lasterror is set.
Returns nil on any error.

133.5.5 GetSource(index as Integer) as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return one of a given entity's sources.

Notes: Lasterror is set.
Returns nil on any error.

133.5.6 NumberOfDestinations as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return the number of destinations in a given entity.
Notes: Lasterror is set.
Returns 0 on any error.

133.5.7 NumberOfSources as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Return the number of sources in a given entity.
Notes: Lasterror is set.
Returns 0 on any error.

133.6 class MidiObjectMBS

133.6.1 class MidiObjectMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: A class for a Mac OS X CoreMidi object.
Blog Entries

- MBS Xojo Plugins, version 24.1pr1
- MBS Xojo Plugins, version 17.4pr2
- MBS Real Studio Plugins, version 12.5pr2

133.6.2 Methods

133.6.3 kMIDIPropertyAdvanceScheduleTimeMuSec as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

device/entity/endpoint property, integer
Set by the owning driver; should not be touched by other clients.
If it is >0, then it is a recommendation of how many microseconds in advance clients should schedule output. Clients should treat this value as a minimum. For devices with a >0 advance schedule time, drivers will receive outgoing messages to the device at the time they are sent by the client, via MIDISend, and the driver is responsible for scheduling events to be played at the right times according to their timestamps.
As of CoreMIDI 1.3, this property may also be set on virtual destinations (but only the creator of the destination should do so).
When a client sends to a virtual destination with an advance schedule time of 0, the virtual destination receives its messages at their scheduled delivery time. If a virtual destination has a non-zero advance schedule time, it receives timestamped messages as soon as they are sent, and must do its own scheduling of the events.

133.6.4 kMIDIPropertyCanRoute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.5 kMIDIPropertyConnectionUniqueID as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

device/entity/endpoint property, integer or CFDataRef

UniqueID of an external device/entity/endpoint attached to this one (strongly recommended that it be an endpoint). This is for the use of a setup editor UI; not currently used internally. A driver-owned entity or endpoint has this property to refer to an external MIDI device that is connected to it.

The property is non-existent or 0 if there is no connection.

New for CoreMIDI 1.1.

Beginning with CoreMIDI 1.3, this property may be a CFDataRef containing an array of big-endian SInt32's, to allow specifying that a driver object connects to multiple external objects (via MIDI thru-ing or splitting).

This property may also exist for external devices/entities/endpoints, in which case it signifies a MIDI Thru connection to another external device/entity/endpoint (again, strongly recommended that it be an edpoint).

133.6.6 kMIDIPropertyDeviceID as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.
device/entity property, integer
The entity's system-exclusive ID, in user-visible form
Drivers may set this property on their devices or entities.
Setup editors may allow the user to set this property on external devices.

133.6.7 kMIDIPropertyDisplayName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: device/entity/endpoint property, string.

Provides the Apple-recommended user-visible name for an endpoint, by combining the device and endpoint names.

For objects other than endpoints, the display name is the same as the name.

New for CoreMIDI 1.5.

133.6.8 kMIDIPropertyDriverDeviceEditorApp as CFStringMBS

MBS MacCF Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: device property, string, contains the full path to an application which knows how to configure this driver-owned devices. Drivers may set this property on their owned devices. Applications must not write to it.

New for CoreMIDI 1.4.

133.6.9 kMIDIPropertyDriverOwner as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

device/entity/endpoint property, string

Name of the driver that owns a device.
Set by the owning driver, on the device; should not be touched by other clients. Property is inherited from the device by its entities and endpoints.

New for CoreMIDI 1.1.

133.6.10 kMIDIPropertyDriverVersion as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

device/entity/endpoint property, integer, returns the driver version API of the owning driver (only for driver-owned devices). Drivers need not set this property; applications should not write to it.

New for CoreMIDI 1.3.

133.6.11 kMIDIPropertyFactoryPatchNameFile as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

device/entity/endpoint property, CFData containing AliasHandle

An alias to the device's current factory patch name file.

Added in CoreMIDI 1.1. DEPRECATED as of CoreMIDI 1.3.
Use kMIDIPropertyNameConfiguration instead.

133.6.12 kMIDIPropertyImage as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

device property, CFStringRef which is a full POSIX path to a device or external device's icon, stored in any standard graphic file format such as JPEG, GIF, PNG and TIFF are all acceptable. (See CFURL for functions to convert between POSIX paths and other ways of specifying files.) The image's maximum size should be 128x128.

Drivers should set the icon on the devices they add.
A studio setup editor should allow the user to choose icons for external devices.

New for CoreMIDI 1.3.

133.6.13 kMIDIPropertyIsBroadcast as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.
entity/endpoint property, integer
1 if the endpoint broadcasts messages to all of the other endpoints in the device, 0 if not. Set by the owning driver; should not be touched by other clients.
New for CoreMIDI 1.3.

133.6.14 kMIDIPropertyIsDrumMachine as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.15 kMIDIPropertyIsEffectUnit as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.16 kMIDIPropertyIsEmbeddedEntity as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

entity/endpoint property, integer
0 if there are external MIDI connectors, 1 if not.
New for CoreMIDI 1.1.

133.6.17 kMIDIPropertyIsMixer as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.18 kMIDIPropertyIsSampler as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.19 kMIDIPropertyManufacturer as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Example:

```
Var m as MidiClientMBS
Var i, n as Integer
Var e as MIDIEndpointMBS
Var d as MIDIDeviceMBS
Var s as CFStringMBS

m = new MidiClientMBS
m.Init NewCFStringMBS("Test")
d = m.GetDevice(0)

s = d.StringProperty(d.kMIDIPropertyManufacturer)

MessageBox s.str
```

Notes: Only available after you called the Init Method.

device/endpoint property, string
Drivers should set this property on their devices.

Setup editors may allow the user to set this property on external devices.
Creators of virtual endpoints may set this property on their endpoints.

133.6.20 kMIDIPropertyMaxReceiveChannels as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0-16

133.6.21 kMIDIPropertyMaxSysExSpeed as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.
device/entity/endpoint property, integer
Set by the owning driver; should not be touched by other clients.
maximum bytes/second of sysex messages sent to it
(default is 3125, as with MIDI 1.0)

133.6.22 kMIDIPropertyMaxTransmitChannels as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0-16

133.6.23 kMIDIPropertyModel as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

device/endpoint property, string
Drivers should set this property on their devices.
Setup editors may allow the user to set this property on external devices.
Creators of virtual endpoints may set this property on their endpoints.

133.6.24 kMIDIPropertyName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Example:

```
// init midi
Var m as new MidiClientMBS
m.Init NewCFStringMBS("TestApp")

// create a source
Var name as CFStringMBS = NewCFStringMBS("TestSource")
Var source as MidiEndpointMBS = m.CreateSource(name)

// query name property
Var s as CFStringMBS = source.StringProperty(source.kMIDIPropertyName)
MessageBox "Name: "+s.str
```

Notes: Only available after you called the Init Method.

device/entity/endpoint property, string
Devices, entities, and endpoints may all have names. The recommended way to display an endpoint's name is to ask for the endpoint name, and display only that name if it is unique. If it is non-unique, prepend the device name.
A setup editor may allow the user to set the names of both driver-owned and external devices.

133.6.25 kMIDIPropertyNameConfiguration as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

device/entity/endpoint property, CFDictionary

This specifies the device's current patch, note and control name values using the MIDINameDocument XML format. This specification requires the use of higher-level, OS-specific constructs outside of the specification,

to fully define the current names for a device.

The MIDINameConfiguration property is implementated as a CFDictionary:

key "master" maps to a CFDataRef containing an AliasHandle referring to the device's master name document.

key "banks" maps to a CFDictionaryRef. This dictionary's keys are CFStringRef names of patchBank elements in the master document, and its values are each a CFDictionaryRef: key "file" maps to a CFDataRef containing an AliasHandle to a document containing patches that override those in the master document, and key "patchNameList" maps to a CFStringRef which is the name of the patchNameList element in the overriding document.

key "currentModes" maps to a 16-element CFArrayRef, each element of which is a CFStringRef of the name of the current mode for each of the 16 MIDI channels.

Clients setting this property must take particular care to preserve dictionary values other than the ones they are interested in changing, and to properly structure the dictionary.

New for CoreMIDI 1.3.

133.6.26 kMIDIPropertyOffline as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

device/entity/endpoint property, integer

1 = device is offline (is temporarily absent), 0 = present
Set by the owning driver, on the device; should not be touched by other clients. Property is inherited from the device by its entities and endpoints.

New for CoreMIDI 1.1.

133.6.27 kMIDIPropertyPanDisruptsStereo as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.28 kMIDIPropertyPrivate as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

device/entity/endpoint property, integer

1 = endpoint is private, hidden from other clients.
May be set on a device or entity, but they will still appear in the API; only affects whether the owned endpoints are hidden.

New for CoreMIDI 1.3.

133.6.29 kMIDIPropertyReceiveChannels as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.
endpoint property, integer
The value is a bitmap of channels on which the object receives, (1«0)=ch 1...(1«15)=ch 16.
Drivers may set this property on their entities or endpoints.
Setup editors may allow the user to set this property on external endpoints.
Virtual destination may set this property on their endpoints.

133.6.30 kMIDIPropertyReceivesBankSelectLSB as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.31 kMIDIPropertyReceivesBankSelectMSB as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.32 kMIDIPropertyReceivesClock as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.33 kMIDIPropertyReceivesMTC as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.34 kMIDIPropertyReceivesNotes as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.35 kMIDIPropertyReceivesProgramChanges as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.36 kMIDIPropertySingleRealtimeEntity as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

device property, integer

Some MIDI interfaces cannot route MIDI realtime messages to individual outputs; they are broadcast. On such devices the inverse is usually also true – incoming realtime messages cannot be identified as originating from any particular source.

When this property is set on a driver device, it signifies the 0-based index of the entity on which incoming realtime messages from the device will appear to have originated from.

New for CoreMIDI 1.3.

133.6.37 kMIDIPropertySupportsGeneralMIDI as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.38 kMIDIPropertySupportsMMC as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.39 kMIDIPropertySupportsShowControl as CFStringMBS

MBS MacCF Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: device/entity property, integer (0/1). Indicates whether the device implements the MIDI.
New for CoreMIDI 1.5.

133.6.40 kMIDIPropertyTransmitChannels as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.
endpoint property, integer
The value is a bitmap of channels on which the object transmits, (1«0)=ch 1...(1«15)=ch 16
New for CoreMIDI 1.3.

133.6.41 kMIDIPropertyTransmitsBankSelectLSB as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.42 kMIDIPropertyTransmitsBankSelectMSB as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.43 kMIDIPropertyTransmitsClock as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.44 kMIDIPropertyTransmitsMTC as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.45 kMIDIPropertyTransmitsNotes as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.46 kMIDIPropertyTransmitsProgramChanges as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

New for CoreMIDI 1.3. This is set on devices/entities, and is ab integer properties, 0/1

133.6.47 kMIDIPropertyUniqueID as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Example:

```
// init midi
Var m as new MidiClientMBS
m.Init NewCFStringMBS("TestApp")

// create a source
Var name as CFStringMBS = NewCFStringMBS("TestSource")
Var source as MidiEndpointMBS = m.CreateSource(name)

// query name property
Var s as Integer = source.IntegerProperty(source.kMIDIPropertyUniqueID)
MessageBox "UniqueID: "+str(s)
```

Notes: Only available after you called the Init Method.
devices, entities, endpoints all have unique ID's, integer
The system assigns unique ID's to all objects. Creators of virtual endpoints may set this property on their endpoints, though doing so may fail if the chosen ID is not unique.

133.6.48 kMIDIPropertyUserPatchNameFile as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: One of the properties for MIDI on Mac OS X.
Notes: Only available after you called the Init Method.

device/entity/endpoint property, CFData containing AliasHandle

An alias to the device's current user patch name file.

Added in CoreMIDI 1.1. DEPRECATED as of CoreMIDI 1.3.
Use kMIDIPropertyNameConfiguration instead.

133.6.49 Properties(deep as boolean) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Get all of an object's properties.

Notes: Deep parameter: true if the object's child objects are to be included (e.g. a device's entities, or an entity's endpoints).
Properties which an object inherits from its owning object (if any) are not included.

New for CoreMIDI 1.1.

Returns nil on any error.
Lasterror is set.

133.6.50 RemoveProperty(name as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Remove an object's property.
Notes: Lasterror is set.

133.6.51 Properties

133.6.52 DisplayName as String

MBS MacCF Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Provides the Apple-recommended user-visible name for an endpoint, by combining the device and endpoint names.
Notes: For objects other than endpoints, the display name is the same as the name.
(Read only property)

133.6.53 Handle as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The handle of this object.
Notes: (Read and Write property)

133.6.54 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The last error code reported.
Notes: 0 if the function was successful.

-1 if the function is not available or the RB parameters were bad. (e.g. nil)
else a Mac OS error code.

Some Midi specific error codes:

kMIDIInvalidClient	-10830	
kMIDIInvalidPort	-10831	
kMIDIWrongEndpointType	-10832	want source, got destination, or vice versa
kMIDINoConnection	-10833	attempt to close a non-existent connection
kMIDIUnknownEndpoint	-10834	
kMIDIUnknownProperty	-10835	
kMIDIWrongPropertyType	-10836	
kMIDINoCurrentSetup	-10837	there is no current setup, or it contains no devices
kMIDIMessageSendErr	-10838	communication with server failed
kMIDIServerStartErr	-10839	couldn't start the server
kMIDISetupFormatErr	-10840	unparseable saved state
kMIDIWrongThread	-10841	driver is calling non I/O function in server from a thread other than server's main one:
kMIDIObjectNotFound	-10842	
kMIDIIDNotUnique	-10843	

(Read and Write property)

133.6.55 Manufacturer as String

MBS MacCF Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Drivers should set this property on their devices.
Notes: Setup editors may allow the user to set this property on external devices.
(Read only property)

133.6.56 Model as String

MBS MacCF Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The model name.
Notes: (Read only property)

133.6.57 Name as String

MBS MacCF Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The item's name.
Notes: Devices, entities, and endpoints may all have names. The recommended way to display an endpoint's name is to ask for the endpoint name, and display only that name if it is unique. If it is non-unique, prepend the device name.

A setup editor may allow the user to set the names of both driver-owned and external devices.
(Read only property)

133.6.58 BinaryProperty(name as CFStringMBS) as CFBinaryDataMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Set or Get an object's data-type property.
Notes: Lasterror is set.
Returns nil on any error.
(Read and Write computed property)

133.6.59 IntegerProperty(name as CFStringMBS) as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Set or Get an object's integer-type property.
Example:

```
// init midi
Var m as new MidiClientMBS
m.Init NewCFStringMBS("TestApp")

// create a source
Var name as CFStringMBS = NewCFStringMBS("TestSource")
Var source as MidiEndpointMBS = m.CreateSource(name)

// query name property
Var s as Integer = source.IntegerProperty(source.kMIDIPropertyUniqueID)
MessageBox "UniqueID: "+str(s)

// set it
source.IntegerProperty(source.kMIDIPropertyUniqueID) = 1234

// query again
Var t as Integer = source.IntegerProperty(source.kMIDIPropertyUniqueID)
MessageBox "UniqueID: "+str(t)
```

Notes: Returns 0 on any error.

Lasterror is set.
(Read and Write computed property)

133.6.60 ObjectProperty(name as CFStringMBS) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Get or Set an object's dictionary-type property.
Notes: Lasterror is set.
New for CoreMIDI 1.3.
Renamed from Property to ObjectProperty in v4.3 for Xojo 6 compatibility.
(Read and Write computed property)

133.6.61 StringProperty(name as CFStringMBS) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Get or Set an object's string-type property.
Example:

```
Var m as MidiClientMBS
Var i, n as Integer
Var e as MIDIEndpointMBS
Var d as MIDIDeviceMBS
Var s as CFStringMBS

m = new MidiClientMBS
m.Init NewCFStringMBS("Test")
d = m.GetDevice(0)

s = d.StringProperty(d.kMIDIPropertyManufacturer)

MessageBox s.str
```

Notes: Lasterror is set.
(Read and Write computed property)

133.7 class MidiPacketListMBS

133.7.1 class MidiPacketListMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: A class to hold a list of MidiPackets.

133.7.2 Methods

133.7.3 FillList(packets() as MidiPacketMBS) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Fills the list with the given Xojo array of MidiPackets.
Example:

```
Var packs(-1) As MIDIPacketMBS

Var pack As New MIDIPacketMBS
Var list As New MIDIPacketListMBS
Var data As New MemoryBlock(9)

data.Byte(0) = &hF0
data.Byte(1) = &h00
data.Byte(2) = &h20
data.Byte(3) = &h1C
data.Byte(4) = &h7F
data.Byte(5) = &h04
data.Byte(6) = &h02
data.Byte(7) = &h01
data.Byte(8) = &hF7

pack.datamemory = data
pack.timeStamp = Nil 'now

packs.Add pack
If Not list.FillList(packs) Then
Break // problem
Else
// send to current port and destination
client.Send(outport, currentDest, list)
End If
```

133.7.4 Item(index as Integer) as MidiPacketMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Returns the item with the given index.

133.7.5 Properties

133.7.6 Count as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The number of items in the list.
Notes: (Read and Write property)

133.8 class MidiPacketMBS

133.8.1 class MidiPacketMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: A class for a midi packet.
Blog Entries

- MBS Xojo Plugins, version 22.5pr1
- MBS Plugins 10.3 Release Notes

133.8.2 Methods

133.8.3 AbsoluteToNanoseconds(value as UInt64) as UInt64

MBS MacCF Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Converts an absolute time value to a nanoseconds time value.
Example:

```
Var x as UInt64 = MidiPacketMBS.CurrentTime

Var y as UInt64 = x + MidiPacketMBS.NanosecondsToAbsolute(5)

MessageBox str(x)+" + 5 ns = "+str(Y)
```

133.8.4 CurrentTime as UInt64

MBS MacCF Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns the current time of the computer as an absolute time value.
Example:

```
Var u as uint64 = MidiPacketMBS.CurrentTime
Var n as uint64 = MidiPacketMBS.AbsoluteToNanoseconds(u)
Var x as Double = n / 1000000000.0

MessageBox str(u)+" "+str(n)+" "+str(x)

Var d as new date
d.Minute = 0
d.Hour = 0
d.Second = 0
d.TotalSeconds = d.TotalSeconds + x
```

```
MessageBox d.ShortTime // how long the mac is running.
```

Notes: While some Macs do have host clock time being in nanoseconds, this is not guaranteed. So use the function AbsoluteToNanoseconds to convert to nanoseconds.

133.8.5 NanosecondsToAbsolute(value as UInt64) as UInt64

MBS MacCF Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Converts a nanoseconds value to an absolute time.
Example:

```
Var x as UInt64 = MidiPacketMBS.CurrentTime

Var y as UInt64 = MidiPacketMBS.NanosecondsToAbsolute(x)

Var seconds as uint64 = y / 1000000000
Var hours as uint64 = seconds / 3600
seconds = seconds - hours*3600
Var minutes as uint64 = seconds / 60
seconds = seconds - minutes*60

// shows how long the Mac is running:
MessageBox str(hours)+" hours, "+str(minutes)+" minutes, "+str(seconds)+" seconds"
```

133.8.6 Properties

133.8.7 DataMemory as MemoryBlock

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The data of the packet as a memoryblock.
Notes: Setting this value will automatically fill the DataString property, so both are in sync.
(Read and Write property)

133.8.8 DataString as String

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The data of the packet as a string.
Notes: Setting this value will automatically fill the DataMemory property, so both are in sync.

This will not work:
DataString="90 5A 7C"

But this is better:
DataString=chrb(&h90)+chrb(&h5A)+chrb(&h7C)

or with the DataMemory property:
m=newmemoryblock(3)
m.byte(0)=&h90
m.byte(1)=&h5A
m.byte(2)=&h7C
DataMemory=m
(Read and Write property)

133.8.9 TimeStamp as MemoryBlock

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use TimeStampValue instead.
Function: The timestamp of the packet.
Example:

```
Var pack as MIDIPacketMBS
Var m as memoryblock

m=newmemoryblock(8)
m.Long(0) = 2345678 // some time value
m.Long(4) = 3456789
pack = new MIDIPacketMBS
pack.TimeStamp = m
```

Notes: A host clock time (64 bit value) representing the time of an event, as returned by MidiPacketMBS.CurrentTime.

As a convenience, you can use zero to use the current time.
And using nil for the memoryblock represents a value of zero (=now).
(Read and Write property)

133.8.10 TimeStampValue as UInt64

MBS MacCF Plugin, Plugin Version: 7.0, Platform: macOS, Targets: All.

Function: The timestamp of the packet.

Notes: A host clock time (64 bit value) representing the time of an event, as returned by MidiPacketMBS.CurrentTime.

As a convenience, you can use zero to use the current time.
(Read and Write property)

133.9 class MidiPlaybackMBS

133.9.1 class MidiPlaybackMBS

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: A class to do Midi playback on Mac OS X.
Example:

```
// play a middle C on the built-in MIDI synthesizer of macOS
// Midi is a property of the window: Midi As MidiPlaybackMBS
Midi = New MidiPlaybackMBS
Midi.SendMidiEvent(&hC0, 0, 0, 0) // program change on channel 1: piano
Midi.SendMidiEvent(&h90, 60, 100, 0) // note on: middle C, velocity 100

// later: note off
// Midi.SendMidiEvent(&h80, 60, 0, 0)
```

Notes: With sandbox, you need the com.apple.security.temporary-exception.audio-unit-host entitlement as of September 2013.
see
https://developer.apple.com/library/mac/qa/qa1483/_index.html

See also AVMIDIPlayerMBS class for playing midi files.

133.9.2 Methods

133.9.3 Callback as Integer

MBS MacOSX Plugin, Plugin Version: 6.0, Platform: macOS, Targets: All.

Function: Needed for the MidiPortMBS class to know which function to call
Example:

```
Var p as MidiPlaybackMBS
Var m as MidiPortMBS
// do something useful
m.SetCallback p.Callback, p
```

Notes: Return the address of the callback method used to process Midi data.
The method is to be used together with the SetCallback method in the MidiPortMBS class.

133.9.4 Constructor(UsesInternalReverb as boolean=false, AutoStart as boolean=true)

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: Initializes the midi playback.
Notes: After calling the constructor the Inited flag is true on success.
If AutoStart is false the midi playback is not started.

133.9.5 CPULoad as single

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: The CPU load of the graph.
Notes:

Returns a short-term running average of the current CPU load of the graph.

133.9.6 InstrumentCount as Integer

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: The number of instruments.

133.9.7 InstrumentID(index as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: The ID of the instrument with the given index.

133.9.8 InstrumentName(index as Integer) as string

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: The name of the instrument with the given index.
Example:

```
// This example needs a window with ListBox1.
// show list of all names
Var m as new MidiPlaybackMBS

Var u as Integer = m.InstrumentCount-1
for i as Integer = 0 to u
ListBox1.AddRow m.InstrumentName(i)
next
```

Notes: Index from 0 to InstrumentCount-1.

133.9.9 IsRunning as boolean

MBS MacOSX Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Whether the midi playback is running.
Notes: Lasterror is set.

133.9.10 LoadSoundBankFile(file as folderitem)

MBS MacOSX Plugin, Plugin Version: 8.5, Platform: macOS, Targets: All.

Function: Loads a sound bank file.
Example:

```
Sub LoadSoundFont (SoundFontName as string)

Var j as Integer
Var f as folderitem
Var e as string

//GET SOUNDFONT
f = Volume(0).Child("Library").Child("Audio").Child("Sounds").Child("Banks").Child(SoundFontName)

if f <>Nil then
//INSTALL SOUNDFONT
me.LoadSoundBankFile(f)
Window1.PopupMenu1.DeleteAllRows
```

```
for j = 0 to 127
if me.InstrumentName(j) <>"" then
Window1.PopupMenu1.addrow me.InstrumentName(j)
end if
next
Window1.PopupMenu1.ListIndex = 0
else
e = "Could not locate the SoundFont: "+ SoundFontName
e = e + " Please make sure the file is a valid soundfont file"
e = e + " and is located in the folder YourHardDrive/Library/Audio/Sounds/Banks"
e = e + " and has the extension .sf2"
MessageBox e
end if

End Sub
```

Notes: This function can load files with .sf2 extension placed in the location: Library/Audio/Sounds/Banks.

Lasterror is set.

To avoid crashes on Mac OS X 10.5, the midi playback is stopped before loading is done and restarted if necessary after loading completed.

As a side effect stopping the midi playback may reset volume, reverb and tuning.

133.9.11 MaxCPULoad as single

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: The Maximum CPU load of the graph
Notes: Returns the max CPU load of the graph since this call was last made or the graph was last started.

133.9.12 SendMidiEvent(Status as Integer, Data1 as Integer, Data2 as Integer, OffsetSampleFrame as Integer)

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: Sends midi data for playback.

133.9.13 Start

MBS MacOSX Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Starts the midi playback.
Notes: Lasterror is set.

133.9.14 Stop

MBS MacOSX Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Stops the midi playback.
Notes: Lasterror is set.

As a side effect stopping the midi playback may reset volume, reverb and tuning.

133.9.15 Properties

133.9.16 FilterNodeHandle as Integer

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The internal reference for the filter graph node.
Notes: (Read only property)

133.9.17 GraphHandle as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: The handle for the AUGraph.
Notes: (Read only property)

133.9.18 Inited as boolean

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: Whether the constructor was successful.
Notes: This property is false if the constructor failed to initialize.
(Read only property)

133.9.19 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: The last error code.
Notes: (Read only property)

133.9.20 OutputNodeHandle as Integer

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The internal reference for the output graph node.
Notes: (Read only property)

133.9.21 SynthNodeHandle as Integer

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The internal reference for the synth graph node.
Notes: (Read only property)

133.9.22 SynthUnitHandle as Integer

MBS MacOSX Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The internal reference for the synth audio unit.
Notes: (Read only property)

133.9.23 InstrumentIDOnChannel(Channel as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: Which instrument is playing on which channel.
Notes: (Read and Write computed property)

133.9.24 ReverbVolume as single

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: The reverb volume.
Notes: The value range is -120 to 40 dB.
(Read and Write computed property)

133.9.25 StreamFromDisk as boolean

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: Whether we are streaming from disk.
Notes: Currently setting this value can crash the application.
(Read and Write computed property)

133.9.26 Tuning as single

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: The tuning setting.
Notes: Value is in cents from -1200 to 1200.
(Read and Write computed property)

133.9.27 UsesInternalReverb as boolean

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: One of the audio unit properties.
Example:

```
Var m as new MidiPlaybackMBS

MessageBox "UsesInternalRever: "+str(m.UsesInternalReverb)
m.UsesInternalReverb=true
MessageBox "UsesInternalRever: "+str(m.UsesInternalReverb)
```

Notes: Lasterror is set.
(Read and Write computed property)

133.9.28 Volume as single

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: All.

Function: The volume.

Notes: The value is in dB from -120 to 40.
(Read and Write computed property)

133.10 class MidiPortMBS

133.10.1 class MidiPortMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: A class for a MIDI port.
Notes: A MIDIPortMBS, which may be an input port or output port, is an object through which a client may communicate with any number of MIDI sources or destinations.
Subclass of the MidiObjectMBS class.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr1

133.10.2 Methods

133.10.3 close

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

133.10.4 ConnectSource(source as MidiEndpointMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Establish a connection from a source to a client's input port.
Notes: Lasterror is set.

133.10.5 DisconnectSource(source as MidiEndpointMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Close a previously-established source-to-input port connection.
Notes: Lasterror is set.

133.10.6 SetCallback(callback as Integer, reference as object)

MBS MacCF Plugin, Plugin Version: 6.0, Platform: macOS, Targets: All.

Function: Connects the MidiPort to send data to given MidiPlayback reference.
Example:

```
Var p as MidiPlaybackMBS
Var m as MidiPortMBS
// do something useful
m.SetCallback p.Callback, p
```

Notes: The method is to be used together with the Callback function in the MidiPlaybackMBS class.
Read event is still being called if needed.

You can call again with 0 as callback to clear it.

133.10.7 Events

133.10.8 Read(endpoint as MidiEndpointMBS, list as MidiPacketListMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Called when data arrives at this port.
Notes: If more than 256 bytes of data is received, it may be splitted and send in several events.

For some devices a Note Off is just a Note On with a zero velocity.

133.11 class MIDISysexSendRequestMBS

133.11.1 class MIDISysexSendRequestMBS

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: An asynchronous request to send a single system-exclusive MIDI event to a MIDI destination.
Example:

```
// Window1 is a window of the example project.
// build a data package
Var data As New MemoryBlock(9)

data.Byte(0) = &hF0
data.Byte(1) = &h00
data.Byte(2) = &h20
data.Byte(3) = &h1C
data.Byte(4) = &h7F
data.Byte(5) = &h04
data.Byte(6) = &h02
data.Byte(7) = &h01
data.Byte(8) = &hF7

// make new second request
Var sendRequest As New MIDISysexSendRequestMBS
sendRequest.Data = data
sendRequest.Destination = currentDest
sendRequest.Send

// store reference for later as send is asynchron
Window1.sendRequest = sendRequest
```

133.11.2 Methods

133.11.3 close

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

133.11.4 Send

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: Send a single system-exclusive event, asynchronously.
Notes: Keep a reference to this object until the call Completes.

133.11.5 Properties

133.11.6 BytesToSend as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: Initially set when sending starts to the number of bytes to be sent.
Notes: MIDISendSysex will decrement this counter as bytes are sent.
(Read and Write property)

133.11.7 Data as Memoryblock

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: The memoryblock with the data you want to send.
Notes: (Read and Write property)

133.11.8 Destination as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: The endpoint to which the event is to be sent.
Notes: (Read and Write property)

133.11.9 IsComplete as boolean

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: The client may set this to true at any time to abort transmission.
Notes: The implementation sets this to true when all bytes have been sent.
Renamed from Complete to IsComplete in v4.3 for Xojo 6 compatibility.
(Read and Write property)

133.11.10 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: The last error code.
Notes: 0 for success.
(Read and Write property)

133.11.11 Length as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: The length of the memoryblock.
Notes: If 0, the memoryblock.size property is taken, but not all memoryblocks know their size.
(Read and Write property)

133.11.12 Events

133.11.13 Complete

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: All.

Function: An event to notify the client of the completion of a call to MIDISendSysex.

133.12 class MidiThruConnectionControlTransformMBS

133.12.1 class MidiThruConnectionControlTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: A class for a control transformation midi connection.
Notes: Note: must order control transforms appropriately – first, filter out and remap. Further transforms can follow, and will apply to the remapped control number (if any).
N.B. All transformations are done using 14-bit control values, so, when doing an add/min/max transform on a 7-bit value, the parameter must be a 14-bit value, e.g. to add n, param must be n «7.

133.12.2 Properties

133.12.3 ControlNumber as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The control number.
Notes: (Read and Write property)

133.12.4 ControlType as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The control type.
Notes: implementation note: some code tests bits of these values

constants:

kMIDIControlType_7Bit	0	control numbers may be 0-127
kMIDIControlType_14Bit	1	control numbers may be 0-31
kMIDIControlType_7BitRPN	2	control numbers may be 0-16383
kMIDIControlType_14BitRPN	3	
kMIDIControlType_7BitNRPN	4	
kMIDIControlType_14BitNRPN	5	

(Read and Write property)

133.12.5 Parameter as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The parameter for the transformation.
Notes: (Read and Write property)

133.12.6 RemappedControlType as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The Remapped Control Type.
Notes: Only used when transform is kMIDITransform_MapControl
(Read and Write property)

133.12.7 Transform as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The transformation code to apply.
Notes: Some constants:

kMIDITransform_None	0	no param
kMIDITransform_FilterOut	1	filter out event type, no param
kMIDITransform_MapControl	2	param is remapped control number
kMIDITransform_Add	8	param is value to add
kMIDITransform_Scale	9	param is amount to scale by: fixed point bbbb.bbbb bbbb bbbb
kMIDITransform_MinValue	10	
kMIDITransform_MaxValue	11	
kMIDITransform_MapValue	12	param is index of map in connection's map array

(Read and Write property)

133.13 class MidiThruConnectionEndpointMBS

133.13.1 class MidiThruConnectionEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: A class for an endpoint specifications.
Notes: When filling one of these out, clients can leave uniqueID 0 if the endpoint exists.
When when one is provided back to the client, the endpoint may be null if it doesn't exist, but the uniqueID will always be non-zero.

133.13.2 Methods

133.13.3 close

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

133.13.4 Properties

133.13.5 Endpoint as MidiEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The endpoint to use for a connection.
Notes: (Read and Write property)

133.13.6 UniqueID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: An unique ID for an endpoint.
Notes: (Read and Write property)

133.14 class MidiThruConnectionMBS

133.14.1 class MidiThruConnectionMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: A class for a midi connection.
Notes: This class defines functions to create MIDI play-through connections between the MIDI sources and destinations. These connections may be persistent or transitory, owned by a client.

By using connections instead of doing MIDI Thru operations themselves, the overhead of moving MIDI messages between the server and the client for thru-ing is reduced.

The aim of these functions is to permit as flexible a set of transformations as possible while keeping the API and data structures relatively simple.
Subclass of the MidiObjectMBS class.

133.14.2 Methods

133.14.3 close

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

133.14.4 Create(PersistentOwnerID as CFStringMBS, params as MidiThruConnectionParamsMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Creates a new connection.
Notes: If inPersistentOwnerID is nil, then the connection is marked as owned by the client and will be automatically disposed with the client.

If it is non-nil, then it should be a unique identifier, e.g. "com.mycompany.MyCoolProgram".

133.14.5 Find(PersistentOwnerID as String) as MidiThruConnectionMBS()

MBS MacCF Plugin, Plugin Version: 24.1, Platform: macOS, Targets: All.

Function: Returns all of the persistent thru connections created by a client.
Notes: PersistentOwnerID: The ID of the owner whose connections are to be returned.

133.14.6 Properties

133.14.7 Parameter as MidiThruConnectionParamsMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The parameters for the connection.
Notes: Lasterror is set.
(Read and Write computed property)

133.15 class MidiThruConnectionParamsMBS

133.15.1 class MidiThruConnectionParamsMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The class for the parameters of a midi connection.

133.15.2 Methods

133.15.3 close

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

133.15.4 Properties

133.15.5 ChannelPressure as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: One of the transformations.
Notes: (Read and Write property)

133.15.6 ControlTransformsCount as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The number of control transformations used.
Notes: If you create a MidiThruConnectionParamsMBS object than this number is counted from the entries in the ControlTransform array.
(Read and Write property)

133.15.7 DestinationsCount as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The number of destinations.
Notes: If you create a MidiThruConnectionParamsMBS object than this number is counted from the entries in the destination array.
(Read and Write property)

133.15.8 FilterOutAllControls as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Unknown.
Notes: (Read and Write property)

133.15.9 FilterOutBeatClock as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Unknown.
Notes: (Read and Write property)

133.15.10 FilterOutMTC as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Unknown.
Notes: (Read and Write property)

133.15.11 FilterOutSysEx as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Unknown.
Notes: (Read and Write property)

133.15.12 FilterOutTuneRequest as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Unknown.
Notes: (Read and Write property)

133.15.13 HighNote as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The high note value.
Notes: Ignored if mapping.
If highNote <lowNote, then 0..highNote and lowNote..127 are passed.
(Read and Write property)

133.15.14 HighVelocity as Integer

MBS MacCF Plugin, Plugin Version: 20.1, Platform: macOS, Targets: All.

Function: Higher velocity limit.
Notes: Note events with a velocity greater than this, if it is not 0, are filtered out.
(Read and Write property)

133.15.15 KeyPressure as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: One of the transformations.
Notes: (Read and Write property)

133.15.16 LowNote as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The low note value.
Notes: Ignored if mapping.
If highNote <lowNote, then 0..highNote and lowNote..127 are passed.
(Read and Write property)

133.15.17 LowVelocity as Integer

MBS MacCF Plugin, Plugin Version: 20.1, Platform: macOS, Targets: All.

Function: Lower velocity limit.
Notes: Note events with a velocity less than this value are filtered out.
(Read and Write property)

133.15.18 MapsCount as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The number of mappings used.
Notes: If you create a MidiThruConnectionParamsMBS object than this number is counted from the entries in the Map array.
(Read and Write property)

133.15.19 NoteNumber as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: One of the transformations.
Notes: (Read and Write property)

133.15.20 PitchBend as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: One of the transformations.
Notes: (Read and Write property)

133.15.21 ProgramChange as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: One of the transformations.
Notes: (Read and Write property)

133.15.22 SourcesCount as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The number of sources used.
Notes: If you create a MidiThruConnectionParamsMBS object than this number is counted from the entries

in the Source array.
(Read and Write property)

133.15.23 Velocity as MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: One of the transformations.
Notes: (Read and Write property)

133.15.24 ChannelMap(index as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The array with the value mappings.
Notes: Map each of the source 16 MIDI channels to channel 0-15 (1-16) or 0xFF to filter out.
(Read and Write computed property)

133.15.25 ControlTransform(index as Integer) as MidiThruConnectionControlTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The array of control transformations.
Notes: (Read and Write computed property)

133.15.26 Destination(index as Integer) as MidiThruConnectionEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The array of destination endpoints.
Notes: (Read and Write computed property)

133.15.27 Map(index as Integer) as MidiThruConnectionValueMapMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The list of mappings for this midi connection.
Notes: Index is from 0 to 15.

(if you need more, send me an email and I upper the limit.)
(Read and Write computed property)

133.15.28 Source(index as Integer) as MidiThruConnectionEndpointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The array of source endpoints.
Notes: (Read and Write computed property)

133.16 class MidiThruConnectionTransformMBS

133.16.1 class MidiThruConnectionTransformMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The class for a Midi connection transformation.

133.16.2 Properties

133.16.3 Parameter as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The parameter of the transformation.
Notes: (Read and Write property)

133.16.4 Transform as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The transformation code.
Notes: Some constants:

kMIDITransform_None	0	no param
kMIDITransform_FilterOut	1	filter out event type, no param
kMIDITransform_MapControl	2	param is remapped control number
kMIDITransform_Add	8	param is value to add
kMIDITransform_Scale	9	param is amount to scale by: fixed point bbbb.bbbb bbbb bbbb
kMIDITransform_MinValue	10	
kMIDITransform_MaxValue	11	
kMIDITransform_MapValue	12	param is index of map in connection's map array

(Read and Write property)

133.17 class MidiThruConnectionValueMapMBS

133.17.1 class MidiThruConnectionValueMapMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: A value map for a Midi connection.
Notes: This is an array to map Midi values from 0 to 127 to new values from 0 to 127.

133.17.2 Properties

133.17.3 Value(index as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: The value Map.
Notes: Index is from 0 to 127.
Use only values from 0 to 127.
(Read and Write computed property)

133.18 class PortMidiDeviceInfoMBS

133.18.1 class PortMidiDeviceInfoMBS

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for device information.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.3pr5

133.18.2 Properties

133.18.3 HasInput as Boolean

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if input is available.
Notes: (Read only property)

133.18.4 HasOutput as Boolean

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if output is available.
Notes: (Read only property)

133.18.5 InterfaceName as String

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Underlying MIDI API.
Notes: e.g. MMSystem, DirectX or CoreMidi.
(Read only property)

133.18.6 Name as String

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The device name.
Notes: e.g. USB MidiSport 1x1

(Read only property)

133.19 class PortMidiEventMBS

133.19.1 class PortMidiEventMBS

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a piece of midi data.
Example:

```
// read incoming notes from a MIDI keyboard with PortMidi, e.g. in a timer
// Input is a property of the window: Input As PortMidiStreamMBS
If Input = Nil Then
Call PortMidiMBS.Initialize
Input = New PortMidiStreamMBS
Call Input.OpenInput(PortMidiMBS.DefaultInputDeviceID, 100)
End If

While Input.Poll >0
Var ev As PortMidiEventMBS
If Input.Read(ev) >0 And ev <>Nil Then
If BitwiseAnd(ev.Status, &hF0) = &h90 And ev.Data2 >0 Then
System.DebugLog "Note " + ev.Data1.ToString + " velocity " + ev.Data2.ToString + " at " + ev.When.ToString
+ " ms"
End If
End If
Wend
```

133.19.2 Methods

133.19.3 Set(status as Integer, data1 as Integer, data2 as Integer)

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the value to the given data.

133.19.4 SetRaw(data0 as Integer, data1 as Integer, data2 as Integer, data3 as Integer)

MBS Audio Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the raw data by setting all 4 bytes together.

133.19.5 Properties

133.19.6 CurrentEvent as PortMidiEventMBS

MBS Audio Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current event played.
Notes: You can use this to show current note playing.
(Read only property)

133.19.7 Data1 as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The first data value in the midi event.
Notes: (Read and Write property)

133.19.8 Data2 as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The second data value in the midi event.
Notes: (Read and Write property)

133.19.9 RawData0 as Integer

MBS Audio Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The first byte of the raw data in this event.
Notes: Same as Status property.
(Read and Write property)

133.19.10 RawData1 as Integer

MBS Audio Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The second byte of the raw data in this event.
Notes: Same as Data1 property.
(Read and Write property)

133.19.11 RawData2 as Integer

MBS Audio Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The third byte of the raw data in this event.
Notes: Same as Data2 property.
(Read and Write property)

133.19.12 RawData3 as Integer

MBS Audio Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The fourth byte of the raw data in this event.
Notes: (Read and Write property)

133.19.13 RawMessage as Integer

MBS Audio Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The raw content of the event as a integer.
Notes: Take care about platform differences like the byte order.
(Read and Write property)

133.19.14 Status as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The status value.
Notes: (Read and Write property)

133.19.15 When as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time value of this midi data.
Notes: Should be milliseconds.
(Read and Write property)

133.20 class PortMidiMBS

133.20.1 class PortMidiMBS

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PortMidi library wrapped for use in Xojo.
Example:

```
// list all MIDI devices found by PortMidi
Call PortMidiMBS.Initialize

Var lines() As String
For id As Integer = 0 To PortMidiMBS.CountDevices - 1
Var info As PortMidiDeviceInfoMBS = PortMidiMBS.DeviceInfo(id)
Var kind As String
If info.HasInput Then kind = "input"
If info.HasOutput Then kind = "output"
lines.Add id.ToString + ": " + info.Name + " (" + info.InterfaceName + ", " + kind + ")"
Next
lines.Add "Default output: " + PortMidiMBS.DefaultOutputDeviceID.ToString
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Error codes:

```
const pmNoError              = 0
const pmHostError            = -10000
const pmInvalidDeviceId      = -9999
const pmInsufficientMemory   = -9998
const pmBufferTooSmall       = -9997
const pmBufferOverflow       = -9996
const pmBadPtr               = -9995
const pmBadData              = -9994
const pmInternalError        = -9993
const pmBufferMaxSize        = -9992
```

Requires libasound.so.2 on Linux to be installed.
Blog Entries

- MBS Xojo Plugins, version 21.2pr5
- MBS Xojo / Real Studio Plugins, version 16.3pr4

133.20.2 Methods

133.20.3 CountDevices as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts the devices.
Example:

```
Var pa as new PortMidiMBS

Var u as Integer = pa.CountDevices-1
for i as Integer = 0 to u
Var d as PortMidiDeviceInfoMBS = pa.DeviceInfo(i)
MessageBox d.Name+", "+D.InterfaceName
next
```

Notes: Returns 0 on any error.

133.20.4 DefaultInputDeviceID as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the default device ID or pmNoDevice (-1) if there are no devices.
Notes: On the PC, the user can specify a default device by setting an environment variable. For example, to use device #1.

set PM_RECOMMENDED_OUTPUT_DEVICE=1

The user should first determine the available device ID by using the supplied application "testin" or "testout".

In general, the registry is a better place for this kind of info, and with USB devices that can come and go, using integers is not very reliable for device identification. Under Windows, if PM_RECOMMENDED_OUTPUT_DEVICE (or PM_RECOMMENDED_INPUT_DEVICE) is *NOT* found in the environment, then the default device is obtained by looking for a string in the registry under: HKEY_LOCAL_MACHINE/SOFTWARE/PortMidi/Recommended_Input_Device and HKEY_LOCAL_MACHINE/SOFTWARE/PortMidi/Recommended_Output_Device for a string. The number of the first device with a substring that matches the string exactly is returned. For example, if the string in the registry is "USB", and device 1 is named "In USB MidiSport 1x1", then that will be the default input because it contains the string "USB".

In addition to the name, PmDeviceInfo has the member "interf", which is the interface name. (The "interface" is the underlying software system or API used by PortMidi to access devices. Examples are MMSystem, DirectX (not implemented), ALSA, OSS (not implemented), etc.) At present, the only Win32 interface is

”MMSystem”, the only Linux interface is ”ALSA”, and the only Max OS X interface is ”CoreMIDI”.
To specify both the interface and the device name in the registry, separate the two with a comma and a space, e.g.:
MMSystem, In USB MidiSport 1x1
In this case, the string before the comma must be a substring of the ”interf” string, and the string after the space must be a substring of the ”name” name string in order to match the device.

Note: in the current release, the default is simply the first device (the input or output device with the lowest PmDeviceID).

133.20.5 DefaultOutputDeviceID as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the default device ID or pmNoDevice (-1) if there are no devices.
Notes: On the PC, the user can specify a default device by setting an environment variable. For example, to use device #1.

set PM_RECOMMENDED_OUTPUT_DEVICE=1

The user should first determine the available device ID by using the supplied application ”testin” or ”testout”.

In general, the registry is a better place for this kind of info, and with USB devices that can come and go, using integers is not very reliable for device identification. Under Windows, if PM_RECOMMENDED_OUTPUT_DEVICE (or PM_RECOMMENDED_INPUT_DEVICE) is *NOT* found in the environment, then the default device is obtained by looking for a string in the registry under: HKEY_LOCAL_MACHINE/SOFTWARE/PortMidi/Recommended_Input_Device and HKEY_LOCAL_MACHINE/SOFTWARE/PortMidi/Recommended_Output_Device for a string. The number of the first device with a substring that matches the string exactly is returned. For example, if the string in the registry is ”USB”, and device 1 is named ”In USB MidiSport 1x1”, then that will be the default input because it contains the string ”USB”.

In addition to the name, PmDeviceInfo has the member ”interf”, which is the interface name. (The ”interface” is the underlying software system or API used by PortMidi to access devices. Examples are MMSystem, DirectX (not implemented), ALSA, OSS (not implemented), etc.) At present, the only Win32 interface is ”MMSystem”, the only Linux interface is ”ALSA”, and the only Max OS X interface is ”CoreMIDI”.
To specify both the interface and the device name in the registry, separate the two with a comma and a space, e.g.:
MMSystem, In USB MidiSport 1x1
In this case, the string before the comma must be a substring of the ”interf” string, and the string after the space must be a substring of the ”name” name string in order to match the device.

Note: in the current release, the default is simply the first device (the input or output device with the lowest

PmDeviceID).

133.20.6 DeviceInfo(DeviceID as Integer) as PortMidiDeviceInfoMBS

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns information about a certain device.
Example:

```
Var pa as new PortMidiMBS

Var u as Integer = pa.CountDevices-1
for i as Integer = 0 to u
Var d as PortMidiDeviceInfoMBS = pa.DeviceInfo(i)
MessageBox d.Name+", "+D.InterfaceName
next
```

Notes: Returns nil on any error.

133.20.7 ErrorText(ErrorNumber as Integer) as string

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error text for the given error code.
Notes: Returns "" on any error.

133.20.8 Initialize as Integer

MBS Audio Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the PortMidi functions.
Notes: You call this manually to trigger initialization now.
Or you just let the plugin do it automatically when you call one of the portmidi functions.
Returns the error code. (0 = okay)

133.20.9 ReInitialize as Integer

MBS Audio Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shuts down PortMidi and initializes it again.
Notes: As PortMidi does not recognize the attachment of new MIdi devices, you can only reinitialize.

Returns a PortMidi error code.

133.20.10 Constants

Constants

Constant	Value	Description
pmBadData	-9994	One of the PortMidi errors. illegal midi data, e.g. missing EOX
pmBadPtr	-9995	One of the PortMidi errors.
pmBufferMaxSize	-9992	One of the PortMidi errors. buffer is already as large as it can be.
pmBufferOverflow	-9996	One of the PortMidi errors.
pmBufferTooSmall	-9997	One of the PortMidi errors.
pmHostError	-10000	One of the PortMidi errors.
pmInsufficientMemory	-9998	One of the PortMidi errors.
pmInternalError	-9993	One of the PortMidi errors.
pmInvalidDeviceId	-9999	One of the PortMidi errors. out of range or output device when input is requested or input device when output is requested or device is already opened.
pmNoDevice	-1	One of the PortMidi errors.
pmNoError	0	One of the PortMidi errors.

133.21 class PortMidiStreamMBS

133.21.1 class PortMidiStreamMBS

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Xojo class to represent a PortMidi stream.
Example:

```
// play a middle C on the default MIDI output with PortMidi
Call PortMidiMBS.Initialize
Var deviceID As Integer = PortMidiMBS.DefaultOutputDeviceID
If deviceID <0 Then Return

// Stream is a property of the window: Stream As PortMidiStreamMBS
Stream = New PortMidiStreamMBS
If Stream.OpenOutput(deviceID, 100, 1) <>0 Then Return // latency >0 to use time stamps
Var now As Integer = PortMidiStreamMBS.currentTimeStamp
Call Stream.WriteShort(now, &h7F3C90) // note on, channel 1, note 60, velocity 127
Call Stream.WriteShort(now + 500, &h003C80) // note off half a second later
```

Notes: A single PortMidiStream is a descriptor for an open MIDI device.

See also macOS specific classes AVMIDIPlayerMBS, MidiPlaybackMBS and MidiClientMBS.

- 15.2, page 10: News

133.21.2 Methods

133.21.3 Abort as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Terminates outgoing messages immediately.
Notes: The caller should immediately close the output port; this call may result in transmission of a partial midi message. There is no abort for Midi input because the user can simply ignore messages in the buffer and close an input device at any time.

Returns an error code.

133.21.4 Close

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

133.21.5 currentTimeStamp as Integer

MBS Audio Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current time stamp.

133.21.6 ErrorText(ErrorNumber as Integer) as string

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error message for this error number.

133.21.7 HostError as string

MBS Audio Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries host error string.
Example:

```
Var s as new PortMidiStreamMBS
// do something that causes an error
MessageBox "HostError: "+s.HostError
```

Notes: Clears error.

133.21.8 OpenInput(DeviceID as Integer, Buffersize as Integer) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a device for reading.
Notes: DeviceID is the id of the device used for input.

For input, the buffersize specifies the number of input events to be buffered waiting to be read using Pm_Read().
(In some cases – see below – PortMidi does not buffer output at all and merely passes data to a lower-level API, in which case buffersize is ignored.)

return value:
Upon success OpenInput returns PmNoError.
If a call to OpenInput fails a nonzero error code is returned (see PMError above) and the value of port is invalid.

133.21.9 OpenOutput(DeviceID as Integer, Buffersize as Integer, Latency as Integer) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a device for writing.
Notes: DeviceID is the id of the device used for input.

For output, buffersize specifies the number of output events to be buffered waiting for output.
(In some cases – see below – PortMidi does not buffer output at all and merely passes data to a lower-level API, in which case buffersize is ignored.)

Latency is the delay in milliseconds applied to timestamps to determine when the output should actually occur. (If latency is <0, 0 is assumed.)
If latency is zero, timestamps are ignored and all output is delivered immediately. If latency is greater than zero, output is delayed until the message timestamp plus the latency. (NOTE: time is measured relative to the time source indicated by time_proc. Timestamps are absolute, not relative delays or offsets.) In some cases, PortMidi can obtain better timing than your application by passing timestamps along to the device driver or hardware. Latency may also help you to synchronize midi data to audio data by matching midi latency to the audio buffer latency.
Due to the may timers work on Windows, the latency is limited there.

return value:
Upon success OpenInput returns PmNoError.
If a call to OpenInput fails a nonzero error code is returned (see PMError above) and the value of port is invalid.

133.21.10 Poll as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tests whether input is available,
Notes: Returns 1 on success and 0 on failure.

133.21.11 Read(byref data as PortMidiEventMBS) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads midi data.
Notes: Returns the number of read items.
(0 for error and 1 for success)

Read retrieves midi data into a buffer, and returns the number of events read. Result is a non-negative number unless an error occurs, in which case a PmError value will be returned.

Buffer Overflow

The problem: if an input overflow occurs, data will be lost, ultimately because there is no flow control all the way back to the data source. When data is lost, the receiver should be notified and some sort of graceful recovery should take place, e.g. you shouldn't resume receiving in the middle of a long sysex message.

With a lock-free fifo, which is pretty much what we're stuck with to enable portability to the Mac, it's tricky for the producer and consumer to synchronously reset the buffer and resume normal operation.

Solution: the buffer managed by PortMidi will be flushed when an overflow occurs. The consumer (Read()) gets an error message (pmBufferOverflow) and ordinary processing resumes as soon as a new message arrives. The remainder of a partial sysex message is not considered to be a "new message" and will be flushed as well.

133.21.12 SetChannelMask(mask as Integer) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Filters incoming messages based on channel.
Example:

```
Var s as PortMidiStreamMBS // your midi stream

call s.SetChannelMask(1+4) // Channel 1 and 3.
```

Notes: The mask is a 16-bit bitfield corresponding to appropriate channels
All channels are allowed by default.
Returns an error code.

133.21.13 SetFilter(filters as Integer) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetFilter() sets filters on an open input stream to drop selected input types.
Notes: By default, only active sensing messages are filtered.
To prohibit, say, active sensing and sysex messages, call SetFilter(FilterActive + FilterSysEx);

Filtering is useful when midi routing or midi thru functionality is being provided by the user application.
For example, you may want to exclude timing messages (clock, MTC, start/stop/continue), while allowing note-related messages to pass.
Or you may be using a sequencer or drum-machine for MIDI clock information but want to exclude any notes it may play.

Returns an error code.

133.21.14 Write(data as PortMidiEventMBS) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes midi data from a buffer.
Notes: This may contain:
- short messages or
- sysex messages that are converted into a sequence of PortMidiStreamMBS objects, e.g. sending data from a file or forwarding them from midi input.

Use WriteSysEx() to write a sysex message stored as a contiguous array of bytes.

Sysex data may contain embedded real-time messages.
Returns an error code.

133.21.15 WriteShort(When as Integer, message as Integer) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a timestamped non-system-exclusive midi message.
Notes: Messages are delivered in order as received, and timestamps must be non-decreasing. (But times-

tamps are ignored if the stream was opened with latency = 0.)

133.21.16 WriteSysEx(When as Integer, message as memoryblock, offset as Integer) as Integer

MBS Audio Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a timestamped system-exclusive midi message.
Notes: The data is taken from the memoryblock at the given offset.
The message must be 0 terminated.

This message must be valid and contain the special start value and a EOX value on the end.
See also:

- 133.21.17 WriteSysEx(When as Integer, message as string) as Integer 18415

133.21.17 WriteSysEx(When as Integer, message as string) as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a timestamped system-exclusive midi message.
Notes: This message must be valid and contain the special start value and a EOX value on the end.
See also:

- 133.21.16 WriteSysEx(When as Integer, message as memoryblock, offset as Integer) as Integer 18415

133.21.18 Properties

133.21.19 ChannelMask as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The channel mask used.
Notes: Use SetChannelMask to change it.
(Read only property)

133.21.20 DeviceID as Integer

MBS Audio Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The device ID.
Notes: The ID of the device the stream is connected to.

(Read only property)

133.21.21 DeviceName as String

MBS Audio Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The device name.
Notes: The name of the device the stream is connected to.
(Read only property)

133.21.22 Filters as Integer

MBS Audio Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The filters setting.
Notes: Use SetFilters to change it.
(Read only property)

133.21.23 Constants

Constants

Constant	Value	Description
FilterActive	&h4000	One of the PortMidi filter constants. filter active sensing messages (&hFE)
FilterAftertouch	&h6000000	One of the PortMidi filter constants. filter both channel and poly aftertouch
FilterChannelAftertouch	&h20000000	One of the PortMidi filter constants. filter channel aftertouch (most midi controllers use this) (&hD0-&hDF)
FilterClock	&h1D00	One of the PortMidi filter constants. filter clock messages (CLOCK &hF8, START &hFA, STOP &hFC, and CONTINUE &hFB)
FilterControl	&h8000000	One of the PortMidi filter constants. Control Changes (CC's) (&hB0-&hBF)
FilterFD	&h2000	One of the PortMidi filter constants. filter undefined FD messages
FilterMTC	2	One of the PortMidi filter constants. MIDI Time Code (&hF1)
FilterNote	&h3000000	One of the PortMidi filter constants. filter note-on and note-off (&h90-&h9F and &h80-&h8F
FilterPitchBend	&h40000000	One of the PortMidi filter constants. Pitch Bender (&hE0-&hEF)
FilterPlay	&h400	One of the PortMidi filter constants. filter play messages (start &hFA, stop &hFC, continue &hFB)
FilterPolyAftertouch	&h4000000	One of the PortMidi filter constants. per-note aftertouch (&hA0-&hAF)
FilterProgram	&h10000000	One of the PortMidi filter constants. Program changes (&hC0-&hCF)
FilterRealTime	&hFF01	One of the PortMidi filter constants. filter all real-time messages
FilterReset	&h8000	One of the PortMidi filter constants. filter reset messages (&hFF)
FilterSongPosition	4	One of the PortMidi filter constants. Song Position (&hF2)
FilterSongSelect	8	One of the PortMidi filter constants. Song Select (&hF3)
FilterSysEx	1	One of the PortMidi filter constants. filter system exclusive messages (&hF0)
FilterSystemCommon	&h4E	One of the PortMidi filter constants. All System Common messages (mtc, song position, song select, tune request)
FilterTick	&h200	One of the PortMidi filter constants. filter tick messages (&hF9)
FilterTune	&h40	One of the PortMidi filter constants. Tuning request (&hF6)
FilterUndefined	&h2000	One of the PortMidi filter constants. filter undefined real-time messages

133.22 class WindowsMidiInputInfoMBS

133.22.1 class WindowsMidiInputInfoMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: A class for information about a certain Midi Device.

133.22.2 Properties

133.22.3 DriverVersion as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Version number of the device driver for the MIDI input device.
Notes: The high-order byte is the major version number, and the low-order byte is the minor version number.
(Read only property)

133.22.4 Flags as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Some flags.
Notes: Currently unused in Windows XP.
(Read only property)

133.22.5 ManufacturerID as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Manufacturer identifier of the device driver for the MIDI input device.
Notes: (Read only property)

133.22.6 Name as String

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Product name.
Notes: Currently an ANSI string.

(Read only property)

133.22.7 ProductID as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Product identifier of the MIDI input device.
Notes: (Read only property)

133.23 class WindowsMidiInputMBS

133.23.1 class WindowsMidiInputMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: A class to represent an open Midi Input device in Xojo.
Example:

```
// receive notes from a MIDI keyboard on Windows
// MyMidiInput is a subclass of WindowsMidiInputMBS with the DeviceData event implemented.
// Input is a property of the window: Input As MyMidiInput
Input = New MyMidiInput
Input.Open(0, 1024) // first MIDI input device
Input.Start

// in MyMidiInput:
Sub DeviceData(timestamp As Integer, status As Integer, data1 As Integer, data2 As Integer, RawData As Integer) Handles DeviceData
If BitwiseAnd(status, &hF0) = &h90 And data2 >0 Then
System.DebugLog "Note " + data1.ToString + " velocity " + data2.ToString + " at " + timestamp.ToString + " ms"
End If
End Sub
```

Notes: Subclass of the WindowsMidiMBS class.
Blog Entries

- MBS Xojo Plugins, version 18.5pr2
- MBS Real Studio Plugins, version 13.1pr9

133.23.2 Methods

133.23.3 Close

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Closes the device.
Notes: First stops recording, second resets midi output device and third Closes the device with waiting till device is done.
Handle is set to 0 and lasterror is set.

133.23.4 Idle

MBS Audio Plugin, Plugin Version: 9.7, Platform: Windows, Targets: All.

Function: Processes events.
Notes: Midi events are buffered in data structures. This method dispatches them to the Xojo event handlers.
Call this method as often as you need events to fire. For example every 100ms in a timer.

same as WindowsMidiMBS.Idle

133.23.5 InputErrorText(errorcode as Integer) as string

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Translates an error number into a human readable text.
Notes: Returns "" on unknown errros.
String returned has Windows ANSI text encoding.

133.23.6 Open(DeviceID as Integer, BufferSize as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Opens a Midi device.
Notes: DeviceID is from 0 to NumberOfMidiInputDevices-1.
Buffersize is the maximum size to allocate for each SysEx receive buffer.
Minimum is 256 bytes. Windows does not handle SysEx messages bigger than 64K.
Lasterror is set.
On success the handle property is non zero.

133.23.7 Reset

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Resets the device.
Notes: Lasterror is set.

133.23.8 Start

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Starts listening for events.
Notes: Lasterror is set.
Please do not call from Open event as that's too early.

133.23.9 Stop

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Stops recording.
Notes: Lasterror is set.
You should not need this and just call close or let the object die.

133.23.10 Events

133.23.11 DeviceClose

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: An event called whenever the output device is closed.
Notes: Called when you call close.

133.23.12 DeviceData(timestamp as Integer, status as Integer, data1 as Integer, data2 as Integer, RawData as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: A simple Midi message has been received.
Notes: Process this event fast to avoid loosing events.
Status, Data1 and Data2 are all 8 bit values.
The time stamp is specified in milliseconds, beginning at zero when the Start function was called.

133.23.13 DeviceError(timestamp as Integer, status as Integer, data1 as Integer, data2 as Integer, RawData as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: A bad Midi message has been received.
Notes: Process this event fast to avoid loosing events.
Status, Data1 and Data2 are all 8 bit values.
The time stamp is specified in milliseconds, beginning at zero when the Start function was called.

133.23.14 DeviceLongData(timestamp as Integer, data as string, dataMemory as memoryblock)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: SysEx data was received.
Notes: If data is "" no free buffer was available to store the data.
The time stamp is specified in milliseconds, beginning at zero when the Start function was called.

133.23.15 DeviceLongError(timestamp as Integer, data as string, dataMemory as memoryblock)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Bad SysEx data was received.
Notes: If data is "" no free buffer was available to store the data.
The time stamp is specified in milliseconds, beginning at zero when the Start function was called.

133.23.16 DeviceOpen

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: An event called whenever the output device is opened.
Notes: Called when you call open.
Please do not call Start from Open event as that's too early.

133.24 class WindowsMidiMBS

133.24.1 class WindowsMidiMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Windows Midi base class.
Example:

```
Var midi as WindowsMidiMBS // your midi object

Sub Open()
Var i as WindowsMidiInputInfoMBS
Var o as WindowsMidiOutputInfoMBS
Var c,n as Integer

midi=new WindowsMidiMBS

c=midi.NumberOfMidiInputDevices-1

for n=0 to c
i=midi.InputDevice(n)

ListBox1.AddRow str(n+1)
ListBox1.CellTextAt(ListBox1.LastAddedRowIndex,1)=i.Name
ListBox1.CellTextAt(ListBox1.LastAddedRowIndex,2)=hex(i.DriverVersion)

next

c=midi.NumberOfMidiOutputDevices-1

for n=0 to c
o=midi.OutputDevice(n)

ListBox2.AddRow str(n+1)
ListBox2.CellTextAt(ListBox2.LastAddedRowIndex,1)=o.Name
ListBox2.CellTextAt(ListBox2.LastAddedRowIndex,2)=hex(o.DriverVersion)

next

End Sub
```

Notes: See also PortMidiMBS class for cross platform Midi handling.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr9

133.24.2 Methods

133.24.3 Connect(output as WindowsMidiOutputMBS)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The Connect function connects a MIDI input device to a MIDI thru or output device, or connects a MIDI thru device to a MIDI output device.
Notes: self must be a MIDI input device or a MIDI thru device.
output must be the MIDI output or thru device.

After calling this function, the MIDI input device receives event data in an DeviceData event whenever a message with the same event data is sent to the output device driver.

A thru driver is a special form of MIDI output driver. The system will allow only one MIDI output device to be connected to a MIDI input device, but multiple MIDI output devices can be connected to a MIDI thru device. Whenever the given MIDI input device receives event data in an DeviceData event, a message with the same event data is sent to the given output device driver (or through the thru driver to the output drivers).

Lasterror is set.

133.24.4 DataLost as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Number of data blocks lost.
Notes: The buffers in the plugins have a certain size.
In case midi events are coming fast in and the Idle method is not called often enough events are lost.
In that case increase the frequency of calling Idle or request the buffer size to be increased in the next plugin version.

133.24.5 Disconnect(output as WindowsMidiOutputMBS)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The Disconnect function disconnects a MIDI input device from a MIDI thru or output device, or disconnects a MIDI thru device from a MIDI output device.
Notes: self must be a MIDI input device or a MIDI thru device.
output must be the MIDI output device to be disconnected.

MIDI input, output, and thru devices can be connected by using the Connect function. Thereafter, whenever the MIDI input device receives event data in an DeviceData event, a message with the same event data is

sent to the output device driver (or through the thru driver to the output drivers).

Lasterror is set.

133.24.6 EventsLost as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Number of events lost.
Notes: The buffers in the plugins have a certain size.
In case midi events are coming fast in and the Idle method is not called often enough events are lost.
In that case increase the frequency of calling Idle or request the buffer size to be increased in the next plugin version.

133.24.7 Idle

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Processes events.
Notes: Midi events are buffered in data structures. This method dispatches them to the Xojo event handlers.
Call this method as often as you need events to fire. For example every 100ms in a timer.

133.24.8 InputDevice(index as Integer) as WindowsMidiInputInfoMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The InputDevice function queries a specified MIDI input device to determine its capabilities.
Example:

```
Var midi as WindowsMidiMBS // your midi object
Var n,c as Integer
Var i as WindowsMidiInputInfoMBS

c=midi.NumberOfMidiInputDevices-1

for n=0 to c
i=midi.InputDevice(n)

ListBox1.AddRow str(n+1)
ListBox1.CellTextAt(ListBox1.LastAddedRowIndex,1)=i.Name
ListBox1.CellTextAt(ListBox1.LastAddedRowIndex,2)=hex(i.DriverVersion)
```

next

Notes: Index is from 0 to NumberOfMidiInputDevices-1.

133.24.9 NumberOfMidiInputDevices as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Returns the number of MIDI input devices present in the system.
Example:

```
Var midi as new WindowsMidiMBS
MessageBox str(midi.NumberOfMidiInputDevices)
```

Notes: A return value of zero means that there are no devices.

133.24.10 NumberOfMidiOutputDevices as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Returns the number of MIDI output devices present in the system.
Example:

```
Var midi as new WindowsMidiMBS
MessageBox str(midi.NumberOfMidiOutputDevices)
```

Notes: A return value of zero means that there are no devices.

133.24.11 OutputDevice(index as Integer) as WindowsMidiOutputInfoMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The OutputDevice function queries a specified MIDI output device to determine its capabilities.
Example:

```
Var midi as WindowsMidiMBS // your midi object
Var c,n as Integer
Var o as WindowsMidiOutputInfoMBS

c=midi.NumberOfMidiOutputDevices-1

for n=0 to c
```

```
o=midi.OutputDevice(n)

ListBox2.AddRow str(n+1)
ListBox2.CellTextAt(ListBox2.LastAddedRowIndex,1)=o.Name
ListBox2.CellTextAt(ListBox2.LastAddedRowIndex,2)=hex(o.DriverVersion)

next
```

Notes: Index is from 0 to NumberOfMidiOutputDevices-1.

133.24.12 Properties

133.24.13 Handle as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The handle for this Midi input or output port.
Notes: Depending on which Xojo class this is, value is a HMIDI, HMIDIIN or HMIDIOUT handle.
(Read only property)

133.24.14 Lasterror as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The last error code reported.
Notes: 0 is no error and -1 is parameter error from the plugin.
(Read only property)

133.25 class WindowsMidiOutputInfoMBS

133.25.1 class WindowsMidiOutputInfoMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: A class for information about a certain Midi Device.

133.25.2 Properties

133.25.3 ChannelMask as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Channels that an internal synthesizer device responds to, where the least significant bit refers to channel 0 and the most significant bit to channel 15.
Notes: Port devices that transmit on all channels set this member to &hFFFF.
(Read only property)

133.25.4 DriverVersion as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Version number of the device driver for the MIDI input device.
Notes: The high-order byte is the major version number, and the low-order byte is the minor version number.
(Read only property)

133.25.5 Flags as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Optional functionality supported by the device.
Notes: It can be one or more of the following:

MIDICAPS_CACHE	= 4	Supports patch caching.
MIDICAPS_LRVOLUME	= 2	Supports separate left and right volume control.
MIDICAPS_STREAM	= 8	Provides direct support for the midiStreamOut function.
MIDICAPS_VOLUME	= 1	Supports volume control.

If a device supports volume changes, the MIDICAPS_VOLUME flag will be set for the dwSupport member.

If a device supports separate volume changes on the left and right channels, both the MIDICAPS_VOLUME and the MIDICAPS_LRVOLUME flags will be set for this member.
(Read only property)

133.25.6 ManufacturerID as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Manufacturer identifier of the device driver for the MIDI input device.
Notes: (Read only property)

133.25.7 Name as String

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Product name.
Notes: Currently an ANSI string.
(Read only property)

133.25.8 Notes as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Maximum number of simultaneous notes that can be played by an internal synthesizer device.
Notes: If the device is a port, this member is not meaningful and is set to 0.
(Read only property)

133.25.9 ProductID as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Product identifier of the MIDI input device.
Notes: (Read only property)

133.25.10 Technology as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Type of the MIDI output device.
Notes: This value can be one of the following:

```
MOD_MIDIPORT     = 1   // output port
MOD_SYNTH        = 2   // generic internal synth
MOD_SQSYNTH      = 3   // square wave internal synth
MOD_FMSYNTH      = 4   // FM internal synth
MOD_MAPPER       = 5   // MIDI mapper
MOD_WAVETABLE    = 6   // hardware wavetable synth
MOD_SWSYNTH      = 7   // software synth
```

(Read only property)

133.25.11 Voices as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Number of voices supported by an internal synthesizer device.
Notes: If the device is a port, this member is not meaningful and is set to 0.
(Read only property)

133.25.12 Volume as Boolean

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Whether volume control is available.
Notes: True if yes and False if no.
(Read only property)

133.25.13 VolumeStereo as Boolean

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Whether the device can control volume on two independent channels.
Notes: True if stereo, False if mono.
(Read only property)

133.26 class WindowsMidiOutputMBS

133.26.1 class WindowsMidiOutputMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: A class to represent a Midi Output device.
Example:

```
// play a C major chord on the default MIDI output on Windows
// Output is a property of the window: Output As WindowsMidiOutputMBS
Output = New WindowsMidiOutputMBS
Output.OpenDefault

Output.SendMessage(&hC0, 0, 0) // program change: piano
For Each note As Integer In Array(60, 64, 67)
Output.SendMessage(&h90, note, 100) // note on
Next
// later, e.g. in a timer: send &h80 (note off) for each note and call Output.Close
```

Notes: Subclass of the WindowsMidiMBS class.
Blog Entries

- MBS Xojo Plugins, version 25.6pr7
- MBS Xojo Plugins, version 18.5pr2

133.26.2 Methods

133.26.3 Close

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Closes the output device.
Notes: Closes the device with waiting till device is done.
Handle is set to 0 and lasterror is set.

133.26.4 Open(DeviceID as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Opens the midi device with the given index.
Notes: DeviceID is from 0 to NumberOfMidiOutputDevices-1.
Lasterror is set.

133.26.5 OpenDefault

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Opens the Midi mapper which opens the device the user selected as the default midi device.
Notes: If only one midi output device is available this one is opened.
On success the handle property is not zero.
Lasterror is set.

133.26.6 OutputErrorText(errorcode as Integer) as string

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Translates an error number into a human readable text.
Notes: Returns "" on unknown errros.
String returned has Windows ANSI text encoding.

133.26.7 Reset

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Resets the output device.
Notes: Lasterror is set.

133.26.8 SendData(data as memoryblock)

MBS Audio Plugin, Plugin Version: 12.5, Platform: Windows, Targets: All.

Function: Sends sysex data.
Notes: Lasterror is set.

See also
http://msdn.microsoft.com/en-us/library/windows/desktop/dd798474(v=vs.85).aspx
See also:

- 133.26.9 SendData(data as memoryblock, size as Integer) 18433
- 133.26.10 SendData(data as string) 18434

133.26.9 SendData(data as memoryblock, size as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Sends sysex data.
Example:

```
Var m as MemoryBlock
Var o as WindowsMidiOutputMBS // your midi output

m=NewMemoryBlock(8)

m.Byte(0)=&hF0
m.Byte(1)=&h7F
m.Byte(2)=&h7F
m.Byte(3)=&h04
m.Byte(4)=&h01
m.Byte(5)=&h7F
m.Byte(6)=&h7F
m.Byte(7)=&hF7

o.SendData m
```

Notes: Lasterror is set.
size is the size of the memoryblock to use. A wrong value will crash the application.

See also:

- 133.26.8 SendData(data as memoryblock) 18433
- 133.26.10 SendData(data as string) 18434

133.26.10 SendData(data as string)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Sends sysex data.
Notes: Lasterror is set.

See also
http://msdn.microsoft.com/en-us/library/windows/desktop/dd798474(v=vs.85).aspx
The plugin prepares MIDIHDR structure and uses your data there.
See also:

- 133.26.8 SendData(data as memoryblock) 18433
- 133.26.9 SendData(data as memoryblock, size as Integer) 18433

133.26.11 SendMessage(message as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Sends a short midi message immediately.
Example:

```
Var o as WindowsMidiOutputMBS // your windows midi output
// &h90 = Note down
// &h43 = the note number
// &h40 = the velocity
o.SendMessage &h404390
```

Notes: The message is stored in one 32bit integer.
lowest 8 bit is status, second 8 bit is data1, third 8 bit is data2 and highest 8 bit is left 0.

Between sending note on and off messages, you need to leave time for actual playback.
Lasterror is set.

See also
http://msdn.microsoft.com/en-us/library/windows/desktop/dd798481(v=vs.85).aspx
See also:

- 133.26.12 SendMessage(status as Integer, data1 as Integer, data2 as Integer) 18435

133.26.12 SendMessage(status as Integer, data1 as Integer, data2 as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Sends a short midi message immediately.
Example:

```
Var o as WindowsMidiOutputMBS // your windows midi output
// &h90 = Note down
// &h3C = the note number
// &h40 = the velocity
o.SendMessage &h90, &h3C, &h40
```

Notes: Lasterror is set.
Between sending note on and off messages, you need to leave time for actual playback.

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/dd798481(v=vs.85).aspx
See also:

• 133.26.11 SendMessage(message as Integer) 18435

133.26.13 Properties

133.26.14 Volume as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The volume to be used for this device.
Example:

```
Var m as WindowsMidiOutputMBS // your midi output

m.Volume=0 // all silent
m.Volume=&hFFFF0000 // right only
m.Volume=&h0000FFFF // left only or max volume for mono device
m.Volume=&h7FFF7FFF // half volume for both channels
```

Notes: Not all devices can set the volume.
Lasterror is set.

The low-order word contains the left-channel volume setting, and the high-order word contains the right-channel setting. A value of &hFFFF represents full volume, and a value of &h0000 is silence.

If a device does not support both left and right volume control, the low-order word of dwVolume specifies the mono volume level, and the high-order word is ignored.
(Read and Write computed property)

133.26.15 Events

133.26.16 DeviceClose

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: An event called when the device is closed.
Notes: Should be called when you call close or the object dies.

133.26.17 DeviceDataSent

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: An event called whenever SysEx data was sent.

133.26.18 DeviceOpen

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: An event called whenever the device was opened successfully.

133.26.19 DevicePositionCallback

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Called when a MEVT_F_CALLBACK Midi event is about to be executed.
Notes: A way to track progress in playback.

133.27 class WindowsMidiStreamMBS

133.27.1 class WindowsMidiStreamMBS

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: A class for a Windows Midi Stream.
Example:

```
// play a short note on the default MIDI device on Windows
// Midi is a property of the window: Midi As WindowsMidiStreamMBS
Midi = New WindowsMidiStreamMBS
Midi.Open(0) // first MIDI output device
If Midi.Lasterror <>0 Then Return

Midi.SendMessage(&h90, 60, 100) // note on, channel 1, middle C, velocity 100
// later, e.g. in a timer:
// Midi.SendMessage(&h80, 60, 0) // note off
```

133.27.2 Methods

133.27.3 Close

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Closes the Midi stream.

133.27.4 Open(DeviceID as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Opens a MIDI stream for output.
Notes: By default, the device is opened in paused mode.
Lasterror is set.
DeviceID: The device is opened on behalf of the stream and closed again when the stream is closed.

133.27.5 Pause

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Pauses playback of a specified MIDI stream.
Notes: Lasterror is set.

133.27.6 PositionBytes as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Position of the stream in bytes.
Notes: Lasterror is set.

133.27.7 PositionMS as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Position of the stream in milliseconds.
Notes: Lasterror is set.

133.27.8 PositionSamples as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Position of the stream in samples.
Notes: Lasterror is set.

133.27.9 PositionTicks as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Position of the stream in ticks.
Notes: Lasterror is set.

133.27.10 Restart

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The Restart function restarts a paused MIDI stream.
Notes: Lasterror is set.

133.27.11 SendMessage(message as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Sends a short midi message immediately.
Example:

```
Var o as WindowsMidiStreamMBS // your midi stream

// &h90 = Note down
// &h43 = the note number
// &h40 = the velocity
o.SendMessage &h404390
```

Notes: The message is stored in one 32bit integer.
lowest 8 bit is status, second 8 bit is data1, third 8 bit is data2 and highest 8 bit is left 0.

Between sending note on and off messages, you need to leave time for actual playback.
Lasterror is set.
See also:

- 133.27.12 SendMessage(status as Integer, data1 as Integer, data2 as Integer) 18440

133.27.12 SendMessage(status as Integer, data1 as Integer, data2 as Integer)

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Sends a short midi message immediately.
Example:

```
Var o as WindowsMidiStreamMBS // your midi stream

// &h90 = Note down
// &h3C = the note number
// &h40 = the velocity
o.SendMessage &h90, &h3C, &h40
```

Notes: Lasterror is set.
Between sending note on and off messages, you need to leave time for actual playback.
See also:

- 133.27.11 SendMessage(message as Integer) 18439

133.27.13 Stop

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The Stop function turns off all notes on all MIDI channels for the specified MIDI output device.
Notes: Lasterror is set.

133.27.14 Properties

133.27.15 Handle as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The handle for the midi stream.
Notes: Type is HMIDISTRM.
(Read only property)

133.27.16 Lasterror as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The last error code reported by one of the class functions.
Notes: (Read only property)

133.27.17 Tempo as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Tempo of the stream, in microseconds per quarter note.
Notes: The tempo is honored only if the time division for the stream is specified in quarter note format.
Lasterror is set.
(Read and Write computed property)

133.27.18 TimeDiv as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: Time division for this stream, in the format specified in the Standard MIDI Files 1.0 specification.
Notes: The low 16 bits of this integer value contain the time division.
Lasterror is set.
(Read and Write computed property)

133.27.19 Volume as Integer

MBS Audio Plugin, Plugin Version: 6.1, Platform: Windows, Targets: All.

Function: The volume to be used for this stream.
Example:

```
Var m as WindowsMidiStreamMBS // your midi stream

m.Volume=0 // all silent
m.Volume=&hFFFF0000 // right only
m.Volume=&h0000FFFF // left only or max volume for mono device
m.Volume=&h7FFF7FFF // half volume for both channels
```

Notes: Not all devices can set the volume.
Lasterror is set.

The low-order word contains the left-channel volume setting, and the high-order word contains the right-channel setting. A value of &hFFFF represents full volume, and a value of &h0000 is silence.

If a device does not support both left and right volume control, the low-order word of dwVolume specifies the mono volume level, and the high-order word is ignored.
Lasterror is set.
(Read and Write computed property)

Chapter 134

Mobile Ads

134.1 class GADAdNetworkResponseInfoMBS

134.1.1 class GADAdNetworkResponseInfoMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Response metadata for an individual ad network in an ad response.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 22.5pr3

134.1.2 Methods

134.1.3 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The private constructor.

134.1.4 Properties

134.1.5 adNetworkClassName as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A class name that identifies the ad network.
Notes: (Read only property)

134.1.6 adSourceID as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The ad source ID associated with this ad network response.
Notes: Empty if the ad server does not populate this field.
(Read only property)

134.1.7 adSourceInstanceID as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The ad source instance ID associated with this ad network response. not populate this field.
Notes: Empty if the ad server does
(Read only property)

134.1.8 adSourceInstanceName as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The ad source instance name associated with this ad network response.
Notes: Empty if the ad server does not populate this field.
(Read only property)

134.1.9 adSourceName as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The ad source name associated with this ad network response.
Notes: Empty if the ad server does not populate this field.
(Read only property)

134.1.10 adUnitMapping as Dictionary

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Network configuration set on the AdMob UI.
Notes: (Read only property)

134.1.11 dictionaryRepresentation as Dictionary

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: JSON-safe dictionary representation of the ad network response info.
Notes: (Read only property)

134.1.12 error as NSErrorMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Error associated with the request to the network.
Notes: Nil if the network successfully loaded an ad or if the network was not attempted.
(Read only property)

134.1.13 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.1.14 latency as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Amount of time the ad network spent loading an ad. 0 if the network was not attempted.
Notes: (Read only property)

134.2 class GADAdRewardMBS

134.2.1 class GADAdRewardMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Ad reward information.
Blog Entries

- MBS Xojo Plugins, version 22.5pr3

134.2.2 Methods

134.2.3 Constructor(rewardType as string, rewardAmount as String)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Returns an initialized GADAdReward with the provided reward type and reward amount.

134.2.4 Properties

134.2.5 amount as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Amount rewarded to the user as string.
Notes: (Read only property)

134.2.6 amountValue as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Amount rewarded to the user as double.
Notes: (Read only property)

134.2.7 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.2.8 type as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Type of the reward.
Notes: (Read only property)

134.3 class GADAdSizeMBS

134.3.1 class GADAdSizeMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The class for an ad size.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- News from the MBS Xojo Plugins Version 22.5

Xojo Developer Magazine

- 21.1, page 33: News from MBS Xojo Plugins, What's up with MonkeyBread Software by Stefanie Juchmes

134.3.2 Methods

134.3.3 Banner as GADAdSizeMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: iPhone and iPod Touch ad size.
Notes: Typically 320x50.

134.3.4 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The private constructor.

134.3.5 Fluid as GADAdSizeMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: An ad size that spans the full width of its container, with a height dynamically determined by the ad.

134.3.6 FullBanner as GADAdSizeMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Full Banner size for the iPad (especially in a PopOver or in sheet).
Notes: Typically 468x60.

134.3.7 Invalid as GADAdSizeMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Invalid ad size marker.

134.3.8 LargeBanner as GADAdSizeMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Taller version of GADAdSizeBanner.
Notes: Typically 320x100.

134.3.9 Leaderboard as GADAdSizeMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Leaderboard size for the iPad.
Notes: Typically 728x90.

134.3.10 MediumRectangle as GADAdSizeMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Medium Rectangle size for the iPad (especially in a UISplitView's left pane).
Notes: Typically 300x250.

134.3.11 Skyscraper as GADAdSizeMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Skyscraper size for the iPad.
Notes: Mediation only. AdMob/Google does not offer this size. Typically 120x600.

134.3.12 Properties

134.3.13 Flags as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The flags field.
Notes: (Read only property)

134.3.14 Height as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The height value.
Notes: (Read only property)

134.3.15 IsFluid as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Returns true if this is a fluid ad size.
Notes: (Read only property)

134.3.16 IsValid as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Returns true if this is a valid size.
Notes: (Read only property)

134.3.17 StringValue as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Returns a string describing the provided AdSize.
Notes: (Read only property)

134.3.18 Width as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The width.
Notes: (Read only property)

134.4 class GADAdValueMBS

134.4.1 class GADAdValueMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The monetary value earned from an ad.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 22.5pr3

134.4.2 Methods

134.4.3 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The private constructor.

134.4.4 Properties

134.4.5 amount as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The ad's value as string.
Notes: (Read only property)

134.4.6 amountValue as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The ad's value as double.
Notes: (Read only property)

134.4.7 currencyCode as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The value's currency code.
Notes: (Read only property)

134.4.8 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.4.9 precision as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The precision of the reported ad value.
Notes: (Read only property)

134.4.10 Constants

Precisions

Constant	Value	Description
PrecisionEstimated	1	An ad value estimated from aggregated data.
PrecisionPrecise	3	The precise value paid for this ad.
PrecisionPublisherProvided	2	A publisher-provided ad value, such as manual CPMs in a mediation group.
PrecisionUnknown	0	An ad value with unknown precision.

134.5 class GADAppOpenAdMBS

134.5.1 class GADAppOpenAdMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: An app open ad.
Notes: Used to monetize app load screens.

See https://developers.google.com/admob/iOS/app-open to get started.
Blog Entries

- MBS Xojo Plugins, version 23.6pr5
- Google Admob for Xojo

134.5.2 Methods

134.5.3 canPresent(byref error as NSErrorMBS) as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Returns whether the interstitial ad can be presented from the provided root view controller.
Notes: Sets the error out parameter if the ad can't be presented.
Must be called on the main thread.

134.5.4 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The constructor.
Notes: Please call Load method first to load the ad in background.
Then later, when loadCompleted was called, the Handle is not zero and finally you can call Present to show the ad over the current view controller.

134.5.5 Destructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The destructor.

134.5.6 loadWithAdUnitID(adUnitID as String, request as GADRequestMBS = nil)

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Loads an interstitial ad.
Notes: adUnitID: An ad unit ID created in the AdMob or Ad Manager UI.
request: An ad request object. If nil, a default ad request object is used.

Calls loadCompleted event later, when the load operation finishes or times out.

134.5.7 Present

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Presents the interstitial ad.
Notes: Must be called on the main thread.

134.5.8 Properties

134.5.9 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.5.10 responseInfo as GADResponseInfoMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Information about the ad response that returned the current ad or an error.
Notes: Nil until the first ad request succeeds or fails.
(Read only property)

134.5.11 Events

134.5.12 DidDismissFullScreenContent

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad dismissed full screen content.

134.5.13 DidFailToPresentFullScreenContentWithError(error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad failed to present full screen content.

134.5.14 DidRecordClick

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when a click has been recorded for the ad.

134.5.15 DidRecordImpression

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when that an impression has been recorded for the ad.

134.5.16 loadCompleted(error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when Load finished.
Notes: Next you can call Present when needed.

134.5.17 paid(value as GADAdValueMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Handles ad events that are estimated to have earned money.

134.5.18 WillDismissFullScreenContent

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad will dismiss full screen content.

134.5.19 WillPresentFullScreenContent

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad will present full screen content.

134.5.20 Constants

Device Orientation Constants

Constant	Value	Description
DeviceOrientationFaceDown	6	The device is held parallel to the ground with the screen facing downwa
DeviceOrientationFaceUp	5	The device is held parallel to the ground with the screen facing upwards
DeviceOrientationLandscapeLeft	3	The device is in landscape mode, with the device held upright and the button on the right side.
DeviceOrientationLandscapeRight	4	The device is in landscape mode, with the device held upright and the button on the left side.
DeviceOrientationPortrait	1	The device is in portrait mode, with the device held upright and the button at the bottom.
DeviceOrientationPortraitUpsideDown	2	The device is in portrait mode but upside down, with the device held u and the home button at the top.
DeviceOrientationUnknown	0	The orientation is currently not known.

134.6 class GADBannerViewMBS

134.6.1 class GADBannerViewMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A view that displays banner ads.
Notes: See https://developers.google.com/admob/iOS/banner to get started.

- News from the MBS Xojo Plugins Version 22.5
- Google Admob for Xojo

Xojo Developer Magazine

- 21.1, page 33: News from MBS Xojo Plugins, What's up with MonkeyBread Software by Stefanie Juchmes

134.6.2 Methods

134.6.3 AddToControl(Control as MobileControl)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Adds the control to the existing mobile control as children.

134.6.4 Constructor(AdSize as GADAdSizeMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Initializes and returns a banner view with the specified ad size placed at its superview's origin.

134.6.5 Destructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The destructor.

134.6.6 loadRequest(request as GADRequestMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Requests an ad. The request object supplies targeting information.

134.6.7 loadWithAdResponseString(adResponseString as String)

MBS iOS Plugin, Plugin Version: 26.4, Platform: iOS, Targets: iOS only.

Function: Loads a banner view ad.
Notes: adResponseString: A server-to-server ad response string.

Calls loadCompleted event later, when the load operation finishes or times out.

134.6.8 setValidAdSizes(sizes() as GADAdSizeMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Sets array of GADAdSizeMBS objects, specifying all valid sizes that are appropriate for this slot.

134.6.9 validAdSizes as GADAdSizeMBS()

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Optional array of GADAdSizeMBS objects, specifying all valid sizes that are appropriate for this slot.

134.6.10 Properties

134.6.11 adSize as GADAdSizeMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Required to set this banner view to a proper size.
Notes: If not using mediation, then changing the adSize after an ad has been shown will cause a new request (for an ad of the new size) to be sent. If using mediation, then a new request may not be sent.
(Read and Write property)

134.6.12 adUnitID as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The ad unit ID.
Notes: Required value created on the Ad Manager website. Create a new ad unit for every unique placement of an ad in your application. Set this to the ID assigned for this placement. Ad units are important for targeting and statistics.

Example Ad Manager ad unit ID: "/6499/example/banner"
(Read and Write property)

134.6.13 autoloadEnabled as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A Boolean value that determines whether autoloading of ads in the receiver is enabled.
Notes: If enabled, you do not need to call the loadRequest method to load ads.
(Read and Write property)

134.6.14 Collapsible as Boolean

MBS iOS Plugin, Plugin Version: 26.4, Platform: iOS, Targets: iOS only.

Function: Indicates whether the last loaded ad is a collapsible banner.
Notes: (Read only property)

134.6.15 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.6.16 placementID as Int64

MBS iOS Plugin, Plugin Version: 26.4, Platform: iOS, Targets: iOS only.

Function: An identifier for a placement in reporting.
Notes: This property must be set prior to presenting the ad.

(Read and Write property)

134.6.17 responseInfo as GADResponseInfoMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Information about the ad response that returned the current ad or an error.
Notes: Nil until the first ad request succeeds or fails.
(Read only property)

134.6.18 Events

134.6.19 DidDismissScreen

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the full screen view has been dismissed.
Notes: You should restart anything paused while handling WillPresentScreen.

134.6.20 DidFailToReceiveAdWithError(error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called whenan ad request failed.
Notes: The failure is normally due to network connectivity or ad availability (for example, no fill).

134.6.21 DidReceiveAd

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when an ad request successfully received an ad.
Notes: You may want to add the banner view to the view hierarchy if it hasn't been added yet.

134.6.22 DidRecordClick

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when a click has been recorded for the ad.

134.6.23 DidRecordImpression

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when an impression has been recorded for an ad.

134.6.24 paid(value as GADAdValueMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Handles ad events that are estimated to have earned money.

134.6.25 WillDismissScreen

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the full screen view will be dismissed.

134.6.26 WillPresentScreen

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when a full screen view will be presented in response to the user clicking on an ad.
Notes: You may want to pause animations and time sensitive interactions.

134.7 class GADInterstitialAdMBS

134.7.1 class GADInterstitialAdMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: An interstitial ad.
Notes: This is a full-screen advertisement shown at natural transition points in your application such as between game levels or news stories.

See https://developers.google.com/admob/iOS/interstitial to get started.
Blog Entries

- Add Google Ads to your Xojo app
- Google Admob for Xojo

134.7.2 Methods

134.7.3 canPresent(byref error as NSErrorMBS) as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Returns whether the interstitial ad can be presented from the provided root view controller.
Notes: Sets the error out parameter if the ad can't be presented.
Must be called on the main thread.

134.7.4 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The constructor.
Notes: Please call Load method first to load the ad in background.
Then later, when loadCompleted was called, the Handle is not zero and finally you can call Present to show the ad over the current view controller.

134.7.5 Destructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The destructor.

134.7.6 loadWithAdResponseString(adResponseString as String)

MBS iOS Plugin, Plugin Version: 26.4, Platform: iOS, Targets: iOS only.

Function: Loads an interstitial ad.
Notes: adResponseString: A server-to-server ad response string.

Calls loadCompleted event later, when the load operation finishes or times out.

134.7.7 loadWithAdUnitID(adUnitID as String, request as GADRequestMBS = nil)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Loads an interstitial ad.
Notes: adUnitID: An ad unit ID created in the AdMob or Ad Manager UI.
request: An ad request object. If nil, a default ad request object is used.

Calls loadCompleted event later, when the load operation finishes or times out.

134.7.8 Present

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Presents the interstitial ad.
Notes: Must be called on the main thread.

134.7.9 Properties

134.7.10 adUnitID as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The ad unit ID.
Notes: (Read only property)

134.7.11 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.7.12 placementID as Int64

MBS iOS Plugin, Plugin Version: 26.4, Platform: iOS, Targets: iOS only.

Function: An identifier for a placement in reporting.
Notes: This property must be set prior to presenting the ad.
(Read and Write property)

134.7.13 responseInfo as GADResponseInfoMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Information about the ad response that returned the current ad or an error.
Notes: Nil until the first ad request succeeds or fails.
(Read only property)

134.7.14 Events

134.7.15 DidDismissFullScreenContent

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad dismissed full screen content.

134.7.16 DidFailToPresentFullScreenContentWithError(error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad failed to present full screen content.

134.7.17 DidRecordClick

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when a click has been recorded for the ad.

134.7.18 DidRecordImpression

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when that an impression has been recorded for the ad.

134.7.19 loadCompleted(error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when Load finished.
Notes: Next you can call Present when needed.

134.7.20 paid(value as GADAdValueMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Handles ad events that are estimated to have earned money.

134.7.21 WillDismissFullScreenContent

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad will dismiss full screen content.

134.7.22 WillPresentFullScreenContent

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad will present full screen content.

134.8 class GADMobileAdsMBS

134.8.1 class GADMobileAdsMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Google Mobile Ads SDK settings.
Notes: You need to load framework first, before using this class.
Blog Entries

- MBS Xojo Plugins, version 26.4pr2
- Add Google Ads to your Xojo app
- MonkeyBread Software Releases the MBS Xojo Plugins in version 22.5

134.8.2 Methods

134.8.3 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The constructor.

134.8.4 Destructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The destructor.

134.8.5 disableMediationInitialization

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Disables mediation adapter initialization during initialization of the GMA SDK.
Notes: Calling this method may negatively impact your ad performance and should only be called if you will not use GMA SDK controlled mediation during this app session. This method must be called before initializing the GMA SDK or loading ads and has no effect once the SDK has been initialized.

134.8.6 disableSDKCrashReporting

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Disables automated SDK crash reporting.
Notes: If not called, the SDK records the original exception handler if available and registers a new exception handler. The new exception handler only reports SDK related exceptions and calls the recorded original exception handler.

134.8.7 registerWebView(WKWebViewPtr as Ptr)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Registers a web view with the Google Mobile Ads SDK to improve in-app ad monetization of ads within this web view.
Notes: Please pass handle of HTMLViewer controls or WKWebViewMBS.
If needed, cast from Integer to Ptr.

134.8.8 requestTrackingAuthorization

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The request for user authorization to access app-related data.
Notes: The requestTrackingAuthorization: is a one-time request to authorize or deny access to app-related data that can be used for tracking the user or the device. The system remembers the user,Äôs choice and doesn,Äôt prompt again unless a user uninstalls and then reinstalls the app on the device.

Calls to the API only prompt when the application state is UIApplicationStateActive. The authorization prompt doesn,Äôt display if another permission request is pending user confirmation. Concurrent requests aren,Äôt preserved by iOS, and calls to the API through an app extension don,Äôt prompt. Check the trackingAuthorizationStatus for a status of TrackingManagerAuthorizationStatusNotDetermined to determine if you need to make an additional call.

134.8.9 sharedInstance as GADMobileAdsMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Returns the shared GADMobileAds instance.

134.8.10 start

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Starts the Google Mobile Ads SDK.
Notes: Call this method as early as possible to reduce latency on the session's first ad request. Calls start-

Completed event when the GMA SDK and all mediation networks are fully set up or if set-up times out. The Google Mobile Ads SDK starts on the first ad request if this method is not called.

134.8.11 Properties

134.8.12 applicationVolume as Single

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The application's audio volume.
Notes: Affects audio volumes of all ads relative to other audio output.
Valid ad volume values range from 0.0 (silent) to 1.0 (current device volume). Use this method only if your application has its own volume controls (e.g., custom music or sound effect volumes). Defaults to 1.0.
(Read and Write property)

134.8.13 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.8.14 requestConfiguration as GADRequestConfigurationMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Request configuration that is common to all requests.
Notes: (Read only property)

134.8.15 trackingAuthorizationStatus as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The authorization status that is current for the calling application.
Notes: Use the trackingAuthorizationStatus property to check authorization status.
(Read only property)

134.8.16 Events

134.8.17 requestTrackingAuthorizationCompleted(status as integer)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when requestTrackingAuthorization is done.

134.8.18 startCompleted

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called, when start method finishes.

134.8.19 Constants

Tracking Authorization Status

Constant	Value	Description
TrackingManagerAuthorizationStatusAuthorized	3	The value that returns if the user authorizes access to tracking the user or the device.
TrackingManagerAuthorizationStatusDenied	2	The value that returns if the user denies authorization t data for tracking the user or the device.
TrackingManagerAuthorizationStatusNotDetermined	0	The value that returns when the app can,Äôt determine rization status for access to app-related data for tracking tl
TrackingManagerAuthorizationStatusRestricted	1	The value that returns if authorization to access app-relat the user or the device has a restricted status.

134.9 class GADRequestConfigurationMBS

134.9.1 class GADRequestConfigurationMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Request configuration.
Notes: The settings in this class will apply to all ad requests.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

134.9.2 Methods

134.9.3 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The private constructor.

134.9.4 GADMaxAdContentRatingGeneral as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Rating for content suitable for general audiences, including families.

134.9.5 GADMaxAdContentRatingMatureAudience as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Rating for content suitable only for mature audiences.

134.9.6 GADMaxAdContentRatingParentalGuidance as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Rating for content suitable for most audiences with parental guidance.

134.9.7 GADMaxAdContentRatingTeen as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Rating for content suitable for teen and older audiences.

134.9.8 setTestDeviceIdentifiers(testDeviceIdentifiers() as string)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Sets the identifiers corresponding to test devices which will always request test ads.
Notes: The test device identifier for the current device is logged to the console when the first ad request is made.

134.9.9 testDeviceIdentifiers as string()

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Identifiers corresponding to test devices which will always request test ads.
Notes: The test device identifier for the current device is logged to the console when the first ad request is made.

134.9.10 Properties

134.9.11 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.9.12 maxAdContentRating as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The maximum ad content rating. All Google ads will have this content rating or lower.
Notes: (Read and Write property)

134.9.13 publisherPrivacyPersonalizationState as Integer

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function:

This property lets you specify the personalization treatment that applies to subsequent ad requests.
Notes:

(Read and Write property)

134.9.14 tagForChildDirectedTreatment as Variant

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: The child directed treatment tag.
Notes: This property indicates whether you would like your app to be treated as child-directed for purposes of the Children,Äôs Online Privacy Protection Act (COPPA),
https://www.ftc.gov/business-guidance/privacy-security/childrens-privacy.

If you set this property with true, you are indicating that your app should be treated as child-directed for purposes of the Children,Äôs Online Privacy Protection Act (COPPA).

If you set this property with false, you are indicating that your app should not be treated as child-directed for purposes of the Children,Äôs Online Privacy Protection Act (COPPA).

If you leave or reset this property as nil, ad requests will include no indication of how you would like your app treated with respect to COPPA.

By setting this property, you certify that this notification is accurate and you are authorized to act on behalf of the owner of the app. You understand that abuse of this setting may result in termination of your Google account.
(Read and Write property)

134.9.15 tagForUnderAgeOfConsent as Variant

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: The tag for under age consent
Notes: This property indicates whether the user is under the age of consent.
https://developers.google.com/admob/iOS/targeting#users_under_the_age_of_consent.

If you set this property with true, a TFUA parameter will be included in all ad requests, and you are indicating that you want ad requests to be handled in a manner suitable for users under the age of consent. This parameter disables personalized advertising, including remarketing, for all ad requests. It also disables requests to third-party ad vendors, such as ad measurement pixels and third-party ad servers.

If you set this property with false, you are indicating that you don't want ad requests to be handled in a manner suitable for users under the age of consent.

If you leave or reset this property as nil, ad requests will include no indication of how you would like your ad requests to be handled in a manner suitable for users under the age of consent.
(Read and Write property)

134.9.16 Constants

Privacy treatment personalization states

Constant	Value	Description
PublisherPrivacyPersonalizationStateDefault	0	Indicates that ad requests should receive the default publisher p ment.
PublisherPrivacyPersonalizationStateDisabled	2	Indicates that ad requests should receive non-personalized publ treatment.
PublisherPrivacyPersonalizationStateEnabled	1	Indicates that ad requests should receive personalized publisher p ment.

134.10 class GADRequestMBS

134.10.1 class GADRequestMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Specifies optional parameters for ad requests.
Blog Entries

- MBS Xojo Plugins, version 26.4pr2
- Add Google Ads to your Xojo app

134.10.2 Methods

134.10.3 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The constructor.

134.10.4 request as GADRequestMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Returns a default request.

134.10.5 Properties

134.10.6 customTargeting as Dictionary

MBS iOS Plugin, Plugin Version: 26.4, Platform: iOS, Targets: iOS only.

Function: Key-value pairs used for custom targeting.
Notes: (Read and Write property)

134.10.7 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.10.8 placementID as Int64

MBS iOS Plugin, Plugin Version: 26.4, Platform: iOS, Targets: iOS only.

Function: An identifier for a placement in reporting.
Notes: This property must be set prior to presenting the ad.
(Read and Write property)

134.10.9 publisherProvidedID as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Publisher provided user ID.
Notes: (Read and Write property)

134.10.10 requestAgent as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: String that identifies the ad request's origin.
Notes: Third party libraries that reference the Mobile Ads SDK should set this property to denote the platform from which the ad request originated.
For example, a third party ad network called "CoolAds network" that is mediating requests to the Mobile Ads SDK should set this property as "CoolAds".
(Read and Write property)

134.11 class GADResponseInfoMBS

134.11.1 class GADResponseInfoMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Information about a response to an ad request.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

134.11.2 Methods

134.11.3 adNetworkInfoArray as GADAdNetworkResponseInfoMBS()

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Array of metadata for each ad network included in the response.

134.11.4 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The private constructor.

134.11.5 GADCustomEventAdNetworkClassName as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Ad network class name for custom event ads.

134.11.6 GADErrorUserInfoKeyResponseInfo as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Key into NSError.userInfo mapping to a GADResponseInfo object.
Notes: When ads fail to load, errors returned contain an instance of GADResponseInfoMBS.

134.11.7 GADGoogleAdNetworkClassName as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Ad network class name for ads returned from Google's ad network.

134.11.8 Properties

134.11.9 dictionaryRepresentation as Dictionary

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: JSON-safe dictionary representation of the response info.
Notes: (Read only property)

134.11.10 extrasDictionary as Dictionary

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Dictionary of extra parameters that may be returned in an ad response.
Notes: (Read only property)

134.11.11 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.11.12 loadedAdNetworkResponseInfo as GADAdNetworkResponseInfoMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The GADAdNetworkResponseInfo corresponding to the adapter that was used to load the ad.
Notes: Nil if the ad failed to load.
(Read only property)

134.11.13 responseIdentifier as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Unique identifier of the ad response.
Notes: (Read only property)

134.12 class GADRewardedAdMBS

134.12.1 class GADRewardedAdMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A rewarded ad.
Notes: Rewarded ads are ads that users have the option of interacting with in exchange for in-app rewards.

134.12.2 Methods

134.12.3 canPresent(byref error as NSErrorMBS) as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Returns whether the ad can be presented from the provided root view controller.
Notes: Sets the error out parameter if the ad can't be presented.
Must be called on the main thread.

134.12.4 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The constructor.
Notes: Please call Load method first to load the ad in background.
Then later, when loadCompleted was called, the Handle is not zero and finally you can call Present to show the ad over the current view controller.

134.12.5 Destructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The destructor.

134.12.6 loadWithAdResponseString(adResponseString as String)

MBS iOS Plugin, Plugin Version: 26.4, Platform: iOS, Targets: iOS only.

Function: Loads a reward ad.
Notes: adResponseString: A server-to-server ad response string.

Calls loadCompleted event later, when the load operation finishes or times out.

134.12.7 loadWithAdUnitID(adUnitID as String, request as GADRequestMBS = nil)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Loads a reward ad.
Notes: adUnitID: An ad unit ID created in the AdMob or Ad Manager UI.
request: An ad request object. If nil, a default ad request object is used.

Calls loadCompleted event later, when the load operation finishes or times out.

134.12.8 Present

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Presents the interstitial ad.
Notes: Must be called on the main thread.

134.12.9 Properties

134.12.10 adReward as GADAdRewardMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The reward earned by the user for interacting with the ad.
Notes: (Read only property)

134.12.11 adUnitID as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The ad unit ID.
Notes: (Read only property)

134.12.12 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.12.13 placementID as Int64

MBS iOS Plugin, Plugin Version: 26.4, Platform: iOS, Targets: iOS only.

Function: An identifier for a placement in reporting.
Notes: This property must be set prior to presenting the ad.
(Read and Write property)

134.12.14 responseInfo as GADResponseInfoMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Information about the ad response that returned the current ad or an error.
Notes: Nil until the first ad request succeeds or fails.
(Read only property)

134.12.15 Events

134.12.16 DidDismissFullScreenContent

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad dismissed full screen content.

134.12.17 DidFailToPresentFullScreenContentWithError(error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad failed to present full screen content.

134.12.18 DidRecordClick

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when a click has been recorded for the ad.

134.12.19 DidRecordImpression

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when that an impression has been recorded for the ad.

134.12.20 loadCompleted(error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when Load finished.
Notes: Next you can call Present when needed.

134.12.21 paid(value as GADAdValueMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Handles ad events that are estimated to have earned money.

134.12.22 userDidEarnReward

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event to be executed when the user earns a reward.

134.12.23 WillDismissFullScreenContent

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad will dismiss full screen content.

134.12.24 WillPresentFullScreenContent

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad will present full screen content.

134.13 class GADRewardedInterstitialAdMBS

134.13.1 class GADRewardedInterstitialAdMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A rewarded interstitial ad.
Notes: Rewarded Interstitial ads are full screen ads that can be presented without user-opt in and allow you to reward the user with in-app items.

134.13.2 Methods

134.13.3 canPresent(byref error as NSErrorMBS) as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Returns whether the interstitial ad can be presented from the provided root view controller.
Notes: Sets the error out parameter if the ad can't be presented.
Must be called on the main thread.

134.13.4 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The constructor.
Notes: Please call Load method first to load the ad in background.
Then later, when loadCompleted was called, the Handle is not zero and finally you can call Present to show the ad over the current view controller.

134.13.5 Destructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The destructor.

134.13.6 loadWithAdResponseString(adResponseString as String)

MBS iOS Plugin, Plugin Version: 26.4, Platform: iOS, Targets: iOS only.

Function: Loads an interstitial reward ad.
Notes: adResponseString: A server-to-server ad response string.

Calls loadCompleted event later, when the load operation finishes or times out.

134.13.7 loadWithAdUnitID(adUnitID as String, request as GADRequestMBS = nil)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Loads a rewarded interstitial ad.
Notes: adUnitID: An ad unit ID created in the AdMob or Ad Manager UI.
request: An ad request object. If nil, a default ad request object is used.

Calls loadCompleted event later, when the load operation finishes or times out.

134.13.8 Present

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Presents the interstitial ad.
Notes: Must be called on the main thread.

134.13.9 Properties

134.13.10 adReward as GADAdRewardMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The reward earned by the user for interacting with the ad.
Notes: (Read only property)

134.13.11 adUnitID as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The ad unit ID.
Notes: (Read only property)

134.13.12 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.13.13 placementID as Int64

MBS iOS Plugin, Plugin Version: 26.4, Platform: iOS, Targets: iOS only.

Function: An identifier for a placement in reporting.
Notes: This property must be set prior to presenting the ad.
(Read and Write property)

134.13.14 responseInfo as GADResponseInfoMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Information about the ad response that returned the current ad or an error.
Notes: Nil until the first ad request succeeds or fails.
(Read only property)

134.13.15 Events

134.13.16 DidDismissFullScreenContent

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad dismissed full screen content.

134.13.17 DidFailToPresentFullScreenContentWithError(error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad failed to present full screen content.

134.13.18 DidRecordClick

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when a click has been recorded for the ad.

134.13.19 DidRecordImpression

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when that an impression has been recorded for the ad.

134.13.20 loadCompleted(error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when Load finished.
Notes: Next you can call Present when needed.

134.13.21 paid(value as GADAdValueMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Handles ad events that are estimated to have earned money.

134.13.22 userDidEarnReward

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event to be executed when the user earns a reward.

134.13.23 WillDismissFullScreenContent

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad will dismiss full screen content.

134.13.24 WillPresentFullScreenContent

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the ad will present full screen content.

134.14 class UIViewControllerMBS

134.14.1 class UIViewControllerMBS

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: An object that manages a view hierarchy for your UIKit app.
Notes: The UIViewController class defines the shared behavior that,Äôs common to all view controllers. You rarely create instances of the UIViewController class directly. Instead, you subclass UIViewController and add the methods and properties needed to manage the view controller,Äôs view hierarchy.

A view controller,Äôs main responsibilities include the following:

- Updating the contents of the views, usually in response to changes to the underlying data
- Responding to user interactions with views
- Resizing views and managing the layout of the overall interface
- Coordinating with other objects —including other view controllers —in your app

A view controller is tightly bound to the views it manages and takes part in handling events in its view hierarchy. Specifically, view controllers are UIResponder objects and are inserted into the responder chain between the view controller,Äôs root view and that view,Äôs superview, which typically belongs to a different view controller. If none of the view controller,Äôs views handle an event, the view controller has the option of handling the event or passing it along to the superview.

View controllers are rarely used in isolation. Instead, you often use multiple view controllers, each of which owns a portion of your app,Äôs user interface. For example, one view controller might display a table of items while a different view controller displays the selected item from that table. Usually, only the views from one view controller are visible at a time. A view controller may present a different view controller to display a new set of views, or it may act as a container for other view controllers,Äô content and animate views however it wants.
Subclass of the NSResponderMBS class.

Xojo Developer Magazine

- 23.6, page 10: News

134.14.2 Methods

134.14.3 beginAppearanceTransition(isAppearing as boolean, animated as boolean)

MBS iOS Plugin, Plugin Version: 25.4, Platform: iOS, Targets: iOS only.

Function: Tells a child controller its appearance is about to change.
Notes: isAppearing: true if the child view controller,Äôs view is about to be added to the view hierarchy, false if it is being removed.
animated: If true, the transition is being animated.

If you are implementing a custom container controller, use this method to tell the child that its views are about to appear or disappear. Do not invoke viewWillAppear, viewWillDisappear, viewDidAppear, or viewDidDisappear directly.

134.14.4 Constructor

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The constructor to create a new empty UIViewController.

134.14.5 dismissViewController(animated as boolean)

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Dismisses the view controller that was presented modally by the view controller.
Notes: animated: Pass true to animate the transition.

The presenting view controller is responsible for dismissing the view controller it presented. If you call this method on the presented view controller itself, UIKit asks the presenting view controller to handle the dismissal.

If you present several view controllers in succession, thus building a stack of presented view controllers, calling this method on a view controller lower in the stack dismisses its immediate child view controller and all view controllers above that child on the stack. When this happens, only the top-most view is dismissed in an animated fashion; any intermediate view controllers are simply removed from the stack. The top-most view is dismissed using its modal transition style, which may differ from the styles used by other view controllers

lower in the stack.

If you want to retain a reference to the view controller's presented view controller, get the value in the presentedViewController property before calling this method.

Xojo may not be happy, if you mess up their controllers!

134.14.6 endAppearanceTransition

MBS iOS Plugin, Plugin Version: 25.4, Platform: iOS, Targets: iOS only.

Function: Tells a child controller its appearance has changed.
Notes: If you are implementing a custom container controller, use this method to tell the child that the view transition is complete.

134.14.7 loadView

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Creates the view that the controller manages.
Notes: You should never call this method directly. The view controller calls this method when its view property is requested but is currently nil. This method loads or creates a view and assigns it to the view property.

134.14.8 presentViewController(ViewController as UIViewControllerMBS, animated as Boolean)

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Presents a view controller modally.
Notes: ViewController: The view controller to display over the current view controller,Äôs content.
animated: Pass true to animate the presentation; otherwise, pass false.

In a horizontally regular environment, the view controller is presented in the style specified by the modalPresentationStyle property. In a horizontally compact environment, the view controller is presented full screen by default. If you associate an adaptive delegate with the presentation controller associated with the object in viewControllerToPresent, you can modify the presentation style dynamically.
The object on which you call this method may not always be the one that handles the presentation. Each presentation style has different rules governing its behavior. For example, a full-screen presentation must be made by a view controller that itself covers the entire screen. If the current view controller is unable to fulfill a request, it forwards the request up the view controller hierarchy to its nearest parent, which can then handle or forward the request.

Before displaying the view controller, this method resizes the presented view controller's view based on the presentation style. For most presentation styles, the resulting view is then animated onscreen using the transition style in the modalTransitionStyle property of the presented view controller. For custom presentations, the view is animated onscreen using the presented view controller,Äôs transitioning delegate. For current context presentations, the view may be animated onscreen using the current view controller,Äôs transition style.

Xojo may not be happy, if you mess up their controllers!

134.14.9 Properties

134.14.10 className as String

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The name of this NSViewController class.
Notes: e.g. XOJViewController
(Read only property)

134.14.11 classPath as String

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The path of this NSViewController class.
Notes: Useful for debugging to know what super classes the view controller has.

e.g. XOJViewController:UIViewController:UIResponder:NSObject
(Read only property)

134.14.12 currentViewController as UIViewControllerMBS

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Queries the current view controller on the screen.
Example:

```
Var c As UIViewControllerMBS = UIViewControllerMBS.currentViewController

Break
```

Notes: (Read only property)

134.14.13 isBeingDismissed as Boolean

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: A Boolean value indicating whether the view controller is dismissing.
Notes: (Read only property)

134.14.14 isBeingPresented as Boolean

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: A Boolean value indicating whether the view controller is presenting.
Notes: (Read only property)

134.14.15 isViewLoaded as Boolean

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: A Boolean value indicating whether the view is currently loaded into memory.
Notes: (Read only property)

134.14.16 parentViewController as UIViewControllerMBS

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The parent view controller of the recipient.
Notes: If the recipient is a child of a container view controller, this property holds the view controller it is contained in. If the recipient has no parent, the value in this property is nil.
(Read only property)

134.14.17 prefersStatusBarHidden as Boolean

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Specifies whether the view controller prefers the status bar to be hidden or shown.
Notes: True if the status bar should be hidden or false if it should be shown.
(Read only property)

134.14.18 presentedViewController as UIViewControllerMBS

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The view controller that is presented by this view controller, or one of its ancestors in the view controller hierarchy.
Notes: When you present a view controller modally (either explicitly or implicitly) using the presentViewController method, the view controller that called the method has this property set to the view controller that it presented. If the current view controller did not present another view controller modally, the value in this property is nil.
(Read only property)

134.14.19 presentingViewController as UIViewControllerMBS

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The view controller that presented this view controller.
Notes: When you present a view controller modally (either explicitly or implicitly) using the presentViewController() method, the view controller that was presented has this property set to the view controller that presented it. If the view controller was not presented modally, but one of its ancestors was, this property contains the view controller that presented the ancestor. If neither the current view controller or any of its ancestors were presented modally, the value in this property is nil.
(Read only property)

134.14.20 Title as String

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: A localized string that represents the view this controller manages.
Notes: Set the title to a human-readable string that describes the view. If the view controller has a valid navigation item or tab-bar item, assigning a value to this property updates the title text of those objects.
(Read and Write property)

134.14.21 View as NSViewMBS

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The view that the controller manages.
Notes: This property represents the root view of the view controller's view hierarchy. The default value of this property is nil.

If you access this property when its value is nil, the view controller automatically calls the loadView method and returns the resulting view.

Each view controller is the sole owner of its view object. Don,Äôt associate the same view object with multiple view controllers. The only exception is that a container view controller implementation may add another view controller,Äôs view object to its own view hierarchy. Before adding the subview, the container must first call its addChildViewController method to create a parent-child relationship between the two view controller objects.

Because accessing this property can cause the view to be loaded automatically, you can use viewLoaded to determine if the view is currently in memory. Unlike this property, viewLoaded doesn,Äôt force the loading of the view if it,Äôs not currently in memory.
(Read and Write property)

134.15 class UMPConsentFormMBS

134.15.1 class UMPConsentFormMBS

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: A single use consent form object.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 24.0
- Google Admob Update
- MBS Xojo Plugins, version 23.6pr5

134.15.2 Methods

134.15.3 Constructor

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: The private constructor.

134.15.4 load(handler as ConsentFormLoadCompletedMBS)

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Loads a consent form and calls completionHandler on completion.
Notes: Must be called on the main queue.

134.15.5 loadAndPresentIfRequiredFromViewController(viewController as UIViewControllerMBS, handler as ConsentFormPresentCompletedMBS)

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Loads a consent form and immediately presents it.
Notes: Loads a consent form and immediately presents it from the provided viewController if ConsentInformation.sharedInstance.consentStatus is UMPConsentStatusRequired. Calls handler after the user selects an option and the form is dismissed, or on the next run loop if no form is presented.
Must be called on the main queue.

134.15.6 presentFromViewController(viewController as UIViewControllerMBS, handler as ConsentFormPresentCompletedMBS)

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Presents the full screen consent form over viewController.
Notes: The form is dismissed and handler is called after the user selects an option.
ConsentInformation.sharedInstance.consentStatus is updated prior to handler being called.

134.15.7 presentPrivacyOptionsFormFromViewController(viewController as UIViewControllerMBS, handler as ConsentFormPresentCompletedMBS)

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Presents a privacy options form.
Notes: Presents a privacy options form from the provided viewController if ConsentInformation.sharedInstance.privacyOptionsRequirementStatus is
PrivacyOptionsRequirementStatusRequired.

Calls handler with nil error after the user selects an option and the form is dismissed, or on the next run loop with a non-nil error if no form is presented. Must be called on the main queue.

This method should only be called in response to a user input to request a privacy options form to be shown. The privacy options form is preloaded by the SDK automatically when a form becomes available. If no form is preloaded, the SDK will invoke the handler on the next run loop, but will asynchronously retry to load one.

134.15.8 UMPErrorDomain as String

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Error domain for all SDK errors.

134.15.9 Properties

134.15.10 Handle as Integer

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.15.11 VersionString as String

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: The SDK version string.
Notes: In the form "major.minor.patch".
(Read only property)

134.15.12 Constants

Error codes

Constant	Value	Description
FormErrorCodeAlreadyUsed	6	Form was already used.
FormErrorCodeInternal	5	Internal error.
FormErrorCodeInvalidViewController	9	Form cannot be presented from the provided view controller.
FormErrorCodeTimeout	8	Loading a form timed out.
FormErrorCodeUnavailable	7	Form is unavailable.
RequestErrorCodeInternal	1	Internal error.
RequestErrorCodeInvalidAppID	2	The application's app ID is invalid.
RequestErrorCodeMisconfiguration	4	A misconfiguration exists in the Funding Choices UI.
RequestErrorCodeNetwork	3	Network error communicating with Funding Choices.

134.15.13 Delegates

134.15.14 ConsentFormLoadCompletedMBS(consentForm as UMPConsentFormMBS, Error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Provides a nonnull consentForm and a nil error if the load succeeded.
Notes: Provides a nil consentForm and a nonnull error if the load failed.

134.15.15 ConsentFormPresentCompletedMBS(Error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Called after presentation of a ConsentForm finishes.

134.16 class UMPConsentInformationMBS

134.16.1 class UMPConsentInformationMBS

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Consent information.
Notes: All methods must be called on the main thread.
Blog Entries

- Google Admob Update
- MBS Xojo Plugins, version 23.6pr5

134.16.2 Methods

134.16.3 Constructor

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: The constructor.
Notes: Gets you the shared instance.

134.16.4 Destructor

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: The destructor.

134.16.5 requestConsentInfoUpdateWithParameters(parameters as UMPRequestParametersMBS = nil)

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Requests consent information update.
Notes: Must be called in every app session before checking the user's consentStatus or loading a consent form. After calling this method, consentStatus will be updated synchronously to hold the consent state from the previous app session, if one exists.
consentStatus may be updated again immediately before the handler is called.

134.16.6 Reset

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Clears all consent state from persistent storage.

134.16.7 Properties

134.16.8 canRequestAds as Boolean

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Indicates whether the app has completed the necessary steps for gathering updated user consent.
Notes: Returns false until requestConsentInfoUpdateWithParameters is called. Returns true once requestConsentInfoUpdateWithParameters is called and when consentStatus is ConsentStatusNotRequired or ConsentStatusObtained.
(Read only property)

134.16.9 consentStatus as Integer

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: The user's consent status.
Notes: This value defaults to ConsentStatusUnknown until requestConsentInfoUpdateWithParameters is called, and defaults to the previous session's value until your handler from requestConsentInfoUpdateWithParameters is called.
(Read only property)

134.16.10 formStatus as Integer

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Consent form status.
Notes: This value defaults to FormStatusUnknown and requires a call to requestConsentInfoUpdateWithParameters to update.
(Read only property)

134.16.11 Handle as Integer

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.16.12 privacyOptionsRequirementStatus as Integer

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Privacy options requirement status.
Notes: This value defaults to PrivacyOptionsRequirementStatusUnknown until requestConsentInfoUpdateWithParameters is called, and defaults to the previous session's value until your handler from requestConsentInfoUpdateWithParameters is called.
(Read only property)

134.16.13 sharedInstance as UMPConsentInformationMBS

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: The shared consent information instance.
Notes: (Read only property)

134.16.14 Events

134.16.15 ConsentInformationUpdateCompleted(Error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Called when the consent info request completes.
Notes: Error is nil on success, and non-nil if the update failed.

134.16.16 Constants

Consent Status

Constant	Value	Description
ConsentStatusNotRequired	2	Consent not required.
ConsentStatusObtained	3	User consent obtained, personalized vs non-personalized undefined.
ConsentStatusRequired	1	User consent required but not yet obtained.
ConsentStatusUnknown	0	Unknown consent status.

Form Status

Constant	Value	Description
FormStatusAvailable	1	Consent forms are available and can be loaded using loadWithCompletionHandler.
FormStatusUnavailable	2	Consent forms are unavailable. Showing a consent form is not required.
FormStatusUnknown	0	Whether a consent form is available is unknown. An update should be requested using requestConsentInfoUpdateWithParameters().

Privacy options requirement status

Constant	Value	Description
PrivacyOptionsRequirementStatusNotRequired	2	User does not need to modify their privacy options. Either required, or the consent type does not require modification.
PrivacyOptionsRequirementStatusRequired	1	A way must be provided for the user to modify their privacy op
PrivacyOptionsRequirementStatusUnknown	0	Requirement unknown.

134.17 class UMPDebugSettingsMBS

134.17.1 class UMPDebugSettingsMBS

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Overrides settings for debugging or testing.
Example:

```
// test for Europe Economic Area
Var debug As New UMPDebugSettingsMBS
debug.geography = debug.DebugGeographyEEA

Var param As New UMPRequestParametersMBS
param.debugSettings = debug
param.tagForUnderAgeOfConsent = True

UMPConsentInformationMBS.sharedInstance.requestConsentInfoUpdateWithParameters param
```

Blog Entries

- MBS Xojo Plugins, version 26.4pr2
- Google Admob Update
- MBS Xojo Plugins, version 23.6pr5

134.17.2 Methods

134.17.3 Constructor

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: The constructor.
Example:

```
// test for Europe Economic Area
Var debug As New UMPDebugSettingsMBS
debug.geography = debug.DebugGeographyEEA

Var param As New UMPRequestParametersMBS
param.debugSettings = debug
param.tagForUnderAgeOfConsent = True

UMPConsentInformationMBS.sharedInstance.requestConsentInfoUpdateWithParameters param
```

134.17.4 copy as UMPDebugSettingsMBS

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Creates a copy o this class.

134.17.5 setTestDeviceIdentifiers(testDeviceIdentifiers() as String)

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Sets the array of device identifier strings.
Notes: Debug features are enabled for devices with these identifiers. Debug features are always enabled for simulators.

134.17.6 testDeviceIdentifiers as String()

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Array of device identifier strings.
Notes: Debug features are enabled for devices with these identifiers. Debug features are always enabled for simulators.

134.17.7 Properties

134.17.8 geography as Integer

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Debug geography.
Notes: (Read and Write property)

134.17.9 Handle as Integer

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.17.10 Constants

Debug Geography

Constant	Value	Description
DebugGeographyDisabled	0	Disable geography debugging.
DebugGeographyEEA	1	Geography appears as in EEA for debug devices.
DebugGeographyNotEEA	2	Geography appears as not in EEA for debug devices. (deprecated in favor 4)
DebugGeographyOther	4	Geography appears as in a region with no regulation in force.
DebugGeographyRegulatedUSState	3	Geography appears as in a regulated US State.

134.18 class UMPRequestParametersMBS

134.18.1 class UMPRequestParametersMBS

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Parameters sent on updates to user consent info.
Blog Entries

- MBS Xojo Plugins, version 26.4pr2
- Google Admob Update
- MBS Xojo Plugins, version 23.6pr5

134.18.2 Methods

134.18.3 Constructor

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: The constructor.

134.18.4 copy as UMPRequestParametersMBS

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Creates a copy of the object.

134.18.5 Properties

134.18.6 consentSyncID as String

MBS iOS Plugin, Plugin Version: 26.4, Platform: iOS, Targets: iOS only.

Function: The consent sync ID to sync the user consent status collected with the same ID.
Notes: The consent sync ID must meet the following requirements:

- Constructed as a UUID string, or matches the regular expression (regex) ^[0-9a-zA-Z+.=\/_\-$, { }] { 22,150 } $.
- A minimum of 22 characters.

- A maximum of 150 characters.

Failure to meet the requirements results in the consent sync ID not being set and the UMP SDK logging a warning to the console.
(Read and Write property)

134.18.7 debugSettings as UMPDebugSettingsMBS

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Debug settings for the request.
Notes: (Read and Write property)

134.18.8 Handle as Integer

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

134.18.9 tagForUnderAgeOfConsent as Boolean

MBS iOS Plugin, Plugin Version: 24.0, Platform: iOS, Targets: iOS only.

Function: Indicates whether the user is tagged for under age of consent.
Notes: (Read and Write property)

Chapter 135

MongoDB

135.1 class MongoBulkOperationMBS

135.1.1 class MongoBulkOperationMBS

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Provides an abstraction for submitting multiple write operations as a single batch.
Example:

```
Var bulk As New MongoBulkOperationMBS(Collection)

// add a record
Var NewRecord As New JSONItem
NewRecord.Value("firstName") = "John"
NewRecord.Value("lastName") = "Miller"
NewRecord.Value("city") = "New York"
NewRecord.Value("phone") = "555-1111-111"

bulk.Insert(NewRecord.toString)

// and a second record
NewRecord = new JSONItem
NewRecord.Value("firstName") = "Bob"
NewRecord.Value("lastName") = "Jones"
NewRecord.Value("city") = "Los Angeles"
NewRecord.Value("phone") = "555-1234-567"

bulk.Insert(NewRecord.toString)
```

```
// now send both together
Var result As String = bulk.Execute

// e.g. { "nInserted" : 2, "nMatched" : 0, "nModified" : 0, "nRemoved" : 0, "nUpserted" : 0, "writeErrors" : [ ] }

MessageBox "Successful at server "+bulk.UsedServerId.ToString + EndOfLine + EndOfLine + result
```

Notes: After adding all of the write operations to the operation, call Execute() to execute the operation.

135.1.2 Methods

135.1.3 Constructor(Collection as MongoCollectionMBS, OptionsJSON as String = "")

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Begins a new bulk operation.
Notes: After creating this you may call various functions such as Update(), Insert() and others.

After calling Execute() the commands will be executed in as large as batches as reasonable by the client.
See also:

- 135.1.4 Constructor(ordered as boolean = false) 18510

135.1.4 Constructor(ordered as boolean = false)

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new bulk operation.
See also:

- 135.1.3 Constructor(Collection as MongoCollectionMBS, OptionsJSON as String = "") 18510

135.1.5 Execute as String

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Executes all operations queued into the bulk operation.
Notes: Unless ordered = false was specified in the opts passed to Constructor, then forward progress will be stopped upon the first error.

It is only valid to call Execute once. The bulk operation must be destroyed afterwards.

Returns the result or raises an exception.
Stores the used server id in the UsedServerId property.

135.1.6 Insert(documentJSON as String, OptionsJSON as String = "")

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queue an insert of a single document into a bulk operation.
Notes: The insert is not performed until Execute() is called.

135.1.7 RemoveMany(selectorJSON as String, OptionsJSON as String = "")

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Delete documents as part of a bulk operation.
Notes: This only queues the operation. To execute it, call Execute().

135.1.8 RemoveOne(selectorJSON as String, OptionsJSON as String = "")

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Remove a single document as part of a bulk operation.
Notes: This only queues the operation. To execute it, call Execute().

135.1.9 ReplaceOne(selectorJSON as String, documentJSON as String, OptionsJSON as String = "")

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Replace a single document as part of a bulk operation.
Notes: This only queues the operation. To execute it, call Execute().
See also:

- 135.1.10 ReplaceOne(selectorJSON as String, documentJSON as String, Upsert as Boolean) 18512

135.1.10 ReplaceOne(selectorJSON as String, documentJSON as String, Upsert as Boolean)

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Replace a single document as part of a bulk operation.
Notes: This only queues the operation. To execute it, call Execute().
See also:

- 135.1.9 ReplaceOne(selectorJSON as String, documentJSON as String, OptionsJSON as String = "") 18511

135.1.11 UpdateMany(selectorJSON as String, documentJSON as String, OptionsJSON as String = "")

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This function queues an update as part of a bulk operation.
Notes: This does not execute the operation. To execute the entirety of the bulk operation call Execute().
See also:

- 135.1.12 UpdateMany(selectorJSON as String, documentJSON as String, Upsert as Boolean) 18512

135.1.12 UpdateMany(selectorJSON as String, documentJSON as String, Upsert as Boolean)

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This function queues an update as part of a bulk operation.
Notes: This does not execute the operation. To execute the entirety of the bulk operation call Execute().

document MUST only contain fields whose key starts with $. See the update document specification for more details.

This function is superseded by UpdateMany or UpdateOne with options.
See also:

- 135.1.11 UpdateMany(selectorJSON as String, documentJSON as String, OptionsJSON as String = "") 18512

135.1.13 UpdateOne(selectorJSON as String, documentJSON as String, OptionsJSON as String = "")

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This function queues an update as part of a bulk operation.
Notes: It will only modify a single document on the MongoDB server. This function does not execute the operation. To execute the entirety of the bulk operation call Execute().
See also:

- 135.1.14 UpdateOne(selectorJSON as String, documentJSON as String, Upsert as Boolean) 18513

135.1.14 UpdateOne(selectorJSON as String, documentJSON as String, Upsert as Boolean)

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This function queues an update as part of a bulk operation.
Notes: It will only modify a single document on the MongoDB server. This function does not execute the operation. To execute the entirety of the bulk operation call Execute().

This function is superseded by UpdateOne with options.
See also:

- 135.1.13 UpdateOne(selectorJSON as String, documentJSON as String, OptionsJSON as String = "") 18512

135.1.15 Properties

135.1.16 BypassDocumentValidation as Boolean

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to bypass document validation for all operations part of this bulk.
Notes: (Read and Write property)

135.1.17 Client as MongoClientMBS

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The client for this operation.
Notes: (Read and Write property)

135.1.18 Collection as String

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The collection name.
Notes: (Read and Write property)

135.1.19 Comment as String

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Assigns a comment to attach to all commands executed as part of this bulk.
Notes: The comment will appear in log messages, profiler output, and currentOp output. Comments for write commands are only supported by MongoDB 4.4+.

It is prohibited to call this function after adding operations to the bulk.
(Read and Write property)

135.1.20 Database as String

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The database name.
Notes: (Read and Write property)

135.1.21 Handle as Integer

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

135.1.22 Let as String

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Defines constants that can be accessed by all update, replace, and delete operations executed as part of this bulk.
Notes: It is prohibited to call this function after adding operations to the bulk.
(Read and Write property)

135.1.23 Parent as MongoCollectionMBS

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parent collection.
Notes: (Read only property)

135.1.24 ServerID as UInt32

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Specifies which server to use for the operation.
Notes: This function has an effect only if called before Execute().

When writing applications, leave the server id unset and allow the driver to choose a suitable server for the bulk operation.
(Read and Write property)

135.1.25 UsedServerId as UInt32

MBS MongoDB Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The used server id set by Execute method.
Notes: (Read only property)

135.2 class MongoChangeStreamMBS

135.2.1 class MongoChangeStreamMBS

MBS MongoDB Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: A MongoDB change stream.
Example:

