Notes: The filter type is chosen based on the type of input signal. See the PhidgetFrequencyCounter_FilterType entry under Enumerations for more information.
(Read and Write property)

145.14.10 Frequency as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent frequency value that the channel has reported.
Notes: This value will always be between 0 Hz and MaxFrequency.
in Hertz.
(Read only property)

145.14.11 FrequencyCutoff as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The frequency at which zero hertz is assumed.
Notes: This means any frequency at or below the FrequencyCutoff value will be reported as 0 Hz.
This property is stored locally, so other users who have this Phidget open over a network connection won't see the effects of your selected cutoff.
(Read and Write property)

145.14.12 InputMode as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The input polarity mode for your channel.
Notes: See your device's User Guide for more information about what value to chooose for the InputMode (Read and Write property)

145.14.13 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.14.14 MaxFrequency as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value the FrequencyChange event will report.
Notes: (Read only property)

145.14.15 MaxFrequencyCutoff as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that FrequencyCutoff can be set to.
Notes: (Read only property)

145.14.16 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)

(Read only property)

145.14.17 MinFrequencyCutoff as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that FrequencyCutoff can be set to.
Notes: (Read only property)

145.14.18 PowerSupply as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Choose the power supply voltage.
Notes: Set this to the voltage specified in the attached sensor's data sheet to power it.
Set to POWER_SUPPLY_OFF to turn off the supply to save power.
(Read and Write property)

145.14.19 TimeElapsed as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The amount of time the frequency counter has been enabled for.
Notes: This property complements Count, the total number of pulses detected since the channel was opened, or last reset.
(Read only property)

145.14.20 Events

145.14.21 CountChanged(counts as UInt64, timeChange as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent values the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: counts: The pulse count of the signal

timeChange: The change in elapsed time since the last change

145.14.22 FrequencyChanged(frequency as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent frequency value the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: frequency: The calculated frequency of the signal.

145.14.23 Constants

Filter Types

Constant	Value	Description
kFilterTypeLogicLevel	2	Logic level
kFilterTypeZeroCrossing	1	Zero crossing

Input Modes

Constant	Value	Description
kInputModeNPN	1	For interfacing NPN digital sensors.
kInputModePNP	2	For interfacing PNP digital sensors.

Power Supply

Constant	Value	Description
kPowerSupply12V	2	The sensor is provided with 12 volts
kPowerSupply24V	3	The sensor is provided with 24 volts
kPowerSupply5V	4	The sensor is provided with 5 volts
kPowerSupplyOff	1	Switch the sensor power supply off.

145.15 class PhidgetGPGGAMBS

145.15.1 class PhidgetGPGGAMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: NMEA GGA Sentence.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

145.15.2 Methods

145.15.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

145.15.4 Properties

145.15.5 altitude as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Mean sea level altitude.
Notes: (Read and Write property)

145.15.6 fixQuality as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: GPS quality indicator.
Notes: (Read and Write property)

145.15.7 heightOfGeoid as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Geoidal separation.
Notes: (Read and Write property)

145.15.8 horizontalDilution as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Horizontal dilution of precision.
Notes: (Read and Write property)

145.15.9 latitude as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Latitude.
Notes: (Read and Write property)

145.15.10 longitude as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Longitude.
Notes: (Read and Write property)

145.15.11 numSatellites as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Number of satellites in use.
Notes: (Read and Write property)

145.16 class PhidgetGPGSAMBS

145.16.1 class PhidgetGPGSAMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: NMEA GSA sentence
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Function: The private constructor.

145.16.4 Properties

145.16.5 fixType as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Fix type.
Notes: 1 = no fix, 2 = 2D, 3 = 3D.
(Read and Write property)

145.16.6 horizDilution as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Horizontal dilution of precision.
Notes: (Read and Write property)

145.16.7 mode as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Manual/Automatic mode.
Notes: A = auto, M = manual.
(Read and Write property)

145.16.8 posnDilution as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Position dilution of precision.
Notes: (Read and Write property)

145.16.9 vertDilution as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Vertical dilution of precision.
Notes: (Read and Write property)

145.16.10 satUsed(index as Integer) as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Satellite IDs.
Notes: Index in range of 0 to 11.
(Read and Write computed property)

145.17 class PhidgetGPRMCMBS

145.17.1 class PhidgetGPRMCMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: NMEA RMC sentence.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

145.17.2 Methods

145.17.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

145.17.4 Properties

145.17.5 heading as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Heading over ground in degrees.
Notes: (Read and Write property)

145.17.6 latitude as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Latitude.
Notes: (Read and Write property)