```
Var pipeline As String = " { } "
Var stream As MongoChangeStreamMBS = Collection.Watch(pipeline)

// now do inserts

// and now query changes
Var changeJSON As String

While stream.NextChange(changeJSON)

MessageBox changeJSON

Wend
```

Notes: Use this class to audit a collection, database or client for changes.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

135.2.2 Methods

135.2.3 Constructor

MBS MongoDB Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

135.2.4 ErrorDocument(byref ReplyJSON as String) as Boolean

MBS MongoDB Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks if an error has occurred when creating or iterating over a change stream.
Notes: Similar to ErrorDocument in MongoCursorMBS if the error has occurred client-side then the reply will be set to an empty BSON document. If the error occurred server-side, reply is set to the server,Äôs reply document.

Provides the reply from server about the error.

Returns a boolean indicating if there was an error.

135.2.5 NextChange(byref RecordJSON as String) as Boolean

MBS MongoDB Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates the underlying change stream, setting RecordJSON to the next document.
Example:

```
Var pipeline As String = " { } "
Var stream As MongoChangeStreamMBS = Collection.Watch(pipeline)

// now do inserts

// and now query changes
Var changeJSON As String

While stream.NextChange(changeJSON)

MessageBox changeJSON

Wend
```

Notes: This will block for a maximum of maxAwaitTimeMS milliseconds as specified in the options when

created, or the default timeout if omitted. Data may be returned before the timeout. If no data is returned this function returns false.

RecordJSON: The location for the resulting document.

This function returns true if a valid bson document was read from the stream. Otherwise, false if there was an error or no document was available.

Raises exception in case of error.

135.2.6 StreamResumeToken as String

MBS MongoDB Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the cached resume token, which may be passed as either the resumeAfter or startAfter option of a watch function to start a new change stream from the same point.
Notes: Returns "" if no resume token is available. This is possible if the change stream has not been iterated and neither resumeAfter nor startAfter options were specified in the watch function.

135.2.7 Properties

135.2.8 Handle as Integer

MBS MongoDB Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

135.2.9 Parent as Variant

MBS MongoDB Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parent object.
Notes: (Read only property)

135.3 class MongoClientMBS

135.3.1 class MongoClientMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: A MongoDB connection.
Example:

```
var URI as string = "mongodb://localhost/"
Var u As New MongoURIMBS(URI)

var client as new MongoClientMBS(u)
```

Notes: This is a class that provides access to a MongoDB server, replica set, or sharded cluster. It maintains management of underlying sockets and routing to individual nodes

The connection is NOT thread-safe and should only be used from one thread at a time.

For macOS and iOS, your application may need to have the NSLocalNetworkUsageDescription in info.plist for local network access and your sandboxed application may need need the com.apple.security.network.client entitlement.

135.3.2 Methods

135.3.3 Collection(DatabaseName as String, CollectionName as String) as MongoCollectionMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get a newly allocated MongoCollectionMBS for the collection named collection in the named database.
Notes: Collections are automatically created on the MongoDB server upon insertion of the first document. There is no need to create a collection manually.

135.3.4 Command(dbName as String, commandJSON as String) as String

MBS MongoDB Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This is a simplified interface to CommandQuery.
Notes: It returns the first document from the result cursor into reply. The client,Äôs read preference, read concern, and write concern are not applied to the command.

This function is not considered a retryable read operation.
See also:

- 135.3.5 Command(dbName as String, commandJSON as String, OptionsJSON as String) as String 18520

135.3.5 Command(dbName as String, commandJSON as String, OptionsJSON as String) as String

MBS MongoDB Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Execute a command on the server, interpreting options according to the MongoDB server version.
Notes: To send a raw command to the server without any of this logic, use Command().

Read preferences, read and write concern, and collation can be overridden by various sources.
See also:

• 135.3.4 Command(dbName as String, commandJSON as String) as String 18520

135.3.6 CommandQuery(dbName as String, queryJSON as String, OptionsJSON as String = "") as MongoCursorMBS

MBS MongoDB Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a query cursor.
Notes: This function creates a cursor which will execute the command when Next on the cursor is called on it. The client,Äôs read preference, read concern, and write concern are not applied to the command, and Next on the cursor will not check the server response for a write concern error or write concern timeout.

135.3.7 CommandWithServerId(dbName as String, commandJSON as String, serverId as UInt32) as String

MBS MongoDB Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This function executes a command on a specific server, using the database and command specification provided.
Notes: This function is not considered a retryable read operation.

dbName: The name of the database to run the command on.
serverId: An opaque id specifying which server to use.

135.3.8 Constructor(URI as MongoURIMBS)

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new client using the URI provided.
Notes: In case of an error, raises MongoExceptionMBS.

Connection is made when you run the first command, so you may want to soon query something or run a ping command.

135.3.9 Database(Name as String) as MongoDatabaseMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Opens the given database.
Notes: Databases are automatically created on the MongoDB server upon insertion of the first document

into a collection. There is no need to create a database manually.

135.3.10 DatabasesNames(OptionsJSON as String = "") as String()

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the MongoDB server for a list of known databases.
Example:

```
const URL = "mongodb://localhost/"

Var uri as new MongoURIMBS(URL)
Var client as new MongoClientMBS(uri)

Var databases() as string = client.DatabasesNames

Break // shows e.g. admin, config and local.
```

Notes: Returns a list of database names.
In case of an error, raises MongoExceptionMBS.

135.3.11 DataToBinary(Data as MemoryBlock) as String

MBS MongoDB Plugin, Plugin Version: 23.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts the data to a binary object.
Notes: Converts a string or MemoryBlock to JSON for MongoDB.
Reads the bytes, converts to base64 and embeds it in a $ binary JSON for use in MongoDB.
See also:

- 135.3.12 DataToBinary(Data as String) as String 18522

135.3.12 DataToBinary(Data as String) as String

MBS MongoDB Plugin, Plugin Version: 23.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts the data to a binary object.
Example:

```
Var json As String = MongoClientMBS.DataToBinary("Hello World")

MessageBox json
```

// shows: { "$ binary" : { "base64" : "SGVsbG8gV29ybGQ=", "subType" : "00" }

Notes: Converts a string or MemoryBlock to JSON for MongoDB.
Reads the bytes, converts to base64 and embeds it in a $ binary JSON for use in MongoDB.
See also:

- 135.3.11 DataToBinary(Data as MemoryBlock) as String 18522

135.3.13 DefaultDatabase as MongoDatabaseMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Opens default database.
Notes: Get the database named in the MongoDB connection URI, or "" if the URI specifies none.
Useful when you want to choose which database to use based only on the URI in a configuration file.

135.3.14 FindDatabases(OptionsJSON as String = "") as MongoCursorMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches list of database records.
Notes: Fetches a cursor containing documents, each corresponding to a database on this MongoDB server.

Sets current cursor.

135.3.15 GridFS(DB as String, Prefix as String = "") as MongoGridFSMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates the GridFS object for the given database.
Notes: The db parameter is the name of the database which the gridfs instance should exist in. The prefix parameter corresponds to the gridfs collection namespacing; its default is ,Äúfs,Äù, thus the default GridFS collection names are ,Äúfs.files,Äù and ,Äúfs.chunks,Äù.

135.3.16 LogMessage(Message as String)

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sends message through MongoDB logging system.
See also:

• 135.3.39 LogMessage(Level as Integer, Domain as String, Message as String) 18531

135.3.17 NewCursorFromCommandReply(commandReplyJSON as String, OptionsJSON as String = "") as MongoCursorMBS

MBS MongoDB Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a cursor object from the reply of a command.
Notes: Some MongoDB commands return a ,Äúcursor,Äù document.

commandReplyJSON: The reply to a command, such as ,Äúaggregate,Äù, ,Äúfind,Äù, or ,ÄúlistCollections,Äù, that returns a cursor document.

135.3.18 NowUTC as String

MBS MongoDB Plugin, Plugin Version: 23.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Create a new JSON value with current date and time.
Notes: Value is in GMT/UTC.
e.g. { "$ date" : "2023-03-09T11:39:34Z" }

135.3.19 Ping

MBS MongoDB Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sends ping command.
Notes: Great to check if connection is there and/or trigger reconnection.

135.3.20 ReadCommand(dbName as String, commandJSON as String, OptionsJSON as String = "") as String

MBS MongoDB Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Execute a command on the server, applying logic that is specific to commands that read, and taking the MongoDB server version into account.
Notes: To send a raw command to the server without any of this logic, use Command().

Use this function for commands that read such as ,Äúcount,Äù or ,Äúdistinct,Äù.

Read preferences, read concern, and collation can be overridden by various sources. In a transaction, read

concern and write concern are prohibited in opts and the read preference must be primary or nil. The highest-priority sources for these options are listed first in the following table. No write concern is applied.

135.3.21 ReadWriteCommand(dbName as String, commandJSON as String, OptionsJSON as String = "") as String

MBS MongoDB Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Execute a command on the server, applying logic for commands that both read and write, and taking the MongoDB server version into account.
Notes: To send a raw command to the server without any of this logic, use Command().

Use this function for commands that both read and write, such as ‚ÄúmapReduce‚Äù with an output collection.

Read and write concern and collation can be overridden by various sources. In a transaction, read concern and write concern are prohibited in opts. The highest-priority sources for these options are listed first in the following table. Read preferences are not applied. The write concern is omitted for MongoDB before 3.4.

135.3.22 ServerDescription(ServerID as UInt32) as MongoServerDescriptionMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get information about the server specified by ServerID.
Example:

```
Const URL = "mongodb://localhost/"

Var uri As New MongoURIMBS(URL)
Var client As New MongoClientMBS(uri)

// do something to trigger connection
Var names() As String = client.DatabasesNames

// now check first server
Var des As MongoServerDescriptionMBS = client.ServerDescription(1)
Break // check in debugger
```

135.3.23 ServerDescriptions as MongoServerDescriptionMBS()

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches an server descroptions for all known servers in the topology.
Example:

```
Const URL = "mongodb://localhost/"

Var uri As New MongoURIMBS(URL)
Var client As New MongoClientMBS(uri)

// do something to trigger connection
Var names() As String = client.DatabasesNames

// now check first server
Var ServerDescriptions() As MongoServerDescriptionMBS = client.ServerDescriptions
Break // check in debugger
```

Notes: Returns no servers until the client connects. Returns a single server if the client is directly connected, or all members of a replica set if the client,Äôs MongoDB URI includes a ,ÄúreplicaSet,Äù option, or all known mongos servers if the MongoDB URI includes a list of them.

135.3.24 Time(SecondsSince1970 as Double) as String

MBS MongoDB Plugin, Plugin Version: 23.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Create a new JSON value with given timestamp.
Notes: Please pass time as seconds since 1970 and in UTC time zone.

e.g. { "$ date" : "2023-03-09T11:39:34Z" }

135.3.25 Watch(pipelineJSON as String, OptionsJSON as String = "") as MongoChangeStreamMBS

MBS MongoDB Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a change stream for a client.
Notes: It is preferred to call this function over using a raw aggregation to create a change stream.

This function uses the read preference and read concern of the client. If the change stream needs to re-establish connection, the same read preference will be used. This may happen if the change stream encounters a resumable error.

Warning A change stream is only supported with majority read concern.
This function is considered a retryable read operation. Upon a transient error (a network error, errors due to replica set failover, etc.) the operation is safely retried once. If retryreads is false in the URI the retry behavior does not apply.

Call this method on the client which the change stream listens to.

pipelineJSON: A JSON representing an aggregation pipeline appended to the change stream. This may be an empty document.

OptionsJSON: A JSON containing change stream options. options may be "" or a JSON document with additional command options:

batchSize: An integer representing number of documents requested to be returned on each call to NextChange()

resumeAfter: A Document representing the logical starting point of the change stream. The result of StreamResumeToken() or the _id field of any change received from a change stream can be used here. This option is mutually exclusive with startAfter and startAtOperationTime.

startAfter: A Document representing the logical starting point of the change stream. Unlike resumeAfter, this can resume notifications after an ,Äúinvalidate,Äù event. The result of StreamResumeToken() or the _id field of any change received from a change stream can be used here. This option is mutually exclusive with resumeAfter and startAtOperationTime.

startAtOperationTime: A Timestamp. The change stream only provides changes that occurred at or after the specified timestamp. Any command run against the server will return an operation time that can be used here. This option is mutually exclusive with resumeAfter and startAfter.

maxAwaitTimeMS: An int64 representing the maximum amount of time a call to StreamResumeToken() will block waiting for data

fullDocument: An optional UTF-8 string. Set this option to ,Äúdefault,Äù, ,ÄúupdateLookup,Äù, ,ÄúwhenAvailable,Äù, or ,Äúrequired,Äù, If unset, The string ,Äúdefault,Äù is assumed. Set this option to ,ÄúupdateLookup,Äù to direct the change stream cursor to lookup the most current majority-committed version of the document associated to an update change stream event.

fullDocumentBeforeChange: An optional UTF-8 string. Set this option to ,ÄúwhenAvailable,Äù, ,Äúrequired,Äù, or ,Äúoff,Äù. When unset, the default value is ,Äúoff,Äù. Similar to ,ÄúfullDocument,Äù, but returns the value of the document before the associated change.

comment: A JSON specifying the comment to attach to this command. The comment will appear in log messages, profiler output, and currentOp output. Only string values are supported prior to MongoDB 4.4.

135.3.26 WriteCommand(dbName as String, commandJSON as String, OptionsJSON as String = "") as String

MBS MongoDB Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Execute a command on the server, applying logic that is specific to commands that write, and taking the MongoDB server version into account.
Notes: To send a raw command to the server without any of this logic, use Command().

Use this function for commands that write such as ,Äúdrop,Äù or ,ÄúcreateRole,Äù (but not for ,Äúinsert,Äù, ,Äúupdate,Äù, or ,Äúdelete,Äù, see Basic Write Operations). Write concern and collation can be overridden by various sources. In a transaction, read concern and write concern are prohibited in opts. The highest-priority sources for these options are listed first in the following table. The write concern is omitted for MongoDB before 3.4.

135.3.27 Properties

135.3.28 Handle as Integer

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

135.3.29 LibraryVersion as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries library version.
Notes: This is the version of the mongo client library we use to build the plugin.
(Read only property)

135.3.30 MaxBSONSize as Integer

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns the maximum

bson document size allowed by the cluster.
Notes: Until a connection has been made, this will be the default of 16Mb.
(Read only property)

135.3.31 MaxMessageSize as Integer

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns the maximum message size allowed by the cluster.
Notes: Until a connection has been made, this will be the default of 40Mb.
(Read only property)

135.3.32 Parent as Variant

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parent object reference.
Notes: (Read only property)

135.3.33 Session as MongoSessionMBS

MBS MongoDB Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current session.
Notes: Weak reference, which is cleared when the session object is destroyed.
(Read only property)

135.3.34 SSLLibrary as String

MBS MongoDB Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries SSL library used.
Notes: Returns SecureTransport, SecureChannel or OpenSSL.
SecureChannel is used on Windows while SecureTransport is Apple's framework on iOS and macOS. And OpenSSL is available for all platforms.
(Read only property)

135.3.35 SSLOptions as MongoSSLOptionsMBS

MBS MongoDB Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the TLS (SSL) options to use when connecting to TLS enabled MongoDB servers.
Example:

```
const URL = "mongodb://localhost/"
Var uri As New MongoURIMBS(URL)

Var client As New MongoClientMBS(URI)

// we assign the options to point to the cacert.pem file
Var SSLOptions As New MongoSSLOptionsMBS
SSLOptions.CertificateAuthorityFile = "/Users/cs/cacert.pem"

client.SSLOptions = SSLOptions

Break
```

Notes: Setting SSLOptions overrides all TLS options set through the connection string with which the client was constructed.
(Read and Write property)

135.3.36 Trace as Boolean

MBS MongoDB Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enables trace messages to be written.
Notes: Default error logging will print errors to stderr/stdout already.
(Read and Write property)

135.3.37 URI as MongoURIMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the URI object used to construct this.
Notes: (Read only property)

135.3.38 Events

135.3.39 LogMessage(Level as Integer, Domain as String, Message as String)

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The event called for log messages in MongoDB client.
Notes: Trace level is not used by our plugin.
See also:

- 135.3.16 LogMessage(Message as String) 18523

135.3.40 Constants

Log Levels

Constant	Value	Description
LogLevelCritical	1	Critical
LogLevelDebug	5	Debug
LogLevelError	0	Error
LogLevelInfo	4	Info
LogLevelMessage	3	Message
LogLevelTrace	6	Trace
LogLevelWarning	2	Warning

135.4 class MongoCollectionMBS

135.4.1 class MongoCollectionMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This class provides access to a MongoDB collection.
Example:

```
var Collection as MongoCollectionMBS
var name as string = "test"

Collection = Database.Collection(name)
```

Notes: This handle is useful for actions for most CRUD operations, I.e. insert, update, delete, find, etc.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

135.4.2 Methods

135.4.3 Aggregate(flags as Integer, pipelineJSON as String, OptionsJSON as String = "") as MongoCursorMBS

MBS MongoDB Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an aggregate collection.
Example:

```
Var collection as MongoCollectionMBS // your collection
Var json As String = " [ "+_
" { ""$ match"" : { ""index"" : 123 } } ,"+_
" { ""$ sort"" : { ""index"" : -1 } } ,"+_
" { ""$ limit"" : 2 } "+_
" ] "

cursor = Collection.Aggregate(Collection.kFlagNone, json)
// loop over cursor
```

Notes: This function creates a cursor which sends the aggregate command on the underlying collection upon the first call to CursorNext. For more information on building aggregation pipelines, see the MongoDB Manual entry on the aggregate command.
Returns a new cursor on success.

Please review the documentation for MongoDB on how to build the JSON for pipeline or options.

Flag	Value	Description
None	0	Specify no query flags.
TailableCursor	2	Cursor will not be closed when the last data is retrieved. You can resume this cursor later.
SecondaryOk	4	Allow query of replica set secondaries.
NoCursorTimeout	16	The server normally times out an idle cursor after an inactivity period (10 minutes). This prevents that.
AwaitData	32	Use with TailableCursor. Block rather than returning no data. After a period, time out.
Exhaust	64	Stream the data down full blast in multiple ,Äúreply,Äù packets. Faster when you are pulling down a lot of data and you know you want to retrieve it all. Only applies to cursors created from a find operation (i.e. find)
Partial	128	Get partial results from mongos if some shards are down (instead of throwing an error).

In case of an error, raises MongoExceptionMBS.

135.4.4 Command(commandJSON as String, OptionsJSON as String = "") as String

MBS MongoDB Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Execute a command on the server.
Example:

```
Var collection as MongoCollectionMBS // your collection

Var Reply as String = collection.Command(" { ""hello"": 1 } ")
```

Notes: Consult the MongoDB Manual entry on Database Commands for each command,Äôs arguments.

In case of an error, raises MongoExceptionMBS.

135.4.5 Constructor

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

135.4.6 Copy as MongoCollectionMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a deep copy of the collection struct and its configuration.
Notes: This function does not copy the contents of the collection on the MongoDB server.

135.4.7 DeleteMany(selectorJSON as String, OptionsJSON as String = "") as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Deletes many records.
Notes: This function removes all documents in the given collection that match selector.

To delete at most one matching document, use DeleteOne().
Returns string with JSON about errors on server.

135.4.8 DeleteOne(selectorJSON as String, OptionsJSON as String = "") as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Deletes one record.
Example:

```
// delete record by object ID

Var oid As New JSONItem
oid.Value("$ oid") = "632752c4031bafedd50fbf21"

Var Record As New JSONItem
Record.Value("_id") = oid

Var Result As String = Collection.DeleteOne(Record.toString)
// e.g. { "deletedCount" : 1 }
```

Notes: This function removes at most one document in the given collection that matches selector.

To delete all matching documents, use DeleteMany().

Returns string with JSON about errors on server.

135.4.9 EstimatedDocumentCount(OptionsJSON as String = "") as Int64

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Executes a count query on collection.
Notes: The count returned is not guaranteed to be accurate.

see also
http://mongoc.org/libmongoc/current/mongoc_collection_estimated_document_count.html
See also:

- 135.4.10 EstimatedDocumentCount(OptionsJSON as String, byref ReplyJSON as String) as Int64 18535

135.4.10 EstimatedDocumentCount(OptionsJSON as String, byref ReplyJSON as String) as Int64

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Executes a count query on collection.
Notes: The count returned is not guaranteed to be accurate.

see also
http://mongoc.org/libmongoc/current/mongoc_collection_estimated_document_count.html
See also:

• 135.4.9 EstimatedDocumentCount(OptionsJSON as String = "") as Int64 18535

135.4.11 Find(FilterJSON as String, OptionsJSON as String = "") as MongoCursorMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Query on collection, passing arbitrary query options to the server in opts.
Example:

```
const URL = "mongodb://localhost/"

Var uri as new MongoURIMBS(URL)
Var client as new MongoClientMBS(uri)

Var database as MongoDatabaseMBS = client.Database("local")
Var Collection as MongoCollectionMBS = database.Collection("test")

Var Filter as new JSONItem
'filter.Value("Hello") = "World"

Var sortOrder as new JSONItem
sortOrder.Value("hello") = -1 // descending

Var options as new JSONItem
options.Value("limit") = 10
options.Value("sort") = sortOrder

Var cursor as MongoCursorMBS = Collection.Find(filter.toString, options.toString)
Var Record as string

while cursor.NextRecord(record)

MessageBox record

wend
```

Notes: See also find command documented here:
https://www.mongodb.com/docs/manual/reference/command/find/

135.4.12 FindIndexes(OptionsJSON as String = "") as MongoCursorMBS

MBS MongoDB Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches a cursor containing documents, each corresponding to an index on this collection.

135.4.13 InsertMany(documentArrayJSON as String, OptionsJSON as String = "") as String

MBS MongoDB Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Insert documents into collection.
Notes: Please pass a JSON array as string for all documents. Each entry in the array should be a JSON object with the document data.

For any document that does not have an "_id" field, a bson_oid_t will be generated locally and added to the document. If you must know the inserted document's _id, generate it in your code and include it in the document. The _id you generate can be a bson_oid_t or any other non-array BSON type.

The reply is filled out with an "insertedCount" field. If there is a server error then reply may contain a "writeErrors" array and/or a "writeConcernErrors" array.
See also:

- 135.4.14 InsertMany(documentJSON() as String, OptionsJSON as String = "") as String 18537

135.4.14 InsertMany(documentJSON() as String, OptionsJSON as String = "") as String

MBS MongoDB Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Insert documents into collection.
Notes: Please pass an array with a JSON object in each entry as string.

For any document that does not have an "_id" field, a bson_oid_t will be generated locally and added to the document. If you must know the inserted document's _id, generate it in your code and include it in the document. The _id you generate can be a bson_oid_t or any other non-array BSON type.

The reply is filled out with an "insertedCount" field. If there is a server error then reply may contain a "writeErrors" array and/or a "writeConcernErrors" array.
See also:

- 135.4.13 InsertMany(documentArrayJSON as String, OptionsJSON as String = "") as String 18537

135.4.15 InsertOne(documentJSON as String, OptionsJSON as String = "") as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Inserts a document into collection.
Example:

```
const URL = "mongodb://localhost/"

Var uri as new MongoURIMBS(URL)
Var client as new MongoClientMBS(uri)

Var database as MongoDatabaseMBS = client.Database("local")
Var Collection as MongoCollectionMBS = database.Collection("test")

Var j as new JSONItem
j.Value("Hello") = "World"

Var reply as string = Collection.InsertOne(j.ToString)

// reply is { "insertedCount" : 1 }

Break
```

Notes: To insert an array of documents, see MongoDB.InsertMany.

If no _id element is found in document, then an oid will be generated locally and added to the document. If you must know the inserted document,Äôs _id, generate it in your code and include it in the document. The _id you generate can be an old or any other non-array BSON type.

The reply is filled out with an ,ÄúinsertedCount,Äù field. If there is a server error then reply contains either a ,ÄúwriteErrors,Äù array with one subdocument or a ,ÄúwriteConcernErrors,Äù array.

In case of an error, raises MongoExceptionMBS.

OptionsJSON may be empty or a JSON document with additional command options:

writeConcern: the write concern.
sessionId: The session ID.
validate: The validation flags.
bypassDocumentValidation: Set to true to skip server-side schema validation of the provided BSON documents.

135.4.16 Keys as String()

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries current collection to find all the key names.
Notes: You may store different JSON documents in the collection with different keys.
This function scans all documents to get the root keys and returns the list.

135.4.17 Rename(NewDatabaseName as String, NewCollectionName as String, DropTargetBeforeRename as Boolean = false, OptionsJSON as String = "") as boolean

MBS MongoDB Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This function is a helper to rename an existing collection on a MongoDB server.
Notes: The name of the collection will also be updated internally so it is safe to continue using this collection after the rename. Additional operations will occur on renamed collection.

NewDatabaseName: The name of the new database.
NewCollectionName: The new name for the collection.
DropTargetBeforeRename: If an existing collection matches the new name, drop it before the rename.

Returns true if successful. Returns false and raises exception in case of an error.

135.4.18 ReplaceOne(selectorJSON as String, replacementJSON as String, OptionsJSON as String = "") as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This replaces documents in collection that match selector with replacement.
Example:

```
const URL = "mongodb://localhost/"

Var uri as new MongoURIMBS(URL)
Var client as new MongoClientMBS(uri)

Var database as MongoDatabaseMBS = client.Database("local")
Var Collection as MongoCollectionMBS = database.Collection("test")

// the conditions to match records
Var j as new JSONItem
j.Value("Hello") = "World"

// the new values
Var u as new JSONItem
u.Value("OtherField") = 456
```

```
u.Value("Hello") = "World"

Var reply as string = Collection.ReplaceOne(j.ToString, u.ToString)

Break
```

Notes: selectorJSON: A JSON containing the query to match the document for updating.
updateJSON: A JSON containing the replacement document.

The reply JSON is populated with the fields matchedCount, modifiedCount, upsertedCount, and optionally upsertedId if applicable. If there is a server error then reply contains either a writeErrors array with one subdocument or a writeConcernErrors array.

In case of an error, raises MongoExceptionMBS.

135.4.19 UpdateMany(selectorJSON as String, updateJSON as String, OptionsJSON as String = "") as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Updates all documents in collection that match selector.
Example:

```
const URL = "mongodb://localhost/"

Var uri as new MongoURIMBS(URL)
Var client as new MongoClientMBS(uri)

Var database as MongoDatabaseMBS = client.Database("local")
Var Collection as MongoCollectionMBS = database.Collection("test")

// the conditions to match records
Var j as new JSONItem
j.Value("Hello") = "World"

// the new values
Var u as new JSONItem
u.Value("OtherField") = 123

// and the update, where we define to set those values
Var s as new JSONItem
s.Value("$ set") = u

Var reply as string = Collection.UpdateMany(j.ToString, s.ToString)
```

```
// reply: { "modifiedCount" : 1, "matchedCount" : 1, "upsertedCount" : 0 }
Break
```

Notes: In case of an error, raises MongoExceptionMBS.

To update at most one document see UpdateOne().

The result JSON is filled out with fields matchedCount, modifiedCount, and optionally upsertedId if applicable. If there is a server error then reply contains either a ,ÄúwriteErrors,Äù array with one subdocument or a ,ÄúwriteConcernErrors,Äù array.

135.4.20 UpdateOne(selectorJSON as String, updateJSON as String, OptionsJSON as String = "") as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Updates at most one document in collection that matches selector.
Example:

```
const URL = "mongodb://localhost/"

Var uri as new MongoURIMBS(URL)
Var client as new MongoClientMBS(uri)

Var database as MongoDatabaseMBS = client.Database("local")
Var Collection as MongoCollectionMBS = database.Collection("test")

// the conditions to match records
Var j as new JSONItem
j.Value("Hello") = "World"

// the new values
Var u as new JSONItem
u.Value("OtherField") = 123

// and the update, where we define to set those values
Var s as new JSONItem
s.Value("$ set") = u

Var reply as string = Collection.UpdateOne(j.ToString, s.ToString)

// reply: { "modifiedCount" : 1, "matchedCount" : 1, "upsertedCount" : 0 }
break
```

Notes: In case of an error, raises MongoExceptionMBS.

To update multiple documents see UpdateMany().

Return is a JSON filled out with fields matchedCount, modifiedCount, and optionally upsertedId if applicable. If there is a server error then reply contains either a ,ÄúwriteErrors,Äù array with one subdocument or a ,ÄúwriteConcernErrors,Äù array.

for Options you may e.g. pass { "upsert":true } to create a new record if the old one doesn't exist.

135.4.21 Watch(pipelineJSON as String, OptionsJSON as String = "") as MongoChangeStreamMBS

MBS MongoDB Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a change stream for a collection.
Notes: It is preferred to call this function over using a raw aggregation to create a change stream.

This function uses the read preference and read concern of the collection. If the change stream needs to re-establish connection, the same read preference will be used. This may happen if the change stream encounters a resumable error.

Warning A change stream is only supported with majority read concern.
This function is considered a retryable read operation. Upon a transient error (a network error, errors due to replica set failover, etc.) the operation is safely retried once. If retryreads is false in the URI the retry behavior does not apply.

Call this method on the collection which the change stream listens to.

pipelineJSON: A JSON representing an aggregation pipeline appended to the change stream. This may be an empty document.

OptionsJSON: A JSON containing change stream options. options may be "" or a JSON document with additional command options:

batchSize: An integer representing number of documents requested to be returned on each call to NextChange()

resumeAfter: A Document representing the logical starting point of the change stream. The result of StreamResumeToken() or the _id field of any change received from a change stream can be used here. This option is mutually exclusive with startAfter and startAtOperationTime.

startAfter: A Document representing the logical starting point of the change stream. Unlike resumeAfter, this can resume notifications after an ,Äúinvalidate,Äù event. The result of StreamResumeToken() or the _id field of any change received from a change stream can be used here. This option is mutually exclusive with resumeAfter and startAtOperationTime.

startAtOperationTime: A Timestamp. The change stream only provides changes that occurred at or after the specified timestamp. Any command run against the server will return an operation time that can be used here. This option is mutually exclusive with resumeAfter and startAfter.

maxAwaitTimeMS: An int64 representing the maximum amount of time a call to StreamResumeToken() will block waiting for data

fullDocument: An optional UTF-8 string. Set this option to ,Äúdefault,Äù, ,ÄúupdateLookup,Äù, ,ÄúwhenAvailable,Äù, or ,Äúrequired,Äù, If unset, The string ,Äúdefault,Äù is assumed. Set this option to ,ÄúupdateLookup,Äù to direct the change stream cursor to lookup the most current majority-committed version of the document associated to an update change stream event.

fullDocumentBeforeChange: An optional UTF-8 string. Set this option to ,ÄúwhenAvailable,Äù, ,Äúrequired,Äù, or ,Äúoff,Äù. When unset, the default value is ,Äúoff,Äù. Similar to ,ÄúfullDocument,Äù, but returns the value of the document before the associated change.

comment: A JSON specifying the comment to attach to this command. The comment will appear in log messages, profiler output, and currentOp output. Only string values are supported prior to MongoDB 4.4.

135.4.22 Properties

135.4.23 Handle as Integer

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

135.4.24 Name as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries name of the collection.
Notes: (Read only property)

135.4.25 Parent as Variant

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parent object reference.
Notes: Points to the related database or client and avoids you free those before this object gets destructed.
(Read only property)

135.4.26 Constants

Flags

Constant	Value	Description
kFlagAwaitData	32	Use with kFlagTailableCursor. Block rather than returning no data. After a period, time out.
kFlagExhaust	64	Stream the data down full blast in multiple ‚Äúreply‚Äù packets. Faster when you are pulling down a lot of data and you know you want to retrieve it all. Only applies to cursors created from a find operation (i.e. find).
kFlagNoCursorTimeout	16	The server normally times out an idle cursor after an inactivity period (10 minutes). This prevents that.
kFlagNone	0	Specify no query flags.
kFlagPartial	128	Get partial results from mongos if some shards are down (instead of throwing an error).
kFlagSecondaryOk	4	Allow query of replica set secondaries.
kFlagTailableCursor	2	Cursor will not be closed when the last data is retrieved. You can resume this cursor later.

135.5 class MongoCursorMBS

135.5.1 class MongoCursorMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This class provides access to a MongoDB query cursor.
Example:

```
var cursor As MongoCursorMBS

Var Filter as new JSONItem
filter.Value("Hello") = "World"

Var sortOrder as new JSONItem
sortOrder.Value("hello") = -1 // descending

Var options as new JSONItem
options.Value("limit") = 20
options.Value("sort") = sortOrder

cursor = Collection.Find(filter.toString, options.toString)
```

Notes: It wraps up the wire protocol negotiation required to initiate a query and retrieve an unknown number of documents.

Cursors are lazy, meaning that no connection is established and no network traffic occurs until the first call to NextRecord().
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

135.5.2 Methods

135.5.3 Clone as MongoCursorMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a copy of a cursor.
Notes: The cloned cursor will be reset to the beginning of the query, and therefore the query will be re-executed on the MongoDB server when Next is called.

135.5.4 Constructor

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

135.5.5 ErrorDocument(byref ReplyJSON as String) as Boolean

MBS MongoDB Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks to see if an error has occurred while iterating the cursor.
Notes: If an error occurred server-side, the ReplyJSON is set to the server,Äôs reply document with information about the error.

135.5.6 NextRecord(byref RecordJSON as String) as Boolean

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the next record as JSON.
Notes: This function shall iterate the underlying cursor, setting bson to the next document.
Returns false if there is no other record.

In case of an error, raises MongoExceptionMBS.
Raises OutOfMemoryException if size of JSON exceeds 2 GB.

135.5.7 Operator_Convert as String

MBS MongoDB Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries all the next records as JSON.
Notes: Queries all following records and return them as a big JSON.

In case of an error, raises MongoExceptionMBS.

In case of an error, raises MongoExceptionMBS.
Raises OutOfMemoryException if size of JSON exceeds 2 GB.

135.5.8 Records as String

MBS MongoDB Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries all the next records as JSON.
Notes: Queries all following records and return them as a big JSON.
In case of an error, raises MongoExceptionMBS.

135.5.9 Properties

135.5.10 BatchSize as UInt32

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The cursor,Äôs batch size.
Notes: (Read and Write property)

135.5.11 Current as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries current record as JSON.
Notes: Fetches the cursors current document or "" if there has been an error.
(Read only property)

135.5.12 Handle as Integer

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

135.5.13 Host as MongoHostListMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches the MongoDB host that the cursor is communicating with in the host out parameter.
Notes: (Read only property)

135.5.14 ID as Int64

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Retrieves the cursor id used by the server to track the cursor.
Notes: This number is zero until the driver actually uses a server when executing the query, and after it has fetched all results from the server.
(Read only property)

135.5.15 Limit as Int64

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Limits the number of documents in the result set.
Notes: This function is useful for setting the limit on a cursor after the cursor is created, but before any calls to NextRecord().

Calling this function after NextRecord() has no effect.
(Read and Write property)

135.5.16 MaxAwaitTimeMS as UInt32

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The maximum amount of time for the server to wait on new documents to satisfy a tailable cursor query.
Notes: Only applies if the cursor is created from Find() with ‚Äútailable‚Äù and ‚ÄúawaitData‚Äù options, and the server is MongoDB 3.2 or later.

The max await time ms cannot be changed after the first call to NextRecord().

This is not applicable to all cursors. Setting batch size on a cursor returned by FindDatabases(), FindCollections(), or FindIndexes() will not change the results.
(Read and Write property)

135.5.17 More as Boolean

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether there may be more data.
Notes: This function shall indicate if there is potentially more data to be read from the cursor.
This is only useful with tailable cursors. Use NextRecord() for regular cursors.

Details: mongoc_cursor_more is unreliable because it does not contact the server to see if there are actually more documents in the result set. It simply returns true if the cursor has not begun, or if it has begun and there are buffered documents in the client-side cursor, or if it has begun and the server has not yet told the cursor it is completely iterated.

This is unreliable with regular queries because it returns true for a new cursor before iteration, even if the cursor will match no documents. It is also true if the collection has been dropped on the server since the previous fetch, or if the cursor has finished its final batch and the next batch will be empty.

Returns true if the cursor has locally-buffered documents, or if a round-trip to the server might fetch additional documents.
(Read only property)

135.5.18 Parent as Variant

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parent object reference.
Notes: Points to the related database or collection and avoids you free those before this object gets destructed.
(Read only property)

135.6 class MongoDatabaseMBS

135.6.1 class MongoDatabaseMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: MongoDB Database Abstraction.
Example:

```
var Database as MongoDatabaseMBS
var name as string = "test"

Database = Client.Database(name)
```

Notes: This class provides access to a MongoDB database. This handle is useful for actions a particular database object. It is not a container for collection objects.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

135.6.2 Methods

135.6.3 Aggregate(pipelineJSON as String, OptionsJSON as String = "") as MongoCursorMBS

MBS MongoDB Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an aggregate database.
Example:

```
Var database as MongoDatabaseMBS // your database

Var Cursor as MongoCursorMBS = database.Aggregate(" [ { ""$ listLocalSessions"": { } } ] ")
// loop over cursor
```

Notes: This function creates a cursor which sends the aggregate command on the underlying database upon the first call to MongoDB.CursorNext. For more information on building aggregation pipelines, see the MongoDB Manual entry on the aggregate command. Note that the pipeline must start with a compatible stage that does not require an underlying collection (e.g. ,Äú$ currentOp,Äù, ,Äú$ listLocalSessions,Äù). Returns a new cursor on success.

Please review the documentation for MongoDB on how to build the JSON for pipeline or options.

In case of an error, raises MongoExceptionMBS.

135.6.4 Collection(Name as String) as MongoCollectionMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the collection with given name.

135.6.5 CollectionNames(OptionsJSON as String = "") as String()

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches the list of the names of all of the collections in database.
Example:

```
const URL = "mongodb://192.168.2.102/"

Var uri as new MongoURIMBS(URL)
Var client as new MongoClientMBS(uri)

Var database as MongoDatabaseMBS = client.Database("local")
Var Collections() as string = database.CollectionNames

Break // see in debugger
```

Notes: see MongoDB documentation for list of options:
https://www.mongodb.com/docs/manual/reference/command/listCollections/

In case of an error, raises MongoExceptionMBS.

135.6.6 Command(commandJSON as String) as String

MBS MongoDB Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This is a simplified interface to Command() that returns the first result document.
Example:

```
Const URL = "mongodb://localhost/"

Var uri As New MongoURIMBS(URL)
Var client As New MongoClientMBS(uri)
Var database As MongoDatabaseMBS = client.Database("local")

Var ping As New JSONItem
ping.Value("ping") = 1

Var reply As String = database.Command(ping.ToString)

Break // { "ok" : 1.0 }
```

Notes: The database,Äôs read preference, read concern, and write concern are not applied to the command. The parameter reply is initialized even upon failure to simplify memory management.

This function is not considered a retryable read operation.
See also:

- 135.6.7 Command(commandJSON as String, OptionsJSON as String) as String 18552

135.6.7 Command(commandJSON as String, OptionsJSON as String) as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Execute a command on the server, interpreting opts according to the MongoDB server version.
Example:

```
Const URL = "mongodb://localhost/"

Var uri As New MongoURIMBS(URL)
Var client As New MongoClientMBS(uri)
Var database As MongoDatabaseMBS = client.Database("local")

Var ping As New JSONItem
```

```
ping.Value("ping") = 1

Var options As New JSONItem

Var reply As String = database.Command(ping.ToString, options.tostring)

Break // { "ok" : 1.0 }
```

Notes: Returns the reply from the server.

In case of an error, raises MongoExceptionMBS.
See also:

- 135.6.6 Command(commandJSON as String) as String 18552

135.6.8 Constructor

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

135.6.9 Copy as MongoDatabaseMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a deep copy of the database struct and its configuration.

135.6.10 CreateCollection(Name as String, OptionsJSON as String = "") as MongoCollectionMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a collection in the database.
Example:

```
const URL = "mongodb://localhost/"

Var uri as new MongoURIMBS(URL)
Var client as new MongoClientMBS(uri)

Var database as MongoDatabaseMBS = client.Database("local")
Var Collection as MongoCollectionMBS = database.CreateCollection("testing2")
```

MessageBox Collection.Name

Break

Notes: If no write concern is provided in opts, the database,Äôs write concern is used.

For a list of all options, see the MongoDB Manual entry on the create command.
In case of an error, raises MongoExceptionMBS.

135.6.11 FindCollections(OptionsJSON as String = "") as MongoCursorMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches a cursor containing documents, each corresponding to a collection on this database.
Example:

```
const URL = "mongodb://localhost/"

Var uri as new MongoURIMBS(URL)
Var client as new MongoClientMBS(uri)

Var database as MongoDatabaseMBS = client.Database("local")

Var cursor as MongoCursorMBS = database.FindCollections
Var Record as string

while cursor.NextRecord(record)

MessageBox record

wend

Break
```

Notes: In case of an error, raises MongoExceptionMBS.

135.6.12 HasCollection(Name as String) as Boolean

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks to see if a collection exists on the MongoDB server within database.
Notes: If the function succeeds, it returns true if the collection exists and false if not.
Raises exception in case of an invalid arguments or a server or network error.

In case of an error, raises MongoExceptionMBS.

135.6.13 ReadCommand(commandJSON as String, OptionsJSON as String = "") as String

MBS MongoDB Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Execute a command on the server, applying logic that is specific to commands that read, and taking the MongoDB server version into account.
Notes: To send a raw command to the server without any of this logic, use Command().

Use this function for commands that read such as ,Äúcount,Äù or ,Äúdistinct,Äù.

Read preferences, read concern, and collation can be overridden by various sources. In a transaction, read concern and write concern are prohibited in opts and the read preference must be primary or nil. The highest-priority sources for these options are listed first in the following table. No write concern is applied.

135.6.14 ReadWriteCommand(commandJSON as String, OptionsJSON as String = "") as String

MBS MongoDB Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Execute a command on the server, applying logic for commands that both read and write, and taking the MongoDB server version into account.
Notes: To send a raw command to the server without any of this logic, use Command().

Use this function for commands that both read and write, such as ,ÄúmapReduce,Äù with an output collection.

Read and write concern and collation can be overridden by various sources. In a transaction, read concern and write concern are prohibited in opts. The highest-priority sources for these options are listed first in the following table. Read preferences are not applied. The write concern is omitted for MongoDB before 3.4.

135.6.15 Watch(pipelineJSON as String, OptionsJSON as String = "") as MongoChangeStreamMBS

MBS MongoDB Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a change stream for a database.
Notes: It is preferred to call this function over using a raw aggregation to create a change stream.

This function uses the read preference and read concern of the database. If the change stream needs to re-establish connection, the same read preference will be used. This may happen if the change stream encounters a resumable error.

Warning A change stream is only supported with majority read concern.
This function is considered a retryable read operation. Upon a transient error (a network error, errors due to replica set failover, etc.) the operation is safely retried once. If retryreads is false in the URI the retry behavior does not apply.

Call this method on the database which the change stream listens to.

pipelineJSON: A JSON representing an aggregation pipeline appended to the change stream. This may be an empty document.

OptionsJSON: A JSON containing change stream options. options may be "" or a JSON document with additional command options:

batchSize: An integer representing number of documents requested to be returned on each call to NextChange()

resumeAfter: A Document representing the logical starting point of the change stream. The result of StreamResumeToken() or the _id field of any change received from a change stream can be used here. This option is mutually exclusive with startAfter and startAtOperationTime.

startAfter: A Document representing the logical starting point of the change stream. Unlike resumeAfter, this can resume notifications after an ,Äúinvalidate,Äù event. The result of StreamResumeToken() or the _id field of any change received from a change stream can be used here. This option is mutually exclusive with resumeAfter and startAtOperationTime.

startAtOperationTime: A Timestamp. The change stream only provides changes that occurred at or after the specified timestamp. Any command run against the server will return an operation time that can be used here. This option is mutually exclusive with resumeAfter and startAfter.

maxAwaitTimeMS: An int64 representing the maximum amount of time a call to StreamResumeToken() will block waiting for data

fullDocument: An optional UTF-8 string. Set this option to ,Äúdefault,Äù, ,ÄúupdateLookup,Äù, ,ÄúwhenAvailable,Äù, or ,Äúrequired,Äù, If unset, The string ,Äúdefault,Äù is assumed. Set this option to ,ÄúupdateLookup,Äù to direct the change stream cursor to lookup the most current majority-committed version

of the document associated to an update change stream event.

fullDocumentBeforeChange: An optional UTF-8 string. Set this option to ‚ÄúwhenAvailable‚Äù, ‚Äúrequired‚Äù, or ‚Äúoff‚Äù. When unset, the default value is ‚Äúoff‚Äù. Similar to ‚ÄúfullDocument‚Äù, but returns the value of the document before the associated change.

comment: A JSON specifying the comment to attach to this command. The comment will appear in log messages, profiler output, and currentOp output. Only string values are supported prior to MongoDB 4.4.

135.6.16 WriteCommand(commandJSON as String, OptionsJSON as String = "") as String

MBS MongoDB Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Execute a command on the server, applying logic that is specific to commands that write, and taking the MongoDB server version into account.
Notes: To send a raw command to the server without any of this logic, use Command().

Use this function for commands that write such as ‚Äúdrop‚Äù or ‚ÄúcreateRole‚Äù (but not for ‚Äúinsert‚Äù, ‚Äúupdate‚Äù, or ‚Äúdelete‚Äù). Write concern and collation can be overridden by various sources. In a transaction, read concern and write concern are prohibited in opts. The highest-priority sources for these options are listed first in the following table. The write concern is omitted for MongoDB before 3.4.

135.6.17 Properties

135.6.18 Client as MongoClientMBS

MBS MongoDB Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current client for this database.
Notes: (Read only property)

135.6.19 Handle as Integer

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

135.6.20 Name as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries name of the database.
Notes: (Read only property)

135.7 class MongoExceptionMBS

135.7.1 class MongoExceptionMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class to report errors in MongoDB.
Notes: Subclass of the RuntimeException class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

135.7.2 Methods

135.7.3 Constructor

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

135.8 class MongoGridFSFileListMBS

135.8.1 class MongoGridFSFileListMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a list of files in GridFS.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

135.8.2 Methods

135.8.3 Constructor

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

135.8.4 NextFile as MongoGridFSFileMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the next file each iteration.

135.8.5 Properties

135.8.6 Handle as Integer

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

135.9 class MongoGridFSFileMBS

135.9.1 class MongoGridFSFileMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This class provides a MongoDB GridFS file abstraction.
Example:

```
Var GridFS As MongoGridFSMBS = Client.GridFS("test", "fs")

Var options As New MongoGridFSFileOptionsMBS
options.FileName = "test.txt"
options.ContentType = "text/plain"

Var file As MongoGridFSFileMBS = GridFS.CreateFile(options)
Var BytesWritten As Integer = file.Write("Hello World")
file.Save
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

135.9.2 Methods

135.9.3 Constructor

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

135.9.4 NewStream as MongoStreamMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: create a new Stream to read from and write to a GridFS file.
Example:

```
Var GridFS As MongoGridFSMBS = Client.GridFS("test", "fs")

// now find the file and read it
Var file As MongoGridFSFileMBS = GridFS.FindOneByFileName( "test.txt")

// open a stream
Var stream As MongoStreamMBS = file.NewStream

// write new content
Var bytes As Integer = stream.Write("Just a test! more bytes")
MessageBox "bytes written: "+bytes.ToString

// this will do file.save internally
stream.Close
```

Notes: GridFS files are created with CreateFile() or CreateFileFromStream().

This function does not transfer ownership of file. Therefore, file must remain valid for the lifetime of this stream.

Note, the returned stream uses the ,ÄúsocketTimeoutMS,Äù and ,ÄúconnectTimeoutMS,Äù values from the MongoDB URI.

135.9.5 Read(ByteCount as Integer, MinBytes as Integer = -1) as String

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reads given number of bytes as String.
Notes: MinBytes: The minimum number of bytes that must be read or an error will be synthesized.

This function performs a scattered read from file, potentially blocking to read from the MongoDB server.

135.9.6 ReadAll as String

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reads all data into a string.
Notes: This function performs a scattered read from file, potentially blocking to read from the MongoDB server.

135.9.7 ReadAllMemory as MemoryBlock

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reads all data into Memoryblock.
Notes: This function performs a scattered read from file, potentially blocking to read from the MongoDB server.

135.9.8 ReadMemory(ByteCount as Integer, MinBytes as Integer = -1) as MemoryBlock

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reads given number of bytes as MemoryBlock.
Notes: MinBytes: The minimum number of bytes that must be read or an error will be synthesized.

This function performs a scattered read from file, potentially blocking to read from the MongoDB server.

135.9.9 Remove

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes file and its data chunks from the MongoDB server.

135.9.10 Save

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Saves modifications to file to the MongoDB server.
Notes: Modifying GridFS files is NOT thread-safe. Only one thread or process can access a GridFS file while it is being modified.

135.9.11 Seek(delta as Int64, whence as Integer = 0)

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adjust the file position pointer in the given file by delta, starting from the position whence.
Notes: The whence argument is interpreted as in fseek:

On success, the file,Äôs underlying position pointer is set appropriately. On failure, the file position is NOT

SeekSet	Set the position relative to the start of the file.
SeekCurrent	Move delta relative to the current file position.
SeekEnd	Move delta relative to the end of the file.

changed and an exception is raised.

135.9.12 Write(Data as MemoryBlock) as Integer

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a gathered write to the underlying gridfs file.
Notes: Modifying GridFS files is NOT thread-safe. Only one thread or process can access a GridFS file while it is being modified.

Returns the number of bytes written.
See also:

- 135.9.13 Write(Data as String) as Integer 18564

135.9.13 Write(Data as String) as Integer

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a gathered write to the underlying gridfs file.
Notes: Modifying GridFS files is NOT thread-safe. Only one thread or process can access a GridFS file while it is being modified.

Returns the number of bytes written.
See also:

- 135.9.12 Write(Data as MemoryBlock) as Integer 18564

135.9.14 Properties

135.9.15 Aliases as String

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches or sets the aliases associated with a gridfs file.
Notes: You need to call Save() to persist this change.
(Read and Write property)

135.9.16 ChunkSize as Int32

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches the chunk size used with the underlying gridfs file.
Notes: (Read only property)

135.9.17 ContentType as String

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches the content type specified for the underlying file.
Notes: Sets the content type for the gridfs file. This should be something like "text/plain".
You need to call Save() to persist this change.
(Read and Write property)

135.9.18 FileName as String

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches or sets the filename for the given gridfs file.
Notes: (Read and Write property)

135.9.19 Handle as Integer

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

135.9.20 ID as String

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches or sets the id of a gridfs file.
Notes: The C Driver always uses an ObjectId for _id, but files created by other drivers may have any type of _id.

Sets the id of file to any BSON type.
(Read and Write property)

135.9.21 Length as Int64

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches the length of the gridfs file in bytes.
Notes: (Read only property)

135.9.22 MD5 as String

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches or sets the pre-computed MD5 for the underlying gridfs file.
Notes: You need to call Save() to persist this change.
(Read and Write property)

135.9.23 Metadata as String

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches or sets a bson document containing the metadata for the gridfs file.
Notes: Sets the metadata associated with file.
You need to call Save() to persist this change.
(Read and Write property)

135.9.24 Position as Int64

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets or sets the current position indicator within file.
Notes: Setting the position will seek within the file.
(Read and Write property)

135.9.25 UploadDate as Int64

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches the specified upload date of the gridfs file in milliseconds since the UNIX epoch.
Example:

```
Var GridFS As MongoGridFSMBS = Client.GridFS("test", "fs")
Var file As MongoGridFSFileMBS = GridFS.FindOneByFileName( "test.txt")
```

```
Var d As New date(1970,1,1,0,0,0)
d.TotalSeconds = d.TotalSeconds + file.UploadDate / 1000.0

MessageBox d.SQLDateTime
```

Notes: (Read only property)

135.9.26 Constants

Seek Modes

Constant	Value	Description
SeekCurrent	1	Position from current position.
SeekEnd	2	Position from end of file.
SeekSet	0	Position from start of file.

135.10 class MongoGridFSFileOptionsMBS

135.10.1 class MongoGridFSFileOptionsMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for file options to create a new file.
Example:

```
Var options As New MongoGridFSFileOptionsMBS
options.FileName = "test.txt"
options.ContentType = "text/plain"
```

135.10.2 Properties

135.10.3 Aliases as String

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The aliases.
Notes: If not empty, a JSON with the aliases to include for the new file.
(Read and Write property)

135.10.4 ChunkSize as Integer

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The chunk size in bytes.
Notes: (Read and Write property)

135.10.5 ContentType as String

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The content type.
Notes: (Read and Write property)

135.10.6 FileName as String

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The file name to use.
Notes: (Read and Write property)

135.10.7 MD5 as String

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The MD5 hash.
Notes: (Read and Write property)

135.10.8 MetaData as String

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The metadata.
Notes: If not empty, a JSON with the metadata to include for the new file.
(Read and Write property)

135.11 class MongoGridFSMBS

135.11.1 class MongoGridFSMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This class provides a MongoDB gridfs implementation.
Notes: The system as a whole is made up of gridfs objects, which contain gridfs files and gridfs file lists. Essentially, a basic file system API.

There are extensive caveats about the kind of use cases gridfs is practical for. In particular, any writing after initial file creation is likely to both break any concurrent readers and be quite expensive. That said, this implementation does allow for arbitrary writes to existing gridfs object, just use them with caution.

mongoc_gridfs also integrates tightly with the MongoStreamMBS class abstraction, which provides some convenient wrapping for file creation and reading/writing. It can be used without, but its worth looking to see if your problem can fit that model.

MongoGridFSMBS is NOT thread-safe and should only be used in the same thread as the owning MongoClientMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

135.11.2 Methods

135.11.3 Chunks as MongoCollectionMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a collection that contains the chunks for files.
Example:

```
Var GridFS As MongoGridFSMBS = Client.GridFS("test", "fs")
Var chunks As MongoCollectionMBS = GridFS.Chunks

// now request content and inspect it
Var item As MongoCursorMBS = chunks.Find(" { } ")
Var items As String = item.Records
```

Break

Notes: This instance is owned by the GridFS instance and should not be modified or freed.

135.11.4 Constructor

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

135.11.5 CreateFile(options as MongoGridFSFileOptionsMBS) as MongoGridFSFileMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new file.
Example:

```
Var GridFS As MongoGridFSMBS = Client.GridFS("test", "fs")

Var options As New MongoGridFSFileOptionsMBS
options.FileName = "test.txt"
options.ContentType = "text/plain"

Var file As MongoGridFSFileMBS = GridFS.CreateFile(options)
Var BytesWritten As Integer = file.Write("Hello World")
file.Save
```

135.11.6 CreateFileFromStream(stream as MongoStreamMBS, options as MongoGridFSFileOptionsMBS) as MongoGridFSFileMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new file and fill it with the contents of the stream.
Example:

```
// create a file from a file on disk
Var options As New MongoGridFSFileOptionsMBS
options.FileName = "test.pdf"
options.ContentType = "application/pdf"

Var stream As MongoStreamMBS = MongoStreamMBS.NewStreamFromPath("/Users/cs/Desktop/Installation.pdf")
```

```
Var file As MongoGridFSFileMBS = GridFS.CreateFileFromStream(stream, options)
```

Notes: Note that this function will read from stream until End of File, making it best suited for file-backed streams.

135.11.7 Drop

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Requests that an entire GridFS be dropped, including all files associated with it.

135.11.8 Files as MongoCollectionMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Retrieves the collection containing the file metadata for GridFS.
Example:

```
Var GridFS As MongoGridFSMBS = Client.GridFS("test", "fs")
Var Files As MongoCollectionMBS = GridFS.Files

// now request content and inspect it
Var item As MongoCursorMBS = Files.Find(" { } ")
Var items As String = item.Records
Break
```

135.11.9 Find(filterJSON as String, OptionsJSON as String = "") as MongoGridFSFileListMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Finds all gridfs files matching filter.
Notes: You can iterate the matched gridfs files with the resulting file list.

See Find() in MongoCollectionMBS for a description of the filter and opts parameters.

This function is considered a retryable read operation. Upon a transient error (a network error, errors due to replica set failover, etc.) the operation is safely retried once. If retryreads is false in the URI, the retry behavior does not apply.

135.11.10 Find2(filterJSON as String, OptionsJSON as String = "") as MongoGridFSFileMBS()

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Finds all gridfs files matching filter.
Example:

```
// find all files
Var GridFS As MongoGridFSMBS = Client.GridFS("test", "fs")
Var files() As MongoGridFSFileMBS = GridFS.Find2(" { } ")
```

Notes: Same as Find() but returns a Xojo array with all files.

135.11.11 FindOne(filterJSON as String, OptionsJSON as String = "") as MongoGridFSFileMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Find the first GridFS file matching filter.
Notes: If there is an error, nil is returned and an exception is reported; if there is no error but no matching file is found, nil is returned.

See Find() for a description of the filter and opts parameters.

This function is considered a retryable read operation. Upon a transient error (a network error, errors due to replica set failover, etc.) the operation is safely retried once. If retryreads is false in the URI, the retry behavior does not apply.

135.11.12 FindOneByFileName(FileName as String) as MongoGridFSFileMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Finds the first file matching the filename specified.
Example:

```
Var GridFS As MongoGridFSMBS = Client.GridFS("test", "fs")

// now find the file and read it
Var file As MongoGridFSFileMBS = GridFS.FindOneByFileName( "test.txt")
Var data As String = file.ReadAll
```

Notes: If there is an error, nil is returned and an exception is raised; if there is no error but no matching

file is found, nil is returned.

This function is considered a retryable read operation. Upon a transient error (a network error, errors due to replica set failover, etc.) the operation is safely retried once. If retryreads is false in the URI the retry behavior does not apply.

135.11.13 RemoveByFileName(Name as String)

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes all files matching filename and their data chunks from the MongoDB server.
Notes: Returns true if successful, including when no files match. Returns false and raises exception if there are invalid arguments or a server or network error.

135.11.14 Properties

135.11.15 Handle as Integer

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

135.12 class MongoHostListMBS

135.12.1 class MongoHostListMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The host entry for a MongoDB server.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

135.12.2 Methods

135.12.3 Constructor

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

135.12.4 Properties

135.12.5 Family as Integer

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The protocol family.
Notes: (Read only property)

135.12.6 Host as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The host.
Notes: (Read only property)

135.12.7 HostAndPort as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The host and port together.
Notes: (Read only property)

135.12.8 NextHost as MongoHostListMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The next entry in the list.
Notes: (Read only property)

135.12.9 Port as Integer

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The port number.
Notes: (Read only property)

135.13 class MongoServerDescriptionMBS

135.13.1 class MongoServerDescriptionMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The server description class.
Example:

```
Const URL = "mongodb://localhost/"

Var uri As New MongoURIMBS(URL)
Var client As New MongoClientMBS(uri)

// do something to trigger connection
Var names() As String = client.DatabasesNames

// now check first server
Var ServerDescriptions() As MongoServerDescriptionMBS = client.ServerDescriptions
Break // check in debugger
```

Notes: Holds information about a mongod or mongos the driver is connected to.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

135.13.2 Methods

135.13.3 Constructor

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

135.13.4 Properties

135.13.5 CompressorID as Integer

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the compressor ID used here.
Notes: (Read only property)

135.13.6 helloResponse as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The hello response from the server.
Notes: (Read only property)

135.13.7 HostList as MongoHostListMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The server's host and port.
Notes: (Read only property)

135.13.8 ID as Integer

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the server's id, an opaque identifier generated by the client or client pool.
Notes: (Read only property)

135.13.9 LastUpdateTime as Integer

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The last timestamp when the server description was updated.
Notes: (Read only property)

135.13.10 RTT as Integer

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the server's round trip time in milliseconds.
Notes: This is the client's measurement of the duration of an "ismaster" command.
(Read only property)

135.13.11 Type as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a string, one of the server types defined in the Server Discovery And Monitoring Spec
Notes: Possible types:

- Standalone
- Mongos
- PossiblePrimary
- RSPrimary
- RSSecondary
- RSArbiter
- RSOther
- RSGhost
- Unknown

(Read only property)

135.14 class MongoSessionMBS

135.14.1 class MongoSessionMBS

MBS MongoDB Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for organizing a transaction session.
Example:

```
Var session As New MongoSessionMBS(Client)

session.StartTransaction

Var NewRecord As New JSONItem

NewRecord.Value("firstName") = "Bob"
NewRecord.Value("lastName") = "Jones"
NewRecord.Value("phone") = "555-1234-567"

Var Result As String = Collection.InsertOne(NewRecord.toString)
Var count2 As Integer = Collection.EstimatedDocumentCount

// you can commit
'Var reply As String = session.CommitTransaction

// or cancel
session.AbortTransaction

Var count3 As Integer = Collection.EstimatedDocumentCount

// if abort works, count1 and count3 are equal and count2 is higher
```

Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 22.5
- MBS Xojo Plugins, version 22.5pr1

135.14.2 Methods

135.14.3 AbortTransaction

MBS MongoDB Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Abort a multi-document transaction.
Example:

```
Var Client as MongoClientMBS // your connection
Var Collection as MongoClientMBS // your collection

// count before
Var count1 As Integer = Collection.EstimatedDocumentCount

Var session As New MongoSessionMBS(Client)
session.StartTransaction

Var NewRecord As New JSONItem

NewRecord.Value("firstName") = "Bob"
NewRecord.Value("lastName") = "Jones"
NewRecord.Value("phone") = "555-1234-567"

Var Result As String = Collection.InsertOne(NewRecord.toString)

// should be count1 + 1
Var count2 As Integer = Collection.EstimatedDocumentCount

details.Text = result

session.AbortTransaction
Var count3 As Integer = Collection.EstimatedDocumentCount
// should be back to count1

Break // see in debugger
```

Notes: Raises exception if there are invalid arguments, such as a session with no transaction in progress. Network or server errors are ignored.

135.14.4 CommitTransaction as String

MBS MongoDB Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Commit a multi-document transaction.
Example:

```
Var Client as MongoClientMBS // your connection
Var Collection as MongoClientMBS // your collection

Var session As New MongoSessionMBS(Client)
```

```
session.StartTransaction

Var NewRecord As New JSONItem

NewRecord.Value("firstName") = "Bob"
NewRecord.Value("lastName") = "Jones"
NewRecord.Value("phone") = "555-1234-567"

Var Result As String = Collection.InsertOne(NewRecord.toString)
Break // see in debugger
```

Notes: Returns JSON if the transaction was committed. Raises exception if there are invalid arguments, such as a session with no transaction in progress, or if there is a server or network error.

135.14.5 Constructor(client as MongoClientMBS)

MBS MongoDB Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Create a session for a sequence of operations.

135.14.6 StartTransaction

MBS MongoDB Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Start a multi-document transaction for all following operations in this session.
Notes: The transaction must be completed with CommitTransaction or AbortTransaction. An in-progress transaction is automatically aborted by destructor.

Raises exception if there are invalid arguments, such as a session with a transaction already in progress.

If you run MongoDB server locally, you may need to configure a replication. Otherwise you get an error like this: "Error 17:20: Transaction numbers are only allowed on a replica set member or mongos".

135.14.7 Properties

135.14.8 Client as Variant

MBS MongoDB Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The reference to the client object.
Notes: (Read only property)

135.14.9 ClusterTime as String

MBS MongoDB Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the session's clusterTime, as a JSON document.
Notes: If the session has not been used for any operation and you have not called AdvanceClusterTime, then the returned value is NULL.
(Read only property)

135.14.10 Handle as Integer

MBS MongoDB Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

135.14.11 InTransaction as Boolean

MBS MongoDB Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Check whether a multi-document transaction is in progress for this session.
Notes: Returns true if a transaction was started and has not been committed or aborted, otherwise false.
(Read only property)

135.14.12 ServerID as UInt32

MBS MongoDB Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the "server ID" of the mongos this session is pinned to.
Notes: A server ID or 0 if this session is not pinned.
(Read only property)

135.14.13 SessionID as String

MBS MongoDB Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the server-side "logical session ID" associated with this session as a JSON document.
Notes: (Read only property)

135.14.14 TransactionState as Integer

MBS MongoDB Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the current transaction state for this session.
Notes: See transaction* constants.
(Read only property)

135.14.15 Constants

Transaction States

Constant	Value	Description
TransactionAborted	4	Aborted
TransactionCommitted	3	Committed
TransactionInProgress	2	In Progress
TransactionNone	0	Not yet initialized.
TransactionStarting	1	Starting transaction

135.15 class MongoSSLOptionsMBS

135.15.1 class MongoSSLOptionsMBS

MBS MongoDB Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for MongoDB SSL Options.
Example:

```
const URL = "mongodb://localhost/"
Var uri As New MongoURIMBS(URL)

Var client As New MongoClientMBS(URI)

// we assign the options to point to the cacert.pem file
Var SSLOptions As New MongoSSLOptionsMBS
SSLOptions.CertificateAuthorityFile = "/Users/cs/cacert.pem"

client.SSLOptions = SSLOptions

Break
```

Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 23.4
- MBS Xojo Plugins, version 23.4pr1

135.15.2 Methods

135.15.3 Constructor

MBS MongoDB Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Initializes the object with default values.
Notes: Default is false for all boolean.

135.15.4 Properties

135.15.5 AllowInvalidCertificates as Boolean

MBS MongoDB Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to do weaker certificate validation.
Notes: Default is false to disallow.
(Read and Write property)

135.15.6 AllowInvalidHostnames as Boolean

MBS MongoDB Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to allow invalid host names.
Notes: This allows you to disable hostname validation to allow to continue if the hostname doesn't match the certificate.

Default is false to disallow.
(Read and Write property)

135.15.7 CertificateAuthorityDirectory as String

MBS MongoDB Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The native file path to the CA directory.
Notes: (Read and Write property)

135.15.8 CertificateAuthorityFile as String

MBS MongoDB Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The native file path for a CA file.
Example:

```
const URL = "mongodb://localhost/"
Var uri As New MongoURIMBS(URL)

Var client As New MongoClientMBS(URI)

// we assign the options to point to the cacert.pem file
Var SSLOptions As New MongoSSLOptionsMBS
SSLOptions.CertificateAuthorityFile = "/Users/cs/cacert.pem"

client.SSLOptions = SSLOptions

Break
```

Notes: e.g. get such a file from CURL website:
https://curl.se/docs/caextract.html
(Read and Write property)

135.15.9 CertificateRevocationListFile as String

MBS MongoDB Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The native file path to the Certificate revocation list file.
Notes: (Read and Write property)

135.15.10 ClientCertificateKeyFile as String

MBS MongoDB Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The native path to the PEM file with the private key to use.
Notes: (Read and Write property)

135.15.11 ClientCertificateKeyPassword as String

MBS MongoDB Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The password for the PEM file with private key.
Notes: (Read and Write property)

135.16 class MongoStreamMBS

135.16.1 class MongoStreamMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This class provides a generic streaming IO abstraction based on a struct of pointers interface.
Example:

```
Var GridFS As MongoGridFSMBS = Client.GridFS("test", "fs")

// test uploading a file
Var options As New MongoGridFSFileOptionsMBS
options.FileName = "test.pdf"
options.ContentType = "application/pdf"

Var stream As MongoStreamMBS = MongoStreamMBS.NewStreamFromPath("/Users/cs/Desktop/Installation.pdf")
Var file As MongoGridFSFileMBS = GridFS.CreateFileFromStream(stream, options)

file.FileName = "other.pdf"
file.Save
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- GridFS with MongoDB
- News from the MBS Xojo Plugins Version 25.2
- MBS Xojo Plugins, version 25.2pr1

135.16.2 Methods

135.16.3 Close

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Closes the underlying file-descriptors.

135.16.4 Constructor

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

135.16.5 Flush

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Flushes any buffered bytes in the underlying stream to the physical transport.
Notes: It mimics the API and semantics of fflush(), forcing a write of user space buffered data.

135.16.6 NewStreamFromFile(File as FolderItem) as MongoStreamMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new stream to read the given file path.

135.16.7 NewStreamFromPath(Path as String) as MongoStreamMBS

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new stream to read the given file path.
Example:

```
Var m As MongoStreamMBS = MongoStreamMBS.NewStreamFromPath("/Users/cs/Desktop/Installation.pdf")
Var data As String = m.ReadAll

Break
```

135.16.8 Read(ByteCount as Integer, MinBytes as Integer = -1) as String

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reads data into string.
Notes: MinBytes: The minimum number of bytes to read or failure will be indicated.

135.16.9 ReadAll as String

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reads all data from the stream.

135.16.10 ReadAllMemory as MemoryBlock

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reads all data from the stream as MemoryBlock.

135.16.11 ReadMemory(ByteCount as Integer, MinBytes as Integer = -1) as MemoryBlock

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reads data into MemoryBlock.
Notes: MinBytes: The minimum number of bytes to read or failure will be indicated.

135.16.12 Write(Data as MemoryBlock) as Integer

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Writes data to a stream.
Notes: Returns the number of bytes written on success,
See also:

- 135.16.13 Write(Data as String) as Integer 18590

135.16.13 Write(Data as String) as Integer

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Writes data to a stream.
Notes: Returns the number of bytes written on success,
See also:

- 135.16.12 Write(Data as MemoryBlock) as Integer 18590

135.16.14 Properties

135.16.15 Handle as Integer

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

135.16.16 ShouldRetry as Boolean

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether you should retry.
Notes: True if the stream is open and has encountered a retryable network error such as EAGAIN or if a TLS exchange is in progress and needs more data.
(Read only property)

135.16.17 TimeOut as Boolean

MBS MongoDB Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: True if there has been a network timeout error on this stream.
Notes: (Read only property)

135.17 class MongoURIMBS

135.17.1 class MongoURIMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: MongoURIMBS provides an abstraction on top of the MongoDB connection URI format.
Example:

```
Var URL As String = "mongodb://myuser:mypass@localhost/"
Var URI As New MongoURIMBS(URL)
```

MessageBox URI.URI

Notes: It provides standardized parsing as well as convenience methods for extracting useful information such as replica hosts or authorization information.

135.17.2 Methods

135.17.3 Constructor(URI as String)

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parses a string containing a MongoDB style URI connection string.
Example:

```
Var URL as string = "mongodb://localhost/"
Var URI as new MongoURIMBS(URI)

MessageBox URI.URI
```

Notes: Raises a MongoExceptionMBS in case of a parsing error.
Examples of some valid MongoDB connection strings can be seen below.

- "mongodb://localhost/"
- "mongodb://localhost/?replicaSet=myreplset"
- "mongodb://myuser:mypass@localhost/"
- "mongodb://kerberosuser%40EXAMPLE.COM@example.com/?authMechanism=GSSAPI"
- "mongodb:// [::1] :27017/"
- "mongodb://10.0.0.1:27017,10.0.0.1:27018, [::1] :27019/?tls=true"
- "mongodb://%2Ftmp%2Fmongodb-27017.sock"
- "mongodb://user:pass@%2Ftmp%2Fmongodb-27017.sock"
- "mongodb://localhost, [::1] /mydb?authSource=mydb"

135.17.4 Copy as MongoURIMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Copies the entire contents of a URI.

135.17.5 Properties

135.17.6 AppName as String

MBS MongoDB Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The client application name.
Notes: This value is used by MongoDB when it logs connection information and profile information, such as slow queries.

Default: Empty (no appname)
(Read and Write property)

135.17.7 AuthMechanism as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Authentication mechanism.
Notes: Sets the ,ÄúauthMechanism,Äù URI option, such as ,ÄúSCRAM-SHA-1,Äù or ,ÄúGSSAPI,Äù, after the URI has been parsed from a string.
Updates the option in-place if already set, otherwise appends it to the URI,Äôs of options.
(Read and Write property)

135.17.8 AuthSource as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Authentication source.
Notes: Sets the ,ÄúauthSource,Äù URI option, after the URI has been parsed from a string.
Updates the option in-place if already set, otherwise appends it to the URI,Äôs options.
(Read and Write property)

135.17.9 Compressors as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets or sets compressors to use.
Notes: Sets the URI,Äôs compressors, after the URI has been parsed from a string. Will overwrite any previously set value.

Value is a text consisting of one or more comma (,) separated compressors (e.g. ,Äúsnappy,zlib,Äù) or "".
Passing "" clears any existing compressors set on uri.
(Read and Write property)

135.17.10 Credentials as String

MBS MongoDB Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries credentials as JSON.
Notes: (Read only property)

135.17.11 DatabaseName as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches the database portion of an URI if provided.
Notes: This is the portion after the / but before the ?.

Sets the URI's database, after the URI has been parsed from a string.

The driver authenticates to this database if the connection string includes authentication credentials. This database is used when you open the default database with DefaultDatabase function.
(Read and Write property)

135.17.12 Handle as Integer

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

135.17.13 Hosts as MongoHostListMBS

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches a linked list of hosts that were defined in the URI (the comma-separated host section).
Notes: (Read only property)

135.17.14 Options as String

MBS MongoDB Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the options from the URL.
Notes: Fetches a JSON document containing all of the options provided after the ? of a URI.
Can be empty if not set.
(Read only property)

135.17.15 Password as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches the password portion of an URI.
Example:

```
Var URL As String = "mongodb://myuser:mypass@localhost/"
Var URI As New MongoURIMBS(URL)

MessageBox URI.Password
```

Notes: (Read and Write property)

135.17.16 ServiceHostName as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the hostname for the service.
Notes: (Read only property)

135.17.17 ServiceName as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the service name.
Notes: (Read only property)

135.17.18 TLS as Boolean

MBS MongoDB Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether this connection is set to be encrypted.
Notes: Fetches a boolean indicating if TLS was specified for use in the URI.

Returns a boolean, true indicating that TLS should be used. This returns true if any TLS option is specified. (Read only property)

135.17.19 URI as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches the URI as a string.
Example:

```
Var URL as string = "mongodb://localhost/"
Var URI as new MongoURIMBS(URL)

MessageBox URI.URI
```

Notes: (Read only property)

135.17.20 UserName as String

MBS MongoDB Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Fetches the username portion of a URI.
Example:

```
Var URL as string = "mongodb://myuser:mypass@localhost/"
Var URI as new MongoURIMBS(URL)

MessageBox URI.UserName+EndOfLine+uri.Password
```

Notes: (Read and Write property)

135.17.21 Constants

Constants

Constant	Value	Description
DefaultPort	27017	The default port number.

Chapter 136

Natural Language

136.1 class NLContextualEmbeddingMBS

136.1.1 class NLContextualEmbeddingMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: A model that computes sequences of embedding vectors for natural language utterances.
Example:

```
// compare the meaning of two sentences with contextual embeddings
Var embedding As NLContextualEmbeddingMBS = NLContextualEmbeddingMBS.contextualEmbedding-
WithLanguage("en")
If embedding = Nil Then Return
If Not embedding.hasAvailableAssets Then
embedding.requestEmbeddingAssets // downloads the model, try again later
MessageBox "Downloading the model, please try again later."
Return
End If

Var error As NSErrorMBS
If Not embedding.Load(error) Then
MessageBox error.localizedDescription
Return
End If

Var a As NLContextualEmbeddingResultMBS = embedding.embeddingResultForString("The cat sleeps on
the sofa.", "en", error)
Var b As NLContextualEmbeddingResultMBS = embedding.embeddingResultForString("A kitten is nap-
ping on the couch.", "en", error)
If a <>Nil And b <>Nil Then
MessageBox "Similarity: " + Format(a.averageToken.cosineSimilarity(b.averageToken), "0.00")
```

End If

Notes: NLContextualEmbeddingMBS provides a dense vector representation of natural language utterances using models trained with contextualized language understanding. Unlike static word embeddings provided by NLEmbeddingMBS, contextual embeddings dynamically adjust based on surrounding words, enabling deeper language comprehension.

If you are building text classification or word tagging models, you can use NLContextualEmbeddingMBS with Create ML by selecting MLTextClassifier.FeatureExtractorType.bertEmbedding as the feature extraction component in your model. For more information on how to create your own text classification model refer to Creating a text classifier model.

Note
For semantic similarity tasks, consider using NLEmbeddingMBS. To learn more on how to implement semantic similarity, refer to Finding similarities between pieces of text.

Before configuring your contextual embedding:

- Select a model that,Äôs appropriate for your target language when initializing the embedding.
- Call requestEmbeddingAssetsWithCompletionHandler: before computing the embedding to confirm assets are available.

Some models support multiple languages; for example, you can use the same object to compute embeddings for both English and Spanish. However, this isn,Äôt always the case —languages like English and Chinese may require separate models. For more information about supported languages, refer to languages.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

136.1.2 Methods

136.1.3 available as boolean

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Whether the class is available.
Example:

```
If NLContextualEmbeddingMBS.available Then
MessageBox "available"
```

```
Else
MessageBox "not available"
end if
```

Notes: Returns true on macOS 14, iOS 17 or newer.

136.1.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

136.1.5 contextualEmbeddingsForValues(values as Dictionary) as NLContextualEmbeddingMBS()

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Returns contextual embedding models that match the specified language, script, or revision criteria.
Notes: The dictionaries has values using the NLContextualEmbeddingKeyLanguages, NLContextualEmbeddingKeyScripts and NLContextualEmbeddingKeyRevision constants.

136.1.6 contextualEmbeddingWithLanguage(language as String) as NLContextualEmbeddingMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Creates a contextual embedding from a language.
Example:

```
const lang = "en"
Var n As NLContextualEmbeddingMBS = NLContextualEmbeddingMBS.contextualEmbeddingWithLanguage(lang)

MessageBox n.modelIdentifier
```

Notes: language: The language the framework uses to find the most recent embedding suitable for the value you specify.

The language the framework uses to find the most recent embedding suitable for the value you specify.

136.1.7 contextualEmbeddingWithModelIdentifier(modelIdentifier as String) as NLContextualEmbeddingMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Creates a contextual embedding from a model identifier.
Notes: modelIdentifier: A string that uniquely identifies the embedding model.

If you train a custom model with the contextual embedding as the feature layer, keep track of this identifier and use it when loading the custom model in your app.

136.1.8 contextualEmbeddingWithScript(script as String) as NLContextualEmbeddingMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Creates a contextual embedding from a script.
Notes: script: The writing system the framework uses to find the most suitable system embedding for the value you specify; for example, Chinese or Latin.

136.1.9 embeddingResultForString(Text as String, Language as String = """, byref Error as NSErrorMBS) as NLContextualEmbeddingResultMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Applies an embedding to a string and obtains the resulting embedding vectors.
Notes: Text: The string to apply an embedding to.
language: The language of the string.
error: On output, an error object that describes why the method failed, or nil if no error occurred.

Returns an embedding result. On failure, this method returns nil.

136.1.10 languages as String()

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The languages that the contextual embedding supports.
Example:

```
const lang = "en"
Var n As NLContextualEmbeddingMBS = NLContextualEmbeddingMBS.contextualEmbeddingWithLanguage(lang)
Var languages() As String = n.languages
```

MessageBox String.FromArray(languages)
// shows: cs da de en es fi fr hr hu id it nb nl pl pt ro sk sv tr vi

Notes: Starting in iOS 17 and macOS 14, the framework supports 27 languages across three models:

- Latin —including Croatian, Czech, Danish, Dutch, English, Finnish, French, German, Hungarian, Indonesian, Italian, Norwegian, Polish, Portuguese, Romanian, Slovak, Swedish, Spanish, Turkish, and Vietnamese
- Cyrillic —including Bulgarian, Kazakh, Russian, and Ukrainian
- Chinese, Japanese, and Korean

In iOS 18 and macOS 15, the framework expands language support to include three additional models:

- Arabic
- Indic —including Bangla, Gujarati, Hindi, Kannada, Malayalam, Marathi, Punjabi, Tamil, Telugu, and Urdu
- Thai

136.1.11 Load(byref error as NSErrorMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The instance method that loads the embedding model.
Notes: error: On output, a pointer to an error object that describes why the method failed, or nil if no error occurred. If you are not interested in the error information, pass nil for this parameter.

Returns a Boolean value that indicates whether the load succeeds. When you create a contextual embedding, the framework doesn,Äôt load the model until you need it. Use load and unload to control when to load and unload the model. The first time load can be expensive, make sure you load the model before you need to use it.

The method fails if the necessary assets aren,Äôt on device for the model you specify. Use hasAvailableAssets and requestEmbeddingAssets to manage the assets.

136.1.12 NLContextualEmbeddingKeyLanguages as String

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Dictionary key for the languages.
Notes: For use with contextualEmbeddingsForValues function.

136.1.13 NLContextualEmbeddingKeyRevision as String

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Dictionary key for the revision.
Notes: For use with contextualEmbeddingsForValues function.

136.1.14 NLContextualEmbeddingKeyScripts as String

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Dictionary key for the scripts.
Notes: For use with contextualEmbeddingsForValues function.

136.1.15 requestEmbeddingAssets

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Requests embedding model assets and downloads them if available.
Notes: You use a contextual embedding after loading the necessary assets onto the device. Use hasAvailableAssets to determine whether assets are available. This method returns immediately if the framework knows the state of the assets or if an error occurs.

Calls requestEmbeddingAssetsCompleted later when finished.

136.1.16 scripts as String()

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The writing systems that the language uses.
Example:

```
const lang = "en"
Var n As NLContextualEmbeddingMBS = NLContextualEmbeddingMBS.contextualEmbeddingWithLanguage(lang)
Var scripts() As String = n.scripts

MessageBox String.FromArray(scripts)
```

// shows: Latn

Notes: The current scripts that are supported by NLContextualEmbedding include:

- Arabic
- Cyrillic
- Chinese, Japanese, and Korean
- Indic
- Latin
- Thai

For the specific languages that each script supports, refer to languages.

136.1.17 unload

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The instance method that unloads the embedding model.

136.1.18 Properties

136.1.19 dimension as UInt64

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The dimensionality of the embedding vectors generated by the model.
Notes: (Read only property)

136.1.20 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

136.1.21 hasAvailableAssets as Boolean

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: A Boolean value that indicates whether assets are available on-device.
Example:

```
const lang = "en"
Var n As NLContextualEmbeddingMBS = NLContextualEmbeddingMBS.contextualEmbeddingWithLanguage(lang)

If n.hasAvailableAssets Then
MessageBox "all things locally installed"
Else
n.requestEmbeddingAssets
MessageBox "loading..."
end if
```

Notes: (Read only property)

136.1.22 maximumSequenceLength as UInt64

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The maximum number of tokens in sequence for which the embedding generates vectors.
Example:

```
const lang = "en"
Var n As NLContextualEmbeddingMBS = NLContextualEmbeddingMBS.contextualEmbeddingWithLanguage(lang)

MessageBox "maximumSequenceLength: "+n.maximumSequenceLength.ToString
```

Notes: The model operates on subword tokens rather than whole words. Each token may represent a single character, part of a word, or (less commonly) an entire word. Most words are split into multiple tokens, especially rare or complex terms. As a result, the number of tokens in a sequence is often greater than the number of words.

Inputs longer than the token limit will be truncated, and only the first maximumSequenceLength tokens will be processed to generate embeddings.

NLContextualEmbedding works best with text snippets at the sentence or paragraph level. The model truncates text that exceeds this maximum length and only processes the truncated portion of the input.
(Read only property)

136.1.23 modelIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: A string that uniquely identifies the embedding model.
Example:

```
const lang = "en"
Var n As NLContextualEmbeddingMBS = NLContextualEmbeddingMBS.contextualEmbeddingWithLanguage(lang)

MessageBox n.modelIdentifier
```

Notes: Use the same model identifier that you developed and tested your app with to maintain consistent results.
(Read only property)

136.1.24 revision as UInt64

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The version number the contextual embedding uses.
Notes: Ensure your app uses the same model revision you used during development and testing to maintain consistent results.
(Read only property)

136.1.25 Events

136.1.26 requestEmbeddingAssetsCompleted(result as Integer, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The event that notifies your app when the asset request completes.

136.1.27 Constants

RequestEmbeddingAssets Results

Constant	Value	Description
NLContextualEmbeddingAssetsResultAvailable	0	A result that indicates that the assets are present on-device
NLContextualEmbeddingAssetsResultError	2	A result that indicates the framework encounters an error.
NLContextualEmbeddingAssetsResultNotAvailable	1	A result that indicates that the assets aren,Äôt present on-

136.2 class NLContextualEmbeddingResultMBS

136.2.1 class NLContextualEmbeddingResultMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: An object that represents the embedding vector result from applying a contextual embedding to a string.
Notes: This object returns embeddings at the subword level, meaning a single word may generate multiple vectors, especially for rare or complex terms. If you need to work with whole-word embeddings or create single representations for entire text inputs, pool or combine subword vectors.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 26.2pr1

136.2.2 Methods

136.2.3 averageToken as NLContextualEmbeddingResultVectorMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Calculates an average over the vectors in the result.
Example:

```
const lang = "en"
Var n As NLContextualEmbeddingMBS = NLContextualEmbeddingMBS.contextualEmbeddingWithLanguage(lang)

var e as NSErrorMBS
var r1 as NLContextualEmbeddingResultMBS = n.embeddingResultForString("Hello World", lang, e)
Var r2 As NLContextualEmbeddingResultMBS = n.embeddingResultForString("Hallo World", lang, e)

Var average1 As NLContextualEmbeddingResultVectorMBS = r1.averageToken
Var average2 As NLContextualEmbeddingResultVectorMBS = r2.averageToken

Var compare As Double = average1.cosineSimilarity(average2)

MessageBox compare.ToString // 0.93
```

Notes: The "Hello World" has six tokens. We sum them up and later divide by count to get the average.

136.2.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

136.2.5 tokenVectorAtIndex(characterIndex as Integer) as NLContextualEmbeddingResultVectorMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Returns a token vector at the specified character index.
Notes: characterIndex: The index to get the token vector at.

136.2.6 tokenVectors as NLContextualEmbeddingResultVectorMBS()

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Provides the embedding vectors corresponding to the result.
Example:

```
const lang = "en"
Var n As NLContextualEmbeddingMBS = NLContextualEmbeddingMBS.contextualEmbeddingWithLanguage(lang)

var e as NSErrorMBS
var r as NLContextualEmbeddingResultMBS = n.embeddingResultForString("Hello World", lang, e)

Var tokenVectors() As NLContextualEmbeddingResultVectorMBS = r.tokenVectors
Break // inspect array in debugger
```

Notes: Use this method to access the individual (subword) token embeddings. You can apply pooling or combination techniques to aggregate these subword vectors into a single representation for a word, phrase, or entire input.

Common pooling techniques include:

- Mean pooling to take the average of subword vectors.
- Max pooling for finding the element-wise maximum across tokens.
- Use the embeddings of the first or last subword tokens to represent the entire input.

136.2.7 Properties

136.2.8 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

136.2.9 Language as String

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The language that the framework identified or used when processing the input string.
Notes: e.g. "en" for English.
(Read only property)

136.2.10 SequenceLength as UInt64

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The number of embedding vectors the request generates.
Example:

```
const lang = "en"
Var n As NLContextualEmbeddingMBS = NLContextualEmbeddingMBS.contextualEmbeddingWithLanguage(lang)

var e as NSErrorMBS
var r as NLContextualEmbeddingResultMBS = n.embeddingResultForString("Hello World", lang, e)

MessageBox r.SequenceLength.ToString+" tokens"
```

Notes: (Read only property)

136.2.11 Text as String

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: A copy of the input string used to generate the embedding vectors.
Notes: (Read only property)

136.3 class NLContextualEmbeddingResultVectorMBS

136.3.1 class NLContextualEmbeddingResultVectorMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The class for a vector.
Notes: An utility class to store a vector, the range and text for it.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- News from the MBS Xojo Plugins in version 26.2
- MBS Xojo Plugins, version 26.2pr1

136.3.2 Methods

136.3.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

136.3.4 cosineSimilarity(other as NLContextualEmbeddingResultVectorMBS) as Double

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Utility function to calculate the cosine similarity between two vectors.
Example:

```
const lang = "en"
Var n As NLContextualEmbeddingMBS = NLContextualEmbeddingMBS.contextualEmbeddingWithLanguage(lang)

// we make vectors for two similar texts
var e as NSErrorMBS
var r1 as NLContextualEmbeddingResultMBS = n.embeddingResultForString("Hello World", lang, e)
Var r2 As NLContextualEmbeddingResultMBS = n.embeddingResultForString("Hallo World", lang, e)

Var average1 As NLContextualEmbeddingResultVectorMBS = r1.averageToken
Var average2 As NLContextualEmbeddingResultVectorMBS = r2.averageToken

Var compare As Double = average1.cosineSimilarity(average2)

MessageBox compare.ToString // 0.93
```

Notes: Returns 1 if equal or 0 if not.

136.3.5 values as Single()

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The vector as array.

136.3.6 Properties

136.3.7 Data as Ptr

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The data pointer for the vector data.
Example:

```
const lang = "en"
Var n As NLContextualEmbeddingMBS = NLContextualEmbeddingMBS.contextualEmbeddingWithLanguage(lang)

var e as NSErrorMBS
var r as NLContextualEmbeddingResultMBS = n.embeddingResultForString("Hello World", lang, e)

Var firstVector As NLContextualEmbeddingResultVectorMBS = r.tokenVectorAtIndex(0)
Var data As Ptr = firstVector.Data

// show first 4 values
MessageBox data.Single(0).ToString+EndOfLine+data.Single(4).ToString+EndOfLine+_
data.Single(8).ToString+EndOfLine+data.Single(12).ToString
```

Notes: Currently 512 single precision values.
(Read only property)

136.3.8 Length as Integer

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The length of the text range.
Notes: (Read only property)

136.3.9 Position as Integer

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The position of the text range.
Notes: (Read only property)

136.3.10 Text as String

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The text for the range.
Notes: (Read only property)

136.4 class NLEmbeddingMBS

136.4.1 class NLEmbeddingMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: A map of strings to vectors, which locates neighboring, similar strings.
Example:

```
// find words with a similar meaning
Var embedding As NLEmbeddingMBS = NLEmbeddingMBS.wordEmbeddingForLanguage("en")
If embedding = Nil Then
MessageBox "No word embedding available for English."
Return
End If

Var similar() As String = embedding.neighborStringsForString("happy", 5)
Var distance As Double = embedding.distanceBetweenString("dog", "cat", NLEmbeddingMBS.NLDistance-
TypeCosine)

MessageBox "Similar to happy: " + String.FromArray(similar, ", ") + EndOfLine + _
"Distance dog to cat: " + Format(distance, "0.000") + EndOfLine + _
"Vocabulary: " + embedding.vocabularySize.ToString + " words with " + embedding.dimension.ToString
+ " dimensions"
```

Notes: Use an NLEmbedding to find similar strings based on the proximity of their vectors. The vocabulary is the entire set of strings in an embedding. Each string in the vocabulary has a vector, which is an array of doubles, and each double corresponds to a dimension in the embedding. An NLEmbedding uses these vectors to determine the distance between two strings, or to find the nearest neighbors of a string in the vocabulary. The higher the similarity of any two strings, the smaller the distance is between them.

Natural Language provides built-in word embeddings that you can retrieve by using the wordEmbeddingFor-Language: method. You can also compile your own custom embedding into an efficient, searchable, on-disk representation. Typically, you compile an embedding by using Create ML,Äôs MLWordEmbedding and save it as a file for your Xcode project at development time.

Your custom embedding can use any kind of string that,Äôs useful to your app, such as phrases, brand names, serial numbers, and so on. For example, you could make an embedding of movie titles. Each movie title could have a vector that places similar movies close together in the embedding.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

136.4.2 Methods

136.4.3 available as boolean

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Whether the class is available.
Example:

```
If NLEmbeddingMBS.available Then
MessageBox "available"
Else
MessageBox "not available"
end if
```

Notes: Returns on macOS 10.15, iOS 13.0 or newer.

136.4.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

136.4.5 containsString(Text as String) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Requests a Boolean value that indicates whether the term is in the vocabulary.
Notes: Text: The term to search for in the word embedding.

Retruns true if the term is in the word embedding,Äôs vocabulary, otherwise false.

136.4.6 currentRevisionForLanguage(language as String) as Integer

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: etrieves the current version of a sentence embedding for the given language.
Notes: language: A language supported by the Natural Language framework.

Returns an integer representing the current version number of a sentence embedding.

136.4.7 currentSentenceEmbeddingRevisionForLanguage(language as String) as Integer

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Retrieves the current version of a sentence embedding for the given language.
Notes: language: A language supported by the Natural Language framework. For possible values, see

Returna an integer representing the current version number of a sentence embedding.

136.4.8 distanceBetweenString(firstString as String, secondString as String, distanceType as Integer = 0) as double

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Calculates the distance between two strings in the vocabulary space.
Example:

```
Var e As NLEmbeddingMBS = NLEmbeddingMBS.wordEmbeddingForLanguage("en")
var distance as double = e.distanceBetweenString("bicycle", "motorcycle")

Break // shows 0.76
```

Notes: firstString: A string in the embedding vocabulary.
secondString: Another string in the embedding vocabulary.
distanceType: A means of calculating distance that determines which formula the method uses to evaluate the distance between firstString and secondString.

Returns the distance associated with distanceType.

136.4.9 embeddingWithContents(File as FolderItem, byref error as NSErrorMBS) as NLEmbeddingMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Creates a word embedding from a model file.
Notes: File: The location of the .mlmodel file that contains a word embedding.
error: On output, a pointer to an error object that describes why the method failed, or nil if no error occurred. If you are not interested in the error information, pass nil for this parameter.

Use this initializer to create a word embedding from an .mlmodel file saved by Create ML,Äôs MLWordEmbedding.
See also:

- 136.4.10 embeddingWithContents(Path as String, byref error as NSErrorMBS) as NLEmbeddingMBS 18617

136.4.10 embeddingWithContents(Path as String, byref error as NSErrorMBS) as NLEmbeddingMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Creates a word embedding from a model file.
Notes: Path: The location of the .mlmodel file that contains a word embedding.
error: On output, a pointer to an error object that describes why the method failed, or nil if no error occurred. If you are not interested in the error information, pass nil for this parameter.

Use this initializer to create a word embedding from an .mlmodel file saved by Create ML,Äôs MLWordEmbedding.
See also:

- 136.4.9 embeddingWithContents(File as FolderItem, byref error as NSErrorMBS) as NLEmbeddingMBS 18616

136.4.11 neighborsForString(text as String, maximumCount as Integer, maximumDistance as double = 0.0, distanceType as Integer = 0) as NLEmbeddingNeighborMBS()

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Retrieves a limited number of strings near a string in the vocabulary.
Notes: text: A string in the embedding vocabulary.
maximumCount: The largest number of neighboring strings that the method can return in an array.
distanceType: A means of calculating distance that determines which formula the method uses to evaluate a neighbor,Äôs distance from string.

Return an array of neighbors.

136.4.12 neighborsForVector(vectorValues() as single, maximumCount as Integer, maximumDistance as double = 0.0, distanceType as Integer = 0) as NLEmbeddingNeighborMBS()

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Passes the nearest strings, within a radius of a location in the vocabulary space, to a block.
Example:

```
Var e As NLEmbeddingMBS = NLEmbeddingMBS.wordEmbeddingForLanguage("en")
Var vector() as single = e.vectorForString("cat")
Var neighbors() As NLEmbeddingNeighborMBS = e.neighborsForVector(vector, 5)

Break // shows: feline, kitten, dog, tabby, pet
```

Notes: vector: A location in the vocabulary space.
maxCount: The largest number of times the method calls block.
distanceType: A means of calculating distance that determines which formula the method uses to evaluate a neighbor,Äôs distance from vector.

136.4.13 neighborStringsForString(text as String, maximumCount as Integer, maximumDistance as double = 0.0, distanceType as Integer = 0) as String()

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Retrieves a limited number of strings near a string in the vocabulary.
Example:

```
Var e As NLEmbeddingMBS = NLEmbeddingMBS.wordEmbeddingForLanguage("en")

Var neighbors() As String = e.neighborStringsForString("cat", 5)

Break // shows: feline, kitten, dog, tabby, pet
```

Notes: text: A string in the embedding vocabulary.
maximumCount: The largest number of neighboring strings that the method can return in an array.
distanceType: A means of calculating distance that determines which formula the method uses to evaluate a neighbor,Äôs distance from string.

Return an array of strings.

136.4.14 neighborStringsForVector(vectorValues() as single, maximumCount as Integer, maximumDistance as double = 0.0, distanceType as Integer = 0) as String()

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Retrieves a limited number of strings within a radius of a location in the vocabulary space.
Example:

```
Var e As NLEmbeddingMBS = NLEmbeddingMBS.wordEmbeddingForLanguage("en")
Var vector() as single = e.vectorForString("cat")
Var neighbors() As String = e.neighborStringsForVector(vector, 5)

Break // shows: feline, kitten, dog, tabby, pet
```

Notes: vector: A location in the vocabulary space.
maxCount: The largest number of neighboring strings that the method can return in an array.
maxDistance: The largest distance a neighbor can be from vector.
distanceType: A means of calculating distance that determines which formula the method uses to evaluate a neighbor,Äôs distance from vector.

Return an array of strings.

136.4.15 sentenceEmbeddingForLanguage(language as String, Revision as Integer = -1) as NLEmbeddingMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Retrieves a sentence embedding for a given language and revision.
Example:

```
Var e As NLEmbeddingMBS = NLEmbeddingMBS.sentenceEmbeddingForLanguage("de")
Var vectorValues() As Single = e.vectorForString("Hello World")

Break
```

Notes: language: The language of the sentence embedding, such as "fr".
revision: Optionally the revision of the sentence embedding.

Returns an NLEmbedding if available, otherwise nil.

136.4.16 supportedRevisionsForLanguage(language as String) as NSIndexSetMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Retrieves all version numbers of a word embedding for the given language.
Notes: language: A language supported by the Natural Language framework.

Returns an index set.

136.4.17 supportedSentenceEmbeddingRevisionsForLanguage(language as String) as NSIndexSetMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Retrieves all version numbers of a sentence embedding for the given language.
Notes: language: A language supported by the Natural Language framework.

Returns an index set representing all of the supported version numbers of the sentence embedding.

136.4.18 vectorForString(text as String) as Single()

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Requests the vector for the given term.
Example:

```
Var e As NLEmbeddingMBS = NLEmbeddingMBS.sentenceEmbeddingForLanguage("de")
Var vectorValues() As Single = e.vectorForString("Hello World")

Break
```

Notes: Text: The term to find in the word embedding.

Returns a vector represented as an array of doubles if present in the word embedding, otherwise nil.

136.4.19 wordEmbeddingForLanguage(language as String, Revision as Integer = -1) as NLEmbeddingMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: Retrieves a word embedding for a given language and revision.
Example:

```
Var e As NLEmbeddingMBS = NLEmbeddingMBS.wordEmbeddingForLanguage("en")
Var vectorValues() As Single = e.vectorForString("a")

Break
```

Notes: language: The language of the word embedding, such as "fr".
revision: Optionally the revision of the word embedding.

Returns an NLEmbedding if available, otherwise nil.

136.4.20 Properties

136.4.21 dimension as Integer

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The number of dimensions in the vocabulary,Äôs vector space.
Notes: (Read only property)

136.4.22 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

136.4.23 Language as String

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The language of the text in the word embedding.
Example:

```
Var e As NLEmbeddingMBS = NLEmbeddingMBS.wordEmbeddingForLanguage("de")

MessageBox e.Language
```

Notes: (Read only property)

136.4.24 revision as Integer

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The revision of the word embedding.
Notes: (Read only property)

136.4.25 vocabularySize as Integer

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The number of words in the vocabulary.
Notes: (Read only property)

136.4.26 Constants

Constants

Constant	Value	Description
NLDistanceTypeCosine	0	The means of calculating a distance between two locations in a text embedding. The meaning of an distance is directly related to the NLDistanceType you use when you call a method that uses it. For example, if you use the neighborsForString method and use NLDistanceTypeCosine for the distanceType parameter, the method calculates the cosine distance and returns it as an NLDistance.

136.5 class NLEmbeddingNeighborMBS

136.5.1 class NLEmbeddingNeighborMBS

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The class for a neighbor with a distance.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

136.5.4 Properties

136.5.5 Distance as Double

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The distance for the neighbor.
Notes: (Read only property)

136.5.6 Text as String

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platforms: macOS, iOS, Targets: All.

Function: The text for the neighbor.
Notes: (Read only property)

136.6 class NLLanguageRecognizerMBS

136.6.1 class NLLanguageRecognizerMBS

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: The class to recognize the language of a body of text.
Example:

```
var recognizer as new NLLanguageRecognizerMBS

recognizer.processString("This is ")
recognizer.processString("an English ")
recognizer.processString("document.")
recognizer.processString("What language?")

MessageBox recognizer.dominantLanguage
```

Notes: An NLLanguageRecognizerMBS object automatically detects the language of a piece of text. It performs language identification by:

- Identifying the dominant script of a piece of text. Some languages have a unique script (like Greek), but others share the same script (like English, French, and German, which all share the Latin script).
- Identifying the language itself.

The identification obtained from an NLLanguageRecognizerMBS object can be either a single most likely language, access through dominantLanguage, or a set of language candidates with probabilities, using languageHypothesesWithMaximum(). You can reset the recognizer to its initial state, to be reused for new analysis.

Use the convenience method, dominantLanguageForString:, to get the most likely language without creating an NLLanguageRecognizer.

136.6.2 Methods

136.6.3 available as boolean

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: Whether this class is available.
Example:

```
If NLLanguageRecognizerMBS.available Then
MessageBox "Available"
Else
MessageBox "not available"
End If
```

Notes: Returns true on macOS 10.14 or iOS 12.0 or newer.

136.6.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: Creates a recognizer that you can customize.

136.6.5 dominantLanguageForString(text as string) as string

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: Finds the most likely language of a piece of text.
Example:

```
var text as string = "This is a simple English sentence."
var language as string = NLLanguageRecognizerMBS.dominantLanguageForString(text)
MessageBox "Detected language: "+language
```

136.6.6 languageConstraints as string()

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: Limits the set of possible languages that the recognizer will return.

136.6.7 languageHypothesesWithMaximum(maxHypotheses as Integer) as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: Generates the probabilities of possible languages for the processed text.
Example:

```
var recognizer as new NLLanguageRecognizerMBS

recognizer.processString("Hola amigos, c√mo est√°n?")

var hypotheses as Dictionary = recognizer.languageHypothesesWithMaximum(3)

For Each entry As DictionaryEntry In hypotheses

System.DebugLog entry.Key+": "+format(entry.Value.DoubleValue, "0.0%")

next
```

Notes: maxHypotheses: The maximum number of languages to return.

A dictionary mapping languages with their probabilities, up to maxHypotheses languages.

136.6.8 NLLanguageAmharic as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Amharic

136.6.9 NLLanguageArabic as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Arabic

136.6.10 NLLanguageArmenian as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Armenian

136.6.11 NLLanguageBengali as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Bengali

136.6.12 NLLanguageBulgarian as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Bulgarian

136.6.13 NLLanguageBurmese as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Burmese

136.6.14 NLLanguageCatalan as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Catalan

136.6.15 NLLanguageCherokee as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Cherokee

136.6.16 NLLanguageCroatian as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Croatian

136.6.17 NLLanguageCzech as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Czech

136.6.18 NLLanguageDanish as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Danish

136.6.19 NLLanguageDutch as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Dutch

136.6.20 NLLanguageEnglish as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: English

136.6.21 NLLanguageFinnish as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Finnish

136.6.22 NLLanguageFrench as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: French

136.6.23 NLLanguageGeorgian as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Georgian

136.6.24 NLLanguageGerman as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: German

136.6.25 NLLanguageGreek as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Greek

136.6.26 NLLanguageGujarati as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Gujarati

136.6.27 NLLanguageHebrew as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Hebrew

136.6.28 NLLanguageHindi as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Hindi

136.6.29 NLLanguageHungarian as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Hungarian

136.6.30 NLLanguageIcelandic as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Icelandic

136.6.31 NLLanguageIndonesian as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Indonesian

136.6.32 NLLanguageItalian as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Italian

136.6.33 NLLanguageJapanese as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Japanese

136.6.34 NLLanguageKannada as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Kannada

136.6.35 NLLanguageKazakh as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Kazakh

136.6.36 NLLanguageKhmer as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Khmer

136.6.37 NLLanguageKorean as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Korean

136.6.38 NLLanguageLao as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Lao

136.6.39 NLLanguageMalay as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Malay

136.6.40 NLLanguageMalayalam as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Malayalam

136.6.41 NLLanguageMarathi as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Marathi

136.6.42 NLLanguageMongolian as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Mongolian

136.6.43 NLLanguageNorwegian as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Norwegian

136.6.44 NLLanguageOriya as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Oriya

136.6.45 NLLanguagePersian as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Persian

136.6.46 NLLanguagePolish as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Polish

136.6.47 NLLanguagePortuguese as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Portuguese

136.6.48 NLLanguagePunjabi as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Punjabi

136.6.49 NLLanguageRomanian as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Romanian

136.6.50 NLLanguageRussian as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Russian

136.6.51 NLLanguageSimplifiedChinese as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: SimplifiedChinese

136.6.52 NLLanguageSinhalese as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Sinhalese

136.6.53 NLLanguageSlovak as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Slovak

136.6.54 NLLanguageSpanish as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Spanish

136.6.55 NLLanguageSwedish as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Swedish

136.6.56 NLLanguageTamil as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Tamil

136.6.57 NLLanguageTelugu as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Telugu

136.6.58 NLLanguageThai as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Thai

136.6.59 NLLanguageTibetan as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Tibetan

136.6.60 NLLanguageTraditionalChinese as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: TraditionalChinese

136.6.61 NLLanguageTurkish as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Turkish

136.6.62 NLLanguageUkrainian as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Ukrainian

136.6.63 NLLanguageUndetermined as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Undetermined

136.6.64 NLLanguageUrdu as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Urdu

136.6.65 NLLanguageVietnamese as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: One of the language constants.
Notes: Vietnamese

136.6.66 processString(text as String)

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: Analyzes the piece of text to determine its dominant language.
Example:

```
var recognizer as new NLLanguageRecognizerMBS

recognizer.processString("Bonjour tout le monde")

var language as string = recognizer.dominantLanguage
MessageBox "Detected language: "+language
```

Notes: Use this method to process the provided text and to update the dominantLanguage result and languageHypotheses() probabilities.

136.6.67 reset

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: Resets the recognizer.
Example:

```
var recognizer as new NLLanguageRecognizerMBS
var text, lang as string

text = "Hallo Welt"
recognizer.processString(text)
lang = recognizer.dominantLanguage

MessageBox text + ": " + lang

recognizer.reset()

Text = "Ciao mondo"
recognizer.processString(Text)
lang = recognizer.dominantLanguage

MessageBox Text + ": " + lang
```

Notes: Resets the recognizer to its initial state.

136.6.68 setLanguageConstraints(testDeviceIdentifiers() as string)

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: Limits the set of possible languages that the recognizer will return.

Example:

```
var recognizer as new NLLanguageRecognizerMBS
Var Text, lang As String

Var languageConstraints() As String

languageConstraints.add recognizer.NLLanguageEnglish
languageConstraints.add recognizer.NLLanguageItalian
languageConstraints.add recognizer.NLLanguagePortuguese

recognizer.setLanguageConstraints languageConstraints

// this is spanish, but let's see what it is closest to
text = "Hola amigo"
recognizer.processString(text)
lang = recognizer.dominantLanguage

MessageBox text + ": " + lang
```

136.6.69 Properties

136.6.70 dominantLanguage as String

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: The most likely language for the processed text.
Example:

```
var recognizer as new NLLanguageRecognizerMBS

recognizer.processString("Bonjour tout le monde")

var language as string = recognizer.dominantLanguage
MessageBox "Detected language: "+language
```

Notes: (Read only property)

136.6.71 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

136.6.72 languageHints as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 26.3, Platforms: macOS, iOS, Targets: All.

Function: A dictionary that maps languages to their probabilities in the language identification process.
Notes: This is a dictionary mapping languages to their probabilities and used by processString.
(Read and Write property)

Chapter 137

Navigation

137.1 class NSOpenPanelMBS

137.1.1 class NSOpenPanelMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The class for the Cocoa Open Panel.
Example:

```
// let the user pick one or more PDF or text files
Var panel As New NSOpenPanelMBS
panel.allowsMultipleSelection = True
panel.canChooseDirectories = False
panel.Title = "Import Documents"
panel.Message = "Choose the files to import."
panel.Prompt = "Import"

Var types() As String = Array("pdf", "txt")
panel.setAllowedFileTypes types

If panel.runModal = NSSavePanelMBS.NSOKButton Then
For Each file As FolderItem In panel.Files
System.DebugLog file.NativePath
Next
End If
```

Notes: Subclass of the NSSavePanelMBS class.

137.1.2 Methods

137.1.3 beginForDirectory(path as folderitem, name as string, filetypes() as string)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Presents a modeless Open panel.
Notes: path:
Directory whose files the panel displays. When nil, the directory is the same directory used in the previous invocation of the panel; this is probably the best choice for most situations.

name:
Specifies a particular file in absoluteDirectoryPath that is selected when the Open panel is presented to the user. When nil, no file is initially selected.

fileTypes:
Array of file extensions and/or HFS file types. Specifies the files the panel allows the user to select. An empty array makes all files in path selectable by the user.

This method will later called the savePanelDidEnd event.

137.1.4 beginSheetForDirectory(path as folderitem, name as string, filetypes() as string, targetWindow as DesktopWindow)

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Presents a sheet Open panel on a given window.
Notes: path:
Directory whose files the panel displays. When nil, the directory is the same directory used in the previous invocation of the panel; this is probably the best choice for most situations.

name:
Specifies a particular file in path that is selected when the Open panel is presented to the user. When "",

no file is initially selected.

filetypes:
Array of file extensions and/or HFS file types. Specifies the files the panel allows the user to select. An empty array makes all files in absoluteDirectoryPath selectable by the user.

targetWindow:
Window to open the sheet on.

This method will later called the savePanelDidEnd event.

Seems like on Mac OS X 10.4 the usage of sheets will raise NSExceptions for missing methods in the NSCarbonWindowFrame class.
See also:

- 137.1.5 beginSheetForDirectory(path as folderitem, name as string, filetypes() as string, targetWindow as window) 18643

137.1.5 beginSheetForDirectory(path as folderitem, name as string, filetypes() as string, targetWindow as window)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Presents a sheet Open panel on a given window.
Notes: path:
Directory whose files the panel displays. When nil, the directory is the same directory used in the previous invocation of the panel; this is probably the best choice for most situations.

name:
Specifies a particular file in path that is selected when the Open panel is presented to the user. When "", no file is initially selected.

filetypes:
Array of file extensions and/or HFS file types. Specifies the files the panel allows the user to select. An empty array makes all files in absoluteDirectoryPath selectable by the user.

targetWindow:
Window to open the sheet on.

This method will later called the savePanelDidEnd event.

Seems like on Mac OS X 10.4 the usage of sheets will raise NSExceptions for missing methods in the

NSCarbonWindowFrame class.

- 137.1.4 beginSheetForDirectory(path as folderitem, name as string, filetypes() as string, targetWindow as DesktopWindow) 18642

137.1.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The constructor which initializes the panel with default values.

137.1.7 Files as FolderItem()

MBS MacCocoa Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop only.

Function: Queries all folderitems.
See also:

- 137.1.8 Files(index as UInt32) as folderitem 18644

137.1.8 Files(index as UInt32) as folderitem

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The array of files.
Notes: Index is zero based.
See also:

- 137.1.7 Files as FolderItem() 18644

137.1.9 runModalForDirectory(path as folderitem, name as string, filetypes as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A convenience version of the runModalForDirectory function which passes one filetype instead of an array of file types.
Notes: See NSCancelButton and NSOkButton constants for return values.
See also:

- 137.1.10 runModalForDirectory(path as folderitem, name as string, filetypes() as string) as Integer 18645

137.1.10 runModalForDirectory(path as folderitem, name as string, filetypes() as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Runs the panel as a modal dialog with the given filetypes.
Notes: path is the directory to use as a start point. Pass nil to use the last directory which has been used.

filetypes:
The filetypes you want to allow.

See NSCancelButton and NSOkButton constants for return values.
See also:

- 137.1.9 runModalForDirectory(path as folderitem, name as string, filetypes as string) as Integer 18644

137.1.11 runModalForTypes(filetypes as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A convenience version of the runModalForTypes function which passes one filetype instead of an array of file types.
Example:

```
Var dlg As New NSOpenPanelMBS
Var iResult as Integer = dlg.runModalForTypes("jpg")
```

Notes: See NSCancelButton and NSOkButton constants for return values.
See also:

- 137.1.12 runModalForTypes(filetypes() as string) as Integer 18645

137.1.12 runModalForTypes(filetypes() as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Runs the panel as a modal dialog with the given filetypes.
Example:

```
Var dlg As New NSOpenPanelMBS
Var types() as string = array("jpg", "tif")
Var iResult as Integer = dlg.runModalForTypes(types)
```

Notes: See NSCancelButton and NSOkButton constants for return values.
See also:

- 137.1.11 runModalForTypes(filetypes as string) as Integer 18645

137.1.13 URL(index as UInt32) as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The array of file URLs.
Notes: Index is zero based.

137.1.14 URLs as String()

MBS MacCocoa Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop only.

Function: Queries all URLs.

137.1.15 Properties

137.1.16 AccessoryViewDisclosed as Boolean

MBS MacCocoa Plugin, Plugin Version: 23.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the panel's accessory view is visible.
Notes: The value of this property is true when the accessory view is visible, and false when it isn't. Setting the value of this property programmatically changes the visibility of the accessory panel. If no accessory panel is present, setting this property does nothing.
(Read and Write property)

137.1.17 allowsMultipleSelection as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the panel's browser allows the user to open multiple files (and directories) at a time.
Notes: (Read and Write property)

137.1.18 canChooseDirectories as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the user can select directories in the pane's browser.
Notes: When a directory is selected, the OK button is enabled only if flag is true.

(Read and Write property)

137.1.19 canChooseFiles as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the panel allows the user to choose files to open.
Notes: (Read and Write property)

137.1.20 canDownloadUbiquitousContents as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop only.

Function: Controls how the receiver responds to ubiquitous documents that aren't yet fully downloaded locally.
Notes: If true, then the receiver will disallow opening non-local ubiquitous files. Also, if the user attempts to select a non-local file, the receiver will trigger or reprioritize downloading for that file so that it can be opened as soon as possible. If false, then the receiver will allow the user to select and open non-local files, giving your application responsibility for downloading and reporting progress. The default value is true, except for applications linked against the 10.9 SDK or earlier that have adopted iCloud by specifying a ubiquitous container identifier entitlement.

To provide the ideal user experience, you should set this property to NO and download the file's contents (with NSFileCoordinator) and show downloading progress (with NSProgress or NSMetadataQuery) in the context of your application, instead of relying on the open panel to do it.

Available in Mac OS X 10.10 and newer.
(Read and Write property)

137.1.21 canResolveUbiquitousConflicts as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop only.

Function: Controls how the receiver responds to ubiquitous documents with conflicting versions.
Notes: If true, then when the user attempts to open one or more documents with conflicts, the receiver will first display conflict resolution UI, requiring the user to resolve those conflicts before the documents can be opened. If false, then the receiver does nothing in response to conflicts, allowing your application to handle them. The default value is true, except for applications linked against the 10.9 SDK or earlier that have adopted iCloud by specifying a ubiquitous container identifier entitlement.

To provide the ideal user experience, you should set this property to NO and do conflict detection and

resolution (using NSURLUbiquitousItemHasUnresolvedConflictsKey and NSFileVersion) in the context of your application, instead of relying on the open panel to do it.

Available in Mac OS X 10.10 and newer.
(Read and Write property)

137.1.22 FilesCount as UInt32

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The number of selected files.
Notes: (Read only property)

137.1.23 resolvesAliases as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver resolves aliases.
Notes: If true, the effect is that dropping an alias on the panel or asking for filenames returns the resolved aliases. The default is true.
(Read and Write property)

137.2 class NSSavePanelMBS

137.2.1 class NSSavePanelMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The class for a Cocoa Save Panel.
Example:

```
Var n as new NSSavePanelMBS

Var e as integer = n.runModal

if e = n.NSCancelButton then
// cancelled
Break
elseif e = n.NSOKButton then
// got file
Var file as FolderItem = n.file
Break
end if
```

Notes: Subclass of the NSPanelMBS class.

137.2.2 Methods

137.2.3 allowedFileTypes as string()

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns an array of the allowed file types.
Notes: If the user specifies a file whose type is in the array of allowed types, the user is not presented with another dialog (see allowsOtherFileTypes for details about this dialog) when trying to save. Examples of common file types are "rtf", "tiff", and "ps". File type strings encoding HFS file types are not valid values for this attribute. A nil return value, which is the default, indicates that the user can save to any ASCII file.

Available in Mac OS X v10.3 and later.

137.2.4 beginSheetForDirectory(path as folderitem, name as string, targetWindow as DesktopWindow)

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Presents a Save panel as a sheet with the directory specified by path and optionally, the file specified by name selected.
Notes: If targetWindow is nil, the panel will be a modal dialog.

This method will later called the savePanelDidEnd event.

Seems like on Mac OS X 10.4 the usage of sheets will raise NSExceptions for missing methods in the NSCarbonWindowFrame class.
See also:

- 137.2.5 beginSheetForDirectory(path as folderitem, name as string, targetWindow as window) 18650

137.2.5 beginSheetForDirectory(path as folderitem, name as string, targetWindow as window)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Presents a Save panel as a sheet with the directory specified by path and optionally, the file specified by name selected.
Notes: If targetWindow is nil, the panel will be a modal dialog.

This method will later called the savePanelDidEnd event.

Seems like on Mac OS X 10.4 the usage of sheets will raise NSExceptions for missing methods in the NSCarbonWindowFrame class.
See also:

- 137.2.4 beginSheetForDirectory(path as folderitem, name as string, targetWindow as DesktopWindow) 18650

137.2.6 Cancel

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: You can cancel the dialog using this method.

137.2.7 Constructor

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The constructor which initializes the panel with default values.

137.2.8 File as folderitem

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The file currently shown in the panel.
Notes: May be nil.

137.2.9 FileTypeForHFSType(hfstype as string) as string

MBS MacCocoa Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Returns a string encoding a file type code.
Example:

```
Var n as new NSSavePanelMBS

MessageBox n.FileTypeForHFSType("TEXT") // shows 'TEXT'
```

Notes: When using Mac Type codes, you need to use this function to convert them in a string the file manager understands.

137.2.10 HideNSNavNodePopUpButton

MBS MacCocoa Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Hides the nagivation popup menu.
Notes: This is a function using undocumented features from the Apple NSSavePanel class, so there is not guarantee that it will work in future versions.

137.2.11 Ok

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: You can click ok in the dialog using this method.

137.2.12 runModal as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Displays the panel and begins its event loop with the current working (or last selected) directory as the default starting point.
Example:

```
Var n as new NSSavePanelMBS

Var e as integer = n.runModal

if e = n.NSCancelButton then
// cancelled
Break
elseif e = n.NSOKButton then
// got file
Var file as FolderItem = n.file
Break
end if
```

Notes: Returns NSOKButton or NSCancelButton or -1 on any error.

137.2.13 runModalForDirectory(path as folderitem, name as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Initializes the panel to the directory specified by path and, optionally, the file specified by filename, then displays it and begins its modal event loop; path and filename can be empty strings.

Notes: If path is nil, the previous directory the Save panel was in is used.
See NSCancelButton and NSOkButton constants for return values.

137.2.14 setAllowedFileTypes(filetype as string)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A convenience method for setAllowedFileTypes with only one file type.
See also:

- 137.2.15 setAllowedFileTypes(filetypes() as string) 18653

137.2.15 setAllowedFileTypes(filetypes() as string)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Specifies the allowed file types.
Notes: A file type is an extension to be appended to any selected files that don't already have that extension; "nib" and "rtf" are examples. The items in types should not include the period that begins the extension. File type strings encoding HFS file types are not valid values. Pass an empty array, to allow any file type, which is the default.
See also:

- 137.2.14 setAllowedFileTypes(filetype as string) 18653

137.2.16 setTagNames(tagNames() as string)

MBS MacCocoa Plugin, Plugin Version: 23.0, Platform: macOS, Targets: Desktop only.

Function: Sets the tag names that you want to include on a saved file.
Example:

```
Var n as new NSSavePanelMBS
n.showsTagField = true
n.setTagNames array("test")
```

Notes: When the value of showsTagField is true, use this property to provide an array of strings that represent the initial tag names to display in the panel. If you set the property to nil or an empty array, the panel displays no initial tag names.

137.2.17 tagNames as string()

MBS MacCocoa Plugin, Plugin Version: 23.0, Platform: macOS, Targets: Desktop only.

Function: The tag names that you want to include on a saved file.
Notes: When the value of showsTagField is true, use this property to provide an array of strings that represent the initial tag names to display in the panel. If you set the property to nil or an empty array, the panel displays no initial tag names.

137.2.18 validateVisibleColumns

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Validates and possibly reloads the browser columns visible in the receiver by invoking the delegate method shouldShowFilename.
Notes: You might use this method if you want the browser to only allow selection of files with certain extensions based on the selection made in an accessory-view pop-up list. When the user changes the selection, you would invoke this method to revalidate the visible columns.

137.2.19 Properties

137.2.20 accessoryView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The custom accessory view for the current application.
Notes: You can place any Cocoa control on that panel.
(Read and Write property)

137.2.21 allowsOtherFileTypes as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver allows the user to save files with an extension that's not in the list of allowed types.
Notes: If the user tries to save a filename with a recognized extension that's not in the list of allowed types they are presented with a dialog. If this property is true, then the dialog presents the option of using the extension the user specified.

The default setting is false.
(Read and Write property)

137.2.22 canCreateDirectories as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver allows the user to create directories.
Notes: (Read and Write property)

137.2.23 canSelectHiddenExtension as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver allows the user to hide or show extensions.
Notes: (Read and Write property)

137.2.24 Directory as folderitem

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The path of the directory currently shown in the panel.
Notes: May be nil on any error.
(Read and Write property)

137.2.25 directoryURL as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The directory shown in the panel as a URL.
Notes: Available in Mac OS X v10.6 and later.
(Read and Write property)

137.2.26 isExpanded as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the panel is expanded.
Notes: (Read only property)

137.2.27 isExtensionHidden as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the extension-hiding checkbox is visible and checked.
Notes: True to show the checkbox and false to hide.
(Read and Write property)

137.2.28 Message as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The message displayed in the panel.
Notes: The default message text is an empty string.
(Read and Write property)

137.2.29 NameFieldLabel as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The string displayed in front of the filename text field.
Notes: By default the label is "Save As:".
(Read and Write property)

137.2.30 nameFieldStringValue as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The user-editable filename currently shown in the name field.
Notes: Available in Mac OS X v10.6 and later.
(Read and Write property)

137.2.31 Prompt as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The prompt of the default button.
Notes: This prompt appears on all SavePanel objects (or all OpenPanel objects if the panel of this message is an NSOpenPanel instance) in your application. By default the text in the default button is "Open" for an Open panel and "Save" for a Save panel.

It is intended that short words or phrases, such as "Open", "Save", "Set", or "Choose", be used on the button. The button is not resized to accommodate long prompts.

Since this method previously affected a title field, any colon at the end of prompt is removed.
(Read and Write property)

137.2.32 requiredFileType as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The required file type (if any).
Notes: A file specified in the Save panel is saved with the designated filename and this file type as an extension. Examples of common file types are "rtf", "tiff", and "ps". File type strings encoding HFS file types are not valid values for this attribute. An "" return value indicates that the user can save to any ASCII file.

This method is equivalent to calling allowedFileTypes and returning the first element of the list of allowed types, or "" if there are none.
(Read and Write property)

137.2.33 showsHiddenFiles as boolean

MBS MacCocoa Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Whether to show or hide the invisible files.
Notes: This is a function using undocumented features from the Apple NSSavePanel class, so there is not guarantee that it will work in future versions.
(Read and Write property)

137.2.34 showsTagField as Boolean

MBS MacCocoa Plugin, Plugin Version: 23.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the panel displays the Tags field.
Example:

```
Var n as new NSSavePanelMBS
n.showsTagField = true
n.setTagNames array("test")
```

Notes: When the value of this property is true, the panel displays the Tags field; if NO, the panel doesn,Äôt display the Tags field. The default value is true. (Note that the Tags field is appropriate only in a Save panel.)
If you set this property to true, you are responsible for setting tag names on the resulting file after saving is complete. If you don,Äôt set this property, macOS will automatically show the tag field and attempt to

apply the tags to the file. To set tags on files, use the NSURLTagNamesKey.
(Read and Write property)

137.2.35 Title as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The title of the panel.
Notes: (Read and Write property)

137.2.36 treatsFilePackagesAsDirectories as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the panel displays file packages to the user as directories.
Notes: (Read and Write property)

137.2.37 Events

137.2.38 compareFilename(name1 as string, name2 as string, caseSensitive as boolean) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Controls the ordering of files presented by the NSSavePanel.
Notes: If this event has no code, the default behavior is used.

The caseSensitive argument, if true, indicates that the ordering is to be case-sensitive.

Don't reorder filenames in the Save panel without good reason, because it may confuse the user to have files in one Save panel or Open panel ordered differently than those in other such panels or in the Finder. The default behavior of Save and Open panels is to order files as they appear in the Finder. Note also that by implementing this method you will reduce the operating performance of the panel.

Constants:
const NSOrderedAscending=-1 // The left operand is smaller than the right operand.
const NSOrderedSame=0 // The two operands are equal.
const NSOrderedDescending=1 // The left operand is greater than the right operand.

137.2.39 directoryDidChange(path as string, folder as folderitem)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Sent when the user has changed the selected directory in the panel.
Notes: If this event has no code, the default behavior is used.

137.2.40 isValidFilename(path as string, item as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Gives the delegate the opportunity to validate selected items.
Notes: If this event has no code, the default behavior is used.

The NSSavePanel object sender sends this event just before the end of a modal session for each filename displayed or selected (including filenames in multiple selections). The event determines whether it wants the file identified by filename; it returns true if the filename is valid, or false if the save panel should stay in its modal loop and wait for the user to type in or select a different filename or names. If the event refuses a filename in a multiple selection, none of the filenames in the selection is accepted.

137.2.41 panelSelectionDidChange

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The event called whenever the selection changed in the dialog.
Notes: If this event has no code, the default behavior is used.

137.2.42 savePanelDidEnd(ReturnCode as Integer)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The save panel finished in sheet mode.
Notes: Returncode is NSOKButton or NSCancelButton.

137.2.43 shouldShowFilename(path as string, item as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Gives the delegate the opportunity to filter items that it doesn't want the user to choose.
Notes: If this event has no code, the default behavior is used.

The NSSavePanel sends this event for each file or directory (filename) it is about to load in the browser. The delegate returns true if filename should be selectable, and false if the save panel should disable the file or directory.

137.2.44 userEnteredFilename(filename as string, confirmed as boolean) as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Sent when the user confirms a filename choice by hitting OK or Return in the NSSavePanel.
Notes: You can either leave the filename alone, return a new filename, or return "" to cancel the save (and leave the Save panel as is). This method is sent before any required extension is appended to the filename and before the Save panel asks the user whether to replace an existing file.

Note that in the future, this method may be called multiple times in the sessions as the user types. In those cases, okFlag will be false until the user confirms the choice, in which case okFlag will become true. If the delegate does extensive validation or puts up alerts, it should do so only when okFlag is true.

If this event has no code, the default behavior is used.

137.2.45 willExpand(expanding as boolean)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Sent when the NSSavePanel is about to expand or collapse because the user clicked the disclosure triangle that displays or hides the file browser.
Notes: If this event has no code, the default behavior is used.

137.2.46 Constants

Constants

Constant	Value	Description
NSCancelButton	0	One of the result codes you may need with this class.
NSOKButton	1	One of the result codes you may need with this class.

137.3 class OpenDialogFileTypeMBS

137.3.1 class OpenDialogFileTypeMBS

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: A class for a file type for the OpenDialog class.
Notes: For Cocoa, only the type field is used and can be an UTI or file extension.

137.3.2 Methods

137.3.3 Close

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

137.3.4 Properties

137.3.5 Extension as String

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The extension for this filetype.
Notes: Currently this value is only used on Windows.
Value e.g. "*.TXT" or "*.TXT;*.BMP".

Use a value like "*.TXT" or to match multiple types, list multiple extensions separated by semicolons like this: "*.TXT;*.BMP".

With version 8.2, we use extensions also for MacOS.
(Read and Write property)

137.3.6 Name as String

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The name of this file type.
Notes: Currently this value is only used on Windows.

(Read and Write property)

137.3.7 Type as String

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The Mac OS type code for this file type.
Notes: Currently this value is only used on Mac OS.
And check the documenation on the Navigation Manager if you use it as you will need a KIND Resource for this.

For Cocoa, only the type field is used and can be an UTI or file extension.
(Read and Write property)

137.4 class OpenDialogItemMBS

137.4.1 class OpenDialogItemMBS

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The class for an item selected via open dialog.
Notes: Currently only used for Windows.
Blog Entries

- New in the MBS Xojo Plugins 20.0
- MBS Xojo Plugins, version 20.0pr7

137.4.2 Methods

137.4.3 ReadData as String

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Reads the data.
Notes: We try to get a stream for the data from Windows and then read all available data.

137.4.4 Properties

137.4.5 Handle as Integer

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The internal object handle.
Notes: Points to an IShellItem object.
(Read and Write property)

137.4.6 Name as String

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The display name of the file.
Notes: (Read and Write property)

137.4.7 Path as String

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The file path of the file.
Notes: Not available for virtual files.
(Read and Write property)

137.4.8 URL as String

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The URL of the file.
Notes: Not available for virtual files.
(Read and Write property)

137.5 class OpenDialogMBS

137.5.1 class OpenDialogMBS

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: A class for a multiple selection open dialog.
Example:

```
// This example needs a window with ListBox1.
Var o as OpenDialogMBS
Var i,c as Integer
Var f as FolderItem

o=new OpenDialogMBS
o.ShowHiddenFiles=true
o.PromptText="Select one or more files:"
o.MultipleSelection=true
o.ActionButtonLabel="Open files"
o.CancelButtonLabel="no, thanks."
o.WindowTitle="This is a window title."
o.ClientName="Client Name?"
o.ShowDialog

c=o.FileCount
if c>0 then
for i=0 to c-1
f=o.Files(i)

ListBox1.AddRow f.NativePath
next

else
// MessageBox "no file was selected."
quit
end if
```

Notes: OpenDialogMBS does not yet use NSOpenPanel yet. So for Cocoa applications you can use NSOpenPanelMBS class directly. For the Mac App Store, you must use NSOpenPanelMBS and avoid OpenDialogMBS.

137.5.2 Methods

137.5.3 AddType(t as OpenDialogFileTypeMBS)

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Adds a file type to the list.

137.5.4 ClearTypes

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Clears the file type list.

137.5.5 CountTypes as Integer

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the number of file types in the file type list.

137.5.6 Files as FolderItem()

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries an array with all files picked.
See also:

• 137.5.7 Files(index as Integer) as folderitem 18667

137.5.7 Files(index as Integer) as folderitem

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The array with the selected files.
Notes: Index goes from 0 to filecount-1.
See also:

• 137.5.6 Files as FolderItem() 18666

137.5.8 GetCustomImageHeight as Integer

MBS Util Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop only.

Function: Returns the heigh of the custom picture in pixels.
Example:

```
Var o as new OpenDialogMBS
MessageBox "GetCustomImageHeight: "+str(o.GetCustomImageHeight) // could show 72 as value.
```

Notes: The height depends on the size of the Windows system font, so it's variable and this function calculates the size for you.

Returns 0 on any error.

137.5.9 GetType(index as Integer) as OpenDialogFileTypeMBS

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the file type with the given index.
Notes: Returns nil on any error.

137.5.10 Items as OpenDialogItemMBS()

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries items picked.
Notes: Currently only provided for Windows to get name, path, URL or data for items, which may not always have a file path.

137.5.11 RefreshCustomImage

MBS Util Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop only.

Function: Call this method after you set the custompicture property to update the window.
Notes: The control is asked to redraw and will use the CustomPicture property for the picture content. Space around is colored with window background color.

137.5.12 ShowDialog

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Shows the dialog.
Example:

```
Var o as new OpenDialogMBS
o.ShowDialog
```

Notes: Check the FileCount property to see whether something was selected.

137.5.13 Properties

137.5.14 accessoryView as Variant

MBS Util Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Customizes the panel for the application by adding a custom view to the panel.
Notes: Only for Cocoa target. Must be a NSViewMBS or subclass.

The custom object that is added appears just above the OK and Cancel buttons at the bottom of the panel. The open panel automatically resizes itself to accommodate the view. You can invoke this method repeatedly to change the accessory view as needed. If view is nil, the panel removes the current accessory view.
(Read and Write property)

137.5.15 ActionButtonLabel as String

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop only.

Function: The label of the action button.
Example:

```
Var o as new OpenDialogMBS
```

```
o.ActionButtonLabel = "Hello"
o.ShowDialog
```

Notes: Used only on Mac OS.
For RB 4.5 and earlier you need to make sure the encoding is set correctly.
Can be set to "" to use the default value.
(Read and Write property)

137.5.16 AllowFolderSelection as Boolean

MBS Util Plugin, Plugin Version: 7.5, Platform: macOS, Targets: Desktop only.

Function: Whether folders can be selected.
Example:

```
// This example needs a window with ListBox1.
Var o as OpenDialogMBS
Var i,c as Integer
Var f as FolderItem

o=new OpenDialogMBS
o.ShowHiddenFiles=true
o.PromptText="Select one or more files/folders:"
o.MultipleSelection=true
o.ActionButtonLabel="Open files/folders"
o.CancelButtonLabel="no, thanks."
o.WindowTitle="This is a window title."
o.ClientName="Client Name?"
o.AllowFolderSelection=true
o.ShowDialog

c=o.FileCount
if c>0 then
for i=0 to c-1
f=o.Files(i)

ListBox1.AddRow f.NativePath
next
end if
```

Notes: Default is false.
Setting this to true on Windows or Linux has no effect there.
(Read and Write property)

137.5.17 CancelButtonLabel as String

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** The text for the cancel button.
Example:

```
Var o as new OpenDialogMBS

o.CancelButtonLabel = "Hello"
o.ShowDialog
```

Notes: Used only on Mac OS Carbon.
Can be set to "" to use the default value.

Deprecated as no longer needed for Windows, Linux or MacOS Cocoa.
(Read and Write property)

137.5.18 ClientName as String

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** The name of the client.
Example:

```
Var o as new OpenDialogMBS
o.ClientName = "Hello"
o.ShowDialog
```

Notes: Used only on Mac OS Carbon.
Can be set to "" to use the default value.

Deprecated as no longer needed for Windows, Linux or MacOS Cocoa.
(Read and Write property)

137.5.19 Creator as String

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop only.

Function: The creator code of your application.
Notes: This property is only used Mac OS if you specify one or more file types.
(Read and Write property)

137.5.20 CustomPicture as Picture

MBS Util Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop only.

Function: The custom picture content.
Notes: You need to call RefreshCustomImage to refresh the picture visible to the user.
(Read and Write property)

137.5.21 File as FolderItem

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The first file selected.
Example:

```
Var o as new OpenDialogMBS
o.MultipleSelection = true
o.ShowDialog

MessageBox o.File.displaypathmbs
```

Notes: file = files(0)
Just for the cases where you only need the first file.
(Read only property)

137.5.22 FileCount as Integer

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The number of files selected.
Example:

```
Var o as new OpenDialogMBS
o.MultipleSelection = true
o.ShowDialog

MessageBox str(o.FileCount)
```

Notes: (Read only property)

137.5.23 InitialDirectory as FolderItem

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Windows, Targets: Desktop only.

Function: The initial directory.
Example:

```
Var o as new OpenDialogMBS
o.InitialDirectory = SpecialFolder.Desktop
o.ShowDialog
```

Notes: Set to nil to get the last directory used.
(Read and Write property)

137.5.24 Lasterror as Integer

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The last error code reported.
Notes: (Read and Write property)

137.5.25 Left as Integer

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop only.

Function: The horizontal position of the dialog.
Notes: -1 is for the default position.
Used only on the Mac side.
(Read and Write property)

137.5.26 MultipleSelection as Boolean

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether you want to allow multiple file selection.
Example:

```
Var o as new OpenDialogMBS
o.MultipleSelection = true
o.ShowDialog
```

Notes: (Read and Write property)

137.5.27 ParentWindow as Variant

MBS Util Plugin, Plugin Version: 6.3, Platforms: Linux, Windows, Targets: Desktop only.

Function: The parent window of the dialog.
Example:

```
Var o as new OpenDialogMBS
o.ParentWindow = Window1
o.ShowDialog
```

Notes: Only implemented for Windows and Linux.
Can reference a Window or DesktopWindow object.
(Read and Write property)

137.5.28 PromptText as String

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop only.

Function: The prompt text.
Example:

```
Var o as new OpenDialogMBS

o.PromptText = "Hello"
o.ShowDialog
```

Notes: For RB 4.5 and earlier you need to make sure the encoding is set correctly.
Can be set to "" to use the default value.
(Read and Write property)

137.5.29 ResolveAliases as Boolean

MBS Util Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether aliases should be resolved.
Example:

```
Var o as new OpenDialogMBS
o.ResolveAliases = false
o.ShowDialog
```

Notes: This property is only used on Mac OS X.
Default is true.

Flag seems to be broken on Mac OS X 10.7.
(Read and Write property)

137.5.30 ShowHiddenFiles as Boolean

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether hidden files should be shown.
Example:

```
Var o as new OpenDialogMBS
o.ShowHiddenFiles = true
o.ShowDialog
```

Notes: Default is false.
(Read and Write property)

137.5.31 Top as Integer

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop only.

Function: The vertical position of the dialog.
Notes: -1 is for the default position.
Used only on the Mac side.
(Read and Write property)

137.5.32 TreatFilePackagesAsDirectories as Boolean

MBS Util Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Sets the panel's behavior for displaying file packages (for example, MyApp.app) to the user.
Notes: If true, the panel will display file packages as directories; if false, it will not.
(Read and Write property)

137.5.33 UseCustomPicture as Integer

MBS Util Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop only.

Function: Whether to add a custom picture control.
Notes: Specify the size of the area you want. As the size is relative to the font size of the system font on

windows, the results can be interesting. For example a value of 50 gives here a 72 pixel height area. Value can be from 1 to 100. Or zero to disable.

This method was added for a client who needed to show a small preview of a project file in the open dialog on Windows.
For Mac OS X you can use the NSSavePanelMBS/NSOpenPanelMBS with an accessory view.
(Read and Write property)

137.5.34 WindowTitle as String

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The window title to use.
Example:

```
Var o as new OpenDialogMBS

o.WindowTitle = "Hello World"
o.ShowDialog
```

Notes: Can be set to "" to use the default value.
Not shown on MacOS.
(Read and Write property)

137.5.35 Events

137.5.36 FilterItem(file as folderitem, filterMode as Integer) as boolean

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Windows, Targets: Desktop only.

Function: An event where you can filter the file list.
Notes: Return true to disable the file.
The result of the event is ignored by Windows. But on Mac OS it works.
So use the event on Mac and the filetype objects on Windows.

137.5.37 SelectionChanged(file as folderitem)

MBS Util Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop only.

Function: Called when the selection changes in the window.
Notes: This is currently only implemented for Windows and gives you only one file name.

137.6 class UIDocumentPickerMBS

137.6.1 class UIDocumentPickerMBS

MBS iOS Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: A view controller that provides access to documents or destinations outside your app,Äôs sandbox.
Notes: Use a document picker view controller to select a document to open or export, and optionally copy. Don,Äôt copy the document if you can avoid it. The document picker operates in two modes:

Open a document. The user selects a document. The document picker provides access to the document, and the user can edit the document in place. Optionally, you can specify that the document picker makes a copy of the document, leaving the original unchanged.

Export a local document. The user selects a destination. The document picker moves the document, and the user can access it and edit it in place. Optionally, you can specify that the document picker makes a copy of the document, leaving the original unchanged.

Working with External Documents
Both the open and export operations grant access to documents outside your app,Äôs sandbox. This access gives users an unprecedented amount of flexibility when working with their documents. However, it also adds a layer of complexity to your file handling. External documents have the following additional requirements: The open and move operations provide security-scoped URLs for all external documents. Call the startAccessingSecurityScopedResource method to access or bookmark these documents, and the stopAccessingSecurityScopedResource method to release them (see NSURLMBS class). If you,Äôre using a UIDocument subclass to manage your document, it automatically manages the security-scoped URL for you.

Always use file coordinators (see NSFileCoordinatorMBS) to read and write to external documents.
Always use a file presenter (see NSFilePresenterMBS) when displaying the contents of an external document.

Don,Äôt save URLs that the open and move operations provide. You can, however, save a bookmark to these URLs after calling startAccessingSecurityScopedResource to ensure you have access. Call the bookmarkDataWithOptions method and pass in the NSURLBookmarkCreationWithSecurityScope option, creating a bookmark that contains a security-scoped URL.

For more information about working with external documents, see Providing Access to Directories and Adding a Document Browser to Your App.

137.6.2 Methods

137.6.3 Constructor(Mode as Integer, contentTypesOrURLs() as String, asCopy as Boolean = true)

MBS iOS Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: Initializes and a document picker/exporter.
Example:

```
var types() As String
types.Add ,Äúpublic.image,Äù
types.Add "public.text"
types.Add "public.rtf"
types.Add "com.adobe.pdf"
types.Add "com.microsoft.excel.xls" // Old Excel Format
types.Add "org.openxmlformats.spreadsheetml.sheet" // New Excel Format
types.Add "com.microsoft.word.doc" // Old Word Format
types.Add "org.openxmlformats.wordprocessingml.document" // New Word Format
types.Add "com.apple.iwork.pages.sffpages"
types.Add "com.apple.iwork.numbers.sffnumbers"
types.Add "com.apple.iwork.keynote.sffkey"

var picker as New UIDocumentPicker(UIDocumentPicker.ModeImport, types, True)
picker.Screen = Self
picker.shouldShowFileExtensions = True
picker.Present

// you need to keep picker in a property!
```

Notes: For Mode = ModeImport or ModeOpen, please pass array of content types. That may be mime types (e.g. "image/jpeg"), file extensions with dot prefix (e.g. ".jpg") or UTIs (e.g. "public.archive"). For iOS 13 and older, please pass only UTIs.

For Mode = ModeExportToService or ModeMoveToService takes in contentTypesOrURLs an array of file URLs to export.

AsCopy defines whether you like to get a copy on import (copied to temp folder) and copies your file for export. This way you can use temporary folders and later delete them when you are done.

137.6.4 Destructor

MBS iOS Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: The destructor.

137.6.5 Dismiss

MBS iOS Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: Dismisses the controller.

137.6.6 Present

MBS iOS Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: Presents the controller.

137.6.7 Properties

137.6.8 allowsMultipleSelection as Boolean

MBS iOS Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: A Boolean value that determines whether the user can select more than one document at a time.
Notes: By default, this property is false.
(Read and Write property)

137.6.9 directoryURL as String

MBS iOS Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: The initial directory that the document picker displays.
Notes: Set this property to specify the starting directory for the document picker. This property defaults to "". If you specify a value, the document picker tries to start at the specified directory. Otherwise, it starts with the last directory chosen by the user.
The directoryURL property only returns a value when you explicitly set it. For example, it doesn,Äôt calculate the default URL presented to the user when the property isn,Äôt set.

For a folderItem, please pass URLPath property.
(Read and Write property)

137.6.10 documentPickerMode as Integer

MBS iOS Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: The type of file transfer operation that the document picker uses.
Notes: (Read only property)

137.6.11 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

137.6.12 isBeingPresented as Boolean

MBS iOS Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: Whether the controller is presented.
Notes: Returns true if the dialog is visible.
(Read only property)

137.6.13 shouldShowFileExtensions as Boolean

MBS iOS Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: A Boolean value that determines whether the browser always shows file extensions.
Notes: The default value is false.
(Read and Write property)

137.6.14 Events

137.6.15 documentPickerDidPickDocuments(URLs() as String)

MBS iOS Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: Event called when documents were picked.
Notes: The array may have one or more URLs.

The meaning of the provided URLs varies depending on the document picker,Äôs mode:

Import:
The URLs refer to a copy of the selected documents. These documents are temporary files. They remain available only until your application terminates. To keep a permanent copy, move these files to a permanent location inside your sandbox.

Open:
The URLs refer to the selected documents.

ExportToService:
The URLs refer to new copies of the exported documents at the selected destination.

MoveToService:
The URLs refer to the documents' new locations.
The provided URLs are security-scoped, referring to files outside your app,Äôs sandbox. For more about working with external, security-scoped URLs, see Requirements in the Document Picker Programming Guide.

137.6.16 documentPickerWasCancelled

MBS iOS Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: The user canceled the document picker.

137.6.17 Constants

Modes

Constant	Value	Description
ModeExportToService	2	The document picker exports a local file to a destination outside the app,Äôs sandbox.
ModeImport	0	The document picker imports a file from outside the app,Äôs sandbox.
ModeMoveToService	3	The document picker moves a local file outside the app,Äôs sandbox and provides access to it as an external file.
ModeOpen	1	The document picker opens an external file outside the app,Äôs sandbox.

137.7 class WinFileDialogExceptionMBS

137.7.1 class WinFileDialogExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The class for an error exception in our WinFileDialog classes.
Notes: Subclass of the RuntimeException class.
Blog Entries

- MBS Xojo Plugins, version 20.1pr3
- Customized File Open and Save Dialogs for Windows

137.8 class WinFileDialogMBS

137.8.1 class WinFileDialogMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The class for a file dialog.
Example:

```
// let the user pick a folder with the Windows file dialog
Var dialog As New WinFileOpenDialogMBS // WinFileDialogMBS is the base class for open and save dialogs
dialog.Title = "Choose the backup folder"
dialog.OptionPickFolders = True
dialog.DefaultFolder = New WinShellItemMBS(SpecialFolder.Documents)

If dialog.Show(Self) Then
Var folder As FolderItem = dialog.Result.Item
MessageBox "Folder: " + folder.NativePath
End If
```

Notes: All methods may raise WinFileDialogExceptionMBS in case of errors.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

137.8.2 Methods

137.8.3 AddCheckButton(ControlID as Integer, label as String, Checked as boolean = false)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds a check button (check box) to the dialog.
Notes: ControlID: The ID of the check button to add.
Label: the button text.

Checked: A boolean indicating the current state of the check button. True if checked; false otherwise.

The default state for this control is enabled and visible.

137.8.4 AddComboBox(ControlID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds a combo box to the dialog.
Notes: ControlID: The ID of the combo box to add.

The default state for this control is enabled and visible.

137.8.5 AddControlItem(ControlID as Integer, ItemID as Integer, Label as String)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds an item to a container control in the dialog.
Notes: ControlID: The ID of the container control to which the item is to be added.
ItemID: The ID of the item.
Label: The item's text, which can be either a label or, in the case of a drop-down list, the item itself.

The default state for this item is enabled and visible. Items in control groups cannot be changed after they have been created, with the exception of their enabled and visible states.
Container controls include option button groups, combo boxes, drop-down lists on the Open or Save button, and menus.

137.8.6 AddEditBox(ControlID as Integer, Text as String = "")

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds an edit box control to the dialog.
Notes: ControlID: The ID of the edit box to add.
Text: The default text displayed in the edit box.

The default state for this control is enabled and visible.
To add a label next to the edit box, place it in a visual group with StartVisualGroup.

137.8.7 AddMenu(ControlID as Integer, Label as String)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds a menu to the dialog.
Notes: ControlID: The ID of the menu to add.
Label: The menu name.

The default state for this control is enabled and visible.
To add items to this control, use AddControlItem.

137.8.8 AddPlace(Item as WinShellItemMBS, top as boolean = false)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds a folder to the list of places available for the user to open or save items.
Notes: Item: the folder to be made available to the user. This can only be a folder.
Top: Specifies where the folder is placed within the list. Pass true for top or false for bottom.

137.8.9 AddPushButton(ControlID as Integer, Label as String)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds a button to the dialog.
Notes: ControlID: The ID of the button to add.
Label: the button text

The default state for this control is enabled and visible..

137.8.10 AddRadioButtonList(ControlID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds an option button (also known as radio button) group to the dialog.
Notes: ControlID: The ID of the option button group to add.
The default state for this control is enabled and visible.

137.8.11 AddSeparator(ControlID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds a separator to the dialog, allowing a visual separation of controls.
Notes: ControlID: The control ID of the separator.

The default state for this control is enabled and visible.

137.8.12 AddText(ControlID as Integer, Text as String = "")

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Adds text content to the dialog.
Notes: ControlID: The ID of the text to add.
Text: The text to show.

The default state for this control is enabled and visible.

137.8.13 ClearClientData

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Instructs the dialog to clear all persisted state information.
Notes: Persisted information can be associated with an application or a GUID. If a GUID was set by using SetClientGuid, that GUID is used to clear persisted information.

137.8.14 Close(cancel as boolean = false)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Closes the dialog.
Notes: Pass or false/true for cancel parameter to have that being returned by Show method.

An application can call this method from an event while the dialog is open. The dialog will close and the Show method will return with the result given by cancel parameter.

If this method is called, there is no result available for the Result or Results methods, and they will fail if called.

137.8.15 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

137.8.16 EnableOpenDropDown(ControlID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Enables a drop-down list on the Open or Save button in the dialog.
Notes: ControlID: The ID of the drop-down list.

The Open or Save button label takes on the text of the first item in the drop-down. This overrides any label set by OkButtonLabel.
Use AddControlItem to add items to the drop-down.

137.8.17 EndVisualGroup

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Stops the addition of elements to a visual group in the dialog.

137.8.18 RemoveAllControlItems(ControlID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Removes all items from a container control in the dialog.
Notes: ControlID: The ID of the container control from which to remove the items.

Container controls include option button groups, combo boxes, drop-down lists on the Open or Save button, and menus.

137.8.19 RemoveControlItem(ControlID as Integer, ItemID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Removes an item from a container control in the dialog.
Notes: ControlID: The ID of the container control from which the item is to be removed.
ItemId: The ID of the item.

Container controls include option button groups, combo boxes, drop-down lists on the Open or Save button, and menus.

137.8.20 SetFileTypes(FileTypes() as WinFileTypeMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The file types that the dialog can open or save.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
Var FileTypes() As WinFileTypeMBS

FileTypes.Add New WinFileTypeMBS("JPEG image", "*.jpg")
FileTypes.Add New WinFileTypeMBS("PNG image", "*.png")
FileTypes.Add New WinFileTypeMBS("Tiff image", "*.tif;*.tiff")

d.SetFileTypes FileTypes
```

Notes: When using the Open dialog, the file types declared there are used to filter the view. When using the Save dialog, these values determine which file name extension is appended to the file name.
This method must be called before the dialog is shown and can only be called once for each dialog instance.
File types cannot be modified once the Common Item dialog box is displayed.

137.8.21 Show as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Launches the modal window.
Notes: Returns true on success or false on failure.
See also:

- 137.8.22 Show(parent as DesktopWindow) as Boolean 18687
- 137.8.23 Show(parent as window) as Boolean 18688

137.8.22 Show(parent as DesktopWindow) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Launches the modal window.
Notes: parent: The handle of the owner window. This value can be nil.
Returns true on success or false on failure.
See also:

- 137.8.21 Show as Boolean 18687
- 137.8.23 Show(parent as window) as Boolean 18688

137.8.23 Show(parent as window) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Launches the modal window.
Notes: parent: The handle of the owner window. This value can be nil.
Returns true on success or false on failure.
See also:

- 137.8.21 Show as Boolean 18687
- 137.8.22 Show(parent as DesktopWindow) as Boolean 18687

137.8.24 StartVisualGroup(ControlID as Integer, label as String)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Declares a visual group in the dialog. Subsequent calls to any "add" method add those elements to this group.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog

d.StartVisualGroup 1, "Metadata"
d.AddText 2, "Author:"
d.AddEditBox 3, CustomValue.Text
d.AddText 4, "Subject:"
d.AddEditBox 5, "Hello World"
d.EndVisualGroup
```

Notes: ControlID: The ID of the visual group.
Label: text that appears next to the visual group.

Controls will continue to be added to this visual group until you call EndVisualGroup.
A visual group can be hidden and disabled like any other control, except that doing so affects all of the controls within it. Individual members of the visual group can also be hidden and disabled singly.

137.8.25 Properties

137.8.26 ClientGuid as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The client GUID.
Notes: A dialog's state can include factors such as the last visited folder and the position and size of the

dialog.
Typically, this state is persisted based on the name of the executable file. By specifying a GUID, an application can have different persisted states for different versions of the dialog within the same application (for example, an import dialog and an open dialog).

SetClientGuid should be called immediately after creation of the dialog object.

Enables a calling application to associate a GUID with a dialog's persisted state.
(Read and Write property)

137.8.27 CurrentSelection as WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The user's current selection in the dialog.
Notes: The item currently selected in the dialog. This item can be a file or folder selected in the view window, or something that the user has entered into the dialog's edit box. The latter case may require a parsing operation (cancelable by the user) that blocks the current thread.

If not result exists, the plugin returns nil and raises no failed exceptions.
(Read only property)

137.8.28 DefaultExtension as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The default extension to be added to file names.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
d.DefaultExtension = "jpg"
```

Notes: The extension text. This string should not include a leading period. For example, "jpg" is correct, while ".jpg" is not.

If this method is called before showing the dialog, the dialog will update the default extension automatically when the user chooses a new file type (see SetFileTypes).
(Read and Write property)

137.8.29 DefaultFolder as WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The folder used as a default if there is not a recently used folder value available.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
d.DefaultFolder = New WinShellItemMBS(SpecialFolder.Desktop)
```

Notes: (Read and Write property)

137.8.30 FileName as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The text currently entered in the dialog's File name edit box.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
d.FileName = "New Document"
```

Notes: The text in the File name edit box does not necessarily reflect the item the user chose. To get the item the user chose, use Result property.

If not result exists, the plugin returns "" and raises no failed exceptions.
(Read and Write property)

137.8.31 FileNameLabel as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The text of the label next to the file name edit box.
Notes: (Read and Write property)

137.8.32 FileTypeIndex as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The currently selected file type.
Notes: The index of the selected file type in the file type array passed to SetFileTypes.

This is a one-based index rather than zero-based.
FileTypeIndex can be called either while the dialog is open or after it has closed.
(Read and Write property)

137.8.33 Folder as WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: A folder that is always selected when the dialog is opened, regardless of previous user action.
Notes: Gets either the folder currently selected in the dialog, or, if the dialog is not currently displayed, the folder that is to be selected when the dialog is opened.

This folder overrides any "most recently used" folder. If this method is called while the dialog is displayed, it causes the dialog to navigate to the specified folder.
In general, we do not recommended the use of this method. If you call SetFolder before you display the dialog box, the most recent location that the user saved to or opened from is not shown. Unless there is a very specific reason for this behavior, it is not a good or expected user experience and should therefore be avoided. In almost all instances, SetDefaultFolder is the better method.

As of Windows 7, if the path of the folder specified through psi is the default path of a known folder, the known folder's current path is used in the dialog. That path might not be the same as the path specified in psi; for instance, if the known folder has been redirected. If the known folder is a library (virtual folders Documents, Music, Pictures, and Videos), the library's path is used in the dialog. If the specified library is hidden (as they are by default as of Windows 8.1), the library's default save location is used in the dialog, such as the Microsoft OneDrive Documents folder for the Documents library. Because of these mappings, the folder location used in the dialog might not be exactly as you specified when you called this method.
(Read and Write property)

137.8.34 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

137.8.35 OkButtonLabel as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The text of the Open or Save button.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
d.OkButtonLabel = "Export"
```

Notes: (Read and Write property)

137.8.36 OptionAllNonStorageItems as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Enables the user to choose any item in the Shell namespace, not just those with SFGAO_STREAM or SFAGO_FILESYSTEM attributes. #
Notes: This flag cannot be combined with OptionForceFileSystem.
(Read and Write property)

137.8.37 OptionAllowMultiSelect as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Enables the user to select multiple items in the open dialog.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
d.OptionAllowMultiSelect = true
```

Notes: Note that when this flag is set, the WinFileOpenDialogMBS class must be used to retrieve those items.
(Read and Write property)

137.8.38 OptionCreatePrompt as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Prompt for creation if the item returned in the save dialog does not exist.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
d.OptionCreatePrompt = true
```

Notes: Note that this does not actually create the item.
(Read and Write property)

137.8.39 OptionDefaultNoMiniMode as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Indicates to the Save As dialog box that it should open in expanded mode.
Notes: Expanded mode is the mode that is set and unset by clicking the button in the lower-left corner of the Save As dialog box that switches between Browse Folders and Hide Folders when clicked. This value is not supported as of Windows 7.
(Read and Write property)

137.8.40 OptionDontAaddToRecent as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Do not add the item being opened or saved to the recent documents list.
Notes: (Read and Write property)

137.8.41 OptionFileMustExist as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The item returned must exist.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
d.OptionFileMustExist = true
```

Notes: This is a default value for the Open dialog.
(Read and Write property)

137.8.42 OptionForceFileSystem as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Ensures that returned items are file system items.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
d.OptionForceFileSystem = true
```

Notes: Note that this does not apply to items returned by CurrentSelection.
(Read and Write property)

137.8.43 OptionForcePreviewPaneOn as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Indicates to the Open dialog box that the preview pane should always be displayed.
Notes: (Read and Write property)

137.8.44 OptionForceShowHidden as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Include hidden and system items.
Notes: (Read and Write property)

137.8.45 OptionHideMRUPlaces as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Hide the list of places from which the user has recently opened or saved items. This value is not supported as of Windows 7.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
d.OptionHideMRUPlaces = true
```

Notes: (Read and Write property)

137.8.46 OptionHidePinnedPlaces as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Hide items shown by default in the view's navigation pane.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
d.OptionHidePinnedPlaces = true
```

Notes: This flag is often used in conjunction with the AddPlace method, to hide standard locations and replace them with custom locations.

Windows 7 and later. Hide all of the standard namespace locations (such as Favorites, Libraries, Computer, and Network) shown in the navigation pane.

Windows Vista. Hide the contents of the Favorite Links tree in the navigation pane. Note that the category itself is still displayed, but shown as empty.
(Read and Write property)

137.8.47 OptionNoChangeDir as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Don't change the current working directory.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
d.OptionNoChangeDir = true
```

Notes: (Read and Write property)

137.8.48 OptionNoDereferenceLinks as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Shortcuts should not be treated as their target items.
Notes: This allows an application to open a .lnk file rather than what that file is a shortcut to.
(Read and Write property)

137.8.49 OptionNoReadOnlyReturn as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Do not return read-only items.
Notes: This is a default value for the Save dialog.
(Read and Write property)

137.8.50 OptionNoTestFileCreate as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Do not test whether creation of the item as specified in the Save dialog will be successful.
Notes: If this flag is not set, the calling application must handle errors, such as denial of access, discovered when the item is created.

(Read and Write property)

137.8.51 OptionNoValidate as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Do not check for situations that would prevent an application from opening the selected file, such as sharing violations or access denied errors.
Notes: (Read and Write property)

137.8.52 OptionOKButtonNeedsInteraction as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: OKButton needs interaction?
Notes: (Read and Write property)

137.8.53 OptionOverwritePrompt as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: When saving a file, prompt before overwriting an existing file of the same name.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
d.OptionOverwritePrompt = true
```

Notes: This is a default value for the Save dialog.
(Read and Write property)

137.8.54 OptionPathMustExist as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The item returned must be in an existing folder.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
d.OptionPathMustExist = true
```

Notes: This is a default value.
(Read and Write property)

137.8.55 OptionPickFolders as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Present an Open dialog that offers a choice of folders rather than files.
Notes: (Read and Write property)

137.8.56 Options as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The current flags that are set to control dialog behavior.
Notes: See kOptions* constants.

Generally, you should read the property, modify it to include or exclude options by setting the appropriate flags and assign it again.
(Read and Write property)

137.8.57 OptionShareaware as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: In the case of a sharing violation when an application is opening a file, call the application back through ShareViolation event for guidance.
Notes: This flag is overridden by kOptionsNoValidate.
(Read and Write property)

137.8.58 OptionStrictFileTypes as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: In the Save dialog, only allow the user to choose a file that has one of the file name extensions specified through SetFileTypes.
Notes: (Read and Write property)

137.8.59 OptionSupportsStreamableItems as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Indicates that the caller is opening a file as a stream (BHID_Stream), so there is no need to download that file.
Notes: (Read and Write property)

137.8.60 ProminentControlID as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Places a control in the dialog so that it stands out compared to other added controls.
Notes: Setting this property causes the control to be placed near the Open or Save button instead of being grouped with the rest of the custom controls.
Only check buttons (check boxes), push buttons, combo boxes, and menus—or a visual group that contains only a single item of one of those types—can be made prominent.
Only one control can be marked in this way. If a dialog has only one added control, that control is marked as prominent by default.
(Read and Write property)

137.8.61 Result as WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The choice that the user made in the dialog.
Notes: Result can be called after the dialog has closed or during the handling of an OnFileOk event. Calling this method at any other time will fail. If multiple items were chosen, this method will fail. In the case of multiple items, call Results method.
Show must return a success code for a result to be available to Result.

If not result exists, the plugin returns nil and raises no failed exceptions.
(Read only property)

137.8.62 Title as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The title of the dialog.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
d.title = "Export database"
```

Notes: (Read and Write property)

137.8.63 WindowHandle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Queries window handle.
Notes: Value is a HWND and may be used in declares.
(Read only property)

137.8.64 CheckButtonState(ControlID as Integer) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The current state of a check button (check box) in the dialog.
Notes: ControlID: The ID of the check box.

True means checked; false, unchecked.
(Read and Write computed property)

137.8.65 ControlItemState(ControlID as Integer, ItemID as Integer) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The current state of an item in a container control found in the dialog.
Notes: ControlID: The ID of the container control.
ItemID: The ID of the item.

See kControlState* flags.
(Read and Write computed property)

137.8.66 ControlItemText(ControlID as Integer, ItemID as Integer) as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The text of a control item.
Notes: For example, the text that accompanies a radio button or an item in a menu.

ControlID: The ID of the container control.
ItemID: The ID of the item.

The default state of a control item is enabled and visible. Items in control groups cannot be changed after they have been created, with the exception of their enabled and visible states.
Container controls include option button groups, combo boxes, drop-down lists on the Open or Save button, and menus.
(Read and Write computed property)

137.8.67 ControlLabel(ControlID as Integer) as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The text associated with a control, such as button text or an edit box label.
Notes: ControlID: The ID of the control whose text is to be changed.

Control labels can be changed at any time, including when the dialog is visible.
(Read and Write computed property)

137.8.68 ControlState(ControlID as Integer) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the current visibility and enabled states of a given control.
Notes: ControlID: The ID of the control in question.

See kControlState* flags.
(Read and Write computed property)

137.8.69 EditBoxText(ControlID as Integer) as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The current text in an edit box control.
Notes: ControlID: The ID of the edit box.
(Read and Write computed property)

137.8.70 SelectedControlItem(ControlID as Integer) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Item index from specified container controls in the dialog.
Notes: ControlID: The ID of the container control.

Value is the ID of the item that the user selected in the control.

To determine the user's final choice, this method can be called on option button groups, combo boxes, and drop-down lists on the Open or Save button after the dialog has closed. This method cannot be called on menus.
For option button groups and combo boxes, this method can also be called while the dialog is showing, to determine the current choice.

When you query, the plugin does not raise error for failure, but returns 0.
(Read and Write computed property)

137.8.71 Events

137.8.72 ButtonClicked(ControlID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Called when the user clicks a command button.
Notes: ControlID: The ID of the button that the user clicked.

137.8.73 CheckButtonToggled(ControlID as Integer, Checked as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Called when the user changes the state of a check button (check box).
Notes: ControlID: The ID of the button that the user clicked.
Checked: A boolean indicating the current state of the check button. true if checked; false otherwise.

137.8.74 ControlActivating(ControlID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Called when an Open button drop-down list customized through EnableOpenDropDown or a Tools menu is about to display its contents.

Notes: ControlID: The ID of the list or menu about to display.

In response to this notification, an application can update the contents of the menu or list about to be displayed, based on the current state of the dialog.

137.8.75 FileOk as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Called just before the dialog is about to return with a result.
Notes: Implementations should return true to accept the current result in the dialog or false to refuse it. In the case of false, the dialog should remain open.

When this method is called, the Result and Results methods can be called.
The application can use this callback method to perform additional validation before the dialog closes, or to prevent the dialog from closing. If the application prevents the dialog from closing, it should display a UI to indicate a cause.

An application can also use this method to perform all of its work surrounding the opening or saving of files.

137.8.76 FileTypeChanged

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Called when the dialog is opened to notify the application of the initial chosen filetype.
Notes: This method is called when the dialog is opened to notify the application of the initially chosen filetype. If the application has code in this event that responds to type changes, it can respond to the type. For example, it could hide certain controls. The application controls the initial file type and could do its own checks, so this method is provided as a convenience.

137.8.77 FolderChanged

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Called when the user navigates to a new folder.

137.8.78 FolderChanging(Folder as WinShellItemMBS) as boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Called before FolderChanged.
Notes: This allows the implementer to stop navigation to a particular location.

Folder: the folder to which the dialog is about to navigate.

Return true to accept or false to decline.

The calling application can set Folder during this callback to redirect navigation to an alternate folder. The actual navigation does not occur until FolderChanging has returned.

If the calling application simply prevents navigation to a particular folder, UI should be displayed with an explanation of the restriction. To obtain a parent HWND for the UI, use WindowHandle property.

Warning: If you implement this, add "return true" to allow folders to change.

137.8.79 ItemSelected(ControlID as Integer, ItemID as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Called when an item is selected in a combo box, when a user clicks an option button (also known as a radio button), or an item is chosen from the Tools menu.
Notes: ControlID: The ID of the control in which the user made a selection.
ItemID: The ID of the selection.

This notification is not sent when the user chooses an item from the drop-down menu attached to the Open button, because the action taken in that case is always the same: close the dialog as if the user had simply clicked the Open button. For that situation, the application can call SelectedControlItem to obtain the item the user chose from that menu.

137.8.80 Overwrite(item as WinShellItemMBS) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Called from the save dialog when the user chooses to overwrite a file.
Notes: item: the item that will be overwritten.

Return one of the kResponse* constants.

137.8.81 SelectionChange

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Called when the user changes the selection in the dialog's view.

137.8.82 ShareViolation(item as WinShellItemMBS) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Enables an application to respond to sharing violations that arise from Open or Save operations.
Notes: item: the item that has the sharing violation.
Return one of the kShareViolation* constants.

The kOptionsShareaware flag must be set through Options before this method is called.
A sharing violation could possibly arise when the application attempts to open a file, because the file could have been locked between the time that the dialog tested it and the application opened it.

137.8.83 Constants

Control States

Constant	Value	Description
kControlStateEnabled	1	The control is active.
kControlStateEnableVisible	3	The control is visible and enabled.
kControlStateInactive	0	The control is inactive and cannot be accessed by the user.
kControlStateVisible	2	The control is visible. The absence of this value indicates that the control is hidden.

Option Flags

Constant	Value	Description
kOptionsAllNonStorageItems	&h80	Enables the user to choose any item in the Shell namespace, not just SFGAO_STREAM or SFAGO_FILESYSTEM attributes. This flag combined with kOptionsForceFileSystem.
kOptionsAllowMultiSelect	&h200	Enables the user to select multiple items in the open dialog. Note this flag is set, the WinFileOpenDialogMBS class must be used to ret items.
kOptionsCreatePrompt	&h2000	Prompt for creation if the item returned in the save dialog does not e that this does not actually create the item.
kOptionsDefaultNoMiniMode	&h20000000	Indicates to the Save As dialog box that it should open in expan Expanded mode is the mode that is set and unset by clicking the the lower-left corner of the Save As dialog box that switches betwe Folders and Hide Folders when clicked. This value is not suppo Windows 7.
kOptionsDontAaddToRecent	&h2000000	Do not add the item being opened or saved to the recent document
kOptionsFileMustExist	&h1000	The item returned must exist. This is a default value for the Open
kOptionsForceFileSystem	&h40	Ensures that returned items are file system items. Note that thi apply to items returned by CurrentSelection.
kOptionsForcePreviewPaneOn	&h40000000	Indicates to the Open dialog box that the preview pane should alw played.
kOptionsForceShowHidden	&h10000000	Include hidden and system items.
kOptionsHideMRUPlaces	&h20000	Hide the list of places from which the user has recently opened or sa This value is not supported as of Windows 7.
kOptionsHidePinnedPlaces	&h40000	Hide items shown by default in the view's navigation pane. This fl used in conjunction with the AddPlace method, to hide standard loc replace them with custom locations. Windows 7 and later. Hide all of the standard namespace location Favorites, Libraries, Computer, and Network) shown in the navigat Windows Vista. Hide the contents of the Favorite Links tree in the pane. Note that the category itself is still displayed, but shown as e
kOptionsNoChangeDir	8	Don't change the current working directory.
kOptionsNoDereferenceLinks	&h100000	Shortcuts should not be treated as their target items. This allows an a to open a .lnk file rather than what that file is a shortcut to.
kOptionsNoReadOnlyReturn	&h8000	Do not return read-only items. This is a default value for the Save
kOptionsNoTestFileCreate	&h10000	Do not test whether creation of the item as specified in the Save be successful. If this flag is not set, the calling application must har such as denial of access, discovered when the item is created.
kOptionsNoValidate	&h100	Do not check for situations that would prevent an application fro the selected file, such as sharing violations or access denied errors.
kOptionsOKButtonNeedsInteraction	&h200000	OKButton needs interaction?
kOptionsOverwritePrompt	2	When saving a file, prompt before overwriting an existing file of the s This is a default value for the Save dialog.
kOptionsPathMustExist	&h800	The item returned must be in an existing folder. This is a default v
kOptionsPickFolders	&h20	Present an Open dialog that offers a choice of folders rather than fi
kOptionsShareaware	&h4000	In the case of a sharing violation when an application is opening the application back through ShareViolation event for guidance. T overridden by kOptionsNoValidate.
kOptionsStrictFileTypes	4	In the Save dialog, only allow the user to choose a file that has one name extensions specified through SetFileTypes.
kOptionsSupportsStreamableItems	&h80000000	Indicates that the caller is opening a file as a stream (BHID_Stream is no need to download that file.

Overwrite Responses

Constant	Value	Description
kOverwriteAccept	1	The application has determined that the file should be returned from the dialog.
kOverwriteDefault	0	The application has not handled the event. The dialog displays a UI asking the user whether the file should be overwritten and returned from the dialog.
kOverwriteRefuse	2	The application has determined that the file should not be returned from the dialog.

Share Violation Responds

Constant	Value	Description
kShareViolationAccept	1	The application has determined that the file should be returned from the dialog.
kShareViolationDefault	0	The application has not handled the event. The dialog displays a UI that indicates that the file is in use and a different file must be chosen.
kShareViolationRefuse	2	The application has determined that the file should not be returned from the dialog.

137.9 class WinFileDialogObserverMBS

137.9.1 class WinFileDialogObserverMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Intercepts save and open dialogs on Windows to provide events to customize.
Notes: You can only have one instance of this class at a time.
First time you create an object, we initialize the necessary feature.

See also NSSavePanelObserverMBS class for Windows.

Xojo Developer Magazine

- 18.6, page 10: News

137.9.2 Properties

137.9.3 Enabled as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Whether the feature is enabled.
Notes: If value is false, no events will be called.
(Read and Write property)

137.9.4 Events

137.9.5 DidShowDialog(dialog as WinFileDialogMBS, Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Event called after dialog showed.
Notes: You can read results from whatever modification you made.

137.9.6 WillShowDialog(dialog as WinFileDialogMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Event called before dialog shows.
Notes: You can do customization just before the dialog shows.

137.10 class WinFileOpenDialogMBS

137.10.1 class WinFileOpenDialogMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Extends the WinFileDialogMBS interface by adding methods specific to the open dialog.
Example:

```
// show the modern Windows open dialog for picture files
Var dialog As New WinFileOpenDialogMBS
dialog.Title = "Choose a picture"
Var types() As WinFileTypeMBS
types.Add New WinFileTypeMBS("Pictures", "*.jpg;*.png;*.gif")
types.Add New WinFileTypeMBS("All files", "*.*")
dialog.SetFileTypes types

If dialog.Show(Self) Then
MessageBox "Chosen: " + dialog.Result.NativePath
End If
```

Notes: Requires Windows Vista or newer.
All methods may raise WinFileDialogExceptionMBS in case of errors.
Subclass of the WinFileDialogMBS class.

137.10.2 Methods

137.10.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The constructor.

137.10.4 Results as WinShellItemArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the user's choices in a dialog that allows multiple selection.
Example:

```
// This example needs a window with ListBox1.
Var d As WinFileOpenDialogMBS // your dialog
Var items As WinShellItemArrayMBS = d.Results

Var c As Integer = items.Count
For i As Integer = 0 To c-1
Var item As WinShellItemMBS = items.Item(i)

ListBox1.AddRow item.NativePath
Next
```

Notes: This method can be used whether the selection consists of a single item or multiple items.

Result property can be called after the dialog has closed or during the handling of an OnFileOk event. Calling this method at any other time will fail.
Show must return a success code for a result to be available to Result/Results.

137.10.5 SelectedItems as WinShellItemArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the currently selected items in the dialog. These items may be items selected in the view, or text selected in the file name edit box.
Notes: This method can be used for single item or multiple item selections. If the user has entered new text in the file name field, this can be a time-consuming operation. When the application calls this method, the application parses the text in the filename field. For example, if this is a network share, the operation could take some time. However, this operation will not block the UI, since the user should able to stop the operation, which will result in SelectedItems raising an exception).

137.11 class WinFileSaveDialogMBS

137.11.1 class WinFileSaveDialogMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Extends the WinFileDialogMBS class by adding methods specific to the save dialog, which include those that provide support for the collection of metadata to be persisted with the file.
Notes: All methods may raise WinFileDialogExceptionMBS in case of errors.
Subclass of the WinFileDialogMBS class.

137.11.2 Methods

137.11.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The constructor.

137.11.4 Properties

137.11.5 SaveAsItem as WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The item to be used as the initial entry in a Save As dialog.
Notes: he name of the item is displayed in the file name edit box, and the containing folder is opened in the view. This would generally be used when the application is saving an item that already exists. For new items, use FileName property.
(Read and Write property)

137.12 class WinFileTypeMBS

137.12.1 class WinFileTypeMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The class for a file type.
Example:

```
Var d As WinFileOpenDialogMBS // your dialog
Var FileTypes() As WinFileTypeMBS

FileTypes.Add New WinFileTypeMBS("JPEG image", "*.jpg")
FileTypes.Add New WinFileTypeMBS("PNG image", "*.png")
FileTypes.Add New WinFileTypeMBS("Tiff image", "*.tif;*.tiff")

d.SetFileTypes FileTypes
```

137.12.2 Methods

137.12.3 Constructor(Name as string, Spec as String)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The constructor.

137.12.4 Properties

137.12.5 Name as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The name of the entry.
Notes: (Read and Write property)

137.12.6 Spec as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The file type specification.
Notes: e.g. "*.jpg;*.jpeg", "*.bmp" or "*.*".
(Read and Write property)

137.13 class WinShellItemArrayMBS

137.13.1 class WinShellItemArrayMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The class for an array of shell items.
Notes: All methods may raise WinFileDialogExceptionMBS in case of errors.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

137.13.2 Methods

137.13.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

137.13.4 Item(index as Integer) as WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the item at the given index in the IShellItemArray.

137.13.5 Properties

137.13.6 Count as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the number of items in the given IShellItem array.
Notes: (Read only property)

137.13.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

137.14 class WinShellItemMBS

137.14.1 class WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The class for a Shell item.
Example:

```
// get the Explorer thumbnail and display name of a file on Windows
Var item As New WinShellItemMBS(SpecialFolder.Documents.Child("report.docx"))
Var thumb As Picture = item.Thumbnail(256)

MessageBox "Name: " + item.DisplayName + EndOfLine + "Path: " + item.NativePath
// show thumb in a Canvas or ImageViewer
```

Notes: All methods may raise WinFileDialogExceptionMBS in case of errors.

137.14.2 Methods

137.14.3 Compare(other as WinShellItemMBS, Mode as Integer = 0) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Compares two shell items.
Notes: Default mode is to compare display names.
Returns 0 if equal or non-null value if not.

137.14.4 Constructor(item as folderItem)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Creates new shell item based on a folderitem.
See also:

- 137.14.5 Constructor(path as String)

137.14.5 Constructor(path as String)

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Creates new shell item based on a path.
See also:

- 137.14.4 Constructor(item as folderItem) 18716

137.14.6 Operator_Compare(other as WinShellItemMBS) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Compares two shell items.
Notes: Returns 0 if equal or non-null value if not.
Compares display name.
This method is called by Xojo when you use = operator on items to compare.

137.14.7 ReadData as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Utility function to read data from item.
Notes: A shell item may not point necessarily to a real file.
This method can read it even if it is not a real file, but still can be opened as IStream.

137.14.8 Thumbnail(preferredSize as Integer) as Picture

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Queries thumbnail for item.
Notes: preferredSize is the size you'd like to have. Resulting image can be smaller or bigger.
Returns nil on any error.
If user disabled thumbnails for explorer, the shell also provides none for us, just icons.
Requires Windows Vista or newer.

137.14.9 Properties

137.14.10 DisplayName as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the display name of the shell item.
Notes: Returns the display name relative to the parent folder. In UI this name is generally ideal for display to the user.

If no path is available, the plugin does not raise exception, but returns "".
(Read only property)

137.14.11 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

137.14.12 Item as FolderItem

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Queries folderitem for the item.
Notes: Queries internally native path and builds folderitem for it.

If no path is available, the plugin does not raise exception, but returns nil.
(Read only property)

137.14.13 NativePath as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the native path of the shell item.
Notes: Returns the item's file system path, if it has one.

If no path is available, the plugin does not raise exception, but returns "".
(Read only property)

137.14.14 Parent as WinShellItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the parent of an IShellItem object.

Notes: (Read only property)

137.14.15 URLPath as String

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Gets the URL of the shell item.
Notes: Returns the item's URL, if it has one.
Some items do not have a URL, and in those cases a call to DisplayName will fail. This name is suitable for display to the user in some cases, but note that it might not be specified for all items.

If no path is available, the plugin does not raise exception, but returns "".
(Read only property)

137.14.16 Constants

Comparison Modes

Constant	Value	Description
kCompareAllFields	&h80000000	Exact comparison of two instances of a Shell item.
kCompareCanonical	&h10000000	Comparison is based on a canonical name.
kCompareDisplayName	0	Comparison based on the display name in a folder view.
kCompareTestFileSystemPathIfNotEqual	&h20000000	Windows 7 and later. If the Shell items are not the same, test paths.

Chapter 138

Network

138.1 class AvahiAddressResolverMBS

138.1.1 class AvahiAddressResolverMBS

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The lookup for an address.
Blog Entries

- News from the MBS Xojo Plugins in Version 25.1
- MonkeyBread Software Releases the MBS Xojo Plugins in version 25.1
- MBS Xojo Plugins, version 25.1pr1

Xojo Developer Magazine

- 23.4, page 10: News

138.1.2 Methods

138.1.3 Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The constructor.

138.1.4 Destructor

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The destructor.

138.1.5 Resolve(InterfaceIndex as integer, Protocol as integer, address as string, flags as integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Resolve an address.

138.1.6 Properties

138.1.7 Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The reference to the parent client object.
Notes: (Read only property)

138.1.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

138.1.9 Events

138.1.10 Failure(error as string, errorcode as integer)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Some error occurred in the resolving.

138.1.11 Found(interfaceIndex as integer, Protocol as Integer, address as string, name as string, flags as integer)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: A name was found.

138.1.12 Constants

IP Protocols

Constant	Value	Description
kInterfaceAny	-1	Any protocol.
kProtocolAny	-1	Any protocol.
kProtocolIPv4	0	Only IPv4.
kProtocolIPv6	1	Only IPv6.

Lookup Flags

Constant	Value	Description
kLookupNoAddress	8	When doing service resolving, don't lookup A/AAAA record.
kLookupNoTxt	4	When doing service resolving, don't lookup TXT record.
kLookupUseMulticast	2	Force lookup via multicast DNS.
kLookupUseWideArea	1	Force lookup via wide area DNS.

Result Flags

Constant	Value	Description
kResultCached	1	This response originates from the cache.
kResultLocal	8	This record/service resides on and was announced by the local host. Only available in service and record browsers and only on Found event.
kResultMultiCast	4	This response originates from multicast DNS.
kResultOurOwn	16	This service belongs to the same local client as the browser object. Only available in avahi-client, and only for service browsers and only on Found event.
kResultStatic	32	The returned data has been defined statically by some configuration option.
kResultWideArea	2	This response originates from wide area DNS.

138.2 class AvahiBrowserMBS

138.2.1 class AvahiBrowserMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class to browse for services.
Example:

```
// find web servers in the local network with Avahi on Linux
// MyAvahiBrowser is a subclass of AvahiBrowserMBS with the ServiceFound event implemented.
// Client is a property of the window: Client As AvahiClientMBS
// Browser is a property of the window: Browser As MyAvahiBrowser
Client = New AvahiClientMBS
Browser = New MyAvahiBrowser(Client)
Call Browser.Browse(AvahiBrowserMBS.kInterfaceAny, AvahiBrowserMBS.kProtocolAny, "_http._tcp")

// call AvahiClientMBS.Poll regularly, e.g. in a timer

// in MyAvahiBrowser:
Sub ServiceFound(InterfaceIndex As Integer, protocol As Integer, name As String, type As String, domain
As String, flags As Integer) Handles ServiceFound
System.DebugLog "Found " + name + " (" + type + " in " + domain + ")"
End Sub
```

Blog Entries

- Bonjour on Linux

138.2.2 Methods

138.2.3 Browse(InterfaceIndex as Integer, Protocol as Integer, servicetype as string, domain as string = ""), flags as Integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Browse for services of a type on the network.
Notes: In most cases you probably want to pass kInterfaceAny and kProtocolAny in InterfaceIndex, resp. protocol to browse on all local networks. The specified events will be called whenever a new service appears or is removed from the network. Please note that events may be collapsed to minimize traffic (i.e. a REMOVED followed by a NEW for the same service data is dropped because redundant). If you want to subscribe to service data changes, you should use AvahiResolverMBS class and keep it open, in which case you will be notified via Found event everytime the service data changes.

Only one browse call per AvahiBrowserMBS object please.
Returns true on success and false on failure.

138.2.4 Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The constructor.

138.2.5 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The destructor.

138.2.6 Properties

138.2.7 Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The reference to the parent client object.
Notes: (Read only property)

138.2.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

138.2.9 Events

138.2.10 AllForNow(type as string)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: One-time event, to notify the user that more records will probably not show up in the near future, i.e. all cache entries have been read and all static servers been queried.

138.2.11 CacheExhausted(type as string)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: One-time event, to notify the user that all entries from the caches have been sent.

138.2.12 Failure(error as string, errorcode as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Some error occurred.

138.2.13 ServiceFound(InterfaceIndex as Integer, protocol as Integer, name as string, type as string, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Found a new object on the network.

138.2.14 ServiceRemoved(InterfaceIndex as Integer, protocol as Integer, name as string, type as string, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The service has been removed from the network.

138.2.15 Constants

Constants

Constant	Value	Description
kInterfaceAny	-1	Special constant to use any interface available. Otherwise you would pass the index of the network interface you want to use.

IP Protocols

Constant	Value	Description
kProtocolAny	-1	Any protocol.
kProtocolIPv4	0	Only IPv4.
kProtocolIPv6	1	Only IPv6.

138.3 class AvahiClientMBS

138.3.1 class AvahiClientMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The base class for avahi.
Example:

```
// connect to the Avahi daemon on Linux and show the host name
// Client is a property of the window: Client As AvahiClientMBS
If Not AvahiClientMBS.Available Then
MessageBox "Avahi is not available."
Return
End If

Client = New AvahiClientMBS
MessageBox "Avahi " + Client.Version + EndOfLine + "Host: " + Client.HostName + "." + Client.Domain-
Name
```

Notes: Typically you create an object of your subclass of AvahiClientMBS at application launch and keep it running.
If events are too slow in GUI events, please use a timer with 50ms and call the AvahiClientMBS.Poll method there.
Blog Entries

- Advertise your Linux app on the network
- MBS Xojo Plugins, version 25.1pr1

138.3.2 Methods

138.3.3 Available as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Whether the avahi library has been found and loaded.

138.3.4 Constructor(flags as Integer = 0)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes the client.

138.3.5 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The destructor.

138.3.6 Poll

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Polls for events.
Example:

```
// in a timer with 50ms
AvahiClientMBS.Poll
```

Notes: This is automatically called by the plugin for GUI applications. If you call it in a timer, you can speedup avahi.
Console applications with their own event loop need to call Poll method regularly.

138.3.7 Properties

138.3.8 DomainName as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Get domain name.
Notes: (Read only property)

138.3.9 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

138.3.10 HostName as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Get host name.
Notes: (Read only property)

138.3.11 State as Integer

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The current state.
Notes: (Read only property)

138.3.12 Version as string

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Get the version of the server.
Notes: (Read only property)

138.3.13 Events

138.3.14 Collision

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: We're still connecting.
Notes: This state is only entered when kClientNoFail has been passed to Constructor() and the daemon is not yet available.

138.3.15 Connecting

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Client is connecting.

138.3.16 Failure(error as string, errorcode as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Some kind of error happened on the client side.

138.3.17 Registering

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Client is registering.

138.3.18 Running

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Client is running.

138.3.19 Constants

Client Flags

Constant	Value	Description
kClientIgnoreUserConfig	1	Don't read user configuration
kClientNoFail	2	Don't fail if the daemon is not available when avahi_client_new() is called, instead enter AVAHI_CLIENT_CONNECTING state and wait for the daemon to appear.

States

Constant	Value	Description
kStateClientConneting	101	We're still connecting. This state is only entered when kClientNoFail has been passed to Constructor() and the daemon is not yet available.
kStateClientFailure	100	Client side failure
kStateCollision	3	Server State: Collision
kStateFailure	4	Server side failure.
kStateInvalid	0	Invalid state
kStateRegistering	1	Server state: Registering
kStateRunning	2	Server state: running

138.4 class AvahiDomainBrowserMBS

138.4.1 class AvahiDomainBrowserMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class to browse for domains.

138.4.2 Methods

138.4.3 BrowseDomains(InterfaceIndex as Integer, Protocol as Integer, domain as string = """, BrowserType as Integer = 0, flags as Integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Browse for domains on the local network.
Notes: Only one BrowseDomains call per AvahiDomainBrowserMBS object please.
Returns true on success and false on failure.

138.4.4 Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The constructor.

138.4.5 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The destructor.

138.4.6 Properties

138.4.7 Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The reference to the parent client object.
Notes: (Read only property)

138.4.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

138.4.9 Events

138.4.10 AllForNow

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: One-time event, to notify the user that more records will probably not show up in the near future, i.e. all cache entries have been read and all static servers been queried.

138.4.11 CacheExhausted

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: One-time event, to notify the user that all entries from the caches have been sent.

138.4.12 DomainFound(InterfaceIndex as Integer, protocol as Integer, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Found a new domain on the network.

138.4.13 DomainRemoved(InterfaceIndex as Integer, protocol as Integer, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The domain has been removed from the network.

138.4.14 Failure(error as string, errorcode as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Some error occurred in the browsing.

138.4.15 Constants

Constants

Constant	Value	Description
kInterfaceAny	-1	Special constant to use any interface available. Otherwise you would pass the index of the network interface you want to use.

Browse modes for domain browsing

Constant	Value	Description
kBrowseTypeBrowse	0	Browse for a list of available browsing domains.
kBrowseTypeBrowseDefault	1	Browse for the default browsing domain.
kBrowseTypeBrowseLegacy	4	Legacy browse domain - see DNS-SD spec for more information.
kBrowseTypeRegister	2	Browse for a list of available registering domains.
kBrowseTypeRegisterDefault	3	Browse for the default registering domain.

Lookup Flags

Constant	Value	Description
kLookupNoAddress	8	When doing service resolving, don't lookup A/AAAA record.
kLookupNoTxt	4	When doing service resolving, don't lookup TXT record.
kLookupUseMulticast	2	Force lookup via multicast DNS.
kLookupUseWideArea	1	Force lookup via wide area DNS.

IP Protocols

Constant	Value	Description
kProtocolAny	-1	Any protocol.
kProtocolIPv4	0	Only IPv4.
kProtocolIPv6	1	Only IPv6.

138.5 class AvahiEntryGroupMBS

138.5.1 class AvahiEntryGroupMBS

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class for publishing services.

138.5.2 Methods

138.5.3 AddAddress(InterfaceIndex as integer, Protocol as integer, flags as Integer, name as string, Address as String)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Add a host/address pair.

138.5.4 AddRecord(InterfaceIndex as integer, Protocol as integer, flags as Integer, name as string, Clazz as Integer, Type as Integer, ttl as integer, Data as MemoryBlock)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Add an arbitrary record. I hope you know what you do.

138.5.5 AddService(InterfaceIndex as integer, Protocol as integer, flags as Integer, Name as string, type as String, Domain as String, Host as String, Port as Integer)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Add a service.
Notes: InterfaceIndex: The interface this service shall be announced on. We recommend to pass kInterfaceAny here, to announce on all interfaces.
Protocol: The protocol this service shall be announced with, i.e. MDNS over IPV4 or MDNS over IPV6. We recommend to pass kProtocolAny here, to announce this service on all protocols the daemon supports.
Flags: Usually 0, unless you know what you do.
Name: The name for the new service. Must be valid service name. i.e. a string shorter than 63 characters and valid UTF-8. May not be empty.
Type: The service type for the new service, such as _http._tcp. May not be empty.
Domain: The domain to register this domain in. We recommend to pass "" here, to let the daemon decide.
Host: The host this services is residing on. We recommend to pass "" here, the daemon will than automatically insert the local host name in that case.
Port: The IP port number of this service.

Please note that this service is not announced on the network before Commit is called.

138.5.6 AddServiceStrList(InterfaceIndex as integer, Protocol as integer, flags as Integer, Name as string, type as String, Domain as String, Host as String, Port as Integer, List() as String)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Add a service, takes an array for TXT records.
Notes: List: The TXT data for this service. You may free this object after calling this function, it is not referenced any further.

Arguments have the same meaning as for AddService().

138.5.7 AddServiceSubType(InterfaceIndex as integer, Protocol as integer, flags as Integer, Name as string, type as String, Domain as String, SubType as String)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Add a subtype for a service.
Notes: InterfaceIndex: The interface this service is announced on. This should match the value passed to the original AddService() call.
Protocol: The protocol this service is announced with. This should match the value passed to the original AddService() call.
flags: Only != 0 if you really know what you do.
Name: The name of the service, as passed to AddService(). Can't be empty.
Type: The type of the service, as passed to AddService(). Can't be empty.
Domain: The domain this service resides is, as passed to AddService(). Can't be empty.

SubType: The new subtype to register for the specified service. Can't be empty.

The service should already be existent in the entry group. You may add as many subtypes for a service as you wish.

138.5.8 Commit

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Commit an AvahiEntryGroup.
Notes: The entries in the entry group are now registered on the network.
Committing empty entry groups is considered an error.

138.5.9 Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The constructor.

138.5.10 Destructor

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The destructor.

138.5.11 Reset

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Reset an AvahiEntryGroup.
Notes: This takes effect immediately.

138.5.12 UpdateServiceStrList(InterfaceIndex as integer, Protocol as integer, flags as Integer, Name as string, type as String, Domain as String, List() as String)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Update a TXT record for an existing service.
Notes: InterfaceIndex: The interface this service is announced on. This should match the value passed to the original AddService() call.
Protocol: The protocol this service is announced with. This should match the value passed to the original AddService() call.
flags: Only != 0 if you really know what you do.
Name: The name of the service, as passed to AddService(). Can't be empty.
Type: The type of the service, as passed to AddService(). Can't be empty.
Domain: The domain this service resides is, as passed to AddService(). Can't be empty.

The service should already be existent in the entry group.

138.5.13 Properties

138.5.14 Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The reference to the parent client object.
Notes: (Read only property)

138.5.15 Handle as Integer

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

138.5.16 isEmpty as Boolean

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Check if an AvahiEntryGroup is empty.
Notes: Returns true if this is empty.
(Read only property)

138.5.17 LastError as Integer

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read only property)

138.5.18 LastErrorMessage as String

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The message text for the last error.
Notes: (Read only property)

138.5.19 State as Integer

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Get an AvahiEntryGroup's state.
Notes: (Read only property)

138.5.20 Events

138.5.21 StateChanged(state as Integer)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The event to inform about a new state.

138.5.22 Constants

Constants

Constant	Value	Description
kInterfaceAny	-1	Special constant to use any interface available. Otherwise you would pass the index of the network interface you want to use.

Publish Flags

Constant	Value	Description
kFlagsAllowMultiple	8	For raw records: Allow multiple local records of this type, even if they are intended to be unique.
kFlagsNoAnnounce	4	For raw records: Do not announce this RR to other hosts.
kFlagsNoCookie	32	For service records: do not implicitly add the local service cookie to TXT data.
kFlagsNone	0	No flags.
kFlagsNoProbe	2	For raw records: Though the RRset is intended to be unique no probes shall be sent.
kFlagsNoReverse	16	For address records: don't create a reverse (PTR) entry.
kFlagsUnique	1	For raw records: The RRset is intended to be unique.
kFlagsUpdate	64	Update existing records instead of adding new ones
kFlagsUseMulticast	256	Register the record using multicast DNS
kFlagsUseWideArea	128	Register the record using wide area DNS (i.e. unicast DNS update)

IP Protocols

Constant	Value	Description
kProtocolAny	-1	Any protocol.
kProtocolIPv4	0	Only IPv4.
kProtocolIPv6	1	Only IPv6.

States

Constant	Value	Description
kStateCollision	3	A name collision for one of the entries in the group has been detected, the entries have been withdrawn.
kStateEstablished	2	The entries have successfully been established.
kStateFailure	4	Some kind of failure happened, the entries have been withdrawn.
kStateRegistering	1	The entries of the group are currently being registered.
kStateUncommited	0	The group has not yet been commited, the user must still call commit.

138.6 class AvahiHostNameResolverMBS

138.6.1 class AvahiHostNameResolverMBS

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: A service resolver object.
Blog Entries

138.6.2 Methods

138.6.3 Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The constructor.

138.6.4 Destructor

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The destructor.

138.6.5 Resolve(InterfaceIndex as integer, Protocol as integer, name as string, aprotocol as Integer = -1, flags as integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Resolve a host name.

138.6.6 Properties

138.6.7 Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The reference to the parent client object.
Notes: (Read only property)

138.6.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

138.6.9 Events

138.6.10 Failure(error as string, errorcode as integer)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Some error occurred in the resolving.

138.6.11 Found(interfaceIndex as integer, Protocol as Integer, name as string, address as string, flags as integer)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: An address was found.

138.6.12 Constants

Constants

Constant	Value	Description
kInterfaceAny	-1	Special constant to use any interface available. Otherwise you would pass the index of the network interface you want to use.

Lookup Flags

Constant	Value	Description
kLookupNoAddress	8	When doing service resolving, don't lookup A/AAAA record.
kLookupNoTxt	4	When doing service resolving, don't lookup TXT record.
kLookupUseMulticast	2	Force lookup via multicast DNS.
kLookupUseWideArea	1	Force lookup via wide area DNS.

IP Protocols

Constant	Value	Description
kProtocolAny	-1	Any protocol.
kProtocolIPv4	0	Only IPv4.
kProtocolIPv6	1	Only IPv6.

Result Flags

Constant	Value	Description
kResultCached	1	This response originates from the cache.
kResultLocal	8	This record/service resides on and was announced by the local host. Only available in service and record browsers and only on Found event.
kResultMultiCast	4	This response originates from multicast DNS.
kResultOurOwn	16	This service belongs to the same local client as the browser object. Only available in avahi-client, and only for service browsers and only on Found event.
kResultStatic	32	The returned data has been defined statically by some configuration option.
kResultWideArea	2	This response originates from wide area DNS.

138.7 class AvahiRecordBrowserMBS

138.7.1 class AvahiRecordBrowserMBS

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class for a record browser.
Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 25.1
- MBS Xojo Plugins, version 25.1pr1

Xojo Developer Magazine

- 23.4, page 10: News

138.7.2 Methods

138.7.3 Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The constructor.

138.7.4 Destructor

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The destructor.
Notes: Cleans up and frees an AvahiRecordBrowser object.

138.7.5 Resolve(InterfaceIndex as integer, Protocol as integer, name as string, Clazz as Integer, Type as Integer, flags as integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Starts record browser.

138.7.6 Properties

138.7.7 Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The reference to the parent client object.
Notes: (Read only property)

138.7.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

138.7.9 Events

138.7.10 AllForNow(type as Integer)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: One-time event, to notify the user that more records will probably not show up in the near future, i.e. all cache entries have been read and all static servers been queried.

138.7.11 CacheExhausted(type as Integer)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: One-time event, to notify the user that all entries from the caches have been sent.

138.7.12 Failure(error as string, errorcode as integer)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Some error occurred in the browsing.

138.7.13 ServiceFound(InterfaceIndex as integer, protocol as Integer, name as string, clazz as Integer, type as Integer, RecordData as MemoryBlock, flags as integer)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: Found a new object on the network.

138.7.14 ServiceRemoved(InterfaceIndex as integer, protocol as Integer, name as string, clazz as Integer, type as Integer, RecordData as MemoryBlock, flags as integer)

MBS Linux Plugin, Plugin Version: 25.1, Platform: Linux, Targets: Desktop, Console & Web.

Function: The service has been removed from the network.

138.7.15 Constants

Constants

Constant	Value	Description
kInterfaceAny	-1	Special constant to use any interface available. Otherwise you would pass the index of the network interface you want to use.

Lookup Flags

Constant	Value	Description
kLookupNoAddress	8	When doing service resolving, don't lookup A/AAAA record.
kLookupNoTxt	4	When doing service resolving, don't lookup TXT record.
kLookupUseMulticast	2	Force lookup via multicast DNS.
kLookupUseWideArea	1	Force lookup via wide area DNS.

IP Protocols

Constant	Value	Description
kProtocolAny	-1	Any protocol.
kProtocolIPv4	0	Only IPv4.
kProtocolIPv6	1	Only IPv6.

Result Flags

Constant	Value	Description
kResultCached	1	This response originates from the cache.
kResultLocal	8	This record/service resides on and was announced by the local host. Only available in service and record browsers and only on Found event.
kResultMultiCast	4	This response originates from multicast DNS.
kResultOurOwn	16	This service belongs to the same local client as the browser object. Only available in avahi-client, and only for service browsers and only on Found event.
kResultStatic	32	The returned data has been defined statically by some configuration option.
kResultWideArea	2	This response originates from wide area DNS.

138.8 class AvahiResolverMBS

138.8.1 class AvahiResolverMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class to resolve service name to IP address.
Example:

```
// resolve a Bonjour service name to host, address and port on Linux
// MyResolver is a subclass of AvahiResolverMBS with the Found and Failure events implemented.
// Client is a property of the window: Client As AvahiClientMBS
// Resolver is a property of the window: Resolver As MyResolver
Client = New AvahiClientMBS
Resolver = New MyResolver(Client)
Call Resolver.Resolve(-1, -1, "My Printer", "_ipp._tcp", "local") // -1 = any interface, any protocol

// in MyResolver:
Sub Found(interfaceIndex As Integer, Protocol As Integer, name As String, type As String, domain As String, hostname As String, port As Integer, address As String, txt As String, flags As Integer) Handles Found
System.DebugLog name + " is " + hostname + " (" + address + ") port " + port.ToString
End Sub

Sub Failure(error As String, errorcode As Integer) Handles Failure
System.DebugLog "Failed: " + error
End Sub
```

138.8.2 Methods

138.8.3 Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The constructor.

138.8.4 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The destructor.

138.8.5 Resolve(InterfaceIndex as Integer, Protocol as Integer, name as string, servicetype as string, domain as string, flags as Integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Create a new service resolver object.
Notes: Please make sure to pass all the service data you received via Found event, especially interface and protocol. The protocol argument specifies the protocol (IPv4 or IPv6) to use as transport for the queries which are sent out by this resolver. The protocol argument specifies the address family (IPv4 or IPv6) of the address of the service we are looking for. Generally, on "protocol" you should only pass what was supplied to you as parameter to your Browse function. In protocol you should pass what your application code can deal with when connecting to the service. Or, more technically speaking: protocol specifies if the mDNS queries should be sent as UDP/IPv4 resp. UDP/IPv6 packets. protocol specifies whether the query is for a A resp. AAAA resource record.

Only one resolve call per AvahiResolverMBS object please.
Returns true on success and false on failure.

138.8.6 Properties

138.8.7 Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The reference to the parent client object.
Notes: (Read only property)

138.8.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

138.8.9 Events

138.8.10 Failure(error as string, errorcode as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Some error occurred.

138.8.11 Found(interfaceIndex as Integer, Protocol as Integer, name as string, type as string, domain as string, hostname as string, port as Integer, address as string, txt as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: An address was found.

138.8.12 Constants

Lookup Flags

Constant	Value	Description
kLookupNoAddress	8	When doing service resolving, don't lookup A/AAAA record.
kLookupNoTxt	4	When doing service resolving, don't lookup TXT record.
kLookupUseMulticast	2	Force lookup via multicast DNS.
kLookupUseWideArea	1	Force lookup via wide area DNS.

Result Flags

Constant	Value	Description
kResultCached	1	This response originates from the cache.
kResultLocal	8	This record/service resides on and was announced by the local host. Only available in service and record browsers and only on Found event.
kResultMultiCast	4	This response originates from multicast DNS.
kResultOurOwn	16	This service belongs to the same local client as the browser object. Only available in avahi-client, and only for service browsers and only on Found event.
kResultStatic	32	The returned data has been defined statically by some configuration option.
kResultWideArea	2	This response originates from wide area DNS.

138.9 class AvahiTypeBrowserMBS

138.9.1 class AvahiTypeBrowserMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class to browse for types.

138.9.2 Methods

138.9.3 BrowseTypes(InterfaceIndex as Integer, Protocol as Integer, domain as string = """, flags as Integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Browse for service types on the local network.
Notes: Only one BrowseTypes call per AvahiTypeBrowserMBS object please.
Returns true on success and false on failure.

138.9.4 Constructor(client as AvahiClientMBS)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The constructor.

138.9.5 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The destructor.

138.9.6 Properties

138.9.7 Client as AvahiClientMBS

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The reference to the parent client object.
Notes: (Read only property)

138.9.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

138.9.9 Events

138.9.10 AllForNow

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: One-time event, to notify the user that more records will probably not show up in the near future, i.e. all cache entries have been read and all static servers been queried.

138.9.11 CacheExhausted

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: One-time event, to notify the user that all entries from the caches have been sent.

138.9.12 Failure(error as string, errorcode as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Some error occurred in the browsing.

138.9.13 TypeFound(InterfaceIndex as Integer, protocol as Integer, type as string, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Found a new type on the network.

138.9.14 TypeRemoved(InterfaceIndex as Integer, protocol as Integer, type as string, domain as string, flags as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The type has been removed from the network.

138.9.15 Constants

Constants

Constant	Value	Description
kInterfaceAny	-1	Special constant to use any interface available. Otherwise you would pass the index of the network interface you want to use.

Lookup Flags

Constant	Value	Description
kLookupNoAddress	8	When doing service resolving, don't lookup A/AAAA record.
kLookupNoTxt	4	When doing service resolving, don't lookup TXT record.
kLookupUseMulticast	2	Force lookup via multicast DNS.
kLookupUseWideArea	1	Force lookup via wide area DNS.

IP Protocols

Constant	Value	Description
kProtocolAny	-1	Any protocol.
kProtocolIPv4	0	Only IPv4.
kProtocolIPv6	1	Only IPv6.

138.10 class CWChannelMBS

138.10.1 class CWChannelMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The CoreWLAN class for a channel.
Notes: Encapsulates an IEEE 802.11 channel.

Available on Mac OS X 10.7 or later.
Please also check the documentation from Apple for the CWChannel class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.10.2 Methods

138.10.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

138.10.4 copy as CWChannelMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of the object.

138.10.5 isEqualToChannel(channel as CWChannelMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Compares two channels.
Notes: Returns true if both are equal.

138.10.6 Operator_Compare(channel as CWChannelMBS) as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Compares two channels.

138.10.7 Properties

138.10.8 channelBand as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The channel band.
Notes: (Read only property)

138.10.9 channelNumber as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The channel number.
Notes: (Read only property)

138.10.10 channelWidth as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The channel width.
Notes: (Read only property)

138.10.11 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference for this object.
Notes: (Read and Write property)

138.11 class CWConfigurationMBS

138.11.1 class CWConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN configuration.
Example:

```
// list the remembered Wi-Fi networks of the Wi-Fi interface
Var wifi As CWInterfaceMBS = CWInterfaceMBS.primaryInterface
If wifi = Nil Then Return

Var config As CWConfigurationMBS = wifi.configuration
Var lines() As String
For Each profile As CWNetworkProfileMBS In config.networkProfiles
lines.Add profile.ssid
Next

MessageBox "Remembered networks:" + EndOfLine + String.FromArray(lines, EndOfLine)
```

Notes: Encapsulates a static configuration for a given IEEE 802.11 wireless interface.

Requires Mac OS X 10.6 or newer.

138.11.2 Methods

138.11.3 configuration as CWConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convenience method for getting an CWConfiguration object.
Notes: Var c as CWConfigurationMBS = CWConfigurationMBS.configuration
MessageBox hex(c.Handle)
See also:

- 138.11.4 configuration(config as CWConfigurationMBS) as CWConfigurationMBS 18755

138.11.4 configuration(config as CWConfigurationMBS) as CWConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convenience method for getting a CWConfiguration object initialized with the given CWCon-

figuration object.
Notes: Available on Mac OS X 10.7 or later.
See also:

- 138.11.3 configuration as CWConfigurationMBS 18755

138.11.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an CWConfiguration.
See also:

- 138.11.6 Constructor(configuration as CWConfigurationMBS) 18756

138.11.6 Constructor(configuration as CWConfigurationMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a CWConfigurationMBS object initialized with the given CWConfigurationMBS object.
Notes: Available on Mac OS X 10.7 or later.
See also:

- 138.11.5 Constructor 18756

138.11.7 copy as CWConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of this object.

138.11.8 isEqualToConfiguration(configuration as CWConfigurationMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Test whether two configurations are equal.
Notes: Two CWConfiguration objects are considered equal if all their corresponding properties are equal.

138.11.9 mutableCopy as CWMutableConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a mutable copy of this object.
Notes: Available on Mac OS X 10.7 or later.

138.11.10 networkProfiles as CWNetworkProfileMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: An array of remembered CWNetworkProfileMBS objects.
Notes: The order of this array corresponds to the order in which the CWNetworkProfile objects participate in the auto-join process.

Available on Mac OS X 10.7 or later.

138.11.11 Operator_Compare(configuration as CWConfigurationMBS) as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Compares two profiles.

138.11.12 Properties

138.11.13 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

138.11.14 rememberJoinedNetworks as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: AirPort client will remember all joined networks.
Notes: Available on Mac OS X 10.7 or later.
(Read only property)

138.11.15 requireAdministratorForAssociation as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Require an administrator password to change networks.
Notes: Available on Mac OS X 10.7 or later.
(Read only property)

138.11.16 requireAdministratorForIBSSMode as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Require an administrator password to create a computer-to-computer network.
Notes: Available on Mac OS X 10.7 or later.
(Read only property)

138.11.17 requireAdministratorForPower as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Require an administrator password to change the interface power state.
Notes: Available on Mac OS X 10.7 or later.
(Read only property)

138.12 module CWGlobalsMBS

138.12.1 module CWGlobalsMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The module for the global constants.
Example:

```
// read the saved WiFi password of the current network from the keychain
Var wifi As CWInterfaceMBS = CWInterfaceMBS.primaryInterface
If wifi = Nil Or wifi.ssidData = Nil Then Return

Var password As String
Var result As Integer = CWGlobalsMBS.KeychainGetPassword(wifi.ssidData, password) // asks the user for permission
If result = 0 Then
MessageBox "Password for " + wifi.ssid + ": " + password
Else
MessageBox "Error " + result.ToString
End If
```

Notes: Please note that MBS Plugin implements all methods from 10.6 to 10.9 in CoreWLAN. But Apple changes things often, so some methods are only for older system, some only for newer. e.g. kCWErrorDomain is for 10.6 and CWErrorDomain for 10.7 and newer.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.4pr2

138.12.2 Methods

138.12.3 CWBSSIDDidChangeNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.
Notes: Please use with NSNotificationObserverMBS class.
Posted when the BSSID of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

138.12.4 CWCountryCodeDidChangeNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.

Notes: Please use with NSNotificationObserverMBS class.
Posted when the country code of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

138.12.5 CWErrorDomain as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN Error Domain.

138.12.6 CWLinkDidChangeNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.
Notes: Please use with NSNotificationObserverMBS class.
Posted when the link state of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

138.12.7 CWLinkQualityDidChangeNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.
Notes: Please use with NSNotificationObserverMBS class.
Posted when the link quality for any WLAN interface changes. The object for this notification is the corresponding BSD interface name. The userInfo dictionary for this notification contains the current RSSI and current transmit rate for the given CoreWLAN interface.

138.12.8 CWLinkQualityNotificationRSSIKey as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Dictionary key for link quality change details.
Notes: Number containing the current RSSI value for the WLAN interface. Found in the userInfo dictionary for the CWLinkQualityChangedNotification.

138.12.9 CWLinkQualityNotificationTransmitRateKey as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Dictionary key for link quality change details.
Notes: Number containing the current transmit rate value for the WLAN interface. Found in the userInfo dictionary for the CWLinkQualityChangedNotification.

138.12.10 CWModeDidChangeNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.
Notes: Please use with NSNotificationObserverMBS class.

Posted when the mode of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

138.12.11 CWPowerDidChangeNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.
Notes: Please use with NSNotificationObserverMBS class.
Posted when the power state of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

138.12.12 CWScanCacheDidUpdateNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.
Notes: Please use with NSNotificationObserverMBS class.
Posted when new entries are added to the scan cache, or existing entries are updated with more current information. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

138.12.13 CWSSIDDidChangeNotification as string

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names for CoreWLAN.
Notes: Please use with NSNotificationObserverMBS class.
Posted when the SSID of any WLAN interface changes. The object for this notification is the corresponding BSD interface name. This notification does not contain a userInfo dictionary.

138.12.14 KeychainDeleteEAPUsernameAndPassword(ssidData as memoryblock) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Deletes the 802.1X username and password for the specified SSID.
Notes: ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainDeleteWiFiEAPUsernameAndPassword instead.

138.12.15 KeychainDeletePassword(ssidData as memoryblock) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Deletes the password for the specified SSID and keychain domain.
Notes: ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainDeleteWiFiPassword instead.

138.12.16 KeychainDeleteWiFiEAPUsernameAndPassword(KeychainDomain as Integer, ssidData as memoryblock) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Deletes the 802.1X username and password for the specified SSID and keychain domain.
Notes: domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.

Returns an OSStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

138.12.17 KeychainDeleteWiFiPassword(KeychainDomain as Integer, ssidData as memoryblock) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Deletes the password for the specified SSID and keychain domain.
Notes: domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.

Returns an OSStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

138.12.18 KeychainFindWiFiEAPUsernameAndPassword(KeychainDomain as Integer, ssidData as memoryblock, byref username as string, byref password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Finds and returns the 802.1X username and password stored for the specified SSID and keychain domain.
Notes: domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
username: a string passed by reference, which upon return will contain the 802.1X username for the specified SSID.
password: a string passed by reference, which upon return will contain the 802.1X password for the specified SSID.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

138.12.19 KeychainFindWiFiPassword(KeychainDomain as Integer, ssidData as memoryblock, byref password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Finds and returns (by reference) the password for the specified SSID and keychain domain.
Notes: domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
password: An string passed by reference, which upon return will contain the Wi-Fi keychain password for the specified SSID. This parameter is optional.

Returns an error code indicating whether or not a failure occurred. errSecSuccess indicates no error occurred.
Available on Mac OS X 10.9 or newer.

138.12.20 KeychainGetEAPIdentity(ssidData as memoryblock, byref SecIdentityRef as Integer) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Finds and returns the identity stored for the specified SSID and keychain domain.
Notes: ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
identity: An Integer passed by reference, which upon return will contain the SecIdentityRef associated with the specified SSID.
The returned value must be released by the caller.

Returns an OSStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainGetWiFiEAPIdentity instead.

138.12.21 KeychainGetEAPIdentityList(byref ListSecIdentityRef() as Integer) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Finds and returns all available identities.
Notes: ListSecIdentityRef: An array passed by reference, which upon return will be populated with a list of integers (SecIdentityRef).

Returns an OSStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

138.12.22 KeychainGetEAPUsernameAndPassword(ssidData as memoryblock, byref username as string, byref password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Finds and returns the 802.1X username and password stored for the specified SSID.
Notes: ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
username: A string passed by reference, which upon return will contain the 802.1X username for the specified SSID.
password: A string passed by reference, which upon return will contain the 802.1X password for the specified SSID.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain.

Available in Mac OS X 10.7, deprecated in 10.9. Please use FindWiFiEAPUsernameAndPassword instead.

138.12.23 KeychainGetPassword(ssidData as memoryblock, byref password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Finds and returns (by reference) the password for the specified SSID.
Notes: ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
password: A string passed by reference, which upon return will contain the Wi-Fi keychain password for the specified SSID.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainFindWiFiPassword instead.

138.12.24 KeychainGetWiFiEAPIdentity(KeychainDomain as Integer, ssidData as memoryblock, byref SecIdentityRef as Integer) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Finds and returns the identity stored for the specified SSID and keychain domain.
Notes: domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
identity: An Integer passed by reference, which upon return will contain the SecIdentityRef associated with the specified SSID.
The returned value must be released by the caller.

Returns an OSStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

138.12.25 KeychainSetEAPIdentity(ssidData as memoryblock, SecIdentityRef as Integer) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Associates an identity to the specified SSID.
Notes: ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
identity: The identity containing the certificate to use for 802.1X authentication.
Passing 0 clears any identity association for the specified SSID.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainSetWiFiEAPIdentity instead.

138.12.26 KeychainSetEAPUsernameAndPassword(ssidData as memoryblock, username as string, password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the 802.1X username and password for the specified SSID.
Notes: ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
username: The 802.1X username.
password: The 802.1X password. This parameter is optional.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use SetWiFiEAPUsernameAndPassword instead.

138.12.27 KeychainSetPassword(ssidData as memoryblock, password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the Wi-Fi network keychain password for the specified SSID.
Notes: ssidData: The service set identifier (SSID) which is used to uniquely identify the keychain item.
password: The Wi-Fi network password.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

The keychain used is determined by the SecPreferencesDomain of the caller as returned by KeychainManagerMBS.PreferenceDomain().
Available in Mac OS X 10.7, deprecated in 10.9. Please use KeychainSetWiFiPassword instead.

138.12.28 KeychainSetWiFiEAPIdentity(KeychainDomain as Integer, ssidData as memoryblock, SecIdentityRef as Integer) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Associates an identity to the specified SSID and keychain domain.
Notes: domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
identity: The identity containing the certificate to use for 802.1X authentication. a SecIdentityRef passed as Integer.

Passing 0 clears any identity association for the specified SSID.

Returns an OSStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

138.12.29 KeychainSetWiFiEAPUsernameAndPassword(KeychainDomain as Integer, ssidData as memoryblock, Username as string, Password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the 802.1X username and password for the specified SSID and keychain domain.
Notes: domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
username: The 802.1X username.
password: The 802.1X password. This parameter is optional.

Returns an OSStatus error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.

Available on Mac OS X 10.9 or newer.

138.12.30 KeychainSetWiFiPassword(KeychainDomain as Integer, ssidData as memoryblock, password as string) as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the Wi-Fi network keychain password for the specified SSID and keychain domain.
Notes: domain: The keychain domain, which determines which keychain will be used.
ssid: The service set identifier (SSID) which is used to uniquely identify the keychain item.
password: The Wi-Fi network password.

Returns an error code indicating whether or not a failure occurred.
errSecSuccess indicates no error occurred.
Available on Mac OS X 10.9 or newer.

138.12.31 MergeNetworks(networks() as CWNetworkMBS) as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Merges the specified set of CWNetwork objects.
Notes: networks: The set of networks to merge.

Duplicate networks are defined as networks with the same SSID, security type, and BSS type (IBSS or Infrastructure).
When duplicate networks exist, the network with the best RSSI value will be chosen.

138.12.32 Constants

Constants

Constant	Value	Description
kCWError	-3931	One of the error constants in CoreWLAN. Generic error.
kCWHTFeaturesNotSupported	-3926	One of the error constants in CoreWLAN. Association was denied because the requesting station does not supp features.
kCWInterfaceStateAssociating	3	One of the interface state constants in CoreWLAN. CoreWLAN interface is associating.
kCWInterfaceStateAuthenticating	2	One of the interface state constants in CoreWLAN. CoreWLAN interface is authenticating.
kCWInterfaceStateInactive	0	One of the interface state constants in CoreWLAN. CoreWLAN interface is in the initial, inactive state.
kCWInterfaceStateRunning	4	One of the interface state constants in CoreWLAN. CoreWLAN interface is running.
kCWInterfaceStateScanning	1	One of the interface state constants in CoreWLAN. CoreWLAN interface is scanning.
kCWIPCError	-3929	One of the error constants in CoreWLAN. Error communicating with a separate process.
kCWOpModeHostAP	3	One of the interface operation mode constants in CoreWLAN. Interface is participating in an infrastructure network as an access poi
kCWOpModeIBSS	1	One of the interface operation mode constants in CoreWLAN. Interface is participating in an IBSS network.
kCWOpModeMonitorMode	2	One of the interface operation mode constants in CoreWLAN. Interface is in 802.11 monitor mode.
kCWOpModeStation	0	One of the interface operation mode constants in CoreWLAN. Interface is participating in an infrastructure network as a non-AP stat
kCWOpNotPermitted	-3930	One of the error constants in CoreWLAN. Calling process does not have permission to perform this operation.
kCWPCOTransitionTimeNotSupported	-3927	One of the error constants in CoreWLAN. Association was denied because the requesting station does not supp PCO transition time required by the AP.
kCWScanTypeActive	0	One of the scan type constants in CoreWLAN. In accordance with the supported channels for the active country co interface will transmit probe request frames and listen for probe respon
kCWScanTypeFast	2	One of the scan type constants in CoreWLAN. The scan will return cached scan results.
kCWScanTypePassive	1	One of the scan type constants in CoreWLAN. The interface will listen for beacon frames on each channel irrespective c try code.
kCWSecurityModeDynamicWEP	7	One of the security mode constants in CoreWLAN. Dynamic WEP 802.1X authentication.
kCWSecurityModeOpen	0	One of the security mode constants in CoreWLAN. Open System authentication.
kCWSecurityModeWEP	1	One of the security mode constants in CoreWLAN. WEP authentication.
kCWSecurityModeWPA2_Enterprise	5	One of the security mode constants in CoreWLAN. WPA2 Enterprise authentication.
kCWSecurityModeWPA2_PSK	3	One of the security mode constants in CoreWLAN. WPA2 Personal authentication.
kCWSecurityModeWPA_Enterprise	4	One of the security mode constants in CoreWLAN. WPA Enterprise authentication.
kCWSecurityModeWPA_PSK	2	One of the security mode constants in CoreWLAN. WPA Personal authentication.
kCWSecurityModeWPS	6	One of the security mode constants in CoreWLAN. WiFi Protected Setup authentication.
kOldCWPHYMode11A	0	One of the physical layer mode constants in CoreWLAN. IEEE 802.11a
kOldCWPHYMode11B	1	One of the physical layer mode constants in CoreWLAN. IEEE 802.11b

Error Codes

Constant	Value	Description
kCWAPFullErr	-3913	Access point is unable to handle another associated station.
kCWAssociationDeniedErr	-3909	Association was denied for an unspecified reason.
kCWAuthAlgUnsupportedErr	-3910	Specified authentication algorithm is not supported.
kCWAuthenticationAlgorithmUnsupportedErr	-3910	Specified authentication algorithm is not supported.
kCWChallengeFailureErr	-3912	Authentication was rejected because of a challenge failure.
kCWCipherSuiteRejectedErr	-3923	Cipher suite rejected due to network security policy.
kCWDSSSOFDMUnsupportedErr	-3916	Association denied because DSSS-OFDM is not supported by tion.
kCWEAPOLErr	1	EAPOL-related error.
kCWErr	-3931	Generic error, no specific error code exists to describe the error
kCWFormatErr	-3904	Invalid protocol element field detected.
kCWHTFeaturesNotSupportedErr	-3926	Association was denied because the requesting station does n features.
kCWInvalidAKMPErr	-3920	Invalid authentication selector requested.
kCWInvalidAuthenticationSequenceNumberErr	-3911	Authentication frame received with an authentication sequence expected sequence.
kCWInvalidAuthSeqNumErr	-3911	Authentication frame received with an authentication sequence expected sequence.
kCWInvalidFormatErr	-3904	Invalid protocol element field detected.
kCWInvalidGroupCipherErr	-3918	Invalid group cipher requested.
kCWInvalidInfoElementErr	-3917	Invalid information element included in association request.
kCWInvalidInformationElementErr	-3917	Invalid information element included in association request.
kCWInvalidPairwiseCipherErr	-3919	Invalid pairwise cipher requested.
kCWInvalidParameterErr	-3900	Parameter error.
kCWInvalidPMKErr	-3924	PMK rejected by the access point.
kCWInvalidRSNCapabilitiesErr	-3922	Invalid RSN capabilities specified in association request.
kCWIPCFailureErr	-3929	Error communicating with a separate process.
kCWNoErr	0	Success.
kCWNoMemErr	-3901	Memory allocation failed.
kCWNoMemoryErr	-3901	Memory allocation failed.
kCWNotSupportedErr	-3903	Operation not supported.
kCWOperationNotPermittedErr	-3930	Calling process does not have permission to perform this opera
kCWParamErr	-3900	Parameter error.
kCWPCOTransitionTimeNotSupportedErr	-3927	Association was denied because the requesting station does n PCO transition time required by the AP.
kCWReassociationDeniedErr	-3908	Reassociation was denied because the access point was unabl that an association exists.
kCWReferenceNotBoundErr	-3928	No interface is bound to the CWInterface.
kCWRefNotBoundErr	-3928	No interface is bound to the CWInterface.
kCWShortSlotUnsupportedErr	-3915	Association denied because short slot time option is not suppor ing station.
kCWSupplicantTimeoutErr	-3925	WPA/WPA2 handshake timed out.
kCWTimeoutErr	-3905	Authentication/Association timed out.
kCWUknownErr	-3902	Unexpected error condition encountered for which no error cod
kCWUnknownErr	-3902	Unexpected error condition encountered for which no error cod
kCWUnspecifiedFailureErr	-3906	Access point did not specify a reason for authentication/associa
kCWUnsupportedCapabilitiesErr	-3907	Access point cannot support all requested capabilities.
kCWUnsupportedRateSetErr	-3914	Interface does not support all of the rates in the access point's
kCWUnsupportedRSNVersionErr	-3921	Invalid WPA/WPA2 version specified.

Channel bands

Constant	Value	Description
kCWChannelBand2GHz	1	2 GHz channel band.
kCWChannelBand5GHz	2	5 GHz channel band.
kCWChannelBandUnknown	0	Unknown channel band.

Channel Widths

Constant	Value	Description
kCWChannelWidth160MHz	4	160MHz channel width.
kCWChannelWidth20MHz	1	20MHz channel width.
kCWChannelWidth40MHz	2	40MHz channel width.
kCWChannelWidth80MHz	3	80MHz channel width.
kCWChannelWidthUnknown	0	Unknown channel width.

Chipher Key Flahs

Constant	Value	Description
kCWCipherKeyFlagsMulticast	4	Cipher key will be used for multicast packets.
kCWCipherKeyFlagsNone	0	Open System authentication.
kCWCipherKeyFlagsRx	16	Cipher key will be used for packets received by the interface.
kCWCipherKeyFlagsTx	8	Cipher key will be used for packets sent from the interface.
kCWCipherKeyFlagsUnicast	2	Cipher key will be used for unicast packets.

IBSS mode security types

Constant	Value	Description
kCWIBSSModeSecurityNone	0	Open System authentication.
kCWIBSSModeSecurityWEP104	2	WPA Personal authentication.
kCWIBSSModeSecurityWEP40	1	WEP security.

Interface operation modes

Constant	Value	Description
kCWInterfaceModeHostAP	3	Interface is participating in an infrastructure network as an access point.
kCWInterfaceModeIBSS	2	Interface is participating in an IBSS network.
kCWInterfaceModeNone	0	Interface is not in any mode.
kCWInterfaceModeStation	1	Interface is participating in an infrastructure network as a non-AP station.

Keychain Domains

Constant	Value	Description
kCWKeychainDomainNone	0	No keychain domain specified.
kCWKeychainDomainSystem	2	The system keychain domain.
kCWKeychainDomainUser	1	The login (user) keychain domain.

Physical Layer Modes

Constant	Value	Description
kCWPHYMode11a	1	IEEE 802.11a PHY.
kCWPHYMode11ac	5	IEEE 802.11ac PHY.
kCWPHYMode11b	2	IEEE 802.11b PHY.
kCWPHYMode11g	3	IEEE 802.11g PHY.
kCWPHYMode11n	4	IEEE 802.11n PHY.
kCWPHYModeNone	0	No PHY mode.

Security types

Constant	Value	Description
kCWSecurityDynamicWEP	6	Dynamic WEP security.
kCWSecurityEnterprise	10	Enterprise authentication.
kCWSecurityNone	0	Open System authentication.
kCWSecurityPersonal	5	Personal authentication.
kCWSecurityUnknown	&h7FFFFFFF	Unknown security type.
kCWSecurityWEP	1	WEP security.
kCWSecurityWPA2Enterprise	9	WPA2 Enterprise authentication.
kCWSecurityWPA2Personal	4	WPA2 Personal authentication.
kCWSecurityWPAEnterprise	7	WPA Enterprise authentication.
kCWSecurityWPAEnterpriseMixed	8	WPA/WPA2 Enterprise authentication.
kCWSecurityWPAPersonal	2	WPA Personal authentication.
kCWSecurityWPAPersonalMixed	3	WPA/WPA2 Personal authentication.

138.13 class CWInterfaceMBS

138.13.1 class CWInterfaceMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN interface.
Example:

```
// scan for WiFi networks nearby
Var wifi As New CWInterfaceMBS // default WiFi interface
If Not wifi.powerOn Then
MessageBox "WiFi is off."
Return
End If

Var error As NSErrorMBS
Var networks() As CWNetworkMBS = wifi.scanForNetworksWithName("", error)

Var lines() As String
For Each network As CWNetworkMBS In networks
lines.Add network.ssid + " " + network.rssiValue.ToString + " dBm"
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Encapsulates an CoreWLAN interface providing controlled access to various interface operations such as scanning, association, and IBSS creation, and providing a means to query and manipulate interface parameters.

Requires Mac OS X 10.6 or newer.

Please note that MBS Plugin implements all methods from 10.6 to 10.9 in CoreWLAN. But Apple changes things often, so some methods are only for older system, some only for newer. e.g. kCWErrorDomain is for 10.6 and CWErrorDomain for 10.7 and newer.

138.13.2 Methods

138.13.3 associateToEnterpriseNetwork(network as CWNetworkMBS, SecIdentityRef as Integer, username as string, password as string, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Connects to the given enterprise network.
Notes: network: The network to which the interface will associate.
username: The username to use for IEEE 802.1X authentication.
password: The password to use for IEEE 802.1X authentication.
identity: The identity to use for IEEE 802.1X authentication. Holds the corresponding client certificate.
error: An NSError object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method.

Returns a Boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

This method will block for the duration of the association. This operation may require an administrator password.

138.13.4 associateToNetwork(network as CWNetworkMBS, parameters as dictionary, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to associate to the given CWNetworkMBS, with the given association parameters.
Notes: parameters: A dicitonary object containing association parameters.
error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

See the association parameters defined in CWGlobalsMBS for more information. Certain networks will require specific authentication credentials for association (i.e. a network using WPA2 Personal authentication will require a passphrase). This method will block for the duration of the association. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.

- 138.13.5 associateToNetwork(network as CWNetworkMBS, password as string, byref error as NSErrorMBS) as boolean 18776

138.13.5 associateToNetwork(network as CWNetworkMBS, password as string, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Associates to a given network using the given network passphrase.
Notes: network: The network to which the interface will associate.

password: The network passphrase or key. Required for association to WEP, WPA Personal, and WPA2 Personal networks.
error: An NSErrorMBS object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method. This parameter is optional and can be passed as nil.

Returns a boolean value which will indicate whether or not a failure occurred during execution. true indicates no error occurred.

This method will block for the duration of the association. This operation may require an administrator password.

Available on Mac OS X 10.7 or later.
See also:

- 138.13.4 associateToNetwork(network as CWNetworkMBS, parameters as dictionary, byref error as NSErrorMBS) as boolean 18776

138.13.6 cachedScanResults as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The networks currently in the scan cache for the WLAN interface.
Notes: Returns empty array in the case of an error.
Available on Mac OS X 10.7 or later.

May include duplicates. Or multiple networks with dame BSSID.

138.13.7 commitConfiguration(config as CWConfigurationMBS, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Changing the interface configuration.
Notes: config: An CWConfiguration object containing the desired changes to the current CW configuration preferences.
error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

This method uses the SFAuthorization property of the given CWInterface object to commit the given configuration. The SFAuthorization property must be authorized with administrative privileges.
See also:

- 138.13.8 commitConfiguration(config as CWConfigurationMBS, SFAuthorizationRef as Integer, byref error as NSErrorMBS) as boolean 18778

138.13.8 commitConfiguration(config as CWConfigurationMBS, SFAuthorizationRef as Integer, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Commit a configuration for the given WLAN interface.
Notes: configuration: The configuration to commit.
authorization: An SFAuthorization object to use for authorizing the commit. This parameter is optional and can be passed as 0.
error: An NSError object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method.

Returns a Boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

This method requires the caller have root privileges or obtain administrator privileges with the authorization parameter.
See also:

- 138.13.7 commitConfiguration(config as CWConfigurationMBS, byref error as NSErrorMBS) as boolean 18777

138.13.9 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an CWInterface for the primary interface.
Example:

```
Var c as new CWInterfaceMBS

MessageBox c.description
```

See also:

- 138.13.10 Constructor(name as string) 18779

138.13.10 Constructor(name as string)

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an interface object linked to the interface of the given name.
Example:

```
Var c as new CWInterfaceMBS("en0")

MessageBox c.description
```

See also:

- 138.13.9 Constructor 18778

138.13.11 disassociate

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Disassociates the CoreWLAN interface from the currently associated network.
Notes: This method is a no-op if the given CoreWLAN interface is not associated to a network. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.

138.13.12 enableIBSSWithParameters as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to create a computer-to-computer network with the given parameters.
Notes: parameters: A dictionary object containing optional parameters for creating an IBSS network. This parameter is optional and may be passed as nil.
error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional and can be passed as nil.

Return a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

See the IBSS creation parameters defined in CWGlobals.h for more information. If no IBSS creation parameters are present, the default behavior is to create an open authentication computer-to-computer network using the machine name as the network name. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.
See also:

- 138.13.13 enableIBSSWithParameters(byref error as NSErrorMBS) as boolean 18780
- 138.13.14 enableIBSSWithParameters(parameters as dictionary) as boolean 18780

- 138.13.15 enableIBSSWithParameters(parameters as dictionary, byref error as NSErrorMBS) as boolean 18781

138.13.13 enableIBSSWithParameters(byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to create a computer-to-computer network with the given parameters.
Notes: parameters: A dictionary object containing optional parameters for creating an IBSS network. This parameter is optional and may be passed as nil.
error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional and can be passed as nil.

Return a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

See the IBSS creation parameters defined in CWGlobals.h for more information. If no IBSS creation parameters are present, the default behavior is to create an open authentication computer-to-computer network using the machine name as the network name. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.

- 138.13.15 enableIBSSWithParameters(parameters as dictionary, byref error as NSErrorMBS) as boolean 18781

138.13.14 enableIBSSWithParameters(parameters as dictionary) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to create a computer-to-computer network with the given parameters.
Notes: parameters: A dictionary object containing optional parameters for creating an IBSS network. This parameter is optional and may be passed as nil.
error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional and can be passed as nil.

Return a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

See the IBSS creation parameters defined in CWGlobals.h for more information. If no IBSS creation parameters are present, the default behavior is to create an open authentication computer-to-computer network using the machine name as the network name. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.

- 138.13.15 enableIBSSWithParameters(parameters as dictionary, byref error as NSErrorMBS) as boolean 18781

138.13.15 enableIBSSWithParameters(parameters as dictionary, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to create a computer-to-computer network with the given parameters.
Notes: parameters: A dictionary object containing optional parameters for creating an IBSS network. This parameter is optional and may be passed as nil.
error: An error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional and can be passed as nil.

Return a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

See the IBSS creation parameters defined in CWGlobals.h for more information. If no IBSS creation parameters are present, the default behavior is to create an open authentication computer-to-computer network using the machine name as the network name. This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.

- 138.13.14 enableIBSSWithParameters(parameters as dictionary) as boolean 18780

138.13.16 interfaceNames as String()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the list of BSD names for WLAN interfaces available on the current system.
Example:

```
Var names() as string = CWInterfaceMBS.interfaceNames
MessageBox Join(names,EndOfLine)
```

Notes: Returns an array of strings representing the supported WLAN BSD interface names avaliable on the current system (i.e. "en1", "en2"). If there are no supported interfaces for the current system, then this method will return an empty NSArray object.
Returns empty array in the case of an error.

Available on Mac OS X 10.7 or later.

138.13.17 interfaceWithName(name as string) as CWInterfaceMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries the interface with the given name.
Example:

```
Var c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")

MessageBox c.description
```

Notes: name: A string representing the name of an Airport interface.

138.13.18 primaryInterface as CWInterfaceMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convenience method for getting an CWInterface object for the primary interface.
Example:

```
Var c as CWInterfaceMBS = CWInterfaceMBS.primaryInterface

MessageBox c.name
```

138.13.19 scanForNetworksWithName(networkName as string, byref error as NSErrorMBS) as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Scans for networks.
Notes: networkName: The name (SSID) of the network for which to scan.
error: An NSErrorMBS object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method. This parameter is optional and can be passed as nil.

Returns an array of CWNetworkMBS objects.

If ssid parameter is present, a directed scan will be performed by the interface, otherwise a broadcast scan will be performed. This method will block for the duration of the scan.

Available on Mac OS X 10.7 or later.

138.13.20 scanForNetworksWithParameters as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Performs a scan with the given CoreWLAN interface, returning any found networks.
Notes: parameters: A dicitonary object containing optional scan parameters which can be used to control the behavior of the scan. This parameter is optional.

error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns an array containing CWNetworkMBS objects representing the networks found in the scan.

See the scan parameters defined in CWGlobalsMBS for controlling scan behavior. If no scan parameters are present, the default behavior is to perform a broadcast scan on active channels, for all supported PHY modes. This method will block for the duration of the scan.
See also:

- 138.13.21 scanForNetworksWithParameters(byref error as NSErrorMBS) as CWNetworkMBS() 18783
- 138.13.22 scanForNetworksWithParameters(parameters as dictionary) as CWNetworkMBS() 18784
- 138.13.23 scanForNetworksWithParameters(parameters as dictionary, byref error as NSErrorMBS) as CWNetworkMBS() 18784

138.13.21 scanForNetworksWithParameters(byref error as NSErrorMBS) as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Performs a scan with the given CoreWLAN interface, returning any found networks.
Notes: parameters: A dicitonary object containing optional scan parameters which can be used to control the behavior of the scan. This parameter is optional.

error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns an array containing CWNetworkMBS objects representing the networks found in the scan.

See the scan parameters defined in CWGlobalsMBS for controlling scan behavior. If no scan parameters are present, the default behavior is to perform a broadcast scan on active channels, for all supported PHY

modes. This method will block for the duration of the scan.
See also:

- 138.13.20 scanForNetworksWithParameters as CWNetworkMBS() 18783
- 138.13.22 scanForNetworksWithParameters(parameters as dictionary) as CWNetworkMBS() 18784
- 138.13.23 scanForNetworksWithParameters(parameters as dictionary, byref error as NSErrorMBS) as CWNetworkMBS() 18784

138.13.22 scanForNetworksWithParameters(parameters as dictionary) as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Performs a scan with the given CoreWLAN interface, returning any found networks.
Notes: parameters: A dicitonary object containing optional scan parameters which can be used to control the behavior of the scan. This parameter is optional.

error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns an array containing CWNetworkMBS objects representing the networks found in the scan.

See the scan parameters defined in CWGlobalsMBS for controlling scan behavior. If no scan parameters are present, the default behavior is to perform a broadcast scan on active channels, for all supported PHY modes. This method will block for the duration of the scan.

- 138.13.20 scanForNetworksWithParameters as CWNetworkMBS() 18783
- 138.13.21 scanForNetworksWithParameters(byref error as NSErrorMBS) as CWNetworkMBS() 18783
- 138.13.23 scanForNetworksWithParameters(parameters as dictionary, byref error as NSErrorMBS) as CWNetworkMBS() 18784

138.13.23 scanForNetworksWithParameters(parameters as dictionary, byref error as NSErrorMBS) as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Performs a scan with the given CoreWLAN interface, returning any found networks.
Notes: parameters: A dicitonary object containing optional scan parameters which can be used to control the behavior of the scan. This parameter is optional.

error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns an array containing CWNetworkMBS objects representing the networks found in the scan.

See the scan parameters defined in CWGlobalsMBS for controlling scan behavior. If no scan parameters are present, the default behavior is to perform a broadcast scan on active channels, for all supported PHY modes. This method will block for the duration of the scan.
See also:

- 138.13.20 scanForNetworksWithParameters as CWNetworkMBS() 18783
- 138.13.21 scanForNetworksWithParameters(byref error as NSErrorMBS) as CWNetworkMBS() 18783
- 138.13.22 scanForNetworksWithParameters(parameters as dictionary) as CWNetworkMBS() 18784

138.13.24 scanForNetworksWithSSID(ssid as memoryblock, byref error as NSErrorMBS) as CWNetworkMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Scans for networks.
Notes: ssid The SSID for which to scan.
error: An NSErrorMBS object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method. This parameter is optional and can be passed as nil.

Returns an array of CWNetworkMBS objects.

If ssid parameter is present, a directed scan will be performed by the interface, otherwise a broadcast scan will be performed. This method will block for the duration of the scan.

Available on Mac OS X 10.7 or later.

138.13.25 setChannel(channel as UInt32) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the channel for the given CoreWLAN interface.
Notes: channel: An integer representing the channel to which the CoreWLAN interface should be tuned.
error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

The current channel cannot be changed if the CoreWLAN interface is associated to a network. channel must be supported by the given interface.
See also:

- 138.13.26 setChannel(channel as UInt32, byref error as NSErrorMBS) as boolean 18786

138.13.26 setChannel(channel as UInt32, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the channel for the given CoreWLAN interface.
Notes: channel: An integer representing the channel to which the CoreWLAN interface should be tuned.
error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

The current channel cannot be changed if the CoreWLAN interface is associated to a network. channel must be supported by the given interface.
See also:

- 138.13.25 setChannel(channel as UInt32) as boolean 18785

138.13.27 setPairwiseMasterKey(key as Memoryblock, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the interface pairwise master key (PMK).
Notes: key: A memoryblock containing the pairwise master key (PMK).
error: An NSError object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method.
Returns a Boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

Key must be 32 octets. If key is nil, this method clears the PMK for the interface.

138.13.28 setPower(p as boolean) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the power state for the given CoreWLAN interface.
Notes: power: A boolean value indicating the power state to which the CoreWLAN interface should be set. False indicates the "OFF" state.

error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.
See also:

- 138.13.29 setPower(p as boolean, byref error as NSErrorMBS) as boolean 18787

138.13.29 setPower(p as boolean, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the power state for the given CoreWLAN interface.
Notes: power: A boolean value indicating the power state to which the CoreWLAN interface should be set. False indicates the "OFF" state.

error: A error object passed by reference, which will be populated with error code and error description if an error occurs during the execution of the method. This parameter is optional.

Returns a boolean value which will indicate whether or not a failure occurred. True indicates no error occurred.

This method may prompt for an administrator password if the corresponding preference is enabled in the current configuration.
See also:

- 138.13.28 setPower(p as boolean) as boolean 18787

138.13.30 setWEPKey(key as Memoryblock, flags as Integer, index as Integer, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the interface WEP key.
Notes: key: A memoryblock containing the WEP key.
flags: The cipher key flags to use for the specified key. Combination of kCWCipherKeyFlagsNone, kCWCipherKeyFlagsUnicast, kCWCipherKeyFlagsMulticast, kCWCipherKeyFlagsTx or kCWCipherKeyFlagsRx.
index: Integer which default key index to use for the specified key.
error An NSError object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method.

Returns a boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

Key must be 5 octets for WEP-40 or 13 octets for WEP-104. if key is nil, this method clears the WEP key for the interface. index must correspond to default key index 1-4.

138.13.31 setWLANChannel(channel as CWChannelMBS, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the interface channel.
Notes: channel: A CWChannel object corresponding to the channel.
error: An NSErrorMBS object passed by reference, which will be populated with the error code and the error description if an error occurs during the execution of this method. This parameter is optional and can be passed as nil.

A Boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

The channel cannot be changed if the interface is associated to a network.

Available on Mac OS X 10.7 or later.

138.13.32 startIBSSModeWithSSID(ssidData as MemoryBlock, security as Integer, channel as Integer, password as string, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a computer-to-computer (ad-hoc) network with the given network name, security type, and password on the specified channel.
Notes: security: The security type to be used. kCWIBSSModeSecurityNone, kCWIBSSModeSecurityWEP40 or kCWIBSSModeSecurityWEP104.
channel: The channel on which the network will be created.
password: The password to be used. This parameter is not applicable to open system authentication.

Returns a Boolean value which will indicate whether or not a failure occurred during execution. True indicates no error occurred.

This operation may require an administrator password.

138.13.33 supportedInterfaces as String()

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Getting all supported interfaces
Notes: Returns an array containing strings representing the supported CoreWLAN interface names avaliable on the current system (i.e. "en1", "en2"). If there are no supported interfaces for the current system, then this method will return an empty array.

138.13.34 supportedWLANChannels as CWChannelMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: An array of channels supported by the interface for the active country code.
Example:

```
Var c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
Var channels() as CWChannelMBS = c.supportedWLANChannels
Var lines() as string
for each ch as CWChannelMBS in channels
lines.Add str(ch.channelNumber) + ": "+ str(ch.channelBand)
next
MessageBox join(lines,", ")
```

Notes: Dynamically queries the interface for the supported channels. Returns an array of CWChannel

objects, or nil in the case of an error.

Available on Mac OS X 10.7 or later.

138.13.35 Properties

138.13.36 activePHYMode as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current active PHY modes for the interface.
Example:

```
Var c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MessageBox str(c.activePHYMode)
```

Notes: Dynamically queries the interface for the current active PHY mode.
Returns kCWPHYModeNone in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)

138.13.37 bssid as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current BSSID of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current BSSID.
(Read only property)

138.13.38 bssidData as Memoryblock

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current BSSID of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current BSSID.
(Read only property)

138.13.39 channel as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current channel of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current channel.
(Read only property)

138.13.40 configuration as CWConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current stored configuration for the CoreWLAN interface.
Notes: (Read only property)

138.13.41 countryCode as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Country code (ISO/IEC 3166-1:1997) of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current country code.
(Read only property)

138.13.42 description as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The object description.
Notes: (Read only property)

138.13.43 deviceAttached as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The interface has its corresponding hardware attached.
Example:

```
Var c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MessageBox str(c.deviceAttached)
```

Notes: Returns false in the case of an error.

Available on Mac OS X 10.7 or later.
(Read only property)

138.13.44 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

138.13.45 hardwareAddress as string

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The hardware media access control (MAC) address for the interface, returned as a UTF-8 string.
Example:

```
Var c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MessageBox c.hardwareAddress
```

Notes: The standard format for printing a MAC-48 address <00:00:00:00:00:00>is used to represent the MAC address as a string. Returns "" in the case of an error.

Available on Mac OS X 10.7 or later.
(Read only property)

138.13.46 interfaceMode as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current mode for the interface.
Example:

```
Var c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MessageBox str(c.interfaceMode)
```

Notes: Dynamically queries the interface for the current mode. Returns kCWInterfaceModeNone in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)

138.13.47 interfaceName as string

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The BSD name of the interface.
Example:

```
Var c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MessageBox c.interfaceName
MessageBox str(c.noiseMeasurement)
```

Notes: Available on Mac OS X 10.7 or later.
(Read only property)

138.13.48 interfaceState as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current state of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current interface state.
(Read only property)

138.13.49 name as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: BSD name for the CoreWLAN interface.
Example:

```
Var c as CWInterfaceMBS = CWInterfaceMBS.primaryInterface

MessageBox c.name
```

Notes: (Read only property)

138.13.50 noise as Double

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current aggregate noise measurement (dBm) of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current aggregate noise measurement.
(Read only property)

138.13.51 noiseMeasurement as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current aggregate noise measurement (dBm) for the interface.
Example:

```
Var c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MessageBox str(c.noiseMeasurement)
```

Notes: Dynamically queries the interface for the current aggregate noise measurement.
Returns 0 in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)

138.13.52 opMode as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current operation mode of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current operation mode.
(Read only property)

138.13.53 phyMode as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current active PHY mode of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current active PHY mode.
(Read only property)

138.13.54 power as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current power state for the CoreWLAN interface.
Notes: Dynamically queries the interface for the current power state.
(Read only property)

138.13.55 powerOn as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The interface power state is set to "ON".
Example:

```
Var c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MessageBox str(c.rssiValue)
```

Notes: Available on Mac OS X 10.7 or later.
(Read only property)

138.13.56 rssi as Double

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current aggregate RSSI measurement (dBm) of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current aggregate RSSI measurement.
(Read only property)

138.13.57 rssiValue as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current aggregate received signal strength indication (RSSI) measurement (dBm) for the interface.
Example:

```
Var c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MessageBox str(c.rssiValue)
```

Notes: Dynamically queries the interface for the current aggregate RSSI measurement.
Returns 0 in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)

138.13.58 security as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current security mode for the interface.
Notes: Dynamically queries the interface for the security mode. Returns kCWSecurityUnknown in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)

138.13.59 securityMode as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current security mode of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current security mode.
(Read only property)

138.13.60 serviceActive as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The interface has its corresponding network service enabled.
Example:

```
Var c as CWInterfaceMBS = CWInterfaceMBS.interfaceWithName("en0")
MessageBox str(c.serviceActive)
```

Notes: Returns false in the case of an error.

Available on Mac OS X 10.7 or later.
(Read only property)

138.13.61 ssid as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current SSID of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current SSID.
(Read only property)

138.13.62 ssidData as Memoryblock

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current service set identifier (SSID) for the interface, returned as data.
Notes: Dynamically queries the interface for the current SSID. The SSID is 1-32 octets.
Returns nil in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)

138.13.63 transmitPower as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current transmit power (mW) for the interface.
Notes: Dynamically queries the interface for the current transmit power.
Returns 0 in the case of an error.

Available on Mac OS X 10.7 or later.
(Read only property)

138.13.64 transmitRate as Double

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current transmit rate (Mbps) for the interface.
Notes: Dynamically queries the interface for the current transmit rate.
Returns 0 in the case of an error, or if the interface is not participating in a network.
Available on Mac OS X 10.7 or later.
(Read only property)

138.13.65 txRate as Double

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Current transmit rate (Mbps) of the CoreWLAN interface.
Notes: Dynamically queries the interface for the current transmit rate.
(Read only property)

138.13.66 wlanChannel as CWChannelMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current channel for the interface.
Notes: Dynamically queries the interface for the current channel. Returns nil in the case of an error, or if the interface is not participating in a network.

Available on Mac OS X 10.7 or later.
(Read only property)

138.14 class CWMutableConfigurationMBS

138.14.1 class CWMutableConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Encapsulates a mutable configuration for an AirPort WLAN interface.
Example:

```
// require an admin password to switch Wi-Fi power and to join other networks
// Changing the configuration needs administrator rights.
Var wifi As CWInterfaceMBS = CWInterfaceMBS.primaryInterface
If wifi = Nil Then Return

Var config As CWMutableConfigurationMBS = wifi.configuration.mutableCopy
config.setRequireAdministratorForPower True
config.setRequireAdministratorForAssociation True

Var error As NSErrorMBS
If Not wifi.commitConfiguration(config, error) Then
MessageBox error.localizedDescription
End If
```

Notes: Available on Mac OS X 10.7 or later.
Please also check the documentation from Apple for the CWMutableConfiguration class.
Subclass of the CWConfigurationMBS class.

138.14.2 Methods

138.14.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new mutable configuration.

138.14.4 setNetworkProfiles(values() as CWNetworkProfileMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: An array of remembered CWNetworkProfileMBS objects.
Notes: The order of this array corresponds to the order in which the CWNetworkProfileMBS objects participate in the auto-join process.

138.14.5 setRememberJoinedNetworks(value as boolean)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: AirPort client will remember all joined networks.

138.14.6 setRequireAdministratorForAssociation(value as boolean)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Require an administrator password to change networks.

138.14.7 setRequireAdministratorForIBSSMode(value as boolean)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Require an administrator password to create a computer-to-computer network.

138.14.8 setRequireAdministratorForPower(value as boolean)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Require an administrator password to change the interface power state.

138.15 class CWMutableNetworkProfileMBS

138.15.1 class CWMutableNetworkProfileMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Encapsulates a mutable network profile entry.
Notes: Available on Mac OS X 10.7 or later.
Please also check the documentation from Apple for the CWMutableNetworkProfile class.
Subclass of the CWNetworkProfileMBS class.

138.15.2 Methods

138.15.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.

138.15.4 setSecurity(value as Integer)

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the security mode for the network profile.
Notes: See kCWSecurity* constants.

138.15.5 setSsidData(data as Memoryblock)

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the service set identifier (SSID) for the network profile, returned as data.
Notes: The SSID is 1-32 octets.

138.16 class CWNetworkMBS

138.16.1 class CWNetworkMBS

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: CoreWLAN wireless (IEEE 802.11) network.
Example:

```
// list the WiFi networks in range with signal strength and channel
// macOS needs location permission to show network names.
Var wifi As CWInterfaceMBS = CWInterfaceMBS.primaryInterface
If wifi = Nil Then Return

Var error As NSErrorMBS
Var lines() As String
For Each n As CWNetworkMBS In wifi.scanForNetworksWithName("", error)
lines.Add n.ssid + ": " + n.rssiValue.ToString + " dBm, channel " + n.wlanChannel.channelNumber.ToString
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Encapsulates a wireless network providing read-only accessors to various properties of the network.

Requires Mac OS X 10.6 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.16.2 Methods

138.16.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

138.16.4 copy as CWNetworkMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of this object.

138.16.5 isEqualToNetwork(network as CWNetworkMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Comparing wireless networks.
Notes: Returns true if the network objects are equal.

Two CWNetworkMBS objects are considered equal if their corresponding ssid, securityMode, and isIBSS properties are equal.

138.16.6 Operator_Compare(profile as CWNetworkMBS) as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Compares two networks.

138.16.7 supportsPHYMode(phyMode as Integer) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Method for determining which PHY modes a network supports.
Notes: True if the network supports the specified PHY mode.

Available on Mac OS X 10.7 or later.

138.16.8 supportsSecurity(security as Integer) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Getting supported security types
Notes: True if the network supports the specified security type.

Method for determining which security types a network supports.

Available on Mac OS X 10.7 or later.

138.16.9 Properties

138.16.10 beaconInterval as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The beacon interval (ms) for the network.
Notes: Available on Mac OS X 10.7 or later.
(Read only property)

138.16.11 bssid as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Basic service set identifier for the given CWNetworkMBS.
Notes: (Read only property)

138.16.12 countryCode as string

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The country code (ISO/IEC 3166-1:1997) for the network.
Notes: Available on Mac OS X 10.7 or later.
(Read only property)

138.16.13 description as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The object description.
Notes: (Read only property)

138.16.14 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

138.16.15 ibss as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The network is an IBSS network.
Notes: Available on Mac OS X 10.7 or later.
(Read only property)

138.16.16 informationElementData as Memoryblock

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Information element data included in beacon or probe response frames.
Notes: Available on Mac OS X 10.7 or later.
(Read only property)

138.16.17 noiseMeasurement as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The aggregate noise measurement (dBm) for the network.
Notes: Available on Mac OS X 10.7 or later.
(Read only property)

138.16.18 rssiValue as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The aggregate received signal strength indication (RSSI) measurement (dBm) for the network.
Notes: Available on Mac OS X 10.7 or later.
(Read only property)

138.16.19 ssid as string

MBS MacFrameworks Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Service set identifier for the given CWNetworkMBS.
Notes: (Read only property)

138.16.20 ssidData as Memoryblock

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The service set identifier (SSID) for the network, returned as data.
Notes: The SSID is defined as 1-32 octets.
(Read only property)

138.16.21 wlanChannel as CWChannelMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The channel for the network.
Notes: Available on Mac OS X 10.7 or later.
(Read only property)

138.17 class CWNetworkProfileMBS

138.17.1 class CWNetworkProfileMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for a network profile.
Example:

```
// show security type of remembered Wi-Fi networks
Var wifi As CWInterfaceMBS = CWInterfaceMBS.primaryInterface
If wifi = Nil Then Return

Var lines() As String
For Each profile As CWNetworkProfileMBS In wifi.configuration.networkProfiles
lines.Add profile.ssid + " (security " + profile.security.ToString + ")"
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Encapsulates an immutable network profile entry.

Available on Mac OS X 10.7 or later.
Please also check the documentation from Apple for the CWNetworkProfile class.

138.17.2 Methods

138.17.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convenience method for getting a CWNetworkProfile object.
See also:

- 138.17.4 Constructor(networkProfile as CWNetworkProfileMBS) 18807

138.17.4 Constructor(networkProfile as CWNetworkProfileMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convenience method for getting a CWNetworkProfile object initialized with the given CWNetworkProfile object.
See also:

- 138.17.3 Constructor 18807

138.17.5 copy as CWNetworkProfileMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of the object.

138.17.6 isEqualToNetworkProfile(networkProfile as CWNetworkProfileMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Comparing network profiles.
Notes: networkProfile: The CWNetworkProfile object with which to compare the receiver.

CWNetworkMBS objects are considered equal if their corresponding ssidData and securityType properties are equal.

138.17.7 mutableCopy as CWMutableNetworkProfileMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a mutable copy of the object.

138.17.8 networkProfile as CWNetworkProfileMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convenience method for getting a CWNetworkProfile object.

138.17.9 networkProfileWithNetworkProfile(networkProfile as CWNetworkProfileMBS) as CWNetworkProfileMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convenience method for getting a CWNetworkProfile object initialized with the given CWNetworkProfile object.
Notes: networkProfile: The CWNetworkProfile object to use to initialize a new CWNetworkProfile object.

138.17.10 Operator_Compare(networkProfile as CWNetworkProfileMBS) as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Compares two network profiles.