145.17.7 longitude as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Longitude.
Notes: (Read and Write property)

145.17.8 magneticVariation as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Magnetic variation.
Notes: (Read and Write property)

145.17.9 mode as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Mode indicator.
Notes: (Read and Write property)

145.17.10 speedKnots as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Speed over ground in knots.
Notes: (Read and Write property)

145.17.11 status as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Status of the data
Notes: (Read and Write property)

145.18 class PhidgetGPSMBS

145.18.1 class PhidgetGPSMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The GPS class is used to configure and gather data from Phidgets GPS sensors, and gives you access to variables from GPS data packets.
Example:

```
// read values from a gps Phidget
// MyGPS is a subclass of PhidgetGPSMBS with the events implemented.
// GPS is a property of the window: GPS As MyGPS

GPS = New MyGPS
GPS.open

// in MyGPS:
Sub Attached() Handles Attached
System.DebugLog "Device attached: " + Me.DeviceSerialNumber.ToString
End Sub

Sub PositionChanged(latitude As Double, longitude As Double, altitude As Double) Handles Position-
Changed
System.DebugLog "latitude: " + latitude.ToString + ", " + "longitude: " + longitude.ToString + ", " +
"altitude: " + altitude.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: Subclass of the PhidgetMBS class.

145.18.2 Methods

145.18.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.18.4 NMEAData as PhidgetGPSNMEAMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries the NMEA data structure.

145.18.5 Properties

145.18.6 Altitude as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The altitude above mean sea level in meters.
Notes: (Read only property)

145.18.7 Date as Date

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The UTC date of the last received position.
Notes: Returns time and date as date object.
(Read only property)

145.18.8 DateTime as DateTime

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The UTC date of the last received position.
Notes: Returns time and date as datetime object.
(Read only property)

145.18.9 Heading as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The current true course over ground of the GPS.
Notes: Heading over ground in degrees.
(Read only property)

145.18.10 Latitude as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The latitude of the GPS in degrees.
Notes: (Read only property)

145.18.11 Longitude as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The longitude of the GPS.
Notes: (Read only property)

145.18.12 PositionFixState as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The status of the position fix.
Notes: True if a fix is available and latitude, longitude, and altitude can be read. False if the fix is not available.
(Read only property)

145.18.13 Velocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The current speed over ground of the GPS.
Notes: (Read only property)

145.18.14 Events

145.18.15 HeadingChanged(heading as double, velocity as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when a heading change occurs.
Notes: heading: The current heading.
velocity: The current velocity.

145.18.16 PositionChanged(latitude as double, longitude as double, altitude as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent values the channel has measured will be reported in this event, which occurs when the GPS position changes.
Notes: latitude: The current latitude.
longitude: The current longitude.
altitude: The current altitude.

145.18.17 PositionFixStateChanged(positionFixState as Boolean)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when a position fix is obtained or lost.
Notes: positionFixState:The state of the position fix.
True indicates a fix is obtained. False indicates no fix found.

145.19 class PhidgetGPSNMEAMBS

145.19.1 class PhidgetGPSNMEAMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The NMEA Data structure.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

145.19.2 Methods

145.19.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

145.19.4 Destructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The destructor.

145.19.5 Properties

145.19.6 GGA as PhidgetGPGGAMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: NMEA GGA Sentence.
Notes: (Read and Write property)

145.19.7 GSA as PhidgetGPGSAMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: NMEA GSA Sentence.
Notes: (Read and Write property)

145.19.8 RMC as PhidgetGPRMCMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: NMEA RMC Sentence.
Notes: (Read and Write property)

145.19.9 VTG as PhidgetGPVTGMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: NMEA VTG Sentence.
Notes: (Read and Write property)

145.20 class PhidgetGPVTGMBS

145.20.1 class PhidgetGPVTGMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: NMEA VTG sentence.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- New Phidgets supported

145.20.2 Methods

145.20.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

145.20.4 Properties

145.20.5 magneticHeading as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Magnetic heading.
Notes: (Read and Write property)

145.20.6 mode as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Mode indicator.
Notes: (Read and Write property)

145.20.7 speed as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Speed over ground in km/h.
Notes: (Read and Write property)

145.20.8 speedKnots as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Speed over ground in knots.
Notes: (Read and Write property)

145.20.9 trueHeading as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: True heading over ground.
Notes: (Read and Write property)

145.21 class PhidgetGyroscopeMBS

145.21.1 class PhidgetGyroscopeMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Gyroscope class reports rotational data from the Phidget containing a gyroscope chip for use in your code.
Example:

```
// read values from a gyroscope Phidget
// MyGyroscope is a subclass of PhidgetGyroscopeMBS with the events implemented.
// Gyroscope is a property of the window: Gyroscope As MyGyroscope

Gyroscope = New MyGyroscope
Gyroscope.open

// in MyGyroscope:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub AngularRateUpdated(angularRate() As Double, timestamp As Double) Handles AngularRateUpdated
System.DebugLog "timestamp: " + timestamp.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: Phidget gyroscopes usually have multiple sensors, each oriented in a different axis, so multiple dimensions of heading can be recorded.