138.17.11 Properties

138.17.12 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

138.17.13 security as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The security mode for the network profile.
Notes: See kCWSecurity* constants.
(Read only property)

138.17.14 ssid as string

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The service set identifier (SSID) for the network profile, encoded as a string.
Notes: If the SSID can not be encoded as a valid UTF-8 or WinLatin1 string, this method returns "".
(Read only property)

138.17.15 ssidData as Memoryblock

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The service set identifier (SSID) for the network profile, returned as data.
Notes: The SSID is 1-32 octets.
(Read only property)

138.18 class CWWiFiClientMBS

138.18.1 class CWWiFiClientMBS

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The interface to the Wi-Fi subsystem on OS X.
Example:

```
// show the WiFi network each interface is connected to
// Note: newer macOS versions need location permission to return the SSID.
Var client As New CWWiFiClientMBS

Var lines() As String
For Each wifi As CWInterfaceMBS In client.interfaces
lines.Add wifi.interfaceName + ": " + wifi.ssid + ", signal " + wifi.rssiValue.ToString + " dBm"
Next

MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Provides access to all Wi-Fi interfaces and allows Wi-Fi clients to setup event notifications.

CWWiFiClientMBS objects are heavy objects, therefore, clients of the CoreWLAN framework should use a single, long-running instance rather than creating several short-lived instances.

The CWWiFiClientMBS object should be used to instantiate CWInterfaceMBS objects rather than using a CWInterfaceMBS initializer directly.

MBS Plugin make sure that all events are routed to main thread.

Available on MacOS 10.10 or newer.

- 17.5, page 40: What's New in the MBS Plugins, With the Plugins growing every year, here are new capabilities you may have missed by Stefanie Juchmes

138.18.2 Methods

138.18.3 available as boolean

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether this class is available.
Notes: Returnes true on MacOS 10.10 or newer.

138.18.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a CWWiFiClient object.
Notes: Available on MacOS 10.10 or newer.

138.18.5 Destructor

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

138.18.6 interfaceNames as String()

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the list of available Wi-Fi interface names (e.g. "en0").
Notes: An Array of string corresponding to Wi-Fi interface names.
If no Wi-Fi interfaces are available, this method will return an empty array.
Returns nil if an error occurs.

138.18.7 interfaces as CWInterfaceMBS()

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns all available Wi-Fi interfaces.
Notes: If no Wi-Fi interfaces are available, this method will return an empty array.
Returns nil if an error occurs.

138.18.8 interfaceWithName(name as string) as CWInterfaceMBS

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the CWInterface object bound to the Wi-Fi interface with a specific interface name.
Notes: interfaceName: The name of an available Wi-Fi interface.

Use interfaceNames function to get a list of available Wi-Fi interface names.
Returns a CWInterface object for the default Wi-Fi interface if no interface name is specified.

138.18.9 startMonitoring(EventType as integer, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Register for specific Wi-Fi event notifications.
Notes: type: A CWEventType value.
error: An NSError object passed by reference, which upon return will contain the error if an error occurs.

Return a boolean value indicating whether or not an error occurred. True indicates no error occurred.

138.18.10 stopMonitoring(EventType as integer, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Unregister for specific Wi-Fi event notifications.
Notes: type: A CWEventType value.

error: An NSError object passed by reference, which upon return will contain the error if an error occurs.

Returns a boolean value indicating whether or not an error occurred. true indicates no error occurred.

138.18.11 stopMonitoringAllEvents(byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Unregister for all Wi-Fi event notifications.
Notes: error: An NSError object passed by reference, which upon return will contain the error if an error occurs.

Returns a boolean value indicating whether or not an error occurred. true indicates no error occurred.

138.18.12 Properties

138.18.13 CWInterface as CWInterfaceMBS

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the CWInterface object for the default Wi-Fi interface.
Notes: This method is named CWInterface as the name interface would cause an error in Xojo.
(Read only property)

138.18.14 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

138.18.15 Events

138.18.16 bssidDidChangeForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invoked when the current BSSID changes.
Notes: interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeBSSIDDidChange event type to register for BSSID event notifications.
Use CWInterfaceMBS.bssid to query the current BSSID.

138.18.17 clientConnectionInterrupted

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invoked if the connection to the Wi-Fi subsystem is temporarily interrupted.
Notes: All event notifications for which the Wi-Fi client has registered will be automatically re-registered if the connection is interrupted.

The Wi-Fi client should re-sync any local state which is updated as a result of Wi-Fi event notifications.

138.18.18 clientConnectionInvalidated

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invoked if the connection to the Wi-Fi subsystem is permanently invalidated.

138.18.19 countryCodeDidChangeForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invoked when the currently adopted country code changes.
Notes: interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeCountryCodeDidChange event type to register for country code event notifications.
Use CWInterfaceMBS.countryCode to query the currently adopted country code.

138.18.20 linkDidChangeForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invoked when the Wi-Fi link state changes.
Notes: interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeLinkDidChange event type to register for link event notifications.

138.18.21 linkQualityDidChangeForWiFiInterfaceWithName(interfaceName as String, rssi as Integer, transmitRate as double)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invoked when the Wi-Fi link quality changes.
Notes: interfaceName: The name of the Wi-Fi interface.
rssi: The RSSI value for the currently associated network on the Wi-Fi interface.
transmitRate: The transmit rate for the currently associated network on the Wi-Fi interface.

Use startMonitoring with the CWEventTypeLinkQualityDidChange event type to register for link quality event notifications.
Use CWInterfaceMBS.rssiValue and CWInterfaceMBS.transmitRate to query the current RSSI and transmit rate, respectively.

138.18.22 modeDidChangeForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invoked when the Wi-Fi operating mode changes.
Notes: interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeModeDidChange event type to register for interface mode event notifications.
Use CWInterfaceMBS.interfaceMode to query the current operating mode.

138.18.23 powerStateDidChangeForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invoked when the Wi-Fi power state changes.
Notes: interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypePowerDidChange event type to register for power event notifications.
Use CWInterfaceMBS.powerOn to query the current Wi-Fi power state.

138.18.24 rangingReportEventForWiFiInterfaceWithName(interfaceName as String, rangingData() as Dictionary, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invoked when WiFi ranging measurement completed.
Notes: interfaceName: The name of the Wi-Fi interface.
rangingData: Dictionary containing distance measurement data.

Use startMonitoring with the CWEventTypeRangingReportEvent event type to register for ranging event notifications.

138.18.25 scanCacheUpdatedForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invoked when the Wi-Fi interface scan cache is updated with new scan results.
Notes: interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeScanCacheUpdated event type to register for scan cache event notifications.
Use CWInterfaceMBS.cachedScanResults to query scan cache results from the last scan.

138.18.26 ssidDidChangeForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invoked when the current SSID changes.
Notes: interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeSSIDDidChange event type to register for SSID event notifications.
Use CWInterfaceMBS.ssidData or CWInterfaceMBS.ssid to query the current SSID.

138.18.27 virtualInterfaceStateChangedForWiFiInterfaceWithName(interfaceName as String)

MBS MacFrameworks Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invoked when any state of WiFi virtual interface changes.
Notes: interfaceName: The name of the Wi-Fi interface.

Use startMonitoring with the CWEventTypeVirtualInterfaceStateChanged event type to register for virtual interface state changed notifications.

138.18.28 Constants

Event Types

Constant	Value	Description
CWEventTypeBSSIDDidChange	3	Posted when the current BSSID of any Wi-Fi interface changes.
CWEventTypeCountryCodeDidChange	4	Posted when the adopted country code of any Wi-Fi interface cha
CWEventTypeLinkDidChange	5	Posted when the link state for any Wi-Fi interface changes.
CWEventTypeLinkQualityDidChange	6	Posted when the RSSI or transmit rate for any Wi-Fi interface ch
CWEventTypeModeDidChange	7	Posted when the operating mode of any Wi-Fi interface changes.
CWEventTypeNone	0	No event type specified.
CWEventTypePowerDidChange	1	Posted when the power state of any Wi-Fi interface changes.
CWEventTypeRangingReportEvent	10	Posted when WiFi ranging measurement completed.
CWEventTypeScanCacheUpdated	8	Posted when the scan cache of any Wi-Fi interface is updated wi results.
CWEventTypeSSIDDidChange	2	Posted when the current SSID of any Wi-Fi interface changes.
CWEventTypeVirtualInterfaceStateChanged	9	Posted when any state of any Wi-Fi virtual interface changes.

138.19 class DatagramMBS

138.19.1 class DatagramMBS

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a datagram.
Blog Entries

- MBS Xojo Plugins, version 19.1pr1

138.19.2 Properties

138.19.3 Address as String

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The address of the datagram.
Notes: This is an IPv4.
(Read and Write property)

138.19.4 Data as String

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The data of the datagram.
Notes: (Read and Write property)

138.19.5 Length as Integer

MBS Network Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Length of Data in bytes.
Notes: (Read and Write property)

138.19.6 Port as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The port of the datagram.
Notes: (Read and Write property)

138.19.7 rawAddress as MemoryBlock

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The raw address.
Notes: This is socket address structure as used in C.
(Read and Write property)

138.20 class DNSLookupMBS

138.20.1 class DNSLookupMBS

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for the result of a Lookup query.
Example:

```
Var d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MessageBox "No DNS Server available?"
else
MessageBox DNSLookupMBS.FormatIP(d.Address)
end if
```

138.20.2 Methods

138.20.3 Addresses(index as Integer) as string

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the address with the given index for this host.
Example:

```
Var d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MessageBox "No DNS Server available?"
else
```

```
Var c as Integer = d.AddressesCount-1
for i as Integer = 0 to c
MessageBox d.FormatIP(d.Addresses(i))
next
end if
```

Notes: Index from 0 to count-1.

138.20.4 Aliases(index as Integer) as string

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the aliasname for the given index.
Example:

```
Var d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MessageBox "No DNS Server available?"
else
Var c as Integer = d.AliasCount-1
for i as Integer = 0 to c
MessageBox d.Aliases(i)
next

end if
```

Notes: Index is from 0 to count-1.

138.20.5 FormatIP(ip as string) as string

MBS Network Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Formats an IP from binary representation into string representation.
Example:

```
Var s as string = DNSLookupMBS.ParseIPv4("65.66.67.68")

MessageBox s // in binary representation of that IP

Var t as string = DNSLookupMBS.FormatIP(s)

MessageBox t
```

Notes: Formats both IPv4 and IPv6 IP addresses in binary representation into human readable text.
On Windows IPv6 is only supported on Windows Vista and newer.
Returns empty string on failure.

138.20.6 LookupHostbyAddress(HostAddressBinary as string) as DNSLookupMBS

MBS Network Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the DNS server for information about a host IP address.
Example:

```
Var l as DNSLookupMBS
Var a as string

a = DNSLookupMBS.ParseIPv4("17.254.0.91")

// try it...
l = DNSLookupMBS.LookupHostbyAddress(a)

// success...
MessageBox l.Name
```

Notes: The address must be a 4 byte IP address like the ones returned by DNSLookupMBS.Address.
Returns nil on any error.

138.20.7 LookupHostbyAddressMT(HostAddressBinary as string) as DNSLookupMBS

MBS Network Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the DNS server for information about a host IP address.
Example:

```
Var l as DNSLookupMBS
Var a as string

a = DNSLookupMBS.ParseIPv4("17.254.0.91")

// try it...
l = DNSLookupMBS.LookupHostbyAddressMT(a)

// success...
MessageBox l.Name
```

Notes: Same as LookupHostbyAddress, but with additional multithreading.

The address must be a 4 byte IP address like the ones returned by DNSLookupMBS.Address.
Returns nil on any error.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

138.20.8 LookupHostbyName(HostName as string) as DNSLookupMBS

MBS Network Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the DNS server for information about a host name.
Example:

```
Var s as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.monkeybreadsoftware.de")

Var c as Integer = s.AddressesCount-1
for i as Integer = 0 to c
Var ss as string = s.Addresses(i)
print str(s.FormatIP(ss))
next
```

Notes: Will fail if you pass an IP as an host. (e.g. 10.20.30.40)
Returns nil on any error.
See also:

- 138.20.9 LookupHostbyName(HostName as string, AddressType as Integer) as DNSLookupMBS 18823

138.20.9 LookupHostbyName(HostName as string, AddressType as Integer) as DNSLookupMBS

MBS Network Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the DNS server for information about a host name.
Example:

```
Var s as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("ipv6.google.com", DNSLookupMBS.AddressTypeIPv6)

if s<>nil then
Var c as Integer = s.AddressesCount-1
for i as Integer = 0 to c
Var ss as string = s.Addresses(i)
```

```
print str(s.FormatIP(ss))
next
end if

s = DNSLookupMBS.LookupHostbyName("www.six.heise.de", DNSLookupMBS.AddressTypeIPv6)

if s<>nil then
Var c as Integer = s.AddressesCount-1
for i as Integer = 0 to c
Var ss as string = s.Addresses(i)
print str(s.FormatIP(ss))
next
end if
```

Notes: Will fail if you pass an IP as an host. (e.g. 10.20.30.40)
Returns nil on any error.

IPv6 on Windows does not work with this method.
See also:

- 138.20.8 LookupHostbyName(HostName as string) as DNSLookupMBS 18823

138.20.10 LookupHostbyNameMT(HostName as string) as DNSLookupMBS

MBS Network Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the DNS server for information about a host name.
Example:

```
Var s as DNSLookupMBS = DNSLookupMBS.LookupHostbyNameMT("www.monkeybreadsoftware.de")

Var c as Integer = s.AddressesCount-1
for i as Integer = 0 to c
Var ss as string = s.Addresses(i)
print str(s.FormatIP(ss))
next
```

Notes: Same as LookupHostbyName, but with additional multithreading.

Will fail if you pass an IP as an host. (e.g. 10.20.30.40)
Returns nil on any error.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

138.20.11 LookupHostbyNameMT(HostName as string, AddressType as Integer) as DNSLookupMBS

MBS Network Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the DNS server for information about a host name.
Example:

```
Var s as DNSLookupMBS = DNSLookupMBS.LookupHostbyNameMT("ipv6.google.com", DNSLookupMBS.AddressTypeIPv6)

if s<>nil then
Var c as Integer = s.AddressesCount-1
for i as Integer = 0 to c
Var ss as string = s.Addresses(i)
print str(s.FormatIP(ss))
next
end if

s = DNSLookupMBS.LookupHostbyNameMT("www.six.heise.de", DNSLookupMBS.AddressTypeIPv6)

if s<>nil then
Var c as Integer = s.AddressesCount-1
for i as Integer = 0 to c
Var ss as string = s.Addresses(i)
print str(s.FormatIP(ss))
next
end if
```

Notes: Same as LookupHostbyName, but with additional multithreading.

Will fail if you pass an IP as an host. (e.g. 10.20.30.40)
Returns nil on any error.

IPv6 on Windows does not work with this method.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

• 138.20.10 LookupHostbyNameMT(HostName as string) as DNSLookupMBS 18824

138.20.12 ParseIPv4(ip as string) as string

MBS Network Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses an IP address in IPv4 format.
Example:

```
Var s as string = DNSLookupMBS.ParseIPv4("65.66.67.68")

MessageBox s // in binary representation of that IP

Var t as string = DNSLookupMBS.FormatIP(s)

MessageBox t
```

Notes: Returns empty string on failure.
Works only for IPv4 strings.

138.20.13 ParseIPv6(ip as string) as string

MBS Network Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses an IP address in IPv6 format.
Example:

```
Var s as string = DNSLookupMBS.ParseIPv6("2001:0db8:85a3:08d3:1319:8a2e:0370:7344")

MessageBox s // in binary representation of that IP

Var t as string = DNSLookupMBS.FormatIP(s)

MessageBox t
```

Notes: Returns empty string on failure.
Works only for IPv6 strings.

138.20.14 Properties

138.20.15 Address as String

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The primary address of the host.
Example:

```
Var d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MessageBox "No DNS Server available?"
else
MessageBox DNSLookupMBS.FormatIP(d.Address)
end if
```

Notes: On TCP/IP based system the address is 4 bytes long binary string.
(Read and Write property)

138.20.16 AddressesCount as Integer

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of addresses for this host.
Example:

```
Var d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MessageBox "No DNS Server available?"
else
MessageBox str(d.AddressesCount)
end if
```

Notes: (Read and Write property)

138.20.17 AddressType as Integer

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of the address format.
Example:

```
Var d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MessageBox "No DNS Server available?"
else
MessageBox str(d.AddressType) // shows 2 for IPv4
```

```
end if
```

Notes: 2 for IPv2
10 for IPv10
(Read and Write property)

138.20.18 AliasCount as Integer

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of aliases for this host.
Example:

```
Var d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MessageBox "No DNS Server available?"
else
MessageBox str(d.AliasCount)
end if
```

Notes: (Read and Write property)

138.20.19 Name as String

MBS Network Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the host.
Example:

```
Var d as DNSLookupMBS = DNSLookupMBS.LookupHostbyName("www.apple.com")

if d=nil then
MessageBox "No DNS Server available?"
else
MessageBox d.Name
end if
```

Notes: (Read and Write property)

138.20.20 Constants

Constants

Constant	Value	Description
AddressTypeIPv4	2	One of the address types. An IPv4 address.
AddressTypeIPv6	10	One of the address types. An IPv6 address.

138.21 class DNSServiceAddrInfoMBS

138.21.1 class DNSServiceAddrInfoMBS

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Windows, Targets: All.

Function: The class to query IP Address for hostname asynchronously.
Notes: Queries for the IP address of a hostname by using either Multicast or Unicast DNS.
Subclass of the DNSServiceBaseMBS class.
Blog Entries

- MBS Xojo Plugins, version 18.1pr3
- MBS Xojo / Real Studio Plugins, version 16.5pr3
- MonkeyBread Software Releases the MBS Xojo / Real Studio plug-ins in version 15.0
- MBS Xojo / Real Studio Plugins, version 15.0pr8

138.21.2 Methods

138.21.3 AddrInfo(InterfaceIndex as Integer, protocol as Integer, HostName as string) as boolean

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Windows, Targets: All.

Function: Queries for the IP address of a hostname by using either Multicast or Unicast DNS.
Notes: interfaceIndex: The interface on which to issue the query. Passing 0 causes the query to be sent on all active interfaces via Multicast or the primary interface via Unicast.
protocol: Pass in kDNSServiceProtocol_IPv4 to look up IPv4 addresses, or kDNSServiceProtocol_IPv6 to look up IPv6 addresses, or both to look up both kinds. If neither flag is set, the system will apply an intelligent heuristic, which is (currently) that it will attempt to look up both, except:
If "hostname" is a wide-area unicast DNS hostname (i.e. not a ".local." name) but this host has no routable IPv6 address, then the call will not try to look up IPv6 addresses for "hostname", since any addresses it found would be unlikely to be of any use anyway. Similarly, if this host has no routable IPv4 address, the call will not try to look up IPv4 addresses for "hostname".

hostname: The fully qualified domain name of the host to be queried for.

Lasterror is set to kDNSServiceErr_NoError (0) on success (any subsequent, asynchronous errors are delivered to the callback), otherwise returns an error code indicating the error that occurred.

Returns false on any error and true on success. Please check lasterror property when false is returned.

138.21.4 Available as boolean

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Windows, Targets: All.

Function: Whether this class is available for use.
Notes: Older versions of Bonjour did not have such functions, so there it may not be available.

138.21.5 Events

138.21.6 ServiceAddrInfo(Flags as Integer, InterfaceIndex as Integer, ErrorCode as Integer, AddressFamily as Integer, IP as string, SockAddr as MemoryBlock, HostName as string, ttl as Integer)

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Windows, Targets: All.

Function: The event called when something is found.
Notes: Flags: Possible values are kDNSServiceFlagsMoreComing and kDNSServiceFlagsAdd.
interfaceIndex: The interface to which the answers pertain.
errorCode: Will be kDNSServiceErr_NoError (0) on success, otherwise will indicate the failure that occurred. Other parameters are undefined if errorCode is nonzero.
hostname: The fully qualified domain name of the host to be queried for.
address: IPv4 or IPv6 address.
ttl: If the client wishes to cache the result for performance reasons, the TTL indicates how long the client may legitimately hold onto this result, in seconds. After the TTL expires, the client should consider the result no longer valid, and if it requires this data again, it should be re-fetched with a new query. Of course, this only applies to clients that cancel the asynchronous operation when they get a result. Clients that leave the asynchronous operation running can safely assume that the data remains valid until they get another callback telling them otherwise.

138.21.7 Constants

Address families

Constant	Value	Description
kAddressFamilyIPv4	2	IPv4 protocol
kAddressFamilyIPv6	30	IPv6 protocol

Protocols

Constant	Value	Description
kProtocolAuto	0	Automatic decide.
kProtocolIPv4	1	IPv4 protocol
kProtocolIPv6	2	IPv6 protocol

138.22 class DNSServiceBaseMBS

138.22.1 class DNSServiceBaseMBS

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: The base DNS Service class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.1pr1
- MBS Xojo / Real Studio Plugins, version 14.2pr4

138.22.2 Methods

138.22.3 Available as boolean

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Whether Bonjour (zeroconfig) is installed and useable.
Notes: If this function returns true, all the needed stuff is installed and the function have been loaded.

138.22.4 Close

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Stops the current request and releases all used memory.
Notes: This is done automatically for you by the destructor.

138.22.5 ConstructFullName(Service as string, regtype as string, domain as string) as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Concatenate a three-part domain name (as returned by the above callbacks) into a properly-escaped full domain name.
Notes: Note that events in the above functions ALREADY ESCAPE strings where necessary.

service: The service name - any dots or backslashes must NOT be escaped. May be "" (to construct a PTR record name, e.g. "_ftp._tcp.apple.com.").
regtype: The service type followed by the protocol, separated by a dot (e.g. "_ftp._tcp").
domain: The domain name, e.g. "apple.com.". Literal dots or backslashes, if any, must be escaped, e.g.

"1st\. Floor.apple.com."

Returns 0 on success, -1 on error.

138.22.6 GetDaemonVersion as Integer

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Queries the version of the daemon.
Notes: Value is zero on any error.

138.22.7 Initialize

MBS Network Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Initializes API.
Notes: On Windows the plugin calls this internally at startup of application.
Now if your app installs Bonjour while running, you can call this method to let the plugin load the bonjour dll.
After successful call, the available functions return true.

Does nothing on Mac OS X or Linux.

138.22.8 Running as boolean

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: True if there is a running request.

138.22.9 Properties

138.22.10 Handle as Integer

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: The handle for this request.
Notes: (Read and Write property)

138.22.11 Lasterror as Integer

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: The last error code reported.
Notes: 0 if the function succeeded.
-1 if the function used was not available.
See the kError constants for possible errors.
(Read and Write property)

138.22.12 Constants

Constants

Constant	Value	Description
kClassIN	1	The DNS class for Internet services.
kErrorAlreadyRegistered	-65547	One of the error constants.
kErrorBadFlags	-65543	One of the error constants.
kErrorBadInterfaceIndex	-65552	One of the error constants.
kErrorBadParam	-65540	One of the error constants.
kErrorBadReference	-65541	One of the error constants.
kErrorBadState	-65542	One of the error constants.
kErrorBadTime	-65559	One of the error constants.
kErrorDoubleNAT	-65558	One of the error constants.
kErrorFirewall	-65550	One of the error constants.
kErrorIncompatible	-65551	One of the error constants.
kErrorInvalid	-65549	One of the error constants.
kErrorNameConflict	-65548	One of the error constants.
kErrorNATTraversal	-65557	One of the error constants.
kErrorNoAuth	-65555	One of the error constants.
kErrorNoError	0	One of the error constants.
kErrorNoMemory	-65539	One of the error constants.
kErrorNoSuchKey	-65556	One of the error constants.
kErrorNoSuchName	-65538	One of the error constants.
kErrorNoSuchRecord	-65554	One of the error constants.
kErrorNotInitialized	-65545	One of the error constants.
kErrorRefused	-65553	One of the error constants.
kErrorUnknown	-65537	One of the error constants.
kErrorUnsupported	-65544	One of the error constants.
kFlagsAdd	2	A flag for domain enumeration and browse/query events. "Default" applies only to enumeration and is only valid in conjuction with "Add". An enumeration callback with the "Add" flag NOT set indicates a "Remove", i.e. the domain is no longer valid.
kFlagsAllowRemoteQuery	&h200	Flag for creating a record for which we will answer remote queries (queries from hosts more than one hop away; hosts not directly connected to the local link).
kFlagsBrowseDomains	&h40	Flags for specifying domain enumeration type in DNSServiceEnumerateDomains. BrowseDomains enumerates domains recommended for browsing, RegistrationDomains enumerates domains recommended for registration.
kFlagsDefault	4	A flag for domain enumeration and browse/query events. "Default" applies only to enumeration and is only valid in conjuction with "Add". An enumeration callback with the "Add" flag NOT set indicates a "Remove", i.e. the domain is no longer valid.
kFlagsForceMulticast	&h400	One of the flags. Flag for signifying that a query or registration should be performed exclusively via multicast DNS, even for a name in a domain (e.g. foo.apple.com.) that would normally imply unicast DNS.
kFlagsLongLivedQuery	&h100	Flag for creating a long-lived unicast query for the QueryRecord call.
kFlagsMoreComing	1	One of the flags used for the events. MoreComing indicates to a callback that at least one more result is queued and will be delivered following immediately after this one. Applications should not update their UI to display browse results when the MoreComing flag is set, because this would result in a great deal of ugly flickering on the screen. Applications should instead wait until until MoreComing is not set, and then update their UI. When MoreComing is not set, that doesn't mean there will be no more answers EVER, just that there are no more answers immediately available right now at this instant. If more answers become available in the future they will be delivered as usual.
kFlagsNoAutoRename	8	The flag for specifying renaming behavior on name conflict when registering non-shared records. By default, name conflicts are automatically handled by renaming the service. NoAutoRename overrides this behavior - with this flag set, name conflicts will result in a callback. The NoAutorename flag is only valid if a name is explicitly

138.23 class DNSServiceBrowseMBS

138.23.1 class DNSServiceBrowseMBS

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: A class for Apple's implementation of ZeroConfig named Bonjour.
Notes: This class allows you to browse for services on the local network using Rendezvous.

This class requires Mac OS X 10.3 or Windows (with installed Bonjour support and the dnssd.dll) to work. Use DNSServiceDiscoveryBrowseMBS if you want to support Mac OS X 10.2.

common error codes:

kDNSServiceErr_NoError	= 0
kDNSServiceErr_Unknown	= -65537 (=&hFFFE FFFF)
kDNSServiceErr_NoSuchName	= -65538
kDNSServiceErr_NoMemory	= -65539
kDNSServiceErr_BadParam	= -65540
kDNSServiceErr_BadReference	= -65541
kDNSServiceErr_BadState	= -65542
kDNSServiceErr_BadFlags	= -65543
kDNSServiceErr_Unsupported	= -65544
kDNSServiceErr_NotInitialized	= -65545
kDNSServiceErr_AlreadyRegistered	= -65547
kDNSServiceErr_NameConflict	= -65548
kDNSServiceErr_Invalid	= -65549
kDNSServiceErr_Incompatible	= -65551 (client library incompatible with daemon)
kDNSServiceErr_BadinterfaceIndex	= -65552

Subclass of the DNSServiceBaseMBS class.

138.23.2 Methods

138.23.3 Browse(InterfaceIndex as Integer, servicetype as string, domain as string) as boolean

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: Asynchronously create a DNS Service browser to search for matching services in the local network.
Notes: servicetype:
The type of service.

domain:
The domain in which to find the service.

Returns true if successful.
The ServiceBrowse event may be called till this browse request is closed.

You need to keep this object alive (keep a reference in a window, a module or your app class) so you can receive events.

In a perfect application you use DNSServiceDomainEnumerationMBS class to enumerate which domains you should use.

Returns false on any error and true on success. Please check lasterror property when false is returned.

138.23.4 Events

138.23.5 ServiceBrowse(Flags as Integer, InterfaceIndex as Integer, ErrorCode as Integer, ServiceName as string, RegType as string, Domain as string)

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: New service found or lost one.
Example:

```
sub ServiceBrowse(Flags as Integer, InterfaceIndex as Integer, ErrorCode as Integer, ServiceName as string,
RegType as string, Domain as string)
// example for event implementation

const kDNSServiceFlagsAdd = 2
const kDNSServiceFlagsRemove = 0
const kDNSServiceFlagsMoreComing = 1
const kDNSServiceFlagsFinished = 0

Var Added as boolean = bitwiseAnd(flags, kDNSServiceFlagsAdd) = kDNSServiceFlagsAdd
Var Removed as boolean = bitwiseAnd(flags, kDNSServiceFlagsAdd) = kDNSServiceFlagsRemove

Var MoreComing as boolean = bitwiseAnd(flags, kDNSServiceFlagsMoreComing) = kDNSServiceFlagsMore-
Coming
Var Finished as boolean = bitwiseAnd(flags, kDNSServiceFlagsMoreComing) = kDNSServiceFlagsFinished

// work with the booleans to decide what to do.

end sub
```

Notes: Values for flags:

kDNSServiceFlagsAdd	= 2
kDNSServiceFlagsRemove	= 0 (i.e. bit not set)
kDNSServiceFlagsMoreComing	= 1
kDNSServiceFlagsFinished	= 0 (i.e. bit not set)

MoreComing indicates to a Browse callback that another result is queued. Applications should not update their UI to display browse results when the MoreComing flag is set, instead deferring the update until the callback's flag is Finished.

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

InterfaceIndex can be kInterfaceIndexLocalOnly, kInterfaceIndexAny or a positive index for the interface index (1 = first device).
For interface indexes, please also check NetworkInterfaceMBS class.

138.24 class DNSServiceDiscoveryBrowseMBS

138.24.1 class DNSServiceDiscoveryBrowseMBS

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use DNSServiceBrowseMBS instead. **Function:** A class for Apple's implementation of ZeroConfig named Bonjour.
Notes: This class allows you to browse for services on the local network using Bonjour.

Common error codes for Rendevouz:

kDNSServiceDiscoveryUnknownErr	-65537
kDNSServiceDiscoveryNoSuchNameErr	-65538
kDNSServiceDiscoveryNoMemoryErr	-65539
kDNSServiceDiscoveryBadParamErr	-65540
kDNSServiceDiscoveryBadReferenceErr	-65541
kDNSServiceDiscoveryBadStateErr	-65542
kDNSServiceDiscoveryBadFlagsErr	-65543
kDNSServiceDiscoveryUnsupportedErr	-65544
kDNSServiceDiscoveryNotInitializedErr	-65545
kDNSServiceDiscoveryNoCache	-65546
kDNSServiceDiscoveryAlreadyRegistered	-65547
kDNSServiceDiscoveryNameConflict	-65548
kDNSServiceDiscoveryInvalid	-65549
kDNSServiceDiscoveryMemFree	-65792

But several other Mac OS error codes may also be there.
This class requires Mac OS X 10.2 to work. Use DNSServiceBrowseMBS if you want to support Mac OS X 10.3 and Windows.

Not available on Mac OS X 10.9.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr4
- MBS Xojo / Real Studio Plugins, version 13.2pr7

138.24.2 Methods

138.24.3 Available as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether Bonjour (zeroconfig) is installed.
Notes: If this function returns true, all the needed stuff is installed and the function have been loaded.

138.24.4 Browse(servicetype as string, domain as string) as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Asynchronously create a DNS Service browser to search for matching services in the local network.
Notes: servicetype:
The type of service.

domain:
The domain in which to find the service.

Returns true if successful.
The ServiceBrowse event may be called till this browse request is closed.

138.24.5 Close

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Stops the current request and releases all used memory.

138.24.6 Running as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: True if there is a running request.

138.24.7 Properties

138.24.8 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The handle for this request.
Notes: (Read only property)

138.24.9 Events

138.24.10 ServiceBrowse(message as Integer, name as string, type as string, domain as string, flags as Integer)

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: New service found or lost one.
Notes: If message=0 a new service was found. Message=1 means that a service was removed.
Flags=1 means that more data is coming. Flags=0 means the end of the current list of services. But several minutes later when a new Mac connects to the network another ServiceBrowse Event may inform you, even if flags was 0.

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

138.25 class DNSServiceDiscoveryDomainEnumerationMBS

138.25.1 class DNSServiceDiscoveryDomainEnumerationMBS

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use DNSServiceDomainEnumerationMBS instead. **Function:** A class for Apple's implementation of ZeroConfig named Bonjour.
Notes: This class allows you to enumerate domains.

Common error codes for Rendevouz:

kDNSServiceDiscoveryUnknownErr	-65537
kDNSServiceDiscoveryNoSuchNameErr	-65538
kDNSServiceDiscoveryNoMemoryErr	-65539
kDNSServiceDiscoveryBadParamErr	-65540
kDNSServiceDiscoveryBadReferenceErr	-65541
kDNSServiceDiscoveryBadStateErr	-65542
kDNSServiceDiscoveryBadFlagsErr	-65543
kDNSServiceDiscoveryUnsupportedErr	-65544
kDNSServiceDiscoveryNotInitializedErr	-65545
kDNSServiceDiscoveryNoCache	-65546
kDNSServiceDiscoveryAlreadyRegistered	-65547
kDNSServiceDiscoveryNameConflict	-65548
kDNSServiceDiscoveryInvalid	-65549
kDNSServiceDiscoveryMemFree	-65792

But several other Mac OS error codes may also be there.
This class requires Mac OS X 10.2 to work. Use DNSServiceDomainEnumerationMBS if you want to support Mac OS X 10.3 and Windows.

Not available on Mac OS X 10.9.

- MBS Xojo / Real Studio Plugins, version 13.2pr7

138.25.2 Methods

138.25.3 Available as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether Bonjour (zeroconfig) is installed.
Notes: If this function returns true, all the needed stuff is installed and the function have been loaded.

138.25.4 Close

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Stops the current request and releases all used memory.

138.25.5 EnumerateDomains(domaintype as Integer) as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Asynchronously create a DNS Domain Enumerator to search for domains in the local network.
Notes: domaintype:
A flag indicating whether you are looking for recommended registration domains (value=1, e.g. equivalent to the AppleTalk zone list in the AppleTalk Control Panel) or recommended browsing domains (value=0, e.g. equivalent to the AppleTalk zone list in the Chooser).

Returns true if successful.
The ServiceDomainEnumeration event may be called till this enumerate request is closed.

138.25.6 Running as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: True if there is a running request.

138.25.7 Properties

138.25.8 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The handle for this request.
Notes: (Read only property)

138.25.9 Events

138.25.10 ServiceDomainEnumeration(message as Integer, domain as string, flags as Integer)

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Domains changed.
Notes: Meaning of message:

0: Domain found.
1: Domain found (and should be selected by default).
2: Domain has been removed from network.

Flags=1 means that more data is coming. Flags=0 means the end of the current list of services. But several minutes later when a new Mac connects to the network another ServiceLookup Event may inform you, even if flags was 0.

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

138.26 class DNSServiceDiscoveryRegisterMBS

138.26.1 class DNSServiceDiscoveryRegisterMBS

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use DNSServiceRegisterMBS instead. **Function:** A class for Apple's implementation of ZeroConfig named Bonjour.
Notes: This class allows you to register names on the local network using Bonjour.

Common error codes for Rendevouz:

kDNSServiceDiscoveryUnknownErr	-65537
kDNSServiceDiscoveryNoSuchNameErr	-65538
kDNSServiceDiscoveryNoMemoryErr	-65539
kDNSServiceDiscoveryBadParamErr	-65540
kDNSServiceDiscoveryBadReferenceErr	-65541
kDNSServiceDiscoveryBadStateErr	-65542
kDNSServiceDiscoveryBadFlagsErr	-65543
kDNSServiceDiscoveryUnsupportedErr	-65544
kDNSServiceDiscoveryNotInitializedErr	-65545
kDNSServiceDiscoveryNoCache	-65546
kDNSServiceDiscoveryAlreadyRegistered	-65547
kDNSServiceDiscoveryNameConflict	-65548
kDNSServiceDiscoveryInvalid	-65549
kDNSServiceDiscoveryMemFree	-65792

But several other Mac OS error codes may also be there.
This class requires Mac OS X 10.2 to work. Use DNSServiceRegisterMBS if you want to support Mac OS X 10.3 and Windows.

Not available on Mac OS X 10.9.

138.26.2 Methods

138.26.3 Available as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether Bonjour (zeroconfig) is installed.
Notes: If this function returns true, all the needed stuff is installed and the function have been loaded.

138.26.4 Close

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Stops the current request and releases all used memory.

138.26.5 Register(servicename as string, servicetype as string, domain as string, port as Integer, text as string) as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Register a named service with DNS Service Discovery.
Notes: servicename:
The name of this service instance (e.g. "Steve's Printer")

servicetype:
The service type (e.g. "_printer._tcp."
See RFC 2782 (DNS SRV) and this website:
http://www.iana.org/assignments/port-numbers

domain:
The domain in which to register the service (e.g. "apple.com.")

port:
The local port on which this service is being offered (in network byte order)

text:
Optional protocol-specific additional information

Returns true if successful.
The ServiceRegistration event may be called till this registration request is closed.

138.26.6 Running as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: True if there is a running request.

138.26.7 UpdateText(data as string, ttl as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Changes the TXT Record.
Notes: data is the TXT Record composed of Pascal Strings.
ttl = time to live.
Returns an error code. (0=success)

138.26.8 Properties

138.26.9 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The handle for this request.
Notes: (Read only property)

138.26.10 Text as String

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last TXT Record text used.
Notes: (Read only property)

138.26.11 Events

138.26.12 ServiceRegistration(errorcode as Integer)

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Registration was done.
Notes: errorcode is 0 if successful.

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

138.27 class DNSServiceDiscoveryResolveMBS

138.27.1 class DNSServiceDiscoveryResolveMBS

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use DNSServiceResolveMBS instead. **Function:** A class for Apple's implementation of ZeroConfig named Bonjour.
Notes: This class allows you to lookup names on the local network using Bonjour.

Common error codes for Rendevouz:

kDNSServiceDiscoveryUnknownErr	-65537
kDNSServiceDiscoveryNoSuchNameErr	-65538
kDNSServiceDiscoveryNoMemoryErr	-65539
kDNSServiceDiscoveryBadParamErr	-65540
kDNSServiceDiscoveryBadReferenceErr	-65541
kDNSServiceDiscoveryBadStateErr	-65542
kDNSServiceDiscoveryBadFlagsErr	-65543
kDNSServiceDiscoveryUnsupportedErr	-65544
kDNSServiceDiscoveryNotInitializedErr	-65545
kDNSServiceDiscoveryNoCache	-65546
kDNSServiceDiscoveryAlreadyRegistered	-65547
kDNSServiceDiscoveryNameConflict	-65548
kDNSServiceDiscoveryInvalid	-65549
kDNSServiceDiscoveryMemFree	-65792

But several other Mac OS error codes may also be there.
This class requires Mac OS X 10.2 to work. Use DNSServiceResolveMBS if you want to support Mac OS X 10.3 and Windows.

Not available on Mac OS X 10.9.
Blog Entries

138.27.2 Methods

138.27.3 Available as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether Bonjour (zeroconfig) is installed.
Notes: If this function returns true, all the needed stuff is installed and the function have been loaded.

138.27.4 Close

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Stops the current request and releases all used memory.

138.27.5 Lookup(servicename as string, servicetype as string, domain as string) as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Resolved a named instance of a service to its address, port, and (optionally) a text description.
Notes: servicename:
The name of the service instance.

servicetype:
The type of service.

domain:
The domain in which to find the service.

Returns true if successful.
The ServiceLookup event may be called till this lookup request is closed.

138.27.6 Running as boolean

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: True if there is a running request.

138.27.7 Properties

138.27.8 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The handle for this request.
Notes: (Read only property)

138.27.9 Events

138.27.10 ServiceLookup(ip as string, port as Integer, text as string, flags as Integer)

MBS MacOSX Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Lookup got something.
Notes: IP is a string like "192.168.1.14".
Flags=1 means that more data is coming. Flags=0 means the end of the current list of services. But several minutes later when a new Mac connects to the network another ServiceLookup Event may inform you, even if flags was 0.

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

138.28 class DNSServiceDomainEnumerationMBS

138.28.1 class DNSServiceDomainEnumerationMBS

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: A class for Apple's implementation of ZeroConfig named Bonjour.
Notes: This class allows you to enumerate domains.

This class requires Mac OS X 10.3 or Windows (with installed Bonjour support and the dnssd.dll) to work. Use DNSServiceDiscoveryBrowseMBS if you want to support Mac OS X 10.2.

common error codes:

kDNSServiceErr_NoError	= 0
kDNSServiceErr_Unknown	= -65537 (=&hFFFE FFFF)
kDNSServiceErr_NoSuchName	= -65538
kDNSServiceErr_NoMemory	= -65539
kDNSServiceErr_BadParam	= -65540
kDNSServiceErr_BadReference	= -65541
kDNSServiceErr_BadState	= -65542
kDNSServiceErr_BadFlags	= -65543
kDNSServiceErr_Unsupported	= -65544
kDNSServiceErr_NotInitialized	= -65545
kDNSServiceErr_AlreadyRegistered	= -65547
kDNSServiceErr_NameConflict	= -65548
kDNSServiceErr_Invalid	= -65549
kDNSServiceErr_Incompatible	= -65551 (client library incompatible with daemon)
kDNSServiceErr_BadinterfaceIndex	= -65552

Subclass of the DNSServiceBaseMBS class.

138.28.2 Methods

138.28.3 EnumerateDomains(Flags as Integer, InterfaceIndex as Integer) as boolean

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: Asynchronously enumerate domains available for browsing and registration.
Notes: Note that the names returned are (like all of DNS-SD) UTF-8 strings, and are escaped using standard DNS escaping rules.
A graphical browser displaying a hierarchical tree-structured view should cut the names at the bare dots to yield individual labels, then de-escape each label according to the escaping rules, and then display the

resulting UTF-8 text.

Flags for specifying domain enumeration type in DNSServiceEnumerateDomains.
BrowseDomains enumerates domains recommended for browsing, RegistrationDomains enumerates domains recommended for registration:

```
kDNSServiceFlagsBrowseDomains          = 64
kDNSServiceFlagsRegistrationDomains    = 128
```

You need to keep this object alive (keep a reference in a window, a module or your app class) so you can receive events.
For interface indexes, please also check NetworkInterfaceMBS class.

Returns false on any error and true on success. Please check lasterror property when false is returned.

138.28.4 Events

138.28.5 ServiceDomainEnumeration(flags as Integer, interfaceIndex as Integer, errorcode as Integer, Domain as string)

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: Domains changed.
Notes: Flags uses this flags: kFlagsAdd, kFlagsDefault.

"Default" applies only to enumeration and is only valid in conjuction with "Add"

Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.
For interface indexes, please also check NetworkInterfaceMBS class.

138.29 class DNSServiceMetaQueryMBS

138.29.1 class DNSServiceMetaQueryMBS

MBS MacOSX Plugin, Plugin Version: 12.0, Platforms: macOS, iOS, Targets: All.

Function: Queries all Bonjour services.
Notes: Useful to learn what services are available. This queries the bonjour cache.

138.29.2 Properties

138.29.3 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 12.0, Platforms: macOS, iOS, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

138.29.4 Events

138.29.5 AddService(type as string, domain as string, interfaceName as string, rrtype as Integer, rrclass as Integer)

MBS MacOSX Plugin, Plugin Version: 12.0, Platforms: macOS, iOS, Targets: All.

Function: A service was found.

138.29.6 RemoveService(type as string, domain as string, interfaceName as string, rrtype as Integer, rrclass as Integer)

MBS MacOSX Plugin, Plugin Version: 12.0, Platforms: macOS, iOS, Targets: All.

Function: A service was removed.
Notes: Remove is only called when a network interface is disabled or if the record expires from the cache. For network efficiency reasons, clients do not send goodbye packets for meta-query PTR records when deregistering a service.

138.30 class DNSServiceRegisterMBS

138.30.1 class DNSServiceRegisterMBS

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: A class for Apple's implementation of ZeroConfig named Bonjour.
Notes: This class allows you to register names on the local network using Bonjour.

This class requires Mac OS X 10.3 or Windows (with installed Bonjour support and the dnssd.dll) to work.
Use DNSServiceDiscoveryBrowseMBS if you want to support Mac OS X 10.2.

common error codes:

kDNSServiceErr_NoError	= 0
kDNSServiceErr_Unknown	= -65537 (=&hFFFE FFFF)
kDNSServiceErr_NoSuchName	= -65538
kDNSServiceErr_NoMemory	= -65539
kDNSServiceErr_BadParam	= -65540
kDNSServiceErr_BadReference	= -65541
kDNSServiceErr_BadState	= -65542
kDNSServiceErr_BadFlags	= -65543
kDNSServiceErr_Unsupported	= -65544
kDNSServiceErr_NotInitialized	= -65545
kDNSServiceErr_AlreadyRegistered	= -65547
kDNSServiceErr_NameConflict	= -65548
kDNSServiceErr_Invalid	= -65549
kDNSServiceErr_Incompatible	= -65551 (client library incompatible with daemon)
kDNSServiceErr_BadinterfaceIndex	= -65552

Subclass of the DNSServiceBaseMBS class.

- Using ServerSocket with a system chosen port

138.30.2 Methods

138.30.3 AddRecord(rrType as Integer, TXTRecord as string, ttl as Integer)

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Windows, Targets: All.

Function: Add a record to a registered service.
Notes: Lasterror is set.

The name of the record will be the same as the registered service's name. The record can later be updated or deregistered by UpdateRecord() or RemoveRecord().

rrtype: The type of the record (e.g. kTypeTXT, kTypeSRV, etc)
data: The raw rdata to be contained in the added resource record.
ttl: The time to live of the resource record, in seconds. Pass 0 to use a default value.

Returns false on any error and true on success. Please check lasterror property when false is returned.

138.30.4 Register(Flags as Integer, interfaceIndex as Integer, servicename as string, servicetype as string, domain as string, host as string, port as Integer, txtRecord as string) as boolean

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: Register a service that is discovered via Browse() and Resolve() calls.
Notes: Flag for specifying renaming behavior on name conflict when registering non-shared records. NoAutorename is only valid if a name is explicitly specified when registering a service (ie the default name is not used.)

```
kDNSServiceFlagsNoAutoRename    = 8,
 kDNSServiceFlagsAutoRename     = 0 (i.e. bit not set)
```

You need to keep this object alive (keep a reference in a window, a module or your app class) so you can receive events.

In a perfect application you use DNSServiceDomainEnumerationMBS class to enumerate which domains you should use.
For interface indexes, please also check NetworkInterfaceMBS class.

Returns false on any error and true on success. Please check lasterror property when false is returned.

138.30.5 RemoveRecord

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Windows, Targets: All.

Function: Remove a record previously added to a service record set via AddTextRecord.
Notes: Returns false on any error and true on success. Please check lasterror property when false is returned.

138.30.6 UpdateRecord(TXTRecord as string, ttl as Integer)

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Changes the TXT Record.
Notes: data is the TXT Record composed of Pascal Strings.
ttl = time to live.

Returns false on any error and true on success. Please check lasterror property when false is returned.

138.30.7 Events

138.30.8 ServiceRegistration(flags as Integer, errorcode as Integer, Name as string, RegType as string, Domain as string)

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: Registration was done.
Notes: Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

138.31 class DNSServiceRegisterRecordMBS

138.31.1 class DNSServiceRegisterRecordMBS

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Windows, Targets: All.

Function: A class for Apple's implementation of ZeroConfig named Bonjour.
Notes: This class is to register a name record with the dns service.
Subclass of the DNSServiceBaseMBS class.

138.31.2 Methods

138.31.3 RegisterRecord(Flags as Integer, interfaceIndex as Integer, fullname as string, rrtype as Integer, rrClass as Integer, data as string, ttl as Integer) as boolean

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Windows, Targets: All.

Function: Registers a record on the DNS system.
Example:

```
const kDNSServiceClass_IN = 1
const kDNSServiceType_SRV = 33
const kDNSServiceFlagsShared = &h10
const kDNSServiceFlagsUnique = &h20
```

Notes: flags: Possible values are kDNSServiceFlagsShared or kDNSServiceFlagsUnique (see flag type definitions for details).
interfaceIndex: If non-zero, specifies the interface on which to register the record (the index for a given interface is determined via the if_nametoindex() family of calls.) Passing 0 causes the record to be registered on all interfaces. See "Constants for specifying an interface index" for more details.
fullname: The full domain name of the resource record.
rrtype: The numerical type of the resource record (e.g. kDNSServiceType_PTR, kDNSServiceType_SRV, etc)
rrclass: The class of the resource record (usually kDNSServiceClass_IN)
data: the raw rdata, as it is to appear in the DNS record.
ttl: The time to live of the resource record, in seconds. Pass 0 to use a default value.

Lasterror is set. kDNSServiceErr_NoError on success (any subsequent, asynchronous errors are delivered to the event), otherwise returns an error code indicating the error that occurred (the event is never invoked)

You need to keep this object alive (keep a reference in a window, a module or your app class) so you can receive events.
For interface indexes, please also check NetworkInterfaceMBS class.

Returns false on any error and true on success. Please check lasterror property when false is returned.

138.31.4 UpdateRecord(TXTRecord as string, ttl as Integer)

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Windows, Targets: All.

Function: Changes the TXT Record.
Notes: data is the TXT Record composed of Pascal Strings.
ttl = time to live.

Returns false on any error and true on success. Please check lasterror property when false is returned.

138.31.5 Events

138.31.6 ServiceRegistration(flags as Integer, errorcode as Integer)

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Windows, Targets: All.

Function: Registration was done.
Notes: Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.

138.32 class DNSServiceResolveMBS

138.32.1 class DNSServiceResolveMBS

MBS Network Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: A class for Apple's implementation of ZeroConfig named Bonjour.
Notes: This class allows you to lookup names on the local network using Bonjour.

This class requires Mac OS X 10.3 or Windows (with installed Bonjour support and the dnssd.dll) to work. Use DNSServiceDiscoveryBrowseMBS if you want to support Mac OS X 10.2.

common error codes:

```
kDNSServiceErr_NoError              = 0
kDNSServiceErr_Unknown              = -65537 (=&hFFFE FFFF)
kDNSServiceErr_NoSuchName           = -65538
kDNSServiceErr_NoMemory             = -65539
kDNSServiceErr_BadParam             = -65540
kDNSServiceErr_BadReference         = -65541
kDNSServiceErr_BadState             = -65542
kDNSServiceErr_BadFlags             = -65543
kDNSServiceErr_Unsupported          = -65544
kDNSServiceErr_NotInitialized       = -65545
kDNSServiceErr_AlreadyRegistered    = -65547
kDNSServiceErr_NameConflict         = -65548
kDNSServiceErr_Invalid              = -65549
kDNSServiceErr_Incompatible         = -65551 (client library incompatible with daemon)
kDNSServiceErr_BadinterfaceIndex    = -65552
```

Subclass of the DNSServiceBaseMBS class.

138.32.2 Methods

138.32.3 Resolve(InterfaceIndex as Integer, servicename as string, servicetype as string, domain as string) as boolean

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Resolves a named instance of a service to its address, port, and (optionally) a text description.
Notes: You need to keep this object alive (keep a reference in a window, a module or your app class) so you can receive events.

If you call this method in response to a browse call, please pass the domain string you got in the Service-

Browse event and do not replace it with something else.
For interface indexes, please also check NetworkInterfaceMBS class.

Returns false on any error and true on success. Please check lasterror property when false is returned.

138.32.4 Events

138.32.5 ServiceResolve(flags as Integer, InterfaceIndex as Integer, ErrorCode as Integer, Fullname as string, Hosttarget as string, Port as Integer, TxtRecord as string)

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Resolve got something.
Notes: Starting a new query from within this event on the same object can cause problems. Better you create a new instance for another query if you need one.
For interface indexes, please also check NetworkInterfaceMBS class.

138.33 class NetSNMPMBS

138.33.1 class NetSNMPMBS

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The class to do SNMP queries.
Example:

```
Var s as new NetSNMPMBS

s.Community = "demopublic"
s.IP = "test.net-snmp.org"

Var r as string = s.Query("system.sysUpTime.0")

MessageBox r
```

Notes: Performs a SNMP GET query.
Using version 1, no authentication and no security options.

- 15.5, page 9: News

138.33.2 Methods

138.33.3 Constructor

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The constructor.

138.33.4 Destructor

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The destructor.

138.33.5 Query(ObjectID as String) as String

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: Peforms a SNMP Get Query
Example:

```
Var s as new NetSNMPMBS

s.Community = "demopublic"
s.IP = "test.net-snmp.org"

Var r as string = s.Query("system.sysUpTime.0")

MessageBox r
```

Notes: Please set community and IP properties before.
Lasterror and ErrorMessage properties are set.

138.33.6 QueryMT(ObjectID as String) as String

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: Peforms a SNMP Get Query
Example:

```
Var s as new NetSNMPMBS

s.Community = "demopublic"
```

```
s.IP = "test.net-snmp.org"

Var r as string = s.Query("system.sysUpTime.0")

MessageBox r
```

Notes: Please set community and IP properties before.
Lasterror and ErrorMessage properties are set.

Same as Query, but thread friendly.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

138.33.7 Properties

138.33.8 AuthProtocol as Integer

MBS Network Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Targets: All.

Function: The authentication protocol to use.
Notes: (Read and Write property)

138.33.9 Community as String

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The community name to use.
Notes: e.g. "public"
(Read and Write property)

138.33.10 ErrorMessage as String

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The last error message as text.
Notes: (Read and Write property)

138.33.11 IP as String

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The IP and port to connect to.
Notes: e.g. "192.168.2.5:1234"
(Read and Write property)

138.33.12 LastError as Integer

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

138.33.13 MaximumReceiveBufferSize as Integer

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: The maximum bytes to allocate for receiving buffer.
Notes: By default 100000 bytes.
(Read and Write property)

138.33.14 Password as String

MBS Network Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Targets: All.

Function: The passphrase to use.
Notes: For authentication with password.
(Read and Write property)

138.33.15 Retries as Integer

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: Number of retries.
Notes: Default is -1 to use system default.
(Read and Write property)

138.33.16 SecurityLevel as Integer

MBS Network Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Targets: All.

Function: The security level to use.
Notes: (Read and Write property)

138.33.17 SecurityName as String

MBS Network Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Targets: All.

Function: The SNMPv3 user name.
Notes: (Read and Write property)

138.33.18 TimeOut as Integer

MBS Network Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Targets: All.

Function: Timeout in seconds.
Notes: Default is -1 to use system default.
(Read and Write property)

138.33.19 Version as Integer

MBS Network Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Targets: All.

Function: The version to use.
Example:

```
Var s As New NetSNMPMBS

// setup login via SMNPv3
s.AuthProtocol = s.AuthProtocolHMACMD5
s.SecurityName = "username"
s.Password = "test"
s.SecurityLevel = s.SecurityLevelAuthPriv
s.Version = s.Version3
```

Notes: Defaults to Version 1.
(Read and Write property)

138.33.20 Constants

Authentication Protocols

Constant	Value	Description
AuthProtocolAESPriv	6	AES Priv
AuthProtocolDESPriv	5	DES Priv
AuthProtocolHMACMD5	2	HMAC MD5
AuthProtocolHMACSHA1	3	HMAC SHA1
AuthProtocolNone	1	No authentication.
AuthProtocolNoPriv	4	No Priv

Security Levels

Constant	Value	Description
SecurityLevelAuthNoPriv	2	Auth means there is cryptographic authentication. It uses MD5 or SHA for this purpose. The authentication mechanism is actually applied to the associated user using the snmp-server user command. The NoPriv remains in this security model as described above.
SecurityLevelAuthPriv	3	As in the previous model, Auth means cryptographic authentication is employed. Priv indicates that the whole SNMP packet is encrypted, which means if the packet is intercepted, it cannot be deciphered.
SecurityLevelNoAuth	1	NoAuth means no cryptographic authentication. Credentials (username and password) are still used, but there is no cryptographic mechanism to verify the authenticity of the message. NoPriv means no privacy of the contents of the SNMP messages, meaning there is no encryption of the payload.

Versions

Constant	Value	Description
Version1	0	Version 1
Version2c	1	Version 2c
Version2u	2	Version 2u (not supported by libnetsnmp)
Version3	3	Version 3

138.34 Globals

138.34.1 DNSAddressToNameIPv6MBS(HostAddress as string) as string

MBS Network Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resolves an IP to it's name.
Example:

```
// find the host name for an IPv6 address (reverse DNS lookup)
MessageBox DNSAddressToNameIPv6MBS("2001:4860:4860::8888")
```

Notes: Only for IPv6.
Returns "" on any error (like no name known).
Improved in 13.1 plugins to work on all platforms.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr13

138.34.2 DNSAddressToNameMBS(HostAddress as string) as string

MBS Network Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resolves an IP to it's name.
Example:

```
// find the host name for an IP address (reverse DNS lookup)
MessageBox DNSAddressToNameMBS("17.253.144.10")
```

Notes: Only for IPv4.
Returns "" on any error (like no name known).
Improved in 13.1 plugins to work on all platforms.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr13

138.34.3 DNSNameToAddressIPv6MBS(HostName as string) as string

MBS Network Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resolves the IP address for this name.
Example:

```
MessageBox dnsnameToAddressIPv6MBS("localhost") + endofLine + dnsnameToAddressMBS("localhost")
```

Notes: Only for IPv6.
Returns "" on any error (like no name known).
Improved in 13.1 plugins to work on all platforms.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.3pr1
- MBS Real Studio Plugins, version 13.1pr13

138.34.4 DNSNameToAddressMBS(HostName as string) as string

MBS Network Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resolves the IP address for this name.
Example:

```
MessageBox dnsnameToAddressIPv6MBS("localhost") + endofLine + dnsnameToAddressMBS("localhost")
```

Notes: Only for IPv4.
Returns "" on any error (like no name known).
Improved in 13.1 plugins to work on all platforms.

This may not work on Windows or Linux with Bonjour host names!

138.34.5 OptionReuseAddressMBS(extends s as SocketCore) as Boolean

MBS Network Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries whether to allow reuse of same port.
Example:

```
// check whether address reuse is enabled for a socket
// Server is a property of the window: Server As TCPSocket (listening)
If Server <>Nil Then MessageBox "Reuse address: " + Server.OptionReuseAddressMBS.ToString
```

Notes: Internally this uses SOL_SOCKET/SO_REUSEADDR option.
Raises UnsupportedOperationException in case of failure.
See also:

- 138.34.6 OptionReuseAddressMBS(extends s as SocketCore, assigns value as Boolean) 18870

138.34.6 OptionReuseAddressMBS(extends s as SocketCore, assigns value as Boolean)

MBS Network Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets whether to allow reuse of same port.
Example:

```
// allow a server to listen again on a port right after a restart
// Server is a property of the window: Server As TCPSocket
Server = New TCPSocket
Server.Port = 8080
Server.OptionReuseAddressMBS = True
Server.Listen
```

Notes: Internally this uses SOL_SOCKET/SO_REUSEADDR option.

see also
http://stackoverflow.com/questions/14388706/socket-options-so-reuseaddr-and-so-reuseport-how-do-they-differ-do-they-mean-t

Raises UnsupportedOperationException in case of failure.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 17.0pr1

See also:

- 138.34.5 OptionReuseAddressMBS(extends s as SocketCore) as Boolean 18869

138.34.7 OptionReusePortMBS(extends s as SocketCore) as Boolean

MBS Network Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Query whether reuse of same port and IP is allowed.
Notes: Internally this uses SOL_SOCKET/SO_REUSEPORT option.
On Windows, this is not supported, so this property sets ReuseAddress.
Raises UnsupportedOperationException in case of failure.
See also:

- 138.34.8 OptionReusePortMBS(extends s as SocketCore, assigns value as Boolean) 18870

138.34.8 OptionReusePortMBS(extends s as SocketCore, assigns value as Boolean)

MBS Network Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets whether to allow reuse of same port and IP.
Notes: Internally this uses SOL_SOCKET/SO_REUSEPORT option.
On Windows, this is not supported, so this property sets ReuseAddress.
Raises UnsupportedOperationException in case of failure.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 17.0pr1

See also:

- 138.34.7 OptionReusePortMBS(extends s as SocketCore) as Boolean 18870

138.34.9 VerifyEmailMBS(email as string, NetworkCheck as boolean) as Integer

MBS Network Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Targets: All.

Function: Checks if an email can be valid.
Example:

```
// should be okay
Var r1 as Integer = VerifyEmailMBS("testing@monkeybreadsoftware.de", true)

// should fail
Var r2 as Integer = VerifyEmailMBS("testing@monkeybreadsoftware.test", true)

MessageBox str(r1)+EndOfLine+str(r2)
```

Notes: If NetworkCheck is true, the DNS server is queries for whether an email service is available (MX Record).
Else we only do a syntax check.

Result is zero for scuccess or one of this error codes:

IDN support is not included. You may need to preprocess email if you need that.

If you have a DNS server, which will redirect all mistyped domain names to a search website, this won,Äôt really work well and detect too many valid domain names.

138.34.10 ClearOptionsMBS(extends s as SocketCore)

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears all options.
Example:

```
// reset all options set with the Option...MBS methods
// Socket is a property of the window: Socket As TCPSocket
If Socket <>Nil Then Socket.ClearOptionsMBS
```

Notes: Works only on BSD Sockets and if the socket handle value is valid.
Raises UnsupportedOperationException in case of failure.

138.34.11 OptionKeepAliveMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the keep alive.
Notes: Works only on BSD Sockets and if the socket handle value is valid.
Returns -1 on any error.

Enables the periodic transmission of messages on a connected socket. Should the connected party fail to respond to these messages, the connection is considered broken and processes using the socket are notified via a SIGPIPE signal when attempting to send data.
See also:

- 138.34.12 OptionKeepAliveMBS(extends s as SocketCore, assigns value as Integer) 18873

138.34.12 OptionKeepAliveMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the keep alive.
Example:

```
// turn on TCP keep alive for a socket, so dead connections are detected
// Socket is a property of the window: Socket As TCPSocket
Socket = New TCPSocket
Socket.Address = "www.example.com"
Socket.Port = 80
Socket.Connect
Socket.OptionKeepAliveMBS = 1
```

Notes: Works only on BSD Sockets and if the socket handle value is valid.

Enables the periodic transmission of messages on a connected socket. Should the connected party fail to respond to these messages, the connection is considered broken and processes using the socket are notified via a SIGPIPE signal when attempting to send data.

See also:

- 138.34.11 OptionKeepAliveMBS(extends s as SocketCore) as Integer 18873

138.34.13 OptionMaximumSegmentSizeMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the maximum segment size.
Example:

```
Var s as new TCPSocket

s.Port = 0
s.listen

MessageBox str(s.OptionMaximumSegmentSizeMBS)
```

Notes: Only for TCP sockets.
Raises UnsupportedOperationException in case of failure.
See also:

- 138.34.14 OptionMaximumSegmentSizeMBS(extends s as SocketCore, assigns value as Integer) 18874

138.34.14 OptionMaximumSegmentSizeMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adjusts the maximum segment size.
Example:

```
// limit the TCP segment size, e.g. for a VPN with small MTU
// Socket is a property of the window: Socket As TCPSocket
Socket = New TCPSocket
Socket.Address = "www.example.com"
Socket.Port = 80
Socket.Connect
Socket.OptionMaximumSegmentSizeMBS = 1200
```

Notes: Raises UnsupportedOperationException in case of failure.

See also:

- 138.34.13 OptionMaximumSegmentSizeMBS(extends s as SocketCore) as Integer 18874

138.34.15 OptionMutliCastTTLMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the multicast time to live value.
Notes: Works only on BSD Sockets and if the socket handle value is valid.
Raises UnsupportedOperationException in case of failure.
See also:

- 138.34.16 OptionMutliCastTTLMBS(extends s as SocketCore, assigns value as Integer) 18875

138.34.16 OptionMutliCastTTLMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the multicast time to live value.
Example:

```
Var t as new UDPSocket

// create a socket
t.Port=80
t.Connect

// wait a second to connect
app.DoEvents 1000

// shows handle
MessageBox str(t.Handle)

// shows current value
MessageBox str(t.OptionMutliCastTTLMBS)
t.OptionMutliCastTTLMBS=10

// shows new value
MessageBox str(t.OptionMutliCastTTLMBS)
```

Notes: Works only on BSD Sockets and if the socket handle value is valid.
Raises UnsupportedOperationException in case of failure.
See also:

- 138.34.15 OptionMutliCastTTLMBS(extends s as SocketCore) as Integer 18875

138.34.17 OptionReceiveBufferSizeMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the receiving buffer size.
Notes: The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Raises UnsupportedOperationException in case of failure.
See also:

- 138.34.18 OptionReceiveBufferSizeMBS(extends s as SocketCore, assigns value as Integer) 18876

138.34.18 OptionReceiveBufferSizeMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adjusts the receiving buffer size.
Example:

```
// use a bigger receive buffer for a fast download over TCP
// Socket is a property of the window: Socket As TCPSocket
Socket = New TCPSocket
Socket.Address = "www.example.com"
Socket.Port = 80
Socket.Connect
Socket.OptionReceiveBufferSizeMBS = 1024 * 1024 // 1 MB
```

Notes: The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Raises UnsupportedOperationException in case of failure.

See also:

- 138.34.17 OptionReceiveBufferSizeMBS(extends s as SocketCore) as Integer 18876

138.34.19 OptionSendBufferSizeMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the sending buffer size.
Example:

```
Var s as new UDPSocket

s.Port = 0
s.Connect

MessageBox str(s.OptionSendBufferSizeMBS)
```

Notes: The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Raises UnsupportedOperationException in case of failure.
See also:

- 138.34.20 OptionSendBufferSizeMBS(extends s as SocketCore, assigns value as Integer) 18877

138.34.20 OptionSendBufferSizeMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adjusts the sending buffer size.
Example:

```
// use a bigger send buffer when uploading big files
// Socket is a property of the window: Socket As TCPSocket
Socket = New TCPSocket
Socket.Address = "www.example.com"
Socket.Port = 80
Socket.Connect
Socket.OptionSendBufferSizeMBS = 512 * 1024
```

Notes: The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Raises UnsupportedOperationException in case of failure.

See also:

- 138.34.19 OptionSendBufferSizeMBS(extends s as SocketCore) as Integer 18876

138.34.21 OptionTOSMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the type of service value.
Notes: Works only on BSD Sockets and if the socket handle value is valid.
Raises UnsupportedOperationException in case of failure.
See also:

- 138.34.22 OptionTOSMBS(extends s as SocketCore, assigns value as Integer) 18878

138.34.22 OptionTOSMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the type of service value.
Example:

```
// mark the packets of a socket for low delay, e.g. for VoIP
// Socket is a property of the window: Socket As UDPSocket
Socket = New UDPSocket
Socket.Port = 5004
Socket.Connect
Socket.OptionTOSMBS = &hB8 // DSCP expedited forwarding
```

Notes: Works only on BSD Sockets and if the socket handle value is valid.
Possible values:
IPTOS_MINCOST = 2
IPTOS_RELIABILITY = 4
IPTOS_THROUGHPUT = 8
IPTOS_LOWDELAY = 16

You may want to set it after connecting.
Raises UnsupportedOperationException in case of failure.
See also:

- 138.34.21 OptionTOSMBS(extends s as SocketCore) as Integer 18877

138.34.23 OptionTTLMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the time to live value.
Example:

```
// show the time to live value of a connected socket
// Socket is a property of the window: Socket As TCPSocket (connected)
If Socket <>Nil And Socket.IsConnected Then MessageBox "TTL: " + Socket.OptionTTLMBS.ToString
```

Notes: Works only on BSD Sockets and if the socket handle value is valid.
Raises UnsupportedOperationException in case of failure.
See also:

- 138.34.24 OptionTTLMBS(extends s as SocketCore, assigns value as Integer) 18879

138.34.24 OptionTTLMBS(extends s as SocketCore, assigns value as Integer)

MBS Network Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the time to live value.
Example:

```
Var t as new TCPSocket

// create a socket
t.Port=80
t.Address="www.apple.com"
t.Connect

// wait a second to connect
app.DoEvents 1000

// shows handle
MessageBox str(t.Handle)

// shows current value
MessageBox str(t.OptionTTLMBS)
t.OptionTTLMBS=10

// shows new value
MessageBox str(t.OptionTTLMBS)
```

Notes: Works only on BSD Sockets and if the socket handle value is valid.
Raises UnsupportedOperationException in case of failure.
See also:

- 138.34.23 OptionTTLMBS(extends s as SocketCore) as Integer 18878

138.34.25 OptionTypeMBS(extends s as SocketCore) as Integer

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the type of socket.
Example:

```
Var u as new UDPSocket

u.Port = 9000
u.Connect

// shows 2 for UDP
MessageBox str(u.OptionTypeMBS)
```

Notes: Type is 1 for stream socket, 2 for datagram socket, 3 for raw socket, 4 for reliably-delivered message socket and 5 for a sequenced packet stream.
Raises UnsupportedOperationException in case of failure.

- MBS Real Studio Plugins, version 13.0pr6

138.35 class NetworkInterfaceMBS

138.35.1 class NetworkInterfaceMBS

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The class for unix network interfaces.
Example:

```
// show IPv4 addresses
Var interfaces() as NetworkInterfaceMBS = NetworkInterfaceMBS.AllInterfaces

for each n as NetworkInterfaceMBS in interfaces
MessageBox n.name+": "+n.IPv4
next
```

Notes: For Windows, please use WindowsEthernetMBS class.
The values are not updated for this class. Just when you create the interface objects, you get a snapshot of the current state.

- Tip of the day: Find network interfaces by name
- MBS Real Studio Plugins, version 13.0pr2

138.35.2 Methods

138.35.3 AllInterfaces(Merge as boolean = true) as NetworkInterfaceMBS()

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: Returns array with all interfaces.
Example:

```
// show IPv4 addresses
Var interfaces() as NetworkInterfaceMBS = NetworkInterfaceMBS.AllInterfaces

for each n as NetworkInterfaceMBS in interfaces
MessageBox n.name+": "+n.IPv4
next
```

Notes: By default we merge several records for the same interface.
You may see one record for each protocol (IPv4, IPv6, LINK layer).

138.35.4 IndexMap as Dictionary

MBS Network Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Targets: All.

Function: Builds a dictionary to map indexes to names.
Example:

```
Var d as Dictionary = NetworkInterfaceMBS.IndexMap
Var lines() as string

for each key as Variant in d.keys
lines.Add key+": "+d.Value(key)
next

MessageBox Join(lines,EndOfLine)
```

Notes: This is convenient method for the case you need to show list to user.
On Windows requires Windows Vista or newer.

138.35.5 IndexToName(Index as Integer) as string

MBS Network Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Targets: All.

Function: Queries name for network interface with index.
Example:

```
Var Name as string
Name = NetworkInterfaceMBS.IndexToName(1)
MessageBox Name
```

Notes: On Windows requires Windows Vista or newer.

138.35.6 IPv4s as string()

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: All IPv4 addresses for this interface.

138.35.7 IPv6s as string()

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: All IPv6 addresses for this interface.

138.35.8 NameToIndex(Name as String) as Integer

MBS Network Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Targets: All.

Function: Queries index for network interface with given name..
Example:

```
Var index as Integer
index = NetworkInterfaceMBS.NameToIndex("en0")
```

Notes: On Windows requires Windows Vista or newer.

138.35.9 Properties

138.35.10 Broadcast as Boolean

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: Whether a broadcast address exists for this interface.
Notes: (Read and Write property)

138.35.11 BroadcastAddress as String

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The broadcast address.
Notes: (Read and Write property)

138.35.12 Flags as Integer

MBS Network Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Targets: All.

Function: The interface flags.
Notes: See if.h file in C system headers.
(Read and Write property)

138.35.13 Index as Integer

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The index of this interface.
Notes: (Read and Write property)

138.35.14 InterfaceIndex as Integer

MBS Network Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Targets: All.

Function: The index of this interface.
Notes: Index counts by plugin from 0 on the interfaces.
But this is real index from operating system.
On Windows requires Windows Vista or newer.
(Read and Write property)

138.35.15 IPv4 as String

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The IPv4 address for this interface.
Example:

```
// show IPv4 addresses
Var interfaces() as NetworkInterfaceMBS = NetworkInterfaceMBS.AllInterfaces
```

```
for each n as NetworkInterfaceMBS in interfaces
MessageBox n.name+": "+n.IPv4
next
```

Notes: (Read and Write property)

138.35.16 IPv4count as Integer

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: Returns the number of IPv4 addresses for this interface.
Notes: (Read and Write property)

138.35.17 IPv6 as String

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The IPv6 address for this interface.
Notes: (Read and Write property)

138.35.18 IPv6count as Integer

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: Returns the number of IPv6 addresses for this interface.
Notes: (Read and Write property)

138.35.19 Loopback as Boolean

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: Whether this interface is the loopback interface.
Notes: (Read and Write property)

138.35.20 MAC as String

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The ethernet hardware address (MAC).
Notes: (Read and Write property)

138.35.21 Multicast as Boolean

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: Whether this interface supports multicast.
Notes: (Read and Write property)

138.35.22 Name as String

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The name of the network interface.
Notes: (Read and Write property)

138.35.23 Netmask as String

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: The network mask.
Notes: Returns the IPv4 netmask.
if that one is undefined, returns the IPv6 netmask.
This property is just kept for compatibility.
(Read only property)

138.35.24 NetmaskIPv4 as String

MBS Network Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Targets: All.

Function: The network mask for IPv4.
Notes: (Read and Write property)

138.35.25 NetmaskIPv6 as String

MBS Network Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Targets: All.

Function: The network mask for IPv6.
Notes: (Read and Write property)

138.35.26 Running as Boolean

MBS Network Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Targets: All.

Function: Whether the interface is running (resources allocated).
Notes: (Read and Write property)

138.35.27 Up as Boolean

MBS Network Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Targets: All.

Function: Whether the interface is up.
Notes: (Read and Write property)

138.36 class NWEndPointMBS

138.36.1 class NWEndPointMBS

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The class for a network endpoint.
Example:

```
// show the gateways of the current network path
// MyPathMonitor is a subclass of NWPathMonitorMBS with the Update event implemented.
// Monitor is a property of the window: Monitor As MyPathMonitor
Monitor = New MyPathMonitor
Monitor.Start

// in MyPathMonitor:
Sub Update(path As NWPathMBS) Handles Update
For Each gateway As NWEndPointMBS In path.Gateways
System.DebugLog "Gateway: " + gateway.AddressString + " port " + gateway.PortString + If(gateway.Host-
Name <>"", " (" + gateway.HostName + ")", "")
Next
End Sub
```

Notes: A Network Endpoint is an abstract static representation of a local or remote network entity. Endpoints indicate specific instances that connections may be created between, such as Hostname + Port pairs, IP Address + Port pairs, and named Bonjour Services.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.36.2 Methods

138.36.3 Constructor

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

138.36.4 Properties

138.36.5 AddressString as String

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Returns an allocated IP address string for a network endpoint with the type address.
Notes: Returns the IP address string for the endpoint, or "" if the endpoint is not of type address.
(Read only property)

138.36.6 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

138.36.7 HostName as String

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Retrieves the hostname string for a network endpoint with the type host or URL.
Notes: (Read only property)

138.36.8 Port as Integer

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Retrieves the port for a network endpoint with the type URL, Host, or address.
Notes: The port will be returned in Host Byte Order.

Returns the port for the endpoint, or 0 if the endpoint is not of type host or address.
(Read only property)

138.36.9 PortString as String

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Returns an allocated port string for a network endpoint with the type host or address.
Notes: (Read only property)

138.36.10 Type as Integer

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Retrieves the type of a network endpoint.
Notes: (Read only property)

138.36.11 URL as String

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Retrieves the URL string from a network endpoint of type URL.
Notes: (Read only property)

138.36.12 Constants

EndPoint Types

Constant	Value	Description
kTypeAddress	1	An IP Address + Port
kTypeBonjourService	3	A Bonjour Service Name + Type + Domain
kTypeHost	2	A Hostname + Port
kTypeInvalid	0	An invalid endpoint
kTypeURL	4	A URL endpoint.

138.37 class NWInterfaceMBS

138.37.1 class NWInterfaceMBS

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: A network interface.
Example:

```
// list the network interfaces the current path uses
// MyPathMonitor is a subclass of NWPathMonitorMBS with the Update event implemented.
// Monitor is a property of the window: Monitor As MyPathMonitor
Monitor = New MyPathMonitor
Monitor.Start

// in MyPathMonitor:
Sub Update(path As NWPathMBS) Handles Update
For Each i As NWInterfaceMBS In path.Interfaces
System.DebugLog i.Name + " (index " + i.Index.ToString + ")" + If(i.Type = NWInterfaceMBS.kInterfaceTypeWifi, " WiFi", "")
Next
End Sub
```

Notes: A Network Interface is an object that represents a static snapshot of an interface that provides network connectivity, such as a Wi-Fi link, an Ethernet connection, a Cellular service, a VPN, or the loopback interface.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.37.2 Methods

138.37.3 Constructor

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

138.37.4 Properties

138.37.5 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

138.37.6 Index as Integer

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Retrieves the index of an interface, to be used for reference or logging purposes.
Notes: This is the same value as provided by if_nametoindex.
(Read only property)

138.37.7 Name as String

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Retrieves the name of an interface, to be used for reference or logging purposes.
Notes: (Read only property)

138.37.8 Type as Integer

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Retrieves the type of an interface.
Notes: This only accesses the type of the specific interface being queried, and will not take into account types used by interfaces that traffic will eventually be routed through. That is, if the interface is a virtual interface (such as a VPN) that eventually forwards traffic through Wi-Fi, the type will be of type other, not wifi.
(Read only property)

138.37.9 Constants

Interface Types

Constant	Value	Description
kInterfaceTypeCellular	2	The network interface type used for communication over cellular networks.
kInterfaceTypeLoopback	4	The network interface type used for communication over local loopback networks.
kInterfaceTypeOther	0	The network interface type used for communication over virtual networks or networks of unknown types.
kInterfaceTypeWifi	1	The network interface type used for communication over Wi-Fi networks.
kInterfaceTypeWired	3	The network interface type used for communication over wired Ethernet networks.

138.38 class NWPathMBS

138.38.1 class NWPathMBS

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: A Network Path object represents a snapshot of network path state.
Example:

```
// watch whether the Mac is online and whether it uses WiFi
// MyPathMonitor is a subclass of NWPathMonitorMBS with the Update event implemented.
// Monitor is a property of the window: Monitor As MyPathMonitor
Monitor = New MyPathMonitor
Monitor.Start

// in MyPathMonitor:
Sub Update(path As NWPathMBS) Handles Update
Var online As Boolean = path.Status = NWPathMBS.kStatusSatisfied
System.DebugLog "Online: " + online.ToString + ", WiFi: " + path.UsesInterfaceType(NWInterfaceMBS.kInterfaceTypeWifi).ToString + _
", expensive: " + path.IsExpensive.ToString + ", IPv6: " + path.HasIPv6.ToString
End Sub
```

Notes: This state represents the known information about the local interface and routes that may be used to send and receive data. If the network path for a connection changes due to interface characteristics, addresses, or other attributes, a new path object will be generated. Note that the differences in the path attributes may not be visible through public accessors, and these changes should be treated merely as an indication that something about the network has changed.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.38.2 Methods

138.38.3 Constructor

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

138.38.4 Gateways as NWEndPointMBS()

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: List the IP addresses of the routers acting as the gateways for the path.

138.38.5 Interfaces as NWInterfaceMBS()

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: List all interfaces associated with the path.

138.38.6 IsEqual(other as NWPathMBS) as Boolean

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Compares two network path objects and checks if their content is equal.
Notes: If they are not equal, they represent two different network states.

Returns true if the paths are equivalent, or false if there is any difference between the paths.

138.38.7 UsesInterfaceType(InterfaceType as Integer) as Boolean

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Checks if the path uses a network interface with the specified type.
Notes: Returns true if the path uses any network interface with the specified type, false otherwise.

138.38.8 Properties

138.38.9 EffectiveLocalEndPoint as NWEndPointMBS

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Retrieve the local endpoint that is being used, if present.
Notes: If this path is the path from an connection, it represents the address that data is sent from. (Read only property)

138.38.10 EffectiveRemoteEndPoint as NWEndPointMBS

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Retrieve the remote endpoint that is being used, if present.
Notes: If this path is the path from a connection, it represents the address that data is sent to.
(Read only property)

138.38.11 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

138.38.12 HasDNS as Boolean

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Checks if the path has a DNS server configuration set.
Notes: Returns true if the path has a DNS server configuration set, false otherwise.
(Read only property)

138.38.13 HasIPv4 as Boolean

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Checks if the path uses a network interface that supports IPv4 connectivity.
Notes: Returns true if the path uses a network interface that supports IPv4, false otherwise.
(Read only property)

138.38.14 HasIPv6 as Boolean

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Checks if the path uses a network interface that supports IPv6 connectivity.
Notes: Returns true if the path uses a network interface that supports IPv6, false otherwise.
(Read only property)

138.38.15 IsConstrained as Boolean

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Checks if the path uses any network interfaces that are considered constrained to the user.
Notes: Returns true if the path uses any network interface that is considered constrained, false otherwise.
(Read only property)

138.38.16 IsExpensive as Boolean

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Checks if the path uses any network interfaces that are considered expensive to the user, such as, but not limited to, a cellular network.
Notes: Returns true if the path uses any network interface that is considered expensive, false otherwise.
(Read only property)

138.38.17 Status as Integer

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Retrieves the status of a path.
Notes: The status of a specific path object will never change, as the path object itself is static. If there is a network change, the object that generated the path object will generate a new path object.
(Read only property)

138.38.18 UnsatisfiedReason as Integer

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Retrieves a reason the path is not satisfied.
Notes: In some cases, the reason helps to determine why the path is not satisfied. While the path may be unsatisfied for more than one reason, only the first reason will be given. In many cases, the path may be unsatisfied with no reason available.

Returns a reason the path is unsatisfied or kUnsatisfiedReasonNotAvailable if a reason is not available.
(Read only property)

138.38.19 Constants

Status

Constant	Value	Description
kStatusInvalid	0	The path is not valid
kStatusSatisfiable	3	The path does not currently have a usable route, but a connection attempt will trigger network attachment.
kStatusSatisfied	1	The path has a usable route upon which to send and receive data.
kStatusUnsatisfied	2	The path does not have a usable route. This may be due to a network interface being down, or due to system policy.

Unsatisfied Reason

Constant	Value	Description
kUnsatisfiedReasonCellularDenied	1	The user has disabled cellular
kUnsatisfiedReasonLocalNetworkDenied	3	The user has disabled local network access
kUnsatisfiedReasonNotAvailable	0	No reason is given
kUnsatisfiedReasonVPNInactive	4	A required VPN is not active
kUnsatisfiedReasonWifiDenied	2	The user has disabled Wi-Fi

138.39 class NWPathMonitorMBS

138.39.1 class NWPathMonitorMBS

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: An observer that you use to monitor and react to network changes.
Example:

```
// get notified when the network connection changes
// MyPathMonitor is a subclass of NWPathMonitorMBS with the Update event implemented.
// Monitor is a property of the app: Monitor As MyPathMonitor
Monitor = New MyPathMonitor
Monitor.Start

// in MyPathMonitor:
Sub Update(path As NWPathMBS) Handles Update
If path.Status = NWPathMBS.kStatusSatisfied Then
System.DebugLog "Online, expensive: " + path.IsExpensive.ToString
Else
System.DebugLog "Offline"
End If
End Sub
```

Notes: The Network Path Monitor allows the caller to fetch the current global path (or a path restricted to a specific network interface type). The path is delivered in an event that is called every time the network path changes.

138.39.2 Methods

138.39.3 Cancel

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Stops receiving network path updates.
Notes: Cancel the path monitor.
Calls Cancel event when done.
See also:

- 138.39.13 Cancel 18900

138.39.4 Constructor

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Initializes a path monitor to observe all available interface types.
Notes: Create a default path monitor, that will allow the enumeration of all available interfaces on the system.
See also:

- 138.39.5 Constructor(requiredInterfaceType as Integer) 18899

138.39.5 Constructor(requiredInterfaceType as Integer)

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Initializes a path monitor to observe a specific interface type.
Notes: Create a path monitor specific to an interface type, that will allow the enumeration of any interface that matches the type on the system.
See also:

- 138.39.4 Constructor 18899

138.39.6 CreateForEthernetChannel as NWPathMonitorMBS

MBS MacOSX Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a path monitor for the ethernet interface.
Notes: Create a path monitor that enumerates all interfaces that support Ethernet channel.

138.39.7 ProhibitInterfaceType(InterfaceType as Integer)

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Prohibit this path monitor from using the provided network interface type.
Notes: Call before calling Start.

138.39.8 Start

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: Starts monitoring path changes.
Notes: Starts the path monitor.

138.39.9 Properties

138.39.10 Current as NWPathMBS

MBS MacOSX Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: THe current path.
Notes: We automatically set this property when a new path is found, so you can query the current path at any time.
(Read and Write property)

138.39.11 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

138.39.12 Events

138.39.13 Cancel

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: The event to be called on the queue provided once cancellation has completed.
Notes: Once the cancel handler has been called, the update event will not fire again.
See also:

• 138.39.3 Cancel 18899

138.39.14 Update(path as NWPathMBS)

MBS MacOSX Plugin, Plugin Version: 24.1, Platforms: macOS, iOS, Targets: All.

Function: An event to be called whenever a path monitor has a new snapshot.
Notes: This will be called one or more times after calling Start.

138.40 class PacketSocketMBS

138.40.1 class PacketSocketMBS

MBS Network Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: An extension to the socket class for easy sending packets through the net.
Notes: A packet is made like this:
+0: Size of data block
+4: 4 byte code string
+8: 4 byte for ID
+12: variable data.

The numbers are send in low endian format so this is crossplatform.

This socket subclass can be easily made in Xojo code itself. I did it for several of my applications, so if you like it decide between making it yourself or using this one which may even be faster, because it is written in C?

This class is only available in RB 4.0 or newer, because it crashes on RB 3.5.

As the strings are transferred as binary data you need to take care that you send text e.g. as UTF8 and restore this encoding setting on receiving.

For macOS and iOS, your application may need to have the NSLocalNetworkUsageDescription in info.plist for local network access and your sandboxed application may need need the com.apple.security.network.client entitlement.
Subclass of the TCPSocket class.

138.40.2 Methods

138.40.3 SendPacket(data as string)

MBS Network Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a packet.
Notes: Uses ID=0 and code="" as a shortcut for the long SendPacket call.
See also:

- 138.40.4 SendPacket(data as string,code as string) 18903
- 138.40.5 SendPacket(data as string,code as string,ID as Integer) 18903

138.40.4 SendPacket(data as string,code as string)

MBS Network Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a packet.
Notes: Uses ID=0 as a shortcut for the long SendPacket call.
See also:

- 138.40.3 SendPacket(data as string) 18902
- 138.40.5 SendPacket(data as string,code as string,ID as Integer) 18903

138.40.5 SendPacket(data as string,code as string,ID as Integer)

MBS Network Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a packet.
Notes: code and ID are optional.
Code is a 4 byte string to identify the content.
(e.g. "mess" for a message or "link" for a link.)
See also:

- 138.40.3 SendPacket(data as string) 18902
- 138.40.4 SendPacket(data as string,code as string) 18903

138.40.6 Events

138.40.7 ReceivedPacket(data as string,code as string,ID as Integer)

MBS Network Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A packet was received.

138.41 class RAWSocketMBS

138.41.1 class RAWSocketMBS

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for low level and raw sockets.
Example:

```
Var sock as RAWSocketMBS

// create UDP socket
sock = new RAWSocketMBS(RAWSocketMBS.AddressFamilyINet, RAWSocketMBS.SocketTypeDatagram,
RAWSocketMBS.ProtocolUDP)
```

Notes: Similar to Xojo's built in Socket class, but more low level and with more options.
Raw sockets for things like PING may need root permissions.

For macOS and iOS, your application may need to have the NSLocalNetworkUsageDescription in info.plist for local network access and your sandboxed application may need need the com.apple.security.network.client entitlement.

- 15.6, page 9: News

138.41.2 Methods

138.41.3 Accept(byref RemoteAddress as String, byref RemotePort as Integer, NewSocket as RAWSocketMBS) as RAWSocketMBS

MBS Network Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Listens for connections on this socket.
Notes: Lasterror is set.

138.41.4 AddressFamilyINet6 as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the address family constants.
Notes: IPv6
This is a method as value is different.
Mac 30, Windows 23 and Linux 10.

138.41.5 Bind(DestAddr as Ptr, DestAddrByteSize as Integer) as Boolean

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Binds the socket to the given destination address.
Notes: Set ReuseAddress to bind to an address which already a socket is bound to.
Lasterror is set.
Returns true on success and false on failure.
Please specify with port and IP in destAddress where to bind against.
Structure of DestAddress is OS and address family dependent.
See also:

- 138.41.6 Bind(Port as Integer, IP as string = "") 18905

138.41.6 Bind(Port as Integer, IP as string = "")

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Binds the socket to the given port.
Notes: If IP is not empty, you can bind the socket to only the given network interface with that IPv4.
Set ReuseAddress to bind to an address which already a socket is bound to.
Lasterror is set.
See also:

- 138.41.5 Bind(DestAddr as Ptr, DestAddrByteSize as Integer) as Boolean 18905

138.41.7 CalcChecksum(data as ptr, ByteCount as Integer) as UInt16

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates checksum for IP header.

138.41.8 Close

MBS Network Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes socket.
Notes: Same as destructor.

138.41.9 Connect(Address as String, Port as Integer, byref ErrorMessage as String) as Boolean

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convenience method to connect.
Notes: Will parse IPv4/IPv6 or query DNS server for IP and connect.
Returns true on success.
See also:

- 138.41.10 Connect(DestAddr as Ptr, DestAddrByteSize as Integer) as Boolean 18906

138.41.10 Connect(DestAddr as Ptr, DestAddrByteSize as Integer) as Boolean

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Connects to destination address.
Notes: lasterror is set.
Returns true on success and false on failure.
Please specify with port and IP in destAddress where package is sent to.
Structure of DestAddress is OS and address family dependent.
See also:

• 138.41.9 Connect(Address as String, Port as Integer, byref ErrorMessage as String) as Boolean 18906

138.41.11 Constructor(AddressFamily as Integer, SocketType as Integer, Protocol as Integer)

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Example:

```
Var sock as RAWSocketMBS

// create UDP socket
sock = new RAWSocketMBS(RAWSocketMBS.AddressFamilyINet, RAWSocketMBS.SocketTypeDatagram,
RAWSocketMBS.ProtocolUDP)
```

Notes: Please pass valid combination of OS supported sockets.
Raises exception if creation is not possible.
Raw socket requires root access.

138.41.12 Destructor

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: Closes the socket.

138.41.13 htonl(value as UInt32) as UInt32

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert 32bit Integer from network to host byte order.

138.41.14 htons(value as UInt16) as UInt16

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert 16bit Integer from network to host byte order.

138.41.15 inet_addr(IPv4 as String) as UInt32

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts IPv4 to numerical representation.

138.41.16 inet_ntoa(IPv4 as UInt32) as String

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts IPv4 to string representation.

138.41.17 Listen(BackLog as Integer = 2)

MBS Network Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Accepts a new incoming connection.
Notes: Sockets uses the accept function to enable incoming connection attempts on a socket.
RemoteAddress and RemotePort are set to address of remote peer.

If you like to pass in your own subclass object for NewSocket, we can use that socket object. Otherwise, we make a new RAWSocketMBS object.

Lasterror is set.

138.41.18 ntohl(value as UInt32) as UInt32

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert 32bit Integer from host to network byte order.

138.41.19 ntohs(value as UInt16) as UInt16

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert 16bit Integer from host to network byte order.

138.41.20 Poll

MBS Network Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Polls for activity.
Notes: Calls events if needed.
This is called automatically via timer by the plugin.

138.41.21 Read(ByteSize as Integer, peek as boolean = false) as MemoryBlock

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read at maximum the given number of bytes in buffer.
Notes: Pass true for peek if data should not be removed from receiving buffer.
Lasterror is set.

Be aware that you may not get whole packages here, so data may come in several chunks.
For that, please collect the data and look for whether your package is complete or a required end mark arrived.

138.41.22 ReadAll(peek as boolean = false) as MemoryBlock

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read all bytes in buffer.
Example:

```
Var sock as RAWSocketMBS
Var data as MemoryBlock = sock.ReadAll
if data = nil then
// nothing read
else

end if
```

Notes: Pass true for peek if data should not be removed from receiving buffer.
Lasterror is set.

Be aware that you may not get whole packages here, so data may come in several chunks.
For that, please collect the data and look for whether your package is complete or a required end mark arrived.

138.41.23 ReadDatagram(peek as boolean = false) as DatagramMBS

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a datagram.
Notes: If peek is true, the data is not removed from read buffer.
On error returns nil.

138.41.24 Send(Data as Ptr, DataByteSize as Integer, Flags as Integer = 0) as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends data.
Notes: Data is sent to address passed with Connect method.
Returns number of bytes sent.
Lasterror is set.

For TCP sockets and similar, which have a stream of data.

138.41.25 SendMessage(Data as DatagramMBS) as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a datagram.
Notes: Please specify with port and address of datagram where package is sent to.
Returns number of bytes sent.
Lasterror is set.

For UDP sockets and similar.
See also:

- 138.41.26 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer 18910
- 138.41.27 SendMessage(Data as string, IP as String, Port as Integer) as Integer 18911

138.41.26 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a datagram.
Notes: Please specify with port and IP where package is sent to.

Returns number of bytes sent.
Lasterror is set.

For UDP sockets and similar.
See also:

- 138.41.25 SendMessage(Data as DatagramMBS) as Integer 18910
- 138.41.27 SendMessage(Data as string, IP as String, Port as Integer) as Integer 18911

138.41.27 SendMessage(Data as string, IP as String, Port as Integer) as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends data to target.
Notes: Please specify with port and IP where package is sent to.
Returns number of bytes sent.
Lasterror is set.

For UDP sockets and similar.
See also:

- 138.41.25 SendMessage(Data as DatagramMBS) as Integer 18910
- 138.41.26 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer 18910

138.41.28 SendTo(Data as Ptr, DataByteSize as Integer, Flags as Integer, DestAddr as Ptr, DestAddrByteSize as Integer) as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends data to dest address.
Example:

```
Var sock as RawSocketMBS
Var Flags as integer
Var r as Integer

// port
Var port as integer = val(iPort.Text)
if port <= 0 or port >= 65535 then
break
MessageBox "Wrong port: "+iPort.Text
Return
end if
```

```
// dest address

'/*
'* Socket address, internet style. C declaration for Mac
'*/
'struct sockaddr_in {
'__uint8_t sin_len; // 1 byte, Mac only
'sa_family_t sin_family; // 1 byte
'in_port_t sin_port; // 2 byte in Network byte order
'struct in_addr sin_addr; // 4 byte
'char sin_zero [ 8 ] ; // 8 bytes filler

' } ;

// convert IPv4 from text to numeric value
Var IP as Uint32 = RAWSocketMBS.inet_addr(iIP.Text)

// create destination address. This is for Mac! Windows and Linux have different structures
Var dest as new MemoryBlock(16)
dest.UInt8Value(0) = dest.size
dest.UInt8Value(1) = RAWSocketMBS.AddressFamilyINet
dest.UInt16Value(2) = RAWSocketMBS.htons(port)
dest.UInt32Value(4) = IP

// message
Var m as string = ConvertEncoding(iMessage.Text, encodings.UTF8)
Var data as MemoryBlock = m

// send
r = sock.SendTo(data, data.size, Flags, dest, dest.size)
```

Notes: Please specify with port and IP in destAddress where package is sent to.
Returns number of bytes sent. Structure of DestAddress is OS and address family dependent.
Lasterror is set.

For UDP sockets and similar.

138.41.29 Properties

138.41.30 AddressFamily as Integer

MBS Network Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The address family of the socket.
Notes: This is either RAWSocketMBS.AddressFamilyINet (2) for IPv4 or RAWSocketMBS.AddressFami-

lyINet6 (Mac 30, Windows 23 and Linux 10) for IPv6.
(Read and Write property)

138.41.31 AvailableBytes as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns number of bytes available for reading.
Notes: Lasterror is set.
(Read only property)

138.41.32 Broadcast as Boolean

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether broadcasts are allowed.
Notes: Set to true before sending a broadcast message.
Internally this uses SOL_SOCKET/SO_BROADCAST option.
Lasterror is set.
(Read and Write property)

138.41.33 Handle as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal socket handle.
Notes: (Read and Write property)

138.41.34 IPHeaderIncluded as Boolean

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the OS provides IP header or you.
Notes: Default is false.
Set to true when you include IP header in data.
(Read and Write property)

138.41.35 Lasterror as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: Platform dependent.
(Read and Write property)

138.41.36 LocalIP as String

MBS Network Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries local IP.
Notes: Can be 0.0.0.0 if unknown.
May only be set if connected or binded.
Lasterror is set.
(Read only property)

138.41.37 LocalPort as Integer

MBS Network Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries local port.
Notes: Lasterror is set.
Can be -1 if unknown.
(Read only property)

138.41.38 Protocol as Integer

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The socket protocol.
Notes: The value from constructor.
(Read and Write property)

138.41.39 ReceiveBufferSize as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the receiving buffer size.
Notes: The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.

Internally this uses SOL_SOCKET/SO_RCVBUF option.
Lasterror is set.
(Read and Write property)

138.41.40 ReuseAddress as Boolean

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allows reuse of same port.
Notes: Internally this uses SOL_SOCKET/SO_REUSEADDR option.

see also
http://stackoverflow.com/questions/14388706/socket-options-so-reuseaddr-and-so-reuseport-how-do-they-differ-do-they-mean-t

Lasterror is set.
(Read and Write property)

138.41.41 ReusePort as Boolean

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allow reuse of same port and IP.
Notes: Internally this uses SOL_SOCKET/SO_REUSEPORT option.
On Windows, this is not supported, so this property sets ReuseAddress.
Lasterror is set.
(Read and Write property)

138.41.42 SendBufferSize as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sending buffer size.
Notes: The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Internally this uses SOL_SOCKET/SO_SNDBUF option.
Lasterror is set.
(Read and Write property)

138.41.43 SocketError as Integer

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The native socket error.
Notes: Internally this uses SOL_SOCKET/SO_ERROR option.
Lasterror is set.
(Read only property)

138.41.44 SocketType as Integer

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The socket type.
Notes: The value from constructor.
(Read and Write property)

138.41.45 Events

138.41.46 DataAvailable

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This event is called when new data is available.
Notes: Requires the socket to be bound.

138.41.47 Error

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called if socket is in error state.

138.41.48 SendComplete

MBS Network Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last write operation is done.

138.41.49 Constants

Address Families

Constant	Value	Description
AddressFamilyINet	2	IPv4

Protocols

Constant	Value	Description
ProtocolICMP	1	ICMP
ProtocolIP	0	IPv4
ProtocolIPv6	41	IPv6
ProtocolRaw	255	Raw protocol
ProtocolTCP	6	TCP
ProtocolUDP	17	UDP

Socket Types

Constant	Value	Description
SocketTypeDatagram	2	Datagram, e.g. UDP.
SocketTypeRaw	3	Raw socket, requires root permissions.
SocketTypeStream	1	Stream socket, e.g. TCP/IP.

138.42 class SSH2ChannelMBS

138.42.1 class SSH2ChannelMBS

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a SSH2 channel.
Example:

```
// run a command on an SSH server and read the output
// Session is a property of the window: Session As SSH2SessionMBS (connected and authenticated)
Var channel As SSH2ChannelMBS = Session.OpenSession
channel.Execute "ls -l"

Var output As String
While Not channel.EOF
output = output + channel.Read
Wend

channel.Close
MessageBox output + EndOfLine + "Exit status: " + channel.ExitStatus.ToString
```

- SSH tunnel in Xojo

138.42.2 Methods

138.42.3 Close(Wait as Boolean = true)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Close a channel.
Notes: Lasterror is set.
Close an active data channel. In practice this means sending an SSH_MSG_CLOSE packet to the remote host which serves as instruction that no further data will be sent to it. The remote host may still send data back until it sends its own close message in response. To wait for the remote end to close its connection as well, follow this command with WaitClosed.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't

really a failure per se.

If wait parameter is true, the plugin does a loop to try close until it receives an okay (and not EAGAIN).

138.42.4 Constructor

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.
See also:

- 138.42.5 Constructor(session as SSH2SessionMBS) 18919

138.42.5 Constructor(session as SSH2SessionMBS)

MBS CURL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create new channel.
Notes: May raise UnsupportedOperationException if channel creation fails.
See also:

- 138.42.4 Constructor 18919

138.42.6 Destructor

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

138.42.7 EOF as boolean

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Check a channel's EOF status.
Example:

```
Var s as string
Var channel as SSH2ChannelMBS // your channel

// read all till end of channel
s = ""
do
app.YieldToNextThread
```

```
Var r as string = channel.Read(50000)
s = s + r

if channel.LastError = SSH2SessionMBS.kErrorEagain then
// no answer yet
Continue
elseif channel.LastError = SSH2SessionMBS.kErrorNone then
// we got something
if channel.EOF then
// done?
MessageBox "Result: " + s
exit
end if
else
exit
end if
loop
```

Notes: Check if the remote host has sent an EOF status for the selected stream.
Returns true if the remote host has sent EOF, otherwise false.
Lasterror is set. On error, this function returns true.

138.42.8 Execute(command as string)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes something on the server.
Notes: Lasterror is set.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.

138.42.9 Flush

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flush stream for this channel.
Notes: Lasterror is set.

138.42.10 FlushAll

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flush all streams for this channel.
Notes: Lasterror is set.

138.42.11 FlushExtendedData

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flush extended data stream for this channel.
Notes: Lasterror is set.

138.42.12 FlushStdErr

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flush stderr stream for this channel.
Notes: Lasterror is set.

138.42.13 Read(length as Integer = 65536) as string

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read data from a channel stream.
Example:

```
Var s as string
Var channel as SSH2ChannelMBS // your channel

// read all till end of channel
s = ""
do
app.YieldToNextThread
Var r as string = channel.Read(50000)
s = s + r

if channel.LastError = SSH2SessionMBS.kErrorEagain then
// no answer yet
Continue
elseif channel.LastError = SSH2SessionMBS.kErrorNone then
// we got something
if channel.EOF then
// done?
MessageBox "Result: " + s
exit
```

```
end if
else
exit
end if
loop
```

Notes: Lasterror is set.
Attempt to read data from a stdout channel stream.
Returns data read.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.
Version up to 18.2 return text marked as UTF-8, but in 18.3 we change to return text without encoding marking. So if you expect UTF-8, you can apply UTF-8 encoding with DefineEncoding.

138.42.14 ReadStdErr(length as Integer = 65536) as string

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read data from a channel stream.
Notes: Lasterror is set.
Attempt to read data from a stderr channel stream.
Returns data read.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.

138.42.15 RequestPTY(term as string)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Request a PTY on an established channel.
Notes: Lasterror is set.
Note that this does not make sense for all channel types and may be ignored by the server despite returning success.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.

138.42.16 SendEOF

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Send EOF to remote server.
Notes: Lasterror is set.

Tell the remote host that no further data will be sent on the specified channel. Processes typically interpret this as a closed stdin descriptor.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.

138.42.17 SetBlocking(blocking as boolean)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set or clear blocking mode on channel.

138.42.18 SetEnv(name as string, value as string)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set an environment variable on the channel.
Notes: Lasterror is set.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.

138.42.19 Shell

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Request a shell on a channel.
Notes: Lasterror is set.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.

138.42.20 WaitClosed

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Wait for the remote to close the channel.
Notes: Lasterror is set.

Enter a temporary blocking state until the remote host closes the named channel. Typically sent after Close in order to examine the exit status.
Lasterror is set to kErrorEAgain when it would otherwise block. While kErrorEAgain is an error, it isn't really a failure per se.

138.42.21 WaitEOF

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Wait for the remote end to acknowledge an EOF request.
Notes: Lasterror is set.
May give kErrorEAgain error which means you should try again later.

138.42.22 Write(data as MemoryBlock) as Integer

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write data to a channel stdout stream.
Notes: Lasterror is set.

Write functions will use as much as possible of the buffer and put it into a single SSH protocol packet. This means that to get maximum performance when sending larger files, you should try to always pass in at least 32K of data to this function.

Returns actual number of bytes written. Lasterror being kErrorEagain when it would otherwise block. While kErrorEagain is an error, it isn't really a failure per se.
See also:

- 138.42.23 Write(text as string) as Integer 18924

138.42.23 Write(text as string) as Integer

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write data to a channel stdout stream.
Notes: Lasterror is set.

Write functions will use as much as possible of the buffer and put it into a single SSH protocol packet. This means that to get maximum performance when sending larger files, you should try to always pass in at least 32K of data to this function.

Returns actual number of bytes written. Lasterror being kErrorEagain when it would otherwise block. While kErrorEagain is an error, it isn't really a failure per se.

Until version 18.2 we send text as UTF-8. Version 18.3 or newer send bytes as they are in whatever encoding your string has.
See also:

• 138.42.22 Write(data as MemoryBlock) as Integer 18924

138.42.24 WriteStdErr(data as MemoryBlock) as Integer

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write data to a channel stderr stream.
Notes: Lasterror is set.

Write functions will use as much as possible of the buffer and put it into a single SSH protocol packet. This means that to get maximum performance when sending larger files, you should try to always pass in at least 32K of data to this function.

Returns actual number of bytes written. Lasterror being kErrorEagain when it would otherwise block. While kErrorEagain is an error, it isn't really a failure per se.
See also:

• 138.42.25 WriteStdErr(text as string) as Integer 18925

138.42.25 WriteStdErr(text as string) as Integer

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write data to a channel stderr stream.
Notes: Lasterror is set.

Write functions will use as much as possible of the buffer and put it into a single SSH protocol packet. This means that to get maximum performance when sending larger files, you should try to always pass in at least 32K of data to this function.

Returns actual number of bytes written. Lasterror being kErrorEagain when it would otherwise block. While kErrorEagain is an error, it isn't really a failure per se.

Until version 18.2 we send text as UTF-8. Version 18.3 or newer send bytes as they are in whatever encoding your string has.
See also:

• 138.42.24 WriteStdErr(data as MemoryBlock) as Integer 18925

138.42.26 Properties

138.42.27 ExitStatus as Integer

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the remote exit code.
Notes: Returns the exit code raised by the process running on the remote host at the other end of the named channel. Note that the exit status may not be available if the remote end has not yet set its status to closed.
Returns 0 on failure, otherwise the Exit Status reported by remote host.
(Read only property)

138.42.28 Handle as Integer

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Internal object reference.
Notes: (Read and Write property)

138.42.29 LastError as Integer

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: See SSH2SessionMBS.kError* constants.
(Read and Write property)

138.42.30 Session as SSH2SessionMBS

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The session this channel belongs to.
Notes: (Read and Write property)

138.42.31 Tag as Variant

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag value.
Notes: A property where you can store any value you like.

(Read and Write property)

138.42.32 Events

138.42.33 DataAvailable(Data as string, ErrorChannel as boolean)

MBS CURL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event for new data coming in.
Notes: For console app with DoEvents loop or for GUI apps.
Works starting with running Execute as that initializes the DataAvailable event.

ErrorChannel is true, if we got data from the stderr channel instead of stdout channel.

138.43 class SSH2ConnectFailedExceptionMBS

138.43.1 class SSH2ConnectFailedExceptionMBS

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception for an error in the SSH2SessionMBS.Constructor.
Notes: Subclass of the RuntimeException class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.0pr5

138.44 class SSH2SessionMBS

138.44.1 class SSH2SessionMBS

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a SSH2 session.
Example:

```
// connect to a server via SSH, log in with a password and run a command
Var session As New SSH2SessionMBS("ssh.example.com", 22)
session.SessionHandshake
If session.LastError <>0 Then
MessageBox "Handshake failed: " + session.LastError.ToString
Return
End If

// check the server fingerprint, e.g. against a stored value
System.DebugLog "Fingerprint: " + EncodeHex(session.HostKeyHash(SSH2SessionMBS.kHostKeyHashSHA256))

session.UserAuthPassword("user", "password")
If Not session.Authenticated Then
MessageBox "Login failed."
Return
End If

Var channel As SSH2ChannelMBS = session.OpenSession
channel.Execute "uname -a"

Var output As String
While Not channel.EOF
output = output + channel.Read
Wend
channel.Close

session.Disconnect "Bye"
MessageBox output
```

Notes: For macOS and iOS, your application may need to have the NSLocalNetworkUsageDescription in info.plist for local network access and your sandboxed application may need need the com.apple.security.network.client entitlement.

138.44.2 Methods

138.44.3 Banner as string

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the remote banner.
Notes: Once the session has been setup and Handshake has completed successfully, this function can be used to get the server id from the banner each server presents.

138.44.4 CipherNames as String()

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of all ciphers.
Example:

```
// see hash and encryption algorithms available
Var CipherNames() as string = SSH2SessionMBS.CipherNames
Var DigestNames() as string = SSH2SessionMBS.DigestNames
Break
```

Notes: The list may not be the same for Mac, Windows and Linux.

138.44.5 ConfigureKeepAlive(WantReply as Boolean = true, Interval as Integer = 2)

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures keep alive probes.
Notes: Set how often keepalive messages should be sent.
WantReply indicates whether the keepalive messages should request a response from the server.
Interval is number of seconds that can pass without any I/O, use 0 to disable keepalives. To avoid some busy-loop corner-cases, if you specify an interval of 1 it will be treated as 2.

138.44.6 Constructor(IP as string, Port as Integer = 22, TimeOut as Integer = 30)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor for using a new socket.
Notes: The plugin creates a new socket, connects to the given IP&Port and than creates a new session for it.
Lasterror is set.
Please check if Handle property is non zero after constructor finishes.

Timeout defines timeout for connection in seconds. While waiting, the plugin yields time to other threads.
If timeout is zero, the connection will not yield and take up to the default TCP/IP timeout.

IPv4, IPv6 address or domain name with version 18.3 or newer.
See also:

- 138.44.7 Constructor(socket as TCPSocket) 18931
- 138.44.8 Constructor(socketHandle as Integer, CloseSocketLater as boolean = false) 18932

138.44.7 Constructor(socket as TCPSocket)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor for using an existing socket.
Notes: Initializes a new session.
socket: The socket to use. The plugin keeps reference to this socket in socket property.

You can use a Xojo socket and connect it. Once connected, pass it here, so the session can use this socket for communication.
If you connect the xojo socket in a loop on a thread, be sure to call poll method of socket, so it processes events like connecting. In main thread with timer, you would get this automatically.
See also:

- 138.44.6 Constructor(IP as string, Port as Integer = 22, TimeOut as Integer = 30) 18931
- 138.44.8 Constructor(socketHandle as Integer, CloseSocketLater as boolean = false) 18932

138.44.8 Constructor(socketHandle as Integer, CloseSocketLater as boolean = false)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor for using an existing socket.
Notes: Initializes a new session.
socketHandle: The socket to use. Can be TCPSocket's handle property for a Xojo socket. Or a socket connected via declares.
You can put the socket in the socket property to keep it alive as long as session is in memory.

Set CloseSocketLater = true if you pass a socket which can be closed in destructor. For Xojo socket, pass false as Xojo closes socket later.
You can use a Xojo socket and connect it. Once connected, pass it here, so the session can use this socket for communication.
See also:

- 138.44.6 Constructor(IP as string, Port as Integer = 22, TimeOut as Integer = 30) 18931
- 138.44.7 Constructor(socket as TCPSocket) 18931

138.44.9 Destructor

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

138.44.10 DigestNames as String()

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of all digest algorithms.
Example:

```
// see hash and encryption algorithms available
Var CipherNames() as string = SSH2SessionMBS.CipherNames
Var DigestNames() as string = SSH2SessionMBS.DigestNames
Break
```

Notes: The list may not be the same for Mac, Windows and Linux.

138.44.11 Disconnect(description as string)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Terminate transport layer.
Notes: Lasterror is set.
description: Human readable reason for disconnection.
See also:

- 138.44.12 Disconnect(reason as Integer, description as string, lang as string = "") 18933

138.44.12 Disconnect(reason as Integer, description as string, lang as string = "")

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Terminate transport layer.
Notes: Lasterror is set.

reason: One of the Disconnect Reason constants.
description: Human readable reason for disconnection.
lang: Localization string describing the langauge/encoding of the description provided.
See also:

- 138.44.11 Disconnect(description as string) 18933

138.44.13 HostKey(byref Type as Integer) as string

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the remote key.

138.44.14 HostKeyHash(HashType as Integer) as string

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return a hash of the remote host's key.
Notes: HashType: kHostKeyHashSHA1 or kHostKeyHashMD5.
Returns the computed digest of the remote system's hostkey. The length of the returned string is hash_type specific (e.g. 16 bytes for MD5, 20 bytes for SHA1).
Computed hostkey hash value, or empty string if the information is not available (either the session has not yet been started up, or the requested hash algorithm was not available). The hash consists of raw binary bytes, not hex digits, so it is not directly printable.

138.44.15 OpenDirectTCPIPChannel(host as string, port as integer, sourceHost as string = "127.0.0.1", sourcePort as Integer = 22) as SSH2ChannelMBS

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tunnel a TCP connection through an SSH session.
Notes: host: Third party host to connect to using the SSH host as a proxy.
port: Port on third party host to connect to.
SourceHost: Host to tell the SSH server the connection originated on.
SourcePort: Port to tell the SSH server the connection originated from.

Tunnel a TCP/IP connection through the SSH transport via the remote host to a third party. Communication from the client to the SSH server remains encrypted, communication from the server to the 3rd party host travels in cleartext.

This is not a replacement for ssh in command line with -L option.

Returns a newly allocated channel object, or nil on errors.

138.44.16 OpenSession as SSH2ChannelMBS

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Establish a generic session channel.
Notes: Lasterror is set.
Returns nil if the session start fails.

138.44.17 SessionFlag(Flag as Integer, Value as boolean)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set a session flag.
Notes: See kFlag* constants.
Lasterror is set.

138.44.18 SessionHandshake

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform the SSH handshake.

Notes: Lasterror is set.

138.44.19 SetBanner(Banner as string)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the SSH prococol banner for the local client.
Notes: Set the banner that will be sent to the remote host when the SSH session is started with Handshake. This is optional; a banner corresponding to the protocol and libssh2 version will be sent by default.
Lasterror is set.

138.44.20 SetMethodPreference(methodType as Integer, Pref as string) as Boolean

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set preferred key exchange method.
Example:

```
// set preferences for key exchange method:
Var r as Boolean = s.SetMethodPreference(SSH2SessionMBS.kMethodKEX, "diffie-hellman-group-exchange-sha256")
```

Notes: methodType: One of the Method Type constants.
Pref: Coma delimited list of preferred methods to use with the most preferred listed first and the least preferred listed last. If a method is listed which is not supported by libssh2 it will be ignored and not sent to the remote host during protocol negotiation.

Set preferred methods to be negotiated. These preferences must be set prior to calling SessionHandshake, as they are used during the protocol initiation phase.

Return true on success or false on failure. Lasterror is set. Lasterror is set to LIBSSH2_ERROR_EAGAIN (-37) when it would otherwise block. While LIBSSH2_ERROR_EAGAIN is a negative number, it isn't really a failure per se.

138.44.21 SupportedAlgorithms(methodType as Integer) as String()

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get list of supported algorithms.
Example:

```
Var s as new SSH2SessionMBS("localhost")
```

```
Var KeyExchange() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodKEX)
Var HostKey() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodHostKey)
Var CryptCS() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodCryptCS)
Var CryptSC() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodCryptSC)
Var MacCS() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodMacCS)
Var MacSC() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodMacSC)
Var CompCS() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodCompCS)
Var CompSC() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodCompSC)
Var LangCS() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodLangCS)
Var LangSC() as string = s.SupportedAlgorithms(SSH2SessionMBS.kMethodLangSC)

Break
```

Notes: Method type: see kMethod* constants.

Get a list of supported algorithms for the given methodType. The methodType parameter is equivalent to methodType in SetMethodPreference.

In order to get a list of all supported compression algorithms, SessionFlag(SSH2SessionMBS.kFlagCompress, true) must be called before calling this function, otherwise only "none" will be returned.

On success, returns array with algorithms
Lasterror is set with error code.

138.44.22 UserAuthKeyboardInteractive(UserName as string)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Authenticate a session using keyboard-interactive authentication.
Notes: username: Name of user to attempt keyboard-interactive authentication for.
Lasterror is set.
Calls KeyboardCallback callback to query input from user.

138.44.23 UserAuthList(username as string) as string

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: List supported authentication methods.
Notes: username: Username which will be used while authenticating. Note that most server implementations do not permit attempting authentication with different usernames between requests. Therefore this must be the same username you will use on later userauth calls.

Send a SSH_USERAUTH_NONE request to the remote host. Unless the remote host is configured to accept none as a viable authentication scheme (unlikely), it will return SSH_USERAUTH_FAILURE along with a listing of what authentication schemes it does support. In the unlikely event that none authentication succeeds, this method with return NULL. This case may be distinguished from a failing case by examining Authenticated.

138.44.24 UserAuthPassword(UserName as string, Password as string)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Authenticate a session with username and password.
Notes: username: Name of user to attempt plain password authentication for.
password: Password to use for authenticating username.

Attempt basic password authentication. Note that many SSH servers which appear to support ordinary password authentication actually have it disabled and use Keyboard Interactive authentication (routed via PAM or another authentication backed) instead.
Lasterror is set.

138.44.25 UserAuthPublicKeyFromFile(UserName as string, publickey as folderitem, privatekey as folderitem, Passphrase as string)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Authenticate a session with a public key, read from a file.
Notes: Lasterror is set.
username: user name to authenticate as.
publickey: Path of the public key file. (e.g. /etc/ssh/hostkey.pub). If libssh2 is built against OpenSSL, this option can be set to ""/nil.
privatekey: Path of the private key file. (e.g. /etc/ssh/hostkey)
passphrase: Passphrase to use when decoding privatekey.

Attempt public key authentication using a PEM encoded private key file stored on disk
See also:

- 138.44.26 UserAuthPublicKeyFromFile(UserName as string, publickey as string, privatekey as string, Passphrase as string) 18938

138.44.26 UserAuthPublicKeyFromFile(UserName as string, publickey as string, privatekey as string, Passphrase as string)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Authenticate a session with a public key, read from a file.
Notes: Lasterror is set.
username: user name to authenticate as.
publickey: Path of the public key file. (e.g. /etc/ssh/hostkey.pub). If libssh2 is built against OpenSSL, this option can be set to ""/nil.
privatekey: Path of the private key file. (e.g. /etc/ssh/hostkey)
passphrase: Passphrase to use when decoding privatekey.

Attempt public key authentication using a PEM encoded private key file stored on disk
See also:

- 138.44.25 UserAuthPublicKeyFromFile(UserName as string, publickey as folderitem, privatekey as folderitem, Passphrase as string) 18937

138.44.27 UserAuthPublicKeyFromMemory(UserName as string, publickey as string, privatekey as string, Passphrase as string)

MBS CURL Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Authenticate a session with a public key, read from memory
Notes: This function allows to authenticate a session with a public key read from memory.
Lasterror is set.

username - Remote user name to authenticate as.
publickeydata - Buffer containing the contents of a public key file. Optional.
privatekeydata - Buffer containing the contents of a private key file.
passphrase - Passphrase to use when decoding private key file.

Keys must have LF as line ending, not CR.

Attempt public key authentication using a PEM encoded private key file stored in memory.

138.44.28 Version as string

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the version for the SSH library.
Example:

MessageBox SSH2SessionMBS.Version

138.44.29 WaitSocket(TimeOut as Double = 0.1)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Waits on the socket for sending or receiving.
Notes: Default used to be 10 seconds, but that may be to much, so since v22.3 the value can be customized and is now 1/10th of a second.

138.44.30 Properties

138.44.31 Authenticated as Boolean

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return authentication status.
Notes: Indicates whether or not the named session has been successfully authenticated.
Returns true if authenticated and false if not.
(Read only property)

138.44.32 Blocking as Boolean

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blocking mode on session.
Notes: blocking: Set to a non-zero value to make the channel block, or zero to make it non-blocking.

Set or clear blocking mode on the selected on the session. This will instantly affect any channels associated with this session. If a read is performed on a session with no data currently available, a blocking session will wait for data to arrive and return what it receives. A non-blocking session will return immediately with an empty buffer. If a write is performed on a session with no room for more data, a blocking session will wait for room. A non-blocking session will return immediately without writing anything.
(Read and Write property)

138.44.33 Handle as Integer

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Internal object reference.

Notes: (Read and Write property)

138.44.34 LastErrNo as Integer

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the most recent error number.
Notes: Returns a numeric error code corresponding to the Error Code constants.
(Read only property)

138.44.35 LastError as Integer

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

138.44.36 Socket as TCPSocket

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The socket value.
Notes: This is set by constructor if you base the session on an existing session.
But you can assign a socket here if you like.
(Read and Write property)

138.44.37 Tag as Variant

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag value.
Notes: A property where you can store any value you like.
(Read and Write property)

138.44.38 TimeOut as Integer

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The timeout for blocking functions.
Notes: In milliseconds.

(Read and Write property)

138.44.39 Events

138.44.40 KeyboardCallback(Name as string, Instruction as string, PromptCount as Integer, Prompts() as SSH2UserAuthKeyboardInteractivePromptMBS, responses() as SSH2UserAuthKeyboardInteractiveResponseMBS)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Event to ask for user input on a UserAuthKeyboardInteractive run.
Notes: You can ask user for password, e.g. with a modal dialog.
You find prompt text in SSH2UserAuthKeyboardInteractivePromptMBS object and place answer in SSH2UserAuthKeyboardInteractiveResponseMBS objects.

138.44.41 Constants

Error Codes

Constant	Value	Description
kErrorAgentProtocol	-42	Invalid agent protocol.
kErrorAlloc	-6	Out of memory.
kErrorAuthenticationFailed	-18	Authentication failed.
kErrorBadSocket	-45	Bad socket handle.
kErrorBadUse	-39	Bad use.
kErrorBannerRecv	-2	Failed to receive banner.
kErrorBannerSend	-3	Failed to send banner.
kErrorBufferTooSmall	-38	Memory buffer is too small.
kErrorChannelClosed	-26	Channel is already closed.
kErrorChannelEofSent	-27	Chanel sent EOF.
kErrorChannelFailure	-21	Generic error on a channel.
kErrorChannelOutoforder	-20	Channel commands out of order.
kErrorChannelPacketExceeded	-25	Channel packet exceeded.
kErrorChannelRequestDenied	-22	Channel request denied.
kErrorChannelUnknown	-23	Unknown channel.
kErrorChannelWindowExceeded	-24	Channel window exceeded.
kErrorChannelWindowFull	-47	Channel window is full.
kErrorCompress	-40	Compression error.
kErrorDecrypt	-12	Error with decryption.
kErrorEagain	-37	Please try again later.
kErrorEncrypt	-44	Error on encrypting.
kErrorFile	-16	File IO error.
kErrorHostkeyInit	-10	Failed to init host key.
kErrorHostkeySign	-11	Failed to sign host key.
kErrorInval	-34	Input value error.
kErrorInvalidMac	-4	Invalid MAC address.
kErrorInvalidPollType	-35	Invalid poll type.
kErrorKexFailure	-5	Key exchange failed.
kErrorKeyExchangeFailure	-8	Key exchange failed.
kErrorKeyfileAuthFailed	-48	Authorization with key file failed.
kErrorKnownHosts	-46	Unknown host.
kErrorMethodNone	-17	No method.
kErrorMethodNotSupported	-33	Method not supported.
kErrorNone	0	No error.
kErrorOutOfBoundary	-41	Out of Boundary.
kErrorPasswordExpired	-15	Password expired.
kErrorProto	-14	Protocol error.
kErrorPublickeyProtocol	-36	Publickey protocol failed.
kErrorPublickeyUnverified	-19	Publickey is not verified.
kErrorRequestDenied	-32	Request denied.
kErrorScpProtocol	-28	Error with SCP protocol.
kErrorSftpProtocol	-31	Error with SFTP protocol.
kErrorSocketDisconnect	-13	Socket got disconnected.
kErrorSocketNone	-1	No socket error.
kErrorSocketRecv	-43	Socket receive failed.
kErrorSocketSend	-7	Socket send failed.
kErrorSocketTimeout	-30	Socket timeout.
kErrorTimeout	-9	Timeout.
kErrorZlib	-29	Error with zlib (Compression).

Flags

Constant	Value	Description
kFlagCompress	2	Set options for the created session. flag is the option to set, while value is typically set to 1 or 0 to enable or disable the option. If set - before the connection negotiation is performed - libssh2 will try to negotiate compression enabling for this connection. By default libssh2 will not attempt to use compression.
kFlagSigPipe	1	Set options for the created session. flag is the option to set, while value is typically set to 1 or 0 to enable or disable the option. If set, libssh2 will not attempt to block SIGPIPEs but will let them trigger from the underlying socket layer.

Hash Type

Constant	Value	Description
kHostKeyHashMD5	1	MD5
kHostKeyHashSHA1	2	SHA1
kHostKeyHashSHA256	3	SHA256

Method Preferences

Constant	Value	Description
kMethodCompCS	6	Compression method. e.g. zlib, zlib@openssh.com, none
kMethodCompSC	7	Compression method. e.g. zlib, zlib@openssh.com, none
kMethodCryptCS	2	Crypt Method. e.g. aes128-ctr, aes192-ctr, aes256-ctr, aes256-cbc, rijndael-cbc@lysator.liu.se, aes192-cbc, aes128-cbc, blowfish-cbc, arcfour128, arcfour, cast128-cbc, 3des-cbc.
kMethodCryptSC	3	Crypt Method. e.g. aes128-ctr, aes192-ctr, aes256-ctr, aes256-cbc, rijndael-cbc@lysator.liu.se, aes192-cbc, aes128-cbc, blowfish-cbc, arcfour128, arcfour, cast128-cbc, 3des-cbc
kMethodHostKey	1	Host key method. e.g. ssh-rsa, ssh-dss
kMethodKEX	0	Key Exchange Method. e.g. diffie-hellman-group-exchange-sha256, diffie-hellman-group-exchange-sha1, diffie-hellman-group14-sha1 or diffie-hellman-group1-sha1.
kMethodLangCS	8	Language.
kMethodLangSC	9	Language.
kMethodMacCS	4	MAC method (hash) e.g. hmac-sha2-256, hmac-sha2-512, hmac-sha1, hmac-sha1-96, hmac-md5, hmac-md5-96, hmac-ripemd160, hmac-ripemd160@openssh.com
kMethodMacSC	5	MAC method (hash) e.g. hmac-sha2-256, hmac-sha2-512, hmac-sha1, hmac-sha1-96, hmac-md5, hmac-md5-96, hmac-ripemd160, hmac-ripemd160@openssh.com

138.45 class SSH2TunnelMBS

138.45.1 class SSH2TunnelMBS

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a SSH tunnel.
Example:

```
// forward local port 3307 through SSH to a MySQL server on the remote network
// Session is a property of the window: Session As SSH2SessionMBS (connected and authenticated)
// Tunnel is a property of the window: Tunnel As SSH2TunnelMBS
Tunnel = New SSH2TunnelMBS(Session)
Tunnel.LocalAddress = "127.0.0.1"
Tunnel.LocalPort = 3307
Tunnel.RemoteAddress = "db.internal"
Tunnel.RemotePort = 3306

// start forwarding
```

Tunnel.Run

```
// now connect your database client to 127.0.0.1:3307
// check Tunnel.Running and Tunnel.Messages for the state
// to stop: Tunnel.Cancel = True
```

Notes: The MBS Plugin can spin of a new preemptive thread to run a tunnel to forward a SSH connection from local socket to remote server via SSH tunnel.
This works well for database access with MySQL.
By using our own thread, we are not blocking or blocked by your Xojo code.

The tunnel allows currently one connection through it, e.g. run one tunnel per MySQL connection to go through the tunnel. If you need multiple tunnels, please create multiple SSH tunnels.

For macOS and iOS, your application may need to have the NSLocalNetworkUsageDescription in info.plist for local network access and your sandboxed application may need need the com.apple.security.network.client entitlement.

138.45.2 Methods

138.45.3 Constructor(session as SSH2SessionMBS)

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: Please pass connected SSH session.

138.45.4 Destructor

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

138.45.5 Run

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs the thread with the tunnel.

138.45.6 Properties

138.45.7 BytesReceived as Int64

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of bytes received.
Notes: (Read only property)

138.45.8 BytesSent as Int64

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of bytes sent.
Notes: (Read only property)

138.45.9 Cancel as Boolean

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to cancel tunnel.
Notes: This property can be set to request end of the thread.
(Read and Write property)

138.45.10 Connected as Boolean

MBS CURL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries whether tunnel is connected and transfers data.
Notes: Returns true if connected or false if not.
(Read only property)

138.45.11 KeepAlive as Boolean

MBS CURL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to sent keep-alive packets.
Example:

```
Var tunnel as SSH2TunnelMBS // your tunnel

// avoid timeing out in Socket and SSH layers
tunnel.KeepAlive = True
session.ConfigureKeepAlive
```

Notes: If set to true, TCP keep alive probes will be sent to avoid TCP/IP timeouts.
Set to false (default behavior) to disable keep alive probes.

You may also need to use ConfigureKeepAlive on the SSH2SessionMBS class.
(Read and Write property)

138.45.12 LocalAddress as String

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The local address to use.
Notes: Defines where we wait for a connection to forward.
IPv4 or IPv6 address.
(Read and Write property)

138.45.13 LocalPort as Integer

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The local port to use.
Notes: (Read and Write property)

138.45.14 Messages as String

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Log messages.
Notes: Filled by thread to tell you about errors.
(Read only property)

138.45.15 RemoteAddress as String

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The remote address to use.
Notes: When connecting through tunnel this address is used from server to connect to.
IPv4 or IPv6 address.
(Read and Write property)

138.45.16 RemotePort as Integer

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The remote port to use.
Notes: When connecting through tunnel this port is used from server to connect to.
(Read and Write property)

138.45.17 Running as Boolean

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether tunnel is running.
Notes: True if running, false if not.
(Read only property)

138.45.18 Session as SSH2SessionMBS

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The session used for the tunnel.
Notes: (Read only property)

138.46 class SSH2UserAuthKeyboardInteractivePromptMBS

138.46.1 class SSH2UserAuthKeyboardInteractivePromptMBS

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an interactive keyboard authentication prompt.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.46.2 Methods

138.46.3 Constructor

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

138.46.4 Destructor

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

138.46.5 Properties

138.46.6 Echo as Integer

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The echo flag.
Notes: (not sure what this is)
(Read and Write property)

138.46.7 Length as Integer

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The length of the text.
Notes: (Read and Write property)

138.46.8 Text as String

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The text message.
Notes: (Read and Write property)

138.47 class SSH2UserAuthKeyboardInteractiveResponseMBS

138.47.1 class SSH2UserAuthKeyboardInteractiveResponseMBS

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a response with interactive keyboard login.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.47.2 Methods

138.47.3 Constructor

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

138.47.4 Destructor

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destrutor.

138.47.5 Properties

138.47.6 Text as String

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The response text.
Notes: Usually a password.
(Read and Write property)

138.48 class TCPSocket

138.48.1 class TCPSocket

Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: .

Function: The Socket class in Xojo which is the superclass of the PacketSocketMBS class.

138.49 class TXTRecordMBS

138.49.1 class TXTRecordMBS

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: The class to represent a DNS-SD TXT record.
Example:

```
Var t as new TXTRecordMBS

call t.SetValue "Hello", "World"

MessageBox t.Bytes // show complete record
MessageBox t.Value("Hello") // lookup value
```

Notes: The constructor creates an empty TXTRecord where you can add values using TXTRecordSetValue.

138.49.2 Methods

138.49.3 Bytes as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Allows you to retrieve a copy of to the raw bytes within a TXTRecord.
Example:

```
Var t as new TXTRecordMBS

call t.SetValue "Hello", "World"
```

Notes: Returns a string with the raw bytes inside the TXTRecord which you can pass directly to DNSServiceRegisterMBS.Register() or to DNSServiceRegisterMBS.UpdateRecord().

138.49.4 ContainsKey(key as string) as boolean

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Allows you to determine if a given TXT Record contains a specified key.
Example:

```
Var t as new TXTRecordMBS

call t.SetValue "Hello", "World"
```

```
if t.ContainsKey("Hello") then
MessageBox "Hello found."
else
MessageBox "Hello not found ->bug."
end if

if t.ContainsKey("hallo") then
MessageBox "hallo found ->bug."
else
MessageBox "hallo not found."
end if
```

Notes: key: An ASCII string containing the key name.

Returns true if the TXT Record contains the specified key. Otherwise, it returns false.
See also:

- 138.49.5 ContainsKey(txtRecord as string, key as string) as boolean 18954

138.49.5 ContainsKey(txtRecord as string, key as string) as boolean

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Allows you to determine if a given TXT Record contains a specified key.
Example:

```
Var t as new TXTRecordMBS

call t.SetValue "Hello", "World"

Var s as string = t.Bytes // copy record to string

// now search in that string:
if TXTRecordMBS.ContainsKey(s, "Hello") then
MessageBox "Hello found."
else
MessageBox "Hello not found ->bug."
end if

if TXTRecordMBS.ContainsKey(s, "hallo") then
MessageBox "hallo found ->bug."
else
MessageBox "hallo not found."
end if
```

Notes: txtRecord: The txt record to search in as a string.
key: An ASCII string containing the key name.

Returns true if the TXT Record contains the specified key. Otherwise, it returns false.
See also:

- 138.49.4 ContainsKey(key as string) as boolean 18953

138.49.6 Count as Integer

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Returns the number of keys stored in the TXT Record.
Example:

```
Var t as new TXTRecordMBS

call t.SetValue "Hello1", "World1"
call t.SetValue "Hello2", "World2"
call t.SetValue "Hello3", "World3"

MessageBox str(t.Count)
```

See also:

- 138.49.7 Count(txtRecord as string) as Integer 18955

138.49.7 Count(txtRecord as string) as Integer

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Returns the number of keys stored in the TXT Record.
Example:

```
Var t as new TXTRecordMBS

call t.SetValue "Hello1", "World1"
call t.SetValue "Hello2", "World2"
call t.SetValue "Hello3", "World3"

Var s as string = t.Bytes // copy record

// now count in that record
MessageBox str(TXTRecordMBS.Count(s))
```

See also:

- 138.49.6 Count as Integer 18955

138.49.8 KeyAtIndex(index as Integer) as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Returns the key with the given index from the txt record.
Example:

```
Var t as new TXTRecordMBS

call t.SetValue "Hello", "World"

MessageBox t.KeyAtIndex(0) +EndOfLine + t.ValueAtIndex(0)
```

Notes: index: the index you want in the range from zero to GetCount()-1.

It's also possible to iterate through keys in a TXT record by simply calling KeyAtIndex() repeatedly, beginning with index zero and increasing until lasterror is set to kErrorInvalid.
See also:

- 138.49.9 KeyAtIndex(txtRecord as string, index as Integer) as string 18956

138.49.9 KeyAtIndex(txtRecord as string, index as Integer) as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Returns the key with the given index from the txt record.
Example:

```
Var t as new TXTRecordMBS

call t.SetValue "Hello", "World"

Var s as string = t.Bytes // copy record to string

// now search in that string:
MessageBox TXTRecordMBS.KeyAtIndex(s,0) +EndOfLine + TXTRecordMBS.ValueAtIndex(s,0)
```

Notes: txtRecord: The txt record to search in as a string.
index: the index you want in the range from zero to GetCount()-1.

It's also possible to iterate through keys in a TXT record by simply calling KeyAtIndex() repeatedly, beginning with index zero and increasing until lasterror is set to kErrorInvalid.
See also:

• 138.49.8 KeyAtIndex(index as Integer) as string 18956

138.49.10 Length as Integer

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Allows you to determine the length of the raw bytes within a TXTRecord.
Example:

```
Var t as new TXTRecordMBS

call t.SetValue "Hello1", "World1"
call t.SetValue "Hello2", "World2"
call t.SetValue "Hello3", "World3"

MessageBox str(t.Length) // shows 42
```

138.49.11 RemoveValue(key as string)

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Removes a key from a TXTRecordRef. The "key" must be an ASCII string which exists in the TXTRecord.
Example:

```
Var t as new TXTRecordMBS

call t.SetValue "Hello1", "World1"
call t.SetValue "Hello2", "World2"
call t.SetValue "Hello3", "World3"

t.RemoveValue "Hello2"

MessageBox t.Bytes
```

Notes: key: A key name which exists in the TXTRecord.

Lasterror is kErrorNoError on success or kErrorNoSuchKey if the "key" does not exist in the TXTRecord.

138.49.12 SetValue(key as string, value as string) as Integer

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Adds a key (optionally with value) to a TXTRecordRef.
Example:

```
Var t as new TXTRecordMBS

call t.SetValue "Hello1", "World1"
call t.SetValue "Hello2", "World2"
call t.SetValue "Hello3", "World3"
```

Notes: If the "key" already exists in the TXTRecord, then the current value will be replaced with the new value.

Keys may exist in four states with respect to a given TXT record:

- Absent (key does not appear at all)
- Present with no value ("key" appears alone)
- Present with empty value ("key=" appears in TXT record)
- Present with non-empty value ("key=value" appears in TXT record)

For more details refer to "Data Syntax for DNS-SD TXT Records" in

http://files.dns-sd.org/draft-cheshire-dnsext-dns-sd.txt

key: A string which only contains printable ASCII values (&h20-&h7E), excluding '=' (&h3D). Keys should be 8 characters or less.
value: Any binary value. For values that represent textual data, UTF-8 is STRONGLY recommended.

Returns kErrorNoError on success. Returns kErrorInvalid if the "key" string contains illegal characters. Returns kErrorNoMemory if adding this key would exceed the available storage.

The plugin currently does not create keys with empty value. If you need that, please email us.

138.49.13 Value(key as string) as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Allows you to retrieve the value for a given key from a TXT Record.
Example:

```
Var t as new TXTRecordMBS
```

```
call t.SetValue "Hello", "World"
MessageBox t.Value("Hello") // lookup value
```

Notes: key: The ASCII string containing the key name.

Returns an empty string if the key does not exist in this TXT record, or exists with no value (to differentiate between these two cases use ContainsKey()).
See also:

- 138.49.14 Value(txtRecord as string, key as string) as string 18959

138.49.14 Value(txtRecord as string, key as string) as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Allows you to retrieve the value for a given key from a TXT Record.
Example:

```
Var t as new TXTRecordMBS

call t.SetValue "Hello", "World"

Var s as string = t.bytes
MessageBox TXTRecordMBS.Value(s, "Hello") // lookup value
```

Notes: txtRecord: Pointer to the received TXT Record bytes.
key: The ASCII string containing the key name.

Returns an empty string if the key does not exist in this TXT record, or exists with no value (to differentiate between these two cases use ContainsKey()).
See also:

- 138.49.13 Value(key as string) as string 18958

138.49.15 ValueAtIndex(index as Integer) as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Returns the key with the given index from the txt record.
Example:

```
Var t as new TXTRecordMBS

call t.SetValue "Hello", "World"
```

```
MessageBox t.KeyAtIndex(0) +EndOfLine + t.ValueAtIndex(0)
```

Notes: index: the index you want in the range from zero to GetCount()-1.

It's also possible to iterate through values in a TXT record by simply calling ValueAtIndex() repeatedly, beginning with index zero and increasing until lasterror is set to kErrorInvalid.
See also:

- 138.49.16 ValueAtIndex(txtRecord as string, index as Integer) as string 18960

138.49.16 ValueAtIndex(txtRecord as string, index as Integer) as string

MBS Network Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: All.

Function: Returns the key with the given index from the txt record.
Example:

```
Var t as new TXTRecordMBS

call t.SetValue "Hello", "World"

Var s as string = t.Bytes // copy record to string

// now search in that string:
MessageBox TXTRecordMBS.KeyAtIndex(s,0) +EndOfLine + TXTRecordMBS.ValueAtIndex(s,0)
```

Notes: txtRecord: The txt record to search in as a string.
index: the index you want in the range from zero to GetCount()-1.

It's also possible to iterate through values in a TXT record by simply calling GetValueAtIndex() repeatedly, beginning with index zero and increasing until lasterror is set to kErrorInvalid.
See also:

- 138.49.15 ValueAtIndex(index as Integer) as string 18959

138.50 class UDPSocketMBS

138.50.1 class UDPSocketMBS

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for UDP sockets.
Example:

```
// receive and send UDP messages
// MyUDPSocket is a subclass of UDPSocketMBS with the events implemented.
// Socket is a property of the window: Socket As MyUDPSocket

Socket = New MyUDPSocket
Socket.Bind 9000 // listen on port 9000

// send a message to ourselves
Call Socket.SendMessage("Hello UDP", "127.0.0.1", 9000)

// in MyUDPSocket:
Sub DataAvailable() Handles DataAvailable
Var d As DatagramMBS = Me.Read
If d <>Nil Then
System.DebugLog "Got " + d.Length.ToString + " bytes from " + d.Address + ":" + d.Port.ToString + ":
" + d.Data
End If
End Sub

Sub Error() Handles Error
System.DebugLog "Socket error " + Me.SocketError.ToString
End Sub
```

Notes: Similar to Xojo's built in UDPSocket class, but more low level and with more options.

For macOS and iOS, your application may need to have the NSLocalNetworkUsageDescription in info.plist for local network access and your sandboxed application may need need the com.apple.security.network.client entitlement.

138.50.2 Methods

138.50.3 AddMembership(MultiAddress as string, InterfaceAddress as string = "")

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds this socket to a multicast group.
Notes: Internally this uses IPPROTO_IP/IP_ADD_MEMBERSHIP option.
Lasterror is set.

MultiAddress: The IPv4 address of the group to join.
InterfaceAddress: The IPv4 address of the network interface to use. Can be empty for any interface.

138.50.4 Bind(Port as Integer, IP as string = "")

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Binds the socket to the given port.
Notes: If IP is not empty, you can bind the socket to only the given network interface with that IPv4.
Set ReuseAddress to bind to an address which already a socket is bound to.
Lasterror is set.

138.50.5 Constructor

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

138.50.6 Destructor

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: Closes the socket.

138.50.7 DropMembership(MultiAddress as string, InterfaceAddress as string = "")

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes this socket from a multicast group.
Notes: Internally this uses IPPROTO_IP/IP_DROP_MEMBERSHIP option.
Lasterror is set.

MultiAddress: The IPv4 address of the group to join.
InterfaceAddress: The IPv4 address of the network interface to use. Can be empty for any interface.

138.50.8 Poll

MBS Network Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Polls for activity.
Notes: Calls events if needed.
This is called automatically via timer by the plugin.

138.50.9 Read(peek as boolean = false) as DatagramMBS

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a datagram.
Notes: If peek is true, the data is not removed from read buffer.
On error returns nil.

138.50.10 SendMessage(Data as DatagramMBS) as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a datagram.
Notes: Please specify with port and address of datagram where package is sent to.

Returns number of bytes sent.
Lasterror is set.
See also:

- 138.50.11 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer 18964
- 138.50.12 SendMessage(Data as string, IP as String, Port as Integer) as Integer 18964

138.50.11 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a datagram.
Notes: Please specify with port and IP where package is sent to.
Returns number of bytes sent.
Lasterror is set.
See also:

- 138.50.10 SendMessage(Data as DatagramMBS) as Integer 18963
- 138.50.12 SendMessage(Data as string, IP as String, Port as Integer) as Integer 18964

138.50.12 SendMessage(Data as string, IP as String, Port as Integer) as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a datagram.
Notes: Please specify with port and IP where package is sent to.
Returns number of bytes sent.
Lasterror is set.
See also:

- 138.50.10 SendMessage(Data as DatagramMBS) as Integer 18963
- 138.50.11 SendMessage(Data as MemoryBlock, IP as String, Port as Integer) as Integer 18964

138.50.13 Properties

138.50.14 AddressFamily as Integer

MBS Network Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The address family of the socket.
Notes: This is either RAWSocketMBS.AddressFamilyINet (2) for IPv4 or RAWSocketMBS.AddressFamilyINet6 (Mac 30, Windows 23 and Linux 10) for IPv6.

(Read and Write property)

138.50.15 AvailableBytes as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns number of bytes available for reading.
Notes: Lasterror is set.
(Read only property)

138.50.16 BindAddress as String

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The IP used for bind operation.
Notes: This is set by Bind on success.
(Read and Write property)

138.50.17 BindPort as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The port used for bind operation.
Notes: This is set by Bind on success.
(Read and Write property)

138.50.18 Broadcast as Boolean

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether broadcasts are allowed.
Notes: Set to true before sending a broadcast message.
Internally this uses SOL_SOCKET/SO_BROADCAST option.
Lasterror is set.
(Read and Write property)

138.50.19 Handle as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal socket handle.
Notes: (Read and Write property)

138.50.20 Lasterror as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: Platform dependent.
(Read and Write property)

138.50.21 LocalIP as String

MBS Network Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries local IP.
Notes: Can be 0.0.0.0 if unknown.
May only be set if connected or binded.
Lasterror is set.
(Read only property)

138.50.22 LocalPort as Integer

MBS Network Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries local port.
Notes: Lasterror is set.
Can be -1 if unknown.
(Read only property)

138.50.23 MulticastInterface as String

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The interface to use for multicast.
Notes: Internally this uses IPPROTO_IP/IP_MULTICAST_IF option.
Lasterror is set.

Assign empty string to use all interfaces.
May return 0.0.0.0 to indicate all interfaces.

(Read and Write property)

138.50.24 MulticastLoop as Boolean

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether multicast packets are also sent to the sending socket.
Notes: Internally this uses IPPROTO_IP/IP_MULTICAST_LOOP option.
Lasterror is set.
(Read and Write property)

138.50.25 MulticastTimeToLive as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The multicast time to live value.
Notes: Internally this uses IPPROTO_IP/IP_MULTICAST_TTL option.
Lasterror is set.
Range from 0 to 255.
(Read and Write property)

138.50.26 Protocol as Integer

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The socket protocol.
Notes: Is ProtocolUDP (17) for UDP sockets.
(Read and Write property)

138.50.27 ReceiveBufferSize as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the receiving buffer size.
Notes: The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Internally this uses SOL_SOCKET/SO_RCVBUF option.
Lasterror is set.
(Read and Write property)

138.50.28 ReuseAddress as Boolean

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allows reuse of same port.
Notes: Internally this uses SOL_SOCKET/SO_REUSEADDR option.

see also
http://stackoverflow.com/questions/14388706/socket-options-so-reuseaddr-and-so-reuseport-how-do-they-differ-do-they-mean-t

Lasterror is set.
(Read and Write property)

138.50.29 ReusePort as Boolean

MBS Network Plugin, Plugin Version: 14.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allow reuse of same port and IP.
Notes: Internally this uses SOL_SOCKET/SO_REUSEPORT option.
On Windows, this is not supported, so this property sets ReuseAddress.
Lasterror is set.
(Read and Write property)

138.50.30 SendBufferSize as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sending buffer size.
Notes: The buffer size may be increased for high-volume connections, or may be decreased to limit the possible backlog of incoming data. The system places an absolute limit on these values.
Internally this uses SOL_SOCKET/SO_SNDBUF option.
Lasterror is set.
(Read and Write property)

138.50.31 SocketError as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The native socket error.
Notes: Internally this uses SOL_SOCKET/SO_ERROR option.
Lasterror is set.

(Read only property)

138.50.32 SocketType as Integer

MBS Network Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The socket type.
Notes: Is SocketTypeDatagram (2) for UDP sockets.
(Read and Write property)

138.50.33 TimeToLive as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time to live value.
Notes: Internally this uses IPPROTO_IP/IP_TTL option.
Lasterror is set.
Range from 0 to 255.
(Read and Write property)

138.50.34 Type as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Socket type.
Notes: Always 2 as this is a datagram socket.
Internally this uses SOL_SOCKET/SO_TYPE option.
Lasterror is set.
(Read only property)

138.50.35 TypeOfService as Integer

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of service value.
Notes: Works only on BSD Sockets.

Possible values:
IPTOS_MINCOST = 2
IPTOS_RELIABILITY = 4
IPTOS_THROUGHPUT = 8

IPTOS_LOWDELAY = 16

Internally this uses IPPROTO_IP/IP_TOS option.
(May not work on Windows.

Lasterror is set.
(Read and Write property)

138.50.36 Events

138.50.37 DataAvailable

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: This event is called when new data is available.
Notes: Requires the socket to be bound.

138.50.38 Error

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called if socket is in error state.

138.50.39 SendComplete

MBS Network Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last write operation is done.

138.51 class WindowsDNSRecordAAAAMBS

138.51.1 class WindowsDNSRecordAAAAMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a DNS IPv6 (AAAA) record.
Notes: Be aware that IPv6 is not available on Windows XP and older.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.51.2 Methods

138.51.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes: This constructor makes sure you don't create useless WindowsDNSRecordAAAAMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

138.51.4 Properties

138.51.5 Address as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The address in a human readable format.
Notes: (Read and Write property)

138.51.6 RawAddress as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The raw address as a 16byte string.
Notes: (Read and Write property)

138.52 class WindowsDNSRecordAMBS

138.52.1 class WindowsDNSRecordAMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a DNS address (A) record.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.52.2 Methods

138.52.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes: This constructor makes sure you don't create useless WindowsDNSRecordAMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

138.52.4 Properties

138.52.5 Address as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The IPv4 address as a string.
Notes: (Read and Write property)

138.52.6 IPAddress as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The raw address as an integer.
Notes: (Read and Write property)

138.53 class WindowsDNSRecordMBS

138.53.1 class WindowsDNSRecordMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for DNS query results on Windows.
Example:

```
// look up the mail servers of a domain with a DNS query on Windows
Var record As WindowsDNSRecordMBS = WindowsDNSRecordMBS.Query("example.com", WindowsDNSRecordMBS.kDNS
Var lines() As String

While record <>Nil
If record.Type = WindowsDNSRecordMBS.kDNSTypeMX Then
lines.Add record.MX.NameExchange + " (preference " + record.MX.Preference.ToString + ")"
End If
record = record.NextRecord
Wend

MessageBox String.FromArray(lines, EndOfLine)
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.53.2 Methods

138.53.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes: This constructor makes sure you don't create useless WindowsDNSRecordMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

138.53.4 Query(name as string, type as Integer, options as Integer = 0) as WindowsDNSRecordMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a DNS query on Windows.
Notes: The DnsQuery function type is the generic query interface to the DNS namespace, and provides

application developers with a DNS query resolution interface.

name: a string that represents the name of the owner of the record set that is queried.
type: A value that represents the RR DNS Record Type that is queried.
Options: A value that contains a combination of kDNSQuery* constants.

Returns the record chain on success.

Applications that call the DnsQuery function build a query using a fully-qualified DNS name and Resource Record (RR) type, and set query options depending on the type of service desired. When the kDNSQuery-Standard option is set, DNS uses the resolver cache, queries first with UDP, then retries with TCP if the response is truncated, and requests that the server to perform recursive resolution on behalf of the client to resolve the query.

Note When calling one of the DnsQuery function types, be aware that a DNS server may return multiple records in response to a query. A computer that is multihomed, for example, will receive multiple A records for the same IP address. The caller must use as many of the returned records as necessary.

Consider the following scenario, in which multiple returned records require additional activity on behalf of the application: A Query function call is made for a multihomed computer and the application finds that the address associated with the first A record is not responding. The application should then attempt to use other IP addresses specified in the (additional) A records returned from the Query function call.

138.53.5 Properties

138.53.6 A as WindowsDNSRecordAMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The address record.
Notes: (Read and Write property)

138.53.7 AAAA as WindowsDNSRecordAAAAMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The IPv6 address record.
Notes: (Read and Write property)

138.53.8 AFSDB as WindowsDNSRecordMXMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.9 CharSet as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: This value specifies the character set used in the associated function call.
Notes: (Read and Write property)

138.53.10 CNAME as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.11 DataLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The length, in bytes, of Data.
Notes: (Read and Write property)

138.53.12 HINFO as WindowsDNSRecordTXTMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.13 ISDN as WindowsDNSRecordTXTMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.14 MB as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.15 MD as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.16 MF as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.17 MG as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.18 MINFO as WindowsDNSRecordMInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.19 MR as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.20 MX as WindowsDNSRecordMXMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.21 Name as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A pointer to a string that represents the domain name of the record set.
Notes: (Read and Write property)

138.53.22 NextRecord as WindowsDNSRecordMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The next record in the answer.
Notes: (Read and Write property)

138.53.23 NS as WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.24 Null as WindowsDNSRecordNullMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.25 RawData as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: the RAW data of this record.
Notes: For debugging.
(Read and Write property)

138.53.26 RP as WindowsDNSRecordMInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.27 RT as WindowsDNSRecordMXMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.28 Section as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: This value specifies the section of interest returned from the DnsQuery function call.
Notes: (Read and Write property)

138.53.29 SOA as WindowsDNSRecordSOAMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.30 TTL as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The DNS RR's Time To Live value (TTL), in seconds.
Notes: (Read and Write property)

138.53.31 TXT as WindowsDNSRecordTXTMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.32 Type as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The DNS record type for this record.
Notes: If type is kDNSTypeA, the A property is filled.
(Read and Write property)

138.53.33 X25 as WindowsDNSRecordTXTMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data record.
Notes: (Read and Write property)

138.53.34 Constants

Constants

Constant	Value	Description
kCharSetAnsi	3	One of the constants for the CharSet property. The character set is ANSI.
kCharSetUnicode	1	One of the constants for the CharSet property. The character set is Unicode.
kCharSetUnknown	0	One of the constants for the CharSet property. The character set is unknown.
kCharSetUtf8	2	One of the constants for the CharSet property. The character set is UTF8.
kDNSClassAll	&h00ff	One of the DNS classes in native byte order (little endian on Win
kDNSClassAny	&h00ff	One of the DNS classes in native byte order (little endian on Win
kDNSClassCHAOS	&h0003	One of the DNS classes in native byte order (little endian on Win
kDNSClassCSNET	&h0002	One of the DNS classes in native byte order (little endian on Win
kDNSClassHESIOD	&h0004	One of the DNS classes in native byte order (little endian on Win
kDNSClassInternet	&h0001	One of the DNS classes in native byte order (little endian on Win
kDNSClassNone	&h00fe	One of the DNS classes in native byte order (little endian on Win
kDNSQueryAcceptTruncatedResponse	&h00000001	One of the possible flags for the Query function. Returns truncated results. Does not retry under TCP.
kDNSQueryBypassCache	&h00000008	One of the possible flags for the Query function. Bypasses the resolver cache on the lookup.
kDNSQueryDontResetTTLValues	&h00100000	One of the possible flags for the Query function. If set, and if the response contains multiple records, records are the TTL corresponding to the minimum value TTL from among When this option is set, "Do not change the TTL of individual rec returned record set is not modified.
kDNSQueryMulticastOnly	&h00000400	One of the possible flags for the Query function. Prevents the query from using DNS and uses only Local Link Mul Resolution (LLMNR). Windows Vista and Windows Server 2008 or later.: This value is
kDNSQueryNoHostsFile	&h00000040	One of the possible flags for the Query function. Prevents the DNS query from consulting the HOSTS file. Windows 2000 Server and Windows 2000 Professional: This valu ported.
kDNSQueryNoLocalName	&h00000020	One of the possible flags for the Query function. Directs DNS to ignore the local name. Windows 2000 Server and Windows 2000 Professional: This valu ported.
kDNSQueryNoMulticast	&h00000800	One of the possible flags for the Query function.
kDNSQueryNoNetBT	&h00000080	One of the possible flags for the Query function. Prevents the DNS query from using NetBT for resolution. Windows 2000 Server and Windows 2000 Professional: This valu ported.
kDNSQueryNoRecursion	&h00000004	One of the possible flags for the Query function. Directs the DNS server to perform an iterative query (specificall DNS server not to perform recursive resolution to resolve the que
kDNSQueryNoWireQuery	&h00000010	One of the possible flags for the Query function. Directs DNS to perform a query on the local cache only.
kDNSQueryReserved	&hff000000	One of the possible flags for the Query function. Reserved.
kDNSQueryReturnMessage	&h00000200	One of the possible flags for the Query function. Directs DNS to return the entire DNS response message. Windows 2000 Server and Windows 2000 Professional: This valu ported.
kDNSQueryStandard	&h00000000	One of the possible flags for the Query function. Standard query.
kDNSQueryTreatAsFQDN	&h00001000	One of the possible flags for the Query function. Prevents the DNS response from attaching suffixes to the submit a name resolution process
kDNSQueryUseTCPOnly	&h00000002	One of the possible flags for the Query function.

138.54 class WindowsDNSRecordMInfoMBS

138.54.1 class WindowsDNSRecordMInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a DNS mail information (MINFO) record.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.54.2 Methods

138.54.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes: This constructor makes sure you don't create useless WindowsDNSRecordMInfoMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

138.54.4 Properties

138.54.5 NameErrorsMailbox as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string that represents the FQDN of the mailbox to receive error messages related to the mailing list.
Notes: (Read and Write property)

138.54.6 NameMailbox as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string that represents the fully qualified domain name (FQDN) of the mailbox responsible for the mailing list or mailbox specified in the record's owner name.
Notes: (Read and Write property)

138.55 class WindowsDNSRecordMXMBS

138.55.1 class WindowsDNSRecordMXMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a DNS mail exchanger (MX) record.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.55.2 Methods

138.55.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes: This constructor makes sure you don't create useless WindowsDNSRecordMXMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

138.55.4 Properties

138.55.5 NameExchange as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string that represents the fully qualified domain name (FQDN) of the host willing to act as a mail exchange.
Notes: (Read and Write property)

138.55.6 Preference as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A preference given to this resource record among others of the same owner. Lower values are preferred.
Notes: (Read and Write property)

138.56 class WindowsDNSRecordNullMBS

138.56.1 class WindowsDNSRecordNullMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a NULL data DNS resource record
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.56.2 Methods

138.56.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes: This constructor makes sure you don't create useless WindowsDNSRecordNullMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

138.56.4 Properties

138.56.5 ByteCount as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of bytes represented in Data.
Notes: (Read and Write property)

138.56.6 Data as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The raw data as a string.
Notes: (Read and Write property)

138.57 class WindowsDNSRecordPTRMBS

138.57.1 class WindowsDNSRecordPTRMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a DNS pointer (PTR) record.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.57.2 Methods

138.57.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes: This constructor makes sure you don't create useless WindowsDNSRecordPTRMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

138.57.4 Properties

138.57.5 NameHost as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The named host.
Notes: (Read and Write property)

138.58 class WindowsDNSRecordSOAMBS

138.58.1 class WindowsDNSRecordSOAMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a DNS start of authority (SOA) record.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.58.2 Methods

138.58.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes: This constructor makes sure you don't create useless WindowsDNSRecordSOAMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

138.58.4 Properties

138.58.5 DefaultTTL as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The lower limit on the time, in seconds, that a DNS server or caching resolver are allowed to cache any resource records (RR) from the zone to which this record belongs.
Notes: (Read and Write property)

138.58.6 Expire as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The time, in seconds, before an unresponsive zone is no longer authoritative.
Notes: (Read and Write property)

138.58.7 NameAdministrator as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string that represents the name of the responsible party for the zone to which the record belongs.
Notes: (Read and Write property)

138.58.8 NamePrimaryServer as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string that represents the name of the authoritative DNS server for the zone to which the record belongs.
Notes: (Read and Write property)

138.58.9 Refresh as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The time, in seconds, before the zone containing this record should be refreshed.
Notes: (Read and Write property)

138.58.10 Retry as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The time, in seconds, before retrying a failed refresh of the zone to which this record belongs.
Notes: (Read and Write property)

138.58.11 SerialNo as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The serial number of the SOA record.
Notes: (Read and Write property)

138.59 class WindowsDNSRecordTXTMBS

138.59.1 class WindowsDNSRecordTXTMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a DNS text (TXT) record.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.59.2 Methods

138.59.3 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes: This constructor makes sure you don't create useless WindowsDNSRecordTXTMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

138.59.4 Strings as String()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: An array of strings representing the descriptive text of the TXT resource record.

138.59.5 Properties

138.59.6 StringCount as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of strings represented in Strings array.
Notes: (Read and Write property)

138.60 class WindowsEthernetAdapterMBS

138.60.1 class WindowsEthernetAdapterMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: A class for the properties of an ethernet adapter.
Example:

```
// list the network adapters with name, MAC address and IP addresses on Windows
Var ethernet As New WindowsEthernetMBS
Var lines() As String
For i As Integer = 0 To ethernet.Count - 1
Var adapter As WindowsEthernetAdapterMBS = ethernet.Item(i)
lines.Add adapter.Description + " (" + adapter.Address + ")"
For j As Integer = 0 To adapter.IPcount - 1
lines.Add " IP " + adapter.IP(j).IP + " / " + adapter.IP(j).Mask
Next
For j As Integer = 0 To adapter.Gatewaycount - 1
lines.Add " Gateway " + adapter.Gateway(j).IP
Next
Next
MessageBox String.FromArray(lines, EndOfLine)
```

138.60.2 Methods

138.60.3 Gateway(index as Integer) as WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Returns one of the IP address of the default gateway for this adapter.
Notes: Index goes from 0 to GatewayGount-1.

138.60.4 IP(index as Integer) as WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Returns one of the IP addresses associated with this adapter.
Notes: Index goes from 0 to IPcount-1.

138.60.5 Properties

138.60.6 AdapterName as String

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Name of the adapter.
Notes: (Read and Write property)

138.60.7 Address as String

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Hardware address for the adapter.
Notes: (Read and Write property)

138.60.8 CurrentIpAddress as WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: The current IP from within the IP list.
Notes: This field is currently normally nil, but in the future it may point to the current IP inside the IP list.
But currently on Windows 2000 it seems to be always nil.
(Read and Write property)

138.60.9 Description as String

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Description for the adapter.
Notes: (Read and Write property)

138.60.10 DhcpEnabled as Boolean

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Specifies whether dynamic host configuration protocol (DHCP) is enabled for this adapter.
Notes: (Read and Write property)

138.60.11 DhcpServer as WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: IP address of the DHCP server for this adapter.
Notes: (Read and Write property)

138.60.12 Gatewaycount as Integer

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: How many gateway IPs are allocated for this adapter.
Notes: (Read and Write property)

138.60.13 HaveWins as Boolean

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Specifies whether this adapter uses Windows Internet Name Service (WINS).
Notes: (Read and Write property)

138.60.14 Index as Integer

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Adapter index.
Notes: (Read and Write property)

138.60.15 IPcount as Integer

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: How many IPs are allocated for this adapter.
Notes: (Read and Write property)

138.60.16 LeaseExpires as Integer

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Time when the current DHCP lease expires.
Notes: (Read and Write property)

138.60.17 LeaseObtained as Integer

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Time when the current DHCP lease was obtained.
Notes: (Read and Write property)

138.60.18 PrimaryWinsServer as WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: IP address of the primary WINS server.
Notes: (Read and Write property)

138.60.19 SecondaryWinsServer as WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: IP address of the secondary WINS server.
Notes: (Read and Write property)

138.60.20 Type as Integer

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Adapter type.
Notes: The type must be of the following values:

MIB_IF_TYPE_OTHER	1
MIB_IF_TYPE_ETHERNET	6
MIB_IF_TYPE_TOKENRING	9
MIB_IF_TYPE_FDDI	15
MIB_IF_TYPE_PPP	23
MIB_IF_TYPE_LOOPBACK	24
MIB_IF_TYPE_SLIP	28

(Read and Write property)

138.61 class WindowsEthernetMBS

138.61.1 class WindowsEthernetMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: A list of the Windows Ethernet Interfaces.
Notes: Requires Windows 98 or 2000 or newer.
Reports count=0 on Windows 95 and NT 4.0.

Only activate adapters are listed.

138.61.2 Methods

138.61.3 Item(index as Integer) as WindowsEthernetAdapterMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Returns the Ethernet Adapter object for the given index.
Notes: Index goes from 0 to count-1.

138.61.4 Update

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: Updates the list.
Notes: Calls the Destructor and than the Constructor so the list is completly rebuilt.

138.61.5 Properties

138.61.6 Count as Integer

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: How much ethernet adapters are available.
Notes: Note that there may be dummy or virtual adapters.
(Read and Write property)

138.62 class WindowsIPAddressMBS

138.62.1 class WindowsIPAddressMBS

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: An IP address.

138.62.2 Properties

138.62.3 IP as String

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: The IP as a string.
Notes: Maximum 15 bytes long.
e.g. "192.168.0.1"
(Read and Write property)

138.62.4 Mask as String

MBS Network Plugin, Plugin Version: 3.1, Platform: Windows, Targets: All.

Function: The mask for the IP.
Notes: e.g. "255.255.255.0"
(Read and Write property)

138.63 class WindowsProxyMBS

138.63.1 class WindowsProxyMBS

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to query the current windows proxy settings.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr5
- Need Proxy Settings?

138.63.2 Properties

138.63.3 ByPass as String

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The proxy
Notes: Example values:
"testserver:1234 apple.de <local>"
or
"testserver3:1234 testserver4:1234 testserver1:1234 testserver2:1234 apple.de <local>"
(Read and Write property)

138.63.4 Proxy as String

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current proxy setting.
Notes: Example values:
"testserver:1234"
or
"https=testserver2:1234 http=testserver1:1234 gopher=testserver4:1234 ftp=testserver3:1234"
(Read and Write property)

138.63.5 UsingProxy as Boolean

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether a proxy is in use.
Notes: (Read and Write property)

138.64 class WindowsQOSMBS

138.64.1 class WindowsQOSMBS

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for Quality Windows Audio/Video Experience (qWAVE).
Notes: Quality Windows Audio/Video Experience (qWAVE) is the next generation Quality of Service (QOS) platform introduced in Windows Vista.
qWAVE provides new features focused on streaming multimedia and real-time content over variable bandwidth networks. These features include the following.

- Auto-discovery of end-to-end QOS compatibility.
- End-to-end bandwidth estimation of maximum link capacity (bottleneck bandwidth) and real-time available bandwidth.
- Intelligent packet prioritization.
- Congestion notification.
- Flow shaping.
- Distributed admission control, including caching to improve performance and minimize latency.

Requires Windows 6 (Vista).

138.64.2 Methods

138.64.3 AddSocketToFlow(Socket as Integer, DestAddr as string, DestPort as Integer, TrafficType as Integer, Flags as Integer, byref FlowId as UInt32) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds a socket to a flow.
Notes: Socket: Identifies the socket that the application will use to flow traffic.
DestAddr: The destination IP address to which the application will send traffic. DestAddr and DestPort are optional if the socket is already connected. If this parameter is specified, the remote IP address and port must match those used in the socket's connect call.
If the socket is not connected, this parameter must be specified. If the socket is already connected, this parameter does not need to be specified. In this case, if the parameter is still specified, the destination host and port must match what was specified during the socket connect call.
Since, under TCP, the socket connect call can be delayed, AddSocketToFlow can be called before a connection is established, passing in the remote system's IP address and port number in the DestAddr parameter.
DestPort: The port for the connection.
TrafficType: A QOSTrafficType* constant that specifies the type of traffic for which this flow will be used.
Flags: Optional flag values. Can be QOSNonAdaptiveFlow.
FlowID: Receives a flow identifier. On input, this value must be 0. On output, the buffer contains a flow identifier if the call succeeds.
If a socket is being added to an existing flow, this parameter will be the identifier of that flow.
An application can make use of this parameter if multiple sockets used can share the same QoS flow properties. The QoS subsystem, then does not have to incur the overhead of provisioning new flows for subsequent sockets with the same properties. Note that only non-adaptive flows can have multiple sockets attached to an existing flow.
A FlowID is an unsigned 32-bit integer.

Lasterror is set.

The use of IPv4/v6 mixed addresses is not supported in qWAVE. The address specified by the DestAddr parameter must be either IPv4 or IPv6.
If there is a requirement for network experiments over a specific network interface, the socket must be bound to that particular interface. Otherwise the most appropriate interface for the experiment, as indicated by the network stack, is assigned by the qWAVE subsystem.
Network traffic associated with this flow is not affected by making this call alone. For example, packet prioritization does not occur immediately.
There are two categories of applications that use this function: adaptive and non-adaptive. An adaptive application makes use of notifications and information in the FlowFundamentals for adapting to network changes such as congestion. The qWAVE service uses Link Layer Topology Discovery (LLTD) QoS extensions for adaptive flows which can be present on the destination device.
After calling this function adaptive A/V applications should call the SetFlowRate function to affect network traffic.
A non-adaptive application either does not adapt to changing network characteristics or is sending traffic to an endpoint that does not support adaptive capabilities as indicated by ERROR_NOT_SUPPORTED.
Non-adaptive applications, or adaptive applications making non-adaptive flows, should call this function with the QOSNonAdaptiveFlow flag. After calling this function A/V applications should call the setOutgoingDSCPValue, setOutgoingRate or setTrafficType function with a Operation. They do not need to be called unless shaping is desired.

- 138.64.3 AddSocketToFlow(Socket as Integer, DestAddr as string, DestPort as Integer, TrafficType as Integer, Flags as Integer, byref FlowId as UInt32) as boolean 18996

138.64.5 Constructor

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: This function initializes the QOS subsystem.
Notes: On success Handle property is not zero.
Lasterror is set.

Every process intending to use qWAVE must first call Constructor.
If a machine enters a power save mode that interrupts connectivity such as sleep or standby, existing and active network experiments such as QOSStartTrackingClient must be reinitiated. This recreation of the flow mirrors the cleanup and creation activities also necessary for existing sockets. A new handle must be created, and the flow must be recreated and readmitted.

138.64.6 getFlowFundamentals(FlowID as Integer, byref BottleneckBandwidthSet as boolean, byref BottleneckBandwidth as UInt64, byref AvailableBandwidthSet as boolean, byref AvailableBandwidth as UInt64, byref RTTSet as boolean, byref RTT as UInt32, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries flow fundamentals.
Notes: FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.
Flags: Optional, can be QOSQueryFlowFresh.
BottleneckBandwidthSet: This Boolean value is set to true if the BottleneckBandwidth field contains a value.
BottleneckBandwidth: Indicates the maximum end-to-end link capacity between the source and sink device, in bits.
AvailableBandwidthSet: Set to true if the AvailableBandwidth field contains a value.
AvailableBandwidth: Indicates how much bandwidth is available for submitting traffic on the end-to-end network path between the source and sink device, in bits.
RTTSet: Set to true if the RTT field contains a value.
RTT: Measures the round-trip time between the source and sink device, in microseconds.

Lasterror is set. Returns true on success or false on failure.

138.64.7 getOutgoingRate(FlowID as Integer, byref Bandwidth as UInt64, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries flow rate.
Notes: FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.
Bandwidth: will contain a UINT64 value that indicates the flow rate specified when requesting the contract, in bits per second.
Flags: Optional, can be QOSQueryFlowFresh.
Lasterror is set. Returns true on success or false on failure.

138.64.8 getPacketPriority(FlowID as Integer, byref ConformantDSCPValue as Integer, byref NonConformantDSCPValue as Integer, byref ConformantL2Value as Integer, byref NonConformantL2Value as Integer, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries packet priorities.
Notes: FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.
Flags: Optional, can be QOSQueryFlowFresh.

ConformantDSCPValue: Differential Services Code Point (DSCP) mark used for flow traffic that conforms to the specified flow rate.
NonConformantDSCPValue: DSCP marking used for flow traffic that exceeds the specified flow rate. Non-conformant DSCP values are only applicable only if value is QOSUseNonConformantMarkings.
ConformantL2Value: Layer-2 (L2) tag used for flow traffic that conforms to the specified flow rate. L2 tags will not be added to packets if the end-to-end path between source and sink does not support them.
NonConformantL2Value: L2 tag used for flow traffic that exceeds the specified flow rate. Non-conformant L2 values are only applicable if value is QOSUseNonConformantMarkings.

Lasterror is set. Returns true on success or false on failure.

138.64.9 RemoveAllSocketsFromFlow(FlowID as Integer) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The RemoveSocketFromFlow function notifies the QOS subsystem that a previously added flow has been terminated by the application, and that the subsystem must update its internal information accordingly.
Notes: FlowId: A flow identifier. A QOS_FLOWID is an unsigned 32-bit integer.

Lasterror is set. Returns true on success or false on failure.
The plugin closes all flows in destructor.

138.64.10 RemoveSocketFromFlow(socketHandle as Integer, FlowID as Integer) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The RemoveSocketFromFlow function notifies the QOS subsystem that a previously added flow has been terminated by the application, and that the subsystem must update its internal information accordingly.
Notes: Socket: Socket to be removed from the flow.
Only flows created with the QOSNonAdaptiveFlow flag may have multiple sockets added to the same flow. By passing the Socket parameter in this call, each socket can be removed individually. If the Socket parameter is not passed, the entire flow will be destroyed. If only one socket was attached to the flow, passing this socket as a parameter to this function and passing 0 as a socket are equivalent calls.
FlowId: A flow identifier. A QOS_FLOWID is an unsigned 32-bit integer.

Lasterror is set. Returns true on success or false on failure.
The plugin closes all flows in destructor.

138.64.11 setOutgoingDSCPValue(FlowID as Integer, OutgoingDSCPValue as Integer, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the outgoing DSCP value.
Notes: FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.

Lasterror is set. Returns true on success or false on failure.

If StartTrackingClient has not already been called, calling QOSSetFlow will cause the QOS subsystem to perform the following.

- Discover whether the end-to-end network path supports prioritization.
- Track end-to-end network characteristics by way of network experiments. These experiments do not place any noteworthy stress on the network.

138.64.12 setOutgoingRate(FlowID as Integer, Bandwidth as UInt64, ShapingBehavior as Integer, Reason as Integer, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets a new outgoing rate.
Notes: FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.
Bandwidth: The rate at which data should be sent, in units of bits per second.
Note Traffic on the network is measured at the IP level, and not at the application level. The rate that is specified should account for the IP and protocol headers.
ShapingBehavior: A shaping constant that defines the shaping behavior of the flow.
Reason: A QOSFlowRate* constant that indicates the reason for a flow rate change.
Lasterror is set. Returns true on success or false on failure.

If StartTrackingClient has not already been called, calling QOSSetFlow will cause the QOS subsystem to perform the following.

- Discover whether the end-to-end network path supports prioritization.
- Track end-to-end network characteristics by way of network experiments. These experiments do not place any noteworthy stress on the network.#

138.64.13 setTrafficType(FlowID as Integer, TrafficType as Integer, Flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the type of traffic
Notes: FlowID: A flow identifier. A flow id is an unsigned 32-bit integer.
TrafficType: One of the traffic type constants.
Lasterror is set. Returns true on success or false on failure.

If StartTrackingClient has not already been called, calling QOSSetFlow will cause the QOS subsystem to perform the following.

- Discover whether the end-to-end network path supports prioritization.
- Track end-to-end network characteristics by way of network experiments. These experiments do not place any noteworthy stress on the network.#

138.64.14 StartTrackingClient(DestAddr as string, flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The StartTrackingClient function notifies the QOS subsystem of the existence of a new client.
Notes: Calling this function increases the likelihood that the QOS subsystem will have gathered sufficient information on the network path to assist when calling QOSSetFlow to set the flow.
Note This call is not required to add a flow with the QOSAddSocketToFlow function although it is highly recommended. Not calling this function may require network experiments to be started during the QOSSetFlow call and can result in QOSSetFlow failing with ERROR_NETWORK_BUSY on initial use.

DestAddr: The IP address of the client device. Clients are identified by their IP address and address family. Any port number specified in the sockaddr structure will be ignored.
Flags: Reserved for future use. Must be set to 0.

On receipt of a QOSStartTrackingClient call the QoS subsystem begins gathering information about the client such as the QoS capabilities and available bandwidth on the end-to-end path.
An application should call this function as soon as it becomes aware of a client device that may need QoS flow. For example this function should be called when a media player device first connects to a media server application.
Network experiments performed by QOSStartTrackingClient do not introduce noteworthy load on the network even if no stream is started for a long period of time. The qWAVE service dynamically adjusts experiment traffic based on QoS subsystem activity.
Link Layer Topology Discovery (LLTD) must be implemented on the sink PC or device for this function to work.

Lasterror is set. Returns true on success or false on failure.

138.64.15 StopTrackingClient(DestAddr as string, flags as Integer = 0) as boolean

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The StopTrackingClient function notifies the QoS subsystem to stop tracking a client that has previously used the StartTrackingClient function.
Notes: If a flow is currently in progress, this function will not affect it.

DestAddr: The IP address of the client device. Clients are identified by their IP address and address family. A port number is not required and will be ignored.
Flags: Reserved for future use.

Lasterror is set. Returns true on success or false on failure.

138.64.16 Properties

138.64.17 Handle as Integer

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

138.64.18 Lasterror as Integer

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

138.64.19 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The generic window error message for the error in lasterror property.
Notes: (Read and Write property)

138.64.20 Constants

Flow Reasons

Constant	Value	Description
QOSFlowRateCongestion	2	Indicates that the flow has changed due to congestion.
QOSFlowRateContentChange	1	Indicates that the content of a flow has changed.
QOSFlowRateHigherContentEncoding	3	Indicates that the user has caused the flow to change.
QOSFlowRateNotApplicable	0	Indicates that there has not been a change in the flow.
QOSFlowRateUserCaused	4	Indicates that the user has caused the flow to change.

Flags

Constant	Value	Description
QOSNonAdaptiveFlow	2	If specified, the QoS subsystem will not gather data about the network path for this flow. As a result, functions which rely on bandwidth estimation techniques will not be available. For example, this would block QOSQueryFlow with an Operation value of QOSQueryFlowFundamentals and QOSNotifyFlow with an Operation value of QOSNotifyCongested, QOSNotifyUncongested, and QOSNotifyAvailable.
QOSQueryFlowFresh	1	The QOS subsystem will only return fresh, not cached, data. If fresh data is unavailable, it will try to obtain such data, at the expense of possibly taking more time. If this is not possible, the call will fail with the error code ERROR_RETRY. This flag is only applicable when the Operation parameter is set to QOSQueryFlowFundamentals.

Shaping Behavior

Constant	Value	Description
QOSShapeAndMark	1	Indicates that the Windows Scheduler will be used to enforce the requeste flow rate. Data packets exceeding the rate are delayed accordingly. Packet receive conformant priority values.
QOSShapeOnly	0	Indicates that the Windows packet scheduler (Pacer) will be used to enforc the requested flow rate. Data packets that exceed the rate are delayed un til appropriate in order to maintain the specified flow rate. If the networ supports prioritization, packets will always receive conformant priority value when QOSShapeFlow is specified.
QOSUseNonConformantMarkings	2	Indicates that the flow rate requested will not be enforced. Data packets tha would exceed the flow rate will receive a priority that indicates they are non conformant. This may lead to lost and reordered packets.

Traffic Types

Constant	Value	Description
QOSTrafficTypeAudioVideo	3	Flow traffic has a network priority higher than QOSTrafficTypeExcellentEffort, yet lower than QOSTrafficTypeVoice. This traffic type should be used for A/V streaming scenarios such as MPEG2 streaming. Sent traffic will contain a DSCP mark with a value of 0x28 and an 802.1p tag with a value of 5.
QOSTrafficTypeBackground	1	Flow traffic has a network priority lower than that of QOSTrafficTypeBestEffort. This traffic type could be used for traffic of an application doing data backup. Sent traffic will contain a DSCP mark with a value of 0x08 and an 802.1p tag with a value of 2.
QOSTrafficTypeBestEffort	0	Flow traffic has the same network priority as regular traffic not associated with QOS. This traffic type is the same as not specifying priority, and as a result, the DSCP mark and 802.1p tag are not added to sent traffic.
QOSTrafficTypeControl	5	Flow traffic has the highest network priority. This traffic type should only be used for the most critical of data. For example, it may be used for data carrying user inputs. Sent traffic will contain a DSCP mark with a value of 0x38 and an 802.1p tag with a value of 7.
QOSTrafficTypeExcellentEffort	2	Flow traffic has a network priority higher than QOSTrafficTypeBestEffort, yet lower than QOSTrafficTypeAudioVideo. This traffic type should be used for data traffic that is more important than normal end-user scenarios, such as email. Sent traffic will contain a DSCP mark with value of 0x28 and 802.1p tag with a value of 5.
QOSTrafficTypeVoice	4	Flow traffic has a network priority higher than QOSTrafficTypeAudioVideo, yet lower than QOSTrafficTypeControl. This traffic type should be used for realtime voice streams such as VOIP. Sent traffic will contain a DSCP mark with a value of 0x38 and an 802.1p tag with a value of 7.

138.65 class WinHTTPClientAutoProxyOptionsMBS

138.65.1 class WinHTTPClientAutoProxyOptionsMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WinHTTPClientAutoProxyOptionsMBS class is used to indicate to the WinHttpGetProxyForURL function whether to specify the URL of the Proxy Auto-Configuration (PAC) file or to automatically locate the URL with DHCP or DNS queries to the network.
Example:

```
// find out which proxy Windows uses for a URL, with automatic proxy detection
Var client As New WinHTTPClientMBS
Var options As New WinHTTPClientAutoProxyOptionsMBS
options.Flags = WinHTTPClientAutoProxyOptionsMBS.kAutoProxyAutoDetect
options.AutoDetectFlags = WinHTTPClientAutoProxyOptionsMBS.kAutoDetectTypeDHCP + WinHTTP-
ClientAutoProxyOptionsMBS.kAutoDetectTypeDNSA
options.AutoLogonIfChallenged = True

Var info As WinHTTPClientProxyInfoMBS
If client.GetProxyForUrl("https://www.example.com/", options, info) Then
MessageBox "Proxy: " + info.Proxy + EndOfLine + "Bypass: " + info.ProxyBypass
Else
MessageBox "No proxy found."
End If
```

Notes: see also:
http://msdn.microsoft.com/en-us/library/windows/desktop/aa384123(v=vs.85).aspx

138.65.2 Methods

138.65.3 Constructor

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

138.65.4 Properties

138.65.5 AutoConfigUrl as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The URL for the config URL.
Notes: If Flags includes the kAutoProxyConfigURL flag, the AutoConfigUrl contains the URL of the proxy auto-configuration (PAC) file.
If Flags does not include the kAutoProxyConfigURL flag, then AutoConfigUrl must be "".
(Read and Write property)

138.65.6 AutoDetectFlags as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The flags for auto detecting.
Notes: If Flags includes the kAutoProxyAutoDetect flag, then AutoDetectFlags specifies what protocols are to be used to locate the PAC file. If both the DHCP and DNS auto detect flags are specified, then DHCP is used first; if no PAC URL is discovered using DHCP, then DNS is used.
If Flags does not include the kAutoProxyAutoDetect flag, then AutoDetectFlags must be zero.

Value	Meaning
kAutoDetectTypeDHCP	Use DHCP to locate the proxy auto-configuration file.
kAutoDetectTypeDNSA	Use DNS to attempt to locate the proxy auto-configuration file at a well-known location on the domain of the local computer.

(Read and Write property)

138.65.7 AutoLogonIfChallenged as Boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies whether the client's domain credentials should be automatically sent in response to an NTLM or Negotiate Authentication challenge when WinHTTP requests the PAC file.
Notes: If this flag is true, credentials should automatically be sent in response to an authentication challenge. If this flag is false and authentication is required to download the PAC file, the WinHttpGetProxyForUrl function fails.
(Read and Write property)

138.65.8 Flags as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Flags for detecting proxy.
Notes: (Read and Write property)

138.65.9 Constants

Auto Detect Types

Constant	Value	Description
kAutoDetectTypeDHCP	1	Use DHCP to locate the proxy auto-configuration file.
kAutoDetectTypeDNSA	2	Use DNS to attempt to locate the proxy auto-configuration file at a well-known location on the domain of the local computer.

Proxy Flags

Constant	Value	Description
kAutoProxyAutoDetect	1	Attempt to automatically discover the URL of the PAC file using both DHCP and DNS queries to the local network.
kAutoProxyConfigURL	2	Download the PAC file from the URL specified by AutoConfigUrl in the WinHTTPClientAutoProxyOptionsMBS class.

138.66 class WinHTTPClientCurrentUserIEProxyConfigMBS

138.66.1 class WinHTTPClientCurrentUserIEProxyConfigMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for Internet Explorer proxy configuration information.
Notes: see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa384250(v=vs.85).aspx
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.66.2 Methods

138.66.3 Constructor

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

138.66.4 Properties

138.66.5 AutoConfigUrl as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The auto-configuration URL.
Notes: The auto-configuration URL if the Internet Explorer proxy configuration for the current user specifies "Use automatic proxy configuration".
(Read and Write property)

138.66.6 AutoDetect as Boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to auto detect proxy settings.
Notes: If true, indicates that the Internet Explorer proxy configuration for the current user specifies "automatically detect settings".
(Read and Write property)

138.66.7 Proxy as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Contains the proxy URL if the Internet Explorer proxy configuration for the current user specifies "use a proxy server".
Notes: (Read and Write property)

138.66.8 ProxyBypass as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Optional proxy by-pass server list.
Notes: (Read and Write property)

138.67 class WinHTTPClientMBS

138.67.1 class WinHTTPClientMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for Windows to do http requests.
Example:

```
// find the proxy to use for a URL on Windows
Var client As New WinHTTPClientMBS
If Not client.Open("MyApp", WinHTTPClientMBS.kAccessTypeNoProxy) Then
MessageBox client.LasterrorString
Return
End If

Var options As New WinHTTPClientAutoProxyOptionsMBS
options.Flags = WinHTTPClientAutoProxyOptionsMBS.kAutoProxyAutoDetect
options.AutoDetectFlags = WinHTTPClientAutoProxyOptionsMBS.kAutoDetectTypeDHCP + WinHTTP-
ClientAutoProxyOptionsMBS.kAutoDetectTypeDNSA
options.AutoLogonIfChallenged = True

Var info As WinHTTPClientProxyInfoMBS
If client.GetProxyForUrl("https://www.monkeybreadsoftware.de/", options, info) Then
MessageBox "Proxy: " + info.Proxy
Else
MessageBox "No proxy found: " + client.LasterrorString
End If

Call client.Close
```

Notes: The plugin only implements proxy related functions.
But this class could be extended to work like HTTPSocket.

- MBS Xojo / Real Studio Plugins, version 14.1pr1

138.67.2 Methods

138.67.3 Close as boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Closes the session.

138.67.4 Constructor

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: The constructor.

138.67.5 CrackUrl(URL as string, Flags as Integer = 0) as WinHTTPClientURLComponentsMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Separates a URL into its component parts such as host name and path.
Notes: URL: the canonical URL to separate. WinHttpCrackUrl does not check this URL for validity or correct format before attempting to crack it.

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa384092(v=vs.85).aspx

138.67.6 DetectAutoProxyConfigUrl(AutoDetectFlags as Integer, byref AutoConfigUrl as string) as Boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Finds the URL for the Proxy Auto-Configuration (PAC) file.
Notes: This function reports the URL of the PAC file, but it does not download the file.

AutoDetectFlags: A data type that specifies what protocols to use to locate the PAC file. If both the DHCP and DNS auto detect flags are set, DHCP is used first; if no PAC URL is discovered using DHCP, then DNS is used.

Value	Meaning
kAutoDetectTypeDHCP	Use DHCP to locate the proxy auto-configuration file.
kAutoDetectTypeDNSA	Use DNS to attempt to locate the proxy auto-configuration file at a well-known location on the domain of the local computer.

AutoConfigUrl: String that contains the configuration URL that receives the proxy data.

Returns true if successful, or false otherwise. For extended error information, call LastError. Among the error codes returned are the following.

WinHTTP implements the Web Proxy Auto-Discovery (WPAD) protocol, often referred to as autoproxy. For more information about well-known locations, see the Discovery Process section of the WPAD protocol document.
Note that because the DetectAutoProxyConfigUrl function takes time to complete its operation, it should not be called from a UI thread.

138.67.7 GetDefaultProxyConfiguration as WinHTTPClientProxyInfoMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Retrieves the default WinHTTP proxy configuration from the registry.
Notes: Returns the default proxy configuration.

138.67.8 GetIEProxyConfigForCurrentUser as WinHTTPClientCurrentUserIEProxyConfigMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Retrieves the Internet Explorer proxy configuration for the current user.
Notes: Queries the Internet Explorer proxy settings for the current active network connection (for example, LAN, dial-up, or VPN connection).

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa384096(v=vs.85).aspx

138.67.9 GetProxyForHost(URL as string, Host as string, byref proxy as string, byref proxyPort as string, AutoConfigURL as string = "") as boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Queries the proxy for a host.
Notes: This is an universal functions using InternetGetProxyInfo, DetectAutoProxyUrl and InternetQueryOption.

URL: The target URL.
Host: The hostname of the target server.

Returns true on success and sets proxy and port. Returns false on failure.
AutoConfigURL is only used on first call instead of a configured auto config URL in Internet Explorer.

138.67.10 GetProxyForUrl(URL as string, AutoProxyOptions as WinHTTPClientAutoProxyOptionsMBS, byref ProxyInfo as WinHTTPClientProxyInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Retrieves the proxy data for the specified URL.
Notes: Url: Contains the URL of the HTTP request that the application is preparing to send.
AutoProxyOptions: Specifies the auto-proxy options to use.
ProxyInfo: Receives the proxy setting.

If the function succeeds, the function returns true.
If the function fails, it returns false. Lasterror is set.

This function implements the Web Proxy Auto-Discovery (WPAD) protocol for automatically configuring the proxy settings for an HTTP request. The WPAD protocol downloads a Proxy Auto-Configuration (PAC) file, which is a script that identifies the proxy server to use for a given target URL. PAC files are typically deployed by the IT department within a corporate network environment. The URL of the PAC file can either be specified explicitly or GetProxyForUrl can be instructed to automatically discover the location of the PAC file on the local network.

GetProxyForUrl supports only ECMAScript-based PAC files.
GetProxyForUrl must be called on a per-URL basis, because the PAC file can return a different proxy server for different URLs. This is useful because the PAC file enables an IT department to implement proxy server load balancing by mapping (hashing) the target URL (specified by the lpcwszUrl parameter) to a certain proxy in a proxy server array.
GetProxyForUrl caches the autoproxy URL and the autoproxy script when auto-discovery is specified in the dwFlags member of the pAutoProxyOptions structure. For more information, see Autoproxy Cache.

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa384097(v=vs.85).aspx

138.67.11 InternetGetProxyInfo(URL as string, Host as string) as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Retrieves proxy data for accessing specified resources.
Notes: This function can only be called by dynamically linking to "JSProxy.dll" (plugin loads this for you).
For better autoproxy support, use HTTP Services (WinHTTP) version 5.1 instead.

Url: Secifies the URL of the target HTTP resource.
HostName: Specifies the host name of the target URL.

Returns the URL of the proxy to use in an HTTP request for the specified resource.
Returns empty string on any error.

138.67.12 Open(UserAgent as string, AccessType as Integer, ProxyName as string = ””, ProxyByPass as string = ””) as boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Initializes an application's use of the WinINet functions.
Notes: lUserAgent: Specifies the name of the application or entity calling the WinINet functions. This name is used as the user agent in the HTTP protocol.
AccessType: Type of access required. This parameter can be one of the following values.

Value	Meaning
INTERNET_OPEN_TYPE_DIRECT	Resolves all host names locally.
INTERNET_OPEN_TYPE_PRECONFIG	Retrieves the proxy or direct configuration from the registry.
INTERNET_OPEN_TYPE_PRECONFIG_WITH_NO_AUTOPROXY	Retrieves the proxy or direct configuration from the registry and prevents the use of a startup Microsoft JScript or Internet Setup (INS) file.
INTERNET_OPEN_TYPE_PROXY	Passes requests to the proxy unless a proxy bypass list is supplied and the name to be resolved bypasses the proxy. In this case, the function uses INTERNET_OPEN_TYPE_DIRECT.

ProxyName: String that specifies the name of the proxy server(s) to use when proxy access is specified by setting dwAccessType to INTERNET_OPEN_TYPE_PROXY. Do not use an empty string, because InternetOpen will use it as the proxy name. The WinINet functions recognize only CERN type proxies (HTTP only) and the TIS FTP gateway (FTP only). If Microsoft Internet Explorer is installed, these functions also support SOCKS proxies. FTP requests can be made through a CERN type proxy either by changing them to an HTTP request or by using InternetOpenUrl. If dwAccessType is not set to INTERNET_OPEN_TYPE_PROXY, this parameter is ignored and should be NULL. For more information about listing proxy servers, see the Listing Proxy Servers section of Enabling Internet Functionality.
ProxyBypass: Specifies an optional list of host names or IP addresses, or both, that should not be routed through the proxy when dwAccessType is set to INTERNET_OPEN_TYPE_PROXY. The list can contain wildcards. Do not use an empty string, because InternetOpen will use it as the proxy bypass list. If this parameter specifies the ”<local>” macro, the function bypasses the proxy for any host name that does not contain a period.
By default, WinINet will bypass the proxy for requests that use the host names ”localhost”, ”loopback”, ”127.0.0.1”, or ” [::1] ”. This behavior exists because a remote proxy server typically will not resolve these addresses properly.
Internet Explorer 9: You can remove the local computer from the proxy bypass list using the ”<-loopback>” macro.
If dwAccessType is not set to INTERNET_OPEN_TYPE_PROXY, this parameter is ignored and should be NULL.
Flags: Options. This parameter can be a combination of the following values.

Returns a valid handle that the application passes to subsequent WinINet functions. If Open fails, it returns false. To retrieve a specific error message, call GetLastError.

Value	Meaning
INTERNET_FLAG_ASYNC	Makes only asynchronous requests on handles descended from the handle returned from this function.
INTERNET_FLAG_FROM_CACHE	Does not make network requests. All entities are returned from the cache. If the requested item is not in the cache, a suitable error, such as ERROR_FILE_NOT_FOUND, is returned.
INTERNET_FLAG_OFFLINE	Identical to INTERNET_FLAG_FROM_CACHE. Does not make network requests. All entities are returned from the cache. If the requested item is not in the cache, a suitable error, such as ERROR_FILE_NOT_FOUND, is returned.

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa385096(v=vs.85).aspx

138.67.13 SetDefaultProxyConfiguration(info as WinHTTPClientProxyInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: Sets the default WinHTTP proxy configuration in the registry.
Notes: see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa384113(v=vs.85).aspx

SetDefaultProxyConfiguration changes the proxy configuration set by ProxyCfg.exe.
The default proxy configuration set by this function can be overridden for an existing WinHTTP session by calling SetOption and specifying the OptionProxy flag. The default proxy configuration can be overridden for a new session by specifying the configuration with the WinHttpOpen function.
The dwAccessType member of the WinHTTPClientProxyInfoMBS structure pointed to by pProxyInfo should be set to kAccessTypeNamedProxy if a proxy is specified. Otherwise, it should be set to kAccessTypeDefaultProxy.
Any new sessions created after calling this function use the new default proxy configuration.
Even when WinHTTP is used in asynchronous mode (that is, when WINHTTP_FLAG_ASYNC has been set in WinHttpOpen), this function operates synchronously. The return value indicates success or failure. To get extended error information, call GetLastError.
Note For Windows XP and Windows 2000, see the Run-Time Requirements section of the WinHTTP start page.

138.67.14 Properties

138.67.15 Handle as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference.
Notes: This is a HINTERNET type.
(Read and Write property)

138.67.16 Lasterror as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error.
Notes: see also error list:
http://msdn.microsoft.com/en-us/library/aa383770(VS.85).aspx
(Read and Write property)

138.67.17 LasterrorString as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The error message for the last error.
Notes: (Read and Write property)

138.67.18 OptionConnectTimeOut as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Get or set the connect timeout.
Notes: Lasterror is set.

Sets or retrieves an unsigned long integer value that contains the time-out value, in milliseconds. Setting this option to infinite (-1) will disable this timer.
If a TCP connection request takes longer than this time-out value, the request is canceled. The default timeout is 60 seconds. When you are attempting to connect to multiple IP addresses for a single host (a multihomed host), the timeout limit is for each individual connection.
(Read and Write property)

138.67.19 OptionProxyPassword as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Get or set the proxy password.
Notes: Sets or retrieves a string value that contains the password used to access the proxy.
Lasterror is set.

(Read and Write property)

138.67.20 OptionProxyUsername as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Get or set the proxy user name.
Notes: Sets or retrieves a string value that contains the user name used to access the proxy.
Lasterror is set.
(Read and Write property)

138.67.21 Constants

Proxy Access Types

Constant	Value	Description
kAccessTypeDefaultProxy	0	Applies only when setting proxy information.
kAccessTypeNamedProxy	3	Internet accessed using a proxy.
kAccessTypeNoProxy	1	Internet accessed through a direct connection.

Autodetect Type Flags

Constant	Value	Description
kAutoDetectTypeDHCP	1	Use DHCP to locate the proxy auto-configuration file.
kAutoDetectTypeDNSA	2	Use DNS to attempt to locate the proxy auto-configuration file at a well-known location on the domain of the local computer.

Scheme Types

Constant	Value	Description
kInternetSchemeHTTP	1	HTTP scheme.
kInternetSchemeHTTPS	2	HTTPS scheme.

138.68 class WinHTTPClientProxyInfoMBS

138.68.1 class WinHTTPClientProxyInfoMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for the session or default proxy configuration.
Notes: see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa383912(v=vs.85).aspx
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.68.2 Methods

138.68.3 Constructor

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

138.68.4 Properties

138.68.5 AccessType as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The access type.
Notes: Can be kAccessTypeDefaultProxy, kAccessTypeNamedProxy or kAccessTypeNoProxy.
(Read and Write property)

138.68.6 Proxy as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The proxy server list.
Notes: (Read and Write property)

138.68.7 ProxyBypass as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The proxy bypass list.
Notes: (Read and Write property)

138.68.8 Constants

Proxy Access Types

Constant	Value	Description
kAccessTypeDefaultProxy	0	Applies only when setting proxy information.
kAccessTypeNamedProxy	3	Internet accessed using a proxy.
kAccessTypeNoProxy	1	Internet accessed through a direct connection.

138.69 class WinHTTPClientURLComponentsMBS

138.69.1 class WinHTTPClientURLComponentsMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class containing the constituent parts of an URL.
Example:

```
// split an URL into its parts with WinHTTP
Var parts As WinHTTPClientURLComponentsMBS = WinHTTPClientMBS.CrackUrl("https://user:secret@www.example.com:8443/path/page.html?id=5")
If parts = Nil Then Return

MessageBox "Scheme: " + parts.Scheme + EndOfLine + _
"Host: " + parts.HostName + ", port " + parts.Port.ToString + EndOfLine + _
"User: " + parts.UserName + EndOfLine + _
"Path: " + parts.UrlPath + EndOfLine + _
"Extra: " + parts.ExtraInfo
```

Notes: see also
http://msdn.microsoft.com/en-us/library/windows/desktop/aa384078(v=vs.85).aspx
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

138.69.2 Methods

138.69.3 Constructor

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

138.69.4 Properties

138.69.5 ExtraInfo as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The extra information, for example, ?something or #something.
Notes: (Read and Write property)

138.69.6 ExtraInfoLength as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The length of the extra information, in characters.
Notes: (Read and Write property)

138.69.7 HostName as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The host name.
Notes: (Read and Write property)

138.69.8 HostNameLength as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Length of the host name, in characters.
Notes: (Read and Write property)

138.69.9 Password as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The password.
Notes: (Read and Write property)

138.69.10 PasswordLength as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Length of the password, in characters.
Notes: (Read and Write property)

138.69.11 Port as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Port number.
Notes: (Read and Write property)

138.69.12 Scheme as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The scheme name.
Notes: (Read and Write property)

138.69.13 SchemeID as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internet protocol scheme.
Notes: Normally 1 for HTTP and 2 for HTTPS.
(Read and Write property)

138.69.14 SchemeLength as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Length of the scheme name, in characters.
Notes: (Read and Write property)

138.69.15 UrlPath as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The URL path.
Notes: (Read and Write property)

138.69.16 UrlPathLength as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Length of the URL path, in characters.
Notes: (Read and Write property)

138.69.17 UserName as String

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The user name.
Notes: (Read and Write property)

138.69.18 UserNameLength as Integer

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Length of the user name, in characters.
Notes: (Read and Write property)

Chapter 139

Nikon Cameras

139.1 class NikonCapInfoMBS

139.1.1 class NikonCapInfoMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class for Capability Information.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

139.1.2 Methods

139.1.3 Constructor

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The private constructor.

139.1.4 Properties

139.1.5 Description as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The description of this capability.
Notes: (Read only property)

139.1.6 ID as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The ID of this property.
Notes: See eNkMAIDCapability in Nikon's documentation.
(Read only property)

139.1.7 Operations as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The supported operations for this capability.
Notes: See eNkCapOperations in Nikon's documentation.
(Read only property)

139.1.8 OperationsString as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The operation value as a string for displaying.
Notes: (Read only property)

139.1.9 Type as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The type of this capability.
Notes: See eNkMAIDCababilityType in Nikon's documentation.
(Read only property)

139.1.10 TypeString as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The type value as a string for displaying.
Notes: (Read only property)

139.1.11 Visibility as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The visibility of this capability.
Notes: See eNkCapVisibility in Nikon's documentation.
(Read only property)

139.1.12 VisibilityString as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The visibility value as a string for displaying.
Notes: (Read only property)

139.2 class NikonFileInfoMBS

139.2.1 class NikonFileInfoMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class for the File Data Delivery Structure.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

139.2.2 Methods

139.2.3 Constructor

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The private constructor.

139.2.4 Properties

139.2.5 DiskFile as Boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: True if the file is delivered on disk.
Notes: (Read and Write property)

139.2.6 FileDataType as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: One of eNkMAIDFileDataTypes.
Notes: Possible values:

kNkMAIDFileDataType_NotSpecified	0
kNkMAIDFileDataType_JPEG	1
kNkMAIDFileDataType_TIFF	2
kNkMAIDFileDataType_FlashPix	3
kNkMAIDFileDataType_NIF	4
kNkMAIDFileDataType_QuickTime	5
kNkMAIDFileDataType_UserType	&h100

(Read and Write property)

139.2.7 Length as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Number of bytes in this delivery.
Notes: (Read and Write property)

139.2.8 RemoveObject as Boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: True if the object should be removed.
Notes: (Read and Write property)

139.2.9 Start as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Index of starting byte (0-based)
Notes: (Read and Write property)

139.2.10 TotalLength as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Total number of bytes to be transferred.
Notes: (Read and Write property)

139.3 class NikonImageInfoMBS

139.3.1 class NikonImageInfoMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class for the Image Data Delivery structure.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

139.3.2 Methods

139.3.3 Bits(index as Integer) as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Number of bits per plane per pixel.
Notes: Index from 0 to 3.

139.3.4 Constructor

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The private constructor.

139.3.5 Properties

139.3.6 ColorSpace as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The colorspace.
Notes: Possible values:

(Read and Write property)

139.3.7 Plane as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

kNkMAIDColorSpace_LineArt	0
kNkMAIDColorSpace_Grey	1
kNkMAIDColorSpace_RGB	2
kNkMAIDColorSpace_sRGB	3
kNkMAIDColorSpace_CMYK	4
kNkMAIDColorSpace_Lab	5
kNkMAIDColorSpace_LCH	6
kNkMAIDColorSpace_AppleRGB	7
kNkMAIDColorSpace_ColorMatchRGB	8
kNkMAIDColorSpace_NTSCRGB	9
kNkMAIDColorSpace_BruceRGB	10
kNkMAIDColorSpace_AdobeRGB	11
kNkMAIDColorSpace_CIERGB	12
kNkMAIDColorSpace_AdobeWideRGB	13
kNkMAIDColorSpace_AppleRGB_Compensated	14

Function: The plane configuration.
Notes: (Read and Write property)

139.3.8 Rect as NikonRectMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The rectangle.
Notes: (Read and Write property)

139.3.9 RemoveObject as Boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: True if the object should be removed.
Notes: (Read and Write property)

139.3.10 RowBytes as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Number of bytes per row of pixels.
Notes: (Read and Write property)

139.3.11 TotalPixels as NikonSizeMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Total size of image to be transfered.
Notes: (Read and Write property)

139.4 class NikonLiveImageMBS

139.4.1 class NikonLiveImageMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class for the live image data structure.
Notes: As there are 5 variants of the data structure for the different camera SDKs, some fields may not be filled for the camera you have.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.5pr10

139.4.2 Methods

139.4.3 AFframes(index as UInt32) as NikonRectMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The auto focus frames array.
Notes: Index from 0 to 34 (fixed to 0 for D5100)
Area of the AF frame size and the AF frame center coordinates for thirty-five persons

139.4.4 Properties

139.4.5 AFAreaIndex as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The Autofocus area index.
Notes: From 0 to 34 (fixed to 0 for D5100)
(Read and Write property)

139.4.6 AFstate as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: AF mode status of the face detection system.
Notes: 0: The face detection system is not set to AF.
1: The face detection system is set to AF.
(Read and Write property)

139.4.7 Aperture as Double

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The aperture value.
Notes: Aperture = F number*100
Only for type 2 and 3.
(Read only property)

139.4.8 AutoFocusHeight as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The height of the auto focus area.
Notes: (Read and Write property)

139.4.9 AutoFocusWidth as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The width of the auto focus area.
Notes: (Read and Write property)

139.4.10 AutoFocusX as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The x coordinate of the auto focus area.
Notes: (Read and Write property)

139.4.11 AutoFocusY as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The y coordinate of the auto focus area.
Notes: (Read and Write property)

139.4.12 CountDownTime as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The Countdown time.
Notes: Countdown every one second starting from 3600 (one hour); countdown starting from thirty seconds with a rise in temperature.
(Read and Write property)

139.4.13 DirectionOfRotation as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The Rotation direction.
Notes: (Read and Write property)

139.4.14 DisplayCenterX as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Display center coordinate.
Notes: (Read and Write property)

139.4.15 DisplayCenterY as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Display center coordinate.
Notes: (Read and Write property)

139.4.16 DisplayHeight as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The height of the display area size.
Notes: (Read and Write property)

139.4.17 DisplayWidth as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The width of the display area size.
Notes: (Read and Write property)

139.4.18 FaceDetectionCount as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The number of persons whose faces are detected by the system.
Notes: From 0 to 35 (Thirty-five is the maximum number of persons for D5100.)
(Read and Write property)

139.4.19 FacePriorityAFMode as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Face priority AF mode.
Notes: 0: Face priority AF is not active.
1: Face priority AF is active.
(Read and Write property)

139.4.20 FocusDriveState as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Focus driving status.
Notes: 0: Not driving
1: Driving
(Read and Write property)

139.4.21 FocusResult as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Focusing judgment result.
Notes: 0: No information
1: Not focused
2: Focused
(Read and Write property)

139.4.22 Height as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Height of the JPEG image.
Notes: (Read and Write property)

139.4.23 JPEGData as MemoryBlock

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The JPEG data of the live image.
Notes: You can use JPEGStringToPictureMBS to decode it.
(Read and Write property)

139.4.24 MovieRecordingInformation as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Movie recording information.
Notes: 0: During LV execution
1: During movie recording
(Read and Write property)

139.4.25 RawData as MemoryBlock

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The raw data used to build this image object and the fill the properties.
Notes: (Read and Write property)

139.4.26 RemainingMovieRecordingTime as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Remaining time of movie recording.
Notes: From 0 to 1200000 [msec] .
It is valid during the movie recording state.
(Read and Write property)

139.4.27 SelectedFocusPoint as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The number of the selected focus area.
Notes: Range from 0 to 11.

(Read and Write property)

139.4.28 ShutterSpeed as Double

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The shutter speed.
Notes: Only for type 2 and 3.
(Read only property)

139.4.29 TotalHeight as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The total size of the image.
Notes: (Read and Write property)

139.4.30 TotalWidth as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The total size of the image.
Notes: (Read and Write property)

139.4.31 Width as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Width of the JPEG image.
Notes: (Read and Write property)

139.4.32 Constants

Constants

Constant	Value	Description
kAFStateDriveImpossibility	0	One of the values for state that AF can be driven. AF drive impossibility.
kAFStateDrivePossible	1	One of the values for state that AF can be driven. AF drive possible.

Rotation Direction

Constant	Value	Description
kDirectionClockWise	2	Rotate clockwise
kDirectionCounterClockWise	1	Rotate counterclockwise
kDirectionNone	0	No rotation

Auto Focus Mode

Constant	Value	Description
kFacePriorityAFModeActive	1	Active
kFacePriorityAFModeNotActive	0	Inactive

Focus Driving

Constant	Value	Description
kFocusDriveStateDriving	0	Driving
kFocusDriveStateNotDriving	1	Not driving.

Focus Result

Constant	Value	Description
kFocusResultInFocus	2	In Focus
kFocusResultNoInformation	0	Focused
kFocusResultOutOfFocus	1	Not focused.

139.5 class NikonMBS

139.5.1 class NikonMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class to talk to a Nikon camera.
Notes: You need to get the SDKs yourself for the various cameras, so you have the PDF manuals, the C header files and the shared libraries.
Blog Entries

- MBS Xojo Plugins, version 17.4pr4
- MBS Xojo / Real Studio Plugins, version 13.4pr1

139.5.2 Methods

139.5.3 Acquire as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Acquires an image.

139.5.4 Async_ as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Performs an asynchronously operation.

139.5.5 AutoFocus as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Performs autofocus.
Notes: Performs operation kNkMAIDCapability_AutoFocus.

139.5.6 AvailableDatatypes as UInt32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns available data types.

139.5.7 Capabilities(what as Integer) as NikonCapInfoMBS()

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the list of capabilities.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.8 CapabilitiesCount(what as Integer) as UInt32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns the number of capabilities.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.9 Capability(what as Integer, ID as Integer) as NikonCapInfoMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the capability with given ID.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.10 Capture as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Performs a capture.
Notes: Performs operation kNkMAIDCapability_Capture.

139.5.11 CloseData

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Closes current data object.

139.5.12 CloseItem

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Closes current item.

139.5.13 CloseModule

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Closes current module.

139.5.14 CloseSource

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Closes current source.

139.5.15 GetCapBoolean(what as Integer, ID as Integer) as Boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a boolean value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.16 GetCapDefaultBoolean(what as Integer, ID as Integer) as Boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the default value for a capability with a boolean value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.17 GetCapDefaultDouble(what as Integer, ID as Integer) as Double

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the default value for a capability with a double value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.18 GetCapDefaultInt32(what as Integer, ID as Integer) as Int32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the default value for a capability with an Int32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.19 GetCapDefaultPoint(what as Integer, ID as Integer) as NikonPointMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the default value for a capability with a point value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.20 GetCapDefaultRect(what as Integer, ID as Integer) as NikonRectMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the default value for a capability with a rectangle value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.21 GetCapDefaultSize(what as Integer, ID as Integer) as NikonSizeMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the default value for a capability with a size value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.22 GetCapDefaultString(what as Integer, ID as Integer) as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the default value for a capability with a string value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.23 GetCapDefaultUInt32(what as Integer, ID as Integer) as UInt32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with an UInt32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.24 GetCapDouble(what as Integer, ID as Integer) as Double

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a double value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.25 GetCapEnumPacketString(what as Integer, ID as Integer, byref current as UInt32) as string()

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a packet string enum value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.26 GetCapEnumString(what as Integer, ID as Integer, byref current as UInt32) as string()

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a string enum value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.27 GetCapEnumUInt32(what as Integer, ID as Integer, byref current as UInt32) as UInt32()

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with an enum UInt32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.28 GetCapInt32(what as Integer, ID as Integer) as Int32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with an Int32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.29 GetCapPoint(what as Integer, ID as Integer) as NikonPointMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a point value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.30 GetCapRange(what as Integer, ID as Integer, byref Value as Double, byref DefaultValue as Double, byref ValueIndex as UInt32, byref DefaultIndex as UInt32, byref LowerValue as Double, byref UpperValue as Double, byref Steps as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a range value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.31 GetCapRect(what as Integer, ID as Integer) as NikonRectMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a rectangle value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.32 GetCapSize(what as Integer, ID as Integer) as NikonSizeMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a size value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.33 GetCapString(what as Integer, ID as Integer) as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with a string value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.34 GetCapUInt32(what as Integer, ID as Integer) as UInt32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a capability with an UInt32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.35 GetItemCount as UInt32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries number of items.

139.5.36 GetLiveViewImage(type as Integer) as NikonLiveImageMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries a live image.
Notes: Performs kNkMAIDCapability_GetLiveViewImage and decodes data returned into a NikonLiveImageMBS object.
Type: Which type of device you have. Value from 1 to 5.

139.5.37 GetSourceCount as UInt32

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries the number of sources (cameras).

139.5.38 GetVideoImageData(Offset as UInt32, BlockSize as UInt32) as String

MBS Cameras Plugin, Plugin Version: 13.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries data of a video file.
Notes: Please use OpenData before to open the video.

139.5.39 GetVideoImageDataSize as UInt32

MBS Cameras Plugin, Plugin Version: 13.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Queries data size of a video.
Notes: Please use OpenData before to open the video.

139.5.40 LoadLibrary(file as folderitem) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Loads the Nikon shard library.
Notes: Returns true on success.
Please pass folderitem pointing to dll on Windows and dylib on Mac OS X.
See also:

- 139.5.41 LoadLibrary(path as string) as boolean 19049

139.5.41 LoadLibrary(path as string) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Loads the Nikon shard library.
Notes: Returns true on success.
Please pass string path pointing to dll on Windows and dylib on Mac OS X.
See also:

- 139.5.40 LoadLibrary(file as folderitem) as boolean 19049

139.5.42 OpenData(type as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Opens data of given type.

139.5.43 OpenItem(index as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Opens the item with the given index.
Notes: Index is zero based.

139.5.44 OpenModule as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Opens the module.

139.5.45 OpenSource(index as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Opens the source with the given index.
Notes: Index is zero based.

139.5.46 PreCapture as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Prepares a capture.
Notes: Performs operation kNkMAIDCapability_PreCapture.

139.5.47 SetCapBoolean(what as Integer, ID as Integer, value as Boolean)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with a boolean value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.48 SetCapDouble(what as Integer, ID as Integer, value as Double)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with an double value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.49 SetCapEnumPackedString(what as Integer, ID as Integer, EnumIndex as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.3, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with an enum of PacketString values.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.
You first query the enum to get the list of options, than you can set a new one by passing index here.

139.5.50 SetCapEnumUInt32(what as Integer, ID as Integer, Value as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with an enum UInt32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.51 SetCapInt32(what as Integer, ID as Integer, value as Int32)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with an Int32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.52 SetCapPoint(what as Integer, ID as Integer, value as NikonPointMBS)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with a point value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.53 SetCapRange(what as Integer, ID as Integer, Value as Double, ValueIndex as UInt32) as boolean

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with a range value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.54 SetCapRect(what as Integer, ID as Integer, value as NikonRectMBS)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with a rectangle value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.55 SetCapSize(what as Integer, ID as Integer, value as NikonSizeMBS)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with an size value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.56 SetCapString(what as Integer, ID as Integer, value as String)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with a string value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.57 SetCapUInt32(what as Integer, ID as Integer, value as UInt32)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets a capability with an UInt32 value.
Notes: What: Selects what to query. Can be kModule, kSource, kItem or kData.

139.5.58 Properties

139.5.59 FunctionPtr as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The main entry function pointer for the Nikon library.
Notes: (Read only property)

139.5.60 Lasterror as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The last error code.
Notes: (Read only property)

139.5.61 LoadErrorMessage as String

MBS Cameras Plugin, Plugin Version: 17.4, Platforms: macOS, Windows, Targets: Desktop only.

Function: The error message from loading library.
Notes: Set by LoadLibrary methods to help debugging.

Windows error 193 means that 64-bit Xojo app tried to load 32-bit library or 32-bit Xojo app tried to load 64-bit library. The bit level must match between app and library. For Mac OS X the error message will tell you about wrong architecture.
(Read only property)

139.5.62 Events

139.5.63 FileDownloadComplete(info as NikonFileInfoMBS, data as Memoryblock, length as Integer)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Informs you about a finished file download.

139.5.64 ImageDownloadComplete(info as NikonImageInfoMBS, data as Memoryblock, length as Integer)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: This event informs you about a finished event.

139.5.65 Progress(Command as Integer, Param as Integer, Done as UInt32, Total as UInt32, Percent as Double)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: This event informs you about progress of an ongoing operation.

139.5.66 Constants

Selector Constants

Constant	Value	Description
kData	8	Apply to data.
kDevice	2	Apply to device/source.
kItem	4	Apply to item.
kModule	1	Apply to module.
kSource	2	Apply to device/source.

Data Object Types

Constant	Value	Description
kDataObjTypeFile	16	Other file
kDataObjTypeImage	1	Image file
kDataObjTypeSound	2	Sound file
kDataObjTypeThumbnail	8	Picture thumbnail
kDataObjTypeVideo	4	Video file

139.6 class NikonPointMBS

139.6.1 class NikonPointMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class for a point.

139.6.2 Methods

139.6.3 Constructor(x as Integer = 0, y as Integer = 0)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The constructor.

139.6.4 Operator_Convert as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Converts the point to a string for displaying.

139.6.5 Properties

139.6.6 x as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The x coordinate.
Notes: (Read and Write property)

139.6.7 y as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The y coordinate.
Notes: (Read and Write property)

139.7 class NikonRectMBS

139.7.1 class NikonRectMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class for a rectangle.

139.7.2 Methods

139.7.3 Constructor(x as Integer = 0, y as Integer = 0, w as Integer = 0, h as Integer = 0)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The constructor.

139.7.4 Operator_Convert as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Converts the rectangle to a string for displaying.

139.7.5 Properties

139.7.6 h as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The height of the rectangle.
Notes: (Read and Write property)

139.7.7 w as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The width of the rectangle.
Notes: (Read and Write property)

139.7.8 x as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The x coordinate of the rectangle.
Notes: (Read and Write property)

139.7.9 y as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The y coordinate of the rectangle.
Notes: (Read and Write property)

139.8 class NikonSizeMBS

139.8.1 class NikonSizeMBS

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The class for a size.

139.8.2 Methods

139.8.3 Constructor(w as Integer = 0, h as Integer = 0)

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The constructor.

139.8.4 Operator_Convert as String

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Converts the size to a string for displaying.

139.8.5 Properties

139.8.6 h as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The height of the size object.
Notes: (Read and Write property)

139.8.7 w as Integer

MBS Cameras Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The width of the size object.
Notes: (Read and Write property)

Chapter 140

Notifications

140.1 class NotificationCenterMBS

140.1.1 class NotificationCenterMBS

MBS MacCF Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for notifications sent on Mac OS X.
Notes: From Apple's help, but modified:

Distributed notifications allow an application to broadcast a message to any number of other applications without needing to know who those other applications are, or even if the other applications exist. Every application type —Cocoa, Carbon, BSD —can use distributed notifications.

An application, the target application in this case, expresses an interest in receiving a broadcasted message by registering itself with the system's distributed notification center, identifying exactly what message, or notification type, it wants to receive. The notification type is defined by an arbitrary string agreed upon by the sender and receiver of the notification. As an example, Cocoa's NSWindow class defines the notification type "NSWindowDidCloseNotification", which an NSWindow instance broadcasts when its window closes. Any other object can register to receive this notification. (This notification, however, is internal to a single application and is not distributed to the rest of the system.)

In addition to the message, the application can identify the particular object sending the message. When the sender and receiver are in the same application—in other words, using nondistributed notifications—the observed object can be anything. When using distributed notifications, though, the object must be a string. A useful choice for the observed string is the bundle identifier of the target application.

In registering for the notification, the application provides a class with an Receive event, which will later be called.

Next, the broadcasting application —your preference pane —sends the notification. It calls the system's notification center, tells the center what notification to send, and optionally passes a dictionary containing additional information. The dictionary can be used to pass the modified preferences directly to the application. Or, the preference pane can choose not to use the dictionary and instead write the changes out to disk. The notification is then used to tell the application to update its preferences from the disk.

The notification center looks up all the applications that registered to receive the given notification type from the particular instance. It then notifies each application's run loop of the notification and gives it a copy of the dictionary. The selected callback function or method is executed during the application's next pass through its run loop.

When using Preference Services, be certain to flush changes to the disk with the appropriate synchronize functions before sending notifications of changes. Otherwise, due to the caching performed by Preference Services, the disk may not accurately reflect the changes when the target receives the notification. Likewise, the target application must resynchronize its preferences after receiving the notification.

140.1.2 Methods

140.1.3 Add(name as CFStringMBS, obj as CFObjectMBS, flags as Integer)

MBS MacCF Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds a new callback.
Notes: This function costs around 24 bytes of memory per call which are never released (needed for the callback between framework and RB).

Values for the flags:

CFNotificationSuspensionBehaviorDrop	1	The server will not queue any notifications with this name and object while the process/app is in the background.
CFNotificationSuspensionBehaviorCoalesce	2	The server will only queue the last notification of the specified name and object; earlier notifications are dropped.
CFNotificationSuspensionBehaviorHold	3	The server will hold all matching notifications until the queue has been filled (queue size determined by the server) at which point the server may flush queued notifications.
CFNotificationSuspensionBehaviorDeliverImmediately	4	The server will deliver notifications matching this registration whether or not the process is in the background. When a notification with this suspension behavior is matched, it has the effect of first flushing any queued notifications.

140.1.4 close(name as CFStringMBS, obj as CFObjectMBS)

MBS MacCF Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Closes the given callback.

140.1.5 closeAll

MBS MacCF Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Closes all registered callbacks.
Notes: This is called by the destructor.

140.1.6 Post(name as CFStringMBS, obj as CFObjectMBS, userinfo as CFDictionaryMBS, deliverImmediately as Boolean)

MBS MacCF Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Posts a new notification.
Notes: Obj and userinfo may be nil.
See also:

- 140.1.7 Post(name as CFStringMBS, obj as CFObjectMBS, userinfo as CFDictionaryMBS, options as Integer) 19061

140.1.7 Post(name as CFStringMBS, obj as CFObjectMBS, userinfo as CFDictionaryMBS, options as Integer)

MBS MacCF Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Posts a new notification.
Example:

```
Var n as new NotificationCenterMBS
n.Post(NewCFStringMBS("test"), nil, nil, n.kCFNotificationPostToAllSessions + n.kCFNotificationDeliverImmediately)
```

Notes: Obj and userinfo may be nil.
Requires Mac OS X 10.3.
For options you can use a combination with kCFNotificationDeliverImmediately=1 and kCFNotificationPostToAllSessions=2.
See also:

- 140.1.6 Post(name as CFStringMBS, obj as CFObjectMBS, userinfo as CFDictionaryMBS, deliverImmediately as Boolean) 19061

140.1.8 Properties

140.1.9 Available as boolean

MBS MacCF Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the needed framework was successful loaded.
Notes: (Read only property)

140.1.10 Events

140.1.11 Received(name as CFStringMBS, obj as CFObjectMBS, userinfo as CFDictionaryMBS)

MBS MacCF Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: A notification was received.
Notes: All parameters may be for any reason nil.

140.1.12 Constants

Constants

Constant	Value	Description
kCFNotificationDeliverImmediately	1	One of the constant you can use for the Post Method.
kCFNotificationPostToAllSessions	2	One of the constant you can use for the Post Method.

140.2 class NotificationMBS

140.2.1 class NotificationMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an application internal notification.
Example:

```
Var n as new NotificationMBS("DatabaseChangedNotification")
NotificationMBS.send(n)
```

Notes: The point of notifications is to inform some other part of your application about something. For example a chart updating if the user enters data in textfields.

So you register for notifications in existing classes/windows with the NotificationReceiverMBS interface. Or you create a subclass of the NotificationObserverMBS class to receive notifications

All notifications are delivered on the same thread as the send method. If needed we could have an asyncron notification system. Please email for that.

Other notifications:

NSNotification: Notifications send from the Cocoa frameworks within your application over NSNotificationCenterMBS class or send across all applications with NSDistributedNotificationCenterMBS.

MacNotificationMBS: A notification message to the user which may have a sound, a message box and/or a jumping dock icon.

- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr8

Xojo Developer Magazine

- 12.1, page 9: News

140.2.2 Methods

140.2.3 Constructor(name as string = ””, ref as Variant = nil, tag as Variant = nil)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new notification with the given values.
Example:

```
Var n as new NotificationMBS("DatabaseChangedNotification")
NotificationMBS.send(n)
```

140.2.4 RegisterReceiver(target as NotificationReceiverMBS, name as string = ””, ref as Variant = nil)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Registers a receiver.
Notes: You have a class/window and you add NotificationReceiverMBS to the interfaces. Xojo will add a ReceivedNotification method which looks like this:

```
ReceivedNotification(name as string, ref as Variant, tag as Variant, notification as NotificationMBS)
```

Don't forget to call UnregisterReceiver later in the Close event or destructor.

If you register with name = ”” and ref = nil, you receive all notifications. If you have a name, you get only notifications matching the name (case sensitive compare). If you have a reference object, you receive only objects for that object. And you can use both name and object.

140.2.5 Send(name as string, ref as object = nil, tag as Variant = nil)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a notification.
Example:

```
NotificationMBS.Send("DatabaseChangedNotification")
```

Notes: This is a convenience method which creates a new NSNotificationMBS object and sends it.

All registered receivers will get the ReceivedNotification method called as well as all registered observers will

get an ReceivedNotification event.
Of course notifications are filtered by name and/or referenced object.
See also:

- 140.2.6 Send(notification as NotificationMBS) 19065

140.2.6 Send(notification as NotificationMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a notification.
Example:

```
Var n as new NotificationMBS("DatabaseChangedNotification")
NotificationMBS.send(n)
```

Notes: All registered receivers will get the ReceivedNotification method called as well as all registered observers will get an ReceivedNotification event.
Of course notifications are filtered by name and/or referenced object.
See also:

- 140.2.5 Send(name as string, ref as object = nil, tag as Variant = nil) 19064

140.2.7 SendDelayed(name as string, ref as object = nil, tag as Variant = nil)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a notification.
Example:

```
NotificationMBS.SendDelayed("DatabaseChangedNotification")
```

Notes: Same as Send method, but the notification will be delivered later on the main thread. The notification is queued and will wait until there is free CPU time.
See also:

- 140.2.8 SendDelayed(notification as NotificationMBS) 19065

140.2.8 SendDelayed(notification as NotificationMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a notification.
Example:

```
Var n as new NotificationMBS("DatabaseChangedNotification", Window1, "test")
NotificationMBS.SendDelayed(n)
```

Notes: Same as Send method, but the notification will be delivered later on the main thread. The notification is queued and will wait until there is free CPU time.
See also:

- 140.2.7 SendDelayed(name as string, ref as object = nil, tag as Variant = nil) 19065

140.2.9 SendNotification

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends this notification.
Example:

```
Var n as new NotificationMBS("DatabaseChangedNotification")
n.SendNotification
```

Notes: All registered receivers will get the ReceivedNotification method called as well as all registered observers will get an ReceivedNotification event.
Of course notifications are filtered by name and/or referenced object.

140.2.10 SendNotificationDelayed

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends a notification.
Example:

```
Var n as new NotificationMBS("DatabaseChangedNotification")
n.SendNotificationDelayed
```

Notes: Same as SendNotification method, but the notification will be delivered later on the main thread. The notification is queued and will wait until there is free CPU time.

140.2.11 UnregisterReceiver(target as NotificationReceiverMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unregisters an receiver.

140.2.12 Properties

140.2.13 Name as String

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name for the notification.
Example:

```
Var n as new NotificationMBS("DatabaseChangedNotification", Window1, "test")
MessageBox n.Name
```

Notes: (Read and Write property)

140.2.14 Ref as Variant

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The reference object.
Notes: Defines which object the notification references. If nil, you target all objects.
(Read and Write property)

140.2.15 Tag as Variant

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The attached value.
Example:

```
Var n as new NotificationMBS
n.Tag = "Hello World"
```

Notes: You can use this property as you like.
This value is sent to the receivers. It allows you to pass an additional value without needing to write a subclass of the NotificationMBS class.
(Read and Write property)

140.3 class NotificationObserverMBS

140.3.1 class NotificationObserverMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for receiving notifications.
Blog Entries

- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr8

140.3.2 Methods

140.3.3 Constructor(name as string = """, ref as object = nil, tag as Variant = nil)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new notification observer.
Notes: If you register with name = "" and ref = nil, you receive all notifications. If you have a name, you get only notifications matching the name (case sensitive compare). If you have a reference object, you receive only objects for that object. And you can use both name and object.

140.3.4 Properties

140.3.5 Name as String

MBS DataTypes Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the notification to listen for.
Notes: (Read only property)

140.3.6 Ref as Object

MBS DataTypes Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The target object to listen for.
Notes: (Read only property)

140.3.7 Events

140.3.8 ReceivedNotification(name as string, ref as Variant, tag as Variant, notification as NotificationMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called if a notification was received.
Notes: This event is registered automatically, so do not call RegisterReceiver with the NotificationObserverMBS object.

If you register with name = "" and ref = nil, you receive all notifications. If you have a name, you get only notifications matching the name (case sensitive compare). If you have a reference object, you receive only objects for that object. And you can use both name and object.

140.4 class NSDistributedNotificationCenterMBS

140.4.1 class NSDistributedNotificationCenterMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The NSDistributedNotificationCenter class provides a way to send notifications to objects in other tasks.
Example:

```
// get notified when the user switches between light and dark mode
// MyObserver is a subclass of NSNotificationObserverMBS with the GotNotification event implemented.
// Observer is a property of the window: Observer As MyObserver
Observer = New MyObserver
NSDistributedNotificationCenterMBS.defaultCenter.addObserver(Observer, "AppleInterfaceThemeChanged-
Notification", "")

// send a notification to other apps
NSDistributedNotificationCenterMBS.defaultCenter.postNotificationName("com.example.myapp.ping", "",
Nil, True)

// in MyObserver:
Sub GotNotification(notification As NSNotificationMBS) Handles GotNotification
System.DebugLog "Received " + notification.name
End Sub
```

Notes: It takes NSNotification objects and broadcasts them to any objects in other tasks that have registered for the notification with their task's default distributed notification center.

The NSDistributedNotificationCenter class implements a notification center that can distribute notifications asynchronously to tasks other than the one in which the notification was posted. An instance of this class are known as a distributed notification center.

Each task has a default distributed notification center that you access with the defaultCenter class method. There may be different types of distributed notification centers. Currently there is a single type—NSLocalNotificationCenterType. This type of distributed notification center handles notifications that can be sent between tasks on a single computer. For communication between tasks on different computers, use Distributed Objects Programming Topics.

Posting a distributed notification is an expensive operation. The notification gets sent to a system-wide server that distributes it to all the tasks that have objects registered for distributed notifications. The latency between posting the notification and the notification's arrival in another task is unbounded. In fact, when too many notifications are posted and the server's queue fills up, notifications may be dropped.
Subclass of the NSNotificationCenterMBS class.

- MBS REALbasic Plugins, version 10.6pr6

140.4.2 Methods

140.4.3 addObserver(observer as NSNotificationObserverMBS, name as string, theObject as Variant, suspensionBehavior as Integer)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds an entry to the receiver's dispatch table with a specific observer and suspended-notifications behavior, and optional notification name and sender.
Notes: observer: Object registering as an observer. Must not be nil.
name: The name of the notification for which to register the observer; that is, only notifications with this name are delivered to the observer. When nil, the notification center doesn't use a notification's name to decide whether to deliver it to the observer.
theObject: The object whose notifications the observer wants to receive; that is, only notifications sent by this sender are delivered to the observer. When nil, the notification center doesn't use a notification's sender to decide whether to deliver it to the observer.
suspensionBehavior: Notification posting behavior when notification delivery is suspended.

The receiver does not retain notificationObserver. Therefore, you should always send removeObserver to the receiver before releasing notificationObserver.

140.4.4 Constructor

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new instance with the default distributed notification center, representing the local notification center for the computer.
Notes: Default distributed notification center for the computer.

This method calls notificationCenterForType: with an argument of NSLocalNotificationCenterType.

140.4.5 defaultCenter as NSDistributedNotificationCenterMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the default distributed notification center, representing the local notification center for the computer.
Notes: Default distributed notification center for the computer.

This method calls notificationCenterForType: with an argument of NSLocalNotificationCenterType.

140.4.6 notificationCenterForType(name as string) as NSDistributedNotificationCenterMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the distributed notification center for a particular notification center type.
Notes: name: Notification center type being inquired about.

Currently only one type, NSLocalNotificationCenterType, is supported.

140.4.7 NSLocalNotificationCenterType as string

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: This constant specifies the notification center type.
Notes: Distributes notifications to all tasks on the sender's computer.

140.4.8 postNotificationName(name as string, theObject as string, userInfo as dictionary, deliverImmediately as boolean)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a notification with information and an immediate-delivery specifier, and posts it to the receiver.
Notes: name: Name of the notification to post. Must not be nil.
theObject: Sender of the notification. May be "".
userInfo: Dictionary containing additional information. May be nil.
deliverImmediately: Specifies when to deliver the notification. When false, the receiver delivers notifications to their observers according to the suspended-notification behavior specified in the corresponding dispatch table entry. When true, the receiver delivers the notification immediately to its observers.

This is the preferred method for posting notifications.
The notificationInfo dictionary is serialized as a property list, so it can be passed to another task. In the receiving task, it is deserialized back into a dictionary. This serialization imposes some restrictions on the objects that can be placed in the notificationInfo dictionary. See XML Property Lists for details.
See also:

- 140.4.9 postNotificationName(name as string, theObject as string, userInfo as dictionary, options as UInt32)

140.4.9 postNotificationName(name as string, theObject as string, userInfo as dictionary, options as UInt32)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a notification with information, and posts it to the receiver.
Example:

```
Var notifyData as string = "Hello World"
Var notifyName as string = "Test"

Var notifyDict As New Dictionary
notifyDict.Value("nData")=notifyData
NSDistributedNotificationCenterMBS.DefaultCenter.postNotificationName(notifyName, "", notifyDict, 2)
```

Notes: name: Name of the notification to post. Must not be nil.
theObject: Sender of the notification. May be "".
userInfo: Dictionary containing additional information. May be nil.
options: Specifies how the notification is posted to the task and when to deliver it to its observers.

The userInfo dictionary is serialized as a property list, so it can be passed to another task. In the receiving task, it is deserialized back into a dictionary. This serialization imposes some restrictions on the objects that can be placed in the notificationInfo dictionary. See XML Property Lists for details.
See also:

- 140.4.8 postNotificationName(name as string, theObject as string, userInfo as dictionary, deliverImmediately as boolean) 19072

140.4.10 Properties

140.4.11 suspended as boolean

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A boolean value that indicates whether notification delivery is suspended.
Notes: The NSApplication class automatically suspends distributed notification delivery when the application is not active. Applications based on the Application Kit framework should let AppKit manage the suspension of notification delivery. Foundation-only programs may have occasional need to use this method.
(Read and Write computed property)

140.4.12 Constants

Constants

Constant	Value	Description
NSNotificationDeliverImmediately	1	One of the option constants to specify the behavior of noti the postNotificationName method. When set, the notification is delivered immediately to all of their suspension behavior or suspension state. Whe normal suspension behavior of notification observers to t
NSNotificationPostToAllSessions	2	One of the option constants to specify the behavior of noti the postNotificationName method. When set, the notification is posted to all sessions. Wh cation is sent only to applications within the same login task.
NSNotificationSuspensionBehaviorCoalesce	2	One of the constants to specify the types of notificatio behaviors. The server only queues the last notification of the specif earlier notifications are dropped. In cover methods for havior is not an explicit argument, NSNotificationSuspen is the default.
NSNotificationSuspensionBehaviorDeliverImmediately	4	One of the constants to specify the types of notificatio behaviors. The server delivers notifications matching this registr whether Suspended is set to true. When a notification behavior is matched, it has the effect of first flushing any The effect is as if setSuspended: with an argument of fa the application is suspended, followed by the notification livered, followed by a transition back to the previous suspe state.
NSNotificationSuspensionBehaviorDrop	1	One of the constants to specify the types of notificatio behaviors. The server does not queue any notifications with this n Suspended is set to false.
NSNotificationSuspensionBehaviorHold	3	One of the constants to specify the types of notificatio behaviors. The server holds all matching notifications until the queue size determined by the server), at which point the serv notifications.

140.5 class NSNotificationCenterMBS

140.5.1 class NSNotificationCenterMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: An NSNotificationCenter object (or simply, notification center) provides a mechanism for broadcasting information within a task.
Example:

```
// get notified when any window of the app becomes the key window
// MyObserver is a subclass of NSNotificationObserverMBS with the GotNotification event implemented.
// Observer is a property of the window: Observer As MyObserver
Observer = New MyObserver
NSNotificationCenterMBS.defaultCenter.addObserver(Observer, "NSWindowDidBecomeKeyNotification")

// you can also post your own notifications
NSNotificationCenterMBS.defaultCenter.postNotificationName("MyAppDataChanged")

// in MyObserver:
Sub GotNotification(notification As NSNotificationMBS) Handles GotNotification
System.DebugLog "Notification: " + notification.name
End Sub
```

Notes: An NSNotificationCenter object is essentially a notification dispatch table.

This is for sending broadcast messages from one application to other application on same computer.
For the notification center in Mac OS X 10.8, please use NSUserNotificationMBS class.
Blog Entries

- MBS Real Studio Plugins, version 12.3pr11

140.5.2 Methods

140.5.3 addObserver(observer as NSNotificationObserverMBS, name as string="", theObject as Variant=nil)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Adds an entry to the receiver's dispatch table with an observer and optional criteria: notification name and sender.
Notes: observer: Object registering as an observer. This value must not be nil.
name: The name of the notification for which to register the observer; that is, only notifications with this name are delivered to the observer. If you pass nil, the notification center doesn't use a notification's name to decide whether to deliver it to the observer.
theObject: The object whose notifications the observer wants to receive; that is, only notifications sent by

this sender are delivered to the observer. If you pass nil, the notification center doesn't use a notification's sender to decide whether to deliver it to the observer.

140.5.4 Constructor

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The constructor to create a new instance of notification center pointing to the default notification center.
Notes: The current task's default notification center, which is used for system notifications.

140.5.5 defaultCenter as NSNotificationCenterMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the task's default notification center.
Notes: The current task's default notification center, which is used for system notifications.

140.5.6 postNotification(notification as NSNotificationMBS)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Posts a given notification to the receiver.
Notes: notification: The notification to post. This value must not be nil.

140.5.7 postNotificationName(name as string)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Creates a notification with a given name and sender and posts it to the receiver.
Notes: name: The name of the notification.
theObject: The object posting the notification.
See also:

- 140.5.8 postNotificationName(name as string, theObject as Variant) 19076
- 140.5.9 postNotificationName(name as string, theObject as Variant, userInfo as dictionary) 19077

140.5.8 postNotificationName(name as string, theObject as Variant)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Creates a notification with a given name and sender and posts it to the receiver.
Notes: name: The name of the notification.
theObject: The object posting the notification.
See also:

- 140.5.7 postNotificationName(name as string) 19076
- 140.5.9 postNotificationName(name as string, theObject as Variant, userInfo as dictionary) 19077

140.5.9 postNotificationName(name as string, theObject as Variant, userInfo as dictionary)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Creates a notification with a given name, sender, and information and posts it to the receiver.
Notes: name: The name of the notification.
theObject: The object posting the notification.
userInfo: Information about the notification. May be nil.

This method is the preferred method for posting notifications.
See also:

- 140.5.7 postNotificationName(name as string) 19076
- 140.5.8 postNotificationName(name as string, theObject as Variant) 19076

140.5.10 removeObserver(observer as NSNotificationObserverMBS)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Removes all the entries specifying a given observer from the receiver's dispatch table.
Notes: observer: The observer to remove. Must not be nil.

Be sure to invoke this method before notificationObserver or any object specified in addObserver is deallocated.
See also:

- 140.5.11 removeObserver(observer as NSNotificationObserverMBS, name as string, theObject as Variant=nil) 19077

140.5.11 removeObserver(observer as NSNotificationObserverMBS, name as string, theObject as Variant=nil)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Removes matching entries from the receiver's dispatch table.
Notes: notificationObserver: Observer to remove from the dispatch table. Specify an observer to remove only entries for this observer. Must not be nil, or message will have no effect.
notificationName: Name of the notification to remove from dispatch table. Specify a notification name to remove only entries that specify this notification name. When nil, the receiver does not use notification names as criteria for removal.
notificationSender: Sender to remove from the dispatch table. Specify a notification sender to remove only entries that specify this sender. When nil, the receiver does not use notification senders as criteria for removal.

Be sure to invoke this method before the observer object or any object specified in addObserver is deallocated.
See also:

- 140.5.10 removeObserver(observer as NSNotificationObserverMBS) 19077

140.5.12 Properties

140.5.13 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The internal reference to the notification center.
Notes: (Read and Write property)

140.6 class NSNotificationMBS

140.6.1 class NSNotificationMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: NSNotification objects encapsulate information so that it can be broadcast to other objects by an NSNotificationCenter object.
Example:

```
// post a notification with extra information to all observers in the app
// MyObserver is a subclass of NSNotificationObserverMBS with the GotNotification event implemented.
// Observer is a property of the window: Observer As MyObserver
Observer = New MyObserver
NSNotificationCenterMBS.defaultCenter.addObserver(Observer, "MyAppDocumentSaved")

Var info As New Dictionary
info.Value("file") = "Report.pdf"
info.Value("pages") = 12
NSNotificationCenterMBS.defaultCenter.postNotification New NSNotificationMBS("MyAppDocumentSaved",
Nil, info)

// in MyObserver:
Sub GotNotification(notification As NSNotificationMBS) Handles GotNotification
Var d As Dictionary = notification.userInfo
System.DebugLog notification.name + ": " + d.Value("file").StringValue + " with " + d.Value("pages").String-
Value + " pages"
End Sub
```

Notes: An NSNotification object (referred to as a notification) contains a name, an object, and an optional dictionary. The name is a tag identifying the notification. The object is any object that the poster of the notification wants to send to observers of that notification (typically, it is the object that posted the notification). The dictionary stores other related objects, if any. NSNotification objects are immutable objects.

You can create a notification object with the class method notificationWithName. However, you don't usually create your own notifications directly. The NSNotificationCenter method postNotificationName allow you to conveniently post a notification without creating it first.

On Windows you can use WinNotificationMBS class for similar functionality.

This is for sending broadcast messages from one application to other application on same computer.
For the notification center in Mac OS X 10.8, please use NSUserNotificationMBS class.

140.6.2 Methods

140.6.3 Constructor(handle as Integer)

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Creates a notification object with a NSNotification reference.
Notes: The object is retained and later in destructor it is released.
See also:

- 140.6.4 Constructor(name as string, theObject as Variant = nil, userInfo as dictionary = nil) 19080

140.6.4 Constructor(name as string, theObject as Variant = nil, userInfo as dictionary = nil)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates a notification object with a specified name, object, and user information.
Example:

```
Var n as new NSNotificationMBS("Hello")
MessageBox n.name
```

Notes: name: The name for the new notification. May not be nil.
theObject: The object for the new notification. Can be nil.
userInfo: The user information dictionary for the new notification. May be nil.
See also:

- 140.6.3 Constructor(handle as Integer) 19080

140.6.5 notificationWithName(name as string, theObject as Variant = nil, userInfo as dictionary = nil) as NSNotificationMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a notification object with a specified name, object, and user information.
Example:

```
Var n as NSNotificationMBS = NSNotificationMBS.notificationWithName("Hello")
MessageBox n.name
```

Notes: name: The name for the new notification. May not be nil.
theObject: The object for the new notification. Can be nil.
userInfo: The user information dictionary for the new notification. May be nil.

140.6.6 Print

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Writes description for this event descriptor to the console.
Notes: You can see result in Console.app.

140.6.7 Properties

140.6.8 description as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: The descriptor for this notification.
Example:

```
Var n as NSNotificationMBS = NSNotificationMBS.notificationWithName("Hello")
MessageBox n.description
```

Notes: This is a text representation for debugging.
(Read only property)

140.6.9 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The internal reference to the NSNotification object.
Notes: (Read and Write property)

140.6.10 name as string

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the name of the notification.
Notes: The name of the notification. Typically you use this method to find out what kind of notification you are dealing with when you receive a notification.
Notification names can be any string. To avoid name collisions, you might want to use a prefix that's specific

to your application.
(Read only property)

140.6.11 objectHandle as Integer

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The reference to the object.
Notes: May be useful for declares.
(Read only property)

140.6.12 objectVariant as Variant

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the object associated with the notification.
Notes: The object associated with the notification. This is often the object that posted this notification. It may be nil.
Typically you use this method to find out what object a notification applies to when you receive a notification.

See the FAQ for the list of supported NSObject types for variant conversion.
(Read only property)

140.6.13 userInfo as dictionary

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the user information dictionary associated with the receiver.
Example:

```
// tests dictionary conversion:

Var d as new Dictionary

Var x as new Dictionary
x.Value("Hello") = "World"

Var b as Boolean = true
Var s as Single = 2.3
Var dd as Double = 3.4
Var h as int64 = 1234

d.Value(1) = 1
```

```
d.Value(2) = 2.0
d.Value(3) = x
d.Value(4) = "Hello"
d.Value(5) = b
d.Value(6) = s
d.Value(7) = dd
d.Value(8) = h

Var n as new NSNotificationMBS("test", nil, d)

Var nd as Dictionary = n.userInfo

// check nd object
break
```

Notes: Returns the user information dictionary associated with the receiver. May be nil.
The user information dictionary stores any additional objects that objects receiving the notification might use.
(Read only property)

140.7 class NSNotificationObserverMBS

140.7.1 class NSNotificationObserverMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The notification class which you use to receive notifications.
Notes: To use this class, please create a subclass. There you can put code in the event handler to do whatever you need in case your notification is received.

Than you create in code objects form this class. Normally only one. And you call addObserver on the NSNotificationCenterMBS or NSDistributedNotificationCenterMBS objects you have to tell the system which notifications you want to receive.

Do not forget to call removeObserver on the notification center for all your observers to avoid crashes.

140.7.2 Methods

140.7.3 Constructor

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The constructor which creates the observer.
Notes: On success the handle property is not zero.

140.7.4 Destructor

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The Destructor.
Notes: Removes in plugin version 12.3 and newer the observer from the NSNotificationCenterMBS and NSDistributedNotificationCenterMBS to avoid crashes.

140.7.5 Properties

140.7.6 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The internal handle to the observer object.
Notes: (Read and Write property)

140.7.7 Events

140.7.8 GotNotification(notification as NSNotificationMBS)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The event called if a new notification is received.
Notes: The MBS Plugin makes sure you receive this event always on the main thread.

140.8 class WinNotificationMBS

140.8.1 class WinNotificationMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This is a class to send broadcast message to all windows applications listening for this notification.
Example:

```
// listen for a notification and send one to all applications
// MyNotification is a subclass of WinNotificationMBS with the GotNotification event implemented.
// Listener is a property of the window: Listener As MyNotification

Listener = New MyNotification
If Listener.ListenForMessage("MyAppMessage") Then
// send to all applications listening for this name, including ourselves
If Not WinNotificationMBS.SendMessage("MyAppMessage", 123, 456) Then
MessageBox "Failed to send."
End If
End If

// in MyNotification:
Sub GotNotification(Message As Integer, Name As String, Value1 As Integer, Value2 As Integer, ByRef
Result As Integer, ByRef Handled As Boolean) Handles GotNotification
System.DebugLog "Got " + Name + ": " + Value1.ToString + ", " + Value2.ToString
Handled = True
End Sub
```

Notes: If you have several applications, you can send notifications from one to another.

Windows Desktop application: Sending and receiving notification works.
Windows Console application: Sending works.
Windows Web application: Sending works. Receives notification of own application, but of others.

This class is useful to tell other instance of your application or other application about something. Like for example whether background process is done.

On Mac OS X you can use NSNotificationMBS class for similar functionality.

With 14.2 plugins we added possibility to listen for any windows broadcast message. Like for example for WM_TIMECHANGE.

- 140.8.7 Constructor(Window as window) 19089
- 140.8.8 Constructor(WindowHandle as Integer) 19089

140.8.4 Constructor(Control as DesktopUIControl)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The control constructor.
Notes: Takes an existing Xojo control and intercepts messages going there to listen for the notifications you are interested for.
The class keeps a reference to the control to make sure it is not destroyed before this object is destroyed.
See also:

- 140.8.3 Constructor 19087
- 140.8.5 Constructor(control as RectControl) 19088
- 140.8.6 Constructor(Window as DesktopWindow) 19088
- 140.8.7 Constructor(Window as window) 19089
- 140.8.8 Constructor(WindowHandle as Integer) 19089

140.8.5 Constructor(control as RectControl)

MBS Win Plugin, Plugin Version: 17.0, Platform: Windows, Targets: Desktop only.

Function: The control constructor.
Notes: Takes an existing Xojo control and intercepts messages going there to listen for the notifications you are interested for.
The class keeps a reference to the control to make sure it is not destroyed before this object is destroyed.
See also:

- 140.8.3 Constructor 19087
- 140.8.4 Constructor(Control as DesktopUIControl) 19087
- 140.8.6 Constructor(Window as DesktopWindow) 19088
- 140.8.7 Constructor(Window as window) 19089
- 140.8.8 Constructor(WindowHandle as Integer) 19089

140.8.6 Constructor(Window as DesktopWindow)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The window constructor.
Notes: Takes an existing Xojo Window and intercepts messages going there to listen for the notifications you are interested for.
If you listen for global notifications sent to all windows, we prefer the other constructor.
The class keeps a reference to the window to make sure it is not destroyed before this object is destroyed.
See also:

- 140.8.3 Constructor 19087
- 140.8.4 Constructor(Control as DesktopUIControl) 19087
- 140.8.5 Constructor(control as RectControl) 19088
- 140.8.7 Constructor(Window as window) 19089
- 140.8.8 Constructor(WindowHandle as Integer) 19089

140.8.7 Constructor(Window as window)

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop only.

Function: The window constructor.
Notes: Takes an existing Xojo Window and intercepts messages going there to listen for the notifications you are interested for.
If you listen for global notifications sent to all windows, we prefer the other constructor.
The class keeps a reference to the window to make sure it is not destroyed before this object is destroyed.
See also:

- 140.8.3 Constructor 19087
- 140.8.4 Constructor(Control as DesktopUIControl) 19087
- 140.8.5 Constructor(control as RectControl) 19088
- 140.8.6 Constructor(Window as DesktopWindow) 19088
- 140.8.8 Constructor(WindowHandle as Integer) 19089

140.8.8 Constructor(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 17.1, Platform: Windows, Targets: Desktop only.

Function: The window constructor.
Notes: Takes an existing window and intercepts messages going there to listen for the notifications you are interested for.
If you listen for global notifications sent to all windows, we prefer the other constructor.
The class keeps a reference to the window to make sure it is not destroyed before this object is destroyed.
See also:

- 140.8.3 Constructor 19087
- 140.8.4 Constructor(Control as DesktopUIControl) 19087
- 140.8.5 Constructor(control as RectControl) 19088
- 140.8.6 Constructor(Window as DesktopWindow) 19088
- 140.8.7 Constructor(Window as window) 19089

140.8.9 IsListeningFor(MessageID as Integer) as boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this object is listening for the given message ID.
Example:

```
Var w as new WinNotificationMBS

const WM_TIMECHANGE = &h001E
if w.ListenForMessage(WM_TIMECHANGE) then
MessageBox str(w.IsListeningFor(WM_TIMECHANGE))
end if
```

Notes: Returns true if we listen for this notification name or false if not.
See also:

- 140.8.10 IsListeningFor(name as string) as boolean 19090

140.8.10 IsListeningFor(name as string) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this object is listening for the given notification.
Example:

```
Var w as new WinNotificationMBS

if w.ListenForMessage("Hello") then
MessageBox str(w.IsListeningFor("Hello"))
end if
```

Notes: Returns true if we listen for this notification name or false if not.
See also:

- 140.8.9 IsListeningFor(MessageID as Integer) as boolean 19089

140.8.11 ListenForMessage(MessageID as Integer) as boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Listens for given notification message id.
Notes: Returns true on success and false on failure.
See also:

- 140.8.12 ListenForMessage(name as string) as boolean 19090

140.8.12 ListenForMessage(name as string) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Listens for given notification name.
Notes: Returns true on success and false on failure.
See also:

- 140.8.11 ListenForMessage(MessageID as Integer) as boolean 19090

140.8.13 SendMessage(byref result as Integer, MessageID as Integer, Value1 as Integer = 0, Value2 as Integer = 0, TimeOut as Integer = 10) as boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sends a message to all applications listening for it.
Example:

```
Var w as new WinNotificationMBS
Var Result as Integer

// send a message and wait for result
if w.SendMessage(Result, 1234567, 123, 456) then
// okay
else
// failed
end if
```

Notes: Sends a message with given message ID.
You can pass two integer parameters.
Returns true if event was sent or false if it failed.
This doesn't tell you whether it was received by someone, but your own application receives it, too.
Timeout is in milliseconds and counts per receiving window.
Result returns the result code from the message.
See also:

- 140.8.14 SendMessage(name as string, Value1 as Integer = 0, Value2 as Integer = 0, TimeOut as Integer = 10) as boolean 19091

140.8.14 SendMessage(name as string, Value1 as Integer = 0, Value2 as Integer = 0, TimeOut as Integer = 10) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sends a message to all applications listening for it.
Example:

```
Var w as new WinNotificationMBS
```

```
if w.SendMessage(Result, "Hello", 123, 456) then
// okay
else
// failed
end if
```

Notes: You can pass two integer parameters.
Returns true if event was sent or false if it failed.
This doesn't tell you whether it was received by someone, but your own application receives it, too.
Timeout is in milliseconds and counts per receiving window.
See also:

- 140.8.13 SendMessage(byref result as Integer, MessageID as Integer, Value1 as Integer = 0, Value2 as Integer = 0, TimeOut as Integer = 10) as boolean 19091

140.8.15 SendMessageToWindow(WindowHandle as Integer, byref result as Integer, MessageID as Integer, Value1 as Integer = 0, Value2 as Integer = 0, TimeOut as Integer = 10) as boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sends a message to all applications listening for it.
Notes: Like SendMessage, but with a target window.
You can pass two integer parameters.
Returns true if event was sent or false if it failed.
This doesn't tell you whether it was received by someone, but your own application receives it, too.
Timeout is in milliseconds and counts per receiving window.

140.8.16 StopListeningForMessage(MessageID as Integer) as boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stops listening for a given message ID.
Example:

```
Var w as new WinNotificationMBS

const WM_TIMECHANGE = &h001E
if w.ListenForMessage(WM_TIMECHANGE) then
if w.StopListeningForMessage(WM_TIMECHANGE) then
MessageBox "OK"
end if
end if
```

See also:

• 140.8.17 StopListeningForMessage(name as string) as boolean 19093

140.8.17 StopListeningForMessage(name as string) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stops listening for a given notification name.
Example:

```
Var w as new WinNotificationMBS

if w.ListenForMessage("Hello") then
if w.StopListeningForMessage("Hello") then
MessageBox "OK"
end if
end if
```

See also:

• 140.8.16 StopListeningForMessage(MessageID as Integer) as boolean 19092

140.8.18 Properties

140.8.19 WindowHandle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal window handle.
Notes: (Read only property)

140.8.20 Events

140.8.21 GotNotification(Message as Integer, Name as string, Value1 as Integer, Value2 as Integer, byref Result as Integer, byref Handled as boolean)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A notification was received.
Notes: Message: The message ID.
Name: If you registered by name, this is the name for the message ID.
Value1 and Value2 are parameters provided with message. (WPARAM and LPARAM)

If Handled is set to true, we pass back Result to the Windows system (LRESULT).
Else the default handler is called.

Chapter 141

OCR

141.1 class TessChoiceIteratorMBS

141.1.1 class TessChoiceIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Class to iterate over the classifier choices for a single symbol.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

141.1.2 Methods

141.1.3 Constructor

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

141.1.4 MoveNext as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to the next choice for the symbol and returns false if there are none left.

141.1.5 Properties

141.1.6 Confidence as Single

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the confidence of the current choice depending on the used language data.
Notes: If only LSTM traineddata is used the value range is 0.0 - 1.0. All choices for one symbol should roughly add up to 1.0. If only traineddata of the legacy engine is used, the number should be interpreted as a percent probability. (0.0 - 100.0) In this case probabilities won't add up to 100. Each one stands on its own.
(Read only property)

141.1.7 Handle as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

141.1.8 Text as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the null terminated UTF-8 encoded text string for the current choice.
Notes: (Read only property)

141.2 class TessEngineMBS

141.2.1 class TessEngineMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for OCR recognition using tesseract library.
Example:

```
Var OCR As new TessEngineMBS // your instance of tesseract

If Not ocr.Initialize("C:\Program Files\Tesseract-OCR\tessdata", "eng") Then
MessageBox "failed to initialize"
Quit
End If

Var f As FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var p As Picture = f.OpenAsPicture
OCR.SetImage(p)

// get the text
Var OCRText As String = OCR.GetText
```

Notes: This replaces the older TesseractMBS class.

The new class is for Tesseract 4.x and 5.x versions.

- 24.3, page 9: News

141.2.2 Methods

141.2.3 AllWordConfidences as Integer()

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns all word confidences (between 0 and 100) in an array.
Notes: The number of confidences should correspond to the number of space-delimited words in GetText.

141.2.4 AnalyseLayout as TessPageIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Runs page layout analysis in the mode set by SetPageSegMode.
Notes: May optionally be called prior to Recognize to get access to just the page layout results. Returns an iterator to the results.

Returns nil on error or an empty page.

141.2.5 Clear

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Free up recognition results and any stored image data, without actually freeing any recognition data that would be time-consuming to reload.
Notes: Afterwards, you must call SetImage or TesseractRect before doing any Recognize or Get* operation.

141.2.6 Constructor

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
Notes: Please call Initialize after this to get started.

141.2.7 GetAltoText(PageNumber as Integer) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Make an XML-formatted string with Alto markup from the internal data structures.

141.2.8 GetAvailableLanguages as String()

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the available languages as array.
Example:

```
Var OCR As TessEngineMBS // your instance of tesseract
Var AvailableLanguages() As String = OCR.GetAvailableLanguages
```

141.2.9 GetBoolVariable(Name as String, byref value as boolean) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries boolean variable value.
Notes: Returns true if the parameter was found among Tesseract parameters.
Fills in value with the value of the parameter.

141.2.10 GetBoxText(PageNumber as Integer) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The recognized text is returned as a char* which is coded in the same format as a box file used in training.
Notes: Constructs coordinates in the original image - not just the rectangle.
PageNumber is a 0-based page index that will appear in the box file.

141.2.11 GetDoubleVariable(Name as String, byref value as Double) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries double variable value.
Notes: Returns true if the parameter was found among Tesseract parameters.
Fills in value with the value of the parameter.

141.2.12 GetHOCRText(PageNumber as Integer) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Make a HTML-formatted string with hOCR markup from the internal data structures.
Notes: PageNumber is 0-based but will appear in the output as 1-based.

141.2.13 GetIntVariable(Name as String, byref value as Integer) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries integer variable value.
Notes: Returns true if the parameter was found among Tesseract parameters.
Fills in value with the value of the parameter.

141.2.14 GetLoadedLanguages as String()

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the loaded languages as array.
Example:

```
Var OCR As TessEngineMBS // your instance of tesseract
Var LoadedLanguages() As String = OCR.GetLoadedLanguages
```

Notes: Includes all languages loaded by the last Init, including those loaded as dependencies of other loaded languages.

141.2.15 GetLSTMBoxText(PageNumber as Integer) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Make a box file for LSTM training from the internal data structures.
Notes: Constructs coordinates in the original image - not just the rectangle.
PageNumber is a 0-based page index that will appear in the box file.

141.2.16 GetStringVariable(Name as String) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries string variable value.
Notes: Returns true if the parameter was found among Tesseract parameters.
Fills in value with the value of the parameter.

141.2.17 GetText as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The recognized text is returned as UTF-text.

141.2.18 GetTsvText(PageNumber as Integer) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Make a TSV-formatted string from the internal data structures.
Notes: PageNumber is 0-based but will appear in the output as 1-based.

141.2.19 GetUNLVText as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The recognized text is returned as a char* which is coded as UNLV format Latin-1 with specific reject and suspect codes.

141.2.20 GetWordStrBoxText(PageNumber as Integer) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The recognized text is returned as a char* which is coded in the same format as a WordStr box file used in training.
Notes: PageNumber is a 0-based page index that will appear in the box file.

141.2.21 Initialize(dataPath as String, language as String, Mode as Integer = 3, configs() as String = nil) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Initializes tesseract.
Example:

```
Var OCR As new TessEngineMBS // your instance of tesseract

If Not ocr.Initialize("C:\Program Files\Tesseract-OCR\tessdata", "eng") Then
MessageBox "failed to initialize"
Quit
End If
```

Notes: Returns true on success and false on failure.

The datapath must be the name of the tessdata directory.
The language is (usually) an ISO 639-3 string or "" will default to eng.
It is entirely safe (and eventually will be efficient too) to call Initialize multiple times on the same instance to change language, or just to reset the classifier.

The language may be a string of the form [
textasciitilde] <lang>[+ [
textasciitilde] <lang>] * indicating that multiple languages are to be loaded. Eg hin+eng will load Hindi and English. Languages may specify internally that they want to be loaded with one or more other languages, so the
textasciitilde sign is available to override that. Eg if hin were set to load eng by default, then hin+
textasciitilde eng would force loading only hin. The number of loaded languages is limited only by memory, with the caveat that loading additional languages will impact both speed and accuracy, as there is more work to do to decide on the applicable language, and there is more chance of hallucinating incorrect words.

Warning: On changing languages, all Tesseract parameters are reset back to their default values. (Which may vary between languages.)
If you have a rare need to set a Variable that controls initialization for a second call to Init you should explicitly call End() and then use SetVariable before Init. This is only a very rare use case, since there are very few uses that require any parameters to be set before Init.

141.2.22 IsValidWord(Word as String) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Check whether a word is valid according to Tesseract's language model.
Notes: Return false if the word is invalid, true if valid.

141.2.23 LibraryLoaded as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the tesseract library was loaded.
Notes: Should be true after succesful call to LoadLibrary.

141.2.24 LibraryLoadError as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The last error from LoadLibrary as number.

141.2.25 LibraryLoadErrorMessage as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The last error from LoadLibrary as text.

141.2.26 LoadLibrary(file as folderitem) as boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads the tesseract library.
Notes: Returns true on success and false on failure.
See LibraryLoadErrorMessage for a textual description.
See also:

- 141.2.27 LoadLibrary(path as string) as boolean 19103

141.2.27 LoadLibrary(path as string) as boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads the tesseract library.
Example:

```
// first load image processing library
Call TessEngineMBS.LoadLibrary("libleptonica-6.dll")

// second load tesseract library
Call TessEngineMBS.LoadLibrary("tesseract-5.dll")
```

Notes: Returns true on success and false on failure.
See LibraryLoadErrorMessage for a textual description.

For Windows load the DLL, for Linux the tesseract.so file and for macOS the dylib file.
You may need to first load leptonica library and second the tesseract library.
See example project for sample code.
See also:

- 141.2.26 LoadLibrary(file as folderitem) as boolean 19103

141.2.28 PrintVariablesToFile(File as FolderItem) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Print Tesseract parameters to the given file.
Notes: Returns true on success.
Fails if the file can't be created.

141.2.29 PrintVariablesToPath(Path as String) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Print Tesseract parameters to the given file.
Notes: Returns true on success.
Fails if the file can't be created.

141.2.30 ProcessPages(ImageFilePath as String, RetryConfig as String = "", TimeOutMilliSec as Integer = 0, Renderer as TessResultRendererMBS) as Boolean

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Turns images into symbolic text.
Example:

```
var ocr as new TessEngineMBS

// initialize with right paths
If Not ocr.Initialize(tessdataPath, Languages) Then
MessageBox "failed to initialize"
Quit
End If

// pass image file
ocr.SetImageFile(imagefile)

// now write PDF file
Var p As FolderItem = SpecialFolder.Desktop.Child("test") // no extension!
Var r As TessResultRendererMBS = TessResultRendererMBS.CreatePDFRenderer(p.NativePath)

If r.BeginDocument("Hello") Then

Call ocr.ProcessPages(ImageFile.NativePath, "", 0, r)

call r.EndDocument
End If
```

Notes: ImageFilePath can point to a single image, a multi-page TIFF, or a plain text list of image filenames.

RetryConfig is useful for debugging. If not empty, you can fall back to an alternate configuration if a page fails for some reason.

TimeOutMilliSec terminates processing if any single page takes too long. Set to 0 for unlimited time.

renderer is responible for creating the output. For example, use the TessTextRenderer if you want plaintext output, or the TessPDFRender to produce searchable PDF.

If tessedit_page_number is non-negative, will only process that single page. Works for multi-page tiff file, or filelist.

Returns true if successful, false on error.

141.2.31 Recognize as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Recognize the image from SetAndThresholdImage, generating Tesseract internal structures.
Notes: Returns true on success.

Optional. The Get*Text functions below will call Recognize if needed.

After Recognize, the output is kept internally until the next SetImage.

141.2.32 ResultIterator as TessResultIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries a result iterator.
Notes: Loop over it to query details.
The result iterator is only valid until you end the engine.

141.2.33 SetCurrentWorkingDirectory(path as folderitem) as boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets current working directory.
Notes: Returns true on success.

See also:

- 141.2.34 SetCurrentWorkingDirectory(path as String) as boolean 19106

141.2.34 SetCurrentWorkingDirectory(path as String) as boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets current working directory.
Notes: Returns true on success.
See also:

- 141.2.33 SetCurrentWorkingDirectory(path as folderitem) as boolean 19105

141.2.35 SetDllDirectory(path as folderitem) as boolean

MBS OCR Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: Adds a directory to the search path used to locate DLLs for the application.
Notes: The directory to be added to the search path. If this parameter is an empty string (""), the call removes the current directory from the default DLL search order. If this parameter is nil, the function restores the default search order.

If the function succeeds, the return value is true, otherwise false.

The SetDllDirectory function affects all subsequent calls to the LoadLibrary and LoadLibraryEx functions. It also effectively disables safe DLL search mode while the specified directory is in the search path.

After calling SetDllDirectory, the standard DLL search path is:

- The directory from which the application loaded.
- The directory specified by the SetDllDirectory function.
- The system directory. Use the GetSystemDirectory function to get the path of this directory. The name of this directory is System32.
- The Windows directory. Use the GetWindowsDirectory function to get the path of this directory.
- The directories that are listed in the PATH environment variable.

Each time the SetDllDirectory function is called, it replaces the directory specified in the previous SetDllDirectory call.

To revert to the standard search path used by LoadLibrary and LoadLibraryEx, call SetDllDirectory with nil. This also restores safe DLL search mode based on the SafeDllSearchMode registry value.
See also:

- 141.2.36 SetDllDirectory(path as String) as boolean 19107

141.2.36 SetDllDirectory(path as String) as boolean

MBS OCR Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: Adds a directory to the search path used to locate DLLs for the application.
Notes: The directory to be added to the search path. If this parameter is an empty string (""), the call removes the current directory from the default DLL search order. If this parameter is nil, the function restores the default search order.

If the function succeeds, the return value is true, otherwise false.

The SetDllDirectory function affects all subsequent calls to the LoadLibrary and LoadLibraryEx functions. It also effectively disables safe DLL search mode while the specified directory is in the search path.

After calling SetDllDirectory, the standard DLL search path is:

- The directory from which the application loaded.
- The directory specified by the SetDllDirectory function.
- The system directory. Use the GetSystemDirectory function to get the path of this directory. The name of this directory is System32.
- The Windows directory. Use the GetWindowsDirectory function to get the path of this directory.
- The directories that are listed in the PATH environment variable.

Each time the SetDllDirectory function is called, it replaces the directory specified in the previous SetDllDirectory call.

To revert to the standard search path used by LoadLibrary and LoadLibraryEx, call SetDllDirectory with nil. This also restores safe DLL search mode based on the SafeDllSearchMode registry value.
See also:

- 141.2.35 SetDllDirectory(path as folderitem) as boolean 19106

141.2.37 SetImage(pic as picture)

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets input image via picture.
Example:

```
Var OCR As TessEngineMBS // your instance of tesseract

Var f As FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var p As Picture = f.OpenAsPicture
OCR.SetImage(p)
```

Notes: Pass Xojo picture and we copy the pixels.
Mask or alpha channel is ignored.

The image is released automatically in destructor.

141.2.38 SetImageData(Data as MemoryBlock)

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets input image via data.
Notes: Image data can be an image file content like JPEG or PNG.
Supported formats depends on what leptonica was compiled to support.

The image is released automatically in destructor.
See also:

- 141.2.39 SetImageData(Data as String) 19108

141.2.39 SetImageData(Data as String)

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets input image via data.
Notes: Image data can be an image file content like JPEG or PNG.
Supported formats depends on what leptonica was compiled to support.

The image is released automatically in destructor.
See also:

- 141.2.38 SetImageData(Data as MemoryBlock) 19108

141.2.40 SetImageFile(File as FolderItem)

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets input image via folderitem.
Example:

```
Var OCR As TessEngineMBS // your instance of tesseract

Var f As FolderItem = SpecialFolder.Desktop.Child("test.jpg")
OCR.SetImageFile(f)
```

Notes: Point to an image file like JPEG or PNG.
Supported formats depends on what leptonica was compiled to support.

The image is released automatically in destructor.
See also:

- 141.2.41 SetImageFile(Path as String) 19109

141.2.41 SetImageFile(Path as String)

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets input image via file path.
Notes: Point to an image file like JPEG or PNG.
Supported formats depends on what leptonica was compiled to support.

The image is released automatically in destructor.
See also:

- 141.2.40 SetImageFile(File as FolderItem) 19109

141.2.42 SetRectangle(Left as Integer, Top as Integer, Width as Integer, Height as Integer)

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Restrict recognition to a sub-rectangle of the image.
Notes: Call after SetImage.
Each SetRectangle clears the recogntion results so multiple rectangles can be recognized with the same image.

141.2.43 SetVariable(Name as String, Value as String)

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the value of an internal "parameter."
Example:

```
Var OCR As TessEngineMBS // your instance of tesseract

OCR.SetVariable("tessedit_char_blacklist", "xyz")
```

Notes: Supply the name of the parameter and the value as a string, just as you would in a config file.
Returns false if the name lookup failed.
e.g.
SetVariable("tessedit_char_blacklist", "xyz") to ignore x, y and z.
Or
SetVariable("classify_bln_numeric_mode", "1") to set numeric-only mode.

SetVariable may be used before Init, but settings will revert to defaults on End().

Note: Must be called after Initialize(). Only works for non-init variables (init variables should be passed to Initialize()).

141.2.44 Properties

141.2.45 DeadlineMSecs as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The deadline in milliseconds.
Notes: (Read and Write property)

141.2.46 Handle as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

141.2.47 ImageHandle as Integer

MBS OCR Plugin, Plugin Version: 26.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal image reference.
Notes: (Read only property)

141.2.48 InitLanguagesAsString as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the languages string used in the last valid initialization.
Example:

```
Var OCR As TessEngineMBS // your instance of tesseract

MessageBox OCR.InitLanguagesAsString
```

Notes: If the last initialization specified "deu+hin" then that will be returned. If hin loaded eng automatically as well, then that will not be included in this list. To find the languages actually loaded use GetLoadedLanguages function.
(Read only property)

141.2.49 InputImage as Picture

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries input image for debugging.
Notes: (Read only property)

141.2.50 InputName as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name of the input file.
Notes: Needed for training and reading a UNLV zone file, and for searchable PDF output.
(Read and Write property)

141.2.51 MeanTextConf as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the (average) confidence value between 0 and 100.
Notes: (Read only property)

141.2.52 PageSegMode as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current page segmentation mode.
Example:

```
Var OCR As TessEngineMBS // your instance of tesseract

OCR.PageSegMode = OCR.kPageSegModeAuto
```

Notes: Defaults to kPageSegModeSingleBlock.
The mode is stored as an IntParam so it can also be modified by ReadConfigFile or SetVariable("tessedit_page-seg_mode", mode as string).
(Read and Write property)

141.2.53 Resolution as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The resolution of the source image in pixels per inch so font size information can be calculated in results.
Notes: Call this after SetImage functions.
(Read and Write property)

141.2.54 ThresholdedImage as Picture

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get a copy of the internal thresholded image from Tesseract.
Notes: (Read only property)

141.2.55 Version as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries version of tesseract library.
Example:

MessageBox TessEngineMBS.Version

Notes: e.g. "4.1.1"
(Read only property)

141.2.56 Events

141.2.57 Cancel(words as integer) as boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Event called regularly to allow you to cancel.
Notes: Return true to cancel current job.

141.2.58 Progress(Left as integer, Right as Integer, Top as Integer, Bottom as Integer, Progress as Integer) as boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Event called regularly to allow you to monitor progress.
Notes: Return true to cancel current job.

141.2.59 Constants

OCR Engine Running Modes

Constant	Value	Description
kOcrEngineModeDefault	3	Specify this mode when calling init_*(), to indicate that any of t modes should be automatically inferred from the variables in the l specific config, command-line configs, or if not specified in any of t should be set to the default kOcrEngineModeTesseractOnly.
kOcrEngineModeLstmOnly	1	Run just the LSTM line recognizer.
kOcrEngineModeTesseractLstmCombined	2	Run the LSTM recognizer, but allow fallback to Tesseract when t difficult. deprecated
kOcrEngineModeTesseractOnly	0	Run Tesseract only - fastest; deprecated

Page Layout

Constant	Value	Description
kPageSegModeAuto	3	Fully automatic page segmentation, but no OSD.
kPageSegModeAutoOnly	2	Automatic page segmentation, but no OSD, or OCR.
kPageSegModeAutoOsd	1	Automatic page segmentation with orientation and script detection. (OSD)
kPageSegModeCircleWord	9	Treat the image as a single word in a circle.
kPageSegModeOsdOnly	0	Orientation and script detection only.
kPageSegModeRawLine	13	Treat the image as a single text line, bypassing hacks that are Tesseract-speci
kPageSegModeSingleBlock	6	Assume a single uniform block of text. (Default.)
kPageSegModeSingleBlockVertText	5	Assume a single uniform block of vertically aligned text.
kPageSegModeSingleChar	10	Treat the image as a single character.
kPageSegModeSingleColumn	4	Assume a single column of text of variable sizes.
kPageSegModeSingleLine	7	Treat the image as a single text line.
kPageSegModeSingleWord	8	Treat the image as a single word.
kPageSegModeSparseText	11	Find as much text as possible in no particular order.
kPageSegModeSparseTextOsd	12	Sparse text with orientation and script det.

141.3 class TessPageIteratorMBS

141.3.1 class TessPageIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The iterator to walk over page content.
Example:

```
// find the text lines on a scanned page without recognizing the text
// The Tesseract library must be loaded first, see TessEngineMBS.LoadLibrary.
Var engine As New TessEngineMBS
Call engine.Initialize(SpecialFolder.Resources.Child("tessdata").NativePath, "eng")
engine.SetImage Picture.Open(SpecialFolder.Desktop.Child("scan.png"))

Var it As TessPageIteratorMBS = engine.AnalyseLayout
If it = Nil Then Return
Var level As Integer = TessPageIteratorMBS.kLevelTextline
Var count As Integer
Do
Var l, t, r, b As Integer
If it.BoundingBox(level, l, t, r, b) Then
count = count + 1
System.DebugLog "Line " + count.ToString + ": " + l.ToString + "/" + t.ToString + " to " + r.ToString
+ "/" + b.ToString
End If
Loop Until Not it.MoveNext(level)
```

Notes: Class to iterate over tesseract page structure, providing access to all levels of the page hierarchy, without including any tesseract headers or having to handle any tesseract structures.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

141.3.2 Methods

141.3.3 Baseline(Level as Integer, byref x1 as Integer, byref y1 as Integer, byref x2 as Integer, byref y2 as Integer) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the baseline of the current object at the given level.
Notes: The baseline is the line that passes through (x1, y1) and (x2, y2).

Warning: with vertical text, baselines may be vertical!

Returns false if there is no baseline at the current position.

141.3.4 Begin

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the iterator to point to the start of the page to begin an iteration.

141.3.5 BinaryImage(Level as Integer) as PIcture

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a binary image of the current object at the given level.
Notes: The position and size match the return from BoundingBoxInternal, and so this could be upscaled with respect to the original input image.

141.3.6 BoundingBox(Level as Integer, byref Left as Integer, byref Top as Integer, byref Right as Integer, byref Bottom as Integer) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the bounding rectangle of the current object at the given level.
Notes: Returns false if there is no such object at the current position.
The returned bounding box is guaranteed to match the size and position of the image returned by GetBinaryImage, but may clip foreground pixels from a grey image. The padding argument to GetImage can be used to expand the image to include more foreground pixels. See BinaryImage below.

141.3.7 Constructor

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

141.3.8 CopyIterator as TessPageIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a copy of the iterator.

141.3.9 IsAtBeginningOf(Level as Integer) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the iterator is at the start of an object at the given level.

141.3.10 IsAtFinalElement(Level as Integer, element as Integer) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether the iterator is positioned at the last element in a given level. (e.g. the last word in a line, the last line in a block)

141.3.11 MoveNext(Level as Integer) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to the start of the next object at the given level in the page hierarchy, and returns false if the end of the page was reached.
Notes: NOTE that symbol will skip non-text blocks, but all other PageIteratorLevel level values will visit each non-text block once. Think of non text blocks as containing a single paragraph, with a single line, with a single imaginary word. Calls to Next with different levels may be freely intermixed. This function iterates words in right-to-left scripts correctly, if the appropriate language has been loaded into Tesseract.