If the Phidget you're using also has an accelerometer and a magnetometer, you may want to use the Spatial classin order to get all of the data at the same time, in a single event.
Subclass of the PhidgetMBS class.

- MBS Xojo Plugins, version 26.1pr1
- Rewritten Phidgets Plugin

145.21.2 Methods

145.21.3 AngularRate as Double()

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent angular rate value that the channel has reported.
Notes: This value will always be between MinAngularRate and MaxAngularRate.

145.21.4 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.21.5 MaxAngularRate as Double()

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value the AngularRateUpdate event will report.

145.21.6 MinAngularRate as Double()

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value the AngularRateUpdate event will report.

145.21.7 zero

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Re-zeros the gyroscope in 1-2 seconds.
Notes: The device must be stationary when zeroing.
The angular rate will be reported as 0.0¬∞/s while zeroing.
Zeroing the gyroscope is a method of compensating for the drift that is inherent to all gyroscopes. See your

device's User Guide for more information on dealing with drift.

145.21.8 Properties

145.21.9 AxisCount as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The number of axes the channel can measure angular rate on.
Notes: See your device's User Guide for more information about the number of axes and their orientation.
(Read only property)

145.21.10 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another AngularRateUpdate event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
Unit: milliseconds (ms)
(Read and Write property)

145.21.11 HeatingEnabled as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Set to true to enable the temperature stabilization feature of this device.
Notes: This enables onboard heating elements to bring the board up to a known temperature to minimize ambient temerature effects on the sensor's reading. You can leave this setting false to conserve power consumption.This property is shared by any and all spatial-related objects on this device (Accelerometer, Gyroscope, Magnetometer, Spatial)

HeatingEnabled: Whether self-heating temperature stabilization is enabled
(Read and Write property)

145.21.12 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.21.13 MaxDataRate as Double

MBS Phidgets Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataRate can be set to.
Notes: In hertz.
(Read only property)

145.21.14 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.21.15 MinDataRate as Double

MBS Phidgets Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataRate can be set to.
Notes: In hertz.
(Read only property)

145.21.16 Precision as Integer

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The precision requested.
Notes: (Read and Write property)

145.21.17 Timestamp as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent timestamp value that the channel has reported.
Notes: This is an extremely accurate time measurement streamed from the device.
If your application requires a time measurement, you should use this value over a local software timestamp.
(Read only property)

145.21.18 Events

145.21.19 AngularRateUpdated(angularRate() as double, timestamp as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent angular rate and timestamp values the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: angularRate: The angular rate values
timestamp: The timestamp value

145.21.20 Constants

Precision

Constant	Value	Description
kPrecisionHigh	1	High
kPrecisionHybrid	0	Hybrid
kPrecisionLow	2	Low

145.22 class PhidgetHubMBS

145.22.1 class PhidgetHubMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The hub class allows you to control power to VINT hub ports.
Example:

```
// switch the power of port 2 of a VINT hub off and on again, e.g. to reset a sensor
Var hub As New PhidgetHubMBS
hub.openWaitForAttachment(5000)

hub.setPortPower(2, 0) // off
MessageBox "Port 2 power: " + hub.PortPower(2).ToString

// switch it on again a moment later, e.g. in a Timer:
// hub.setPortPower(2, 1)
```

Notes: Subclass of the PhidgetMBS class.

145.22.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.22.4 PortMaxSpeed(Port as Integer) as UInt32

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The max communication speed of a high-speed capable VINT Port.

145.22.5 PortSupportsAutoSetSpeed(Port as Integer) as Boolean

MBS Phidgets Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that this VINT Port support Auto Set Speed.
Notes: port: The Hub port

Returns the supported state.

145.22.6 PortSupportsSetSpeed(Port as Integer) as Boolean

MBS Phidgets Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that the communication speed of this VINT port can be set.
Notes: port: The Hub port

Returns the supported state

145.22.7 setPortAutoSetSpeed(Port as Integer, State as Integer)

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables / disables Auto Set Speed on the hub port.
Notes: When enabled, and a supported VINT device is attached, the HubPortSpeed will automatically be set to the fastest reliable speed. This is enabled by default on supported VINT Hubs.