141.3.12 Properties

141.3.13 BlockType as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the type of the current block.
Notes: (Read only property)

141.3.14 DeskewAngle as Single

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The deskew angle.
Notes: After rotating the block so the text orientation is upright, how many radians does one have to rotate the block anti-clockwise for it to be level?
-Pi/4 <= deskew_angle <= Pi/4

(Read only property)

141.3.15 FirstLineIndent as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The first line indent.
Notes: For LEFT aligned paragraphs, the first text line of paragraphs of this kind are indented this many pixels from the left edge of the rest of the paragraph.
for RIGHT aligned paragraphs, the first text line of paragraphs of this kind are indented this many pixels from the right edge of the rest of the paragraph.

This value may be negative.

if IsCrown is true, the first line of this paragraph is actually flush, and first_line_indent is set to the "common" first line indent for subsequent paragraphs in this block of text.
(Read only property)

141.3.16 Handle as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

141.3.17 IsCrown as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the current item is a crown.
Notes: True if the first line of the paragraph is aligned with the other lines of the paragraph even though subsequent paragraphs have first line indents. This typically indicates that this is the continuation of a previous paragraph or that it is the very first paragraph in the chapter.
(Read only property)

141.3.18 IsListItem as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether current item is a list item.

Notes: True if we believe this is a member of an ordered or unordered list.
(Read only property)

141.3.19 Justification as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries justification for current block.
Notes: LEFT if ragged right, or fully justified and script is left-to-right.
RIGHT if ragged left, or fully justified and script is right-to-left.
unknown if it looks like source code or we have very few lines.
(Read only property)

141.3.20 Orientation as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The orientation of the current block.
Notes: (Read only property)

141.3.21 TextlineOrder as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The text orientation of the current block.
Notes: (Read only property)

141.3.22 WritingDirection as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The writing direction of the current block.
Notes: (Read only property)

141.3.23 Constants

Block Types

Constant	Value	Description
kBlockTypeCaptionText	8	Text that belongs to an image.
kBlockTypeEquation	4	Partition belonging to an equation region.
kBlockTypeFlowingImage	9	Image that lives inside a column.
kBlockTypeFlowingText	1	Text that lives inside a column.
kBlockTypeHeadingImage	10	Image that spans more than one column.
kBlockTypeHeadingText	2	Text that spans more than one column.
kBlockTypeHorzLine	12	Horizontal Line.
kBlockTypeInlineEquation	5	Partition has inline equation.
kBlockTypeNoise	14	Lies outside of any column.
kBlockTypePulloutImage	11	Image that is in a cross-column pull-out region.
kBlockTypePulloutText	3	Text that is in a cross-column pull-out region.
kBlockTypeTable	6	Partition belonging to a table region.
kBlockTypeUnknown	0	Type is not yet known. Keep as the first element.
kBlockTypeVerticalText	7	Text-line runs vertically.
kBlockTypeVertLine	13	Vertical Line.

Justifications

Constant	Value	Description
kJustificationCenter	2	The text lines of the paragraph are centered about a line going down through their middle of the text lines.
kJustificationLeft	1	Each line, except possibly the first, is flush to the same left tab stop.
kJustificationRight	3	Each line, except possibly the first, is flush to the same right tab stop.
kJustificationUnknown	0	Unknown.

Level

Constant	Value	Description
kLevelBlock	0	Block
kLevelParagraph	1	Paragraph
kLevelSymbol	4	Symbol
kLevelTextline	2	Textline
kLevelWord	3	Word

Orientations

Constant	Value	Description
kOrientationPageDown	2	Orientation is down.
kOrientationPageLeft	3	Orientation is left.
kOrientationPageRight	1	Orientation is right.
kOrientationPageUp	0	Orientation is up.

Text Line Order

Constant	Value	Description
kTextlineOrderLefttoRight	0	Mongolian is written in vertical columns top to bottom like Chinese, but the lines order left-to right.
kTextlineOrderRighttoLeft	1	In Chinese, vertical text lines are read right-to-left.
kTextlineOrderToptoBottom	2	In English, the order is top-to-bottom.

Writing Direction

Constant	Value	Description
kWritingDirectionLefttoRight	0	For English text, the writing direction is left-to-right.
kWritingDirectionRighttoLeft	1	For Arabic the text direction is right to left.
kWritingDirectionToptoBottom	2	For the Chinese text in the above example, the writing direction is top-to-bottom.

141.4 class TessResultIteratorMBS

141.4.1 class TessResultIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Class to iterate over tesseract results, providing access to all levels of the page hierarchy, without including any tesseract headers or having to handle any tesseract structures.
Example:

```
// recognize text in a picture and list each word with confidence and position
// The Tesseract library must be loaded first, see TessEngineMBS.LoadLibrary.
Var engine As New TessEngineMBS
Call engine.Initialize(SpecialFolder.Resources.Child("tessdata").NativePath, "eng")
engine.SetImage Picture.Open(SpecialFolder.Desktop.Child("scan.png"))
If Not engine.Recognize Then Return

Var it As TessResultIteratorMBS = engine.ResultIterator
Var level As Integer = TessResultIteratorMBS.kLevelWord
Do
Var l, t, r, b As Integer
Call it.PageIterator.BoundingBox(level, l, t, r, b)
System.DebugLog it.Text(level) + " (" + Format(it.Confidence(level), "0") + "%) at " + l.ToString + "/"
+ t.ToString
Loop Until Not it.MoveNext(level)
```

Notes: WARNING! This class points to data held within the TessEngineMBS class, and therefore can only be used while the TessBaseAPI class still exists and has not been subjected to a call of Init, SetImage, Recognize, Clear, End DetectOS, or anything else that changes the internal PAGE_RES.

See also base class TessPageIteratorMBS class, which contains the bulk of the interface. TessResultIteratorMBS adds text-specific methods for access to OCR output.
Subclass of the TessPageIteratorMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 26.5pr2

141.4.2 Methods

141.4.3 ChoiceIterator as TessChoiceIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries choice iterator for current object.

141.4.4 Confidence(Level as Integer) as Single

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the mean confidence of the current object at the given level.
Notes: The number should be interpreted as a percent probability. (0.0 - 100.0)

141.4.5 Constructor

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

141.4.6 CopyIterator as TessResultIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Copies the result iterator.

141.4.7 MoveNext(Level as Integer) as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to the next choice for the symbol and returns false if there are none left.

141.4.8 PageIterator as TessPageIteratorMBS

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the page iterator for this result.

141.4.9 Text(Level as Integer) as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the UTF-8 encoded text string for the current object at the given level.

141.4.10 Properties

141.4.11 FontID as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The font ID.
Notes: The font attributes of the current word.
(Read only property)

141.4.12 FontName as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The font name.
Notes: The font attributes of the current word.
(Read only property)

141.4.13 IsBold as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The bold font attribute.
Notes: The font attributes of the current word.
(Read only property)

141.4.14 IsItalic as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The italic font attribute.
Notes: The font attributes of the current word.
(Read only property)

141.4.15 IsMonoSpace as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The monospace font attribute.
Notes: The font attributes of the current word.

(Read only property)

141.4.16 IsSerif as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The serif font attribute.
Notes: The font attributes of the current word.
(Read only property)

141.4.17 IsSmallCaps as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The smallcaps font attribute.
Notes: The font attributes of the current word.
(Read only property)

141.4.18 IsUnderlined as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The underlined font attribute.
Notes: The font attributes of the current word.
(Read only property)

141.4.19 PointSize as Integer

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The point size font attribute.
Notes: The font attributes of the current word.
Pointsize is returned in printers points (1/72 inch.)
(Read only property)

141.4.20 SymbolIsDropcap as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the current symbol is a dropcap.
Notes: If iterating at a higher level object than symbols, eg words, then this will return the attributes of the first symbol in that word.
(Read only property)

141.4.21 SymbolIsSubscript as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the current symbol is a subscript.
Notes: If iterating at a higher level object than symbols, eg words, then this will return the attributes of the first symbol in that word.
(Read only property)

141.4.22 SymbolIsSuperscript as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the current symbol is a superscript.
Notes: If iterating at a higher level object than symbols, eg words, then this will return the attributes of the first symbol in that word.
(Read only property)

141.4.23 WordIsFromDictionary as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the current word was found in a dictionary.
Notes: (Read only property)

141.4.24 WordIsNumeric as Boolean

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the current word is numeric.
Notes: (Read only property)

141.4.25 WordRecognitionLanguage as String

MBS OCR Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return the name of the language used to recognize this word.
Notes: On error, this is empty.
(Read only property)

141.4.26 Constants

Level

Constant	Value	Description
kLevelBlock	0	Block
kLevelParagraph	1	Paragraph
kLevelSymbol	4	Symbol
kLevelTextline	2	Textline
kLevelWord	3	Word

141.5 class TessResultRendererMBS

141.5.1 class TessResultRendererMBS

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Interface for rendering tesseract results into a document, such as text, HOCR or pdf.
Example:

```
var ocr as new TessEngineMBS

// initialize with right paths
If Not ocr.Initialize(tessdataPath, Languages) Then
MessageBox "failed to initialize"
Quit
End If

// pass image file
ocr.SetImageFile(imagefile)

// now write PDF file
Var p As FolderItem = SpecialFolder.Desktop.Child("test") // no extension!
Var r As TessResultRendererMBS = TessResultRendererMBS.CreatePDFRenderer(p.NativePath)

If r.BeginDocument("Hello") Then

Call ocr.ProcessPages(ImageFile.NativePath, "", 0, r)

call r.EndDocument
End If
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

141.5.2 Methods

141.5.3 AddImage(engine as TessEngineMBS) as Boolean

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds the recognized text from the source image to the current document.
Notes: Invalid if BeginDocument not yet called.

141.5.4 BeginDocument(Title as String) as Boolean

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Starts a new document with the given title.
Notes: This clears the contents of the output data.

141.5.5 Constructor

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Private constructor.

141.5.6 CreateAltoRenderer(Path as String) as TessResultRendererMBS

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a alto renderer.

141.5.7 CreateBoxTextRenderer(Path as String) as TessResultRendererMBS

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a text box renderer.

141.5.8 CreateHOcrRenderer(Path as String) as TessResultRendererMBS

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Renders tesseract output into an hocr text string.
See also:

- 141.5.9 CreateHOcrRenderer(Path as String, FontInfo as boolean = false) as TessResultRendererMBS 19130

141.5.9 CreateHOcrRenderer(Path as String, FontInfo as boolean = false) as TessResultRendererMBS

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Renders tesseract output into an hocr text string.
See also:

- 141.5.8 CreateHOcrRenderer(Path as String) as TessResultRendererMBS 19129

141.5.10 CreateLSTMBoxRenderer(Path as String) as TessResultRendererMBS

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Renders tesseract output into a plain UTF-8 text string for LSTMBox.

141.5.11 CreatePDFRenderer(Path as String, DataDirectory as String = """, TextOnly as Boolean = false) as TessResultRendererMBS

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Renders tesseract output into searchable PDF.

141.5.12 CreateTextRenderer(Path as String) as TessResultRendererMBS

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a text renderer.

141.5.13 CreateTsvRenderer(Path as String) as TessResultRendererMBS

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Renders Tesseract output into a TSV string.

141.5.14 CreateUnlvRenderer(Path as String) as TessResultRendererMBS

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Renders tesseract output into a plain UTF-8 text string.

141.5.15 CreateWordStrBoxRenderer(Path as String) as TessResultRendererMBS

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Renders tesseract output into a plain UTF-8 text string in WordStr format.

141.5.16 EndDocument as Boolean

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Finishes the document and finalizes the output data Invalid if BeginDocument not yet called.

141.5.17 Properties

141.5.18 Extention as String

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The file extension used by the current renderer.
Notes: (Read only property)

141.5.19 Handle as Integer

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

141.5.20 ImageNum as Integer

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the index of the last image given to AddImage.
Notes: i.e. images are incremented whether the image succeeded or not.

This is always defined. It means either the number of the current image, the last image ended, or in the completed document depending on when in the document lifecycle you are looking at it. Will return -1 if a document was never started.
(Read only property)

141.5.21 Title as String

MBS OCR Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the title for the current document.
Notes: (Read only property)

Chapter 142

Open Directory

142.1 class ODNodeMBS

142.1.1 class ODNodeMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: An Open Directory node.
Example:

```
// open the local Open Directory node and list the record types it supports
Var error As NSErrorMBS
Var node As ODNodeMBS = ODNodeMBS.nodeWithName(ODSessionMBS.defaultSession, "/Local/Default", error)
If node = Nil Then
MessageBox error.localizedDescription
Return
End If

MessageBox node.nodeName + EndOfLine + String.FromArray(node.supportedRecordTypes(error), EndOfLine)
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

142.1.2 Methods

142.1.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

142.1.4 nodeDetails(byref error as NSErrorMBS) as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a dictionary containing details about a node.
Notes: Error: An error reference for error details. Can be nil.

Returns a dictionary containing details.

142.1.5 nodeDetailsForKeys(keys() as string, byref error as NSErrorMBS) as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a dictionary containing details about a node.
Notes: Keys: An array of keys corresponding to the values returned in the dictionary.
Error: An error reference for error details. Can be nil.

Returns a dictionary containing details about the node corresponding to keys specified by Keys.

142.1.6 nodeWithName(session as ODSessionMBS, name as string, byref error as NSErrorMBS) as ODNodeMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a node object with a specified session and name.
Notes: Session: The session.
Name: The name of the node.

Error: An error reference for error details. Can be nil.

Returns the created node object.

142.1.7 nodeWithType(session as ODSessionMBS, type as integer, byref error as NSErrorMBS) as ODNodeMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a node object with a specified session and type.
Notes: Session: The session.
Type: The node type.
Error: An error reference for error details.

Returns the created node object.

142.1.8 subnodeNames(byref error as NSErrorMBS) as String()

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the names of subnodes for the node.

142.1.9 supportedAttributesForRecordType(RecordType as String, byref error as NSErrorMBS) as String()

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of attribute types supported by the node,Äôs records.
Notes: RecordType: The record type to list supported attribute types for. Can be nil.
Error: An error reference for error details. Can be nil.

Returns an array of supported attribute types.

142.1.10 supportedRecordTypes(byref error as NSErrorMBS) as String()

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of the record types supported by the node.
Notes: If the node does not support checking for supported record types, all possible record types are

returned.

142.1.11 unreachableSubnodeNames(byref error as NSErrorMBS) as String()

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of the subnodes of a given node that are currently unreachable.

142.1.12 Properties

142.1.13 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

142.1.14 nodeName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The node,Äôs name.
Notes: (Read only property)

142.1.15 Constants

Node Types

Constant	Value	Description
kODNodeTypeAuthentication	&h2201	A node used for authentication or record lookups.
kODNodeTypeConfigure	&h2202	A node that specifically refers to the Directory Services configuration.
kODNodeTypeContacts	&h2204	A node used for applications that handle contact data.
kODNodeTypeLocalNodes	&h2200	A node that specifically looks at the local directory.
kODNodeTypeNetwork	&h2205	A node used for looking up network resource type data.

142.2 class ODQueryMBS

142.2.1 class ODQueryMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: An Open Directory query.
Example:

```
// find all local user accounts with Open Directory
Var error As NSErrorMBS
Var node As ODNodeMBS = ODNodeMBS.nodeWithName(ODSessionMBS.defaultSession, "/Local/Default", error)
If node = Nil Then Return

Var query As ODQueryMBS = ODQueryMBS.queryWithNode(node, ODRecordMBS.kODRecordTypeUsers, ODRecordMBS.kODAttributeTypeRecordName, ODQueryMBS.kODMatchAny, Nil, Nil, 0, error)
Var lines() As String
For Each record As ODRecordMBS In query.resultsAllowingPartial(False, error)
lines.Add record.recordName
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Currently only partially implemented for Xojo for reading values. If you need more, please contact Monkeybread Software.

142.2.2 Methods

142.2.3 Constructor(node as ODNodeMBS, inRecordTypeOrList as Variant, inAttribute as String, matchType as Integer, inQueryValueOrList as Variant, inReturnAttributeOrList as Variant, maximumResults as Integer, byref error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an query object created with provided parameters.
Notes: Node: The node to query.
in RecordTypeOrList: The type or types of record to query. Can be an NSString object for a single type or an NSArray object containing NSString objects for multiple types.
inAttribute: The name of the attribute to query.
MatchType: The type of query.
inQueryValueOrList: The value or values to query in the attribute. Can be a string or a memoryblock object for a single value, or an array containing string and memoryblock objects for multiple values.
inReturnAttributeOrList: The attribute or attributes to be returned from the query. Can be a string for a single attribute or an array object containing strings for multiple attributes. Passing nil is equivalent to passing kODAttributeTypeStandardOnly.
maximumResults: The maximum number of values to be returned.
Error: An error reference for error details.

142.2.4 Destructor

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

142.2.5 queryWithNode(node as ODNodeMBS, inRecordTypeOrList as Variant, inAttribute as String, matchType as Integer, inQueryValueOrList as Variant, inReturnAttributeOrList as Variant, maximumResults as Integer, byref error as NSErrorMBS) as ODQueryMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an query object created with provided parameters.
Notes: Node: The node to query.
in RecordTypeOrList: The type or types of record to query. Can be an NSString object for a single type or an NSArray object containing NSString objects for multiple types.
inAttribute: The name of the attribute to query.
MatchType: The type of query.
inQueryValueOrList: The value or values to query in the attribute. Can be a string or a memoryblock object for a single value, or an array containing string and memoryblock objects for multiple values.

inReturnAttributeOrList: The attribute or attributes to be returned from the query. Can be a string for a single attribute or an array object containing strings for multiple attributes. Passing nil is equivalent to passing kODAttributeTypeStandardOnly.
maximumResults: The maximum number of values to be returned.
Error: An error reference for error details.

142.2.6 resultsAllowingPartial(AllowPartialResults as Boolean, byref error as NSErrorMBS) as ODRecordMBS()

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns results from a query synchronously.
Notes: AllowPartialResults: If true, only immediately available results are returned; otherwise, the function waits until all results are available.
Error: An error reference for error details. Can be nil.

Returns the results of the query in an array of ODRecordMBS objects.

142.2.7 start

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Starts asynchronous search.

142.2.8 synchronize

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Restarts a query, disposing of any results it has obtained.
Notes: If the query was originally started asynchronously, the event is called with inResults set to nil, error.code set to kODErrorQuerySynchronize, and error.domain set to kODErrorDomainFramework.

142.2.9 Properties

142.2.10 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

142.2.11 Constants

Match Types

Constant	Value	Description
kODMatchAny	1	is used to search for any records (typically passed with nil search value)
kODMatchBeginsWith	&h2002	is searching values that begin with the provided value
kODMatchContains	&h2004	is searching values that contain the provided value
kODMatchEndsWith	&h2003	is searching values that end with the provided value
kODMatchEqualTo	&h2001	is searching values that are equal to the provided value
kODMatchGreaterThan	&h2006	is searching values greater than the provided value
kODMatchLessThan	&h2007	is searching values less than the provided value

142.3 class ODRecordMBS

142.3.1 class ODRecordMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: An Open Directory record.
Example:

```
// show full name and home folder of the current user from Open Directory
Var error As NSErrorMBS
Var node As ODNodeMBS = ODNodeMBS.nodeWithName(ODSessionMBS.defaultSession, "/Local/Default", error)
If node = Nil Then Return

Var query As ODQueryMBS = ODQueryMBS.queryWithNode(node, ODRecordMBS.kODRecordTypeUsers, ODRecordMBS.kODAttributeTypeRecordName, ODQueryMBS.kODMatchEqualTo, SystemInformationMBS.ShortUsername, Nil, 1, error)
For Each record As ODRecordMBS In query.resultsAllowingPartial(False, error)
Var fullNames() As Variant = record.valuesForAttribute(ODRecordMBS.kODAttributeTypeFullName, error)
Var homes() As Variant = record.valuesForAttribute(ODRecordMBS.kODAttributeTypeNFSHomeDirectory, error)
If fullNames.Count >0 And homes.Count >0 Then
MessageBox record.recordName + ": " + fullNames(0).StringValue + EndOfLine + "Home: " + homes(0).StringValue
End If
Next
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

142.3.2 Methods

142.3.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

142.3.4 kODAttributeTypeAccessControlEntry as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type which stores directory access control directives.

142.3.5 kODAttributeTypeAddressLine1 as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Line one of multiple lines of address data for a user.

142.3.6 kODAttributeTypeAddressLine2 as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Line two of multiple lines of address data for a user.

142.3.7 kODAttributeTypeAddressLine3 as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Line three of multiple lines of address data for a user.

142.3.8 kODAttributeTypeAdminLimits as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: XML plist indicating what an admin user can edit. Found in kODRecordTypeUsers records.

142.3.9 kODAttributeTypeAdvertisedServices as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.

142.3.10 kODAttributeTypeAlias as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Alias attribute, contain pointer to another node/record/attribute.

142.3.11 kODAttributeTypeAllAttributes as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used in requesting all attribute types in a search.

142.3.12 kODAttributeTypeAllTypes as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to indicated recommended attribute types for a record type in the Config node.

142.3.13 kODAttributeTypeAltSecurityIdentities as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to store alternate identities for the record. Values will have standardized form as specified by Microsoft LDAP schema (1.2.840.113556.1.4.867).

Kerberos:user\@REALM

142.3.14 kODAttributeTypeAreaCode as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Area code of a user's phone number.

142.3.15 kODAttributeTypeAttrListRefCount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute List reference count for a process.

142.3.16 kODAttributeTypeAttrListRefs as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: All the attribute list references for a process.

142.3.17 kODAttributeTypeAttrListValueRefCount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attr List Value reference count for a process.

142.3.18 kODAttributeTypeAttrListValueRefs as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: All the attribute list value references for a process.

142.3.19 kODAttributeTypeAuthCredential as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: An authentication credential, to be used to authenticate to a Directory.

142.3.20 kODAttributeTypeAuthenticationAuthority as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Determines what mechanism is used to verify or set a user's password.
If multiple values are present, the first attributes returned take precedence.
Typically found in User records (kODRecordTypeUsers).

Authentication authorities are a multi-part string separated by semi-colons.
One component is the "type" of authority, such as those listed below:

"basic"	- is a crypt password
"ShadowHash"	- is a hashed password stored in a secure location
"ApplePasswordServer"	- is a password server-based account
"Kerberosv5"	- is a Kerberosv5 based
"LocalCachedUser"	- is a cached account based on an account from another node, using a ShadowHash password
"DisabledUser"	- is an account that has been disabled

142.3.21 kODAttributeTypeAuthenticationHint as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to identify the authentication hint phrase.

142.3.22 kODAttributeTypeAuthMethod as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Authentication method for an authentication capable record.

142.3.23 kODAttributeTypeAuthorityRevocationList as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute containing the binary of the authority revocation list.
A certificate revocation list that defines certificate authority certificates which are no longer trusted. No user certificates are included in this list.
Usually found in kODRecordTypeCertificateAuthorities records.

142.3.24 kODAttributeTypeAutomaticSearchPath as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Automatic search path defined by the search node.

142.3.25 kODAttributeTypeAutomountInformation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: xDetermines what mechanism is used to verify or set a user's password.
If multiple values are present, the first attributes returned take precedence.
Typically found in User records (kODRecordTypeUsers).

142.3.26 kODAttributeTypeBirthday as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Single-valued attribute that defines the user's birthday.
Format is x.208 standard YYYYMMDDHHMMSSZ which we will require as GMT time.

142.3.27 kODAttributeTypeBootParams as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type in host or machine records for storing boot params.

142.3.28 kODAttributeTypeBuilding as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the building name for a user or person record.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

142.3.29 kODAttributeTypeBuildVersion as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Build version for reference.

142.3.30 kODAttributeTypeCACertificate as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute containing the binary of the certificate of a certificate authority.
Its corresponding private key is used to sign certificates.
Usually found in kODRecordTypeCertificateAuthority records.

142.3.31 kODAttributeTypeCapacity as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type for the capacity of a resource.
found in resource records (kODRecordTypeResources).
Example: 50

142.3.32 kODAttributeTypeCertificateRevocationList as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute containing the binary of the certificate revocation list.
This is a list of certificates which are no longer trusted.
Usually found in kODRecordTypeCertificateAuthority records.

142.3.33 kODAttributeTypeCity as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Usually, city for a user or person record.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

142.3.34 kODAttributeTypeComment as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute used for unformatted comment.

142.3.35 kODAttributeTypeCompany as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: attribute that defines the user's company.
Example: Apple Inc.

142.3.36 kODAttributeTypeComputers as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of computers.

142.3.37 kODAttributeTypeConfigAvailable as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Config avail tag.

142.3.38 kODAttributeTypeConfigFile as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Config file name.

142.3.39 kODAttributeTypeContactGUID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type for the contact GUID of a group.
Usually found in group records (kODRecordTypeGroups)

142.3.40 kODAttributeTypeContactPerson as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type for the contact person of the machine.
Found in host or machine records.

142.3.41 kODAttributeTypeCopyTimestamp as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Timestamp used in local account caching.

142.3.42 kODAttributeTypeCoreFWVersion as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Core FW version for reference.

142.3.43 kODAttributeTypeCountry as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents country of a record entry.
Usually found in user or people records (kODRecordTypeUsers or

kODRecordTypePeople).

142.3.44 kODAttributeTypeCreationTimestamp as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute showing date/time of record creation.
Format is x.208 standard YYYYMMDDHHMMSSZ which should be GMT time.

142.3.45 kODAttributeTypeCrossCertificatePair as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute containing the binary of a pair of certificates which verify each other. Both certificates have the same level of authority.
Usually found in kODRecordTypeCertificateAuthority records.

142.3.46 kODAttributeTypeCustomSearchPath as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Admin user configured custom search path defined by the search node.

142.3.47 kODAttributeTypeDataStamp as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute for checksum/meta data

142.3.48 kODAttributeTypeDateRecordCreated as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Date of record creation.

142.3.49 kODAttributeTypeDepartment as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the department name of a user or person.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

142.3.50 kODAttributeTypeDirRefCount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Directory reference count for a process.

142.3.51 kODAttributeTypeDirRefs as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: All the directory references for a process.

142.3.52 kODAttributeTypeDNSDomain as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: DNS Resolver domain attribute.

142.3.53 kODAttributeTypeDNSName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: DNS Resolver nameserver attribute.

142.3.54 kODAttributeTypeDNSNameServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: DNS Resolver nameserver attribute.

142.3.55 kODAttributeTypeEMailAddress as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Email address of usually a user record.

142.3.56 kODAttributeTypeEMailContacts as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute that defines a record's custom email addresses.
found in user records (kODRecordTypeUsers).
Example: home:johndoe\@mymail.com

142.3.57 kODAttributeTypeENetAddress as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute for hardware Ethernet address (MAC address).
Found in computer records (kODRecordTypeComputers).

142.3.58 kODAttributeTypeExpire as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for expiration date or time depending on association.

142.3.59 kODAttributeTypeFaxNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the FAX numbers of a user or person.

Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

142.3.60 kODAttributeTypeFirstName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for first name of user or person record.

142.3.61 kODAttributeTypeFullName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Full name of a record (e.g., "John Doe", "John Doe's Computer")

142.3.62 kODAttributeTypeFunctionalState as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Functional state of plugin for example.

142.3.63 kODAttributeTypeFWVersion as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Framework version for reference.

142.3.64 kODAttributeTypeGroup as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of groups.

142.3.65 kODAttributeTypeGroupMembers as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type in group records containing lists of GUID values for members other than groups.

142.3.66 kODAttributeTypeGroupMembership as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Usually a list of users that below to a given group record.

142.3.67 kODAttributeTypeGroupServices as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: xml-plist attribute that defines a group's services.
Found in group records (kODRecordTypeGroups).

142.3.68 kODAttributeTypeGUID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for 36 character (128 bit) unique ID. An example value is "A579E95E-CDFE-4EBC-B7E7-F2158562170F". The standard format contains 32 uppercase hex characters and four hyphen characters.

142.3.69 kODAttributeTypeHardwareUUID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to store hardware UUID in string form for a record. Typically found in kODRecordTypeComputers.

142.3.70 kODAttributeTypeHomeDirectory as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Network home directory URL.

142.3.71 kODAttributeTypeHomeDirectoryQuota as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the allowed usage for a user's home directory in bytes.
Found in user records (kODRecordTypeUsers).

142.3.72 kODAttributeTypeHomeDirectorySoftQuota as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to define home directory size limit in bytes when user is notified that the hard limit is approaching.

142.3.73 kODAttributeTypeHomeLocOwner as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the owner of a workgroup's shared home directory.
Typically found in kODRecordTypeGroups records.

142.3.74 kODAttributeTypeHomePhoneNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Home telephone number of a user or person.

142.3.75 kODAttributeTypeHTML as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: HTML location.

142.3.76 kODAttributeTypeIMHandle as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the Instant Messaging handles of a user.
Values should be prefixed with the appropriate IM type
(i.e., AIM:, Jabber:, MSN:, Yahoo:, or ICQ:).
Usually found in user records (kODRecordTypeUsers).

142.3.77 kODAttributeTypeInternetAlias as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to track internet alias.

142.3.78 kODAttributeTypeIPAddress as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: IP address expressed either as domain or IP notation.

142.3.79 kODAttributeTypeIPAddressAndENetAddress as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: A pairing of IPv4 or IPv6 addresses with Ethernet addresses (e.g., "10.1.1.1/00:16:cb:92:56:41").
Usually found on kODRecordTypeComputers for use by services that need specific pairing of the two values.
This should be in addition to kODAttributeTypeIPAddress, kODAttributeTypeIPv6Address and kODAttributeTypeENetAddress. This is necessary because not all directories return attribute values in a guaranteed order.

142.3.80 kODAttributeTypeIPv6Address as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: IPv6 address expressed in the standard notation (e.g., "fe80::236:caff:fcc2:5641")
Usually found on kODRecordTypeComputers and kODRecordTypeHosts.

142.3.81 kODAttributeTypeJobTitle as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the job title of a user.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

142.3.82 kODAttributeTypeJPEGPhoto as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to store binary picture data in JPEG format.
Usually found in user, people or group records (kODRecordTypeUsers, kODRecordTypePeople, kODRecordTypeGroups).

142.3.83 kODAttributeTypeKDCAuthKey as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: KDC master key RSA encrypted with realm public key.

142.3.84 kODAttributeTypeKDCConfigData as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Contents of the kdc.conf file.

142.3.85 kODAttributeTypeKerberosRealm as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Supports Kerberized SMB Server services.

142.3.86 kODAttributeTypeKerberosServices as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: This is used to store the principals in host records (i.e., "host", "vnc", etc.)

142.3.87 kODAttributeTypeKeywords as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Keywords using for searching capability.

142.3.88 kODAttributeTypeLastName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for the last name of user or person record.

142.3.89 kODAttributeTypeLDAPReadReplicas as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of LDAP server URLs which can each be used to read directory data.

142.3.90 kODAttributeTypeLDAPSearchBaseSuffix as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Search base suffix for a LDAP server.

142.3.91 kODAttributeTypeLDAPWriteReplicas as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of LDAP server URLs which can each be used to write directory data.

142.3.92 kODAttributeTypeLocaleRelay as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.

142.3.93 kODAttributeTypeLocaleSubnets as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.

142.3.94 kODAttributeTypeLocalOnlySearchPath as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Local only search path defined by the search node.

142.3.95 kODAttributeTypeLocation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the location a service is available from (usually domain name).
Typically found in service record types including kODRecordTypeAFPServer, kODRecordTypeLDAPServer, and kODRecordTypeWebServer.

142.3.96 kODAttributeTypeMailAttribute as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Holds the mail account config data.

142.3.97 kODAttributeTypeMapCoordinates as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: attribute that defines coordinates for a user's location.
found in user records (kODRecordTypeUsers) and resource records (kODRecordTypeResources).
Example: 7.7,10.6

142.3.98 kODAttributeTypeMapGUID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the GUID for a record's map.

142.3.99 kODAttributeTypeMapURI as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: attribute that defines the URI of a user's location.
Usually found in user records (kODRecordTypeUsers).
Example: http://example.com/bldg1

142.3.100 kODAttributeTypeMCXFlags as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used by ManagedClient.

142.3.101 kODAttributeTypeMCXSettings as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used by ManagedClient.

142.3.102 kODAttributeTypeMetaAmbiguousName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Searches a configured list of attributes; by default: RecordName, FullName, EMailAddress.

142.3.103 kODAttributeTypeMetaAugmentedAttributes as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attributes that have been augmented.

142.3.104 kODAttributeTypeMetaAutomountMap as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to query for kODRecordTypeAutomount entries associated with a specific kODRecordTypeAutomountMap.

142.3.105 kODAttributeTypeMetaNodeLocation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Meta attribute returning registered node name by directory node plugin.

142.3.106 kODAttributeTypeMetaRecordName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Native record name, e.g. LDAP DN

142.3.107 kODAttributeTypeMiddleName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for the middle name of user or person record.

142.3.108 kODAttributeTypeMIME as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Data contained in this attribute type is a fully qualified MIME Type.

142.3.109 kODAttributeTypeMobileNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the mobile numbers of a user or person.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

142.3.110 kODAttributeTypeModificationTimestamp as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute showing date/time of record modification.
Format is x.208 standard YYYYMMDDHHMMSSZ which is required as GMT time.

142.3.111 kODAttributeTypeNamePrefix as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the title prefix of a user or person. ie. Mr., Ms., Mrs., Dr., etc.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

142.3.112 kODAttributeTypeNameSuffix as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the name suffix of a user or person.
i.e., Jr., Sr., etc.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

142.3.113 kODAttributeTypeNativeOnly as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used in requesting all native attribute types in a search.

142.3.114 kODAttributeTypeNestedGroups as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type in group records for the list of GUID values for nested groups.

142.3.115 kODAttributeTypeNetGroups as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type that indicates which netgroups its record is a member of.
Found in user and host records.

142.3.116 kODAttributeTypeNetGroupTriplet as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute that defines the host, user and domain triplet combinations to support NetGroups. Each attribute value is comma separated string to maintain the triplet (e.g., host,user,domain).

142.3.117 kODAttributeTypeNetworkInterfaces as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.

142.3.118 kODAttributeTypeNetworkNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute that defines a network number. Usually found in network records (kODRecordTypeNetworks)

142.3.119 kODAttributeTypeNFSHomeDirectory as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Defines a user's home directory mount point on the local machine.

142.3.120 kODAttributeTypeNickName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the nickname of a user or person.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

142.3.121 kODAttributeTypeNodeOptions as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Any extended options supported by the node during creation

142.3.122 kODAttributeTypeNodePath as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type in Neighborhood records describing the DS Node to search while looking up aliases in this neighborhood.

142.3.123 kODAttributeTypeNodeRefCount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Node reference count for a process.

142.3.124 kODAttributeTypeNodeRefs as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: All the node references for a process.

142.3.125 kODAttributeTypeNodeSASLRealm as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Contains the SASL realm associated with this node (if any)

142.3.126 kODAttributeTypeNote as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Note attribute.

142.3.127 kODAttributeTypeNTDomainComputerAccount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Supports Kerberized SMB Server services.

142.3.128 kODAttributeTypeNumTableList as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Summary of the reference table entries presented as attribute values from the Configure node.

142.3.129 kODAttributeTypeOperatingSystem as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Returns the operating system type where the daemon is running, e.g., Mac OS X or Mac OS X Server

142.3.130 kODAttributeTypeOperatingSystemVersion as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Returns the operating system version where the daemon is running, e.g., 10.6

142.3.131 kODAttributeTypeOrganizationInfo as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Usually the organization info of a user.

142.3.132 kODAttributeTypeOrganizationName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Usually the organization of a user.

142.3.133 kODAttributeTypeOriginalHomeDirectory as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Home directory URL used in local account caching.

142.3.134 kODAttributeTypeOriginalNFSHomeDirectory as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: NFS home directory used in local account caching.

142.3.135 kODAttributeTypeOriginalNodeName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Nodename used in local account caching.

142.3.136 kODAttributeTypeOwner as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type for the owner of a record.
Typically the value is a LDAP distinguished name.

142.3.137 kODAttributeTypeOwnerGUID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type for the owner GUID of a group.
Found in group records (kODRecordTypeGroups).

142.3.138 kODAttributeTypePagerNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the pager numbers of a user or person.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

142.3.139 kODAttributeTypeParentLocales as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.

142.3.140 kODAttributeTypePassword as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Holds the password or credential value.

142.3.141 kODAttributeTypePasswordPlus as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Holds marker data to indicate possible authentication redirection.

142.3.142 kODAttributeTypePasswordPolicyOptions as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Collection of password policy options in single attribute.
Used in user presets record.

142.3.143 kODAttributeTypePasswordServerList as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the attribute for storing the password server's replication information.

142.3.144 kODAttributeTypePasswordServerLocation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Specifies the IP address or domain name of the Password Server associated with a given directory node. Found in a config record named PasswordServer.

142.3.145 kODAttributeTypePGPPublicKey as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Pretty Good Privacy public encryption key.

142.3.146 kODAttributeTypePhoneContacts as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: attribute that defines a record's custom phone numbers.
found in user or people records.
Example: home fax:408-555-4444

142.3.147 kODAttributeTypePhoneNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Telephone number of a user.

142.3.148 kODAttributeTypePicture as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the path of the picture for each user displayed in the login window.
Found in user records (kODRecordTypeUsers).

142.3.149 kODAttributeTypePIDValue as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: PID value.

142.3.150 kODAttributeTypePluginIndex as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Plugin index for reference.

142.3.151 kODAttributeTypePlugInInfo as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Information (version, signature, about, credits, etc.) about the plug-in that is actually servicing a

particular directory node.
Has never been supported.

142.3.152 kODAttributeTypePort as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the port number a service is available on.
Typically found in service record types including kODRecordTypeAFPServer, kODRecordTypeLDAPServer, and kODRecordTypeWebServer.

142.3.153 kODAttributeTypePostalAddress as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: The postal address usually excluding postal code.

142.3.154 kODAttributeTypePostalAddressContacts as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: attribute that defines a record's alternate postal addresses.
Found in user records (kODRecordTypeUsers) and resource records (kODRecordTypeResources).

142.3.155 kODAttributeTypePostalCode as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: The postal code such as zip code in the USA.

142.3.156 kODAttributeTypePresetUserIsAdmin as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Flag to indicate whether users created from this preset are administrators by default. Found in

kODRecordTypePresetUsers records.

142.3.157 kODAttributeTypePrimaryComputerGUID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: An attribute that defines a primary computer of the computer group.
Added to computer group record type (kODRecordTypeComputerGroups)

142.3.158 kODAttributeTypePrimaryComputerList as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: The GUID of the computer list with which this computer record is associated.

142.3.159 kODAttributeTypePrimaryGroupID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: This is the 32 bit unique ID that represents the primary group a user is part of, or the ID of a group. Format is a signed 32 bit integer represented as a string.

142.3.160 kODAttributeTypePrimaryLocale as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.

142.3.161 kODAttributeTypePrimaryNTDomain as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Supports Kerberized SMB Server services.

142.3.162 kODAttributeTypePrinter1284DeviceID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute that defines the IEEE 1284 DeviceID of a printer.
This is used when configuring a printer.

142.3.163 kODAttributeTypePrinterLPRHost as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Standard attribute type for kODRecordTypePrinters.

142.3.164 kODAttributeTypePrinterLPRQueue as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Standard attribute type for kODRecordTypePrinters.

142.3.165 kODAttributeTypePrinterMakeAndModel as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute for definition of the Printer Make and Model. An example value would be "HP LaserJet 2200". This would be used to determine the proper PPD file to be used when configuring a printer from the Directory. This attribute is based on the IPP Printing Specification RFC and IETF IPP-LDAP Printer Record.

142.3.166 kODAttributeTypePrinterType as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Standard attribute type for kODRecordTypePrinters.

142.3.167 kODAttributeTypePrinterURI as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute that defines the URI of a printer "ipp://address" or "smb://server/queue". This is used when configuring a printer. This attribute is based on the IPP Printing Specification RFC and IETF IPP-LDAP Printer Record.

142.3.168 kODAttributeTypePrinterXRISupported as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: attribute that defines additional URIs supported by a printer.
This is used when configuring a printer. This attribute is based on the IPP Printing Specification RFC and IETF IPP-LDAP Printer Record.

142.3.169 kODAttributeTypePrintServiceInfoText as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Standard attribute type for kODRecordTypePrinters.

142.3.170 kODAttributeTypePrintServiceInfoXML as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Standard attribute type for kODRecordTypePrinters.

142.3.171 kODAttributeTypePrintServiceUserData as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute for print quota configuration or statistics (XML data).
Found in user records (kODRecordTypeUsers) or print service statistics records (kODRecordTypePrintServiceUser).

142.3.172 kODAttributeTypeProcessName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Process Name.

142.3.173 kODAttributeTypeProfiles as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Profiles associated with the record.

142.3.174 kODAttributeTypeProfilesTimestamp as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Timestamp for the profiles associated with the record.

142.3.175 kODAttributeTypeProtocolNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute that defines a protocol number. Usually found in protocol records (kODRecordTypeProtocols)

142.3.176 kODAttributeTypeProtocols as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of protocols.

142.3.177 kODAttributeTypePwdAgingPolicy as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Contains the password aging policy data for an authentication capable record.

142.3.178 kODAttributeTypeReadOnlyNode as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Can be found using dsGetDirNodeInfo and will return one of
ReadOnly, ReadWrite, or WriteOnly strings.
Note that ReadWrite does not imply fully readable or writable

142.3.179 kODAttributeTypeRealUserID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used by Managed Client

142.3.180 kODAttributeTypeRecordName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of names/keys for this record.

142.3.181 kODAttributeTypeRecordType as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute for a Record or a Directory Node.

142.3.182 kODAttributeTypeRecRefCount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Record reference count for a process.

142.3.183 kODAttributeTypeRecRefs as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: All the record references for a process.

142.3.184 kODAttributeTypeRelationships as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: attribute that defines the relationship to the record type.
found in user records (kODRecordTypeUsers).
Example: brother:John

142.3.185 kODAttributeTypeRelativeDNPrefix as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to map the first native LDAP attribute type required in the building of the Relative Distinguished Name for LDAP record creation.

142.3.186 kODAttributeTypeResourceInfo as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: attribute that defines a resource record's info.

142.3.187 kODAttributeTypeResourceType as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute type for the kind of resource.
found in resource records (kODRecordTypeResources).
Example: ConferenceRoom

142.3.188 kODAttributeTypeRPCNumber as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute that defines an RPC number. Usually found in RPC records (kODRecordTypeRPC)

142.3.189 kODAttributeTypeSchema as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of attribute types.

142.3.190 kODAttributeTypeSearchPath as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Search path used by the search node.

142.3.191 kODAttributeTypeSearchPolicy as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Search policy for the search node.

142.3.192 kODAttributeTypeServicesLocator as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: the URI for a record's calendar

142.3.193 kODAttributeTypeServiceType as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the service type for the service. This is the raw service type of the service. For example a service record type of kODRecordTypeWebServer might have a service type of "http" or "https".

142.3.194 kODAttributeTypeSetupAdvertising as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for Setup Assistant automatic population.

142.3.195 kODAttributeTypeSetupAutoRegister as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for Setup Assistant automatic population.

142.3.196 kODAttributeTypeSetupLocation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for Setup Assistant automatic population.

142.3.197 kODAttributeTypeSetupOccupation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used for Setup Assistant automatic population.

142.3.198 kODAttributeTypeSMBAcctFlags as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Account control flag.

142.3.199 kODAttributeTypeSMBGroupRID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Constant for supporting PDC SMB interaction with DirectoryService.

142.3.200 kODAttributeTypeSMBHome as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: UNC address of Windows homedirectory mount point (\server\sharepoint).

142.3.201 kODAttributeTypeSMBHomeDrive as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Drive letter for homedirectory mount point.

142.3.202 kODAttributeTypeSMBKickoffTime as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute in support of SMB interaction.

142.3.203 kODAttributeTypeSMBLogoffTime as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute in support of SMB interaction.

142.3.204 kODAttributeTypeSMBLogonTime as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: SMB Primary Group Security ID, stored as a string attribute of up to 64 bytes. Found in user, group, and computer records (kODRecordTypeUsers, kODRecordTypeGroups, kODRecordTypeComputers).

142.3.205 kODAttributeTypeSMBPrimaryGroupSID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.

142.3.206 kODAttributeTypeSMBProfilePath as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Desktop management info (dock, desktop links, etc).

142.3.207 kODAttributeTypeSMBPWDLastSet as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute in support of SMB interaction.

142.3.208 kODAttributeTypeSMBRID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute in support of SMB interaction.

142.3.209 kODAttributeTypeSMBScriptPath as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Login script path.

142.3.210 kODAttributeTypeSMBSID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: SMB Security ID, stored as a string attribute of up to 64 bytes.
Found in user, group, and computer records (kODRecordTypeUsers, kODRecordTypeGroups, kODRecordTypeComputers).

142.3.211 kODAttributeTypeSMBUserWorkstations as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of workstations user can login from (machine account names).

142.3.212 kODAttributeTypeStandardOnly as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used in requesting all standard attribute types in a query.

142.3.213 kODAttributeTypeState as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: The state or province of a country.

142.3.214 kODAttributeTypeStreet as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Represents the street address of a user or person.
Usually found in user or people records (kODRecordTypeUsers or kODRecordTypePeople).

142.3.215 kODAttributeTypeSubNodes as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute of a node which lists the available subnodes of that node.

142.3.216 kODAttributeTypeTimePackage as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Data of Create, Modify, Backup time in UTC.

142.3.217 kODAttributeTypeTimeToLive as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute recommending how long to cache the record's attribute values.
Format is an unsigned 32 bit representing seconds. ie. 300 is 5 minutes.

142.3.218 kODAttributeTypeTotalRefCount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Total count of references for a process.

142.3.219 kODAttributeTypeTotalSize as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: checksum/meta data.

142.3.220 kODAttributeTypeTrustInformation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to describe a node's trust information.

142.3.221 kODAttributeTypeUniqueID as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: This is the 32 bit unique ID that represents the user in the legacy manner.
Format is a signed integer represented as a string.

142.3.222 kODAttributeTypeURL as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: List of URLs.

142.3.223 kODAttributeTypeUserCertificate as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute containing the binary of the user's certificate.
Usually found in user records. The certificate is data which identifies a user.
This data is attested to by a known party, and can be independently verified by a third party.

142.3.224 kODAttributeTypeUserPKCS12Data as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute containing binary data in PKCS #12 format.

Usually found in user records. The value can contain keys, certificates, and other related information and is encrypted with a passphrase.

142.3.225 kODAttributeTypeUserShell as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used to represent the user's shell setting.

142.3.226 kODAttributeTypeUserSMIMECertificate as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute containing the binary of the user's SMIME certificate.
Usually found in user records. The certificate is data which identifies a user.
This data is attested to by a known party, and can be independently verified by a third party. SMIME certificates are often used for signed or encrypted emails.

142.3.227 kODAttributeTypeVersion as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Version label.

142.3.228 kODAttributeTypeVFSDumpFreq as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute used to support mount records.

142.3.229 kODAttributeTypeVFSLinkDir as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute used to support mount records.

142.3.230 kODAttributeTypeVFSOpts as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Used in support of mount records.

142.3.231 kODAttributeTypeVFSPassNo as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute used to support mount records.

142.3.232 kODAttributeTypeVFSType as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: Attribute used to support mount records.

142.3.233 kODAttributeTypeWeblogURI as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: attribute that defines the URI of a user's weblog.
Usually found in user records (kODRecordTypeUsers).
Example: http://example.com/blog/jsmith

142.3.234 kODAttributeTypeXMLPlist as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the attribute type constants.
Notes: XML plist used.

142.3.235 kODRecordTypeAFPServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record type of AFP server records.

142.3.236 kODRecordTypeAliases as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Used to represent alias records.

142.3.237 kODRecordTypeAttributeTypes as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies records that represent each possible attribute type.

142.3.238 kODRecordTypeAugments as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Used to store augmented record data.

142.3.239 kODRecordTypeAutomount as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Used to store automount record data.

142.3.240 kODRecordTypeAutomountMap as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Used to store automountMap record data.

142.3.241 kODRecordTypeAutoServerSetup as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Used to discover automated server setup information.

142.3.242 kODRecordTypeBootp as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record in the local node for storing bootp info.

142.3.243 kODRecordTypeCertificateAuthorities as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record type that contains certificate authority informatio

142.3.244 kODRecordTypeComputerGroups as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies computer group records.

142.3.245 kODRecordTypeComputerLists as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies computer list records.

142.3.246 kODRecordTypeComputers as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies computer records.

142.3.247 kODRecordTypeConfiguration as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies configuration records.

142.3.248 kODRecordTypeEthernets as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record in the node for storing ethernets.

142.3.249 kODRecordTypeFileMakerServers as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: FileMaker servers record type that describes available FileMaker servers, used for service discovery.

142.3.250 kODRecordTypeFTPServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies ftp server records.

142.3.251 kODRecordTypeGroups as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies group records.

142.3.252 kODRecordTypeHosts as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies host records.

142.3.253 kODRecordTypeHostServices as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record in the local node for storing host services.

142.3.254 kODRecordTypeLDAPServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies LDAP server records.

142.3.255 kODRecordTypeLocations as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Location record type.

142.3.256 kODRecordTypeMounts as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies mount records.

142.3.257 kODRecordTypeNetDomains as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record in the local node for storing net domains.

142.3.258 kODRecordTypeNetGroups as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record in the local node for storing net groups.

142.3.259 kODRecordTypeNetworks as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies network records.

142.3.260 kODRecordTypeNFS as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies NFS records.

142.3.261 kODRecordTypePeople as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record type that contains "People" records used for contact information.

142.3.262 kODRecordTypePresetComputerGroups as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: The computer group record type used for presets in record creation.

142.3.263 kODRecordTypePresetComputerLists as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: The computer list record type used for presets in record creation.

142.3.264 kODRecordTypePresetComputers as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: The computer record type used for presets in record creation.

142.3.265 kODRecordTypePresetGroups as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: The group record type used for presets in record creation.

142.3.266 kODRecordTypePresetUsers as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: The user record type used for presets in record creation.

142.3.267 kODRecordTypePrinters as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies printer records.

142.3.268 kODRecordTypePrintService as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies print service records.

142.3.269 kODRecordTypePrintServiceUser as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Record in the local node for storing quota usage for a user.

142.3.270 kODRecordTypeProtocols as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies protocol records.

142.3.271 kODRecordTypeQTSServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies quicktime streaming server records.

142.3.272 kODRecordTypeQueryInformation as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Specifically to return query information inline such as skipped nodes

142.3.273 kODRecordTypeRecordTypes as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies records that represent each possible record type.

142.3.274 kODRecordTypeResources as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies resources used in group services.

142.3.275 kODRecordTypeRPC as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies remote procedure call records.

142.3.276 kODRecordTypeServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies generic server records.

142.3.277 kODRecordTypeServices as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies directory based service records.

142.3.278 kODRecordTypeSharePoints as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Share point record type.

142.3.279 kODRecordTypeSMBServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies SMB server records.

142.3.280 kODRecordTypeUsers as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies user records.

142.3.281 kODRecordTypeWebServer as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the record type constants.
Notes: Identifies web server records.

142.3.282 recordDetails(byref error as NSErrorMBS) as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a dictionary of attributes with their respective values.
Notes: Error: An error reference for error details.

Returns a dictionary of the attributes in inAttributes with their respective values.

142.3.283 recordDetailsForAttributes(inAttributes() as string, byref error as NSErrorMBS) as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a dictionary of attributes with their respective values.
Notes: inAttributes: An array of attributes. Can be nil.
Error: An error reference for error details.

Returns a dictionary of the attributes in inAttributes with their respective values.

If inAttributes is nil, all currently retrieved attributes are returned.

142.3.284 synchronize(byref error as NSErrorMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Synchronizes the record from the directory to get current data and commit changes.
Notes: Returns true if the record successfully synchronizes; otherwise, false.

This method only fetches those attributes that have been fetched before.

142.3.285 valuesForAttribute(inAttribute as String, byref error as NSErrorMBS) as Variant()

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the values of an attribute of the record.
Notes: inAttribute: The attribute.
Error: An error reference for error details. Can be nil.

Returns an array of attribute values. Elements are of type String or MemoryBlock.

142.3.286 Properties

142.3.287 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

142.3.288 recordName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The official name of the record.
Notes: (Read only property)

142.3.289 recordType as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The record,Äôs type.
Notes: (Read only property)

142.4 class ODSessionMBS

142.4.1 class ODSessionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for an Open Directory session.
Example:

```
// list the Open Directory nodes available on this Mac
Var session As ODSessionMBS = ODSessionMBS.defaultSession
Var error As NSErrorMBS
Var names() As String = session.nodeNames(error)

If error <>Nil Then
MessageBox error.localizedDescription
Else
MessageBox String.FromArray(names, EndOfLine)
End If
```

142.4.2 Methods

142.4.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: gets default session.

142.4.4 defaultSession as ODSessionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a shared instance of the local session.

142.4.5 nodeNames(byref error as NSErrorMBS) as String()

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the node names that are registered with this session.

142.4.6 ODSessionProxyAddress as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the options dictionary.
Notes: The address to connect to via proxy. The value is of type string.

142.4.7 ODSessionProxyPassword as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the options dictionary.
Notes: The password to connect with via proxy. The value is of type string.

142.4.8 ODSessionProxyPort as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the options dictionary.
Notes: The port to connect to via proxy. The value is of type integer.

142.4.9 ODSessionProxyUsername as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the options dictionary.
Notes: The username to connect with via proxy. The value is of type string.

142.4.10 session(options as dictionary, byref Error as NSErrorMBS) as ODSessionMBS

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a session object directed over proxy to another host.
Notes: Options: A dictionary of options to associate with the session. Can be nil.
Error: An error reference for error details. Can be nil.

Returns the initialized session object.

142.4.11 UserName as String

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries user name.
Notes: Convenience function to query user name of current user.

142.4.12 Properties

142.4.13 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

Chapter 143

OpenCL

143.1 class CLCommandQueueMBS

143.1.1 class CLCommandQueueMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The class for an OpenCL command queue.
Example:

```
Var devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeGPU)
Var device as CLDeviceMBS = devices(0) // we use first one

// Create a context
Var context as new CLContextMBS(device, CLContextMBS.kErrorModeLogMessagesToSystemLog)

// Create a command queue
Var queue as new CLCommandQueueMBS(context, device, 0)
```

Blog Entries

- OpenCL support in our plugins

143.1.2 Methods

143.1.3 Constructor(context as CLContextMBS, device as CLDeviceMBS, flags as Integer = 0)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Create a command-queue on a specific device.
Example:

```
Var devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeGPU)
Var device as CLDeviceMBS = devices(0) // we use first one

// Create a context
Var context as new CLContextMBS(device, CLContextMBS.kErrorModeLogMessagesToSystemLog)

// Create a command queue
Var queue as new CLCommandQueueMBS(context, device, 0)
```

Notes: context: Must be a valid OpenCL context.
device: Must be a device associated with context. It can either be in the list of devices specified when context is created using CLContextMBS Constructor or have the same device type as the device type specified when the context is created.
flags: Specifies a list of properties for the command-queue. This is a bit-field. Only command-queue properties specified in the table below can be set in properties; otherwise the value specified in properties is considered to be not valid.

Command-Queue Properties	Description
kQueueOutOfOrderExecModeEnable	Determines whether the commands queued in the command-queue are executed in-order or out-of-order. If set, the commands in the command-queue are executed out-of-order. Otherwise, commands are executed in-order.
kQueueProfilingEnable	Enable or disable profiling of commands in the command-queue. If set, the profiling of commands is enabled. Otherwise profiling of commands is disabled. See clGetEventProfilingInfo for more information.

The OpenCL functions that are submitted to a command-queue are enqueued in the order the calls are made but can be configured to execute in-order or out-of-order. The properties argument in clCreateCommandQueue can be used to specify the execution order.

If the kQueueOutOfOrderExecModeEnable property of a command-queue is not set, the commands enqueued to a command-queue execute in order. For example, if an application calls EnqueueNDRangeKernel to execute kernel A followed by a EnqueueNDRangeKernel to execute kernel B, the application can assume that kernel A finishes first and then kernel B is executed. If the memory objects output by kernel A are inputs to kernel B then kernel B will see the correct data in memory objects produced by execution of kernel A. If the kQueueOutOfOrderExecModeEnable property of a commandqueue is set, then there is no guarantee that kernel A will finish before kernel B starts execution.

Applications can configure the commands enqueued to a command-queue to execute out-of-order by setting the kQueueOutOfOrderExecModeEnable property of the command-queue. This can be specified when the command-queue is created or can be changed dynamically using this Constructor. In out-of-order execution mode there is no guarantee that the enqueued commands will finish execution in the order they were queued. As there is no guarantee that kernels will be executed in order, i.e. based on when the EnqueueNDRangeKernel calls are made within a command-queue, it is therefore possible that an earlier EnqueueNDRangeKernel

call to execute kernel A identified by event A may execute and/or finish later than a EnqueueNDRangeKernel call to execute kernel B which was called by the application at a later point in time. To guarantee a specific order of execution of kernels, a wait on a particular event (in this case event A) can be used. The wait for event A can be specified in the event_wait_list argument to EnqueueNDRangeKernel for kernel B.

In addition, a wait for events or a barrier command can be enqueued to the command-queue. The wait for events command ensures that previously enqueued commands identified by the list of events to wait for have finished before the next batch of commands is executed. The barrier command ensures that all previously enqueued commands in a command-queue have finished execution before the next batch of commands is executed.

Similarly, commands to read, write, copy or map memory objects that are enqueued after EnqueueNDRangeKernel, EnqueueTask or EnqueueNativeKernel commands are not guaranteed to wait for kernels scheduled for execution to have completed (if the kQueueOutOfOrderExecModeEnable property is set). To ensure correct ordering of commands, the event object returned by EnqueueNDRangeKernel, EnqueueTask or EnqueueNativeKernel can be used to enqueue a wait for event or a barrier command can be enqueued that must complete before reads or writes to the memory object(s) occur.

Lasterror is set.

143.1.4 Context as CLContextMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the context specified when the command-queue is created.
Notes: Lasterror is set.

143.1.5 Device as CLDeviceMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the device specified when the command-queue is created.
Notes: Lasterror is set.

143.1.6 EnqueueBarrier

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: A synchronization point that enqueues a barrier operation.
Notes: EnqueueBarrier is a synchronization point that ensures that all queued commands in command_queue

have finished execution before the next batch of commands can begin execution.

Lasterror is set.

143.1.7 EnqueueCopyBuffer(sourceBuffer as CLMemMBS, destBuffer as CLMemMBS, sourceOffset as Integer, destOffset as Integer, size as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to copy a buffer object to another buffer object.
Notes: sourceBuffer: the source memory object.
destBuffer: the destination memory object.
sourceOffset: The offset where to begin copying data from sourceBuffer.
destOffset: The offset where to begin copying data into destBuffer.
size: Refers to the size in bytes to copy.
EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in event_wait_list act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.
outEvent: Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.
Lasterror is set.
See also:

- 143.1.8 EnqueueCopyBuffer(sourceBuffer as CLMemMBS, destBuffer as CLMemMBS, sourceOffset as Integer, destOffset as Integer, size as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) 19204

143.1.8 EnqueueCopyBuffer(sourceBuffer as CLMemMBS, destBuffer as CLMemMBS, sourceOffset as Integer, destOffset as Integer, size as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to copy a buffer object to another buffer object.
Notes: sourceBuffer: the source memory object.
destBuffer: the destination memory object.
sourceOffset: The offset where to begin copying data from sourceBuffer.
destOffset: The offset where to begin copying data into destBuffer.
size: Refers to the size in bytes to copy.
EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in event_wait_list act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.

outEvent: Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.
Lasterror is set.
See also:

- 143.1.7 EnqueueCopyBuffer(sourceBuffer as CLMemMBS, destBuffer as CLMemMBS, sourceOffset as Integer, destOffset as Integer, size as Integer) 19204

143.1.9 EnqueueCopyBufferToImage(SourceBuffer as CLMemMBS, destImage as CLMemMBS, sourceOffset as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to copy a buffer object to an image object.
Notes: SourceBuffer: A valid buffer object.
destImage: A valid image object.

sourceOffset: The offset where to begin copying data from SourceBuffer.

destOrigin: The (x, y, z) offset in pixels where to begin copying data to destImage. If destImage is a 2D image object, the z value given by destOriginZ must be 0.

region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle to copy. If destImage is a 2D image object, the depth value given by RegionDepth must be 1.

The size in bytes of the region to be copied from SourceBuffer referred to as src_cb is computed as width * height * depth * bytes/image element if destImage is a 3D image object and is computed as width * height * bytes/image element if destImage is a 2D image object.

EventWaitList: Optionally, Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Optional. Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

Lasterror is set.

- 143.1.10 EnqueueCopyBufferToImage(SourceBuffer as CLMemMBS, destImage as CLMemMBS, sourceOffset as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth

as Integer, RegionHeight as Integer, RegionDepth as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) 19206

143.1.10 EnqueueCopyBufferToImage(SourceBuffer as CLMemMBS, destImage as CLMemMBS, sourceOffset as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to copy a buffer object to an image object.
Notes: SourceBuffer: A valid buffer object.
destImage: A valid image object.

sourceOffset: The offset where to begin copying data from SourceBuffer.

destOrigin: The (x, y, z) offset in pixels where to begin copying data to destImage. If destImage is a 2D image object, the z value given by destOriginZ must be 0.

region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle to copy. If destImage is a 2D image object, the depth value given by RegionDepth must be 1.

The size in bytes of the region to be copied from SourceBuffer referred to as src_cb is computed as width * height * depth * bytes/image element if destImage is a 3D image object and is computed as width * height * bytes/image element if destImage is a 2D image object.

EventWaitList: Optionally, Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Optional. Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

Lasterror is set.

- 143.1.9 EnqueueCopyBufferToImage(SourceBuffer as CLMemMBS, destImage as CLMemMBS, sourceOffset as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer) 19205

143.1.11 EnqueueCopyImage(sourceImage as CLMemMBS, destImage as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, destOriginX as Integer, destOriginY as Integer, destOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to copy image objects.
Notes: sourceImage: Source image.
destImage: Dest image.

sourceOrigin: Defines the starting (x, y, z) location in pixels in src_image from where to start the data copy. If src_image is a 2D image object, the z value given by sourceOriginZ must be 0.

sourceOrigin: Defines the starting (x, y, z) location in pixels in dst_image from where to start the data copy. If dst_image is a 2D image object, the z value given by sourceOriginZ must be 0.

region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle to copy. If src_image or dst_image is a 2D image object, the depth value given by RegionDepth must be 1.

EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CommandQueue must be the same.

outEvent: Optional, Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

It is currently a requirement that the sourceImage and destImage image memory objects for EnqueueCopyImage must have the exact same image format (i.e. the cl_image_format descriptor specified when sourceImage and destImage are created must match).

sourceImage and destImage can be 2D or 3D image objects allowing us to perform the following actions:

- Copy a 2D image object to a 2D image object.
- Copy a 2D image object to a 2D slice of a 3D image object.
- Copy a 2D slice of a 3D image object to a 2D image object.
- Copy a 3D image object to a 3D image object.

Lasterror is set.

143.1.15 EnqueueMapBuffer(buffer as CLMemMBS, BlockingMap as boolean, MapFlags as Integer, offset as Integer, size as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) as memoryblock

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to map a region of the buffer object given by buffer into the host address space and returns a pointer to this mapped region.
Notes: BlockingMap: Optional, Indicates if the map operation is blocking or non-blocking. If BlockingMap is true, EnqueueMapBuffer does not return until the specified region in buffer can be mapped. If BlockingMap is false i.e. map operation is non-blocking, the pointer to the mapped region returned by clEnqueueMapBuffer cannot be used until the map command has completed. The event argument returns an event object which can be used to query the execution status of the map command. When the map command is completed, the application can access the contents of the mapped region using the pointer returned by EnqueueMapBuffer.
MapFlags: Is a bit-field and can be set to kMapRead to indicate that the region specified by (offset, size) in the buffer object is being mapped for reading, and/or kMapWrite to indicate that the region specified by (offset, size) in the buffer object is being mapped for writing.
buffer: A valid buffer object. The OpenCL context associated with CLCommandQueueMBS and buffer must be the same.
offset, size: The offset in bytes and the size of the region in the buffer object that is being mapped.
EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. The events specified in EventWaitList act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.
outEvent: Returns an event object that identifies this particular copy command and can be used toquery or queue a wait for this particular command to complete.

Lasterror is set.

The contents of the regions of a memory object mapped for writing (i.e. kMapWrite is set in map_flags argument to EnqueueMapBuffer or EnqueueMapImage) are considered to be undefined until this region is unmapped. Reads and writes by a kernel executing on a device to a memory region(s) mapped for writing are undefined.

Multiple command-queues can map a region or overlapping regions of a memory object for reading (i.e. MapFlags = kMapRead). The contents of the regions of a memory object mapped for reading can also be read by kernels executing on a device(s). The behavior of writes by a kernel executing on a device to a mapped region of a memory object is undefined. Mapping (and unmapping) overlapped regions of a buffer or image memory object for writing is undefined.

The behavior of OpenCL function calls that enqueue commands that write or copy to regions of a memory object that are mapped is undefined.

Lasterror is set.

143.1.17 EnqueueMapImage(image as CLMemMBS, BlockingMap as boolean, MapFlags as Integer, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, byref RowPitch as Integer, byref SlicePitch as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) as memoryblock

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to map a region of an image object into the host address space and returns a pointer to this mapped region.
Notes: image: A valid image object. The OpenCL context associated with CLCommandQueueMBS and image must be the same.

BlockingMap: Optional, Indicates if the map operation is blocking or non-blocking. If BlockingMap is true, EnqueueMapImage does not return until the specified region in image can be mapped. If BlockingMap is false i.e. map operation is non-blocking, the pointer to the mapped region returned by EnqueueMapImage cannot be used until the map command has completed. The event argument returns an event object which can be used to query the execution status of the map command. When the map command is completed, the application can access the contents of the mapped region using the pointer returned by EnqueueMapImage.

MapFlags: Is a bit-field and can be set to kMapRead to indicate that the region specified by (origin, region) in the image object is being mapped for reading, and/or kMapWrite to indicate that the region specified by (origin, region) in the image object is being mapped for writing.
origin, region: Define the (x, y, z) offset in pixels and (width, height, depth) in pixels of the 2D or 3D rectangle region that is to be mapped. If image is a 2D image object, the z value given by originZ must be 0 and the depth value given by regionDepth must be 1.

RowPitch: Returns the scan-line pitch in bytes for the mapped region. This must be a non-nil value.
SlicePitch: Returns the size in bytes of each 2D slice for the mapped region. For a 2D image, zero is returned if this argument is not nil. For a 3D image, image_slice_pitch must be a non-nil value.

EventWaitList: Optional, Specify events that need to complete before EnqueueMapImage can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and CLCommandQueueMBS must be the same.

outEvent: Optional, Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete. event can be nil in which case it will not be possible for the application to query the status of this command or queue a wait for this command to complete.

Lasterror is set.

If the buffer or image object is created with kMemoryUseHostPtr set in mem_flags, the following will be true:

The HostPtr specified in Constructor is guaranteed to contain the latest bits in the region being mapped when the EnqueueMapBuffer or EnqueueMapImage command has completed.
The pointer value returned by EnqueueMapBuffer or EnqueueMapImage will be derived from the HostPtr specified when the buffer or image object is created.
The contents of the regions of a memory object mapped for writing (i.e. kMapWrite is set in MapFlags argument to EnqueueMapBuffer or EnqueueMapImage) are considered to be undefined until this region is unmapped. Reads and writes by a kernel executing on a device to a memory region(s) mapped for writing are undefined.

Multiple command-queues can map a region or overlapping regions of a memory object for reading (i.e. MapFlags = kMapRead). 143.1.19 EnqueueMarker(byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a marker command.
Notes: Enqueues a marker command to the command queue. The marker command returns an event which can be used to queue a wait on this marker event i.e. wait for all commands queued before the marker command to complete.

Lasterror is set.

143.1.20 EnqueueNativeKernel(FunctionPtr as ptr, args as memoryblock, argsSize as Integer, NumberOfMemoryObjects as Integer, MemList as memoryblock, ArgsMemoryLocations as memoryblock)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to execute a native C/C++ function not compiled using the OpenCL compiler.
Notes: First a warning: Don't use this with Xojo methods. You can point to a function written in C which you made thread safe.

self: A valid command-queue. A native user function can only be executed on a command-queue created on a device that has kExceNativeKernel capability set in ExecutionCapabilities property.

FunctionPtr: A pointer to a host-callable user function.

args: A pointer to the args list that FunctionPtr should be called with.
argsSize: The size in bytes of the args list that args points to.

The data pointed to by args and argsSize bytes in size will be copied and a pointer to this copied region will be passed to FunctionPtr. The copy needs to be done because the memory objects (CLMemMBS.handle values) that args may contain need to be modified and replaced by appropriate pointers to global memory. When EnqueueNativeKernel returns, the memory region pointed to by args can be reused by the application.

NumberOfMemoryObjects: The number of buffer objects that are passed in args.

MemList: A list of valid buffer objects, if NumberOfMemoryObjects is greater than 0. The buffer object values specified in MemList are memory object handles (CLMemMBS.handle values) or nil.

ArgsMemoryLocations: A pointer to appropriate locations that args points to where memory object handles (CLMemMBS.handle values) are stored. Before the user function is executed, the memory object handles are replaced by pointers to global memory.

EventWaitList: Optionally, Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Optionally, Returns an event object that identifies this particular kernel execution instance.

The data pointed to by args and argsSize bytes in size will be copied and a pointer to this copied region will be passed to FunctionPtr. The copy needs to be done because the memory objects (CLMemMBS.handle values) that args may contain need to be modified and replaced by appropriate pointers to global memory. When EnqueueNativeKernel returns, the memory region pointed to by args can be reused by the application.

Lasterror is set.

- 143.1.20 EnqueueNativeKernel(FunctionPtr as ptr, args as memoryblock, argsSize as Integer, NumberOfMemoryObjects as Integer, MemList as memoryblock, ArgsMemoryLocations as memoryblock) 19216

143.1.22 EnqueueNDRangeKernel(kernel as CLKernelMBS, GlobalWorkSize as Integer, LocalWorkSize as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to execute a kernel on a device.
Notes: kernel: A valid kernel object. The OpenCL context associated with kernel and command_queue must be the same.
GlobalWorkSize: The number of global work-items.
LocalWorkSize: The number of work-items that make up a work-group (also referred to as the size of the work-group) that will execute the kernel specified by kernel.

The work-group size to be used for kernel can also be specified in the program source using the __attribute__((reqd_work_group_size(X, Y, Z)))qualifier. In this case the size of work group specified by local_work_size must match the value specified by the reqd_work_group_size __attribute__ qualifier.

EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.
outEvent: Optional, Returns an event object that identifies this particular kernel execution instance. Event objects are unique and can be used to identify a particular kernel execution instance later on.

Work-group instances are executed in parallel across multiple compute units or concurrently on the same compute unit.

Each work-item is uniquely identified by a global identifier. The global ID, which can be read inside the kernel, is computed using the value given by GlobalWorkSize and global_work_offset. In OpenCL 1.0, the starting global ID is always (0, 0, ... 0). In addition, a work-item is also identified within a work-group by a unique local ID. The local ID, which can also be read by the kernel, is computed using the value given by LocalWorkSize. The starting local ID is always (0, 0, ... 0).

Lasterror is set.

- 143.1.23 EnqueueNDRangeKernel(kernel as CLKernelMBS, GlobalWorkSize as Integer, LocalWorkSize as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) 19220

143.1.23 EnqueueNDRangeKernel(kernel as CLKernelMBS, GlobalWorkSize as Integer, LocalWorkSize as Integer, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to execute a kernel on a device.
Notes: kernel: A valid kernel object. The OpenCL context associated with kernel and command_queue must be the same.
GlobalWorkSize: The number of global work-items.
LocalWorkSize: The number of work-items that make up a work-group (also referred to as the size of the work-group) that will execute the kernel specified by kernel.

The work-group size to be used for kernel can also be specified in the program source using the __attribute__((reqd_work_group_size(X, Y, Z)))qualifier. In this case the size of work group specified by local_work_size must match the value specified by the reqd_work_group_size __attribute__ qualifier.

EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.
outEvent: Optional, Returns an event object that identifies this particular kernel execution instance. Event objects are unique and can be used to identify a particular kernel execution instance later on.

Work-group instances are executed in parallel across multiple compute units or concurrently on the same compute unit.

Each work-item is uniquely identified by a global identifier. The global ID, which can be read inside the kernel, is computed using the value given by GlobalWorkSize and global_work_offset. In OpenCL 1.0, the starting global ID is always (0, 0, ... 0). In addition, a work-item is also identified within a work-group by a unique local ID. The local ID, which can also be read by the kernel, is computed using the value given by LocalWorkSize. The starting local ID is always (0, 0, ... 0).

Lasterror is set.

143.1.24 EnqueueReadBuffer(buffer as CLMemMBS, BlockingRead as boolean, offset as Integer, size as Integer, mem as Memoryblock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueue commands to read from a buffer object to host memory.
Notes: buffer: Refers to a valid buffer object.
BlockingRead: Optional, Indicates if the read operations are blocking or non-blocking. If BlockingRead is true i.e. the read command is blocking, clEnqueueReadBuffer does not return until the buffer data has been read and copied into memory pointed to by ptr.

If BlockingRead is false i.e. the read command is non-blocking, EnqueueReadBuffer queues a non-blocking read command and returns. The contents of the buffer that ptr points to cannot be used until the read command has completed. The event argument returns an event object which can be used to query the execution status of the read command. When the read command has completed, the contents of the buffer that ptr points to can be used by the application.

offset: The offset in bytes in the buffer object to read from.
size: The size in bytes of data being read.
mem: The pointer to buffer in host memory where data is to be read into.

EventWaitList: Optional, specifies events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and command_queue must be the same.

outEvent: Optional, Returns an event object that identifies this particular read command and can be used to query or queue a wait for this particular command to complete.

Calling EnqueueReadBuffer to read a region of the buffer object with the ptr argument value set to mem + offset, where mem is a pointer to the memory region specified when the buffer object being read is created with kMemoryUseHostPtr, must meet the following requirements in order to avoid undefined behavior:

All commands that use this buffer object have finished execution before the read command begins execution
The buffer object is not mapped
The buffer object is not used by any command-queue until the read command has finished execution

Lasterror is set.

- 143.1.25 EnqueueReadBuffer(buffer as CLMemMBS, offset as Integer, size as Integer, mem as Memoryblock) 19222

143.1.25 EnqueueReadBuffer(buffer as CLMemMBS, offset as Integer, size as Integer, mem as Memoryblock)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueue commands to read from a buffer object to host memory.
Notes: buffer: Refers to a valid buffer object.
BlockingRead: Optional, Indicates if the read operations are blocking or non-blocking. If BlockingRead is true i.e. the read command is blocking, clEnqueueReadBuffer does not return until the buffer data has been read and copied into memory pointed to by ptr.

If BlockingRead is false i.e. the read command is non-blocking, EnqueueReadBuffer queues a non-blocking read command and returns. The contents of the buffer that ptr points to cannot be used until the read command has completed. The event argument returns an event object which can be used to query the execution status of the read command. When the read command has completed, the contents of the buffer that ptr points to can be used by the application.

offset: The offset in bytes in the buffer object to read from.
size: The size in bytes of data being read.
mem: The pointer to buffer in host memory where data is to be read into.

EventWaitList: Optional, specifies events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and command_queue must be the same.

outEvent: Optional, Returns an event object that identifies this particular read command and can be used to query or queue a wait for this particular command to complete.

Calling EnqueueReadBuffer to read a region of the buffer object with the ptr argument value set to mem + offset, where mem is a pointer to the memory region specified when the buffer object being read is created with kMemoryUseHostPtr, must meet the following requirements in order to avoid undefined behavior:

All commands that use this buffer object have finished execution before the read command begins execution
The buffer object is not mapped
The buffer object is not used by any command-queue until the read command has finished execution

Lasterror is set.

- 143.1.24 EnqueueReadBuffer(buffer as CLMemMBS, BlockingRead as boolean, offset as Integer, size as Integer, mem as Memoryblock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) 19221

143.1.26 EnqueueReadImage(image as CLMemMBS, BlockingRead as boolean, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, RowPitch as Integer, SlicePitch as Integer, mem as Memoryblock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to read from a 2D or 3D image object to host memory.
Notes: image: Refers to a valid 2D or 3D image object.

BlockingRead: Optional. Indicates if the read operations are blocking or non-blocking.

If BlockingRead is true i.e. the read command is blocking, clEnqueueReadImage does not return until the buffer data has been read and copied into memory pointed to by mem.

If BlockingRead is false i.e. map operation is non-blocking, clEnqueueReadImage queues a non-blocking read command and returns. The contents of the buffer that mem points to cannot be used until the read command has completed. The event argument returns an event object which can be used to query the execution status of the read command. When the read command has completed, the contents of the buffer that mem points to can be used by the application.

origin: Defines the (x, y, z) offset in pixels in the image from where to read. If image is a 2D image object, the z value given by sourceOriginZ must be 0.

region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle being read. If image is a 2D image object, the depth value given by RegionDepth must be 1.

RowPitch: The length of each row in bytes. This value must be greater than or equal to the element size in bytes * width. If RowPitch is set to 0, the appropriate row pitch is calculated based on the size of each element in bytes multiplied by width.

SlicePitch: Size in bytes of the 2D slice of the 3D region of a 3D image being read. This must be 0 if image is a 2D image. This value must be greater than or equal to RowPitch * height. If SlicePitch is set to 0, the appropriate slice pitch is calculated based on the RowPitch * height.

mem: The pointer to a buffer in host memory where image data is to be read from.

EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Optional, Returns an event object that identifies this particular read command and can be used to query or queue a wait for this particular command to complete. event can be nil in which case it will not be possible for the application to query the status of this command or queue a wait for this command to complete.

Calling EnqueueReadImage to read a region of the image object with the mem argument value set to HostPtr + (sourceOriginZ * image slice pitch + sourceOriginY * image row pitch + sourceOriginX * bytes per pixel), where host_ptr is a pointer to the memory region specified when the image object being read is created with kMemoryUseHostPtr, must meet the following requirements in order to avoid undefined behavior:

- All commands that use this image object have finished execution before the read command begins execution.
- The RowPitch and SlicePitch argument values in EnqueueReadImage must be set to the image row pitch and slice pitch.
- The image object is not mapped.
- The image object is not used by any command-queue until the read command has finished execution.

Lasterror is set.

143.1.27 EnqueueReadImage(image as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, RowPitch as Integer, SlicePitch as Integer, mem as Memoryblock)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to read from a 2D or 3D image object to host memory..
Notes: image: Refers to a valid 2D or 3D image object.

BlockingRead: Optional. Indicates if the read operations are blocking or non-blocking.

If BlockingRead is true i.e. the read command is blocking, clEnqueueReadImage does not return until the buffer data has been read and copied into memory pointed to by mem.

If BlockingRead is false i.e. map operation is non-blocking, clEnqueueReadImage queues a non-blocking read command and returns. The contents of the buffer that mem points to cannot be used until the read command has completed. The event argument returns an event object which can be used to query the execution status of the read command. When the read command has completed, the contents of the buffer that mem points to can be used by the application.

origin: Defines the (x, y, z) offset in pixels in the image from where to read. If image is a 2D image object, the z value given by sourceOriginZ must be 0.

region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle being read. If image is a 2D image object, the depth value given by RegionDepth must be 1.

RowPitch: The length of each row in bytes. This value must be greater than or equal to the element size in bytes * width. If RowPitch is set to 0, the appropriate row pitch is calculated based on the size of each element in bytes multiplied by width.

SlicePitch: Size in bytes of the 2D slice of the 3D region of a 3D image being read. This must be 0 if image is a 2D image. This value must be greater than or equal to RowPitch * height. If SlicePitch is set to 0, the appropriate slice pitch is calculated based on the RowPitch * height.

mem: The pointer to a buffer in host memory where image data is to be read from.

EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Optional, Returns an event object that identifies this particular read command and can be used to query or queue a wait for this particular command to complete. event can be nil in which case it will not be possible for the application to query the status of this command or queue a wait for this command to complete.

Calling EnqueueReadImage to read a region of the image object with the mem argument value set to HostPtr + (sourceOriginZ * image slice pitch + sourceOriginY * image row pitch + sourceOriginX * bytes per pixel), where host_ptr is a pointer to the memory region specified when the image object being read is created with kMemoryUseHostPtr, must meet the following requirements in order to avoid undefined behavior:

- All commands that use this image object have finished execution before the read command begins execution.
- The RowPitch and SlicePitch argument values in EnqueueReadImage must be set to the image row pitch and slice pitch.
- The image object is not mapped.

- The image object is not used by any command-queue until the read command has finished execution.

Lasterror is set.

143.1.28 EnqueueReadPicture(image as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, RegionWidth as Integer, RegionHeight as Integer, pic as picture)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Enqueues a command to read from a 2D or 3D image object to a Xojo picture object.
Example:

```
const size = 500

// create test picture
Var pic1 as Picture = LogoMBS(size)
// create destination picture
Var pic2 as new Picture(size, size, 32)

// get device list
Var devices() as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeAll)
Var device as CLDeviceMBS = devices(0)

// Create context for that device
Var c as new CLContextMBS(device)

// query what format Xojo uses for pictures
Var RowPitch as Integer
Var format as CLImageFormatMBS = OpenCLMBS.GetPictureImageFormat(pic1, RowPitch)

// create a matching memory object
Var m as new CLMemMBS(c, CLMemMBS.kMemoryReadWrite, format, size, size, RowPitch)

// create command queue
Var cq as new CLCommandQueueMBS(c, device, 0)

// copy picture content into CLMem object
cq.EnqueueWritePicture(m, 0, 0, size, size, pic1)

// and copy back to second picture
```

```
cq.EnqueueReadPicture(m, 0, 0, size, size, pic2)

// finally display it
Backdrop = pic2
```

Notes: image: Refers to a valid 2D or 3D image object.

origin: Defines the (x, y) offset in pixels in the image from where to read.
region: Defines the (width, heigh) in pixels of the 2D or 3D rectangle being read.

pic: The Xojo picture object to write pixel data to.

This command is always blocking.
Lasterror is set.

143.1.29 EnqueueTask(kernel as CLKernelMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to execute a kernel on a device.
Notes: kernel: A valid kernel object. The OpenCL context associated with kernel and command_queue must be the same.
EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. If EventWaitList is not passed or empty, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.
outEvent: Optional, Returns an event object that identifies this particular kernel execution instance. Event objects are unique and can be used to identify a particular kernel execution instance later on.

The kernel is executed using a single work-item.

EnqueueTask is equivalent to calling EnqueueNDRangeKernel with work_dim = 1, global_work_size set to 1, and local_work_size set to 1.
Lasterror is set.
See also:

- 143.1.30 EnqueueTask(kernel as CLKernelMBS, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) 19228

143.1.30 EnqueueTask(kernel as CLKernelMBS, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to execute a kernel on a device.
Notes: kernel: A valid kernel object. The OpenCL context associated with kernel and command_queue must be the same.
EventWaitList: Optional, Specify events that need to complete before this particular command can be executed. If EventWaitList is not passed or empty, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.
outEvent: Optional, Returns an event object that identifies this particular kernel execution instance. Event objects are unique and can be used to identify a particular kernel execution instance later on.

The kernel is executed using a single work-item.

EnqueueTask is equivalent to calling EnqueueNDRangeKernel with work_dim = 1, global_work_size set to 1, and local_work_size set to 1.
Lasterror is set.
See also:

- 143.1.29 EnqueueTask(kernel as CLKernelMBS) 19227

143.1.31 EnqueueUnmapMemObject(buffer as CLMemMBS, mem as Memoryblock)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to unmap a previously mapped region of a memory object.
Notes: memobj: A valid memory object. The OpenCL context associated with CLCommandQueueMBS and memobj must be the same.

mem: The host address returned by a previous call to EnqueueMapBuffer or EnqueueMapImage for memobj. Do not use this memoryblock after it has been unmapped.

EventWaitList: Optionally, Specify events that need to complete before EnqueueUnmapMemObject can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.

outEvent: Optionally, Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

Reads or writes from the host using the pointer returned by EnqueueMapBuffer or EnqueueMapImage are

considered to be complete.

EnqueueMapBuffer and EnqueueMapImage increments the mapped count of the memory object. The initial mapped count value of a memory object is zero. Multiple calls to EnqueueMapBuffer or EnqueueMapImage on the same memory object will increment this mapped count by appropriate number of calls. EnqueueUnmapMemObject decrements the mapped count of the memory object.

EnqueueMapBuffer and clEnqueueMapImage act as synchronization points for a region of the memory object being mapped.
See also:

- 143.1.32 EnqueueUnmapMemObject(buffer as CLMemMBS, mem as Memoryblock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) 19229

143.1.32 EnqueueUnmapMemObject(buffer as CLMemMBS, mem as Memoryblock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to unmap a previously mapped region of a memory object.
Notes: memobj: A valid memory object. The OpenCL context associated with CLCommandQueueMBS and memobj must be the same.

mem: The host address returned by a previous call to EnqueueMapBuffer or EnqueueMapImage for memobj. Do not use this memoryblock after it has been unmapped.

EventWaitList: Optionally, Specify events that need to complete before EnqueueUnmapMemObject can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.

outEvent: Optionally, Returns an event object that identifies this particular copy command and can be used to query or queue a wait for this particular command to complete.

Reads or writes from the host using the pointer returned by EnqueueMapBuffer or EnqueueMapImage are considered to be complete.

EnqueueMapBuffer and EnqueueMapImage increments the mapped count of the memory object. The initial mapped count value of a memory object is zero. Multiple calls to EnqueueMapBuffer or EnqueueMapImage on the same memory object will increment this mapped count by appropriate number of calls. EnqueueUnmapMemObject decrements the mapped count of the memory object.

EnqueueMapBuffer and clEnqueueMapImage act as synchronization points for a region of the memory object

being mapped.

- 143.1.31 EnqueueUnmapMemObject(buffer as CLMemMBS, mem as Memoryblock) 19228

143.1.33 EnqueueWaitForEvents(EventWaitList() as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a wait for a specific event or a list of events to complete before any future commands queued in the command-queue are executed.
Notes: EventWaitList: Events specified in EventWaitList act as synchronization points.

The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.

Lasterror is set.

143.1.34 EnqueueWriteBuffer(buffer as CLMemMBS, BlockingWrite as boolean, offset as Integer, size as Integer, mem as Memoryblock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueue commands to write to a buffer object from host memory.
Notes: buffer: Refers to a valid buffer object.
BlockingWrite: Optional, Indicates if the write operations are blocking or nonblocking.

If blocking_write is true, the OpenCL implementation copies the data referred to by mem and enqueues the write operation in the command-queue. The memory pointed to by mem can be reused by the application after the EnqueueWriteBuffer call returns.

If blocking_write is false, the OpenCL implementation will use mem to perform a nonblocking write. As the write is non-blocking the implementation can return immediately. The memory pointed to by mem cannot be reused by the application after the call returns. The event argument returns an event object which can be used to query the execution status of the write command. When the write command has completed, the memory pointed to by mem can then be reused by the application.

offset: The offset in bytes in the buffer object to write to.
size: The size in bytes of data being written.
mem: The pointer to buffer in host memory where data is to be written from.

EventWaitList: Optional. Specifies events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.

outEvent: Optional. Returns an event object that identifies this particular write command and can be used to query or queue a wait for this particular command to complete.

Calling EnqueueWriteBuffer to update the latest bits in a region of the buffer object with the mem argument value set to host_ptr + offset, where host_ptr is a pointer to the memory region specified when the buffer object being written is created with CL_MEM_USE_HOST_PTR, must meet the following requirements in order to avoid undefined behavior:

The host memory region given by (mem + offset, size) contains the latest bits when the enqueued write command begins execution.
The buffer object is not mapped.
The buffer object is not used by any command-queue until the write command has finished execution.

Lasterror is set.

143.1.35 EnqueueWriteBuffer(buffer as CLMemMBS, offset as Integer, size as Integer, mem as Memoryblock)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueue commands to write to a buffer object from host memory.
Notes: buffer: Refers to a valid buffer object.
BlockingWrite: Optional, Indicates if the write operations are blocking or nonblocking.

If blocking_write is true, the OpenCL implementation copies the data referred to by mem and enqueues the write operation in the command-queue. The memory pointed to by mem can be reused by the application after the EnqueueWriteBuffer call returns.

If blocking_write is false, the OpenCL implementation will use mem to perform a nonblocking write. As the write is non-blocking the implementation can return immediately. The memory pointed to by mem cannot be reused by the application after the call returns. The event argument returns an event object which can be used to query the execution status of the write command. When the write command has completed, the memory pointed to by mem can then be reused by the application.

offset: The offset in bytes in the buffer object to write to.
size: The size in bytes of data being written.
mem: The pointer to buffer in host memory where data is to be written from.

EventWaitList: Optional. Specifies events that need to complete before this particular command can be executed. If EventWaitList is empty or not passed, then this particular command does not wait on any event to complete. The events specified in EventWaitList act as synchronization points. The context associated with events in EventWaitList and CLCommandQueueMBS must be the same.

outEvent: Optional. Returns an event object that identifies this particular write command and can be used to query or queue a wait for this particular command to complete.

Calling EnqueueWriteBuffer to update the latest bits in a region of the buffer object with the mem argument value set to host_ptr + offset, where host_ptr is a pointer to the memory region specified when the buffer object being written is created with CL_MEM_USE_HOST_PTR, must meet the following requirements in order to avoid undefined behavior:

The host memory region given by (mem + offset, size) contains the latest bits when the enqueued write command begins execution.
The buffer object is not mapped.
The buffer object is not used by any command-queue until the write command has finished execution.

Lasterror is set.

143.1.36 EnqueueWriteImage(image as CLMemMBS, BlockingWrite as boolean, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, RowPitch as Integer, SlicePitch as Integer, mem as Memoryblock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to write from a 2D or 3D image object to host memory.
Notes: image: Refers to a valid 2D or 3D image object.

BlockingWrite: Optional. Indicates if the write operation is blocking or non-blocking.

If BlockingWrite is true the OpenCL implementation copies the data referred to by mem and enqueues the write command in the command-queue. The memory pointed to by mem can be reused by the application after the clEnqueueWriteImage call returns. If BlockingWrite is false the OpenCL implementation will use mem to perform a nonblocking write. As the write is non-blocking the implementation can return immediately. The memory pointed to by mem cannot be reused by the application after the call returns. The event argument returns an event object which can be used to query the execution status of the write command. When the write command has completed, the memory pointed to by mem can then be reused by the application.

origin: Defines the (x, y, z) offset in pixels in the image from where to write or write. If image is a 2D image object, the z value given by sourceOriginZ must be 0.

region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle being write or written. If image is a 2D image object, the depth value given by RegionDepth must be 1.

RowPitch
The length of each row in bytes. This value must be greater than or equal to the element size in bytes * width. If RowPitch is set to 0, the appropriate row pitch is calculated based on the size of each element in bytes multiplied by width.

RowPitch: Size in bytes of the 2D slice of the 3D region of a 3D image being written. This must be 0 if image is a 2D image. This value must be greater than or equal to RowPitch * height. If SlicePitch is set to 0, the appropriate slice pitch is calculated based on the RowPitch * height.

mem: The pointer to a buffer in host memory where image data is to be written to.

EventWaitList: Optional. Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Optional. Returns an event object that identifies this particular write command and can be used to query or queue a wait for this particular command to complete.

Calling EnqueueWriteImage to update the latest bits in a region of the image object with the mem argument value set to mem + (sourceOriginZ * image slice pitch + sourceOriginY * image row pitch + sourceOriginX * bytes per pixel), where mem is a pointer to the memory region specified when the image object being written is created with kMemoryUseHostPtr, must meet the following requirements in order to avoid undefined behavior:

- The host memory region being written contains the latest bits when the enqueued write command begins execution.
- The RowPitch and SlicePitch argument values in EnqueueWriteImage must be set to the image row

pitch and slice pitch.

- The image object is not mapped.
- The image object is not used by any command-queue until the write command has finished execution.

- 143.1.37 EnqueueWriteImage(image as CLMemMBS,sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, RowPitch as Integer, SlicePitch as Integer, mem as Memoryblock) 19234

143.1.37 EnqueueWriteImage(image as CLMemMBS,sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, RowPitch as Integer, SlicePitch as Integer, mem as Memoryblock)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Enqueues a command to write from a 2D or 3D image object to host memory.
Notes: image: Refers to a valid 2D or 3D image object.

BlockingWrite: Optional. Indicates if the write operation is blocking or non-blocking.

If BlockingWrite is true the OpenCL implementation copies the data referred to by mem and enqueues the write command in the command-queue. The memory pointed to by mem can be reused by the application after the clEnqueueWriteImage call returns. If BlockingWrite is false the OpenCL implementation will use mem to perform a nonblocking write. As the write is non-blocking the implementation can return immediately. The memory pointed to by mem cannot be reused by the application after the call returns. The event argument returns an event object which can be used to query the execution status of the write command. When the write command has completed, the memory pointed to by mem can then be reused by the application.

origin: Defines the (x, y, z) offset in pixels in the image from where to write or write. If image is a 2D image object, the z value given by sourceOriginZ must be 0.

region: Defines the (width, height, depth) in pixels of the 2D or 3D rectangle being write or written. If image is a 2D image object, the depth value given by RegionDepth must be 1.

RowPitch
The length of each row in bytes. This value must be greater than or equal to the element size in bytes * width. If RowPitch is set to 0, the appropriate row pitch is calculated based on the size of each element in bytes multiplied by width.

RowPitch: Size in bytes of the 2D slice of the 3D region of a 3D image being written. This must be 0 if image is a 2D image. This value must be greater than or equal to RowPitch * height. If SlicePitch is set to 0, the appropriate slice pitch is calculated based on the RowPitch * height.

mem: The pointer to a buffer in host memory where image data is to be written to.

EventWaitList: Optional. Specify events that need to complete before this particular command can be executed. The events specified in event_wait_list act as synchronization points. The context associated with events in event_wait_list and command_queue must be the same.

outEvent: Optional. Returns an event object that identifies this particular write command and can be used to query or queue a wait for this particular command to complete.

Calling EnqueueWriteImage to update the latest bits in a region of the image object with the mem argument value set to mem + (sourceOriginZ * image slice pitch + sourceOriginY * image row pitch + sourceOriginX * bytes per pixel), where mem is a pointer to the memory region specified when the image object being written is created with kMemoryUseHostPtr, must meet the following requirements in order to avoid undefined behavior:

- The host memory region being written contains the latest bits when the enqueued write command begins execution.
- The RowPitch and SlicePitch argument values in EnqueueWriteImage must be set to the image row pitch and slice pitch.
- The image object is not mapped.
- The image object is not used by any command-queue until the write command has finished execution.

- 143.1.36 EnqueueWriteImage(image as CLMemMBS, BlockingWrite as boolean, sourceOriginX as Integer, sourceOriginY as Integer, sourceOriginZ as Integer, RegionWidth as Integer, RegionHeight as Integer, RegionDepth as Integer, RowPitch as Integer, SlicePitch as Integer, mem as Memoryblock, EventWaitList() as CLEventMBS, byref outEvent as CLEventMBS) 19232

143.1.38 EnqueueWritePicture(image as CLMemMBS, sourceOriginX as Integer, sourceOriginY as Integer, RegionWidth as Integer, RegionHeight as Integer, pic as picture)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Enqueues a command to write from a 2D or 3D image object to a Xojo Picture.
Example:

```
const size = 500

// create test picture
Var pic1 as Picture = LogoMBS(size)
// create destination picture
Var pic2 as new Picture(size, size, 32)

// get device list
Var devices() as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeAll)
Var device as CLDeviceMBS = devices(0)

// Create context for that device
Var c as new CLContextMBS(device)

// query what format Xojo uses for pictures
Var RowPitch as Integer
Var format as CLImageFormatMBS = OpenCLMBS.GetPictureImageFormat(pic1, RowPitch)

// create a matching memory object
Var m as new CLMemMBS(c, CLMemMBS.kMemoryReadWrite, format, size, size, RowPitch)

// create command queue
Var cq as new CLCommandQueueMBS(c, device, 0)

// copy picture content into CLMem object
cq.EnqueueWritePicture(m, 0, 0, size, size, pic1)

// and copy back to second picture
cq.EnqueueReadPicture(m, 0, 0, size, size, pic2)

// finally display it
Backdrop = pic2
```

Notes: image: Refers to a valid 2D or 3D image object.

BlockingWrite: Optional. Indicates if the write operation is blocking or non-blocking.

origin: Defines the (x, y) offset in pixels in the image from where to write or write.

region: Defines the (width, height) in pixels of the 2D or 3D rectangle being write or written.

pic: The target Xojo picture object. This must match in the image format for the image object and the size you specified in region.

This operation is always performed blocked.
Lasterror is set.

143.1.39 Finish

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Blocks until all previously queued OpenCL commands in a command-queue are issued to the associated device and have completed.
Notes: Blocks until all previously queued OpenCL commands in command_queue are issued to the associated device and have completed.

Finish does not return until all queued commands in command_queue have been processed and completed. clFinish is also a synchronization point.

Lasterror is set.

143.1.40 Flush

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Issues all previously queued OpenCL commands in a command-queue to the device associated with the command-queue.
Notes: Issues all previously queued OpenCL commands in command_queue to the device associated with command_queue.

Flush only guarantees that all queued commands to command_queue get issued to the appropriate device. There is no guarantee that they will be complete after Flush returns.

Lasterror is set.

Any blocking commands queued in a command-queue such as EnqueueReadImage or EnqueueReadBuffer with BlockingRead set to true, EnqueueWriteImage or EnqueueWriteBuffer with BlockingWrite set to true, EnqueueMapImage or EnqueueMapBuffer with BlockingMap set to true or WaitForEvents perform an implicit flush of the command-queue.

To use event objects that refer to commands enqueued in a command-queue as event objects to wait on by commands enqueued in a different command-queue, the application must call a Flush or any blocking commands that perform an implicit flush of the command-queue where the commands that refer to these event objects are enqueued.
Lasterror is set.

143.1.41 Properties as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the currently specified properties for the command-queue.
Notes: Lasterror is set.

143.1.42 ReferenceCount as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the command-queue reference count.
Notes: Lasterror is set.

143.1.43 Properties

143.1.44 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The internel object reference.
Notes: Not zero if this object is valid.
(Read and Write property)

143.1.45 LastError as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The last error code.
Notes: See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

143.2 class CLContextMBS

143.2.1 class CLContextMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The OpenCL class for a context.
Example:

```
Var devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeGPU)
Var device as CLDeviceMBS = devices(0) // we use first one

// Create a context
Var context as new CLContextMBS(device, CLContextMBS.kErrorModeLogMessagesToSystemLog)
```

Notes: Contexts are used by the OpenCL runtime for managing objects such as command-queues, memory, program and kernel objects and for executing kernels on one or more devices specified in the context.

143.2.2 Methods

143.2.3 Constructor(Device as CLDeviceMBS, ErrorHandlerMode as Integer = 0)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Creates an OpenCL context.
Example:

```
Var devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeGPU)
Var device as CLDeviceMBS = devices(0) // we use first one

// Create a context
Var context as new CLContextMBS(device, CLContextMBS.kErrorModeLogMessagesToSystemLog)
```

Notes: Platform: Optional, Specifies the platform to use.
Devices: The devices you want to use. Can be one or several devices. If you specify none, the default one is picked.
ErrorHandlerMode: The error handler mode. Check kErrorMode* constants.

Lasterror is set.

- 143.2.5 Constructor(DeviceType as Integer, ErrorHandlerMode as Integer = 0) 19240
- 143.2.6 Constructor(Platform as CLPlatformMBS, Device as CLDeviceMBS, ErrorHandlerMode as Integer = 0) 19241
- 143.2.7 Constructor(Platform as CLPlatformMBS, Devices() as CLDeviceMBS, ErrorHandlerMode as Integer = 0) 19242
- 143.2.8 Constructor(Platform as CLPlatformMBS, DeviceType as Integer, ErrorHandlerMode as Integer = 0) 19242

143.2.4 Constructor(Devices() as CLDeviceMBS, ErrorHandlerMode as Integer = 0)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Creates an OpenCL context.
Notes: Platform: Optional, specifies the platform to use.
Devices: The devices you want to use. Can be one or several devices. If you specify none, the default one is picked.
ErrorHandlerMode: The error handler mode. Check kErrorMode* constants.

Lasterror is set.

- 143.2.8 Constructor(Platform as CLPlatformMBS, DeviceType as Integer, ErrorHandlerMode as Integer = 0) 19242

143.2.5 Constructor(DeviceType as Integer, ErrorHandlerMode as Integer = 0)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Create an OpenCL context from a device type that identifies the specific device(s) to use.
Example:

Var co as new CLContextMBS(CLDeviceMBS.kDeviceTypeAll)

Notes: Platform: Optional, Specifies the platform to use.
DeviceType: A bit-field that identifies the type of device and is described in the table below.
ErrorHandlerMode: The error handler mode. Check kErrorMode* constants.

Constants	Description
kDeviceTypeCPU	An OpenCL device that is the host processor. The host processor runs the OpenCL implementations and is a single or multi-core CPU.
kDeviceTypeGPU	An OpenCL device that is a GPU. By this we mean that the device can also be used to accelerate a 3D API such as OpenGL or DirectX.
kDeviceTypeAccelerator	Dedicated OpenCL accelerators (for example the IBM CELL Blade). These devices communicate with the host processor using a peripheral interconnect such as PCIe.
kDeviceTypeDefault	The default OpenCL device in the system.
kDeviceTypeAll	All OpenCL devices available in the system.

Lasterror is set.

143.2.8 Constructor(Platform as CLPlatformMBS, DeviceType as Integer, ErrorHandlerMode as Integer = 0)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Create an OpenCL context from a device type that identifies the specific device(s) to use.
Notes: Platform: Optional, Specifies the platform to use.

DeviceType: A bit-field that identifies the type of device and is described in the table below.
ErrorHandlerMode: The error handler mode. Check kErrorMode* constants.

Constants	Description
kDeviceTypeCPU	An OpenCL device that is the host processor. The host processor runs the OpenCL implementations and is a single or multi-core CPU.
kDeviceTypeGPU	An OpenCL device that is a GPU. By this we mean that the device can also be used to accelerate a 3D API such as OpenGL or DirectX.
kDeviceTypeAccelerator	Dedicated OpenCL accelerators (for example the IBM CELL Blade). These devices communicate with the host processor using a peripheral interconnect such as PCIe.
kDeviceTypeDefault	The default OpenCL device in the system.
kDeviceTypeAll	All OpenCL devices available in the system.

Lasterror is set.
See also:

- 143.2.3 Constructor(Device as CLDeviceMBS, ErrorHandlerMode as Integer = 0) 19239
- 143.2.4 Constructor(Devices() as CLDeviceMBS, ErrorHandlerMode as Integer = 0) 19240
- 143.2.5 Constructor(DeviceType as Integer, ErrorHandlerMode as Integer = 0) 19240
- 143.2.6 Constructor(Platform as CLPlatformMBS, Device as CLDeviceMBS, ErrorHandlerMode as Integer = 0) 19241
- 143.2.7 Constructor(Platform as CLPlatformMBS, Devices() as CLDeviceMBS, ErrorHandlerMode as Integer = 0) 19242

143.2.9 Devices as CLDeviceMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the list of devices in context.
Example:

```
// create context for all devices
Var co as new CLContextMBS(CLDeviceMBS.kDeviceTypeAll)

// and query it for it's devices
for each d as CLDeviceMBS in co.Devices
MessageBox d.Name
next
```

143.2.10 GetSupportedImageFormats(flags as UInt64, type as UInt32) as CLImageFormatMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Get the list of image formats supported by an OpenCL implementation.
Example:

```
Var co as new CLContextMBS(CLDeviceMBS.kDeviceTypeAll)

Var formats(-1) as CLImageFormatMBS = co.GetSupportedImageFormats(CLMemMBS.kMemoryReadWrite,
CLMemMBS.kMemoryTypeImage2D)
Var lines(-1) as string

for each f as CLImageFormatMBS in formats
// see constants for what this values mean
lines.Add hex(f.ImageChannelOrder)+" - "+hex(f.ImageChannelDataType)
next

MessageBox Join(lines,EndOfLine)
```

Notes: self: A valid OpenCL context on which the image object(s) will be created.
flags: A bit-field that is used to specify allocation and usage information about the image memory object being created and is described in the List of supported cl_mem_flags values for clCreateBuffer
type: Describes the image type and must be either kMemoryTypeImage2D or kMemoryTypeImage3D.

Returns an array of imageformat objects.

143.2.11 ReferenceCount as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the context reference count.
Example:

```
Var devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeGPU)
Var device as CLDeviceMBS = devices(0) // we use first one

// Create a context
Var context as new CLContextMBS(device, CLContextMBS.kErrorModeLogMessagesToSystemLog)

MessageBox str(context.ReferenceCount) // 1

// Create a command queue
Var queue as new CLCommandQueueMBS(context, device, 0)
```

MessageBox str(context.ReferenceCount) // 2 as the command queue points to the context, too.

143.2.12 Properties

143.2.13 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The internel object reference.
Notes: Not zero if this object is valid.
(Read and Write property)

143.2.14 LastError as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The last error code.
Notes: See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

143.2.15 Constants

Error mode constants

Constant	Value	Description
kErrorModeIgnore	0	
kErrorModeLogMessagesToStderr	3	Sends all log messages to the file descriptor stderr.
kErrorModeLogMessagesToStdout	2	Sends all log messages to the file descriptor stdout.
kErrorModeLogMessagesToSystemLog	1	Fowards on all log messages to the Apple System Logger.

143.3 class CLDeviceMBS

143.3.1 class CLDeviceMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The class for an OpenCL Device.

143.3.2 Methods

143.3.3 AddressBits as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The default compute device address space size specified as an unsigned integer value in bits.
Example:

```
Var Devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeAll)

for each p as CLDeviceMBS in Devices
MessageBox p.Name+": "+str(p.AddressBits)
next
```

Notes: Currently supported values are 32 or 64 bits.
Lasterror is set.

143.3.4 Available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns true if the device is available and false if the device is not available.
Notes: Lasterror is set.

143.3.5 CompilerAvailable as Boolean

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns false if the implementation does not have a compiler available to compile the program source.
Notes: Is true if the compiler is available. This can be false for the embedded platform profile only.

Lasterror is set.

143.3.6 DeviceType as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The OpenCL device type.
Notes: Currently supported values are one of or a combination of: kDeviceTypeCPU, kDeviceTypeGPU, kDeviceTypeAccelerator, or kDeviceTypeDefault.
Lasterror is set.

143.3.7 DeviceVersion as String

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: OpenCL version string.
Notes: Returns the OpenCL version supported by the device. This version string has the following format:

OpenCL<space><major_version.minor_version><space><vendor-specific information>

The major_version.minor_version value returned will be 1.0.
Lasterror is set.

143.3.8 DriverVersion as String

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: OpenCL software driver version string in the form major_number.minor_number.
Notes: Lasterror is set.

143.3.9 EndianLittle as Boolean

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns true if the OpenCL device is a little endian device and false otherwise.
Notes: Lasterror is set.

143.3.10 ErrorCorrectionSupport as Boolean

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns true if the device implements error correction for the memories, caches, registers etc. in the device.
Notes: Returns false if the device does not implement error correction. This can be a requirement for certain clients of OpenCL.
Lasterror is set.

143.3.11 ExecutionCapabilities as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Describes the execution capabilities of the device.
Notes: This is a bit-field that describes one or more of the following values:

kExecKernel - The OpenCL device can execute OpenCL kernels.
kExceNativeKernel - The OpenCL device can execute native kernels.

The mandated minimum capability is kExecKernel.
Lasterror is set.

143.3.12 Extensions as String

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns a space separated list of extension names.
Example:

```
// show MessageBox with all extensions for first device

Var devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeAll)
Var device as CLDeviceMBS = devices(0)

Var extensions(-1) as string = split(device.Extensions," ")

Var lines(-1) as string

for each extension as string in extensions
lines.Add extension
next

MessageBox Join(lines,EndOfLine)
```

Notes: (the extension names themselves do not contain any spaces).
The list of extension names returned currently can include one or more of the following approved extension names:

cl_khr_fp64
cl_khr_select_fprounding_mode
cl_khr_global_int32_base_atomics
cl_khr_global_int32_extended_atomics
cl_khr_local_int32_base_atomics
cl_khr_local_int32_extended_atomics
cl_khr_int64_base_atomics
cl_khr_int64_extended_atomics
cl_khr_3d_image_writes
cl_khr_byte_addressable_store
cl_khr_fp16

Lasterror is set.

143.3.13 GlobalMemoryCacheLineSize as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Size of global memory cache line in bytes.
Notes: Lasterror is set.

143.3.14 GlobalMemoryCacheSize as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Size of global memory cache in bytes.
Notes: Lasterror is set.

143.3.15 GlobalMemoryCacheType as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Type of global memory cache supported.
Notes: See kCacheMemType* constants.
Lasterror is set.

143.3.16 GlobalMemorySize as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Size of global device memory in bytes.
Notes: Lasterror is set.

143.3.17 Image2DMaxHeight as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Max height of 2D image in pixels.
Notes: The minimum value is 8192 if ImageSupport is true.
Lasterror is set.

143.3.18 Image2DMaxWidth as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Max width of 2D image in pixels.
Notes: The minimum value is 8192 if ImageSupport is true.
Lasterror is set.

143.3.19 Image3DMaxDepth as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Max depth of 3D image in pixels.
Notes: The minimum value is 2048 if ImageSupport is true.
Lasterror is set.

143.3.20 Image3DMaxHeight as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Max height of 3D image in pixels.
Notes: The minimum value is 2048 if ImageSupport is true.
Lasterror is set.

143.3.21 Image3DMaxWidth as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Max width of 3D image in pixels.
Notes: The minimum value is 2048 if ImageSupport is true.
Lasterror is set.

143.3.22 ImageSupport as Boolean

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns true if images are supported by the OpenCL device and false otherwise.
Notes: Lasterror is set.

143.3.23 LocalMemorySize as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Size of local memory arena in bytes.
Notes: The minimum value is 16 KB.
Lasterror is set.

143.3.24 LocalMemType as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Type of local memory supported.
Notes: This can be set to kMemTypeLocal implying dedicated local memory storage such as SRAM, or kMemTypeGlobal.
Lasterror is set.

143.3.25 MaxClockFrequency as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Maximum configured clock frequency of the device in MHz.
Notes: Lasterror is set.

143.3.26 MaxComputeUnits as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The number of parallel compute cores on the OpenCL device.
Notes: The minimum value is 1.
Lasterror is set.

143.3.27 MaxConstantArgs as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Max number of arguments declared with the __constant qualifier in a kernel.
Notes: The minimum value is 8.
Lasterror is set.

143.3.28 MaxConstantBufferSize as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Max size in bytes of a constant buffer allocation.
Notes: The minimum value is 64 KB.
Lasterror is set.

143.3.29 MaxMemoryAllocSize as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Max size of memory object allocation in bytes.
Notes: The minimum value is max (1/4th of GlobalMemorySize, 128*1024*1024)
Lasterror is set.

143.3.30 MaxParameterSize as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Max size in bytes of the arguments that can be passed to a kernel.
Notes: The minimum value is 256.
Lasterror is set.

143.3.31 MaxReadImageArgs as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Max number of simultaneous image objects that can be read by a kernel.
Notes: Lasterror is set.
The minimum value is 128 if ImageSupport is true.

143.3.32 MaxSamplers as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Maximum number of samplers that can be used in a kernel.
Notes: The minimum value is 16 if ImageSupport is true.
Lasterror is set.

143.3.33 MaxWorkGroupSize as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Maximum number of work-items in a work-group executing a kernel using the data parallel execution model.
Notes: (Refer to EnqueueNDRangeKernel). The minimum value is 1.
Lasterror is set.

143.3.34 MaxWorkItemDimensions as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Maximum dimensions that specify the global and local work-item IDs used by the data parallel execution model.
Notes: (Refer to EnqueueNDRangeKernel). The minimum value is 3.
Lasterror is set.

143.3.35 MaxWriteImageArgs as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Max number of simultaneous image objects that can be written to by a kernel.
Notes: The minimum value is 8 if ImageSupport is true.
Lasterror is set.

143.3.36 MemoryBaseAddressAlign as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Describes the alignment in bits of the base address of any allocated memory object.
Notes: Lasterror is set.

143.3.37 MinDataTypeAlignSize as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The smallest alignment in bytes which can be used for any data type.
Notes: Lasterror is set.

143.3.38 Name as String

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Device name string.
Example:

```
Var Devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeAll)

for each p as CLDeviceMBS in Devices
MessageBox p.Name
next
```

Notes: Lasterror is set.

143.3.39 Platform as CLPlatformMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The platform associated with this device.
Notes: Lasterror is set.

143.3.40 PreferredVectorWidthChar as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Preferred native vector width size for built-in scalar types that can be put into vectors.

Notes: The vector width is defined as the number of scalar elements that can be stored in the vector.
Lasterror is set.

143.3.41 PreferredVectorWidthDouble as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Preferred native vector width size for built-in scalar types that can be put into vectors.
Notes: The vector width is defined as the number of scalar elements that can be stored in the vector.

If the cl_khr_fp64 extension is not supported, this function must return 0.
Lasterror is set.

143.3.42 PreferredVectorWidthFloat as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Preferred native vector width size for built-in scalar types that can be put into vectors.
Notes: The vector width is defined as the number of scalar elements that can be stored in the vector.
Lasterror is set.

143.3.43 PreferredVectorWidthInt as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Preferred native vector width size for built-in scalar types that can be put into vectors.
Notes: The vector width is defined as the number of scalar elements that can be stored in the vector.
Lasterror is set.

143.3.44 PreferredVectorWidthLong as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Preferred native vector width size for built-in scalar types that can be put into vectors.
Notes: The vector width is defined as the number of scalar elements that can be stored in the vector.
Lasterror is set.

143.3.45 PreferredVectorWidthShort as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Preferred native vector width size for built-in scalar types that can be put into vectors.
Notes: The vector width is defined as the number of scalar elements that can be stored in the vector.
Lasterror is set.

143.3.46 Profile as String

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: OpenCL profile string.
Notes: Returns the profile name supported by the device (see note). The profile name returned can be one of the following strings:

FULL_PROFILE - if the device supports the OpenCL specification (functionality defined as part of the core specification and does not require any extensions to be supported).

EMBEDDED_PROFILE - if the device supports the OpenCL embedded profile.
Lasterror is set.

143.3.47 ProfilingTimerResolution as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Describes the resolution of device timer. This is measured in nanoseconds.
Notes: Lasterror is set.

143.3.48 QueueProperties as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Describes the command-queue properties supported by the device.
Notes: See kQueueOutOfOrderExecModeEnable and kQueueProfilingEnable.
Lasterror is set.

143.3.49 SingleFPConfig as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Describes single precision floating-point capability of the device.
Notes: The mandated minimum floating-point capability is kFPRoundToNearest+kFPInfNAN.
Lasterror is set.

143.3.50 Vendor as String

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Vendor name string.
Notes: Lasterror is set.

143.3.51 VendorID as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: A unique device vendor identifier.
Notes: An example of a unique device identifier could be the PCIe ID.
Lasterror is set.

143.3.52 Properties

143.3.53 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The internel object reference.
Notes: Not zero if this object is valid.
(Read and Write property)

143.3.54 LastError as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The last error code.
Notes: See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

143.3.55 Constants

Constants

Constant	Value	Description
kFPDenorm	1	One of the floating point capabilities constants. denorms are supported
kFPFMA	32	One of the floating point capabilities constants. IEEE754-2008 fused multiply-add is supported
kFPInfNAN	2	One of the floating point capabilities constants. INF and quiet NaNs are supported
kFPRoundToInf	16	One of the floating point capabilities constants. Round to +ve and -ve infinity rounding modes supported
kFPRoundToNearest	4	One of the floating point capabilities constants. Round to nearest even rounding mode supported
kFPRoundToZero	8	One of the floating point capabilities constants. Round to zero rounding mode supported

Cache memory type constants.

Constant	Value	Description
kCacheMemTypeNone	0	
kCacheMemTypeReadOnlyCache	1	Read Only Cache.
kCacheMemTypeReadWriteCache	2	Read/Write Cache.

Device Type Constants

Constant	Value	Description
kDeviceTypeAccelerator	8	Accelerator = some special acceleration device
kDeviceTypeAll	&Hffffffff	This is the bitmask to catch all possible types.
kDeviceTypeCPU	2	CPU = your processor
kDeviceTypeDefault	1	Default device.
kDeviceTypeGPU	4	GPU = your graphics card

Execution Capabilities Constants

Constant	Value	Description
kExceNativeKernel	2	The OpenCL device can execute native kernels.
kExecKernel	1	The OpenCL device can execute OpenCL kernels.

Memory Type Constants

Constant	Value	Description
kMemTypeGlobal	2	Dedicated local memory storage such as SRAM.
kMemTypeLocal	1	

Queue properties constants.

Constant	Value	Description
kQueueOutOfOrderExecModeEnable	1	Out of order execution mode enabled.
kQueueProfilingEnable	2	Profiling enabled.

143.4 class CLEventMBS

143.4.1 class CLEventMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The class for an OpenCL event.
Notes: You can chain several operations together inside a command queue. With events you can have an item execute after another item.
Blog Entries

- MBS Plugins 11.1 Release notes
- MBS REALbasic Plugins, version 11.1pr5

143.4.2 Methods

143.4.3 CommandExecutionStatus as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the execution status of the command identified by event.
Notes: See kCommandExecutionStatus* constants.
Lasterror is set.

143.4.4 CommandQueue as CLCommandQueueMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the command-queue associated with event.
Notes: Lasterror is set.

143.4.5 CommandType as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the command associated with event.
Notes: See kCommand* constants.
Lasterror is set.

143.4.6 ProfilingCommandEnd as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: A 64-bit value that describes the current device time counter in nanoseconds when the command identified by event has finished execution on the device.
Notes: Lasterror is set.

143.4.7 ProfilingCommandQueued as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: A 64-bit value that describes the current device time counter in nanoseconds when the command identified by event is enqueued in a command-queue by the host.
Notes: Lasterror is set.

143.4.8 ProfilingCommandStart as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: A 64-bit value that describes the current device time counter in nanoseconds when the command identified by event starts execution on the device.
Notes: Lasterror is set.

143.4.9 ProfilingCommandSubmit as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: A 64-bit value that describes the current device time counter in nanoseconds when the command identified by event that has been enqueued is submitted by the host to the device associated with the commandqueue.
Notes: Lasterror is set.

143.4.10 ReferenceCount as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the event reference count.
Notes: The reference count returned should be considered immediately stale. It is unsuitable for general use in applications. This feature is provided for identifying memory leaks.
Lasterror is set.

143.4.11 Properties

143.4.12 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The internel object reference.
Notes: Not zero if this object is valid.
(Read and Write property)

143.4.13 LastError as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The last error code.
Notes: See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

143.4.14 Constants

Command Type Constants

Constant	Value	Description
kCommandAcquireGLObjects	&h11FF	Acquire GL objects
kCommandCopyBuffer	&h11F5	Copy Buffer
kCommandCopyBufferToImage	&h11FA	Copy Buffer to Image
kCommandCopyImage	&h11F8	Copy Image
kCommandCopyImageToBuffer	&h11F9	Copy Image to Buffer
kCommandMapBuffer	&h11FB	Map Buffer
kCommandMapImage	&h11FC	Map Image
kCommandMarker	&h11FE	Marker
kCommandNativeKernel	&h11F2	Execute Native Kernel
kCommandNDRangeKernel	&h11F0	Execute a ND Range Kernel
kCommandReadBuffer	&h11F3	Read Buffer
kCommandReadImage	&h11F6	Read Image
kCommandReleaseGLObjects	&h1200	Release GL objects
kCommandTask	&h11F1	Execute task
kCommandUnmapMemObject	&h11FD	Unmap memory object
kCommandWriteBuffer	&h11F4	Write Buffer
kCommandWriteImage	&h11F7	Write Image

Command excecution status constants.

Constant	Value	Description
kCommandExecutionStatusComplete	0	The command has completed.
kCommandExecutionStatusQueued	3	command has been enqueued in the command-queue.
kCommandExecutionStatusRunning	1	Device is currently executing this command.
kCommandExecutionStatusSubmitted	2	enqueued command has been submitted by the host to the device assoc with the command-queue.

143.5 class CLImageFormatMBS

143.5.1 class CLImageFormatMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** the OpenCL class for an image format.

143.5.2 Properties

143.5.3 ImageChannelDataType as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Describes the size of the channel data type.
Notes: The number of bits per element determined by the ImageChannelDataType and ImageChannelOrder must be a power of two. The list of supported values is described in the table below.

Image Channel Data Type	Description
kChannelTypeSNormInt8	Each channel component is a normalized signed 8-bit integer value.
kChannelTypeSNormInt16	Each channel component is a normalized signed 16-bit integer value.
kChannelTypeUNormInt8	Each channel component is a normalized unsigned 8-bit integer value.
kChannelTypeUNormInt16	Each channel component is a normalized unsigned 16-bit integer value.
kChannelTypeUNormShort565	Represents a normalized 5-6-5 3-channel RGB image. The channel order must be kChannelOrderRGB.
kChannelTypeUNormShort555	Represents a normalized x-5-5-5 4-channel xRGB image. The channel order must be kChannelOrderRGB.
kChannelTypeUNormInt101010	Represents a normalized x-10-10-10 4-channel xRGB image. The channel order must be kChannelOrderRGB.
kChannelTypeSignedInt8	Each channel component is an unnormalized signed 8-bit integer value.
kChannelTypeSignedInt16	Each channel component is an unnormalized signed 16-bit integer value.
kChannelTypeSignedInt32	Each channel component is an unnormalized signed 32-bit integer value.
kChannelTypeUnsignedInt8	Each channel component is an unnormalized unsigned 8-bit integer value.
kChannelTypeUnsignedInt16	Each channel component is an unnormalized unsigned 16-bit integer value.
kChannelTypeUnsignedInt32	Each channel component is an unnormalized unsigned 32-bit integer value.
kChannelTypeHalfFloat	Each channel component is a 16-bit half-float value.
kChannelTypeFloat	Each channel component is a single precision floating-point value.

(Read and Write property)

143.5.4 ImageChannelOrder as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Specifies the number of channels and the channel layout i.e. the memory layout in which channels are stored in the image.
Notes: Valid values are described in the table below.

Format	Description
kChannelOrderR, or kChannelOrderA	
kChannelOrderIntensity	This format can only be used if channel data type = kChannelTypeUNormInt8, kChannelTypeUNormInt16, kChannelTypeSNormInt8, kChannelTypeSNormInt16, kChannelTypeHalfFloat, or kChannelTypeFloat.
kChannelOrderLuminance	This format can only be used if channel data type = kChannelTypeUNormInt8, kChannelTypeUNormInt16, kChannelTypeSNormInt8, kChannelTypeSNormInt16, kChannelTypeHalfFloat, or kChannelTypeFloat.
kChannelOrderRG, or kChannelOrderRA	
kChannelOrderRGB	This format can only be used if channel data type = kChannelTypeUNormShort565, kChannelTypeUNormShort555 or kChannelTypeUNormInt101010.
kChannelOrderRGBA	
kChannelOrderARGB, kChannelOrderBGRA.	This format can only be used if channel data type = kChannelTypeUNormInt8, kChannelTypeSNormInt8, kChannelTypeSignedInt8 or kChannelTypeUnsignedInt8.

(Read and Write property)

143.5.5 Constants

Channel Order Constants

Constant	Value	Description
kChannelOrderA	&h10B1	
kChannelOrderARGB	&h10B7	
kChannelOrderBGRA	&h10B6	
kChannelOrderIntensity	&h10B8	This format can only be used if channel data type = kChannelTypeUNormInt8, kChannelTypeUNormInt16, kChannelTypeSNormInt8, kChannelTypeSNormInt16, kChannelTypeHalfFloat, or kChannelTypeFloat.
kChannelOrderLuminance	&h10B9	This format can only be used if channel data type = kChannelTypeUNormInt8, kChannelTypeUNormInt16, kChannelTypeSNormInt8, kChannelTypeSNormInt16, kChannelTypeHalfFloat, or kChannelTypeFloat.
kChannelOrderR	&h10B0	
kChannelOrderRA	&h10B3	
kChannelOrderRG	&h10B2	
kChannelOrderRGB	&h10B4	This format can only be used if channel data type = kChannelTypeUNormShort565, kChannelTypeUNormShort555 or kChannelTypeUNormInt101010.
kChannelOrderRGBA	&h10B5	

Channel data type constants

Constant	Value	Description
kChannelTypeFloat	&h10DE	Each channel component is a single precision floating-point value.
kChannelTypeHalfFloat	&h10DD	Each channel component is a 16-bit half-float value.
kChannelTypeSignedInt16	&h10D8	Each channel component is an unnormalized signed 16-bit integer value.
kChannelTypeSignedInt32	&h10D9	Each channel component is an unnormalized signed 32-bit integer value.
kChannelTypeSignedInt8	&h10D7	Each channel component is an unnormalized signed 8-bit integer value.
kChannelTypeSNormInt16	&h10D1	Each channel component is a normalized signed 16-bit integer value.
kChannelTypeSNormInt8	&h10D0	Each channel component is a normalized signed 8-bit integer value.
kChannelTypeUNormInt101010	&h10D6	Represents a normalized x-10-10-10 4-channel xRGB image. The channel ord must be kChannelOrderRGB.
kChannelTypeUNormInt16	&h10D3	Each channel component is a normalized unsigned 16-bit integer value.
kChannelTypeUNormInt8	&h10D2	Each channel component is a normalized unsigned 8-bit integer value.
kChannelTypeUNormShort555	&h10D5	Represents a normalized x-5-5-5 4-channel xRGB image. The channel ord must be kChannelOrderRGB.
kChannelTypeUNormShort565	&h10D4	Represents a normalized 5-6-5 3-channel RGB image. The channel order mu be kChannelOrderRGB.
kChannelTypeUnsignedInt16	&h10DB	Each channel component is an unnormalized unsigned 16-bit integer value.
kChannelTypeUnsignedInt32	&h10DC	Each channel component is an unnormalized unsigned 32-bit integer value.
kChannelTypeUnsignedInt8	&h10DA	Each channel component is an unnormalized unsigned 8-bit integer value.

143.6 class CLKernelMBS

143.6.1 class CLKernelMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The class for an OpenCL Kernel.
Blog Entries

- MBS Plugins 11.1 Release notes
- MBS REALbasic Plugins, version 11.1pr5

143.6.2 Methods

143.6.3 Constructor(Program as CLProgramMBS, KernelName as string)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Creates a kernal object.
Notes: Program: A program object with a successfully built executable.
KernelName: A function name in the program declared with the ___kernel qualifier

A kernel is a function declared in a program. A kernel is identified by the ___kernel qualifier applied to any function in a program. A kernel object encapsulates the specific ___kernel function declared in a program and the argument values to be used when executing this ___kernel function.
Lasterror is set.

143.6.4 FunctionName as string

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the kernel function name.
Notes: Lasterror is set.

143.6.5 GetKernelCompileWorkGroupSize(device as CLDeviceMBS, byref X as Int64, byref Y as Int64, byref Z as Int64)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns the work-group size specified by the ___attribute___((reqd_work_gr oup_size(X, Y, Z))) qualifier.

Notes: device: Identifies a specific device in the list of devices associated with kernel. The list of devices is the list of devices in the OpenCL context that is associated with kernel. If the list of devices associated with kernel is a single device, device can be a nil value.

If the work-group size is not specified using the above attribute qualifier (0, 0, 0) is returned.
Lasterror is set.

143.6.6 GetKernelLocalMemorySize(device as CLDeviceMBS = nil) as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns the amount of local memory in bytes being used by a kernel.
Notes: device: Identifies a specific device in the list of devices associated with kernel. The list of devices is the list of devices in the OpenCL context that is associated with kernel. If the list of devices associated with kernel is a single device, device can be a nil value.

This includes local memory that may be needed by an implementation to execute the kernel, variables declared inside the kernel with the __local address qualifier and local memory to be allocated for arguments to the kernel declared as pointers with the __local address qualifier and whose size is specified with clSetKernelArg.

If the local memory size, for any pointer argument to the kernel declared with the __local address qualifier, is not specified, its size is assumed to be 0.
Lasterror is set.

143.6.7 GetKernelWorkGroupSize(device as CLDeviceMBS = nil) as Int64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: This provides a mechanism for the application to query the work-group size that can be used to execute a kernel on a specific device given by device.
Notes: device: Identifies a specific device in the list of devices associated with kernel. The list of devices is the list of devices in the OpenCL context that is associated with kernel. If the list of devices associated with kernel is a single device, device can be a nil value.

The OpenCL implementation uses the resource requirements of the kernel (register usage etc.) to determine what this work-group size should be.
Lasterror is set.

143.6.8 NumberOfArguments as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the number of arguments to kernel.
Notes: Lasterror is set.

143.6.9 ReferenceCount as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the kernel reference count.
Notes: The reference count returned should be considered immediately stale. It is unsuitable for general use in applications. This feature is provided for identifying memory leaks.
Lasterror is set.

143.6.10 SetKernelArgDouble(index as Integer, value as Double)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Sets the kernel argument with the given index.
Notes: index: The argument index. Arguments to the kernel are referred by indices that go from 0 for the leftmost argument to n - 1, where n is the total number of arguments declared by a kernel.
value: the value.

We have currently setters for Int32, Int64, Float, Double and CLMemMBS. Please email for additional types.
Lasterror is set.

143.6.11 SetKernelArgFloat(index as Integer, value as Single)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Sets the kernel argument with the given index.
Notes: index: The argument index. Arguments to the kernel are referred by indices that go from 0 for the leftmost argument to n - 1, where n is the total number of arguments declared by a kernel.
value: the value.

We have currently setters for Int32, Int64, Float, Double and CLMemMBS. Please email for additional types.
Lasterror is set.

143.6.12 SetKernelArgInt32(index as Integer, value as Int32)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Sets the kernel argument with the given index.
Notes: index: The argument index. Arguments to the kernel are referred by indices that go from 0 for the leftmost argument to n - 1, where n is the total number of arguments declared by a kernel.
value: the value.

We have currently setters for Int32, Int64, Float, Double and CLMemMBS. Please email for additional types.
Lasterror is set.

143.6.13 SetKernelArgInt64(index as Integer, value as Int64)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Sets the kernel argument with the given index.
Notes: index: The argument index. Arguments to the kernel are referred by indices that go from 0 for the leftmost argument to n - 1, where n is the total number of arguments declared by a kernel.
value: the value.

We have currently setters for Int32, Int64, Float, Double and CLMemMBS. Please email for additional types.
Lasterror is set.

143.6.14 SetKernelArgMem(index as Integer, mem as CLMemMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Sets the kernel argument with the given index.
Notes: index: The argument index. Arguments to the kernel are referred by indices that go from 0 for the leftmost argument to n - 1, where n is the total number of arguments declared by a kernel.
value: the memory object to set for argument.

We have currently setters for Int32, Int64, Float, Double and CLMemMBS. Please email for additional types.
Lasterror is set.

143.6.15 Properties

143.6.16 Context as CLContextMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the context associated with kernel.
Notes: Lasterror is set.
(Read and Write property)

143.6.17 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The internel object reference.
Notes: Not zero if this object is valid.
(Read and Write property)

143.6.18 LastError as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The last error code.
Notes: See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

143.6.19 Program as CLProgramMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the program object associated with kernel.
Notes: Lasterror is set.
(Read and Write property)

143.7 class CLMemMBS

143.7.1 class CLMemMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The class for a OpenCL memory block.
Example:

```
const Size = 4096
Var context as CLContextMBS // your context
Var input as new CLMemMBS(context, CLMEMMBS.kMemoryReadOnly, 4096)
```

143.7.2 Methods

143.7.3 Constructor(Context as CLContextMBS, Flags as UInt64, ImageFormat as CLImageFormatMBS, Width as Integer, Height as Integer, Depth as Integer, RowPitch as Integer, SlicePitch as Integer, HostPtr as Memoryblock = nil)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Creates a 3D image object.
Notes: context: A valid OpenCL context on which the image object is to be created.
flags: A bit-field that is used to specify allocation and usage information about the image memory object being created. See kMemory* constants.
ImageFormat: the image format properties of the image to be allocated.
Width, Height: The width and height of the image in pixels. These must be values greater than or equal to 1.
Depth: The depth of the image in pixels. This must be a value greater than 1.
RowPitch: The scan-line pitch in bytes. This must be 0 if HostPtr is nil and can be either 0 or greater than or equal to Width * size of element in bytes if HostPtr is not nil. If HostPtr is not nil and RowPitch is equal to 0, RowPitch is calculated as Width * size of element in bytes. If RowPitch is not 0, it must be a multiple of the image element size in bytes.
SlicePitch: The size in bytes of each 2D slice in the 3D image. This must be 0 if HostPtr is nil and can be either 0 or greater than or equal to RowPitch * Height if HostPtr is not nil. If HostPtr is not nil and SlicePitch equal to 0, SlicePitch is calculated as RowPitch * Height. If SlicePitch is not 0, it must be a multiple of the RowPitch.
HostPtr: A pointer to the image data that may already be allocated by the application. The size of the

buffer that HostPtr points to must be greater than or equal to SlicePitch * image_depth. The size of each element in bytes must be a power of 2. The image data specified by HostPtr is stored as a linear sequence of adjacent 2D slices. Each 2D slice is a linear sequence of adjacent scanlines. Each scanline is a linear sequence of image elements.

Lasterror is set.

- 143.7.3 Constructor(Context as CLContextMBS, Flags as UInt64, ImageFormat as CLImageFormatMBS, Width as Integer, Height as Integer, Depth as Integer, RowPitch as Integer, SlicePitch as Integer, HostPtr as Memoryblock = nil) 19272
- 143.7.5 Constructor(Context as CLContextMBS, Flags as UInt64, Size as Integer, HostPtr as Memoryblock = nil) 19274

143.7.5 Constructor(Context as CLContextMBS, Flags as UInt64, Size as Integer, HostPtr as Memoryblock = nil)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Creates a new buffer object.
Notes: context: A valid OpenCL context used to create the buffer object.
flags: A bit-field that is used to specify allocation and usage information such as the memory arena that should be used to allocate the buffer object and how it will be used. The following table describes the possible values for flags:
size: The size in bytes of the buffer memory object to be allocated.
HostPtr: A memoryblock that may already be allocated by the application. The size of the buffer that HostPtr points to must be greater than or equal to the size bytes.

Flags	Description
kMemoryReadWrite	This flag specifies that the memory object will be read and written by a kernel. This is the default.
kMemoryWriteOnly	This flags specifies that the memory object will be written but not read by a kernel. Reading from a buffer or image object created with kMemoryWriteOnly inside a kernel is undefined.
kMemoryReadOnly	This flag specifies that the memory object is a read-only memory object when used inside a kernel. Writing to a buffer or image object created with kMemoryReadOnly inside a kernel is undefined.
kMemoryUseHostPtr	This flag is valid only if HostPtr is not nil. If specified, it indicates that the application wants the OpenCL implementation to use memory referenced by HostPtr as the storage bits for the memory object. OpenCL implementations are allowed to cache the buffer contents pointed to by HostPtr in device memory. This cached copy can be used when kernels are executed on a device. The result of OpenCL commands that operate on multiple buffer objects created with the same HostPtr or overlapping host regions is considered to be undefined.
kMemoryAllocHostPtr	This flag specifies that the application wants the OpenCL implementation to allocate memory from host accessible memory. kMemoryAllocHostPtr and kMemoryUseHostPtr are mutually exclusive.
kMemoryCopyHostPtr	This flag is valid only if HostPtr is not nil. If specified, it indicates that the application wants the OpenCL implementation to allocate memory for the memory object and copy the data from memory referenced by HostPtr. kMemoryCopyHostPtr and kMemoryUseHostPtr are mutually exclusive. kMemoryCopyHostPtr can be used with kMemoryAllocHostPtr to initialize the contents of the cl_mem object allocated using host-accessible (e.g. PCIe) memory.

Lasterror is set.

- 143.7.3 Constructor(Context as CLContextMBS, Flags as UInt64, ImageFormat as CLImageFormatMBS, Width as Integer, Height as Integer, Depth as Integer, RowPitch as Integer, SlicePitch as Integer,

HostPtr as Memoryblock = nil) 19272

- 143.7.4 Constructor(Context as CLContextMBS, Flags as UInt64, ImageFormat as CLImageFormatMBS, Width as Integer, Height as Integer, RowPitch as Integer, HostPtr as Memoryblock = nil) 19273

143.7.6 Context as CLContextMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return context specified when memory object is created.
Notes: Lasterror is set.

143.7.7 Flags as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the flags argument value specified with Constructor.
Notes: Lasterror is set.

143.7.8 ImageDepth as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return depth of the image in pixels.
Notes: For a 2D image, depth equals 0.
Lasterror is set.

143.7.9 ImageElementSize as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return size of each element of the image memory object given by image.
Notes: An element is made up of n channels. The value of n is given with image format descriptor.
Lasterror is set.

143.7.10 ImageFormat as CLImageFormatMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return image format descriptor.
Notes: Lasterror is set.

143.7.11 ImageHeight as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return height of image in pixels.
Notes: Lasterror is set.

143.7.12 ImageRowPitch as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return size in bytes of a row of elements of the image object given by image.
Notes: Lasterror is set.

143.7.13 ImageSlicePitch as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return size in bytes of a 2D slice for the 3D image object given by image.
Notes: For a 2D image object this value will be 0.
Lasterror is set.

143.7.14 ImageWidth as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return width of image in pixels.
Notes: Lasterror is set.

143.7.15 ReferenceCount as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return memory object reference count.
Notes: The reference count returned should be considered immediately stale. It is unsuitable for general use in applications. This feature is provided for identifying memory leaks.
Lasterror is set.

143.7.16 Size as UInt64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return actual size of memory object in bytes.
Notes: Lasterror is set.

143.7.17 Type as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns the memory type.
Notes: Either normal buffer, image 2D or image 3D.
Lasterror is set.

143.7.18 Properties

143.7.19 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The internel object reference.
Notes: Not zero if this object is valid.
(Read and Write property)

143.7.20 LastError as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The last error code.
Notes: See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

143.7.21 Target as Memoryblock

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The reference to the memoryblock if you used kMemoryUseHostPtr to create this memory object.
Notes: (Read and Write property)

143.7.22 Constants

Mapping mode constants

Constant	Value	Description
kMapRead	1	
kMapWrite	2	

Constants for creating a memory block.

Constant	Value	Description
kMemoryAllocHostPtr	16	
kMemoryCopyHostPtr	32	
kMemoryReadOnly	4	
kMemoryReadWrite	1	
kMemoryUseHostPtr	8	
kMemoryWriteOnly	2	This flags specifies that the memory object will be written but not read by a kernel. Reading from a buffer or image object created with kMemoryWriteOnly inside a kernel is undefined.

Memory object types.

Constant	Value	Description
kMemoryTypeBuffer	&h10F0	A normal memory buffer.
kMemoryTypeImage2D	&h10F1	2D Image
kMemoryTypeImage3D	&h10F2	3D Image

143.8 class CLPlatformMBS

143.8.1 class CLPlatformMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The OpenCL class for a platform.
Blog Entries

143.8.2 Methods

143.8.3 DeviceCount(types as Int64) as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Queries number of devices with given types.
Example:

```
Var Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms

for each p as CLPlatformMBS in Platforms
MessageBox p.Name+": "+str(p.DeviceCount(CLDeviceMBS.kDeviceTypeAll))+" devices"
next
```

Notes: types: A bitfield that identifies the type of OpenCL device. The device_type can be used to query specific OpenCL devices or all OpenCL devices available. The valid values for device_type are specified in the following table.

cl_device_type	Description
kDeviceTypeCPU	An OpenCL device that is the host processor. The host processor runs the OpenCL implementations and is a single or multi-core CPU.
kDeviceTypeGPU	An OpenCL device that is a GPU. By this we mean that the device can also be used to accelerate a 3D API such as OpenGL or DirectX.
kDeviceTypeAccelerator	Dedicated OpenCL accelerators (for example the IBM CELL Blade). These devices communicate with the host processor using a peripheral interconnect such as PCIe.
kDeviceTypeDefault	The default OpenCL device in the system.
kDeviceTypeAll	All OpenCL devices available in the system.

Lasterror is set.

143.8.4 Devices(types as Int64) as CLDeviceMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Queries devices with given types.
Example:

```
// check all platforms
Var Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms

for each p as CLPlatformMBS in Platforms
Var lines(-1) as string

lines.Add p.Name
lines.Add ""

// and show device names
for each d as CLDeviceMBS in p.Devices(CLDeviceMBS.kDeviceTypeAll)
lines.Add d.name
next

MessageBox Join(lines,EndOfLine)
next
```

Notes: types: A bitfield that identifies the type of OpenCL device. The device_type can be used to query specific OpenCL devices or all OpenCL devices available. The valid values for device_type are specified in the following table.

cl_device_type	Description
kDeviceTypeCPU	An OpenCL device that is the host processor. The host processor runs the OpenCL implementations and is a single or multi-core CPU.
kDeviceTypeGPU	An OpenCL device that is a GPU. By this we mean that the device can also be used to accelerate a 3D API such as OpenGL or DirectX.
kDeviceTypeAccelerator	Dedicated OpenCL accelerators (for example the IBM CELL Blade). These devices communicate with the host processor using a peripheral interconnect such as PCIe.
kDeviceTypeDefault	The default OpenCL device in the system.
kDeviceTypeAll	All OpenCL devices available in the system.

Lasterror is set.

143.8.5 Extensions as string

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns a space-separated list of extension names (the extension names themselves do not contain any spaces) supported by the platform.
Example:

```
Var Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms

for each p as CLPlatformMBS in Platforms
MessageBox p.Name+": "+p.Extensions
next
```

Notes: Extensions defined here must be supported by all devices associated with this platform.
Lasterror is set.

143.8.6 Name as string

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Platform name string.
Example:

```
Var Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms

for each p as CLPlatformMBS in Platforms
MessageBox p.Name
next
```

Notes: Lasterror is set.

143.8.7 Profile as string

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: OpenCL profile string.
Example:

```
Var Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms

for each p as CLPlatformMBS in Platforms
MessageBox p.Name+": "+p.Profile
next
```

Notes: Returns the profile name supported by the implementation. The profile name returned can be one of the following strings:

FULL_PROFILE - if the implementation supports the OpenCL specification (functionality defined as part of the core specification and does not require any extensions to be supported).

EMBEDDED_PROFILE - if the implementation supports the OpenCL embedded profile. The embedded profile is defined to be a subset for each version of OpenCL.

Lasterror is set.

143.8.8 Vendor as string

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Platform vendor string.
Example:

```
Var Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms

for each p as CLPlatformMBS in Platforms
MessageBox p.Name+": "+p.Vendor
next
```

Notes: Lasterror is set.

143.8.9 Version as string

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: OpenCL version string.
Example:

```
Var Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms

for each p as CLPlatformMBS in Platforms
MessageBox p.Name+": "+p.Version
next
```

Notes: Returns the OpenCL version supported by the implementation. This version string has the following format:

OpenCL<space><major_version.minor_version><space><platform-specific information>

The major_version.minor_version value returned will be 1.0.
Lasterror is set.

143.8.10 Properties

143.8.11 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The internel object reference.
Notes: Not zero if this object is valid.
(Read and Write property)

143.8.12 LastError as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The last error code.
Notes: See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

143.9 class CLProgramMBS

143.9.1 class CLProgramMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The OpenCL class for a program.
Blog Entries

- MBS REALbasic Plugins, version 11.1pr5

143.9.2 Methods

143.9.3 Binaries as String()

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the program binaries for all devices associated with program.
Notes: For each device in program, the binary returned can be the binary specified for the device when program is created with Constructor or it can be the executable binary generated by BuildProgram. If program is created with Constructor (with Source code), the binary returned is the binary generated by BuildProgram. The bits returned can be an implementation-specific intermediate representation (a.k.a. IR) or device specific executable bits or both. The decision on which information is returned in the binary is up to the OpenCL implementation.

Each entry in this array is used by the implementation as the location in memory where to copy the program binary for a specific device, if there is a binary available.

Lasterror is set.

143.9.4 BinarySizes as UInt64()

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns an array that contains the size in bytes of the program binary for each device associated with program.
Notes: The size of the array is the number of devices associated with program. If a binary is not available for a device(s), a size of zero is returned.

Lasterror is set.

143.9.5 BuildLog(device as CLDeviceMBS) as string

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the build log when BuildProgram was called for device.
Notes: If build status of program for device is kBuildNone, an empty string is returned.
Lasterror is set.

143.9.6 BuildOptions(device as CLDeviceMBS) as string

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the build options specified by the options argument in BuildProgram for device.
Notes: If build status of program for device is kBuildNone, an empty string is returned.
Lasterror is set.

143.9.7 BuildProgram(device as CLDeviceMBS, options as string = "")

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Builds (compiles and links) a program executable from the program source or binary.
Notes: See other BuildProgram method for details
See also:

- 143.9.8 BuildProgram(devices() as CLDeviceMBS, options as string = "") 19285
- 143.9.9 BuildProgram(options as string = "") 19288

143.9.8 BuildProgram(devices() as CLDeviceMBS, options as string = "")

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Builds (compiles and links) a program executable from the program source or binary.
Notes:

devices	Optional, a list of devices you want to build for. If you specify no device, you build for all devices.
device	Optional, the device you want to build for. If you specify no device, you build for all devices.
options	A string that describes the build options to be used for building the program executable. The list of supported options is described in "Build Options" below.

OpenCL allows program executables to be built using the source or the binary.

The build options are categorized as pre-processor options, options for math intrinsics, options that control optimization and miscellaneous options. This specification defines a standard set of options that must be supported by an OpenCL compiler when building program executables online or offline. These may be extended by a set of vendor- or platform-specific options.

Preprocessor Options

These options control the OpenCL preprocessor which is run on each program source before actual compilation. -D options are processed in the order they are given in the options argument to clBuildProgram.
-D name
Predefine name as a macro, with definition 1.

-D name=definition
The contents of definition are tokenized and processed as if they appeared during translation phase three in a '#define' directive. In particular, the definition will be truncated by embedded newline characters.

-I dir
Add the directory dir to the list of directories to be searched for header files.

Math Intrinsics Options

These options control compiler behavior regarding floating-point arithmetic. These options trade off between speed and correctness.

-cl-single-precision-constant
Treat double precision floating-point constant as single precision constant.

-cl-denorms-are-zero
This option controls how single precision and double precision denormalized numbers are handled. If specified as a build option, the single precision denormalized numbers may be flushed to zero and if the optional extension for double precision is supported, double precision denormalized numbers may also be flushed to zero. This is intended to be a performance hint and the OpenCL compiler can choose not to flush denorms to zero if the device supports single precision (or double precision) denormalized numbers.

This option is ignored for single precision numbers if the device does not support single precision denormalized numbers i.e. kFPDenorm bit is not set in SingleFPConfig.

This option is ignored for double precision numbers if the device does not support double precision or if it does support double precison but CL_FP_DENORM bit is not set in CL_DEVICE_DOUBLE_FP_CON-

FIG.

This flag only applies for scalar and vector single precision floating-point variables and computations on these floating-point variables inside a program. It does not apply to reading from or writing to image objects.

Optimization Options

These options control various sorts of optimizations. Turning on optimization flags makes the compiler attempt to improve the performance and/or code size at the expense of compilation time and possibly the ability to debug the program.
-cl-opt-disable
This option disables all optimizations. The default is optimizations are enabled.

-cl-strict-aliasing
This option allows the compiler to assume the strictest aliasing rules.

The following options control compiler behavior regarding floating-point arithmetic. These options trade off between performance and correctness and must be specifically enabled. These options are not turned on by default since it can result in incorrect output for programs which depend on an exact implementation of IEEE 754 rules/specifications for math functions.

-cl-mad-enable
Allow a * b + c to be replaced by a mad. The mad computes a * b + c with reduced accuracy. For example, some OpenCL devices implement mad as truncate the result of a * b before adding it to c.

-cl-no-signed-zeros
Allow optimizations for floating-point arithmetic that ignore the signedness of zero. IEEE 754 arithmetic specifies the behavior of distinct +0.0 and -0.0 values, which then prohibits simplification of expressions such as x+0.0 or 0.0*x (even with -clfinite-math only). This option implies that the sign of a zero result isn't significant.

-cl-unsafe-math-optimizations
Allow optimizations for floating-point arithmetic that (a) assume that arguments and results are valid, (b) may violate IEEE 754 standard and (c) may violate the OpenCL numerical compliance requirements as defined in section 7.4 for single-precision floating-point, section 9.3.9 for double-precision floating-point, and edge case behavior in section 7.5. This option includes the -cl-no-signed-zeros and -cl-mad-enable options.

-cl-finite-math-only
Allow optimizations for floating-point arithmetic that assume that arguments and results are not NaNs or ¬±,àû. This option may violate the OpenCL numerical compliance requirements defined in in section 7.4 for single-precision floating-point, section 9.3.9 for double-precision floating-point, and edge case behavior in section 7.5.

-cl-fast-relaxed-math
Sets the optimization options -cl-finite-math-only and -cl-unsafe-math-optimizations. This allows optimizations for floating-point arithmetic that may violate the IEEE 754 standard and the OpenCL numerical compliance requirements defined in the specification in section 7.4 for single-precision floating-point, section 9.3.9 for double-precision floating-point, and edge case behavior in section 7.5. This option causes the preprocessor macro __FAST_RELAXED_MATH__ to be defined in the OpenCL program.

Options to Request or Suppress Warnings

Warnings are diagnostic messages that report constructions which are not inherently erroneous but which are risky or suggest there may have been an error. The following languageindependent options do not enable specific warnings but control the kinds of diagnostics produced by the OpenCL compiler.
-w
Inhibit all warning messages.

-Werror
Make all warnings into errors.

Lasterror is set.
See also:

- 143.9.7 BuildProgram(device as CLDeviceMBS, options as string = "") 19285
- 143.9.9 BuildProgram(options as string = "") 19288

143.9.9 BuildProgram(options as string = "")

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Builds (compiles and links) a program executable from the program source or binary.
Notes: See other BuildProgram method for details
Lasterror is set.
See also:

- 143.9.7 BuildProgram(device as CLDeviceMBS, options as string = "") 19285
- 143.9.8 BuildProgram(devices() as CLDeviceMBS, options as string = "") 19285

143.9.10 BuildStatus(device as CLDeviceMBS) as Int64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns the build status of program for a specific device as given by device.
Notes: See kBuild* constants.

Lasterror is set.

143.9.11 Constructor(context as CLContextMBS, devices() as CLDeviceMBS, binaries() as string, status() as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Creates a program object for a context, and loads specified binary data into the program object.
Notes: context: Must be a valid OpenCL context.
devices: a list of devices that are in context. The binaries are loaded for devices specified in this list.

The devices associated with the program object will be the list of devices specified by devices. The list of devices specified by devices must be devices associated with context.

binaries: An array of strings containing the program binaries to be loaded for devices specified by devices. For each device given by devices(i), the string with the program binary for that device is given by binaries(i).

The program binaries specified by binaries contain the bits that describe the program executable that will be run on the device(s) associated with context. The program binary can consist of either or both of device-specific executable(s), and/or implementation-specific intermediate representation (IR) which will be converted to the device-specific executable.

sttaus: Returns whether the program binary for each device specified in devices was loaded successfully or not. It is an array of ubound -1 and is filled by the plugin.

Lasterror is set.

OpenCL allows applications to create a program object using the program source or binary and build appropriate program executables. This allows applications to determine whether they want to use the pre-built offline binary or load and compile the program source and use the executable compiled/linked online as the program executable. This can be very useful as it allows applications to load and build program executables online on its first instance for appropriate OpenCL devices in the system. These executables can now be queried and cached by the application. Future instances of the application launching will no longer need to compile and build the program executables. The cached executables can be read and loaded by the application, which can help significantly reduce the application initialization time.

- 143.9.13 Constructor(context as CLContextMBS, lines() as string) 19290

143.9.12 Constructor(context as CLContextMBS, line as string)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Creates a program object for a context, and loads the source code specified by the line string into the program object.
Notes: context: Must be a valid OpenCL context.
line: A string with all the lines of the program.

The devices associated with the program object are the devices associated with context.

OpenCL allows applications to create a program object using the program source or binary and build appropriate program executables. This allows applications to determine whether they want to use the pre-built offline binary or load and compile the program source and use the executable compiled/linked online as the program executable. This can be very useful as it allows applications to load and build program executables online on its first instance for appropriate OpenCL devices in the system. These executables can now be queried and cached by the application. Future instances of the application launching will no longer need to compile and build the program executables. The cached executables can be read and loaded by the application, which can help significantly reduce the application initialization time.

An OpenCL program consists of a set of kernels that are identified as functions declared with the __kernel qualifier in the program source. OpenCL programs may also contain auxiliary functions and constant data that can be used by __kernel functions. The program executable can be generated online or offline by the OpenCL compiler for the appropriate target device(s).

Lasterror is set.

- 143.9.13 Constructor(context as CLContextMBS, lines() as string) 19290

143.9.13 Constructor(context as CLContextMBS, lines() as string)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Creates a program object for a context, and loads the source code specified by the text strings in the lines array into the program object.
Notes: context: Must be a valid OpenCL context.
lines: An array of strings that make up the source code.

The devices associated with the program object are the devices associated with context.

OpenCL allows applications to create a program object using the program source or binary and build appropriate program executables. This allows applications to determine whether they want to use the pre-built offline binary or load and compile the program source and use the executable compiled/linked online as the program executable. This can be very useful as it allows applications to load and build program executables online on its first instance for appropriate OpenCL devices in the system. These executables can now be queried and cached by the application. Future instances of the application launching will no longer need to compile and build the program executables. The cached executables can be read and loaded by the application, which can help significantly reduce the application initialization time.

An OpenCL program consists of a set of kernels that are identified as functions declared with the ___kernel qualifier in the program source. OpenCL programs may also contain auxiliary functions and constant data that can be used by ___kernel functions. The program executable can be generated online or offline by the OpenCL compiler for the appropriate target device(s).

Lasterror is set.

- 143.9.11 Constructor(context as CLContextMBS, devices() as CLDeviceMBS, binaries() as string, status() as Integer) 19289
- 143.9.12 Constructor(context as CLContextMBS, line as string) 19290

143.9.14 Context as CLContextMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The context for this program.
Notes: Lasterror is set.

143.9.15 CreateKernelsInProgram(maxKernels as Integer = 100) as CLKernelMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Creates kernel objects for all kernel functions in program.
Notes: maxKernels: maximum number of kernels to return.

Kernel objects are not created for any ___kernel functions in program that do not have the same function definition across all devices for which a program executable has been successfully built.

Kernel objects can only be created once you have a program object with a valid program source or binary loaded into the program object and the program executable has been successfully built for one or more devices associated with program. No changes to the program executable are allowed while there are kernel

objects associated with a program object. This means that calls to BuildProgram return kInvalidOperation (in lasterror) if there are kernel objects attached to a program object. The OpenCL context associated with program will be the context associated with kernel. The list of devices associated with program are the devices associated with kernel. Devices associated with a program object for which a valid program executable has been built can be used to execute kernels declared in the program object.

Lasterror is set.

143.9.16 Devices as CLDeviceMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the list of devices associated with the program object.
Notes: This can be the devices associated with context on which the program object has been created or can be a subset of devices that are specified when a progam object is created.

143.9.17 NumDevices as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the number of devices associated with program.
Notes: Lasterror is set.

143.9.18 ReferenceCount as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the program reference count.
Notes: Lasterror is set.

143.9.19 Source as string

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Return the program source code specified in the Constructor.
Notes: The source string returned is a concatenation of all source strings specified to Constructor.

143.9.20 Properties

143.9.21 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The internel object reference.
Notes: Not zero if this object is valid.
(Read and Write property)

143.9.22 LastError as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The last error code.
Notes: See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

143.9.23 Constants

Build Status constants

Constant	Value	Description
kBuildError	-2	The build status returned if the last call to BuildProgram on the specified program object for device generated an error.
kBuildInProgress	-3	The build status returned if the last call to BuildProgram on the specified program object for device has not finished.
kBuildNone	-1	The build status returned if no build has been performed on the specified program object for device.
kBuildSuccess	0	The build status returned if the last call to BuildProgram on the specified program object for device was successful.

143.10 class CLSamplerMBS

143.10.1 class CLSamplerMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The class for a Sampler.
Blog Entries

- MBS Real Studio Plugins, version 11.2pr9
- MBS Plugins 11.1 Release notes
- MBS REALbasic Plugins, version 11.1pr5

143.10.2 Methods

143.10.3 AddressingMode as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Return the value specified by addressingmode argument to Constructor.

143.10.4 Constructor(Context as CLContextMBS, NormalizedCoords as Boolean, AddressingMode as UInt32, FilterMode as UInt32)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Creates a sampler object.
Notes: context: Must be a valid OpenCL context.

NormalizedCoords: Determines if the image coordinates specified are normalized (if normalized_coords is true) or not (if normalized_coords is false).

AddressingMode: Specifies how out-of-range image coordinates are handled when reading from an image. This can be set to kAddressRepeat, kAddressClampToEdge, kAddressClamp, and kAddressNone.

FilterMode: Specifies the type of filter that must be applied when reading an image. This can be kFilterNearest or kFilterLinear.

Lasterror is set.

A sampler object describes how to sample an image when the image is read in the kernel. The built-in functions to read from an image in a kernel take a sampler as an argument. The sampler arguments to the image read function can be sampler objects created using OpenCL functions and passed as argument values to the kernel or can be samplers declared inside a kernel. In this section we discuss how sampler objects are created using OpenCL functions.

143.10.5 Context as CLContextMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Return the context specified when the sampler is created.

143.10.6 FilterMode as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Return the value specified by filterMode argument to Constructor.

143.10.7 NormalizedCoords as Boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Return the value specified by normalizedCoords argument to Constructor.

143.10.8 ReferenceCount as UInt32

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Return the sampler reference count.
Notes: The reference count returned should be considered immediately stale. It is unsuitable for general use in applications. This feature is provided for identifying memory leaks.

143.10.9 Properties

143.10.10 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The internel object reference.
Notes: Not zero if this object is valid.

(Read and Write property)

143.10.11 LastError as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The last error code.
Notes: See error constants in OpenCLMBS module.
The plugin uses lasterror = -1 for the case a function is not available.
(Read and Write property)

143.10.12 Constants

Address mode constants

Constant	Value	Description
kAddressClamp	&h1132	
kAddressClampToEdge	&h1131	
kAddressNone	&h1130	
kAddressRepeat	&h1133	

Filter mode constants

Constant	Value	Description
kFilterLinear	&h1141	
kFilterNearest	&h1140	

143.11 module OpenCLMBS

143.11.1 module OpenCLMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The module for OpenCL.
Example:

```
// list the OpenCL platforms and their GPU and CPU devices
If Not OpenCLMBS.isAvailable Then Return
Var lines() As String
For Each platform As CLPlatformMBS In OpenCLMBS.Platforms
lines.Add platform.Name + " " + platform.Version + " by " + platform.Vendor
For Each device As CLDeviceMBS In platform.Devices(CLDeviceMBS.kDeviceTypeAll)
lines.Add " " + device.Name + ", " + device.MaxComputeUnits.ToString + " compute units"
Next
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: from wikipedia:

OpenCL (Open Computing Language) is a framework for writing programs that execute across heterogeneous platforms consisting of CPUs, GPUs, and other processors. OpenCL includes a language (based on C99) for writing kernels (functions that execute on OpenCL devices), plus APIs that are used to define and then control the platforms. OpenCL provides parallel computing using task-based and data-based parallelism.

Xojo Developer Magazine

- 7.6, page 8: News

143.11.2 Methods

143.11.3 AllDeviceCount(types as Int64) as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Queries number of devices with given types.
Example:

```
Var c as Integer = OpenCLMBS.AllDeviceCount(CLDeviceMBS.kDeviceTypeCPU)
Var g as Integer = OpenCLMBS.AllDeviceCount(CLDeviceMBS.kDeviceTypeGPU)
MessageBox str(c)+" CPU and "+str(g)+" GPU"
```

Notes: types: A bitfield that identifies the type of OpenCL device. The device_type can be used to query specific OpenCL devices or all OpenCL devices available. The valid values for device_type are specified in the following table.

cl_device_type	Description
kDeviceTypeCPU	An OpenCL device that is the host processor. The host processor runs the OpenCL implementations and is a single or multi-core CPU.
kDeviceTypeGPU	An OpenCL device that is a GPU. By this we mean that the device can also be used to accelerate a 3D API such as OpenGL or DirectX.
kDeviceTypeAccelerator	Dedicated OpenCL accelerators (for example the IBM CELL Blade). These devices communicate with the host processor using a peripheral interconnect such as PCIe.
kDeviceTypeDefault	The default OpenCL device in the system.
kDeviceTypeAll	All OpenCL devices available in the system.

Lasterror is set.

143.11.4 AllDevices(types as Int64) as CLDeviceMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Queries devices with given types.
Example:

```
Var Devices(-1) as CLDeviceMBS = OpenCLMBS.AllDevices(CLDeviceMBS.kDeviceTypeAll)

for each p as CLDeviceMBS in Devices
MessageBox p.Name
next
```

Notes: types: A bitfield that identifies the type of OpenCL device. The device_type can be used to query specific OpenCL devices or all OpenCL devices available. The valid values for device_type are specified in the following table.

Lasterror is set.

cl_device_type	Description
kDeviceTypeCPU	An OpenCL device that is the host processor. The host processor runs the OpenCL implementations and is a single or multi-core CPU.
kDeviceTypeGPU	An OpenCL device that is a GPU. By this we mean that the device can also be used to accelerate a 3D API such as OpenGL or DirectX.
kDeviceTypeAccelerator	Dedicated OpenCL accelerators (for example the IBM CELL Blade). These devices communicate with the host processor using a peripheral interconnect such as PCIe.
kDeviceTypeDefault	The default OpenCL device in the system.
kDeviceTypeAll	All OpenCL devices available in the system.

143.11.5 GetExtensionFunctionAddress(name as string) as ptr

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns the address of the extension function named by funcname.
Notes: The function GetExtensionFunctionAddress returns the address of the extension function named by funcname. The pointer returned should be cast to a function pointer type matching the extension function's definition defined in the appropriate extension specification and header file. A return value of nil indicates that the specified function does not exist for the implementation. A non-nil return value for GetExtensionFunctionAddress does not guarantee that an extension function is actually supported. The application must also make a corresponding query using CLPlatformMBS.Extensions or CLDeviceMBS.Extensions to determine if an extension is supported by the OpenCL implementation.

GetExtensionFunctionAddress may not be queried for core (non-extension) functions in OpenCL. For functions that are queryable with clGetExtensionFunctionAddress, implementations may choose to also export those functions statically from the object libraries implementing those functions. However, portable applications cannot rely on this behavior.

Since there is no way to qualify the query with a device, the function pointer returned must work for all implementations of that extension on different devices. The behavior of calling a device extension function on a device not supporting that extension is undefined.

143.11.6 GetPictureImageFormat(pic as picture, byref RowPitch as Integer) as CLImageFormatMBS

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Queries the image format this picture would need when creating a storage object with CLMemMBS.
Example:

```
Var p as new Picture(100,100,32)
Var rowbytes as Integer
Var format as CLImageFormatMBS = OpenCLMBS.GetPictureImageFormat(p, rowbytes)
```

```
MessageBox hex(format.ImageChannelOrder)+" "+hex(format.ImageChannelDataType)+" "+str(rowbytes)
// shows 10B7 and 10D2 and 416 on Mac OS X Carbon
```

Notes: As Xojo uses 4 bytes per pixel on Mac and Windows, the plugin returns ARGB (or other byte order). The alpha channel is not used as Xojo stores

143.11.7 isAvailable as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Whether OpenCL is available.
Example:

```
if not OpenCLMBS.isAvailable then
if TargetMachO and TargetX86 then
MessageBox "OpenCL not available. Please install Mac OS X 10.6 to use it."
else
MessageBox "OpenCL not available. You need a Mac with Intel processor running Mac OS X 10.6."
end if
end if
```

Notes: Should return true on Mac OS X 10.6 and false everywhere else.

143.11.8 PlatformCount as Int64

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Queries number of platforms available.
Example:

```
MessageBox str(OpenCLMBS.PlatformCount)
```

Notes: Typically you have two with modern Macs as you get both CPU and GPU listed.
Lasterror is set.

143.11.9 Platforms as CLPlatformMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Obtain the list of platforms available.
Example:

```
Var Platforms(-1) as CLPlatformMBS = OpenCLMBS.Platforms

for each p as CLPlatformMBS in Platforms
MessageBox p.Name
next
```

Notes: Lasterror is set.

143.11.10 UnloadCompiler

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Allows the implementation to release the resources allocated by the OpenCL compiler.
Example:

```
OpenCLMBS.UnloadCompiler
MessageBox OpenCLMBS.LastErrorMessage
```

Notes: This is a hint from the application and does not guarantee that the compiler will not be used in the future or that the compiler will actually be unloaded by the implementation. Calls to BuildProgram after UnloadCompiler will reload the compiler, if necessary, to build the appropriate program executable.
Lasterror is set.

143.11.11 WaitForEvents(events() as CLEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Waits on the host thread for commands identified by event objects to complete.
Notes: events: The events specified in event_list act as synchronization points.

Waits on the host thread for commands identified by event objects in event_list to complete. A command is considered complete if its execution status is kCommandExecutionStatusComplete or a negative value.

Lasterror is set.

143.11.12 Properties

143.11.13 LastError as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The last error code.
Example:

MessageBox str(OpenCLMBS.LastError)

Notes: All the functions in all the OpenCL classes set this property, too.
(Read only property)

143.11.14 LastErrorMessage as string

MBS MacFrameworks Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The text message for the last error code.
Example:

MessageBox OpenCLMBS.LastErrorMessage

Notes: (Read only property)

143.11.15 Constants

Constants

Constant	Value	Description
kBuildProgramFailure	-11	One of the constants for OpenCL errors.
kCompilerNotAvailable	-3	One of the constants for OpenCL errors.
kDeviceNotAvailable	-2	One of the constants for OpenCL errors.
kDeviceNotFound	-1	One of the constants for OpenCL errors.
kImageFormatMismatch	-9	One of the constants for OpenCL errors.
kImageFormatNotSupported	-10	One of the constants for OpenCL errors.
kInvalidArgIndex	-49	One of the constants for OpenCL errors.
kInvalidArgSize	-51	One of the constants for OpenCL errors.
kInvalidArgValue	-50	One of the constants for OpenCL errors.
kInvalidBinary	-42	One of the constants for OpenCL errors.
kInvalidBufferSize	-61	One of the constants for OpenCL errors.
kInvalidBuildOptions	-43	One of the constants for OpenCL errors.
kInvalidCommandQueue	-36	One of the constants for OpenCL errors.
kInvalidContext	-34	One of the constants for OpenCL errors.
kInvalidDevice	-33	One of the constants for OpenCL errors.
kInvalidDeviceType	-31	One of the constants for OpenCL errors.
kInvalidEvent	-58	One of the constants for OpenCL errors.
kInvalidEventWaitList	-57	One of the constants for OpenCL errors.
kInvalidGlobalOffset	-56	One of the constants for OpenCL errors.
kInvalidGlObject	-60	One of the constants for OpenCL errors.
kInvalidHostPtr	-37	One of the constants for OpenCL errors.
kInvalidImageFormatDescriptor	-39	One of the constants for OpenCL errors.
kInvalidImageSize	-40	One of the constants for OpenCL errors.
kInvalidKernel	-48	One of the constants for OpenCL errors.
kInvalidKernelArgs	-52	One of the constants for OpenCL errors.
kInvalidKernelDefinition	-47	One of the constants for OpenCL errors.
kInvalidKernelName	-46	One of the constants for OpenCL errors.
kInvalidMemObject	-38	One of the constants for OpenCL errors.
kInvalidMipLevel	-62	One of the constants for OpenCL errors.
kInvalidOperation	-59	One of the constants for OpenCL errors.
kInvalidPlatform	-32	One of the constants for OpenCL errors.
kInvalidProgram	-44	One of the constants for OpenCL errors.
kInvalidProgramExecutable	-45	One of the constants for OpenCL errors.
kInvalidQueueProperties	-35	One of the constants for OpenCL errors.
kInvalidSampler	-41	One of the constants for OpenCL errors.
kInvalidValue	-30	One of the constants for OpenCL errors.
kInvalidWorkDimension	-53	One of the constants for OpenCL errors.
kInvalidWorkGroupSize	-54	One of the constants for OpenCL errors.
kInvalidWorkItemSize	-55	One of the constants for OpenCL errors.
kMapFailure	-12	One of the constants for OpenCL errors.
kMemCopyOverlap	-8	One of the constants for OpenCL errors.
kMemObjectAllocationFailure	-4	One of the constants for OpenCL errors.
kOutOfHostMemory	-6	One of the constants for OpenCL errors.
kOutOfResources	-5	One of the constants for OpenCL errors.
kProfilingInfoNotAvailable	-7	One of the constants for OpenCL errors.
kSuccess	0	One of the constants for OpenCL errors.

Chapter 144

PDFKit

144.1 class CustomPDFViewMBS

144.1.1 class CustomPDFViewMBS

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: The class for a custom PDFView.
Notes: Subclass of the PDFViewMBS class.
Blog Entries

144.1.2 Methods

144.1.3 ClearOverlay(page as PDFPageMBS, post as boolean = true)

MBS PDFKit Plugin, Plugin Version: 17.5, Platform: macOS, Targets: Desktop only.

Function: Clear overlay item for this page.
Notes: Is post = false, than we clear the item for pre page drawing, else for post page drawing.
The plugin does not trigger a redraw, so change takes effect on the next time the page is drawn.

144.1.4 ClearOverlays

MBS PDFKit Plugin, Plugin Version: 17.5, Platform: macOS, Targets: Desktop only.

Function: Clear all overlays.
Notes: The plugin does not trigger a redraw, so change takes effect on the next time the page is drawn.

144.1.5 Constructor

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new custom PDFView object.
See also:

- 144.1.6 Constructor(Handle as Integer) 19306
- 144.1.7 Constructor(left as Double, top as Double, width as Double, height as Double) 19306

144.1.6 Constructor(Handle as Integer)

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The constructor.
See also:

- 144.1.5 Constructor 19306
- 144.1.7 Constructor(left as Double, top as Double, width as Double, height as Double) 19306

144.1.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new custom PDFView object.
See also:

- 144.1.5 Constructor 19306
- 144.1.6 Constructor(Handle as Integer) 19306

144.1.8 Destructor

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The destructor.

144.1.9 Properties

144.1.10 Overlay(page as PDFPageMBS, post as boolean = true) as variant

MBS PDFKit Plugin, Plugin Version: 17.5, Platform: macOS, Targets: Desktop only.

Function: Get/Set overlay item.
Notes: MBS Plugin can draw a picture, NSImageMBS or PDFPageMBS below/over the PDF page.
The plugin does not trigger a redraw, so change takes effect on the next time the page is drawn.
(Read and Write computed property)

144.1.11 Events

144.1.12 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes: The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

144.1.13 acceptsFirstResponder as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

144.1.14 AfterDrawPage(graphics as NSGraphicsMBS, page as PDFPageMBS)

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: The draw event called after a page was drawn.
Notes: This event may not be called on OS X 10.11 or newer.
On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.1.15 AfterDrawPagePost(graphics as NSGraphicsMBS, page as PDFPageMBS)

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: The draw event called after a page annotations were drawn.
Notes: This event may not be called on OS X 10.11 or newer.
On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.1.16 AfterDrawRect(graphics as NSGraphicsMBS, x as Double, y as Double, w as Double, h as Double)

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The draw event called after something was drawn.
Notes: This event may not be called on OS X 10.11 or newer.
On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.1.17 becomeFirstResponder as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Called when the object gets focus.
Notes: Return true to accept.

144.1.18 BeforeDrawPage(graphics as NSGraphicsMBS, page as PDFPageMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: The draw event called before a page was drawn.

Notes: This event may not be called on OS X 10.11 or newer.
On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.1.19 BeforeDrawPagePost(graphics as NSGraphicsMBS, page as PDFPageMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: The draw event called before a page annotations were drawn.
Notes: This event may not be called on OS X 10.11 or newer.
On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.1.20 BeforeDrawRect(graphics as NSGraphicsMBS, x as Double, y as Double, w as Double, h as Double) as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The draw event called before a something was drawn.
Notes: This event may not be called on OS X 10.11 or newer.
On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.1.21 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a touch gesture.
Notes: e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

144.1.22 canBecomeKeyView as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

144.1.23 Close

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom NSView is destroyed.

144.1.24 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

144.1.25 draggingEnded(sender as NSDraggingInfoMBS)

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

144.1.26 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.

Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

144.1.27 draggingExited(sender as NSDraggingInfoMBS)

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

144.1.28 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging session has completed.
Notes: session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

144.1.29 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag moves on the screen.
Notes: session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

144.1.30 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Declares the types of operations the source allows to be performed. (required)
Notes: session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

144.1.31 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag will begin.
Notes: session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

144.1.32 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

144.1.33 endGestureWithEvent(e as NSEventMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has ended a touch gesture.
Notes: e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

144.1.34 ignoreModifierKeysForDraggingSession(session as NSDraggingSession-MBS) as boolean

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes: session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

144.1.35 isOpaque as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Whether this view is opaque.

144.1.36 keyDown(e as NSEventMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.

144.1.37 keyUp(e as NSEventMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.

144.1.38 magnifyWithEvent(e as NSEventMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a pinch gesture.
Notes: e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

144.1.39 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS PDFKit Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.

Notes: theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

144.1.40 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

144.1.41 mouseDownCanMoveWindow as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: This event is called so you can decide what happens with mouse down.
Notes: Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

144.1.42 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

144.1.43 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

144.1.44 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

144.1.45 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

144.1.46 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

144.1.47 Open

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom NSView is created.

144.1.48 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

144.1.49 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

144.1.50 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

144.1.51 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

144.1.52 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.

Notes: sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this method.

144.1.53 pressureChange(e as NSEventMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes: This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

144.1.54 resignFirstResponder as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Focus is going away.
Notes: Return true to accept.

144.1.55 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

144.1.56 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

144.1.57 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

144.1.58 rotateWithEvent(e as NSEventMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a rotation gesture.
Notes: e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

144.1.59 scrollWheel(e as NSEventMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes: e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

144.1.60 swipeWithEvent(e as NSEventMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a swipe gesture.
Notes: e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

144.1.61 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging images should be changed.
Notes: sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

144.1.62 viewDidMoveToWindow

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that it has been added to a new view hierarchy.
Notes: The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

144.1.63 wantsPeriodicDraggingUpdates as boolean

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes: Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

144.2 control DesktopPDFThumbnailViewControlMBS

144.2.1 control DesktopPDFThumbnailViewControlMBS

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a PDFThumbnailView.
Notes: This control embeds a special PDFThumbnailView subclass.
Designed for Xojo 2021r3 and newer.
Please use view property to access the underlaying object and set properties.

Does no longer work well with MacOS 10.12 or 10.13 as focus can't be set.
Blog Entries

- PDF Viewer controls for iOS

- New desktop controls
- MBS Xojo / Real Studio Plugins, version 13.4pr7

144.2.2 Properties

144.2.3 View as PDFThumbnailViewMBS

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

144.2.4 Events

144.2.5 BoundsChanged

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

144.2.6 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

144.2.7 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

144.2.8 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

144.2.9 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS PDFKit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

144.2.10 FocusLost

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

144.2.11 FocusReceived

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

144.2.12 FrameChanged

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

144.2.13 MenuBarSelected

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

144.2.14 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

144.2.15 MouseDrag(x as Integer, y as Integer)

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

144.2.16 MouseUp(x as Integer, y as Integer)

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

144.2.17 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

144.2.18 ScaleFactorChanged(NewFactor as Double)

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

144.2.19 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS PDFKit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

144.3 control DesktopPDFViewControlMBS

144.3.1 control DesktopPDFViewControlMBS

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a PDFView.
Notes: This control embeds a special PDFView subclass.
Designed for Xojo 2021r3 and newer.
Please use view property to access the underlaying object and set properties.

144.3.2 Methods

144.3.3 ClearOverlay(page as PDFPageMBS, post as boolean = true)

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Clear overlay item for this page.
Notes: Is post = false, than we clear the item for pre page drawing, else for post page drawing.
The plugin does not trigger a redraw, so change takes effect on the next time the page is drawn.

144.3.4 ClearOverlays

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Clear all overlays.
Notes: The plugin does not trigger a redraw, so change takes effect on the next time the page is drawn.

144.3.5 Properties

144.3.6 View as PDFViewMBS

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

144.3.7 Overlay(page as PDFPageMBS, post as boolean = true) as variant

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Get/Set overlay item.
Notes: MBS Plugin can draw a picture, NSImageMBS or PDFPageMBS below/over the PDF page.
The plugin does not trigger a redraw, so change takes effect on the next time the page is drawn.
(Read and Write computed property)

144.3.8 Events

144.3.9 AfterDrawPage(graphics as NSGraphicsMBS, page as PDFPageMBS)

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The draw event called after something was drawn.
Notes: On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.3.10 AfterDrawPagePost(graphics as NSGraphicsMBS, page as PDFPageMBS)

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The draw event called after a page annotations were drawn.
Notes: On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.3.11 AfterDrawRect(graphics as NSGraphicsMBS, x as Double, y as Double, w as Double, h as Double)

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The draw event called after a page was drawn.
Notes: On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.3.12 BeforeDrawPage(graphics as NSGraphicsMBS, page as PDFPageMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The draw event called before a page was drawn.
Notes: On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.3.13 BeforeDrawPagePost(graphics as NSGraphicsMBS, page as PDFPageMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The draw event called before a page annotations were drawn.
Notes: On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.3.14 BeforeDrawRect(graphics as NSGraphicsMBS, x as Double, y as Double, w as Double, h as Double) as boolean

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The draw event called before a something was drawn.

144.3.15 BoundsChanged

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

144.3.16 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

144.3.17 CocoaMouseDown(e as NSEventMBS)

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: This is called before MouseDown, but provides the original Cocoa event, so you can query additional properties.

144.3.18 CocoaMouseDrag(e as NSEventMBS)

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: This is called before MouseDrag, but provides the original Cocoa event, so you can query additional properties.

144.3.19 CocoaMouseUp(e as NSEventMBS)

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: This is called before MouseUp, but provides the original Cocoa event, so you can query additional properties.

144.3.20 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

144.3.21 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

144.3.22 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS PDFKit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

144.3.23 FocusLost

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

144.3.24 FocusReceived

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

144.3.25 FrameChanged

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

144.3.26 MenuBarSelected

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

144.3.27 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

144.3.28 MouseDrag(x as Integer, y as Integer)

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

144.3.29 MouseUp(x as Integer, y as Integer)

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

144.3.30 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

144.3.31 OpenPDFforRemoteGoToAction(action as PDFActionRemoteGoToMBS)

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Opens a specified page.
Notes: This event will be called to handle clicks on annotations containing a PDFActionRemoteGoToMBS action. The action contains a URL and a page index and point. You should open the PDF indicated by the URL and go to the page and point indicated. The easiest way to do the latter is to create a PDFDestinationMBS with the page index and point once a PDFDocumentMBS from the URL is created - then you can call: goToDestination method. The default implementation simply beeps.

144.3.32 PerformFind

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Performs a find operation.
Notes: Certain PDFAction's may request that the PDF viewer application perform a Find.
The event will be called when the user clicks on an annotation with such an action.

144.3.33 PerformGoToPage

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Performs a go-to operation.
Notes: Certain PDFAction's may request that the PDF viewer application bring up a panel allowing the

user to enter a specific page number. The event will be called when the user clicks on an annotation with such an action.

144.3.34 PerformPrint

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Prints the current document.
Notes: Certain PDFAction's may request that the PDF viewer application Print the current document. This event will be called when the user clicks on an annotation with such an action.

144.3.35 PrintJobTitle as String

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Overrides the job title used when the PDFView is printed.
Notes: Allows to override the job title when PDFView is printed. The default implementation uses the string, if any, associated with the "Title" key from the view's PDFDocumentMBS attribute dictionary. Failing that, it uses the last path component if the PDFDocumentMBS is URL-based.

144.3.36 ScaleFactorChanged(NewFactor as Double)

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

144.3.37 WillChangeScaleFactor(scale as Double) as Double

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Overrides changes to the scale factor.
Notes: Allows to override changes to the scale factor. The default implementation pins scaling between 0.1 and 10.0.

If you add this event, please return a value, e.g. the passed scale value.

144.3.38 WillClickOnLink(URL as String)

MBS PDFKit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Handle clicks on URL links in a view.
Notes: If implemented, this event will be called to handle clicks on URL links within the PDFView.
The default implementation calls openURL on NSWorkspaceMBS class.

144.3.39 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS PDFKit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

144.4 class PDFActionGoToMBS

144.4.1 class PDFActionGoToMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: PDFActionGoTo, a subclass of PDFAction, defines methods for getting and setting the destination of a go-to action.
Notes: A PDFActionGoTo object represents the action of going to a specific location within the PDF document.
Subclass of the PDFActionMBS class.
Blog Entries

- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr4

144.4.2 Methods

144.4.3 Constructor(destination as PDFDestinationMBS)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Initializes the go-to action.
Notes: destination: The destination with which to initialize the go-to action.
Available in Mac OS X v10.5 and later.

144.4.4 Properties

144.4.5 destination as PDFDestinationMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The destination associated with the action.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.5 class PDFActionMBS

144.5.1 class PDFActionMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: PDFAction represents an action that is performed when, for example, a PDF annotation is activated or an outline item is clicked.
Notes: A PDFAction object represents an action associated with a PDF element, such as an annotation or a link, that the viewer application can perform. See the Adobe PDF Specification for more about actions and action types.

PDFAction is an abstract superclass of the following concrete classes:

- PDFActionGoToMBS
- PDFActionNamedMBS
- PDFActionRemoteGoToMBS
- PDFActionResetFormMBS
- PDFActionURLMBS

Blog Entries

- New in the MBS Xojo Plugins Version 20.2
- MBS Xojo Plugins, version 20.2pr3

144.5.2 Methods

144.5.3 Constructor

MBS PDFKit Plugin, Plugin Version: 10.4, Platform: macOS, Targets: All.

Function: The private constructor.
Notes: This class is the base class for a number of annotations. So this constructor is private to make sure you don't create instances of PDFActionMBS. But you can still create instances of the subclasses.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.
See also:

- 144.5.4 Constructor(Handle as Integer) 19336

144.5.4 Constructor(Handle as Integer)

MBS PDFKit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a new object based on a given PDFAction handle.
Notes: Please pass in a non zero handle which points to a PDFAction object.
For use with declares.
See also:

- 144.5.3 Constructor 19335

144.5.5 copy as PDFActionMBS

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates a copy of the action object.

144.5.6 Properties

144.5.7 Handle as Integer

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The internal reference to the PDF action object.
Notes: (Read and Write property)

144.5.8 type as string

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the type of the action.
Notes: The PDF action type returned by this method may not correspond precisely to the name of a PDFAction subclass. For example, a PDFActionURL object might return "URI" or "Launch," depending on the original action as defined by the Adobe PDF Specification. In the PDF Kit, these two actions are handled in the single PDFActionURL subclass, and the more familiar term "URL" is used instead.

Available in Mac OS X v10.5 and later.
(Read only property)

144.6 class PDFActionNamedMBS

144.6.1 class PDFActionNamedMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: PDFActionNamed defines methods used to work with actions in PDF documents, some of which are named in the Adobe PDF Specification.
Example:

```
// add a link area that jumps to the next page when clicked
Var doc As New PDFDocumentMBS(SpecialFolder.Desktop.Child("test.pdf"))
If doc.pageCount = 0 Then Return

Var link As New PDFAnnotationMBS(500, 30, 80, 20, PDFAnnotationMBS.PDFAnnotationSubtypeLink)
link.Action = New PDFActionNamedMBS(PDFActionNamedMBS.kPDFActionNamedNextPage)

doc.pageAtIndex(0).addAnnotation link
Call doc.write(SpecialFolder.Desktop.Child("test with link.pdf"))
```

Notes: A PDFActionNamed object represents an action with a defined name, such as "Go back" or "Zoom in."
Subclass of the PDFActionMBS class.

144.6.2 Methods

144.6.3 Constructor(name as Integer)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Initializes the PDFActionName object with the specified named action.
Notes: Available in Mac OS X v10.5 and later.

144.6.4 Properties

144.6.5 name as Integer

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The name of the named action.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.6.6 Constants

Constants

Constant	Value	Description
kPDFActionNamedFind	8	One of the name constants for the action. The Find action. Available in Mac OS X v10.5 and later.
kPDFActionNamedFirstPage	3	One of the name constants for the action. The First Page action. Available in Mac OS X v10.5 and later.
kPDFActionNamedGoBack	5	One of the name constants for the action. The Go Back action. Available in Mac OS X v10.5 and later.
kPDFActionNamedGoForward	6	One of the name constants for the action. The Go Forward action. Available in Mac OS X v10.5 and later.
kPDFActionNamedGoToPage	7	One of the name constants for the action. The Go to Page action. Available in Mac OS X v10.5 and later.
kPDFActionNamedLastPage	4	One of the name constants for the action. The Last Page action. Available in Mac OS X v10.5 and later.
kPDFActionNamedNextPage	1	One of the name constants for the action. The Next Page action. Available in Mac OS X v10.5 and later.
kPDFActionNamedNone	0	One of the name constants for the action. The action has no name. Available in Mac OS X v10.5 and later.
kPDFActionNamedPreviousPage	2	One of the name constants for the action. The Previous Page action. Available in Mac OS X v10.5 and later.
kPDFActionNamedPrint	9	One of the name constants for the action. The Print action. Available in Mac OS X v10.5 and later.
kPDFActionNamedZoomIn	10	One of the name constants for the action. The Zoom In action. Available in Mac OS X v10.5 and later.
kPDFActionNamedZoomOut	11	One of the name constants for the action. The Zoom Out action. Available in Mac OS X v10.5 and later.

144.7 class PDFActionRemoteGoToMBS

144.7.1 class PDFActionRemoteGoToMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: PDFActionRemoteGoTo, a subclass of PDFAction, defines methods for getting and setting the destination of a go-to action that targets another document.
Notes: Available in Mac OS X v10.5 and later.
Subclass of the PDFActionMBS class.

144.7.2 Methods

144.7.3 Constructor(PageIndex as Integer, atPoint as NSPointMBS, file as folderitem)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Initializes the remote go-to action with the specified page index, point, and document URL.
Notes: pageIndex: The page index of the remote document.
point: The point on the page in the remote document.
file: The file of the remote PDF document.

The PDFActionRemoteGoTo object uses a zero-based page index, not a PDFPage object. This simplifies the handling of remote destinations for documents that may not be instantiated yet.

Available in Mac OS X v10.5 and later.
See also:

- 144.7.4 Constructor(PageIndex as Integer, atPoint as NSPointMBS, url as string) 19339

144.7.4 Constructor(PageIndex as Integer, atPoint as NSPointMBS, url as string)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Initializes the remote go-to action with the specified page index, point, and document URL.
Notes: pageIndex: The page index of the remote document.
point: The point on the page in the remote document.
url: The URL of the remote PDF document.

The PDFActionRemoteGoTo object uses a zero-based page index, not a PDFPage object. This simplifies the handling of remote destinations for documents that may not be instantiated yet.

Available in Mac OS X v10.5 and later.
See also:

- 144.7.3 Constructor(PageIndex as Integer, atPoint as NSPointMBS, file as folderitem) 19339

144.7.5 Properties

144.7.6 pageIndex as Integer

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The zero-based page index referenced by the remote go-to action.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.7.7 point as NSPointMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The point, in page space, on the page referenced by the remote go-to action.
Notes: The point on the page of the remote document referenced by the action. If either the x value or the y value of the point is kPDFDestinationUnspecifiedValue, no position on the page is specified.

Page space is a 72-dpi coordinate system with the origin at the lower-left corner of the current page.

Available in Mac OS X v10.5 and later.
(Read and Write property)

144.7.8 URL as string

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The URL of the document referenced by the remote go-to action.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.8 class PDFActionResetFormMBS

144.8.1 class PDFActionResetFormMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: PDFActionResetForm, a subclass of PDFAction, defines methods for getting and clearing fields in a PDF form.
Notes: A PDFActionResetForm object represents an action associated with a PDF form.
Subclass of the PDFActionMBS class.

144.8.2 Methods

144.8.3 Constructor

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Initializes a reset form action.
Notes: Initially, there are no fields and fieldsIncludedAreCleared returns true.

Available in Mac OS X v10.5 and later.

144.8.4 fields as string()

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns an array of fields associated with the reset action.
Notes: An array of strings that corresponds to the fieldNames property of widget annotations (such as PDFAnnotationButtonWidget) on the PDF page. This method can return an empty array.

Available in Mac OS X v10.5 and later.

144.8.5 setFields(fields() as string)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Sets the array of fields associated with the reset action.
Notes: Available in Mac OS X v10.5 and later.

144.8.6 Properties

144.8.7 fieldsIncludedAreCleared as boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Whether the fields associated with the reset action are cleared when the action is performed.
Notes: If true, the reset action's fields are cleared when the action is performed. If false, the fields are excluded from the reset action; that is, they are not cleared, but all other fields in the document are cleared.

Available in Mac OS X v10.5 and later.
(Read and Write property)

144.9 class PDFActionURLMBS

144.9.1 class PDFActionURLMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: PDFActionURL, a subclass of PDFAction, defines methods for getting and setting the URL associated with a URL action.
Notes: Subclass of the PDFActionMBS class.

144.9.2 Methods

144.9.3 Constructor(url as string)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Initializes a URL action with the specified URL.
Notes: Available in Mac OS X v10.5 and later.

144.9.4 Properties

144.9.5 URL as string

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The URL associated with the URL action.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.10 class PDFAnnotationButtonWidgetMBS

144.10.1 class PDFAnnotationButtonWidgetMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for an annotation button widget.
Example:

```
// add a checked checkbox to a PDF form
Var doc As New PDFDocumentMBS(SpecialFolder.Desktop.Child("form.pdf"))
If doc.pageCount = 0 Then Return

Var checkbox As New PDFAnnotationButtonWidgetMBS(72, 650, 16, 16)
checkbox.controlType = PDFAnnotationButtonWidgetMBS.kPDFWidgetCheckBoxControl
checkbox.fieldName = "newsletter"
checkbox.onStateValue = "Yes"
checkbox.state = PDFAnnotationButtonWidgetMBS.kPDFWidgetOnState

doc.pageAtIndex(0).addAnnotation checkbox
Call doc.write(SpecialFolder.Desktop.Child("form filled.pdf"))
```

Notes: Subclass of the PDFAnnotationMBS class.

144.10.2 Methods

144.10.3 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor which creates a new annotation widget.
See also:

- 144.10.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil) 19344

144.10.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor which creates a new annotation widget.
See also:

• 144.10.3 Constructor(left as Double, top as Double, width as Double, height as Double) 19344

144.10.5 Properties

144.10.6 allowsToggleToOff as boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether a radio button behaves in a toggling manner.
Notes: True if clicking a radio button control that is already in the on state toggles it to the off state; otherwise false.

Available in Mac OS X v10.5 and later.
(Read only property)

144.10.7 backgroundColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The background color.
Notes: (Read and Write property)

144.10.8 caption as string

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The text of the label on a push button control.
Notes: This method applies only to the label drawn on a control of type kPDFWidgetPushButtonControl.
Available in Mac OS X v10.5 and later.
(Read and Write property)

144.10.9 controlType as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The control type of this widget.
Notes: Value is one of the following constants:

kPDFWidgetUnknownControl
kPDFWidgetPushButtonControl
kPDFWidgetRadioButtonControl

kPDFWidgetCheckBoxControl
(Read and Write property)

144.10.10 fieldName as string

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal name of a field (used for reset-form actions).
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.10.11 font as NSFontMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The font used in the control's label.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.10.12 fontColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The font color used in the control's label.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.10.13 Highlighted as boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: A Boolean value that indicates whether the control is highlighted when it is drawn.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.10.14 onStateValue as string

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The string associated with the on state of a radio button or checkbox control.
Notes: This is a required string for controls of types kPDFWidgetRadioButtonControl and kPDFWidgetCheckBoxControl. The off state is always labeled "Off".

Available in Mac OS X v10.5 and later.
(Read and Write property)

144.10.15 state as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The state value.
Notes: (Read and Write property)

144.10.16 Events

144.10.17 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called for a custom drawing.
Notes: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

144.10.18 Constants

Constants

Constant	Value	Description
kPDFWidgetCheckBoxControl	2	One of the control types for this widget.
kPDFWidgetPushButtonControl	0	One of the control types for this widget.
kPDFWidgetRadioButtonControl	1	One of the control types for this widget.
kPDFWidgetUnknownControl	-1	One of the control types for this widget.
NSOffState	0	One of the state constants. The corresponding feature is in effect nowhere.
NSOnState	1	One of the state constants. The corresponding feature is in effect everywhere.

States

Constant	Value	Description
kPDFWidgetMixedState	-1	The corresponding feature is in mixed state.
kPDFWidgetOffState	0	The corresponding feature is in effect nowhere.
kPDFWidgetOnState	1	The corresponding feature is in effect everywhere.

144.11 class PDFAnnotationChoiceWidgetMBS

144.11.1 class PDFAnnotationChoiceWidgetMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: A PDFAnnotationChoiceWidget object provides user interactivity on a page of a PDF document, in the form of pop-up menus and lists.
Example:

```
// add a popup menu with countries to a PDF form
Var doc As New PDFDocumentMBS(SpecialFolder.Desktop.Child("form.pdf"))
If doc.pageCount = 0 Then Return

Var choice As New PDFAnnotationChoiceWidgetMBS(72, 600, 150, 20)
choice.fieldName = "country"
choice.isListChoice = False // popup menu instead of list
Var countries() As String = Array("Germany", "France", "Italy", "Spain")
choice.setChoices countries
choice.stringValue = "Germany"

doc.pageAtIndex(0).addAnnotation choice
Call doc.write(SpecialFolder.Desktop.Child("form filled.pdf"))
```

Notes: PDFAnnotationChoiceWidget inherits general annotation behavior from the PDFAnnotation class. If you use a PDFAnnotationChoiceWidget object, your application must handle hit testing, unless you are simply using PDFView to display content. This is because PDFView automatically handles hit testing for you.
Subclass of the PDFAnnotationMBS class.

144.11.2 Methods

144.11.3 choices as string()

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of strings that represent the items available in the list or pop-up menu of the choice widget annotation.
Notes: Available in Mac OS X v10.5 and later.

144.11.4 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a PDF annotation object.
Notes: Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page.
Available in Mac OS X v10.4 and later.
See also:

- 144.11.5 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil) 19350

144.11.5 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a PDF annotation object.
See also:

- 144.11.4 Constructor(left as Double, top as Double, width as Double, height as Double) 19350

144.11.6 setChoices(choices() as string)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the items available in the list or pop-up menu of the choice widget annotation.
Notes: choices: Send an array of strings, each of which represents an item in the list or pop-up menu of the choice annotation widget.

Available in Mac OS X v10.5 and later.

144.11.7 Properties

144.11.8 backgroundColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color of the widget annotation background.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.11.9 fieldName as string

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal field name associated with the widget annotation's value.
Notes: If the widget annotation is backed by PDF form data, it can associate an optional field name with a value or other data.

Available in Mac OS X v10.5 and later.
(Read and Write property)

144.11.10 font as NSFontMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The font used to display the text in the widget annotation.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.11.11 fontColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The font color used to display the text in the widget annotation.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.11.12 isListChoice as boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the widget annotation is a list.
Notes: A choice widget annotation can be either a list or a pop-up menu.

Available in Mac OS X v10.5 and later.
(Read and Write property)

144.11.13 stringValue as string

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The selection in the widget annotation.
Notes: If the widget annotation object is backed by PDF form data, this method returns the value associated with the appropriate field in the form object, if possible.

Available in Mac OS X v10.5 and later.
(Read and Write property)

144.11.14 Events

144.11.15 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called for a custom drawing.
Notes: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

144.12 class PDFAnnotationCircleMBS

144.12.1 class PDFAnnotationCircleMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The PDFKit class for an annotation circle.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)

Var page as PDFPageMBS = doc.pageAtIndex(0)
Var a as new PDFAnnotationCircleMBS(100,100,100,100)

a.border.style = PDFBorderMBS.kPDFBorderStyleBeveled

page.addAnnotation(a)

Var o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

Notes: Subclass of the PDFAnnotationMBS class.

144.12.2 Methods

144.12.3 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor to create a new annotation circle.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)

Var page as PDFPageMBS = doc.pageAtIndex(0)
Var a as new PDFAnnotationCircleMBS(100,100,100,100)

page.addAnnotation(a)

Var o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

See also:

- 144.12.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil) 19354

144.12.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor to create a new annotation circle.
See also:

- 144.12.3 Constructor(left as Double, top as Double, width as Double, height as Double) 19353

144.12.5 Properties

144.12.6 interiorColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Fill color used for drawing annotation.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)

Var page as PDFPageMBS = doc.pageAtIndex(0)
Var a as new PDFAnnotationCircleMBS(100,100,100,100)
a.interiorColor = NSColorMBS.magentaColor

page.addAnnotation(a)

Var o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

Notes: (Read and Write property)

144.12.7 Events

144.12.8 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called for a custom drawing.
Notes: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

144.13 class PDFAnnotationFreeTextMBS

144.13.1 class PDFAnnotationFreeTextMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for a free text annotation.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
Var page as PDFPageMBS = doc.pageAtIndex(0)
Var annotations(-1) as PDFAnnotationMBS = page.annotations

for each a as PDFAnnotationMBS in annotations
if a isa PDFAnnotationFreeTextMBS then
Var ft as PDFAnnotationFreeTextMBS = PDFAnnotationFreeTextMBS(a)
MessageBox ft.contents
end if
next
```

Notes: Subclass of the PDFAnnotationMBS class.
Blog Entries

- MBS Xojo Plugins, version 22.1pr3

144.13.2 Methods

144.13.3 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor to create a new free text annotation.
See also:

- 144.13.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil) 19356

144.13.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor to create a new free text annotation.
See also:

• 144.13.3 Constructor(left as Double, top as Double, width as Double, height as Double) 19356

144.13.5 NSCenterTextAlignment as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop only.

Function: The Cocoa text alignment constant for center.

144.13.6 NSRightTextAlignment as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop only.

Function: The Cocoa text alignment constant for right.

144.13.7 Properties

144.13.8 alignment as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Alignment of text within annotation bounds.
Example:

```
Var a as PDFAnnotationFreeTextMBS // an annotation

if a.alignment=a.NSLeftTextAlignment then
// left aligned
end if
```

Notes: Supported: NSLeftTextAlignment, NSRightTextAlignment and NSCenterTextAlignment.
(Read and Write property)

144.13.9 font as NSFontMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Font associated with the text field.
Notes: (Read and Write property)

144.13.10 fontColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The font color used in the text field of the annotation.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.13.11 Events

144.13.12 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called for a custom drawing.
Notes: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

144.13.13 Constants

Constants

Constant	Value	Description
NSJustifiedTextAlignment	3	The Cocoa text alignment constant for justified.
NSLeftTextAlignment	0	The Cocoa text alignment constant for left.
NSNaturalTextAlignment	4	The Cocoa text alignment constant for natural.

144.14 class PDFAnnotationInkMBS

144.14.1 class PDFAnnotationInkMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The PDFKit class for an ink annotation.
Example:

```
// draw a freehand underline with an ink annotation
Var doc As New PDFDocumentMBS(SpecialFolder.Desktop.Child("test.pdf"))
If doc.pageCount = 0 Then Return

Var path As New NSBezierPathMBS
path.moveToPoint New NSPointMBS(0, 5)
path.curveToPoint(New NSPointMBS(200, 5), New NSPointMBS(60, 0), New NSPointMBS(140, 10))

Var ink As New PDFAnnotationInkMBS(72, 500, 200, 10)
ink.addBezierPath path // coordinates relative to the annotation bounds
ink.colorValue = NSColorMBS.systemRedColor

doc.pageAtIndex(0).addAnnotation ink
Call doc.write(SpecialFolder.Desktop.Child("test with ink.pdf"))
```

Notes: Subclass of the PDFAnnotationMBS class.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr4

144.14.2 Methods

144.14.3 addBezierPath(path as NSBezierPathMBS)

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds a Bezier path to an annotation.

144.14.4 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor to create a new ink annotation.
See also:

- 144.14.5 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil) 19360

144.14.5 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor to create a new ink annotation.
See also:

- 144.14.4 Constructor(left as Double, top as Double, width as Double, height as Double) 19359

144.14.6 paths as NSBezierPathMBS()

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array containing the Bezier paths that make up an annotation.
Example:

```
Var a as new PDFAnnotationInkMBS(0, 0, 100, 100)

Var b1 as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(NSMakeRectMBS(10, 10, 10, 10))
a.addBezierPath b1

Var b2 as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(NSMakeRectMBS(50, 50, 20, 30))
a.addBezierPath b2

Var paths() as NSBezierPathMBS = a.paths
break
```

144.14.7 removeBezierPath(path as NSBezierPathMBS)

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes a Bezier path from an annotation.

144.14.8 Events

144.14.9 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called for a custom drawing.
Notes: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

144.15 class PDFAnnotationLineMBS

144.15.1 class PDFAnnotationLineMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The PDFKit class for a line annotation.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
Var page as PDFPageMBS = doc.pageAtIndex(0)
Var annotations(-1) as PDFAnnotationMBS = page.annotations

// show lines on first page
for each a as PDFAnnotationMBS in annotations
if a isa PDFAnnotationLineMBS then
Var l as PDFAnnotationLineMBS = PDFAnnotationLineMBS(a)
MessageBox "Line from "+l.startPoint.String+" to "+l.endPoint.String
end if
next
```

Notes: Subclass of the PDFAnnotationMBS class.

144.15.2 Methods

144.15.3 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor for a new annotation line.
Example:

```
Var a as new PDFAnnotationLineMBS(100,100,100,100)
```

See also:

- 144.15.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

144.15.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor for a new annotation line.
See also:

- 144.15.3 Constructor(left as Double, top as Double, width as Double, height as Double) 19362

144.15.5 Properties

144.15.6 endLineStyle as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Style used for ornaments at the line end.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)

Var page as PDFPageMBS = doc.pageAtIndex(0)
Var a as new PDFAnnotationLineMBS(100,100,100,100)

a.colorValue = NSColorMBS.redColor
a.endLineStyle = a.kPDFLineStyleOpenArrow

page.addAnnotation(a)

Var o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
```

Notes: (Read and Write property)

144.15.7 endPoint as NSPointMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: A point specifying the end point for line annotation.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
Var page as PDFPageMBS = doc.pageAtIndex(0)
```

```
Var annotations(-1) as PDFAnnotationMBS = page.annotations

// show lines on first page
for each a as PDFAnnotationMBS in annotations
if a isa PDFAnnotationLineMBS then
Var l as PDFAnnotationLineMBS = PDFAnnotationLineMBS(a)
MessageBox "Line from "+l.startPoint.String+" to "+l.endPoint.String
end if
next
```

Notes: (Read and Write property)

144.15.8 interiorColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color used to fill the ornament at the ends of the line.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.15.9 startLineStyle as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Style used for ornaments at the line start.
Example:

```
Var a as new PDFAnnotationLineMBS(100,100,100,100)
a.startLineStyle = a.kPDFLineStyleSquare
```

Notes: (Read and Write property)

144.15.10 startPoint as NSPointMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: A point specifying the start pointfor line annotation.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
Var page as PDFPageMBS = doc.pageAtIndex(0)
Var annotations(-1) as PDFAnnotationMBS = page.annotations
```

```
// show lines on first page
for each a as PDFAnnotationMBS in annotations
if a isa PDFAnnotationLineMBS then
Var l as PDFAnnotationLineMBS = PDFAnnotationLineMBS(a)
MessageBox "Line from "+l.startPoint.String+" to "+l.endPoint.String
end if
next
```

Notes: (Read and Write property)

144.15.11 Events

144.15.12 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called for a custom drawing.
Notes: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

144.15.13 Constants

Line Styles

Constant	Value	Description
kPDFLineStyleCircle	2	
kPDFLineStyleClosedArrow	5	
kPDFLineStyleDiamond	3	
kPDFLineStyleNone	0	
kPDFLineStyleOpenArrow	4	
kPDFLineStyleSquare	1	

144.16 class PDFAnnotationLinkMBS

144.16.1 class PDFAnnotationLinkMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The PDFKit class for a link annotation.
Example:

```
// load a PDF
Var sourceFile as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var p as new PDFDocumentMBS(sourceFile)

// get 4th page
Var page as PDFPageMBS = p.pageAtIndex(3)
// create a destination
Var dest as new PDFDestinationMBS(page, NSMakePointMBS(0,0))

// create the link annotation
Var LinkAnnotation as new PDFAnnotationLinkMBS(100,100,100,100)
LinkAnnotation.destination = dest

// add a color rect so we see the link
Var SquareAnnotation as new PDFAnnotationSquareMBS(100,100,100,100)
SquareAnnotation.colorValue = NSColorMBS.redColor

// add to the first page
p.pageAtIndex(0).addAnnotation(SquareAnnotation)
p.pageAtIndex(0).addAnnotation(LinkAnnotation)

// and write new PDF.
Var destfile as FolderItem = SpecialFolder.Desktop.Child("output.pdf")
call p.write(destfile)
```

Notes: Subclass of the PDFAnnotationMBS class.

144.16.2 Methods

144.16.3 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor for a new annotation link.
See also:

- 144.16.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil) 19367

144.16.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor for a new annotation link.
See also:

- 144.16.3 Constructor(left as Double, top as Double, width as Double, height as Double) 19366

144.16.5 setHighlighted(value as boolean)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The highlight state dictates how the annotation is drawn.
Notes: If a user has clicked on a "Link" annotation, you should set highlighted to true and redraw it. When the user lets up, set highlighted to false and redraw again.

144.16.6 Properties

144.16.7 destination as PDFDestinationMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Destination for the link.
Notes: (Read and Write property)

144.16.8 URL as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: URL for the link.
Notes: (Read and Write property)

144.16.9 Events

144.16.10 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called for a custom drawing.
Notes: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

144.17 class PDFAnnotationMarkupMBS

144.17.1 class PDFAnnotationMarkupMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for a markup annotation.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)

Var page as PDFPageMBS = doc.pageAtIndex(0)
Var a as new PDFAnnotationMarkupMBS(100,100,100,100)

page.addAnnotation(a)

Var o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

Notes: Subclass of the PDFAnnotationMBS class.

144.17.2 Methods

144.17.3 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor to create a new markup annotation.
Example:

```
Var a as new PDFAnnotationMarkupMBS(100,100,100,100)
```

See also:

- 144.17.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil) 19370

144.17.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor to create a new markup annotation.
See also:

- 144.17.3 Constructor(left as Double, top as Double, width as Double, height as Double) 19369

144.17.5 quadrilateralPoints as NSPointMBS()

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the quadrilateral points.
Example:

```
Var m as new PDFAnnotationMarkupMBS(10, 20, 30, 40)
Var points() as NSPointMBS = m.quadrilateralPoints
break // see points in debugger
```

Notes: Array of (n * 4) NSPoints defining n quadrilaterals in page space where n is the number of quad points.
The points for each quad are ordered in a 'Z' pattern. That is, the first point should represent the upper left point representing the start of the marked-up text, the next point will be the upper right, the third point will represent the lower left of the text and the last point the lower right. Points are specified relative to the annotation's bound's origin.

144.17.6 setQuadrilateralPoints(points() as NSPointMBS)

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Set the quadrilateral points.
Notes: Array of (n * 4) NSPoints defining n quadrilaterals in page space where n is the number of quad points.
The points for each quad are ordered in a 'Z' pattern. That is, the first point should represent the upper left point representing the start of the marked-up text, the next point will be the upper right, the third point will represent the lower left of the text and the last point the lower right. Points are specified relative to the annotation's bound's origin.

144.17.7 Properties

144.17.8 markupType as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Type of mark-up (highlight, strike-out or underline).
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)

Var page as PDFPageMBS = doc.pageAtIndex(0)
Var a as new PDFAnnotationMarkupMBS(100,100,100,100)
a.markupType = PDFAnnotationMarkupMBS.kPDFMarkupTypeUnderline
page.addAnnotation(a)

Var o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

Notes: Changing the markup type also changes the annotations type to one of: "Highlight", "Strikeout", or "Underline" (these are three separate annotation types treated here as three separate flavors of the one PDFAnnotationMarkup class).
(Read and Write property)

144.17.9 Events

144.17.10 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called for a custom drawing.
Notes: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

144.17.11 Constants

Markup Types

Constant	Value	Description
kPDFMarkupTypeHighlight	0	Highlight

kPDFMarkupTypeStrikeOut	1	StrikeOut
kPDFMarkupTypeUnderline	2	Underline

144.18 class PDFAnnotationMBS

144.18.1 class PDFAnnotationMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: This is the base class for all annotations.
Example:

```
// add a yellow note to the first page of a PDF file and save it
Var doc As New PDFDocumentMBS(SpecialFolder.Desktop.Child("test.pdf"))
If doc.pageCount = 0 Then Return

Var note As New PDFAnnotationMBS(100, 600, 200, 100, PDFAnnotationMBS.PDFAnnotationSubtype-
FreeText)
note.contents = "Please check this page."
note.colorValue = NSColorMBS.yellowColor

doc.pageAtIndex(0).addAnnotation note
Call doc.write(SpecialFolder.Desktop.Child("test with note.pdf"))
```

Notes: A PDFAnnotation object by itself is not useful, only the subclasses (like PDFAnnotationCircle, PDFAnnotationText) are interesting. In parsing a PDF however, any unknown or unsupported annotations will be represented as this base class. Its drawRect method merely frames the bounds of the annotation and prints the annotation type (like "TrapNet") within the box.

144.18.2 Methods

144.18.3 addBezierPath(path as NSBezierPathMBS)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Add paths from the annotation.
Notes: Path points are specified in annotation space.
Used by annotations type(s): /Ink.

144.18.4 choices as string()

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The choices are an array of strings indicating the options (items) in either a list or pop-up menu.
Notes: Used by annotations type(s): /Widget (field type(s): /Ch).

144.18.5 Constructor

MBS PDFKit Plugin, Plugin Version: 10.4, Platform: macOS, Targets: All.

Function: The private constructor.
Notes: This class is the base class for a number of annotations. So this constructor is private to make sure you don't create instances of PDFAnnotationMBS. But you can still create instances of the subclasses.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

- 144.18.7 Constructor(left as Double, top as Double, width as Double, height as Double) 19374
- 144.18.8 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil) 19375

144.18.6 Constructor(Handle as Integer)

MBS PDFKit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a new object based on a given PDFAnnotation handle.
Notes: Please pass in a non zero handle which points to a PDFAnnotation object.
For use with declares.
See also:

- 144.18.5 Constructor 19374
- 144.18.7 Constructor(left as Double, top as Double, width as Double, height as Double) 19374
- 144.18.8 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil) 19375

144.18.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new annotation.
Notes: You need to set type once.
See also:

- 144.18.5 Constructor 19374
- 144.18.6 Constructor(Handle as Integer) 19374
- 144.18.8 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil) 19375

144.18.8 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Creates a new annotation of given type.
See also:

- 144.18.5 Constructor 19374
- 144.18.6 Constructor(Handle as Integer) 19374
- 144.18.7 Constructor(left as Double, top as Double, width as Double, height as Double) 19374

144.18.9 copy as PDFAnnotationMBS

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates a copy of the annotation object.
Notes: For Mac OS X 10.7 and newer this function uses the framework function.
For Mac OS X 10.6 and older this function uses our own copy function to duplicate the annotation.

144.18.10 Destructor

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The destructor.

144.18.11 drawWithBox(box as Integer)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Draws the annotation on its associated page.
Notes: The annotation is drawn relative to the origin of box in page space.

Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page.

For additional information see the "Constants" section in the PDFPage class.

Available in Mac OS X v10.4 and later.

144.18.12 lineStyleFromName(Name as String) as Integer

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Queries line style for given name.
Notes: Method to help with mapping PDFLineStyle to the associated name based on PDF specification
Used by annotations type(s): /Line.

144.18.13 nameForLineStyle(LineStyle as Integer) as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Queries name for line style.
Notes: Method to help with mapping PDFLineStyle to the associated name based on PDF specification
Used by annotations type(s): /Line.

144.18.14 paths as NSBezierPathMBS()

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Array of NSBezierPathsMBS that comprise the annotation.
Notes: Paths are specified in annotation space.
Used by annotations type(s): /Ink.

144.18.15 PDFAnnotationHighlightingModeInvert as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the highlighting mode constants.
Notes: Invert

144.18.16 PDFAnnotationHighlightingModeNone as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the highlighting mode constants.
Notes: No

144.18.17 PDFAnnotationHighlightingModeOutline as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the highlighting mode constants.
Notes: Outline

144.18.18 PDFAnnotationHighlightingModePush as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the highlighting mode constants.
Notes: Push

144.18.19 PDFAnnotationKeyAction as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.20 PDFAnnotationKeyAdditionalActions as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.21 PDFAnnotationKeyAppearanceDictionary as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.22 PDFAnnotationKeyAppearanceState as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.23 PDFAnnotationKeyBorder as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.24 PDFAnnotationKeyBorderStyle as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.25 PDFAnnotationKeyColor as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.26 PDFAnnotationKeyContents as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.27 PDFAnnotationKeyDate as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.28 PDFAnnotationKeyDefaultAppearance as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.29 PDFAnnotationKeyDestination as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.30 PDFAnnotationKeyFlags as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.31 PDFAnnotationKeyHighlightingMode as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.32 PDFAnnotationKeyIconName as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.33 PDFAnnotationKeyInklist as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.34 PDFAnnotationKeyInteriorColor as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.35 PDFAnnotationKeyLineEndingStyles as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.36 PDFAnnotationKeyLinePoints as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.37 PDFAnnotationKeyName as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.38 PDFAnnotationKeyOpen as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.39 PDFAnnotationKeyPage as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.40 PDFAnnotationKeyParent as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.41 PDFAnnotationKeyPopup as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.42 PDFAnnotationKeyQuadding as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.43 PDFAnnotationKeyQuadPoints as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.44 PDFAnnotationKeyRect as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.45 PDFAnnotationKeySubtype as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.46 PDFAnnotationKeyTextLabel as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the annotation property keys.

144.18.47 PDFAnnotationKeyWidgetAppearanceDictionary as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the key widget property keys.

144.18.48 PDFAnnotationKeyWidgetBackgroundColor as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the key widget property keys.

144.18.49 PDFAnnotationKeyWidgetBorderColor as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the key widget property keys.

144.18.50 PDFAnnotationKeyWidgetCaption as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the key widget property keys.

144.18.51 PDFAnnotationKeyWidgetDefaultValue as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the key widget property keys.

144.18.52 PDFAnnotationKeyWidgetDownCaption as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the key widget property keys.

144.18.53 PDFAnnotationKeyWidgetFieldFlags as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the key widget property keys.

144.18.54 PDFAnnotationKeyWidgetFieldType as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the key widget property keys.

144.18.55 PDFAnnotationKeyWidgetMaxLen as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the key widget property keys.

144.18.56 PDFAnnotationKeyWidgetOptions as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the key widget property keys.

144.18.57 PDFAnnotationKeyWidgetRolloverCaption as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the key widget property keys.

144.18.58 PDFAnnotationKeyWidgetRotation as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the key widget property keys.

144.18.59 PDFAnnotationKeyWidgetTextLabelUI as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the key widget property keys.

144.18.60 PDFAnnotationKeyWidgetValue as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the key widget property keys.

144.18.61 PDFAnnotationLineEndingStyleCircle as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the line ending style constants.
Notes: Circle

144.18.62 PDFAnnotationLineEndingStyleClosedArrow as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the line ending style constants.
Notes: Closed Arrow

144.18.63 PDFAnnotationLineEndingStyleDiamond as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the line ending style constants.
Notes: Diamond

144.18.64 PDFAnnotationLineEndingStyleNone as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the line ending style constants.
Notes: No

144.18.65 PDFAnnotationLineEndingStyleOpenArrow as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the line ending style constants.
Notes: Open Arrow

144.18.66 PDFAnnotationLineEndingStyleSquare as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the line ending style constants.
Notes: Square

144.18.67 PDFAnnotationSubtypeCircle as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the subtypes.
Notes: Circle

144.18.68 PDFAnnotationSubtypeFreeText as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the subtypes.
Notes: Freetext

144.18.69 PDFAnnotationSubtypeHighlight as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the subtypes.
Notes: Highlight

144.18.70 PDFAnnotationSubtypeInk as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the subtypes.
Notes: Ink

144.18.71 PDFAnnotationSubtypeLine as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the subtypes.
Notes: Line

144.18.72 PDFAnnotationSubtypeLink as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the subtypes.
Notes: Link

144.18.73 PDFAnnotationSubtypePopup as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the subtypes.
Notes: Popup

144.18.74 PDFAnnotationSubtypeSquare as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the subtypes.
Notes: Square

144.18.75 PDFAnnotationSubtypeStamp as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the subtypes.
Notes: Stamp

144.18.76 PDFAnnotationSubtypeStrikeOut as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the subtypes.
Notes: Strike out

144.18.77 PDFAnnotationSubtypeText as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the subtypes.
Notes: Text

144.18.78 PDFAnnotationSubtypeUnderline as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the subtypes.
Notes: Underline

144.18.79 PDFAnnotationSubtypeWidget as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the subtypes.
Notes: Widget

144.18.80 PDFAnnotationTextIconTypeComment as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the icon type constants.
Notes: Comment

144.18.81 PDFAnnotationTextIconTypeHelp as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the icon type constants.
Notes: Help

144.18.82 PDFAnnotationTextIconTypeInsert as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the icon type constants.
Notes: Insert

144.18.83 PDFAnnotationTextIconTypeKey as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the icon type constants.
Notes: Key

144.18.84 PDFAnnotationTextIconTypeNewParagraph as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the icon type constants.
Notes: New Paragraph

144.18.85 PDFAnnotationTextIconTypeNote as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the icon type constants.
Notes: Note

144.18.86 PDFAnnotationTextIconTypeParagraph as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the icon type constants.
Notes: Paragraph

144.18.87 PDFAnnotationWidgetSubtypeButton as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the widget subtypes.
Notes: Button

144.18.88 PDFAnnotationWidgetSubtypeChoice as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the widget subtypes.
Notes: Choice

144.18.89 PDFAnnotationWidgetSubtypeSignature as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the widget subtypes.
Notes: Signature

144.18.90 PDFAnnotationWidgetSubtypeText as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the widget subtypes.
Notes: Text

144.18.91 quadrilateralPoints as NSPointMBS()

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Array of n * 4 points, packed as NSValue pointValue / CGPointValue, defining n quadrilaterals in page space where n is the number of quad points.
Notes: The points for each quad are ordered in a 'Z' pattern. That is, the first point should represent the upper left point representing the start of the marked-up text, the next point will be the upper right, the third point will represent the lower left of the text and the last point the lower right.
Points are specified relative to the annotation's bound's origin.

144.18.92 removeAllAppearanceStreams

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: All appearance streams for the target annotation are removed.
Notes: Without an appearance stream, annotations are drawn strictly according to their parameters (color, border, font, etc.). When a PDF is saved, PDF Kit will always write out an appearance stream(s) for each annotation. If the PDF is reloaded, you will need to remove the appearance streams in order to continue to edit the annotations parameters.

Requires Mac OS X 10.5.

144.18.93 removeBezierPath(path as NSBezierPathMBS)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Remove paths from the annotation.

144.18.94 removeValueForAnnotationKey(Key as String)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Remove the key-value pair from the annotation dictionary. Returns true on successful removal.

144.18.95 setBooleanValue(Key as String, value as Boolean) as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Sets a boolean value.
Notes: See also setValue.

144.18.96 setChoices(choices() as string)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The choices are an array of strings indicating the options (items) in either a list or pop-up menu.
Notes: Used by annotations type(s): /Widget (field type(s): /Ch).

144.18.97 setQuadrilateralPoints(points() as NSPointMBS)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Array of n * 4 points, packed as NSValue pointValue / CGPointValue, defining n quadrilaterals in page space where n is the number of quad points.
Notes: The points for each quad are ordered in a 'Z' pattern. That is, the first point should represent the upper left point representing the start of the marked-up text, the next point will be the upper right, the third point will represent the lower left of the text and the last point the lower right.
Points are specified relative to the annotation's bound's origin.

144.18.98 setRectValue(Key as String, value as NSRectMBS) as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Sets a rectangle value.
Notes: See also setValue.

144.18.99 setValue(Key as String, value as Variant) as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Allows you to set a key-value pair in this annotation's dictionary.
Notes: Returns true on successful assignment, false on error. Key must be valid for a PDF annotation's object type, and must have a value that is acceptable for the key type. These values can either be a string, number, array of strings or numbers, or an dictionary of the previously listed types. Some keys expect a complex type, for example the key "/C" expects a color in the format of an array of 0, 1, 3, or 4 elements, with each element being a floating-point number in the range of 0.0 - 1.0). As a convenience, these kind of keys will directly accept NSColorMBS values. Other convenience functions provide similar support can be found in PDFAnnotationUtilities header file. Note that you can set the environment variable "PDFKIT_LOG_ANNOTATIONS" to log any key-value assignment failures.

144.18.100 setValues(values() as string)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The choices are an array of strings indicating the option,Äôs export values in either a list or pop-up menu.
Notes: Used by annotations type(s): /Widget (field type(s): /Ch).

144.18.101 valueForAnnotationKey(Key as String) as Variant

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Retrieves a deep copy of the key-value pair based on the given key; key can either be from the keys PDFAnnotationKey, or an appropriate string from the PDF specification.

144.18.102 values as string()

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The choices are an array of strings indicating the option,Äôs export values in either a list or pop-up menu.
Notes: Used by annotations type(s): /Widget (field type(s): /Ch).

144.18.103 Properties

144.18.104 Action as PDFActionMBS

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Optional action performed when a user clicks / taps an annotation.
Notes: PDF readers ignore actions except for those associated with Link or button Widget annotations.

Available in macOS 10.5 or newer
(Read and Write property)

144.18.105 alignment as Integer

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Alignment of text within annotation bounds. Supported: NSLeftTextAlignment, NSRightTextAlignment and NSCenterTextAlignment.
Notes: Used by annotations type(s): /FreeText, /Widget (field type(s): /Tx).
(Read and Write property)

144.18.106 allowsToggleToOff as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: For radio buttons, indicates whether clicking on widget whose state is already On toggles it Off.
Notes: Used by annotations type(s): /Widget (field type(s): /Btn).
(Read and Write property)

144.18.107 annotationKeyValues as Dictionary

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: List all key-value pairs for this annotation; returns a deep copy of all pairs.
Notes: Note that this method will not include a copy of the value for /Parent. This is by design as to avoid introducing a memory cycle. If you would like to get the /Parent propery, use valueForAnnotationKey with key PDFAnnotationKeyParent.
(Read only property)

144.18.108 backgroundColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Background color characteristics.
Notes: Used by annotations type(s): /Widget (field type(s): /Btn, /Ch, /Tx).
(Read and Write property)

144.18.109 border as PDFBorderMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Optional border or border style that describes how to draw the annotation border (if any).
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)

Var page as PDFPageMBS = doc.pageAtIndex(0)
Var a as new PDFAnnotationSquareMBS(100,100,100,100)

a.interiorColor = NSColorMBS.greenColor
a.colorValue = NSColorMBS.redColor
a.border.lineWidth=5

page.addAnnotation(a)

Var o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

Notes: (Read and Write property)

144.18.110 bounds as NSRectMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The bounding box for the annotation in page space.
Notes: Page space is a 72-dpi coordinate system with the origin at the lower-left corner of the current page.

Available in Mac OS X v10.4 and later.
(Read and Write property)

144.18.111 buttonWidgetState as Integer

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The current state of a button widget annotation.
Notes: Used by annotations type(s): /Widget (field type(s): /Btn).
(Read and Write property)

144.18.112 buttonWidgetStateString as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The string that represents the ON state of a button widget annotation.
Notes: This should be set when trying to, for example, group together a set of radio buttons with the same field name.
When buttons share the same field name, their individual state strings set them apart from one another.
Used by annotations type(s): /Widget (field type(s): /Btn).
(Read and Write property)

144.18.113 caption as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Label for the button. Applies to kPDFWidgetPushButtonControl only.
Notes: Used by annotations type(s): /Widget (field type(s): /Btn).
(Read and Write property)

144.18.114 colorValue as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: For many annotations ("Circle", "Square") the stroke color.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)

Var page as PDFPageMBS = doc.pageAtIndex(0)
Var a as new PDFAnnotationLineMBS(100,100,100,100)

a.colorValue = NSColorMBS.redColor
a.endLineStyle = a.kPDFLineStyleOpenArrow

page.addAnnotation(a)
```

```
Var o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
```

Notes: Used for other annotations as well.
(Read and Write property)

144.18.115 comb as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Used to configure combing for PDF text fields.
Notes: If set, the field is automatically divided into as many equally spaced positions, or combs, as the value of the maximum length of the field. To get the maximum length, use annotaiton key: PDFAnnotationKeyWidgetMaxLen.
Used by annotations type(s): /Widget (field type(s): /Tx).
(Read and Write property)

144.18.116 contents as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: A string of text associated with an annotation.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)

Var page as PDFPageMBS = doc.pageAtIndex(0)
Var a as new PDFAnnotationTextMBS(100,100,100,100)

a.contents="Hello"
a.colorValue = NSColorMBS.redColor

page.addAnnotation(a)

Var o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

Notes: Often to be displayed in a pop-up when the annotation is clicked on ("FreeText" and "Text" especially).
(Read and Write property)

144.18.117 destination as PDFDestinationMBS

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Destination for the link. May be nil if no destination associated with link; in this case the URL may be valid.
Notes: The preferred way though is to use action property.
Used by annotations type(s): /Link.
(Read and Write property)

144.18.118 endLineStyle as Integer

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Style used for ornaments at the lines end (optional, PDF 1.4).
Notes: Used by annotations type(s): /Line.
(Read and Write property)

144.18.119 endPoint as NSPointMBS

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Points specifying end points for line annotation (required).
Notes: Points are specified in annotation space.
Used by annotations type(s): /Line.
(Read and Write property)

144.18.120 fieldName as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Widget annotations backed by form data have (internal) field names with which to associate a value or data.
Notes: Can also be used for ResetForm actions.
Used by annotations type(s): /Widget (field type(s): /Btn, /Ch, /Tx).
(Read and Write property)

144.18.121 font as NSFontMBS

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Font and font color associated with the text field.
Notes: Used by annotations type(s): /FreeText, /Popup, /Widget (field type(s): /Btn, /Ch, and /Tx).
(Read and Write property)

144.18.122 fontColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Width of line used to stroke border.
Notes: Used by annotations type(s): /FreeText, /Widget (field type(s): /Btn, /Ch, and /Tx).
(Read and Write property)

144.18.123 Handle as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The handle used internally for the object reference.
Notes: (Read and Write property)

144.18.124 hasAppearanceStream as boolean

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Returns true if the annotation has an appearance stream.
Notes: Annotations with appearance streams are drawn using their stream. As a result, setting many parameters (like 'setColor' above), will have no visible effect.
(Read only property)

144.18.125 iconType as Integer

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The type of icon displayed in the PDF. Supported icons: "Comment", "Key", "Note", "Help", "NewParagraph", "Paragraph" and "Insert".
Notes: Used by annotations type(s): /Text.
(Read and Write property)

144.18.126 interiorColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Interior color of the annotation.
Notes: Used by annotations type(s): /Circle, /Line, /Square.
(Read and Write property)

144.18.127 isHighlighted as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The highlight state dictates how the annotation is drawn.
Notes: For example, if a user has clicked on a "Link" annotation, you should set highlighted to YES and redraw it. When the user lets up, set highlighted to false and redraw again.

Available in macOS 10.13 or newer or iOS 11.0 or newer.
(Read and Write property)

144.18.128 isPasswordField as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Used to determine if a PDF text field is a password field.
Notes: Used by annotations type(s): /Widget (field type(s): /Tx).
(Read only property)

144.18.129 ListChoice as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: There are two flavors of Choice widget annotations, lists and pop-up menus. This method allow you to differentiate.
Notes: Used by annotations type(s): /Widget (field type(s): /Ch).
(Read and Write property)

144.18.130 markupType as Integer

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Type of mark-up (highlight, strike-out or underline). Changing the markup type also changes the annotations type.
Notes: Used by annotations type(s): /Highlight, /StrikeOut, /Underline.
(Read and Write property)

144.18.131 maximumLength as Integer

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Maximum characters allowed (optional, zero indicates no specified maximum).
Notes: Used by annotations type(s): /Widget (field type(s): /Tx).
(Read and Write property)

144.18.132 modificationDate as date

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The modification date of the annotation.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.18.133 modificationDateTime as DateTime

MBS PDFKit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The modification date of the annotation.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.18.134 mouseUpAction as PDFActionMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The action performed when a user releases the mouse button within an annotation.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.18.135 multiline as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Used to configure multiline PDF text fields.
Notes: Used by annotations type(s): /Widget (field type(s): /Tx).
(Read and Write property)

144.18.136 Open as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Used to tell if an annotation is open or closed.
Notes: Used by annotations type(s): /Popup.
(Read and Write property)

144.18.137 page as PDFPageMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Returns the page the annotation is associated with.
Notes: (Read only property)

144.18.138 popup as Variant

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The pop-up annotation associated with an annotation.
Notes: The variant is a PDFAnnotationPopupMBS.

Pop-up annotations are not used with links or widgets. The bounds and open state of the pop-up annotation indicate the placement and open state of the pop-up window.

Available in Mac OS X v10.5 and later.
(Read and Write property)

144.18.139 radiosInUnison as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: For radio buttons, indicates whether a group of radio buttons will turn on and off in unison; that is if one is checked, they are all checked. If clear, the buttons are mutually exclusive.
Notes: Used by annotations type(s): /Widget (field type(s): /Btn).
(Read and Write property)

144.18.140 ReadOnly as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Determines if a text field should be editable or not.
Notes: Used by annotations type(s): /Widget (field type(s): /Btn, /Ch, /Tx).
(Read and Write property)

144.18.141 shouldDisplay as boolean

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Specifies whether it should be drawn to the display or not.
Notes: (Read and Write property)

144.18.142 shouldPrint as boolean

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Specifies whether it should be printed or not.
Notes: (Read and Write property)

144.18.143 stampName as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Name of stamp annotation.
Notes: Standard stamps include names like, "Approved", "Draft", "TopSecret", etc.
The name must be representable as ASCII. Very little is rendered if the annotation has no appearance stream.
Used by annotations type(s): /Stamp
(Read and Write property)

144.18.144 startLineStyle as Integer

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Style used for ornaments at the lines start (optional, PDF 1.4).
Notes: Used by annotations type(s): /Line.
(Read and Write property)

144.18.145 startPoint as NSPointMBS

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Points specifying start points for line annotation (required).
Notes: Points are specified in annotation space.
Used by annotations type(s): /Line.
(Read and Write property)

144.18.146 toolTip as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: String used for tooltips.
Notes: The base class returns contents, sub-classes may override as appropriate.
(Read only property)

144.18.147 type as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Returns the annotation type (called "Subtype" in the PDF specification since "Annot" is the type).
Example:

```
Var a as new PDFAnnotationTextMBS(100,100,100,100)
MessageBox a.type // Text
```

Notes: Examples include: "Text", "Link", "Line", etc.
(Read and Write property)

144.18.148 URL as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: URL for the link. May be nil if no URL action associated with link; in this case the destination may be valid.
Notes: The preferred way though is to via action property.
Used by annotations type(s): /Link.
(Read and Write property)

144.18.149 userName as string

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The name of the user who created the annotation.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.18.150 widgetControlType as Integer

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The type of button widget control type (radio button, push button, or checkbox).
Notes: Used by annotations type(s): /Widget (field type(s): /Btn).
(Read and Write property)

144.18.151 widgetDefaultStringValue as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The string value for a widget annotation.
Notes: Used by annotations type(s): /Widget (field type(s): /Btn, /Ch, /Tx).
(Read and Write property)

144.18.152 widgetFieldType as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The specific field type of a widget annotation (button, choice, or text).
Notes: Used by annotations type(s): /Widget (field type(s): /Btn, /Ch, /Tx).
(Read and Write property)

144.18.153 widgetStringValue as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The string value for a widget annotation.
Notes: Used by annotations type(s): /Widget (field type(s): /Btn, /Ch, /Tx).
(Read and Write property)

144.19 class PDFAnnotationPopupMBS

144.19.1 class PDFAnnotationPopupMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: A PDFAnnotationPopup object provides user interactivity on a PDF page in the form of a pop-up menu.
Notes: Subclass of the PDFAnnotationMBS class.

144.19.2 Methods

144.19.3 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new annotation popup annotation with the given size.
See also:

- 144.19.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil) 19406

144.19.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new annotation popup annotation with the given size.
See also:

- 144.19.3 Constructor(left as Double, top as Double, width as Double, height as Double) 19406

144.19.5 Properties

144.19.6 isOpen as boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: A Boolean value indicating whether the pop-up is open.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.19.7 Events

144.19.8 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called for a custom drawing.
Notes: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

144.20 class PDFAnnotationSquareMBS

144.20.1 class PDFAnnotationSquareMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for a square annotation.
Example:

```
// load a PDF
Var sourceFile as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var p as new PDFDocumentMBS(sourceFile)

// get 4th page
Var page as PDFPageMBS = p.pageAtIndex(3)
// create a destination
Var dest as new PDFDestinationMBS(page, NSMakePointMBS(0,0))

// create the link annotation
Var LinkAnnotation as new PDFAnnotationLinkMBS(100,100,100,100)
LinkAnnotation.destination = dest

// add a color rect so we see the link
Var SquareAnnotation as new PDFAnnotationSquareMBS(100,100,100,100)
SquareAnnotation.colorValue = NSColorMBS.redColor

// add to the first page
p.pageAtIndex(0).addAnnotation(SquareAnnotation)
p.pageAtIndex(0).addAnnotation(LinkAnnotation)

// and write new PDF.
Var destfile as FolderItem = SpecialFolder.Desktop.Child("output.pdf")
call p.write(destfile)
```

Notes: Subclass of the PDFAnnotationMBS class.

144.20.2 Methods

144.20.3 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor to create a square annotation.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)

Var page as PDFPageMBS = doc.pageAtIndex(0)
Var a as new PDFAnnotationSquareMBS(100,100,100,100)

a.interiorColor = NSColorMBS.greenColor
a.colorValue = NSColorMBS.redColor
a.border.lineWidth=5

page.addAnnotation(a)

Var o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

See also:

- 144.20.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil) 19409

144.20.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor to create a square annotation.
See also:

- 144.20.3 Constructor(left as Double, top as Double, width as Double, height as Double) 19408

144.20.5 Properties

144.20.6 interiorColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Fill color used for drawing annotation.
Example:

```
Var a as new PDFAnnotationSquareMBS(100,100,100,100)
a.interiorColor = NSColorMBS.greenColor
```

Notes: (Read and Write property)

144.20.7 Events

144.20.8 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called for a custom drawing.
Notes: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

144.21 class PDFAnnotationStampMBS

144.21.1 class PDFAnnotationStampMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: A PDFAnnotationStamp object allows you to display a word or phrase, such as "Confidential," in a PDF page.
Example:

```
// create new document with blank page
Var doc as new PDFDocumentMBS
Var page as new PDFPageMBS
doc.appendPage page

// make new stamp annotation
Var stamp as new PDFAnnotationStampMBS(100, 100, 100, 100)

// Name of stamp annotation.  Standard stamps include names like, "Approved", "Draft", "TopSecret",
etc.
// The name must be representable as ASCII.
// Very little is rendered if the annotation has no appearance stream.
stamp.name = "Approved"

page.addAnnotation stamp

// save to file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")

if doc.write(f) then
f.Launch
else
MessageBox "write failed"
end if
```

Notes: A PDFAnnotationStamp object should have an appearance stream associated with it; otherwise, nothing useful is rendered.
Subclass of the PDFAnnotationMBS class.
Blog Entries

144.21.2 Methods

144.21.3 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new annotation stamp with the given size.
See also:

- 144.21.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil) 19412

144.21.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new annotation stamp with the given size.
See also:

- 144.21.3 Constructor(left as Double, top as Double, width as Double, height as Double) 19412

144.21.5 Properties

144.21.6 name as string

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name associated with the stamp annotation.
Notes: The name must be representable in ASCII. You can set a stamp annotation's name to help you identify it, but that name is not displayed on the PDF page. You must provide the string you want displayed on the page, such as "Draft" or "Top Secret", in the appearance stream for the annotation.

Note that the name value of the stamp annotation is not necessarily identical to the user-visible appearance of the stamp annotation. For example, a stamp annotation that displays "Confidential" on a PDF page may not have a name value of "Confidential".

Available in Mac OS X v10.5 and later.
(Read and Write property)

144.21.7 Events

144.21.8 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called for a custom drawing.
Notes: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

144.22 class PDFAnnotationTextMBS

144.22.1 class PDFAnnotationTextMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The PDFKit class for an annotation text.
Example:

```
// add a sticky note icon with a comment to a PDF page
Var doc As New PDFDocumentMBS(SpecialFolder.Desktop.Child("test.pdf"))
If doc.pageCount = 0 Then Return

Var note As New PDFAnnotationTextMBS(500, 700, 20, 20)
note.iconType = PDFAnnotationTextMBS.kPDFTextAnnotationIconComment
note.contents = "Please update these numbers."
note.colorValue = NSColorMBS.yellowColor

doc.pageAtIndex(0).addAnnotation note
Call doc.write(SpecialFolder.Desktop.Child("test with comment.pdf"))
```

Notes: Subclass of the PDFAnnotationMBS class.

144.22.2 Methods

144.22.3 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor to create a new annotation text.
See also:

- 144.22.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil) 19414

144.22.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor to create a new annotation text.
See also:

- 144.22.3 Constructor(left as Double, top as Double, width as Double, height as Double) 19414

144.22.5 Properties

144.22.6 iconType as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The type of icon displayed in the PDF.
Notes: Supported icons: "Comment", "Key", "Note", "Help", "NewParagraph", "Paragraph" and "Insert".
(Read and Write property)

144.22.7 Events

144.22.8 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called for a custom drawing.
Notes: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

144.22.9 Constants

Constants

Constant	Value	Description
kPDFTextAnnotationIconComment	0	One of the constants for use with the icontype property.
kPDFTextAnnotationIconHelp	3	One of the constants for use with the icontype property.
kPDFTextAnnotationIconInsert	6	One of the constants for use with the icontype property.
kPDFTextAnnotationIconKey	1	One of the constants for use with the icontype property.
kPDFTextAnnotationIconNewParagraph	4	One of the constants for use with the icontype property.
kPDFTextAnnotationIconNote	2	One of the constants for use with the icontype property.
kPDFTextAnnotationIconParagraph	5	One of the constants for use with the icontype property.

144.23 class PDFAnnotationTextWidgetMBS

144.23.1 class PDFAnnotationTextWidgetMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The PDFKit class for a text widget annotation.
Example:

```
// add a fillable text field to the first page of a PDF and save it
Var doc As New PDFDocumentMBS(SpecialFolder.Desktop.Child("form.pdf"))
If doc.pageCount = 0 Then Return

Var field As New PDFAnnotationTextWidgetMBS(72, 700, 200, 20)
field.fieldName = "name"
field.stringValue = "John Smith"
field.font = NSFontMBS.systemFontOfSize(12)
field.maximumLength = 50
field.backgroundColor = NSColorMBS.colorWithRGB(0.9, 0.95, 1)

doc.pageAtIndex(0).addAnnotation field
Call doc.write(SpecialFolder.Desktop.Child("form filled.pdf"))
```

Notes: Subclass of the PDFAnnotationMBS class.
Blog Entries

- MBS Xojo Plugins, version 22.1pr3

144.23.2 Methods

144.23.3 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor to create a new annotation.
See also:

- 144.23.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

144.23.4 Constructor(left as Double, top as Double, width as Double, height as Double, annotationType as String, properties as Dictionary = nil)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor to create a new annotation.
See also:

- 144.23.3 Constructor(left as Double, top as Double, width as Double, height as Double) 19416

144.23.5 NSCenterTextAlignment as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop only.

Function: The Cocoa text alignment constant for center.

144.23.6 NSRightTextAlignment as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop only.

Function: The Cocoa text alignment constant for right.

144.23.7 Properties

144.23.8 alignment as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Alignment of text.
Notes: Supported: NSLeftTextAlignment, NSRightTextAlignment and NSCenterTextAlignment.
(Read and Write property)

144.23.9 attributedStringValue as NSAttributedStringMBS

MBS PDFKit Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attributed string associated with text field (font / fontColor).
Notes: Available on Mac OS X 10.8 or newer.
(Read and Write property)

144.23.10 backgroundColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The background color of the annotation text field.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.23.11 fieldName as string

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal name for the annotation text field.
Notes: Field names are optional, internal names that identify text fields in a PDF form. You use field names with the PDFActionResetForm action.
Note that multiple PDFAnnotationTextWidget objects with the same field name always have the same text associated with that field name. When text is entered into one of the objects, the text associated with that field name is changed in all objects. If you need to ensure unique text for a PDFAnnotationTextWidget object, you must give it a unique field name.
Available in Mac OS X v10.5 and later.
(Read and Write property)

144.23.12 font as NSFontMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Font associated with the text field.
Notes: (Read and Write property)

144.23.13 fontColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The font color used for the annotation's text field.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.23.14 isMultiline as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Configuring multiline PDF text fields.
Notes: (Read and Write property)

144.23.15 maximumLength as Integer

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The maximum number of characters allowed in the annotations string.
Notes: A value of 0 means that there is no specified maximum.
Available in Mac OS X v10.5 and later.
(Read and Write property)

144.23.16 rotation as Integer

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The rotation angle of the annotation text field in degrees.
Notes: The rotation angle to be applied to the annotation text field, in degrees. The rotation angle must be a positive or negative multiple of 90 (negative angles are converted to their positive equivalents; for example -90 is changed to 270).
Available in Mac OS X v10.5 and later.
(Read and Write property)

144.23.17 stringValue as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: String value associated with text field.
Notes: (Read and Write property)

144.23.18 Events

144.23.19 drawWithBox(box as Integer, g as NSGraphicsMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called for a custom drawing.
Notes: You can draw here what the annotation should show.
Return true to disable the default drawing from PDFKit.

144.23.20 Constants

Constants

Constant	Value	Description
NSJustifiedTextAlignment	3	The Cocoa text alignment constant for justified.
NSLeftTextAlignment	0	The Cocoa text alignment constant for left.
NSNaturalTextAlignment	4	The Cocoa text alignment constant for natural.

144.24 class PDFAppearanceCharacteristicsMBS

144.24.1 class PDFAppearanceCharacteristicsMBS

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: PDFAppearanceCharacteristics represents a dictionary that is specific to widget annotation types, containing additional information for constructing the annotation,Äôs appearance.
Notes: It is designed to be a representation of the /MK appearance characteristics entry in the annotation dictionary. Because the /MK entry is optional, all properties of PDFAppearanceCharacteristics are optional as well.

144.24.2 Methods

144.24.3 Constructor

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The constructor.
See also:

- 144.24.4 Constructor(Handle as Integer) 19421

144.24.4 Constructor(Handle as Integer)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The constructor.
Notes: Handle must point to an existing PDFAppearanceCharacteristics object.
See also:

- 144.24.3 Constructor 19421

144.24.5 copy as PDFAppearanceCharacteristicsMBS

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

144.24.6 PDFAppearanceCharacteristicsKeyBackgroundColor as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the widget appearance characteristics keys.

144.24.7 PDFAppearanceCharacteristicsKeyBorderColor as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the widget appearance characteristics keys.

144.24.8 PDFAppearanceCharacteristicsKeyCaption as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the widget appearance characteristics keys.

144.24.9 PDFAppearanceCharacteristicsKeyDownCaption as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the widget appearance characteristics keys.

144.24.10 PDFAppearanceCharacteristicsKeyRolloverCaption as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the widget appearance characteristics keys.

144.24.11 PDFAppearanceCharacteristicsKeyRotation as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: One of the widget appearance characteristics keys.

144.24.12 Properties

144.24.13 appearanceCharacteristicsKeyValues as Dictionary

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: List all appearance characteristics properties as key-value pairs; returns a deep copy of all pairs.
Notes: Helpful for debugging.
(Read only property)

144.24.14 backgroundColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The background color of the widget annotation.
Notes: (Read and Write property)

144.24.15 borderColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The border color of the widget annotation.
Notes: (Read and Write property)

144.24.16 caption as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The widget annotation,Äôs normal caption, displayed when it is not interacting with the user.
Notes: (Read and Write property)

144.24.17 controlType as Integer

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: For button widget annotations, need to specify the control type for PDFAppearanceCharacteristicsMBS as certain attributes, i.e. captions, are only available for certain flavors.
Notes: Control type does not need to be set for text or choice widget annotations.
(Read and Write property)

144.24.18 downCaption as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The widget's caption displayed when the user holds the mouse button while over the annotation.
Notes: Applies only to kPDFWidgetPushButtonControl.
(Read and Write property)

144.24.19 Handle as Integer

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

144.24.20 rolloverCaption as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The widget's caption displayed when the user moves the mouse over the annotation.
Notes: Applies only to kPDFWidgetPushButtonControl.
(Read and Write property)

144.24.21 rotation as Integer

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The number of *degrees* by which the widget annotation is rotated counterclockwise relative to the page.
Notes: The value must be a multiple of 90. Default value: 0.
(Read and Write property)

144.25 class PDFBorderMBS

144.25.1 class PDFBorderMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The class for PDFKit borders.
Example:

```
// give a square annotation a dashed border
Var doc As New PDFDocumentMBS(SpecialFolder.Desktop.Child("test.pdf"))
If doc.pageCount = 0 Then Return

Var border As New PDFBorderMBS
border.lineWidth = 3
border.style = PDFBorderMBS.kPDFBorderStyleDashed
Var dashes() As Double = Array(6.0, 3.0)
border.setDashPattern dashes

Var box As New PDFAnnotationMBS(100, 100, 200, 150, PDFAnnotationMBS.PDFAnnotationSubtype-
Square)
box.colorValue = NSColorMBS.redColor
box.border = border

doc.pageAtIndex(0).addAnnotation box
Call doc.write(SpecialFolder.Desktop.Child("test with box.pdf"))
```

144.25.2 Methods

144.25.3 Constructor

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The constructor.
Notes: Updated for version 21.1 to be public. Used to be private.
See also:

- 144.25.4 Constructor(Handle as Integer) 19426

144.25.4 Constructor(Handle as Integer)

MBS PDFKit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a new object based on a given PDFBorder handle.
Notes: Please pass in a non zero handle which points to a PDFBorder object.
For use with declares.
See also:

- 144.25.3 Constructor 19425

144.25.5 copy as PDFBorderMBS

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates a copy of the border object.
Notes: Not available in Mac OS X 10.6.

144.25.6 dashPattern as Double()

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Gets the dash pattern for the border.
Notes: Refer to the description for NSBezierPath for more information.

144.25.7 PDFBorderKeyDashPattern as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Key for the dash pattern property.

144.25.8 PDFBorderKeyLineWidth as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Key for the line width property.

144.25.9 PDFBorderKeyStyle as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Key for the style property.

144.25.10 setDashPattern(values() as Double)

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Sets the dash pattern for the border.
Notes: Refer to the description for NSBezierPath for more information.

144.25.11 Properties

144.25.12 borderKeyValues as Dictionary

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: List all border properties as key-value pairs; returns a deep copy of all pairs.
Notes: Helpful for debugging.
(Read only property)

144.25.13 horizontalCornerRadius as single

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: For rounded-rect borders, the corner radius.
Notes: Deprecated in Mac OS X 10.7.
(Read and Write property)

144.25.14 lineWidth as Double

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Width of line used to strok border.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)

Var page as PDFPageMBS = doc.pageAtIndex(0)
Var a as new PDFAnnotationSquareMBS(100,100,100,100)

a.interiorColor = NSColorMBS.greenColor
```

```
a.colorValue = NSColorMBS.redColor
a.border.lineWidth=5

page.addAnnotation(a)

Var o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

Notes: (Read and Write property)

144.25.15 style as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Whether border is drawn solid, dashed etc.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)

Var page as PDFPageMBS = doc.pageAtIndex(0)
Var a as new PDFAnnotationSquareMBS(100,100,100,100)

a.border.style = PDFBorderMBS.kPDFBorderStyleDashed

page.addAnnotation(a)

Var o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
o.Launch
```

Notes: Use this constants:

```
kPDFBorderStyleSolid      = 0
kPDFBorderStyleDashed     = 1
kPDFBorderStyleBeveled    = 2
kPDFBorderStyleInset      = 3
kPDFBorderStyleUnderline  = 4
```

(Read and Write property)

144.25.16 verticalCornerRadius as single

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: For rounded-rect borders, the corner radius.
Notes: Deprecated in Mac OS X 10.7.
(Read and Write property)

144.25.17 Constants

Constants

Constant	Value	Description
kPDFBorderStyleBeveled	2	One of the constants for the border style.
kPDFBorderStyleDashed	1	One of the constants for the border style.
kPDFBorderStyleInset	3	One of the constants for the border style.
kPDFBorderStyleSolid	0	One of the constants for the border style.
kPDFBorderStyleUnderline	4	One of the constants for the border style.

144.26 class PDFDestinationMBS

144.26.1 class PDFDestinationMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The class for a pdf destination.
Example:

```
// This example needs a window with PDFViewControlMBS1.
// show a PDF and jump to the top of page 3 with 150% zoom
Var doc As New PDFDocumentMBS(SpecialFolder.Desktop.Child("test.pdf"))
If doc.pageCount <3 Then Return

Var view As PDFViewMBS = PDFViewControlMBS1.View
view.document = doc

Var page As PDFPageMBS = doc.pageAtIndex(2)
Var top As Double = page.boundsForBox(PDFPageMBS.kPDFDisplayBoxMediaBox).Height
Var destination As New PDFDestinationMBS(page, New NSPointMBS(0, top))
destination.Zoom = 1.5
view.goToDestination destination
```

Blog Entries

- MBS Xojo Plugins, version 20.2pr3

144.26.2 Methods

144.26.3 compare(dest as PDFDestinationMBS) as Integer

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a comparison result that indicates the location of the destination in the document, relative to the current position.
Notes: A comparison result, indicating the position of the passed-in destination relative to the current position.

If destination is between the receiver's position and the end of the document, compare returns NSOrderedAscending; if it is between the receiver's position and the beginning of the document, compare returns NSOrderedDescending. Otherwise, if destination matches the receiver's position, compare returns NSOrderedSame.

This method ignores the horizontal component of the destination point (the x value). If the destination's vertical component (or y value) is kPDFDestinationUnspecifiedValue, compare treats the destination as if its y value is the top point on the destination page.

An exception is raised if destination does not have a page associated with it or if its page is associated with a document other than the receiver's document.

Available in Mac OS X v10.5 and later.

144.26.4 Constructor(Handle as Integer)

MBS PDFKit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a new object based on a given PDFDestination handle.
Notes: Please pass in a non zero handle which points to a PDFDestination object.
For use with declares.
See also:

- 144.26.5 Constructor(page as PDFPageMBS, point as NSPointMBS) 19431

144.26.5 Constructor(page as PDFPageMBS, point as NSPointMBS)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Initializes the destination.
Notes: page: The page of the destination.
point: The point of the destination, in page space.

Specify point in page space. Typically, there's no need to initialize destinations. Instead, you get them from PDFAnnotationLink, PDFOutline, or PDFView objects.

Page space is a 72-dpi coordinate system with the origin at the lower-left corner of the current page.

Available in Mac OS X v10.4 and later.
See also:

- 144.26.4 Constructor(Handle as Integer) 19431

144.26.6 copy as PDFDestinationMBS

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates a copy of the destination object.

144.26.7 kPDFDestinationUnspecifiedValue as Double

MBS PDFKit Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Value used for unspecified destination.
Example:

MessageBox str(PDFDestinationMBS.kPDFDestinationUnspecifiedValue)

Notes: Unspecified value used when a destination's actual x or y value is unimportant.
Available in Mac OS X v10.5 and later.

144.26.8 point as NSPointMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the point, in page space, that the destination refers to.
Notes: Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page.

Available in Mac OS X v10.4 and later.

144.26.9 Properties

144.26.10 Handle as Integer

MBS PDFKit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

144.26.11 page as PDFPageMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Page the destination refers to (destination page).
Notes: (Read only property)

144.26.12 Zoom as Double

MBS PDFKit Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Specify the scale factor the PDF viewer should assume for this destination.
Notes: kPDFDestinationUnspecifiedValue indicates the scale factor is unaffected.
Available in Mac OS X 10.7 and later.
(Read and Write property)

144.27 class PDFDocumentDelegateMBS

144.27.1 class PDFDocumentDelegateMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: A class for a document delegate.
Notes: Subclass this class to handle document events.

144.27.2 Events

144.27.3 Close

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Called when the delegate is destroyed.

144.27.4 didMatchString(selection as PDFSelectionMBS)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The event for an item found.
Notes: If implemented by the delegate, called for every search instance found during a find. PDFDocument's implentation accumulates each PDFSelection in an array.

144.27.5 documentDidBeginDocumentFind

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The search started on the document.

144.27.6 documentDidBeginPageFind(PageIndex as Integer)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The page search started on this page.
Notes: PageIndex is zero based.

144.27.7 documentDidEndDocumentFind

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The search finished on this document.

144.27.8 documentDidEndPageFind(PageIndex as Integer)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The page search finished on this page.
Notes: PageIndex is zero based.

144.27.9 documentDidFindMatch(selection as PDFSelectionMBS)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The search found an item.

144.27.10 documentDidUnlock

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The document has been unlocked.

144.27.11 Open

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Called when the delegate is installed.

144.28 class PDFDocumentMBS

144.28.1 class PDFDocumentMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The PDFKit class for a PDF document.
Example:

```
// open a PDF file and show page count and text of the first page
Var file As FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc As New PDFDocumentMBS(file)

If doc.Handle = 0 Then
MessageBox "Failed to open PDF."
Return
End If

If doc.isLocked And Not doc.unlockWithPassword("secret") Then
MessageBox "PDF is password protected."
Return
End If

Var text As String
If doc.pageCount >0 Then
text = doc.pageAtIndex(0).stringValue
End If

MessageBox doc.pageCount.ToString + " pages" + EndOfLine + "Title: " + doc.Title + EndOfLine +
EndOfLine + text
```

Notes: Basicly this is the code used by Preview.app by Apple.

Destructor is dispatched to main thread to avoid bugs in OS X 10.12.

144.28.2 Methods

144.28.3 appendPage(page as PDFPageMBS)

MBS PDFKit Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Appends a page to the document.

144.28.4 beginFindString(text as string, options as Integer)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Begins a find, searching the document for string.
Notes: Search results are handled via a DidFindMatch event in the delegate. Supported options are: NSCaseInsensitiveSearch, NSLiteralSearch, and NSBackwardsSearch.

144.28.5 beginFindStrings(texts() as string, options as integer)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Like beginFindString but it accepts an array of strings to search for.

144.28.6 cancelFindString

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Method to cancel a search.
Notes: Can be called from a user method being serviced by a find notification.

144.28.7 Constructor

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The constructor to create a new pdf document in memory.
Example:

```
Var doc as new PDFDocumentMBS // new empty document
Var page as new PDFPageMBS // new empty page

doc.Creator="Xojo"
doc.Title="Test file"

doc.insertPage page,0

Var f as FolderItem=SpecialFolder.Desktop.Child("test.pdf")

if doc.write(f) then
f.launch
end if
```

144.28.8 Constructor(data as memoryblock)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The constructor to create a new pdf document based on a string.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var b as BinaryStream = f.OpenAsBinaryFile(false)
Var s as string = b.Read(b.Length)

Var doc as new PDFDocumentMBS(s)
```

MessageBox doc.Title

- 144.28.8 Constructor(data as memoryblock) 19438
- 144.28.10 Constructor(file as folderitem) 19439
- 144.28.11 Constructor(Handle as Integer) 19440

144.28.10 Constructor(file as folderitem)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The constructor to create a new pdf document based on a file.
Example:

```
Var p as PDFDocumentMBS
Var f as FolderItem

f=SpecialFolder.Desktop.Child("test.pdf")
p=new PDFDocumentMBS(f)

MessageBox "Text from first page:"+EndOfLine+EndOfLine+p.pageAtIndex(0).stringValue
```

See also:

- 144.28.7 Constructor 19438
- 144.28.8 Constructor(data as memoryblock) 19438
- 144.28.9 Constructor(data as String) 19439
- 144.28.11 Constructor(Handle as Integer) 19440

144.28.11 Constructor(Handle as Integer)

MBS PDFKit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a new object based on a given PDFDocument handle.
Notes: Please pass in a non zero handle which points to a PDFDocument object.
For use with declares.
See also:

- 144.28.7 Constructor 19438
- 144.28.8 Constructor(data as memoryblock) 19438
- 144.28.9 Constructor(data as String) 19439
- 144.28.10 Constructor(file as folderitem) 19439

144.28.12 copy as PDFDocumentMBS

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates a copy of the document object.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var p as new PDFDocumentMBS(f)

// make a copy
Var c as PDFDocumentMBS = p.copy

// remove second page
c.removePageAtIndex 1

// c has one page less
MessageBox str(p.pageCount)+" "+str(c.pageCount)
```

Notes: For Mac OS X 10.7 and newer this function uses the framework function.
For Mac OS X 10.6 and older this function uses our own copy function to duplicate the document.

144.28.13 dataRepresentation(QuartzFilter as Variant = nil) as memoryblock

MBS PDFKit Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Methods to record the current state of the PDFDocument as data string.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)

Var o as FolderItem = SpecialFolder.Desktop.Child("out.pdf")
Var b as BinaryStream = o.CreateBinaryFile("")

b.Write doc.dataRepresentation
```

Notes: Optional for Mac OS X 10.6, you can pass a QuartzFilterMBS object to use that filter here.

Looks like newer macOS versions like 10.14 or later ignore the quartz filter.

144.28.14 exchangePageAtIndexWithPageAtIndex(indexA as Integer, indexB as Integer)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Exchanges the two pages with the given index.
Notes: Index is zero based.

144.28.15 findString(text as string, options as Integer) as PDFSelectionMBS()

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Searches entire document for string and returns an array of PDFSelections representing all instances found.
Example:

```
Var p as PDFDocumentMBS
Var f as FolderItem
Var sa() as PDFSelectionMBS
Var i,c as Integer
Var s as PDFSelectionMBS

const NSCaseInsensitiveSearch=1

f=SpecialFolder.Desktop.Child("test.pdf")
p=new PDFDocumentMBS(f)

if p.pageCount=0 then
MessageBox "Failed to load the PDF."
Return
end if
```

```
sa=p.findString("Plugin",NSCaseInsensitiveSearch)

if sa.LastIndex<0 then
MessageBox "no item found."
else
MessageBox str(sa.Count)+" items found."
end if

s=sa(0)
s.extendSelectionAtEnd(50)
s.extendSelectionAtStart(50)

MessageBox s.stringValue // shows a bit more text before and after the location found
```

Notes: May return an empty array if nothing is found.
Returns nil on any error.

Supported options are:
NSCaseInsensitiveSearch, NSLiteralSearch, and NSBackwardsSearch.

144.28.16 findStringFromSelection(text as string, selection as PDFSelectionMBS, options as Integer) as PDFSelectionMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Searches for only the next instance of string beginning after the last character of selection with options (or preceding the first character of the selection if NSBackwardsSearch is specified as a search option).
Notes: Returns next instance as a PDFSelection or nil if the end of the document is reached. Supported options are: NSCaseInsensitiveSearch, NSLiteralSearch, and NSBackwardsSearch. Passing in nil for selection will start the search from the beginning of the document (or end if NSBackwardsSearch is specified).

144.28.17 indexForPage(page as PDFPageMBS) as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Given a PDFPage, returns the pages index within the document.
Notes: Indicees are zero-based.

144.28.18 insertPage(page as PDFPageMBS, index as Integer)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Inserts a page in the pdf on the given index.
Example:

```
Var file1,file2,file3,destfile as FolderItem
Var page1,page2,page3 as PDFPageMBS
Var doc1,doc2 as PDFDocumentMBS
Var img as NSImageMBS
Var doc as PDFDocumentMBS

file1=SpecialFolder.Desktop.Child("test1.pdf")
file2=SpecialFolder.Desktop.Child("test2.pdf")
file3=SpecialFolder.Desktop.Child("logo.jpg")

doc1=new PDFDocumentMBS(file1)
doc2=new PDFDocumentMBS(file2)

MessageBox str(doc1.pageCount)

img=new NSImageMBS(file3)

Backdrop=img.CopyPicture

page1=new PDFPageMBS(img)
page2=doc1.pageAtIndex(0)
page3=doc2.pageAtIndex(0)

doc=new PDFDocumentMBS
doc.insertPage page1,0
doc.insertPage page2,1
doc.insertPage page3,2

destfile=SpecialFolder.Desktop.Child("test.pdf")
call doc.write(destfile)
```

Notes: Index is zero based.

144.28.19 Keywords as string()

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Array of Strings containing document keywords.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox join(doc.Keywords)
```

144.28.20 outlineItemForSelection(selection as PDFSelectionMBS) as PDFOutlineMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Given a PDFSelection, this method returns the child outline item the selection most closely falls beneath.
Notes: Since a selection may span multiple outline items, only the point representing the first character of the PDFSelection is considered. Typically, outline's indicate things like chapters for the PDF. Therefore, this method would help you identify the chapter the selection falls within.

For some PDFs this method returns nil.

144.28.21 pageAtIndex(index as Integer) as PDFPageMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Returns a PDFPage object representing the page at index.
Example:

```
Var p as PDFDocumentMBS
Var f as FolderItem

f=SpecialFolder.Desktop.Child("test.pdf")
p=new PDFDocumentMBS(f)

MessageBox "Text from first page:"+EndOfLine+EndOfLine+p.pageAtIndex(0).stringValue
```

Notes: Will raise an exception if index is out of bounds. Indicees are zero-based.

144.28.22 PDFDocumentAuthorAttribute as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: One of the property keys.
Notes: An optional text string containing the name of the author of the document.

144.28.23 PDFDocumentCreationDateAttribute as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: One of the property keys.
Notes: An optional text string containing the document,Äôs creation date.

144.28.24 PDFDocumentCreatorAttribute as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: One of the property keys.
Notes: An optional text string containing the name of the application that created the document content.

144.28.25 PDFDocumentDidBeginFindNotification as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: A notification that the beginFindString or findString method begins finding.
Notes: The notification object is the PDFDocument object itself.
Use with NSNotificationObserverMBS class.

144.28.26 PDFDocumentDidBeginPageFindNotification as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: A notification that a find operation begins working on a new page of a document.
Notes: You can use this notification to update a progress bar.
The notification object is the PDFDocument object itself. To determine the page, use the PDFDocumentPageIndex key to obtain userinfo of type Number.

Use with NSNotificationObserverMBS class.

144.28.27 PDFDocumentDidBeginPageWriteNotification as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: A notification that a write operation begins working on a page in a document.
Notes: The notification object is the PDFDocumentMBS object itself. To determine the page, use the PDFDocumentPageIndex key to obtain userinfo of type Number.

Use with NSNotificationObserverMBS class.

144.28.28 PDFDocumentDidBeginWriteNotification as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: A notification that a write operation begins working on a document.
Notes: The notification object is the PDFDocumentMBS object itself.

Use with NSNotificationObserverMBS class.

144.28.29 PDFDocumentDidEndFindNotification as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: A notification that the beginFindString or findString method returns.
Notes: The beginFindString method returns immediately, so this notification is posted when the ,Äúfind,Äù operation is finished.
You can use this notification to know when to close or hide a progress bar.
The notification object is the PDFDocument object itself.

Use with NSNotificationObserverMBS class.

144.28.30 PDFDocumentDidEndPageFindNotification as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: A notification that a find operation finishes working on a page in a document.
Notes: You can use this notification to update a progress bar.
The notification object is the PDFDocument object itself. To determine the page, use the PDFDocumentPageIndex key to obtain userinfo of type Number.

Use with NSNotificationObserverMBS class.

144.28.31 PDFDocumentDidEndPageWriteNotification as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: A notification that a write operation finishes working on a page in a document.
Notes: The notification object is the PDFDocumentMBS object itself. To determine the page, use the

PDFDocumentPageIndex key to obtain userinfo of type Number.

Use with NSNotificationObserverMBS class.

144.28.32 PDFDocumentDidEndWriteNotification as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: A notification that a write operation finishes working on a document.
Notes: The notification object is the PDFDocumentMBS object itself.

Use with NSNotificationObserverMBS class.

144.28.33 PDFDocumentDidFindMatchNotification as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: A notification that a string match is found in a document.
Notes: The notification object is the PDFDocumentMBS object itself. To determine the string selection found, use the PDFDocumentFoundSelection key to obtain userinfo of type PDFSelectionMBS.

Use with NSNotificationObserverMBS class.

144.28.34 PDFDocumentDidUnlockNotification as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: A notification that a document unlocks after a unlockWithPassword message.
Notes: Use with NSNotificationObserverMBS class.
The notification object is the PDFDocument object itself.

144.28.35 PDFDocumentKeywordsAttribute as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: One of the property keys.
Notes: An optional array of text strings containing keywords for the document.

144.28.36 PDFDocumentModificationDateAttribute as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: One of the property keys.
Notes: An optional text string containing the document,Äôs last-modified date.

144.28.37 PDFDocumentOwnerPasswordOption as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: One of the options for writing a PDF.
Notes: A string object for the owner's password which is required for encryption.

144.28.38 PDFDocumentProducerAttribute as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: One of the property keys.
Notes: An optional text string containing the name of the application that produced the PDF data for the document.