145.22.8 setPortPower(Port as Integer, State as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Controls power to the VINT Hub Ports.
Notes: port: The Hub port
state: The power state

145.22.9 Properties

145.22.10 PortMode(Port as Integer) as Integer

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The mode of the selected port.
Notes: This could be used to set a port back to VINT mode if it was left in digital/analog mode.
(Read and Write computed property)

145.22.11 PortPower(Port as Integer) as Integer

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets and sets the VINT Hub Port power state
Notes: (Read and Write computed property)

145.23 class PhidgetHumiditySensorMBS

145.23.1 class PhidgetHumiditySensorMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Humidity Sensor class gathers relative humidity data from the Phidget and makes it available to your code.
Example:

```
// read values from a humidity sensor Phidget
// MyHumiditySensor is a subclass of PhidgetHumiditySensorMBS with the events implemented.
// HumiditySensor is a property of the window: HumiditySensor As MyHumiditySensor

HumiditySensor = New MyHumiditySensor
HumiditySensor.open

// in MyHumiditySensor:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub HumidityChanged(humidity As Double) Handles HumidityChanged
System.DebugLog "humidity: " + humidity.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: If you're using a simple 0-5V sensor that does not have its own firmware, use the VoltageInput or VoltageRatioInput class instead, as specified for your device.
Subclass of the PhidgetMBS class.

- Rewritten Phidgets Plugin

145.23.2 Methods

145.23.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.23.4 Properties

145.23.5 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another HumidityChange event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
The timing between HumidityChange events can also affected by the HumidityChangeTrigger.
Unit: milliseconds (ms)
(Read and Write property)

145.23.6 Humidity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent humidity value that the channel has reported.
Notes: This value will always be between MinHumidity and MaxHumidity.
(Read only property)

145.23.7 HumidityChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a HumidityChange event until the humidity value has changed by the amount specified by the HumidityChangeTrigger.
Notes: Setting the HumidityChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering.
(Read and Write property)

145.23.8 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.23.9 MaxHumidity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that the HumidityChange event will report.
Notes: (Read only property)

145.23.10 MaxHumidityChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that HumidityChangeTrigger can be set to.
Notes: (Read only property)

145.23.11 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.23.12 MinHumidity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that the HumidityChange event will report.
Notes: (Read only property)

145.23.13 MinHumidityChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that HumidityChangeTrigger can be set to.
Notes: (Read only property)

145.23.14 Events

145.23.15 HumidityChanged(humidity as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent humidity value the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a HumidityChangeTrigger has been set to a non-zero value, the HumidityChange event will not occur until the humidity has changed by at least the HumidityChangeTrigger value.

humidity: The ambient relative humidity

145.24 class PhidgetIRCodeInfoMBS

145.24.1 class PhidgetIRCodeInfoMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The PhidgetIR CodeInfo structure contains all information needed to transmit a code, apart from the actual code data.
Notes: Some values can be set to null to select defaults.
Blog Entries

- MBS REALbasic Plugins, version 10.6pr7

145.24.2 Properties

145.24.3 bitCount as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Number of bits in the code.
Notes: (Read and Write property)

145.24.4 carrierFrequency as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Carrier frequency in Hz - defaults to 38kHz
Notes: (Read and Write property)

145.24.5 dutyCycle as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Duty Cycle in percent (0.1-0.5).
Notes: Defaults to 0.33

Unit: duty cycle (duty cycle)
(Read and Write property)

145.24.6 encoding as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Encoding technique used to encode the data.
Notes: (Read and Write property)

145.24.7 gap as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gap time in microseconds.
Notes: (Read and Write property)

145.24.8 length as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Constant or Variable length encoding.
Notes: (Read and Write property)

145.24.9 minRepeat as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Minium number of times to repeat a code on transmit.
Notes: (Read and Write property)

145.24.10 trail as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Trail time in microseconds.
Notes: Can be zero for no trail.
(Read and Write property)

145.24.11 header(index as Integer) as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Header pulse and space.
Notes: Can be zero for no header.
Index in range of 0 to 1.
(Read and Write computed property)

145.24.12 one(index as Integer) as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Pulse and Space times to represent a '1' bit, in microseconds
Notes: Index in range of 0 to 1.
(Read and Write computed property)

145.24.13 repeat(index as Integer) as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: A series or pulse and space times to represent the repeat code.
Notes: Start and end with pulses and null terminate. Set to 0 for none.
Index in range of 0 to 25.
(Read and