144.28.39 PDFDocumentSubjectAttribute as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: One of the property keys.
Example:

```
// read a file
Var f As New FolderItem("Installation.pdf")
Var p As New PDFDocumentMBS(f)

// change an attribute
Var d As Dictionary = p.documentAttributes
d.Value(PDFDocumentMBS.PDFDocumentSubjectAttribute) = "Hello World"
p.documentAttributes = d

// and write back to disk
Var f2 As New FolderItem("Installation2.pdf")
Call p.write(f2)
```

Notes: An optional text string containing a description of the subject of the document.

144.28.40 PDFDocumentTitleAttribute as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: One of the property keys.
Notes: An optional text string containing the title of the document.

144.28.41 PDFDocumentUserPasswordOption as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: One of the options for writing a PDF.
Notes: A string for the user's password which is optional for encryption.

144.28.42 PrintOperation(PrintInfo as Variant, AutoRotate as boolean = true, scalingMode as Integer = 0) as Variant

MBS PDFKit Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates print operation for PDF document.
Example:

```
// select a PDF
Var f as FolderItem = FolderItem.ShowOpenFileDialog("")
if f = nil then Return

// open PDF
Var doc as new PDFDocumentMBS(f)

// define some print setting via PrintInfo
Var PrintInfo as new NSPrintInfoMBS

// start print operation
Var printOperation as NSPrintOperationMBS = doc.PrintOperation(printinfo)

printOperation.showsPrintPanel = true
printOperation.showsProgressPanel = true

call printOperation.runOperation
```

Notes: Returns NSPrintOperationMBS object.

144.28.43 removePageAtIndex(index as Integer)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Removes a page in the pdf on the given index.
Notes: Index is zero based.

144.28.44 selectionForEntireDocument as PDFSelectionMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Returns a selection representing text for the entire document.

144.28.45 selectionFromPage(StartPage as PDFPageMBS, StartCharacterIndex as Integer, EndPage as PDFPageMBS, EndCharacterIndex as Integer) as PDFSelectionMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Returns a selection representing text from page startPage and point StartCharacterIndex to page endPage and to point EndCharacterIndex on that page.
Notes: Start and end page can be the same.
See also:

- 144.28.46 selectionFromPage(StartPage as PDFPageMBS, StartPointX as single, StartPointY as single, EndPage as PDFPageMBS, EndPointX as single, EndPointY as single) as PDFSelectionMBS 19450

144.28.46 selectionFromPage(StartPage as PDFPageMBS, StartPointX as single, StartPointY as single, EndPage as PDFPageMBS, EndPointX as single, EndPointY as single) as PDFSelectionMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Returns a selection representing text from page startPage and point startPt to page endPage and to point endPt on that page.
Notes: Points are in page-space and relative to their respective pages. Start and end page can be the same (and are then equivalent to calling selectionFromPointToPoint).
See also:

- 144.28.45 selectionFromPage(StartPage as PDFPageMBS, StartCharacterIndex as Integer, EndPage as PDFPageMBS, EndCharacterIndex as Integer) as PDFSelectionMBS 19450

144.28.47 SetDelegate(d as PDFDocumentDelegateMBS)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: If a PDFDocument has a delegate, delegate methods may be called for this document.

144.28.48 SetKeywords(keywords() as string)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Sets the array of strings containing document keywords.

144.28.49 unlockWithPassword(password as string) as boolean

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Unlocks an encrypted PDF with the given password.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)

if doc.unlockWithPassword("mypassword") then
MessageBox "OK"
end if
```

Notes: Means of passing in a password to unlock encrypted PDF's. Calling unlockWithPassword will attempt to unlock the PDF. If successful, a DidUnlockDocument event is sent to the delegate. You cannot "re-lock" a PDF by passing in a bogus password. Returns true if the document is now unlocked, false otherwise (isLocked = false).

144.28.50 write(file as folderitem, QuartzFilter as Variant = nil) as boolean

MBS PDFKit Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Methods to record the current state of the PDFDocument as a file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
```

```
// modify here

Var o as FolderItem = SpecialFolder.Desktop.Child("testout.pdf")
call doc.write(o)
```

Notes: Returns true on success and false on failure.

There is a bug known in Mac OS X 10.4 that this function may return true even if the saving failed. So you may prefer to check the file whether it exists after write.

Optional for Mac OS X 10.6, you can pass a QuartzFilterMBS object to use that filter here.

Looks like newer macOS versions like 10.14 or later ignore the quartz filter.

144.28.51 writeWithOptions(file as folderitem, options as dictionary) as boolean

MBS PDFKit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Writes PDF to file with options.
Notes: Returns true on success and false on failure.

Some keys to use include:
CGPDFContextMBS.kCGPDFContextUserPassword
CGPDFContextMBS.kCGPDFContextTitle
CGPDFContextMBS.kCGPDFContextSubject
CGPDFContextMBS.kCGPDFContextOwnerPassword
CGPDFContextMBS.kCGPDFContextOutputIntents
CGPDFContextMBS.kCGPDFContextOutputIntent
CGPDFContextMBS.kCGPDFContextKeywords
CGPDFContextMBS.kCGPDFContextEncryptionKeyLength
CGPDFContextMBS.kCGPDFContextCreator
CGPDFContextMBS.kCGPDFContextAuthor
CGPDFContextMBS.kCGPDFContextAllowsPrinting
CGPDFContextMBS.kCGPDFContextAllowsCopying

144.28.52 Properties

144.28.53 allowsCommenting as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether you can create or modify document annotations, including form field entries.
Notes: Available in macOS 10.13 or newer.
(Read only property)

144.28.54 allowsContentAccessibility as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether you can extract content from the document, but only for the purpose of accessibility.
Notes: Available in macOS 10.13 or newer.
(Read only property)

144.28.55 allowsCopying as boolean

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Whether copying is allowed.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox str(doc.allowsCopying)
```

Notes: Even unlocked, encrypted PDF's may have certain restrictions regarding copying or printing placed upon them.
(Read only property)

144.28.56 allowsDocumentAssembly as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether you can manage a document by inserting, deleting, and rotating pages.
Notes: Available in macOS 10.13 or newer.
(Read only property)

144.28.57 allowsDocumentChanges as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether you can modify the document contents except for document attributes.
Notes: Available in macOS 10.13 or newer.
(Read only property)

144.28.58 allowsFormFieldEntry as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether you can modify form field entries even if you can't edit document annotations.
Notes: Available in macOS 10.13 or newer.
(Read only property)

144.28.59 allowsPrinting as boolean

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Whether printing is allowed.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox str(doc.allowsPrinting)
```

Notes: Even unlocked, encrypted PDF's may have certain restrictions regarding copying or printing placed upon them.
(Read only property)

144.28.60 Author as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: String containing document author.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox doc.Author
```

Notes: (Read and Write property)

144.28.61 CreationDate as Date

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Date representing document creation date.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox doc.CreationDate.LongDate
```

Notes: (Read and Write property)

144.28.62 CreationDateTime as DateTime

MBS PDFKit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Date representing document creation date.
Notes: (Read and Write property)

144.28.63 Creator as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: String containing name of app that created document content.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox doc.Creator
```

Notes: (Read and Write property)

144.28.64 documentRef as Integer

MBS PDFKit Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns a CGPDFDocumentRef value for this document.
Notes: This is the CGPDFDocument associated with the PDFDocument object. With this object you can call many CoreGraphics API. May return 0 if the document was not created from an existing PDF file or data.

Use CGPDFDocumentMBS with Constructor taking a handle to call functions on this CGPDFDocument

object.
(Read only property)

144.28.65 documentURL as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The document location.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox doc.documentURL
```

Notes: May return nil if the document was created from data.
(Read only property)

144.28.66 Handle as Integer

MBS PDFKit Plugin, Plugin Version: 10.4, Platform: macOS, Targets: All.

Function: The internal reference to the PDF Document.
Notes: (Read and Write property)

144.28.67 isEncrypted as boolean

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Whether the PDF is encrypted.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox str(doc.isEncrypted)
```

Notes: With the right password, a PDF can be unlocked - nontheless, the PDF still indicates that it is encrypted - just no longer locked. Some PDF's may be encrypted but can be unlocked with the empty string. These are unlocked automatically.
(Read only property)

144.28.68 isFinding as boolean

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Returns true if document is currently searching for a string.
Notes: (Read only property)

144.28.69 isLocked as boolean

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Whether the PDF is locked.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox str(doc.isLocked)
```

Notes: With the right password, a PDF can be unlocked - nontheless, the PDF still indicates that it is encrypted - just no longer locked. Some PDF's may be encrypted but can be unlocked with the empty string. These are unlocked automatically.
(Read only property)

144.28.70 majorVersion as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: PDF version of the PDF file (example: major version = 1, minor = 4; PDF v1.4).
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox str(doc.majorVersion)+"."+str(Doc.minorVersion)
```

Notes: (Read only property)

144.28.71 minorVersion as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: PDF version of the PDF file (example: major version = 1, minor = 4; PDF v1.4).
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox str(doc.majorVersion)+"."+str(Doc.minorVersion)
```

Notes: (Read only property)

144.28.72 ModificationDate as Date

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Date representing last document modification date.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox doc.ModificationDate.LongDate
```

Notes: (Read and Write property)

144.28.73 ModificationDateTime as DateTime

MBS PDFKit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Date representing last document modification date.
Notes: (Read and Write property)

144.28.74 outlineRoot as PDFOutlineMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Returns the root outline object for the PDF (or nil if none).
Notes: (Read and Write property)

144.28.75 pageCount as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The number of pages in the document.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox str(Doc.pageCount)
```

Notes: (Read only property)

144.28.76 permissionsStatus as Integer

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the permissions status of the PDF document.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)

Select case doc.permissionsStatus
case doc.kPDFDocumentPermissionsNone
MessageBox "None"
case doc.kPDFDocumentPermissionsOwner
MessageBox "Owner or no password"
case doc.kPDFDocumentPermissionsUser
MessageBox "User"
end Select
```

Notes: You have kPDFDocumentPermissionsNone status for an encrypted document that you have not supplied either a valid user or owner password. For a document with no encryption, you automatically have kPDFDocumentPermissionsOwner status.

Requires Mac OS X 10.6.
(Read only property)

144.28.77 Producer as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: String containing name of app that produced PDF data.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox doc.Producer
```

Notes: (Read and Write property)

144.28.78 stringValue as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The text of the document.
Example:

```
Var p as PDFDocumentMBS
Var f as FolderItem

f=SpecialFolder.Desktop.Child("test.pdf")
p=new PDFDocumentMBS(f)

MessageBox "Text from PDF Document:"+EndOfLine+EndOfLine+p.stringValue
```

Notes: Convenience method. Returns a string representing the entire document (each page's string concatenated with line feeds between pages).

If you need to extract the text of a PDF document cross platform or with more options, you may want to look on the DynaPDF plugin.

It seems like this string value is not always available. It works for PDF Documents created from a disc file, but not for files our test app created on runtime in memory by using PDFDocument constructor and insertpage.
(Read only property)

144.28.79 Subject as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: String containing document subject.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox doc.Subject
```

Notes: (Read and Write property)

144.28.80 Title as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: String containing document title.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
MessageBox doc.Title
```

Notes: (Read and Write property)

144.28.81 documentAttributes as Dictionary

MBS PDFKit Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The PDF meta data as a Xojo Dictionary object.
Example:

```
// read a file
Var f As New FolderItem("Installation.pdf")
Var p As New PDFDocumentMBS(f)

// change an attribute
Var d As Dictionary = p.documentAttributes
d.Value(PDFDocumentMBS.PDFDocumentSubjectAttribute) = "Hello World"
p.documentAttributes = d

// and write back to disk
Var f2 As New FolderItem("Installation2.pdf")
Call p.write(f2)
```

Notes: Returns a dictionary with PDF metadata. Metadata is optional for PDF's and so some of the keys may be missing or the entire dictionary may be empty.
(Read and Write computed property)

144.28.82 Constants

Document Permissions

Constant	Value	Description
kPDFDocumentPermissionsNone	0	Document permissions status. For encrypted PDF's, supplying the owner pas word will enable owner permission status.
kPDFDocumentPermissionsOwner	2	
kPDFDocumentPermissionsUser	1	

Page Scaling Modes

Constant	Value	Description
kPDFPrintPageScaleDownToFit	2	
kPDFPrintPageScaleNone	0	
kPDFPrintPageScaleToFit	1	

Search Flags

Constant	Value	Description
NSBackwardsSearch	4	Performs searching from the end of the range toward the beginning.
NSCaseInsensitiveSearch	1	Ignores case distinctions among characters.
NSLiteralSearch	2	Performs a byte-for-byte comparison. Differing literal sequences (such as composed character sequences) that would otherwise be considered equivalent are considered not to match. Using this option can speed some operations dramatically.

144.29 class PDFOutlineMBS

144.29.1 class PDFOutlineMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The class for a pdf outine object.
Example:

```
// add bookmarks for each page to a PDF file
Var doc As New PDFDocumentMBS(SpecialFolder.Desktop.Child("test.pdf"))
Var root As New PDFOutlineMBS

For i As Integer = 0 To doc.pageCount - 1
Var page As PDFPageMBS = doc.pageAtIndex(i)
Var item As New PDFOutlineMBS
item.label = "Page " + Str(i + 1)
item.destination = New PDFDestinationMBS(page, New NSPointMBS(0, page.boundsForBox(PDFPageMBS.kPDFDisplayBoxMediaBox).Height))
root.insertChild(item, i)
Next

doc.outlineRoot = root
Call doc.write(SpecialFolder.Desktop.Child("test with bookmarks.pdf"))
```

- MBS Xojo Plugins, version 20.2pr3

144.29.2 Methods

144.29.3 childAtIndex(index as Integer) as PDFOutlineMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: PDFOutline child at index.
Notes: Will throw exception if index is out of range.

144.29.4 Constructor

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Initializes a PDFOutline object.
Notes: If you want the PDFOutline object returned by this method to be the outline root, you must add additional PDFOutline objects to create the outline hierarchy you desire. Then, you must add the root outline object to your PDF document by assigning it to the PDFDocument OutlineRoot.

If you want the PDFOutline object returned by this method to be a child of an existing outline, you must use setLabel: to give it a label and give it either a destination or action using setDestination: or setAction:, respectively. In addition, you must add this outline object to the existing PDFOutline object as a new child, using insertChild.

Available in Mac OS X v10.4 and later.
See also:

- 144.29.5 Constructor(Handle as Integer) 19464

144.29.5 Constructor(Handle as Integer)

MBS PDFKit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a new object based on a given PDFOutline handle.
Notes: Please pass in a non zero handle which points to a PDFOutline object.
For use with declares.
See also:

- 144.29.4 Constructor 19463

144.29.6 insertChild(child as PDFOutlineMBS, index as Integer)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Inserts the specified outline object at the specified index.
Notes: To build a PDF outline hierarchy, use this method to add child outline objects. Before you call this method on a PDFOutline object that already has a parent, you should retain the object and call removeFromParent on it first.

Available in Mac OS X v10.5 and later.

144.29.7 removeFromParent

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Removes the outline object from its parent (does nothing if outline object is the root outline object).

Notes: Available in Mac OS X v10.5 and later.

144.29.8 Properties

144.29.9 action as PDFActionMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The action performed when users click the outline.
Notes: The root outline serves only as a container for the outlines it owns; it does not have an action. Note that a PDFOutline object can have either an action or a destination, not both.

If the PDFOutline object has a destination, instead of an action, action returns a PDFActionGoTo object (this is equivalent to calling destination on the PDFOutline object). For other action types, action returns the appropriate PDF Kit action type object, such as PDFActionURL.

Available in Mac OS X v10.5 and later.
(Read and Write property)

144.29.10 destination as PDFDestinationMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The destination asscoiated with the outline item.
Notes: The root PDFOutline has no destination.
(Read and Write property)

144.29.11 document as PDFDocumentMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The PDFDocument the outline is asscoiated with.
Notes: (Read only property)

144.29.12 index as Integer

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the index of the outline.
Notes: The index of the outline object is relative to its siblings and from the perspective of the parent of

the outline object. The root outline object, and any outline object without a parent, has an index value of 0.

Available in Mac OS X v10.5 and later.
(Read only property)

144.29.13 isOpen as boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Whether the outline object is initially disclosed.
Notes: Calling isOpen on an outline object that has no children always returns false. Calling isOpen on the root outline object always returns true.

Available in Mac OS X v10.5 and later.
(Read and Write property)

144.29.14 label as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The label for the outline.
Notes: The root PDFOutline has no label and is only a container for children PDFOutlines.
(Read and Write property)

144.29.15 numberOfChildren as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Number of PDFOutline children this PDFOutline has.
Notes: (Read only property)

144.29.16 parent as PDFOutlineMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The parent outline object of the outline.
Notes: Can be nil for the root object.
Available in Mac OS X v10.5 and later.

(Read only property)

144.30 class PDFPageMBS

144.30.1 class PDFPageMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The PDFKit class for a page in a pdf document.
Example:

```
Var file1,file2,file3,destfile as FolderItem
Var page1,page2,page3 as PDFPageMBS
Var doc1,doc2 as PDFDocumentMBS
Var img as NSImageMBS
Var doc as PDFDocumentMBS

file1=SpecialFolder.Desktop.Child("test1.pdf")
file2=SpecialFolder.Desktop.Child("test2.pdf")
file3=SpecialFolder.Desktop.Child("logo.jpg")

doc1=new PDFDocumentMBS(file1)
doc2=new PDFDocumentMBS(file2)

MessageBox str(doc1.pageCount)

img=new NSImageMBS(file3)

Backdrop=img.CopyPicture

page1=new PDFPageMBS(img)
page2=doc1.pageAtIndex(0)
page3=doc2.pageAtIndex(0)

doc=new PDFDocumentMBS
doc.insertPage page1,0
doc.insertPage page2,1
doc.insertPage page3,2

destfile=SpecialFolder.Desktop.Child("test.pdf")
call doc.write(destfile)
```

144.30.2 Methods

144.30.3 addAnnotation(annotation as PDFAnnotationMBS)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Methods allowing annotations to be added.

144.30.4 annotationAtPoint(x as single, y as single) as PDFAnnotationMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Hit-testing method returns the annotation at point (or nil if none).
Notes: The point is in page-space.

144.30.5 annotations as PDFAnnotationMBS()

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns an array containing the page's annotations.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc as new PDFDocumentMBS(f)
Var page as PDFPageMBS = doc.pageAtIndex(0)
Var annotations(-1) as PDFAnnotationMBS = page.annotations

// show a MessageBox with the types of all annotations
Var types(-1) as string

for each a as PDFAnnotationMBS in annotations
types.Add a.type
next

MessageBox Join(types)
```

Notes: The elements of the array will most likely be typed to subclasses of the PDFAnnotation class.

Available in Mac OS X v10.4 and later.

144.30.6 CalcTransformForBox(box as Integer) as Variant

MBS PDFKit Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: An utility function to calculate the transform needed to draw into a page.
Notes: Returns NSAffineTransformMBS object.

144.30.7 characterBoundsAtIndex(index as Integer) as NSRectMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Returns the bounds in page-space of the character at index.
Notes: In the unlikely event that more than one character are at the specified point, only the first character encountered is returned.

144.30.8 characterIndexAtPoint(x as single, y as single) as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Returns the index of the character at point (in page space).
Notes: Returns -1 if no character at point.

144.30.9 Constructor

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor to create a custom PDF page.
Example:

```
Var doc as new PDFDocumentMBS
Var page as PDFPageMBS
Var f as FolderItem

page=new MyPDFPageMBS

doc.Creator="Xojo"
doc.Title="Test file"

doc.insertPage page,0

f=SpecialFolder.Desktop.Child("test.pdf")

if doc.write(f) then
f.launch
end if
```

Notes: You draw the content using drawRect event.
See also:

- 144.30.10 Constructor(Handle as Integer) 19471
- 144.30.11 Constructor(image as NSImageMBS) 19471

144.30.10 Constructor(Handle as Integer)

MBS PDFKit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a new object based on a given PDFPage handle.
Notes: Please pass in a non zero handle which points to a PDFPage object.
For use with declares.
See also:

- 144.30.9 Constructor 19471
- 144.30.11 Constructor(image as NSImageMBS) 19471

144.30.11 Constructor(image as NSImageMBS)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Creates a PDFPage for the NSImage passed in.
Notes: An easy way to create a PDFPage from an image to add to a PDFDocument.

Mac OS X 10.5 only.
See also:

- 144.30.9 Constructor 19471
- 144.30.10 Constructor(Handle as Integer) 19471

144.30.12 copy as PDFPageMBS

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates a copy of the page object.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var p as new PDFDocumentMBS(f)

// make a new PDF
Var c as new PDFDocumentMBS

// get first page
Var page as PDFPageMBS = p.pageAtIndex(0)

// add copy of page to new pdf
c.insertPage page.copy, 0

// c now has one page
MessageBox str(p.pageCount)+" "+str(c.pageCount)
```

144.30.13 Destructor

MBS PDFKit Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The destructor.

144.30.14 Draw(g as NSGraphicsMBS, box as Integer = 0)

MBS PDFKit Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Draws PDF page into graphics environment.
Notes: Use kPDFDisplay*Box constants for box parameter.

144.30.15 drawWithBox(box as Integer)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Draws the page within the specified box.
Notes: This method takes into account the page rotation and draws clipped to the specified box. If the page is set to display annotations, this method also draws them. This method does not clear the background. To clear the background before drawing, use NSRectFill with NSColor set (typically) to white.

144.30.16 removeAnnotation(annotation as PDFAnnotationMBS)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Methods allowing annotations to be removed.

144.30.17 Render(dpi as Double = 72.0, box as Integer = 0, background as NSColorMBS = nil) as NSImageMBS

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Renders a PDF Page into an image.
Example:

```
Var f as FolderItem = New FolderItem("Castles.pdf")
Var doc as new PDFDocumentMBS(f)
Var page as PDFPageMBS = doc.pageAtIndex(0)
Var image as NSImageMBS = page.Render

Backdrop = image.CopyPicture
```

Notes: dpi: The resolution you want to have on the image. Default 72.0. To get a scaled image with factor x, pass 72.0*x.
box: The display box. Use one of the kPDFDisplayBox* constants.
background: optional NSColorMBS object to fill the background before drawing the PDF. This will affect only PDFs with transparent background.

Returns nil on any error.

Version 11.1pr8 adds code here to handle rotation better.
Due to bugs in Apple,Äôs PDFKit you may see memory leaks with JPEG data from PDF pages (seen in

macOS 10.12).

144.30.18 selectionForLineAtPoint(left as single, top as single) as PDFSelectionMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Given a point in page-space, returns a selection representing a whole line at that point.
Notes: May return nil if no character (and by extension no line) under point.

144.30.19 selectionForRange(position as Integer, length as Integer) as PDFSelectionMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Given a range, returns a selection representing text within that range.
Example:

```
Var MyPDFView as PDFViewMBS // your view

Var doc as PDFDocumentMBS = MyPDFView.document
Var page as PDFPageMBS = doc.pageAtIndex(0)
Var sel as PDFSelectionMBS = page.selectionForRange(0,5)
MyPDFView.currentSelection = sel
```

Notes: Will raise an exception if the range length is zero or if the range is outside the range of the characters on the page.

144.30.20 selectionForRect(left as single, top as single, width as single, height as single) as PDFSelectionMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Given a rect in page-space, returns a selection representing enclosed text on page.

144.30.21 selectionForWordAtPoint(left as single, top as single) as PDFSelectionMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Given a point in page-space, returns a selection representing a whole word at that point.
Notes: May return nil if no character (and by extension no word) under point.

144.30.22 selectionFromPointToPoint(startleft as single, starttop as single, endleft as single, endtop as single) as PDFSelectionMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Returns a selection representing text between startPt and endPt.
Notes: Point are sorted first top to bottom, left to right.

144.30.23 thumbnailOfSize(size as NSSizeMBS, box as integer) as NSImageMBS

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Convenience function that returns an image of this page, with annotations, that fits the given size.
Notes: Note that the produced image is "size to fit": it retains the original page aspect-ratio. The size you give may not match the size of the returned image, but the returned image is guaranteed to be equal or less.

Available in macOS 10.13 or newer.

144.30.24 transformContextForBox(box as Integer)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Given a display box, will transform the current context to take into account the rotation of the page as well as the origin of the box with repect to the page's base coordinates system.
Notes: This is a convenient method to call from within drawPage or from within the draw method a PDFAnnotation subclass.

Mac OS X 10.5 only.

144.30.25 transformForBox(box as integer) as variant

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: This transform correctly rotates and offsets based on the given page's rotation property and the display box type.

Notes: Available in macOS 10.13 or newer.

144.30.26 Properties

144.30.27 attributedString as NSAttributedStringMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: String (with linefeeds and in some cases spaces inserted) representing the text on the page.
Notes: (Read only property)

144.30.28 CGPDFPageHandle as Integer

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The CoreGraphics PDFPage handle.
Notes: (Read only property)

144.30.29 dataRepresentation as memoryblock

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Returns PDF data (a proper PDF document) consisting of a single page (this page).
Notes: Note, external page links are not preserved.
(Read only property)

144.30.30 displaysAnnotations as boolean

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Method to turn on or off the display of annotations when the page is drawn.
Notes: (Read and Write property)

144.30.31 document as PDFDocumentMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The PDFDocument the page is associated with.
Notes: (Read only property)

144.30.32 label as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The page label. Usually "1" for the first page, "2" for the second, etc.
Notes: (Read only property)

144.30.33 numberOfCharacters as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Number of characters on the page (including linefeeds and spaces inserted).
Notes: (Read only property)

144.30.34 rotation as Integer

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Rotation on a page.
Notes: Must be 0, 90, 180 or 270 (negative rotations will be "normalized" to one of 0, 90, 180 or 270). Some PDF's have an inherent rotation and so rotation may be non-zero when a PDF is first opened.
(Read and Write property)

144.30.35 stringValue as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: String (with linefeeds and in some cases spaces inserted) representing the text on the page.
Example:

```
Var p as PDFDocumentMBS
Var f as FolderItem

f=SpecialFolder.Desktop.Child("test.pdf")
p=new PDFDocumentMBS(f)

MessageBox "Text from first page:"+EndOfLine+EndOfLine+p.pageAtIndex(0).stringValue
```

Notes: If you need to extract the text of a PDF document page cross platform or with more options, you may want to look on the DynaPDF plugin.

It seems like this string value is not always available. It works for PDF Documents created from a disc

file, but not for files our test app created on runtime in memory by using PDFDocument constructor and insertpage.
(Read only property)

144.30.36 boundsForBox(box as Integer) as NSRectMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the bounds for the specified PDF display box.
Notes: The PDFDisplayBox enumeration defines the various box types.

Note that only the media box is required for a PDF. If you request the bounds for the crop box, but the PDF does not include a crop box, the bounds for the media box are returned instead. If you request the bounds for other box types, and the PDF does not includes these types, the bounds for the crop box are returned instead.

The coordinates for the box are in page space, so you might need to transform the points if the page has a rotation on it. Also, note that the bounds boundsForBox returns are intersected with the page's media box.

boundsForBox throws a range exception if box is not in range.
(Read and Write computed property)

144.30.37 Events

144.30.38 drawRect(box as Integer, g as NSGraphicsMBS)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The event called when the PDFPage needs to be drawn.
Example:

```
Sub drawRect(box as Integer, g as NSGraphicsMBS)

if g.Valid then
System.DebugLog "is valid"
else
System.DebugLog "not valid"
end if

g.SetColorRGB 0,1,0

g.drawRect 200,200,200,200

g.SetColorRGB 1,0,0
```

```
g.fillRect 100,100,100,100
End Sub
```

Notes: Do not store the graphics reference as it is only valid in this event.
Use the kPDFDisplayBox* constants for the box value.
You can draw another PDF page here with Draw command.

To avoid drawRect causing StackOverflowException when showing in a control, please have PDF produced as file or MemoryBlock, then read it back to a new PDFDocumentMBS object and show that in a control.

144.30.39 Constants

Constants

Constant	Value	Description
kPDFDisplayBoxArtBox	4	One of the constants to use for page boxes.

Boxes

Constant	Value	Description
kPDFDisplayBoxBleedBox	2	
kPDFDisplayBoxCropBox	1	
kPDFDisplayBoxMediaBox	0	
kPDFDisplayBoxTrimBox	3	

144.31 class PDFSelectionMBS

144.31.1 class PDFSelectionMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The PDFKit class for selections.
Example:

```
Var MyPDFView as PDFViewMBS // your view

Var doc as PDFDocumentMBS = MyPDFView.document
Var page as PDFPageMBS = doc.pageAtIndex(0)
Var sel as PDFSelectionMBS = page.selectionForRange(0,5)
MyPDFView.currentSelection = sel
```

Blog Entries

- MBS Xojo Plugins, version 20.2pr3

Xojo Developer Magazine

- 24.2, pages 81 to 82: PDF Highlights, Setting highlights with PDFKit from the MBS Xojo plugins by Stefanie Juchmes-Simonis

144.31.2 Methods

144.31.3 addSelection(selection as PDFSelectionMBS)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Add a selection to this selection.
Notes: Selections do not have to be contiguous. If the selection added overlaps with this selection, overlaps are removed.

144.31.4 addSelections(selection() as PDFSelectionMBS)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Adds the specified array of selections to the receiving selection.
Notes: This method provides better performance than multiple calls to addSelection if you need to add several selections to an existing selection. This is because the normalization of the selection (the removal of any overlaps between selections) occurs only once, after all selections have been added.

Available in Mac OS X v10.5 and later.

144.31.5 boundsForPage(page as PDFPageMBS) as NSRectMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the bounds of the selection on the specified page.
Notes: The selection rectangle is given in page space.
Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page.

144.31.6 Constructor(doc as PDFDocumentMBS)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates an empty PDFSelection object.
Notes: Typically, you don't need to create a PDFSelection object, but you can use an empty PDFSelection object as a container into which you can place selections, using addSelection: and addSelections.
Available in Mac OS X v10.5 and later.
See also:

- 144.31.7 Constructor(Handle as Integer) 19481

144.31.7 Constructor(Handle as Integer)

MBS PDFKit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a new object based on a given PDFSelection handle.
Notes: Please pass in a non zero handle which points to a PDFSelection object.
For use with declares.
See also:

- 144.31.6 Constructor(doc as PDFDocumentMBS) 19481

144.31.8 copy as PDFSelectionMBS

MBS PDFKit Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates a copy of the selection object.

144.31.9 drawForPage(page as PDFPageMBS, active as boolean)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Calls drawForPage with a default value for box parameter.
Notes: The default value is kPDFDisplayBoxCropBox. If active is true, drawing uses selectedTextBackgroundColor. If false, it uses secondarySelectedControlColor.
See also:

- 144.31.10 drawForPage(page as PDFPageMBS, box as Integer, active as boolean) 19482

144.31.10 drawForPage(page as PDFPageMBS, box as Integer, active as boolean)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Draws the selection relative to the origin of the specified box in page space.
Notes: The selection is drawn using the current highlight color. If active is true, drawing uses selectedTextBackgroundColor. If false, it uses secondarySelectedControlColor. Refer to the PDFPage class for the list of available box types.

Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page.
See also:

- 144.31.9 drawForPage(page as PDFPageMBS, active as boolean) 19481

144.31.11 extendSelectionAtEnd(chars as Integer)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Extends the selection at either end.
Example:

```
Var s as PDFSelectionMBS // your selection

s.extendSelectionAtEnd(50)
```

Notes: Selections can be extended right off onto neighboring pages even to include the entire PDF document.

144.31.12 extendSelectionAtStart(chars as Integer)

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Extends the selection at either end.
Example:

```
Var s as PDFSelectionMBS // your selection

s.extendSelectionAtStart(50)
```

Notes: Selections can be extended right off onto neighboring pages even to include the entire PDF document.

144.31.13 extendSelectionForLineBoundaries

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Extend to the selection to the beginning and end of the currently selected lines of text.
Notes: If the current selection is on a single line, then this will extend it to the entire line width. If the selection is across multiple lines, then the first and last lines are expected to wholly contain their respective rows of text.

Available in macOS 10.13 or newer or iOS 11.0 or newer.

144.31.14 numberOfTextRangesOnPage(page as PDFPageMBS) as UInt32

MBS PDFKit Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns the number of contiguous ranges of text on the specified page.
Notes: Returns zero if page is not in selection.
A typical, simple selection will contain a single range of text.

Available in Mac OS X 10.7 and later.

144.31.15 pages as PDFPageMBS()

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: Array of pages covered by the selection.
Notes: These are sorted by page index.
Returns nil on any error.

144.31.16 rangeAtIndex(page as PDFPageMBS, index as Integer) as NSRangeMBS

MBS PDFKit Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns a range of contiguous text at index on the specified page.
Notes: A simple selection. A typical, simple selection will contain a single range of text.
Available in Mac OS X 10.7 and later.

144.31.17 selectionsByLine as PDFSelectionMBS()

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns an array of selections, one for each line of text covered by the receiver.
Notes: If you call this method on a PDFSelection object that represents a paragraph, for example, selectionsByLine returns an array that contains one PDFSelection object for each line of text in the paragraph. Available in Mac OS X v10.5 and later.

144.31.18 Properties

144.31.19 attributedString as NSAttributedStringMBS

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: String representing the text covered by the selection.
Notes: May contain line-feeds.
(Read only property)

144.31.20 colorValue as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The color used to draw the selection.
Notes: Note that when no color has been specified for the PDFSelection objects in a document, the selections are drawn using NSColorMBS.selectedTextBackgroundColor for the active state and NSColorMBS.secondarySelectedControlColor for the inactive state.
(Read and Write property)

144.31.21 Handle as Integer

MBS PDFKit Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The handle used internally for the object reference.
Notes: (Read and Write property)

144.31.22 stringValue as string

MBS PDFKit Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: String representing the text covered by the selection.

Notes: May contain line-feeds.
(Read only property)

144.32 control PDFThumbnailViewControlMBS

144.32.1 control PDFThumbnailViewControlMBS

MBS PDFKit Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a PDFThumbnailView.
Notes: This control embeds a special PDFThumbnailView subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

See PDFThumbnailViewIOSControlMBS for iOS projects.

144.32.2 Properties

144.32.3 View as PDFThumbnailViewMBS

MBS PDFKit Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

144.32.4 Events

144.32.5 BoundsChanged

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

144.32.6 Close

MBS PDFKit Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

144.32.7 Closing

Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

144.32.8 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS PDFKit Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

144.32.9 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

144.32.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS PDFKit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

144.32.11 EnableMenuItems

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

144.32.12 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

144.32.13 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

144.32.14 FrameChanged

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

144.32.15 GotFocus

MBS PDFKit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.

Notes:

This only fires if the control itself got focus and not a sub control.

144.32.16 LostFocus

MBS PDFKit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

144.32.17 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

144.32.18 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

144.32.19 MouseDrag(x as Integer, y as Integer)

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

144.32.20 MouseUp(x as Integer, y as Integer)

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

144.32.21 Open

MBS PDFKit Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

144.32.22 Opening

Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

144.32.23 ScaleFactorChanged(NewFactor as Double)

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

144.32.24 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS PDFKit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

144.33 control PDFThumbnailViewIOSControlMBS

144.33.1 control PDFThumbnailViewIOSControlMBS

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The Xojo control for a PDFThumbnailView.
Notes: This control embeds a special PDFThumbnailView subclass.
Please use view property to access the underlaying object and set properties.

See PDFThumbnailViewControlMBS for desktop projects.

144.33.2 Properties

144.33.3 View as PDFThumbnailViewMBS

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

144.33.4 Events

144.33.5 Close

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: Desktop & iOS.

Function: The control is about to close.

144.33.6 GotFocus

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: Desktop & iOS.

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

144.33.7 LostFocus

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: Desktop & iOS.

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

144.33.8 Open

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: Desktop & iOS.

Function: The control is about to was created and you can initialize it.

144.34 class PDFThumbnailViewMBS

144.34.1 class PDFThumbnailViewMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: A PDFThumbnailView object contains a set of thumbnails, each of which represents a page in a PDF document.
Example:

```
// This example needs a window with PDFViewControlMBS1 and PDFThumbnailViewControlMBS1.
// show page thumbnails next to a PDF view
Var doc As New PDFDocumentMBS(SpecialFolder.Desktop.Child("test.pdf"))
PDFViewControlMBS1.View.document = doc

Var thumbs As PDFThumbnailViewMBS = PDFThumbnailViewControlMBS1.View
thumbs.PDFView = PDFViewControlMBS1.View // click a thumbnail to go to the page
thumbs.thumbnailSize = NSMakeSizeMBS(100, 130)
thumbs.maximumNumberOfColumns = 1
thumbs.allowsMultipleSelection = True
```

Notes: You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

144.34.2 Methods

144.34.3 Constructor

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new PDF thumbnail view with size 100/100 and position 0/0
Example:

```
Var t as new PDFThumbnailViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 144.34.4 Constructor(Handle as Integer) 19495
- 144.34.5 Constructor(left as Double, top as Double, width as Double, height as Double) 19495

144.34.4 Constructor(Handle as Integer)

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an object based on the given PDFThumbnailView handle.
Example:

```
Var t as new PDFThumbnailViewMBS(0, 0, 100, 100)
Var v as new PDFThumbnailViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a PDFThumbnailView and the plugin retains this handle.
See also:

- 144.34.3 Constructor 19494
- 144.34.5 Constructor(left as Double, top as Double, width as Double, height as Double) 19495

144.34.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new PDF thumbnail view with the given size and position.
Example:

```
Var x as new PDFThumbnailViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 144.34.3 Constructor 19494
- 144.34.4 Constructor(Handle as Integer) 19495

144.34.6 PDFThumbnailViewDocumentEditedNotification as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop & iOS.

Function: The Notification when PDFDocument is modified.
Notes: Use NSNotificationObserverMBS class to listen for this one.

144.34.7 selectedPages as PDFPageMBS()

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns an array of PDF pages that correspond to the selected thumbnails in the thumbnail view.
Notes: If the thumbnail view allows multiple selections (if allowsMultipleSelection returns true), you can use this method to get the PDF pages that correspond to the selected thumbnails.
Available in Mac OS X v10.5 and later.

144.34.8 Properties

144.34.9 allowsDragging as boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether users can drag thumbnails within the thumbnail view; that is, re-order pages in the document.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.34.10 allowsMultipleSelection as boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether the thumbnail view allows users to select more than one thumbnail at a time.
Notes: By default, PDFThumbnailView allows only a single thumbnail to be selected at one time. When this is the case, you can get the PDF page that corresponds to the selected thumbnail using the PDFView method currentPage.

If you use setAllowsMultipleSelection to enable multiple selections, however, you must use selectedPages to get the pages that correspond to the set of selected thumbnails.
Available in Mac OS X v10.5 and later.
(Read and Write property)

144.34.11 backgroundColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The color used in the background of the thumbnail view.
Notes: Available in Mac OS X v10.5 and later.

(Read and Write property)

144.34.12 Bezeled as Boolean

MBS PDFKit Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop only.

Function: Whether to use bezel for control.
Notes: (Read and Write property)

144.34.13 labelFont as NSFontMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The font used to label the thumbnails.
Notes: Typically, the label of a thumbnail is the page number of the page it represents.
Available in Mac OS X v10.5 and later.
(Read and Write property)

144.34.14 maximumNumberOfColumns as Integer

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the maximum number of columns of thumbnails the thumbnail view can display.
Notes: The thumbnail displays as many columns of thumbnails as fit in its size.
Available in Mac OS X v10.5 and later.
(Read and Write property)

144.34.15 PDFView as PDFViewMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The PDFView object associated with the thumbnail view.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.34.16 thumbnailSize as NSSizeMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum width and height of the thumbnails in the thumbnail view.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

144.35 control PDFViewControlMBS

144.35.1 control PDFViewControlMBS

MBS PDFKit Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a PDFView.
Notes: This control embeds a special PDFView subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

Can be linked to a PDFThumbnailViewControlMBS control to show the thumbnails for the pages.

See PDFViewIOSControlMBS control for iOS projects.
See WinPreviewControlMBS control for Windows targets.

144.35.2 Methods

144.35.3 ClearOverlay(page as PDFPageMBS, post as boolean = true)

MBS PDFKit Plugin, Plugin Version: 17.5, Platform: macOS, Targets: Desktop only.

Function: Clear overlay item for this page.
Notes: Is post = false, than we clear the item for pre page drawing, else for post page drawing.
The plugin does not trigger a redraw, so change takes effect on the next time the page is drawn.

144.35.4 ClearOverlays

MBS PDFKit Plugin, Plugin Version: 17.5, Platform: macOS, Targets: Desktop only.

Function: Clear all overlays.
Notes: The plugin does not trigger a redraw, so change takes effect on the next time the page is drawn.

144.35.5 Properties

144.35.6 View as PDFViewMBS

MBS PDFKit Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

144.35.7 Overlay(page as PDFPageMBS, post as boolean = true) as variant

MBS PDFKit Plugin, Plugin Version: 17.5, Platform: macOS, Targets: Desktop only.

Function: Get/Set overlay item.
Notes: MBS Plugin can draw a picture, NSImageMBS or PDFPageMBS below/over the PDF page.
The plugin does not trigger a redraw, so change takes effect on the next time the page is drawn.
(Read and Write computed property)

144.35.8 Events

144.35.9 AfterDrawPage(graphics as NSGraphicsMBS, page as PDFPageMBS)

MBS PDFKit Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The draw event called after something was drawn.
Notes: On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.35.10 AfterDrawPagePost(graphics as NSGraphicsMBS, page as PDFPageMBS)

MBS PDFKit Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The draw event called after a page annotations were drawn.
Notes: On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.35.11 AfterDrawRect(graphics as NSGraphicsMBS, x as Double, y as Double, w as Double, h as Double)

MBS PDFKit Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The draw event called after a page was drawn.
Notes: On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.35.12 BeforeDrawPage(graphics as NSGraphicsMBS, page as PDFPageMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The draw event called before a page was drawn.
Notes: On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.35.13 BeforeDrawPagePost(graphics as NSGraphicsMBS, page as PDFPageMBS) as boolean

MBS PDFKit Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The draw event called before a page annotations were drawn.
Notes: On macOS 10.12.2 or later, this event is called on a non-main thread. In that case the plugin will not call this event.

144.35.14 BeforeDrawRect(graphics as NSGraphicsMBS, x as Double, y as Double, w as Double, h as Double) as boolean

MBS PDFKit Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The draw event called before a something was drawn.

144.35.15 BoundsChanged

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

144.35.16 Close

MBS PDFKit Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

144.35.17 Closing

Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

144.35.18 CocoaMouseDown(e as NSEventMBS)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: This is called before MouseDown, but provides the original Cocoa event, so you can query additional properties.

144.35.19 CocoaMouseDrag(e as NSEventMBS)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: This is called before MouseDrag, but provides the original Cocoa event, so you can query additional properties.

144.35.20 CocoaMouseUp(e as NSEventMBS)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: This is called before MouseUp, but provides the original Cocoa event, so you can query additional properties.

144.35.21 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS PDFKit Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

144.35.22 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

144.35.23 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS PDFKit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

144.35.24 EnableMenuItems

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

144.35.25 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

144.35.26 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

144.35.27 FrameChanged

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

144.35.28 GotFocus

MBS PDFKit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

144.35.29 LostFocus

MBS PDFKit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

144.35.30 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

144.35.31 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

144.35.32 MouseDrag(x as Integer, y as Integer)

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.

As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

144.35.33 MouseUp(x as Integer, y as Integer)

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

144.35.34 Open

MBS PDFKit Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

144.35.35 Opening

Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

144.35.36 OpenPDFforRemoteGoToAction(action as PDFActionRemoteGoToMBS)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: Opens a specified page.
Notes: This event will be called to handle clicks on annotations containing a PDFActionRemoteGoToMBS action. The action contains a URL and a page index and point. You should open the PDF indicated by the URL and go to the page and point indicated. The easiest way to do the latter is to create a PDFDestinationMBS with the page index and point once a PDFDocumentMBS from the URL is created - then you can call: goToDestination method. The default implementation simply beeps.

144.35.37 PerformFind

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: Performs a find operation.
Notes: Certain PDFAction's may request that the PDF viewer application perform a Find.
The event will be called when the user clicks on an annotation with such an action.

144.35.38 PerformGoToPage

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: Performs a go-to operation.
Notes: Certain PDFAction's may request that the PDF viewer application bring up a panel allowing the user to enter a specific page number. The event will be called when the user clicks on an annotation with such an action.

144.35.39 PerformPrint

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: Prints the current document.
Notes: Certain PDFAction's may request that the PDF viewer application Print the current document. This event will be called when the user clicks on an annotation with such an action.

144.35.40 PrintJobTitle as String

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: Overrides the job title used when the PDFView is printed.
Notes: Allows to override the job title when PDFView is printed. The default implementation uses the string, if any, associated with the "Title" key from the view's PDFDocumentMBS attribute dictionary. Failing that, it uses the last path component if the PDFDocumentMBS is URL-based.

144.35.41 ScaleFactorChanged(NewFactor as Double)

MBS PDFKit Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

144.35.42 WillChangeScaleFactor(scale as Double) as Double

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: Overrides changes to the scale factor.
Notes: Allows to override changes to the scale factor. The default implementation pins scaling between 0.1 and 10.0.

If you add this event, please return a value, e.g. the passed scale value.

144.35.43 WillClickOnLink(URL as String)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: Handle clicks on URL links in a view.
Notes: If implemented, this event will be called to handle clicks on URL links within the PDFView.
The default implementation calls openURL on NSWorkspaceMBS class.

144.35.44 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS PDFKit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

144.36 control PDFViewIOSControlMBS

144.36.1 control PDFViewIOSControlMBS

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The Xojo control for a PDFView.
Notes: This control embeds a special PDFView subclass.
Please use view property to access the underlaying object and set properties.

Can be linked to a PDFThumbnailViewIOSControlMBS control to show the thumbnails for the pages.

See PDFViewControlMBS control for desktop projects.
See WinPreviewControlMBS control for Windows targets.

144.36.2 Properties

144.36.3 View as PDFViewMBS

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

144.36.4 Events

144.36.5 Close

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: Desktop & iOS.

Function: The control is about to close.

144.36.6 GotFocus

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: Desktop & iOS.

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

144.36.7 LostFocus

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: Desktop & iOS.

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

144.36.8 Open

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: Desktop & iOS.

Function: The control is about to was created and you can initialize it.

144.36.9 OpenPDFforRemoteGoToAction(action as PDFActionRemoteGoToMBS)

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: Desktop & iOS.

Function: Opens a specified page.
Notes: This event will be called to handle clicks on annotations containing a PDFActionRemoteGoToMBS action. The action contains a URL and a page index and point. You should open the PDF indicated by the URL and go to the page and point indicated. The easiest way to do the latter is to create a PDFDestinationMBS with the page index and point once a PDFDocumentMBS from the URL is created - then you can call: goToDestination method. The default implementation simply beeps.

144.36.10 PerformFind

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: Desktop & iOS.

Function: Performs a find operation.
Notes: Certain PDFAction's may request that the PDF viewer application perform a Find.
The event will be called when the user clicks on an annotation with such an action.

144.36.11 PerformGoToPage

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: Desktop & iOS.

Function: Performs a go-to operation.
Notes: Certain PDFAction's may request that the PDF viewer application bring up a panel allowing the user to enter a specific page number. The event will be called when the user clicks on an annotation with such an action.

144.36.12 WillClickOnLink(URL as String)

MBS PDFKit Plugin, Plugin Version: 23.3, Platform: iOS, Targets: Desktop & iOS.

Function: Handle clicks on URL links in a view.
Notes: If implemented, this event will be called to handle clicks on URL links within the PDFView.
The default implementation calls openURL on NSWorkspaceMBS class.

144.37 class PDFViewMBS

144.37.1 class PDFViewMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: A PDFView object encapsulates the functionality of PDF Kit into a single widget that you can add to your application.
Example:

```
// show a PDF document in the window
Var view As New PDFViewMBS(0, 0, Self.Width, Self.Height)
view.document = New PDFDocumentMBS(SpecialFolder.Desktop.Child("test.pdf"))
view.autoScales = True
view.displayMode = PDFViewMBS.kPDFDisplaySinglePageContinuous

Self.NSWindowMBS.contentView.addSubview view
```

Notes: PDFView may be the only class you need to deal with for adding PDF functionality to your application. It lets you display PDF data and allows users to select content, navigate through a document, set zoom level, and copy textual content to the Pasteboard. PDFView also keeps track of page history.

You can subclass PDFView to create a custom PDF viewer or better use our CustomPDFViewMBS class.

You can also create a custom PDF viewer by using the PDF Kit utility classes directly and not using PDFView at all.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

144.37.2 Methods

144.37.3 annotationsChangedOnPage(page as PDFPageMBS)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Tells the PDF view that an annotation on the specified page has changed.
Notes: When the PDFView object receives this message, it rescans for tool tips and pop-ups and informs the PDFThumbailView objects so the thumbnail images can be redrawn.
Available in Mac OS X v10.5 and later.

144.37.4 areaOfInterestForMouse(e as NSEventMBS) as Integer

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the type of area the mouse cursor is over.
Notes: The PDFAreaOfInterest enumeration defines the various area types. This method is for custom subclasses of the PDFView class. Use it if you override the NSResponder class's mouseMoved: method or related methods.

144.37.5 areaOfInterestForPoint(p as NSPointMBS) as integer

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: Returns type of area (see defines above) mouse is over.

144.37.6 clearSelection

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Clears the selection.
Notes: The view redraws as necessary but does not scroll. This call is equivalent to setting CurrentSelection=nil.

144.37.7 Constructor

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new PDF view with size 100/100 and position 0/0
Example:

```
Var t as new PDFViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 144.37.8 Constructor(Handle as Integer) 19514
- 144.37.9 Constructor(left as Double, top as Double, width as Double, height as Double) 19514

144.37.8 Constructor(Handle as Integer)

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an object based on the given PDFView handle.
Example:

```
Var t as new PDFViewMBS(0, 0, 100, 100)
Var v as new PDFViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSButton and the plugin retains this handle.
See also:

- 144.37.7 Constructor 19513
- 144.37.9 Constructor(left as Double, top as Double, width as Double, height as Double) 19514

144.37.9 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new PDF view with the given size and position.
Example:

```
Var x as new PDFViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 144.37.7 Constructor 19513
- 144.37.8 Constructor(Handle as Integer) 19514

144.37.10 convertPointFromPage(point as NSPointMBS, page as PDFPageMBS) as NSPointMBS

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a point from page space to view space.
Notes: Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page. View space is a coordinate system with the origin at the lower-left corner of the current PDF view.

144.37.11 convertPointToPage(point as NSPointMBS, page as PDFPageMBS) as NSPointMBS

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a point from view space to page space.
Example:

```
// convert point from mouse event to page coordinates
Function MouseDown(x as Integer, y as Integer, Modifiers as Integer) Handles MouseDown as Boolean
Var a As NSApplicationMBS = NSApplicationMBS.sharedApplication
Var n As NSEventMBS = a.currentEvent
Var v As PDFViewMBS = Me.View
Var w As NSWindowMBS = Self.NSWindowMBS
Var p As NSPointMBS = n.locationInWindow

System.DebugLog "p: "+str(p.x)+"/"+str(p.y)

Var doc As PDFDocumentMBS = v.document
Var page As PDFPageMBS = doc.pageAtIndex(0)
Var r As NSPointMBS = v.convertPointFromView(p, Nil)

System.DebugLog "r: "+Str(r.x)+"/"+Str(r.y)

Var d As NSPointMBS = v.convertPointToPage(r, page)

System.DebugLog "d: "+Str(d.x)+"/"+Str(d.y)
End Function
```

Notes: Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page. View space is a coordinate system with the origin at the lower-left corner of the current PDF view.

144.37.12 convertRectFromPage(rect as NSRectMBS, page as PDFPageMBS) as NSRectMBS

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a rectangle from page space to view space.
Notes: Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page. View space is a coordinate system with the origin at the lower-left corner of the current PDF view.

144.37.13 convertRectToPage(rect as NSRectMBS, page as PDFPageMBS) as NSRectMBS

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a rectangle from view space to page space.
Notes: Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page. View space is a coordinate system with the origin at the lower-left corner of the current PDF view.

144.37.14 copy

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Copies the text in the selection, if any, to the Pasteboard.

144.37.15 drawPage(page as PDFPageMBS)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: For use by subclasses of PDFView for custom rendering of pages.
Notes: Do not invoke this method, except by invoking it on super from a subclass.

The PDFView class calls drawPage: as necessary for each visible page that requires rendering. In the PDFView class, this method erases page to white, calls page.drawInRect(pageRect,self.displayBox), and then draws the selection, if any.

You can override this method to draw on top of a PDF page or to control how pages are drawn. In these cases, invoke this method on super and then perform custom drawing on top of the PDF page.

Changed in v22.5 to work on macOS Ventura.
But if the drawPage is called by macOS on the wrong thread, we ignore that to prevent StackOverflowException from Xojo runtime.

144.37.16 drawPagePost(page as PDFPageMBS)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: For use by subclasses of PDFView for post-page rendering.
Notes: The default implementation of this method draws the text highlighting (if any) for the page. This method does not apply scaling or rotating to the current context to map to page space; instead, the context is in view-space coordinates (in which the origin is at the lower-left corner of the current PDF view).
Available in Mac OS X v10.5 and later.

144.37.17 goBack

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Navigates back one step in the page history.
Notes: The page history gets built as your application calls navigation methods such as goToDestination and goToLastPage.

144.37.18 goForward

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Navigates forward one step in the page history.
Notes: The page history gets built as your application calls navigation methods such as goToDestination and goToLastPage.

144.37.19 goToDestination(page as PDFDestinationMBS)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Navigates to the specified destination.
Notes: Destinations include a page and a point on the page specified in page space.
Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page.

144.37.20 goToFirstPage

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Navigates to the first page of the document.
Notes: PDF Kit records the move in its page history.

144.37.21 goToLastPage

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Navigates to the last page of the document.
Notes: PDF Kit records the move in its page history.

144.37.22 goToNextPage

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Navigates to the next page of the document.
Notes: PDF Kit records the move in its page history.

144.37.23 goToPage(page as PDFPageMBS)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Scrolls to the specified page.
Notes: PDF Kit records the move in its page history.

144.37.24 goToPreviousPage

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Navigates to the previous page of the document.
Notes: PDF Kit records the move in its page history.

144.37.25 goToRect(rect as NSRectMBS, page as PDFPageMBS)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Navigates to the specified rectangle on the specified page.
Notes: If the specified rectangle is already visible, this method does nothing. This allows you to scroll the PDFView object to a specific PDFAnnotation or PDFSelection object, because both of these objects have bounds methods that return an annotation or selection position in page space.

Note that rect is specified in page-space coordinates. Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page.
Available in Mac OS X v10.5 and later.

144.37.26 goToSelection(page as PDFSelectionMBS)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Scrolls to the first character of the specified selection.
Notes: PDF Kit records the move in its page history.

144.37.27 highlightedSelections as PDFSelectionMBS()

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop & iOS.

Function: Queries highlighted selections.
Notes: Unlike the user selection (above), these selections do not go away when the user clicks in the PDFView, etc. You must explicitly remove them by passing nil to setHighlightedSelections. These methods allow you to highlight text perhaps to indicate matches from a text search. To avoid confusion you should probably make sure the PDFSelectionMBS passed in are a different color from the user's default text selection color. Commonly used for highlighting search results.

144.37.28 layoutDocumentView

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Performs layout of the inner views.
Notes: The PDFView actually contains several subviews, such as the document view (where the PDF is actually drawn) and a "matte view" (which may appear as a gray area around the PDF content, depending on the scaling). Changes to the PDF content may require changes to these inner views, so you must call this method explicitly if you use PDF Kit utility classes to add or remove a page, rotate a page, or perform other operations affecting visible layout.

This method is called automatically from PDFView methods that affect the visible layout (such as setDocument, setDisplayBox or zoomIn).

144.37.29 pageForPoint(point as NSPointMBS, nearest as boolean) as PDFPageMBS

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the page containing a point specified in view coordinates.
Notes: Returns nil if there's no page at the specified point and nearest is set to false.

144.37.30 PDFViewAnnotationHitNotification as string

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification names used with the PDF view.
Notes: Posted when the user clicks on an annotation.

Use the "PDFAnnotationHit" key to obtain userinfo of type PDFAnnotation.

144.37.31 PDFViewAnnotationWillHitNotification as string

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification names used with the PDF view.
Notes: Posted before the user clicks an annotation.
Available in Mac OS X v10.5 and later.

144.37.32 PDFViewChangedHistoryNotification as string

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification names used with the PDF view.
Notes: Posted when the page history changes.

144.37.33 PDFViewCopyPermissionNotification as string

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification names used with the PDF view.
Notes: Posted when the user attempts to copy to the pasteboard without the appropriate permissions.

144.37.34 PDFViewDisplayBoxChangedNotification as string

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification names used with the PDF view.
Notes: Posted when the display box has changed.
Available in Mac OS X v10.5 and later.

144.37.35 PDFViewDisplayModeChangedNotification as string

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification names used with the PDF view.
Notes: Posted when the display mode has changed.
Available in Mac OS X v10.5 and later.

144.37.36 PDFViewDocumentChangedNotification as string

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification names used with the PDF view.
Notes: Posted when a new document is associated with the view.

144.37.37 PDFViewPageChangedNotification as string

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification names used with the PDF view.
Notes: Posted when a new page becomes the current page.

144.37.38 PDFViewPrintPermissionNotification as string

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification names used with the PDF view.
Notes: Posted when the user attempts to print without the appropriate permissions.

144.37.39 PDFViewScaleChangedNotification as string

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification names used with the PDF view.
Notes: Posted when the scale factor changes.

144.37.40 PDFViewSelectionChangedNotification as string

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification names used with the PDF view.
Notes: Posted when the current selection has changed.
Available in Mac OS X v10.5 and later.

144.37.41 PDFViewVisiblePagesChangedNotification as string

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop & iOS.

Function: Notification when the scroll view has scrolled into the bounds of a new page.

144.37.42 performAction(action as PDFActionMBS)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Performs the specified action.
Notes: Available in Mac OS X v10.5 and later.

144.37.43 printWithInfo(printInfo as NSRectMBS, autoRotate as Boolean)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: Print the PDF document.
Notes: If autoRotate is true, will ignore the orientation attribute in printInfo and rather choose the orientation on a page by page basis that best fits the page to the paper size.
See also:

- 144.37.44 printWithInfo(printInfo as NSRectMBS, autoRotate as Boolean, pageScaling as Integer) 19522

144.37.44 printWithInfo(printInfo as NSRectMBS, autoRotate as Boolean, pageScaling as Integer)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: Like the above method but allows an additional parameter to describe page scaling (see PDFDocument.h for types).
Notes: If pageScaling is equal to kPDFPrintPageScaleToFit each page is scaled up or down in order to best fit the paper size. Specifying kPDFPrintPageScaleDownToFit for pageScaling will only scale large

pages down to fit the paper, smaller pages will not be scaled up. Passing pageScaling equal to kPDFPrintPageScaleNone is the equivalent of calling printWithInfo above.
See also:

- 144.37.43 printWithInfo(printInfo as NSRectMBS, autoRotate as Boolean) 19522

144.37.45 rowSizeForPage(page as PDFPageMBS) as NSSizeMBS

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the size needed to display a row of the current document page.
Notes: The size is dependent on the current scale factor and display attributes.

144.37.46 scrollSelectionToVisible

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Scrolls the view until the selection is visible.

144.37.47 selectAll

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Selects all text in the document.

144.37.48 setCurrentSelection(selection as PDFSelectionMBS, animate as boolean)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the selection, in an animated way, if desired.
Notes: This method behaves as setCurrentSelection, but with the addition of animation, if animate is true. The animation serves to draw the user's attention to the new selection, which can be useful when implementing search.
Available in Mac OS X v10.5 and later.

144.37.49 setCursorForAreaOfInterest(area as Integer)

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets the type of mouse cursor according to the type of area the mouse cursor is over.
Notes: This method is especially useful for custom subclasses of the PDFView class.

144.37.50 setHighlightedSelections(selections() as PDFSelectionMBS)

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop & iOS.

Function: Sets highlighted selections.
Notes: Unlike the user selection (above), these selections do not go away when the user clicks in the PDFView, etc. You must explicitly remove them by passing nil to setHighlightedSelections. These methods allow you to highlight text perhaps to indicate matches from a text search. To avoid confusion you should probably make sure the PDFSelectionMBS passed in are a different color from the user's default text selection color. Commonly used for highlighting search results.

144.37.51 visiblePages as PDFPageMBS()

MBS PDFKit Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns an array of PDFPageMBS objects that represent the currently visible pages.
Notes: Available in Mac OS X v10.5 and later.

144.37.52 zoomIn

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Zooms in by increasing the scaling factor.
Notes: Each invocation of zoomIn muliplies the scaling factor by the square root of 2.
Available in Mac OS X v10.4 and later.

144.37.53 zoomOut

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Zooms out by decreasing the scaling factor.
Notes: Each invocation of zoomOut divides the scaling factor by the square root of 2.
Available in Mac OS X v10.4 and later.

144.37.54 Properties

144.37.55 acceptsDraggedFiles as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: Indicate whether dragging a file into PDFView is allowed.
Notes: If false (default), dragging events are not supported.
If true, a user can drag and drop a PDF file into the view and have it loaded & set as the visible document (the old document is released).

Available in macOS 10.13 or newer.
(Read and Write property)

144.37.56 allowsDragging as Boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Determines whether the view can accept new PDF documents dragged into it by the user.
Notes: (Read and Write property)

144.37.57 autoScales as Boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether autoscaling is set.
Notes: (Read and Write property)

144.37.58 backgroundColor as NSColorMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the view's background color.
Notes: A view's background is the area displayed to either side of a PDF document's pages. The background also appears between pages when page breaks are enabled. The default color is a 50% gray.
(Read and Write property)

144.37.59 canGoBack as Boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean value indicating whether the user can navigate to the previous page in the page history.
Notes: The page history gets built as your application calls navigation methods such as goToDestination and goToLastPage.
(Read only property)

144.37.60 canGoForward as Boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean value indicating whether the user can navigate to the next page in the page history.
Notes: The page history gets built as your application calls navigation methods such as goToDestination and goToLastPage.
(Read only property)

144.37.61 canGoToFirstPage as Boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean value indicating whether the user can navigate to the first page of the document.
Notes: The return value will be true unless the view is already displaying the first page.
(Read only property)

144.37.62 canGoToLastPage as Boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean value indicating whether the user can navigate to the last page of the document.
Notes: The return value will be true unless the view is already displaying the last page.
(Read only property)

144.37.63 canGoToNextPage as Boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean value indicating whether the user can navigate to the next page of the document.
Notes: The return value will be true unless the view is displaying the last page.

(Read only property)

144.37.64 canGoToPreviousPage as Boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean value indicating whether the user can navigate to the previous page of the document.
Notes: The return value will be true unless the view is displaying the first page.
(Read only property)

144.37.65 canZoomIn as Boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean value indicating whether the user can magnify the view—that is, zoom in.
Notes: (Read only property)

144.37.66 canZoomOut as Boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean value indicating whether the user can view an expanded area—that is, zoom out.
Notes: (Read only property)

144.37.67 currentDestination as PDFDestinationMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a PDFDestination object representing the current page and the current point in the view specified in page space.
Notes: Page space is a 72 dpi coordinate system with the origin at the lower-left corner of the current page.
(Read only property)

144.37.68 currentPage as PDFPageMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the current page.
Notes: When there are two pages in the view in a two-up mode, "current page" is the left page. For continuous modes, returns the page crossing a horizontal line halfway between the view's top and bottom bounds.
(Read only property)

144.37.69 currentSelection as PDFSelectionMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the current selection.
Example:

```
Var MyPDFView as PDFViewMBS // your view

Var doc as PDFDocumentMBS = MyPDFView.document
Var page as PDFPageMBS = doc.pageAtIndex(0)
Var sel as PDFSelectionMBS = page.selectionForRange(0,5)
MyPDFView.currentSelection = sel
```

Notes: Returns NULL if no selection exists.

Note that this method returns the actual instance of the current PDFSelectionMBS object. Therefore, if you want to modify it, you should make a copy of the returned selection and modify that, instead.
(Read and Write property)

144.37.70 displayBox as Integer

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The current style of display box.
Notes: The available values for display boxes are defined in the Constants section in the PDFPageMBS class.
(Read and Write property)

144.37.71 displayDirection as Integer

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop & iOS.

Function: Set the layout direction, either vertical or horizontal, for the given display mode.
Notes: Defaults to vertical layout (kPDFDisplayDirectionVertical).
Available in macOS 10.13 or newer.

(Read and Write property)

144.37.72 displayMode as Integer

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The current display mode.
Notes: Value can be kPDFDisplaySinglePage, kPDFDisplaySinglePageContinuous, kPDFDisplayTwoUp and kPDFDisplayTwoUpContinuous.
(Read and Write property)

144.37.73 displaysAsBook as Boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the view will display the first page as a book cover (meaningful only when the document is in two-up or two-up continuous display mode).
Notes: (Read and Write property)

144.37.74 displaysPageBreaks as Boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the view is displaying page breaks.
Notes: (Read and Write property)

144.37.75 displaysRTL as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies presentation of pages from right-to-left.
Notes: Defaults to false.
(Read and Write property)

144.37.76 document as PDFDocumentMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the document associated with a PDFView object.
Notes: (Read and Write property)

144.37.77 documentView as NSViewMBS

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the innermost view used by PDFView or by your PDFView subclass.
Notes: The innermost view is the one displaying the visible document pages. This method is useful when converting coordinates from one view to another.
(Read only property)

144.37.78 enableDataDetectors as Boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Whether data detection is enabled.
Notes: If enabled, page text will be scanned for URL's as the page becomes visible. Where
// URL's are found, Link annotations are created in place. These are temporary annotations and are not saved.

Requires Mac OS X 10.6.
(Read and Write property)

144.37.79 greekingThreshold as Double

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The greeking threshold to use for displaying text.
Notes: The default threshold is 3.0.
(Read and Write property)

144.37.80 interpolationQuality as Integer

MBS PDFKit Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The interpolation quality for images drawn into the PDFView context.
Notes: Available in Mac OS X 10.7 or later.
(Read and Write property)

144.37.81 maxScaleFactor as Double

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop & iOS.

Function: Set the maximum scaling factor for the PDF document.
Notes: Assigning this value will implicitly turn off autoScales, and allows scaleFactor to vary between these min / max scale factors
Available in macOS 10.13 or newer.
(Read and Write property)

144.37.82 minScaleFactor as Double

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop & iOS.

Function: Set the minimum scaling factor for the PDF document.
Notes: Assigning this value will implicitly turn off autoScales, and allows scaleFactor to vary between these min / max scale factors
Available in macOS 10.13 or newer.
(Read and Write property)

144.37.83 pageBreakMargins as NSEdgeInsetsMBS

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop & iOS.

Function: The page break margins.
Notes: If displaysPageBreaks is enabled, you may customize the spacing between pages by defining margins for the top, bottom, left, and right of each page. Note that pageBreakMargins only allows positive values and will clamp any negative value to 0.0. By default, if displaysPageBreaks is enabled, pageBreakMargins is { 4.75, 4.0, 4.75, 4.0 } (with respect to top, left, bottom, right), otherwise it is { 0.0, 0.0, 0.0, 0.0 }
(Read and Write property)

144.37.84 pageShadowsEnabled as Boolean

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies if shadows should be drawn around page borders in a PDFView.
Notes: Defaults to true.
Available in macOS 10.14 or newer.
(Read and Write property)

144.37.85 scaleFactor as Double

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The scale factor for the view.
Notes: The default value is 1.0, corresponding to actual size.
(Read and Write property)

144.37.86 scaleFactorForSizeToFit as Double

MBS PDFKit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop & iOS.

Function: Regardless of current autoScales mode, this returns the "size to fit" scale factor that autoScales would use for scaling the current document and layout.
Notes: For continuous modes this is a "fit width" scale, for non-continuous modes it is a "best fit" scale. Available in macOS 10.13 or newer.
(Read only property)

144.37.87 shouldAntiAlias as Boolean

MBS PDFKit Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether to use anti-aliasing in the view.
Notes: (Read and Write property)

144.37.88 Constants

PDF Area Of Interest

Constant	Value	Description
kPDFAnnotationArea	4	The mouse is over an annotation.
kPDFControlArea	16	The mouse is over a control.
kPDFIconArea	64	The mouse is over an icon. Available in Mac OS X v10.5 and later.
kPDFImageArea	256	Over an image.
kPDFLinkArea	8	The mouse is over a link.
kPDFNoArea	0	The mouse is over an undefined area.
kPDFPageArea	1	The mouse is over a page.
kPDFPopupArea	128	The mouse is over a popup menu.
kPDFTableArea	512	The mouse is over a table area.
kPDFTableResizeArea	1024	The mouse is over a resize area.
kPDFTextArea	2	The mouse is over text.
kPDFTextFieldArea	32	The mouse is over a text field.

Display Directions

Constant	Value	Description
kPDFDisplayDirectionHorizontal	1	Horizontal
kPDFDisplayDirectionVertical	0	Vertical

Display Mode

Constant	Value	Description
kPDFDisplaySinglePage	0	The document displays one page at a time horizontally and vertically. Verti and horizontal scrolling apply only to the current page.
kPDFDisplaySinglePageContinuous	1	he document displays in continuous mode vertically, with single-page wic horizontally. Vertical scrolling applies to the entire document.
kPDFDisplayTwoUp	2	The document displays two pages side-by-side. Vertical and horizontal scroll apply only to the pair of displayed pages.
kPDFDisplayTwoUpContinuous	3	The document displays in continuous mode vertically and displays two pa side-by-side horizontally. Vertical scrolling applies to the entire document.

Interpolation Quality Constants

Constant	Value	Description
kPDFInterpolationQualityHigh	2	high
kPDFInterpolationQualityLow	1	low
kPDFInterpolationQualityNone	0	

Chapter 145

Phidgets

145.1 class PhidgetAccelerometerMBS

145.1.1 class PhidgetAccelerometerMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Accelerometer class is used to gather acceleration data from Phidget accelerometer boards.
Example:

```
// read values from a accelerometer Phidget
// MyAccelerometer is a subclass of PhidgetAccelerometerMBS with the events implemented.
// Accelerometer is a property of the window: Accelerometer As MyAccelerometer

Accelerometer = New MyAccelerometer
Accelerometer.open

// in MyAccelerometer:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub AccelerationChanged(acceleration() As Double, timestamp As Double) Handles AccelerationChanged
System.DebugLog "timestamp: " + timestamp.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: Phidget accelerometers usually have multiple sensors, each oriented in a different axis, so multiple dimensions of acceleration can be recorded.

If the Phidget you're using also has a gyroscope and a magnetometer, you may want to use the Spatial class in order to get all of the data at the same time, in a single event.
Subclass of the PhidgetMBS class.
Blog Entries

- MBS Xojo Plugins, version 26.1pr1
- Rewritten Phidgets Plugin

145.1.2 Methods

145.1.3 Acceleration as Double()

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent acceleration value that the channel has reported.

145.1.4 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.1.5 MaxAcceleration as Double()

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value the AccelerationChange event will report.

145.1.6 MinAcceleration as Double()

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value the AccelerationChange event will report.

145.1.7 Properties

145.1.8 AccelerationChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a AccelerationChange event until the acceleration value has changed by the amount specified by the AccelerationChangeTrigger.
Notes: Setting the AccelerationChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering
(Read and Write property)

145.1.9 AxisCount as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The number of axes the channel can measure acceleration on.
Notes: (Read only property)

145.1.10 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another AccelerationChange event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
The timing between AccelerationChange events can also affected by the AccelerationChangeTrigger.

Unit: milliseconds (ms)
(Read and Write property)

145.1.11 HeatingEnabled as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether self-heating temperature stabilization is enabled.
Notes: Set to true to enable the temperature stabilization feature of this device. This enables onboard heating elements to bring the board up to a known temperature to minimize ambient temerature effects on

the sensor's reading. You can leave this setting false to conserve power consumption.This property is shared by any and all spatial-related objects on this device (Accelerometer, Gyroscope, Magnetometer, Spatial)
(Read and Write property)

145.1.12 MaxAccelerationChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that AccelerationChangeTrigger can be set to.
Notes: (Read only property)

145.1.13 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.1.14 MinAccelerationChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that AccelerationChangeTrigger can be set to.
Notes: (Read only property)

145.1.15 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.1.16 Precision as Integer

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The precision requested.
Notes: (Read and Write property)

145.1.17 Timestamp as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent timestamp value that the channel has reported.
Notes: This is an extremely accurate time measurement streamed from the device.
If your application requires a time measurement, you should use this value over a local software timestamp.
(Read only property)

145.1.18 Events

145.1.19 AccelerationChanged(acceleration() as double, timestamp as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent acceleration values the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a AccelerationChangeTrigger has been set to a non-zero value, the AccelerationChange event will not occur until the acceleration has changed by at least the AccelerationChangeTrigger value.

acceleration: The acceleration values.
timestamp: The timestamp value.

145.1.20 Constants

Precision

Constant	Value	Description
kPrecisionHigh	1	High
kPrecisionHybrid	0	Hybrid
kPrecisionLow	2	Low

145.2 class PhidgetBLDCMotorMBS

145.2.1 class PhidgetBLDCMotorMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The BLDC Motor class controls the power applied to attached brushless DC motors to affect its speed and direction.
Example:

```
// run a brushless DC motor at half speed for two seconds
Var p As New PhidgetBLDCMotorMBS

// wait up to 5 seconds for the device
p.openWaitForAttachment(5000)

p.TargetVelocity = 0.5 // -1 to 1
Thread.SleepCurrent(2000)
p.TargetVelocity = 0

p.close
```

Notes: It can also contain various other control and monitoring functions that aid in the control of brushless DC motors.
Subclass of the PhidgetMBS class.

- MBS Xojo Plugins, version 25.0pr8
- Rewritten Phidgets Plugin

145.2.2 Methods

145.2.3 addPositionOffset(positionOffset as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds an offset (positive or negative) to the current position.
Notes: This can be especially useful for zeroing position.

145.2.4 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.2.5 enableFailsafe(failsafeTime as UInt32)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables the failsafe feature for the channel, with a given failsafe time.
Notes: The failsafe feature is intended for use in applications where it is important for the channel to enter a known safe state if the program controlling it locks up or crashes. If you do not enable the failsafe feature, the channel will carry out whatever instructions it was last given until it is explicitly told to stop.

Enabling the failsafe feature starts a recurring failsafe timer for the channel. Once the failsafe timer is enabled, it must be reset within the specified time or the channel will enter a failsafe state. The failsafe timer may be reset either by calling this function again, or using the ResetFailsafe function. Resetting the failsafe timer will reload the timer with the specified failsafe time, starting when the message to reset the timer is received by the Phidget.

For example: if the failsafe is enabled with a failsafe time of 1000ms, you will have 1000ms to reset the failsafe timer. Every time the failsafe timer is reset, you will have 1000ms from that time to reset the failsafe again.

If the failsafe timer is not reset before it runs out, the channel will enter a failsafe state. For BLDC Motor channels, this will set the Target Velocity to 0. Once the channel enters the failsafe state, it will reject any further input until the channel is reopened.

To prevent the channel from falsely entering the failsafe state, we recommend resetting the failsafe timer as frequently as is practical for your applicaiton. A good rule of thumb is to not let more than a third of the failsafe time pass before resetting the timer.

Once the failsafe timer has been set, it cannot be disabled by any means other than closing and reopening the channel.

145.2.6 resetFailsafe

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Resets the failsafe timer, if one has been set. See EnableFailsafe for details.
Notes: This function will fail if no failsafe timer has been set for the channel.

145.2.7 setTargetVelocityAsync(targetVelocity as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets target velocity asynchronously.
Notes: The average voltage across the motor is based on the TargetVelocity value.
At a constant load, increasing the target velocity will increase the speed of the motor.
TargetVelocity is bounded by -1√óMaxVelocity and MaxVelocity, where a sign change (¬±) is indicitave of a direction change.
Setting TargetVelocity to MinVelocity will stop the motor. See TargetBrakingStrength for more information on stopping the motor.
The units of TargetVelocity and Acceleration refer to 'duty cycle'. This is because the controller must rapidly switch the power on/off (i.e. change the duty cycle) in order to manipulate the voltage across the motor.

Calls setTargetVelocityAsyncCompleted event later.

145.2.8 Properties

145.2.9 Acceleration as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The rate at which the controller can change the motor's Velocity.
Notes: The acceleration is bounded by MinAccleration and MaxAcceleration.
Unit: duty cycle per second (duty cycle/s)
(Read and Write property)

145.2.10 ActiveCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The current limit that the controller is actively following.
Notes: The SurgeCurrentLimit, CurrentLimit, and temperature will impact this value.
(Read only property)

145.2.11 BrakingEnabled as Boolean

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether braking is enabled.
Notes: This setting allows you to choose whether the motor will resist being turned when it is not being driven forward or reverse (Velocity = 0).

- Setting BrakingEnabled to FALSE corresponds to free-wheeling. This means: The motor will continue to rotate after the controller is no longer driving the motor (Velocity = 0), due to its momentum. The motor shaft will provide little resistance to being turned when it is stopped.
- Setting BrakingEnabled to TRUE will engage electrical braking of the DC motor. This means: The motor will stop more quickly if it is in motion when braking is requested. The motor shaft will resist rotation by outside forces.
- Braking will be added gradually, according to the Acceleration setting, once the motor controller's Velocity reaches 0.0
- Braking will be immediately stopped when a new (non-zero) TargetVelocity is set, and the motor will accelerate to the requested velocity.
- Braking mode is enabled by setting the Velocity to 0.0

(Read and Write property)

145.2.12 BrakingStrength as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent braking strength value that the controller has reported.
Notes: (Read only property)

145.2.13 CurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The controller will limit the current through the motor to the CurrentLimit value.
Notes: (Read and Write property)

145.2.14 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the controller will fire another update event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
Unit: milliseconds (ms)
(Read and Write property)

145.2.15 DriveMode as Integer

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This setting impacts how your motor decelerates and the amount of current that is available to your motor at any given moment.
Notes: (Read and Write property)

145.2.16 FailsafeBrakingEnabled as Boolean

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether to enable failsafe braking.
Notes: This setting allows you to choose whether motor will forcibly stop once it enters a FAILSAFE state.

A setting of FALSE will simply stop applying power to the motor, allowing it to spin down naturally.
A setting of TRUE will apply braking up to the FailsafeCurrentLimit, actively stopping the motor
(Read and Write property)

145.2.17 FailsafeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When the controller enters a FAILSAFE state, the controller will limit the current through the motor to the FailsafeCurrentLimit value.

Notes: (Read and Write property)

145.2.18 Inductance as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Inductance value.
Notes: The controller will attempt to measure the inductance of your motor when opened. This value is used to improve control of the motor.

Set this value during the Attach event to skip motor characterization (including the audible beeps). You can use a previously saved Inductance value, or information from your motor's datasheet.
(Read and Write property)

145.2.19 MaxAcceleration as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that Acceleration can be set to.
Notes: Unit: duty cycle per second (duty cycle/s)
(Read only property)

145.2.20 MaxBrakingStrength as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that TargetBrakingStrength can be set to.
Notes: (Read only property)

145.2.21 MaxCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that CurrentLimit can be set to.
Notes: (Read only property)

145.2.22 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.2.23 MaxFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: (Read only property)

145.2.24 MaxInductance as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that Inductance can be set to.
Notes: See Inductance for details.
(Read only property)

145.2.25 MaxPosition as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The upper bound of Position.
Notes: (Read only property)

145.2.26 MaxStallVelocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The upper bound of StallVelocity.
Notes: (Read only property)

145.2.27 MaxSurgeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that SurgeCurrentLimit can be set to.
Notes: (Read only property)

145.2.28 MaxVelocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that TargetVelocity can be set to.
Notes: TargetVelocity is bounded by -1√óMaxVelocity and MaxVelocity, where a sign change (¬±) is indicitave of a direction change.
(Read only property)

145.2.29 MinAcceleration as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that Acceleration can be set to.
Notes: Unit: duty cycle per second (duty cycle/s)
(Read only property)

145.2.30 MinBrakingStrength as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that TargetBrakingStrength can be set to.
Notes: (Read only property)

145.2.31 MinCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that CurrentLimit can be set to.
Notes: (Read only property)

145.2.32 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.2.33 MinFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: (Read only property)

145.2.34 MinInductance as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that Inductance can be set to.
Notes: See Inductance for details.
(Read only property)

145.2.35 MinPosition as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The lower bound of Position.
Notes: (Read only property)

145.2.36 MinStallVelocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The lower bound of StallVelocity.
Notes: (Read only property)

145.2.37 MinSurgeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that SurgeCurrentLimit can be set to.
Notes: (Read only property)

145.2.38 MinVelocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that TargetVelocity can be set to.
Notes: Set the TargetVelocity to MinVelocity to stop the motor. See TargetBrakingStrength for more information on stopping the motor.
TargetVelocity is bounded by -1√óMaxVelocity and MaxVelocity, where a sign change (¬±) is indicitave of a direction change.
(Read only property)

145.2.39 Position as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent position value that the controller has reported.
Notes: Position values are calculated using Hall Effect sensors mounted on the motor, therefore, the resolution of position depends on the motor you are using.
Units for Position can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees. For more information on how to apply the RescaleFactor to your application, see your controller's User Guide.
(Read only property)

145.2.40 RescaleFactor as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Change the units of your parameters so that your application is more intuitive.
Notes: Units for Position can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees. For more information on how to apply the RescaleFactor to your application, see your controller's User Guide.
(Read and Write property)

145.2.41 StallVelocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The stall velocity.
Notes: Before reading this description, it is important to note the difference between the units of StallVelocity and Velocity.

- Velocity is a number between -1 and 1 with units of 'duty cycle'. It simply represents the average voltage across the motor.
- StallVelocity represents a real velocity (e.g. m/s, RPM, etc.) and the units are determined by the RescaleFactor. With a RescaleFactor of 1, the default units would be in commutations per second.

If the load on your motor is large, your motor may begin rotating more slowly, or even fully stall. Depending on the voltage across your motor, this may result in a large amount of current through both the controller and the motor. In order to prevent damage in these situations, you can use the StallVelocity property.

The StallVelocity should be set to the lowest velocity you would expect from your motor. The controller will then monitor the motor's velocity, as well as the Velocity, and prevent a 'dangerous stall' from occuring. If the controller detects a dangerous stall, it will immediately reduce the Velocity (i.e. average voltage) to 0 and an error will be reported to your program.

- A 'dangerous stall' will occur faster when the Velocity is higher (i.e. when the average voltage across the motor is higher)
- A 'dangerous stall' will occur faster as (StallVelocity - motor velocity) becomes larger .

Setting StallVelocity to 0 will turn off stall protection functionality.
(Read and Write property)

145.2.42 SurgeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The SurgeCurrentLimit allows for increased performance from your motor.
Notes: The controller will limit the current through your motor to the SurgeCurrentLimit briefly, then scale current down to the CurrentLimit.
View ActiveCurrentLimit for information about what current limit the controller is actively following.
(Read and Write property)

145.2.43 TargetBrakingStrength as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The braking value.
Notes: When a motor is not being actively driven forward or reverse, you can choose if the motor will be allowed to freely turn, or will resist being turned.
A low TargetBrakingStrength value corresponds to free wheeling, this will have the following effects:
The motor will continue to rotate after the controller is no longer driving the motor (i.e. Velocity is 0), due to inertia.
The motor shaft will provide little resistance to being turned when it is stopped.
A higher TargetBrakingStrength value will resist being turned, this will have the following effects:
The motor will more stop more quickly if it is in motion and braking has been requested. It will fight against the rotation of the shaft.
Braking mode is enabled by setting the Velocity to MinVelocity
(Read and Write property)

145.2.44 TargetVelocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The average voltage across the motor is based on the TargetVelocity value.
Notes: At a constant load, increasing the target velocity will increase the speed of the motor.
TargetVelocity is bounded by -1√óMaxVelocity and MaxVelocity, where a sign change (¬±) is indicitave of a direction change.
Setting TargetVelocity to MinVelocity will stop the motor. See TargetBrakingStrength for more information on stopping the motor.
The units of TargetVelocity and Acceleration refer to 'duty cycle'. This is because the controller must rapidly switch the power on/off (i.e. change the duty cycle) in order to manipulate the voltage across the motor.
(Read and Write property)

145.2.45 Velocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent velocity value that the controller has reported.
Notes: (Read only property)

145.2.46 Events

145.2.47 BrakingStrengthChanged(brakingStrength as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent braking strength value will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: Regardless of the DataInterval, this event will occur only when the braking strength value has changed from the previous value reported.
Braking mode is enabled by setting the Velocity to MinVelocity.

145.2.48 PositionChanged(position as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Regardless of the DataInterval, this event will occur only when the position value has changed from the previous value reported.
Notes: Position values are calculated using Hall Effect sensors mounted on the motor, therefore, the resolution of position depends on the motor you are using.
Units for Position can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees. For more information on how to apply the RescaleFactor to your application, see your controller's User Guide.

145.2.49 setTargetVelocityAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Event called when setTargetVelocityAsync finished.

145.2.50 VelocityUpdated(velocity as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent velocity value will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: This event will always occur when the DataInterval elapses. You can depend on this event for constant timing when implementing control loops in code. This is the last event to fire, giving you up-to-date access to all properties.

145.2.51 Constants

Drive Mode

Constant	Value	Description
kDriveModeCoast	1	Coast
kDriveModeForced	2	Forced

145.3 class PhidgetCapacitiveTouchMBS

145.3.1 class PhidgetCapacitiveTouchMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Capacitive Touch class gathers input data from capacitive buttons and sliders on Phidget boards.
Example:

```
// read values from a capacitive touch Phidget
// MyCapacitiveTouch is a subclass of PhidgetCapacitiveTouchMBS with the events implemented.
// CapacitiveTouch is a property of the window: CapacitiveTouch As MyCapacitiveTouch

CapacitiveTouch = New MyCapacitiveTouch
CapacitiveTouch.open

// in MyCapacitiveTouch:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub Touched(touchValue As Double) Handles Touched
System.DebugLog "touchValue: " + touchValue.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: Subclass of the PhidgetMBS class.

- Rewritten Phidgets Plugin

145.3.2 Methods

145.3.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.3.4 Properties

145.3.5 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another Touch event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
The timing between Touch events can also affected by the TouchValueChangeTrigger.

Unit: milliseconds (ms)
(Read and Write property)

145.3.6 IsTouched as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent touch state that the channel has reported.
Notes: This will be false or true.
false is not touched
true is touched
(Read only property)

145.3.7 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.3.8 MaxSensitivity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that Sensitivity can be set to.
Notes: (Read only property)

145.3.9 MaxTouchValue as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value the Touch event will report.
Notes: (Read only property)

145.3.10 MaxTouchValueChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that TouchValueChangeTrigger can be set to.
Notes: (Read only property)

145.3.11 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.3.12 MinSensitivity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that Sensitivity can be set to.
Notes: (Read only property)

145.3.13 MinTouchValue as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value the Touch event will report.
Notes: (Read only property)

145.3.14 MinTouchValueChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that TouchValueChangeTrigger can be set to.
Notes: (Read only property)

145.3.15 Sensitivity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Determines the sensitivity of all capacitive regions on the device.
Notes: Higher values result in greater touch sensitivity.
The sensitivity value is bounded by MinSensitivity and MaxSensitivity.
(Read and Write property)

145.3.16 TouchValue as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent touch value that the channel has reported.
Notes: This will be 0 or 1 for button-type inputs, or a ratio between 0-1 for axis-type inputs.
This value is bounded by MinTouchValue and MaxTouchValue.
The value is not reset when the touch ends.
(Read only property)

145.3.17 TouchValueChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a Touch event until the touch value has changed by the amount specified by the TouchValueChangeTrigger.
Notes: Setting the TouchValueChangeTrigger to 0 will result in the channel firing events every DataInterval.
This is useful for applications that implement their own data filtering
(Read and Write property)

145.3.18 Events

145.3.19 Touched(touchValue as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent touch value the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a TouchValueChangeTrigger has been set to a non-zero value, the Touch event will not occur until the touch value has changed by at least the TouchValueChangeTrigger value.

touchValue:Value of the touch input axis.

145.3.20 TouchEnded

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will report a TouchEnd event to signify that it is no longer detecting a touch.

145.4 class PhidgetCurrentInputMBS

145.4.1 class PhidgetCurrentInputMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Current Input class is used to measure current flowing through the Phidget from outside sources..
Example:

```
// read values from a current input Phidget
// MyCurrentInput is a subclass of PhidgetCurrentInputMBS with the events implemented.
// CurrentInput is a property of the window: CurrentInput As MyCurrentInput

CurrentInput = New MyCurrentInput
CurrentInput.open

// in MyCurrentInput:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub CurrentChanged(current As Double) Handles CurrentChanged
System.DebugLog "current: " + current.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: This class may be used on a simple current sensor, or sometimes on a more complex Phidget that measures the amount of current flowing through an attached device, such as a motor controller, for diagnostic or control purposes.
Subclass of the PhidgetMBS class.

- Rewritten Phidgets Plugin

145.4.2 Methods

145.4.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.4.4 Properties

145.4.5 Current as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent current value that the channel has reported.
Notes: This value will always be between MinCurrent and MaxCurrent.
In amperes.
(Read only property)

145.4.6 CurrentChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a CurrentChange event until the current value has changed by the amount specified by the CurrentChangeTrigger.
Notes: Setting the CurrentChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering.
in amperes.
(Read and Write property)

145.4.7 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another CurrentChange event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
The timing between CurrentChange events can also affected by the CurrentChangeTrigger.

Unit: milliseconds (ms)
(Read and Write property)

145.4.8 MaxCurrent as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value the CurrentChange event will report.
Notes: (Read only property)

145.4.9 MaxCurrentChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that CurrentChangeTrigger can be set to.
Notes: (Read only property)

145.4.10 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.4.11 MinCurrent as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value the CurrentChange event will report.
Notes: (Read only property)

145.4.12 MinCurrentChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that CurrentChangeTrigger can be set to.
Notes: (Read only property)

145.4.13 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.4.14 PowerSupply as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Choose the power supply voltage.
Notes: Set this to the voltage specified in the attached sensor's data sheet to power it.
Set to kPowerSupplyOff to turn off the supply to save power.
(Read and Write property)

145.4.15 Events

145.4.16 CurrentChanged(current as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent current value the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a CurrentChangeTrigger has been set to a non-zero value, the CurrentChange event will not occur until the current value has changed by at least the CurrentChangeTrigger value.

145.5 class PhidgetCurrentOutputMBS

145.5.1 class PhidgetCurrentOutputMBS

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The class for a current output.
Example:

```
// set a current output to 10 mA
Var p As New PhidgetCurrentOutputMBS

// wait up to 5 seconds for the device
p.openWaitForAttachment(5000)

p.Current = 0.01 // in ampere

p.close
```

Notes: Subclass of the PhidgetMBS class.

145.5.2 Methods

145.5.3 Constructor

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.5.4 enableFailsafe(failsafeTime as UInt32)

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables the failsafe feature for the channel, with the specified failsafe time.
Notes: Enabling the failsafe feature starts a recurring failsafe timer for the channel. Once the failsafe is enabled, the timer must be reset within the specified time or the channel will enter a failsafe state. For DC Motor channels, this will disengage the motor. The failsafe timer can be reset by using any API call except for 'get' API calls.

145.5.5 resetFailsafe

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Resets the failsafe timer, if one has been set.
Notes: See enableFailsafe() for details.

This function will fail if no failsafe timer has been set for the channel.

145.5.6 Properties

145.5.7 Current as Double

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The current to output.
Notes: (Read and Write property)

145.5.8 MaxCurrent as Double

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum current.
Notes: (Read only property)

145.5.9 MaxFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that failsafeTime can be set to when calling enableFailsafe().

Notes: (Read only property)

145.5.10 MinCurrent as Double

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum current.
Notes: (Read only property)

145.5.11 MinFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that failsafeTime can be set to when calling enableFailsafe().
Notes: (Read only property)

145.6 class PhidgetDataAdapterMBS

145.6.1 class PhidgetDataAdapterMBS

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Data Adapter class is used to interface third party devices and microcontrollers with Phidgets.
Notes: Subclass of the PhidgetMBS class.

145.6.2 Methods

145.6.3 Constructor

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.6.4 i2cComplexTransaction(address as Integer, I2CPacketString as String, Data as MemoryBlock, recvDataLen as Integer) as MemoryBlock

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Initiates a set of write and read transactions to happen in quick succession.
Notes: address: The address of the I2C device
I2CPacketString: Specify the bytes of your I2C packet using 's' for start, 'R' for read, 'T' for write, and 'p' for stop. Only one stop condition per call is supported.

For example, if you wanted to write two bytes, generate a repeat start, write one more byte, then read three bytes, the string would be "sTTsTsRRRp".

You can also use numbers to indicate the number of bytes, e.g. "sT2sTsR3p"
data: The entire set of data to send, in order from first to last. The length of this data must match the total number of bytes specified to be sent in the I2CPacketString. The byte length must be ,â§ MaxSendPacketLength.
recvDataLen: Specifies the length of the recvData array.

Returns the data read.
See also:

- 145.6.5 i2cComplexTransaction(address as Integer, I2CPacketString as String, Data as String, recvDataLen as Integer) as String 19567

145.6.5 i2cComplexTransaction(address as Integer, I2CPacketString as String, Data as String, recvDataLen as Integer) as String

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Initiates a set of write and read transactions to happen in quick succession.
Notes: address: The address of the I2C device
I2CPacketString: Specify the bytes of your I2C packet using 's' for start, 'R' for read, 'T' for write, and 'p' for stop. Only one stop condition per call is supported.

For example, if you wanted to write two bytes, generate a repeat start, write one more byte, then read three bytes, the string would be "sTTsTsRRRp".

You can also use numbers to indicate the number of bytes, e.g. "sT2sTsR3p"
data: The entire set of data to send, in order from first to last. The length of this data must match the total number of bytes specified to be sent in the I2CPacketString. The byte length must be ,â§ MaxSendPacketLength.
recvDataLen: Specifies the length of the recvData array.

Returns the data read.
See also:

- 145.6.4 i2cComplexTransaction(address as Integer, I2CPacketString as String, Data as MemoryBlock, recvDataLen as Integer) as MemoryBlock 19566

145.6.6 i2cSendReceive(address as Integer, Data as MemoryBlock, recvDataLen as Integer) as MemoryBlock

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Write a number of bytes and immediately read a number of bytes over I2C.
Notes: address: The address of the I2C device
data: The data to send. Byte length must be ,â§ MaxSendPacketLength.
recvDataLen: The number of bytes to receive. Must be ,â§ MaxReceivePacketLength.

Returns the data read.
See also:

- 145.6.7 i2cSendReceive(address as Integer, Data as String, recvDataLen as Integer) as String 19568

145.6.7 i2cSendReceive(address as Integer, Data as String, recvDataLen as Integer) as String

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Write a number of bytes and immediately read a number of bytes over I2C.
Notes: address: The address of the I2C device
data: The data to send. Byte length must be ,â§ MaxSendPacketLength.
recvDataLen: The number of bytes to receive. Must be ,â§ MaxReceivePacketLength.

Returns the data read.
See also:

- 145.6.6 i2cSendReceive(address as Integer, Data as MemoryBlock, recvDataLen as Integer) as MemoryBlock 19567

145.6.8 sendPacket(Data as MemoryBlock)

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Transmits a packet of data using the selected protocol information on the corresponding communication terminals to any connected device(s).
Notes: data: The data to send. Length must be ,â§ MaxSendPacketLength.
See also:

- 145.6.9 sendPacket(Data as String) 19568

145.6.9 sendPacket(Data as String)

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Transmits a packet of data using the selected protocol information on the corresponding communication terminals to any connected device(s).
Notes: data: The data to send. Length must be ,â§ MaxSendPacketLength.
See also:

- 145.6.8 sendPacket(Data as MemoryBlock) 19568

145.6.10 sendPacketAsync(Data as MemoryBlock)

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Transmits a packet of data using the selected protocol information on the corresponding communication terminals to any connected device(s).
Notes: Data: The data to send.

Calls sendPacketAsyncCompleted event later with the result.
See also:

- 145.6.11 sendPacketAsync(Data as String) 19569

145.6.11 sendPacketAsync(Data as String)

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Transmits a packet of data using the selected protocol information on the corresponding communication terminals to any connected device(s).
Notes: Data: The data to send.

Calls sendPacketAsyncCompleted event later with the result.
See also:

- 145.6.10 sendPacketAsync(Data as MemoryBlock) 19569

145.6.12 sendPacketWaitResponse(Data as MemoryBlock, recvDataLen as Integer = -1) as MemoryBlock

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sends a packet and waits for a corresponding response from the external device, until the timeout elapses.
Notes: data: The data to send. Byte length must be ,â§ MaxSendPacketLength.

recvDataLen: Specifies the length of the recvData array. If <= 0, we check MaxReceivePacketLength for a length.

Returns the data read.
See also:

- 145.6.13 sendPacketWaitResponse(Data as String, recvDataLen as Integer = -1) as String 19570

145.6.13 sendPacketWaitResponse(Data as String, recvDataLen as Integer = -1) as String

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sends a packet and waits for a corresponding response from the external device, until the timeout elapses.
Notes: data: The data to send. Byte length must be ,â§ MaxSendPacketLength.
recvDataLen: Specifies the length of the recvData array. If <= 0, we check MaxReceivePacketLength for a length.

Returns the data read.
See also:

- 145.6.12 sendPacketWaitResponse(Data as MemoryBlock, recvDataLen as Integer = -1) as MemoryBlock 19569

145.6.14 Properties

145.6.15 DataAdapterVoltage as Integer

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The voltage used to communicate with and power the external device.
Notes: (Read and Write property)

145.6.16 DataBits as UInt32

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Configures the number of data bits used for communication.
Notes: Refer to the documentation for the device you are communicating with.

(Read and Write property)

145.6.17 Endianness as Integer

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Configures endianness of each byte.
Notes: (Read and Write property)

145.6.18 Frequency as Integer

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The rate at which data is transmitted over the communication lines in bits per second.
Notes: (Read and Write property)

145.6.19 MaxDataBits as UInt32

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum number of data bits.
Notes: (Read only property)

145.6.20 MaxReceivePacketLength as UInt32

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum length of a packet that can be received in bytes.
Notes: (Read only property)

145.6.21 MaxSendPacketLength as UInt32

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum length of a packet that can be sent in bytes.
Notes: (Read only property)

145.6.22 MinDataBits as UInt32

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum number of data bits.
Notes: (Read only property)

145.6.23 SPIChipSelect as Integer

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Configures functionality of the SPI chip select pin.
Notes: (Read and Write property)

145.6.24 SPIMode as Integer

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Configures SCLK polarity and phase.
Notes: (Read and Write property)

145.6.25 Events

145.6.26 sendPacketAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when the async sending is done.

145.6.27 Constants

Voltages

Constant	Value	Description
DataAdapterVoltage2_5V	3	5.0 Volt
DataAdapterVoltage3_3V	4	3.3 Volt
DataAdapterVoltage5_0V	5	5.0 Volt
DataAdapterVoltageExtern	1	Voltage supplied by external device

Endianness

Constant	Value	Description
EndiannessLSBFirst	2	LSB First
EndiannessMSBFirst	1	MSB First

Frequencies

Constant	Value	Description
Frequency100kHz	2	100kHz communication frequency
Frequency10kHz	1	10kHz communication frequency
Frequency1500kHz	7	1500kHz communication frequency
Frequency188kHz	4	187.5kHz communication frequency
Frequency375kHz	5	375kHz communication frequency
Frequency3MHz	8	3MHz communication frequency
Frequency400kHz	3	400kHz communication frequency
Frequency6MHz	9	6MHz communication frequency
Frequency750kHz	6	750kHz communication frequency

SPI Chip Select

Constant	Value	Description
SPIChipSelectActiveHigh	2	CS normally LOW, Automatically goes HIGH during transmission
SPIChipSelectActiveLow	1	CS normally HIGH, Automatically goes LOW during transmission
SPIChipSelectHigh	4	CS is held HIGH as long as this is set
SPIChipSelectLow	3	CS is held LOW as long as this is set

Modes

Constant	Value	Description
SPIMode0	1	CPOL = 0 CPHA = 0
SPIMode1	2	CPOL = 0 CPHA = 1
SPIMode2	3	CPOL = 1 CPHA = 0
SPIMode3	4	CPOL = 1 CPHA = 1

145.7 class PhidgetDCMotorMBS

145.7.1 class PhidgetDCMotorMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DC Motor class controls the power applied to attached DC motors to affect its speed and direction.
Example:

```
// run a DC motor at half speed for two seconds
Var p As New PhidgetDCMotorMBS

// wait up to 5 seconds for the device
p.openWaitForAttachment(5000)

p.TargetVelocity = 0.5 // -1 to 1
Thread.SleepCurrent(2000)
p.TargetVelocity = 0

p.close
```

Notes: It can also contain various other control and monitoring functions that aid in the control of DC motors.
Subclass of the PhidgetMBS class.

- MBS Xojo Plugins, version 25.0pr8
- Rewritten Phidgets Plugin

145.7.2 Methods

145.7.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.7.4 enableFailsafe(failsafeTime as UInt32)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables the failsafe feature for the channel, with a given failsafe time.
Notes: The failsafe feature is intended for use in applications where it is important for the channel to enter a known safe state if the program controlling it locks up or crashes. If you do not enable the failsafe feature, the channel will carry out whatever instructions it was last given until it is explicitly told to stop.

Enabling the failsafe feature starts a recurring failsafe timer for the channel. Once the failsafe timer is enabled, it must be reset within the specified time or the channel will enter a failsafe state. The failsafe timer may be reset either by calling this function again, or using the ResetFailsafe function. Resetting the failsafe timer will reload the timer with the specified failsafe time, starting when the message to reset the timer is received by the Phidget.

For example: if the failsafe is enabled with a failsafe time of 1000ms, you will have 1000ms to reset the failsafe timer. Every time the failsafe timer is reset, you will have 1000ms from that time to reset the failsafe again.

If the failsafe timer is not reset before it runs out, the channel will enter a failsafe state. For DC Motor channels, this will set the Target Velocity to 0. Once the channel enters the failsafe state, it will reject any further input until the channel is reopened.

To prevent the channel from falsely entering the failsafe state, we recommend resetting the failsafe timer as frequently as is practical for your applicaiton. A good rule of thumb is to not let more than a third of the failsafe time pass before resetting the timer.

Once the failsafe timer has been set, it cannot be disabled by any means other than closing and reopening the channel.

145.7.5 resetFailsafe

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Resets the failsafe timer, if one has been set. See EnableFailsafe for details.
Notes: This function will fail if no failsafe timer has been set for the channel.

145.7.6 setTargetVelocityAsync(targetVelocity as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets target velocity asynchronously.
Notes: The average voltage across the motor is based on the TargetVelocity value.
At a constant load, increasing the target velocity will increase the speed of the motor.
TargetVelocity is bounded by -1√óMaxVelocity and MaxVelocity, where a sign change (¬±) is indicitave of a direction change.
Setting TargetVelocity to MinVelocity will stop the motor. See TargetBrakingStrength for more information on stopping the motor.
The units of TargetVelocity and Acceleration refer to 'duty cycle'. This is because the controller controls velocity by rapidly switching the power on/off (i.e. changing the duty cycle) in order to manipulate the voltage across the motor.

Calls setTargetVelocityAsyncCompleted event later when done.

145.7.7 Properties

145.7.8 Acceleration as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The rate at which the controller can change the motor's Velocity.
Notes: The acceleration is bounded by MinAccleration and MaxAcceleration.

Unit: duty cycle per second (duty cycle/s)
(Read and Write property)

145.7.9 ActiveCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The current limit that the controller is actively following.
Notes: The SurgeCurrentLimit, CurrentLimit, and temperature will impact this value.
(Read only property)

145.7.10 BackEMF as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent BackEMF value that the controller has reported.
Notes: (Read only property)

145.7.11 BackEMFSensingState as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When BackEMFSensingState is enabled, the controller will measure and report the BackEMF.
Notes: The motor will coast (freewheel) 5% of the time while the back EMF is being measured (800ŒºÊs every 16ms). Therefore, at a DutyCycle of 100%, the motor will only be driven for 95% of the time.
(Read and Write property)

145.7.12 BrakingEnabled as Boolean

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether braking is enabled.
Notes: This setting allows you to choose whether the motor will resist being turned when it is not being driven forward or reverse (Velocity = 0).

- Setting BrakingEnabled to FALSE corresponds to free-wheeling. This means: The motor will continue to rotate after the controller is no longer driving the motor (Velocity = 0), due to its momentum. The motor shaft will provide little resistance to being turned when it is stopped.
- Setting BrakingEnabled to TRUE will engage electrical braking of the DC motor. This means: The motor will stop more quickly if it is in motion when braking is requested. The motor shaft will resist rotation by outside forces.
- Braking will be added gradually, according to the Acceleration setting, once the motor controller's Velocity reaches 0.0
- Braking will be immediately stopped when a new (non-zero) TargetVelocity is set, and the motor will accelerate to the requested velocity.
- Braking mode is enabled by setting the Velocity to 0.0

(Read and Write property)

145.7.13 BrakingStrength as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent braking strength value that the controller has reported.
Notes: See TargetBrakingStrength for details.
(Read only property)

145.7.14 CurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The controller will limit the current through the motor to the CurrentLimit value.
Notes: Unit: amperes (A)
(Read and Write property)

145.7.15 CurrentRegulatorGain as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The current regulator gain.
Notes: Depending on power supply voltage and motor coil inductance, current through the motor can change relatively slowly or extremely rapidly. A physically larger DC Motor will typically have a lower inductance, requiring a higher current regulator gain. A higher power supply voltage will result in motor current changing more rapidly, requiring a higher current regulator gain. If the current regulator gain is too small, spikes in current will occur, causing large variations in torque, and possibly damaging the motor controller. If the current regulator gain is too high, the current will jitter, causing the motor to sound 'rough', especially when changing directions.

As a rule of thumb, we recommend setting this value as follows:
(Read and Write property)

145.7.16 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the controller will fire another VelocityUpdate/BrakingStrengthChange event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.

Note: BrakingStrengthChange events will only fire if a change in braking has occurred.

Unit: milliseconds (ms)
(Read and Write property)

145.7.17 DriveMode as Integer

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This setting impacts how your motor decelerates and the amount of current that is available to your motor at any given moment.
Notes: (Read and Write property)

145.7.18 FailsafeBrakingEnabled as Boolean

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether to enable failsafe braking.
Notes: This setting allows you to choose whether motor will forcibly stop once it enters a FAILSAFE state.

A setting of FALSE will simply stop applying power to the motor, allowing it to spin down naturally.
A setting of TRUE will apply braking up to the FailsafeCurrentLimit, actively stopping the motor
(Read and Write property)

145.7.19 FailsafeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When the controller enters a FAILSAFE state, the controller will limit the current through the motor to the FailsafeCurrentLimit value.
Notes: (Read and Write property)

145.7.20 Inductance as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The inductance value.
Notes: The controller will attempt to measure the inductance of your motor when opened. This value is used to improve control of the motor.

Set this value during the Attach Event to skip motor characterization (including the audible beeps). You can use a previously saved Inductance value, or information from your motor's datasheet.
(Read and Write property)

145.7.21 MaxAcceleration as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that Acceleration can be set to.
Notes: Unit: duty cycle per second (duty cycle/s)
(Read only property)

145.7.22 MaxBrakingStrength as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that TargetBrakingStrength can be set to.
Notes: See TargetBrakingStrength for details.
(Read only property)

145.7.23 MaxCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that CurrentLimit can be set to.
Notes: Unit: amperes (A)
(Read only property)

145.7.24 MaxCurrentRegulatorGain as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that CurrentRegulatorGain can be set to.
Notes: (Read only property)

145.7.25 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.7.26 MaxFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: in milliseconds.
(Read only property)

145.7.27 MaxInductance as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that Inductance can be set to. See Inductance for details.
Notes: (Read only property)

145.7.28 MaxSurgeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that SurgeCurrentLimit can be set to.
Notes: (Read only property)

145.7.29 MaxVelocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that TargetVelocity can be set to.
Notes: TargetVelocity is bounded by -1√óMaxVelocity and MaxVelocity, where a sign change (¬±) is indicitave of a direction change.

Unit: duty cycle (duty cycle)
(Read only property)

145.7.30 MinAcceleration as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that Acceleration can be set to.
Notes: Unit: duty cycle per second (duty cycle/s)
(Read only property)

145.7.31 MinBrakingStrength as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that TargetBrakingStrength can be set to.
Notes: See TargetBrakingStrength for details.
(Read only property)

145.7.32 MinCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that CurrentLimit can be set to.
Notes: Unit: amperes (A)
(Read only property)

145.7.33 MinCurrentRegulatorGain as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that CurrentRegulatorGain can be set to.
Notes: (Read only property)

145.7.34 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.7.35 MinFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: in milliseconds.
(Read only property)

145.7.36 MinInductance as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that Inductance can be set to. See Inductance for details.
Notes: (Read only property)

145.7.37 MinSurgeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that SurgeCurrentLimit can be set to.
Notes: (Read only property)

145.7.38 MinVelocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that TargetVelocity can be set to
Notes: Set the TargetVelocity to MinVelocity to stop the motor. See TargetBrakingStrength for more information on stopping the motor.
TargetVelocity is bounded by -1√óMaxVelocity and MaxVelocity, where a sign change (¬±) is indicitave of a direction change.

Unit: duty cycle (duty cycle)
(Read only property)

145.7.39 SurgeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The SurgeCurrentLimit allows for increased performance from your motor.
Notes: The controller will limit the current through your motor to the SurgeCurrentLimit briefly, then scale current down to the CurrentLimit.
View ActiveCurrentLimit for information about what current limit the controller is actively following.
(Read and Write property)

145.7.40 TargetBrakingStrength as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This setting allows you to choose how hard the motor will resist being turned when it is not being driven forward or reverse (Velocity = 0).
Notes: The TargetBrakingStrength sets the relative amount of electrical braking to be applied to the DC motor, with MinBrakingStrength corresponding to no braking (free-wheeling), and MaxBrakingStrength indicating full braking.

A low TargetBrakingStrength value corresponds to free-wheeling. This means:
The motor will continue to rotate after the controller is no longer driving the motor (Velocity = 0), due to its momentum.
The motor shaft will provide little resistance to being turned when it is stopped.
As TargetBrakingStrength increases, this will engage electrical braking of the DC motor. This means:
The motor will stop more quickly if it is in motion when braking is requested.
The motor shaft will resist rotation by oustide forces.
Braking will be added gradually, according to the Acceleration setting, once the motor controller's Velocity

reaches 0.0
Braking will be immediately stopped when a new (non-zero) TargetVelocity is set, and the motor will accelerate to the requested velocity.
Braking mode is enabled by setting the Velocity to 0.0
(Read and Write property)

145.7.41 TargetVelocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The target velocity.
Notes: The average voltage across the motor is based on the TargetVelocity value.
At a constant load, increasing the target velocity will increase the speed of the motor.
TargetVelocity is bounded by -1√óMaxVelocity and MaxVelocity, where a sign change (¬±) is indicitave of a direction change.
Setting TargetVelocity to MinVelocity will stop the motor. See TargetBrakingStrength for more information on stopping the motor.
The units of TargetVelocity and Acceleration refer to 'duty cycle'. This is because the controller controls velocity by rapidly switching the power on/off (i.e. changing the duty cycle) in order to manipulate the voltage across the motor.
(Read and Write property)

145.7.42 Velocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent velocity value that the controller has reported.
Notes: Unit: duty cycle (duty cycle)
(Read only property)

145.7.43 Events

145.7.44 BackEMFChanged(backEMF as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent back emf value will be reported in this event.
Notes: backEMF: The back EMF voltage from the motor

145.7.45 BrakingStrengthChanged(brakingStrength as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when the motor braking strength changes.
Notes: brakingStrength:The most recent braking strength value will be reported in this event.
This event will occur only when the value of braking strength has changed
See TargetBrakingStrength for details about what this number represents.

145.7.46 setTargetVelocityAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when setTargetVelocityAsync completed.

145.7.47 VelocityUpdated(velocity as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs at a rate defined by the DataInterval.
Notes: velocity:The most recent velocity value will be reported in this event.

145.7.48 Constants

Drive Mode

Constant	Value	Description
kDriveModeCoast	1	Coast
kDriveModeForced	2	Forced

145.8 class PhidgetDictionaryMBS

145.8.1 class PhidgetDictionaryMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Dictionaries are useful for passing information between multiple programs using Phidgets. #
Example:

```
// share values between programs through a dictionary on the Phidget network server
// MyPhidgetDictionary is a subclass of PhidgetDictionaryMBS with the events implemented.
// Dict is a property of the window: Dict As MyPhidgetDictionary
Dict = New MyPhidgetDictionary
Dict.DeviceSerialNumber = 1000 // the serial number of the dictionary on the server
Dict.openWaitForAttachment(5000)

Dict.add("temperature", "21.5")
Dict.update("temperature", "22.0")

// in MyPhidgetDictionary:
Sub Updated(Key As String, Value As String) Handles Updated
System.DebugLog Key + " changed to " + Value
End Sub
```

Notes: A common example would be to have one program controlling your application that receives commands sent via a Phidget dictionary from a web interface, as outlined in many of our articles.

Keys can be thought of as being similar to variable names, with their values as their associated value. Phidget dictionaries contain groups of related key-value pairs, and are stored on a central Phigdet Network Server. Dictionaries, and the key-value pairs within may be accessed from programs that have access to the Phigdet Network Server.

The Dictionary API supports connecting to a dictionary on the server, managing key-value pairs, and monitoring changes made to the dictionary.

More information on Phidget Dictionaries can be found on the Phidget Dictionary support page.
Subclass of the PhidgetMBS class.

- Rewritten Phidgets Plugin

145.8.2 Methods

145.8.3 add(key as String, value as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds a new key value pair to the dictionary.
Notes: It is an error if the key already exits.

145.8.4 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: creates an instance of a Phidget channel.

145.8.5 Keys as String()

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries all keys in a dictionary.
Notes: The list might not contain all of the keys in the dictionary if it is modified while you query keys. Keys added during the scan may be missed, and keys deleted during the scan may be included.

145.8.6 remove(key as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Removes the key from the dictionary.

145.8.7 removeAll

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Removes every key from the dictionary.

145.8.8 update(key as String, value as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Updates a key value pair in the dictionary.
Notes: It is an error if the key does not exist.

145.8.9 validDictionaryKey(key as String) as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Checks whether this is a valid key to use.
Notes: Returns true on success or false on failure.

145.8.10 Properties

145.8.11 Value(key as String) as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Set or get the value associated with the given key from the dictionary.
Notes: (Read and Write computed property)

145.8.12 Events

145.8.13 Added(Key as String, Value as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when a new key value pair is added to the dictionary.
Notes: key: The key that was added
value: The value of the new key

145.8.14 Removed(Key as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when a key is removed from the dictionary.

145.8.15 Updated(Key as String, Value as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when a change is made to a key value pair in the dictionary.

145.9 class PhidgetDigitalInputMBS

145.9.1 class PhidgetDigitalInputMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Digital Input class is used to monitor the state of Phidget digital inputs.
Example:

```
// read values from a digital input Phidget
// MyDigitalInput is a subclass of PhidgetDigitalInputMBS with the events implemented.
// DigitalInput is a property of the window: DigitalInput As MyDigitalInput

DigitalInput = New MyDigitalInput
DigitalInput.open

// in MyDigitalInput:
Sub Attached() Handles Attached
System.DebugLog "Device attached: " + Me.DeviceSerialNumber.ToString
End Sub

Sub StateChanged(state As Integer) Handles StateChanged
System.DebugLog "state: " + state.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: Use digital inputs to monitor the state of buttons, switches, or switch-to-ground sensors.
Subclass of the PhidgetMBS class.

- Rewritten Phidgets Plugin

145.9.2 Methods

145.9.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.9.4 Properties

145.9.5 DataAdapterVoltage as Integer

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The desired data adapter voltage.
Notes: Can be 2.5, 3.3 or 5.0 Volt.
(Read and Write property)

145.9.6 InputMode as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The input polarity mode for your channel.
Notes: See your device's User Guide for more information about what value to chooose for the InputMode.
(Read and Write property)

145.9.7 PowerSupply as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Choose the power supply voltage.
Notes: Set this to the voltage specified in the attached sensor's data sheet to power it.
Set to kPowerSupplyOff to turn off the supply to save power.
(Read and Write property)

145.9.8 State as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent state value that the channel has reported.
Notes: (Read only property)

145.9.9 Events

145.9.10 StateChanged(state as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This event will occur when the state of the digital input has changed.
Notes: The value will either be 0 or 1 (true or false).

145.9.11 Constants

Data Adapter Voltage

Constant	Value	Description
kDataAdapterVoltageExtern	1	Extern
kDataAdapterVoltage_2_5V	3	2.5V
kDataAdapterVoltage_3_3V	4	3.3V
kDataAdapterVoltage_5_0V	5	5.0V

Input Modes

Constant	Value	Description
kInputModeNPN	1	For interfacing NPN digital sensors.
kInputModePNP	2	For interfacing PNP digital sensors.

Power Supply

Constant	Value	Description
kPowerSupply12V	2	The sensor is provided with 12 volts.
kPowerSupply24V	3	The sensor is provided with 24 volts.
kPowerSupply5V	4	The sensor is provided with 5 volts
kPowerSupplyOff	1	Switch the sensor power supply off.

145.10 class PhidgetDigitalOutputMBS

145.10.1 class PhidgetDigitalOutputMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Digital Output class is used to control digital logic outputs and LED outputs on Phidgets boards.
Example:

```
// switch a digital output on for one second
Var p As New PhidgetDigitalOutputMBS

// wait up to 5 seconds for the device
p.openWaitForAttachment(5000)

p.State = True
Thread.SleepCurrent(1000)
p.State = False

p.close
```

Notes: Subclass of the PhidgetMBS class.

- MBS Xojo Plugins, version 26.1pr1
- Rewritten Phidgets Plugin

145.10.2 Methods

145.10.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.10.4 enableFailsafe(failsafeTime as UInt32)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables the failsafe feature for the channel, with a given failsafe time.
Notes: The failsafe feature is intended for use in applications where it is important for the channel to enter a known safe state if the program controlling it locks up or crashes. If you do not enable the failsafe feature, the channel will carry out whatever instructions it was last given until it is explicitly told to stop.

Enabling the failsafe feature starts a recurring failsafe timer for the channel. Once the failsafe timer is enabled, it must be reset within the specified time or the channel will enter a failsafe state. The failsafe timer may be reset either by calling this function again, or using the ResetFailsafe function. Resetting the failsafe timer will reload the timer with the specified failsafe time, starting when the message to reset the timer is received by the Phidget.

For example: if the failsafe is enabled with a failsafe time of 1000ms, you will have 1000ms to reset the failsafe timer. Every time the failsafe timer is reset, you will have 1000ms from that time to reset the failsafe again.

If the failsafe timer is not reset before it runs out, the channel will enter a failsafe state. For Digital Output channels, this will set the output state to FALSE. Once the channel enters the failsafe state, it will reject any further input until the channel is reopened.

To prevent the channel from falsely entering the failsafe state, we recommend resetting the failsafe timer as frequently as is practical for your applicaiton. A good rule of thumb is to not let more than a third of the failsafe time pass before resetting the timer.

Once the failsafe timer has been set, it cannot be disabled by any means other than closing and reopening the channel.

145.10.5 resetFailsafe

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Resets the failsafe timer, if one has been set. See EnableFailsafe for details.
Notes: This function will fail if no failsafe timer has been set for the channel.

145.10.6 setDutyCycleAsync(dutyCycle as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the duty cycle asynchronously.
Notes: The DutyCycle represents the fraction of time the output is on (high).
This will override the State setting on the channel.

A DutyCycle of 1.0 translates to a high output, a DutyCycle of 0 translates to a low output.
This is equivalent to setting a State of TRUE and FALSE respectively.
A DutyCycle of 0.5 translates to an output that is high half the time, which results in an average output voltage of (output voltage x 0.5)
You can use the DutyCycle to create a dimming effect on LEDs.
If the DigitalOutput channel you are using does not support PWM, then this value may only be set to 1.0 or 0.0
You can check if your device supports PWM by checking the ChannelSubclass property, viewable by selecting Phidget API above. Your DigitalOutput channel supports PWM if it is any subclass other than NONE.

calls setDutyCycleAsyncCompleted later.

145.10.7 setLEDCurrentLimitAsync(LEDCurrentLimit as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The LEDCurrentLimit is the maximum amount of current that the controller will provide to the output.
Notes: Reference the data sheet of the LED you are using before setting this value.

Calls setLEDCurrentLimitAsyncCompleted event later.

145.10.8 setStateAsync(state as Boolean)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the state asynchronously.
Notes: The State will dictate whether the output is constantly high (true) or low (false).
This will override any DutyCycle that may have been set on the channel.
Setting the State to true is the same as setting DutyCycle to 1.0, and setting the State to false is the same as setting a DutyCycle of 0.0.

Calls setStateAsyncCompleted event later.

145.10.9 Properties

145.10.10 DataAdapterVoltage as Integer

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The desired data adapter voltage.
Notes: Can be 2.5, 3.3 or 5.0 Volt.
(Read and Write property)

145.10.11 DutyCycle as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DutyCycle represents the fraction of time the output is on (high).
Notes: A DutyCycle of 1.0 translates to a high output, a DutyCycle of 0 translates to a low output.
A DutyCycle of 0.5 translates to an output that is high half the time, which results in an average output voltage of (output voltage x 0.5)
You can use the DutyCycle to create a dimming effect on LEDs.

Unit: duty cycle (duty cycle)
(Read and Write property)

145.10.12 Frequency as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Frequency parameter sets the PWM frequency for all frequency-settable PWM outputs on the board.
Notes: in hertz (Hz)
(Read and Write property)

145.10.13 LEDCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The LEDCurrentLimit is the maximum amount of current that the controller will provide to the output.

Notes: Reference the data sheet of the LED you are using before setting this value.
n amperes.
(Read and Write property)

145.10.14 LEDForwardVoltage as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The LEDCurrentLimit is the maximum amount of current that the controller will provide to the output.
Notes: Reference the data sheet of the LED you are using before setting this value.
(Read and Write property)

145.10.15 MaxDutyCycle as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DutyCycle can be set to.
Notes: Unit: duty cycle (duty cycle)
(Read only property)

145.10.16 MaxFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: in milliseconds.
(Read only property)

145.10.17 MaxFrequency as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DutyCycle can be set to.
Notes: in hertz (Hz)
(Read only property)

145.10.18 MaxLEDCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that LEDCurrentLimit can be set to.
Notes: in amperes.
(Read only property)

145.10.19 MinDutyCycle as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DutyCycle can be set to.
Notes: Unit: duty cycle (duty cycle)
(Read only property)

145.10.20 MinFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: in milliseconds.
(Read only property)

145.10.21 MinFrequency as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DutyCycle can be set to.
Notes: in hertz (Hz)
(Read only property)

145.10.22 MinLEDCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that LEDCurrentLimit can be set to.
Notes: in amperes.
(Read only property)

145.10.23 State as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The State will indicate whether the output is high (true) or low (false).
Notes: If a DutyCycle has been set, the state will return as true if the DutyCycle is above 0.5, or false otherwise.
(Read and Write property)

145.10.24 Events

145.10.25 setDutyCycleAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when setDutyCycleAsync is done.

145.10.26 setLEDCurrentLimitAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when setLEDCurrentLimitAsync completed.

145.10.27 setStateAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when setStateAsync completed.

145.10.28 Constants

Data Adapter Voltage

Constant	Value	Description
kDataAdapterVoltageExtern	1	Extern
kDataAdapterVoltage_2_5V	3	2.5V
kDataAdapterVoltage_3_3V	4	3.3V
kDataAdapterVoltage_5_0V	5	5.0V

LED Forward Voltage Setting

Constant	Value	Description
kLEDForwardVoltage_1_7V	1	1.7V
kLEDForwardVoltage_2_75V	2	2.75V
kLEDForwardVoltage_3_2V	3	3.2V
kLEDForwardVoltage_3_9V	4	3.9V
kLEDForwardVoltage_4_0V	5	4.0V
kLEDForwardVoltage_4_8V	6	4.8V
kLEDForwardVoltage_5_0V	7	5.0V
kLEDForwardVoltage_5_6V	8	5.6V

145.11 class PhidgetDistanceSensorMBS

145.11.1 class PhidgetDistanceSensorMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Distance Sensor class gathers data from the distance sensor on a Phidget board.
Example:

```
// read values from a distance sensor Phidget
// MyDistanceSensor is a subclass of PhidgetDistanceSensorMBS with the events implemented.
// DistanceSensor is a property of the window: DistanceSensor As MyDistanceSensor

DistanceSensor = New MyDistanceSensor
DistanceSensor.open

// in MyDistanceSensor:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub DistanceChanged(distance As UInt32) Handles DistanceChanged
System.DebugLog "distance: " + distance.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: If you're using a simple 0-5V sensor that does not have its own firmware, use the VoltageInput or VoltageRatioInput class instead, as specified for your device.
Subclass of the PhidgetMBS class.

- Rewritten Phidgets Plugin

145.11.2 Methods

145.11.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.11.4 SonarReflectionsAmplitudes as UInt32()

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent reflection values that the channel has reported.
Notes: The amplitude values are relative amplitudes of the reflections that are normalized to an arbitrary scale.

145.11.5 SonarReflectionsDistances as UInt32()

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent reflection values that the channel has reported.
Notes: The distance values will always be between MinDistance and MaxDistance.
The closest reflection will be placed at index 0 of the distances array, and the furthest reflection at index 7

145.11.6 Properties

145.11.7 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
The timing between events can also affected by the change trigger.

Unit: milliseconds (ms)
(Read and Write property)

145.11.8 Distance as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent distance value that the channel has reported.
Notes: This value will always be between MinDistance and MaxDistance.

in milliseconds.
(Read only property)

145.11.9 DistanceChangeTrigger as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue an event until the distance value has changed by the amount specified by the DistanceChangeTrigger.
Notes: Setting the DistanceChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering.

in milliseconds.
(Read and Write property)

145.11.10 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.11.11 MaxDistance as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum distance that a event will report.
Notes: in milliseconds.
(Read only property)

145.11.12 MaxDistanceChangeTrigger as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DistanceChangeTrigger can be set to.
Notes: in milliseconds.

(Read only property)

145.11.13 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.11.14 MinDistance as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum distance that a event will report.
Notes: in milliseconds.
(Read only property)

145.11.15 MinDistanceChangeTrigger as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DistanceChangeTrigger can be set to.
Notes: in milliseconds.
(Read only property)

145.11.16 SonarQuietMode as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When set to true, the device will operate more quietly.
Notes: The measurable range is reduced when operating in quiet mode.
(Read and Write property)

145.11.17 Events

145.11.18 DistanceChanged(distance as UInt32)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent distance value the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a DistanceChangeTrigger has been set to a non-zero value, the DistanceChange event will not occur until the distance has changed by at least the DistanceChangeTrigger value.

145.11.19 SonarReflectionsUpdated(distances() as UInt32, amplitudes() as UInt32, count as UInt32)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent reflections the channel has detected will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a DistanceChangeTrigger has been set to a non-zero value, the SonarReflectionsUpdate event will not occur until the distance has changed by at least the DistanceChangeTrigger value.
The closest reflection will be placed at index 0 of the distances array, and the furthest reflection at index 7.
If you are only interested in the closest reflection, you can simply use the DistanceChange event.
The values reported as amplitudes are relative amplitudes of the reflections that are normalized to an arbitrary scale.

distances: The reflection values
amplitudes: The amplitude values
count: The number of reflections detected

145.12 class PhidgetEncoderMBS

145.12.1 class PhidgetEncoderMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Encoder class is used to read position data from quadrature encoders in order to track linear or rotary movement.
Example:

```
// read values from a encoder Phidget
// MyEncoder is a subclass of PhidgetEncoderMBS with the events implemented.
// Encoder is a property of the window: Encoder As MyEncoder

Encoder = New MyEncoder
Encoder.open

// in MyEncoder:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub PositionChanged(positionChange As Integer, timeChange As Double, indexTriggered As Integer) Handles PositionChanged
System.DebugLog "positionChange: " + positionChange.ToString + ", " + "timeChange: " + timeChange.ToString + ", " + "indexTriggered: " + indexTriggered.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: If the device supports an index pin as a reference point, you can also access it through this class.
Subclass of the PhidgetMBS class.

145.12.2 Methods

145.12.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.12.4 Properties

145.12.5 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another PositionChange event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
The timing between PositionChange events can also affected by the PositionChangeTrigger.

Unit: milliseconds (ms)
(Read and Write property)

145.12.6 Enabled as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The enabled state of the encoder.
Notes: (Read and Write property)

145.12.7 IndexPosition as Int64

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent position of the index channel calculated by the Phidgets library.
Notes: The index channel will usually pulse once per rotation.
Setting the encoder position will move the index position the same amount so their relative position stays the same.
Index position is tracked locally as the last position at which the index was triggered. Setting position will only affect the local copy of the index position value. This means that index positions seen by multiple network applications may not agree.
(Read only property)

145.12.8 IOMode as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The encoder interface mode. Match the mode to the type of encoder you have attached.
Notes: It is recommended to only change this when the encoder disabled in order to avoid unexpected results.
(Read and Write property)

145.12.9 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.12.10 MaxPositionChangeTrigger as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that PositionChangeTrigger can be set to.
Notes: (Read only property)

145.12.11 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.12.12 MinPositionChangeTrigger as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that PositionChangeTrigger can be set to.
Notes: (Read only property)

145.12.13 Position as Int64

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent position value calculated by the Phidgets library.
Notes: Position counts quadrature edges within a quadrature cycle. This means there are four counts per full quadrature cycle.
Position is tracked locally as the total position change from the time the channel is opened. Setting position will only affect the local copy of the position value. This means that positions seen by multiple network applications may not agree.
(Read and Write property)

145.12.14 PositionChangeTrigger as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a PositionChange event until the position value has changed by the amount specified by the PositionChangeTrigger.
Notes: Setting the PositionChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering
(Read and Write property)

145.12.15 Events

145.12.16 PositionChanged(positionChange as Integer, timeChange as double, indexTriggered as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent values the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a PositionChangeTrigger has been set to a non-zero value, the PositionChange event will not occur until the position has changed by at least the PositionChangeTrigger value.

positionChange: The amount the position changed since the last change event
timeChange: The time elapsed since the last change event in milliseconds

indexTriggered: True if the index was passed since the last change event

145.12.17 Constants

Encoder Interface Modes

Constant	Value	Description
kEncoderIOModeCollector10K	5	Line Driver 10K, 10kŒ© pull-down resistors will be applied to the input lines.
kEncoderIOModeCollector2K2	4	Open Collector 2.2K, 2.2kŒ© pull-up resistors will be applied to the input lines.
kEncoderIOModeLineDriver10K	3	Open Collector 10K, 10kŒ© pull-up resistors will be applied to the input lines.
kEncoderIOModeLineDriver2K2	2	Line Driver 2.2K, 2.2kŒ© pull-down resistors will be applied to the input lines.
kEncoderIOModePushPull	1	Push-Pull, No additional pull-up or pull-down resistors will be applied to the input lines.

145.13 class PhidgetErrorExceptionMBS

145.13.1 class PhidgetErrorExceptionMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The error exception.
Notes: Whenever a Phidget function returns an error, we raise an exception and put the error number into the exceptions.
Subclass of the RuntimeException class.

- Rewritten Phidgets Plugin

145.14 class PhidgetFrequencyCounterMBS

145.14.1 class PhidgetFrequencyCounterMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Frequency Counter class is used to measure the frequency of pulses in an electronic signal, or to count the pulses in the signal.
Example:

```
// read values from a frequency counter Phidget
// MyFrequencyCounter is a subclass of PhidgetFrequencyCounterMBS with the events implemented.
// FrequencyCounter is a property of the window: FrequencyCounter As MyFrequencyCounter

FrequencyCounter = New MyFrequencyCounter
FrequencyCounter.open

// in MyFrequencyCounter:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub FrequencyChanged(frequency As Double) Handles FrequencyChanged
System.DebugLog "frequency: " + frequency.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: Such signals can come from other electronics, or certain sensors that have a pulse output.
Subclass of the PhidgetMBS class.

145.14.2 Methods

145.14.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.14.4 reset

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Resets the Count and TimeElapsed.
Notes: For best results, reset should be called when the channel is disabled.

145.14.5 Properties

145.14.6 Count as UInt64

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent count value the channel has reported.
Notes: The count represents the total number of pulses since the channel was opened, or last reset.
(Read only property)

145.14.7 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another CountChange/FrequencyChange event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.

Unit: milliseconds (ms)
(Read and Write property)

145.14.8 Enabled as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables or disables the channel.
Notes: When a channel is disabled, it will not longer register counts, therefore the TimeElapsed and Count will not be updated until the channel is re-enabled.
(Read and Write property)

145.14.9 FilterType as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Determines the signal type that the channel responds to.
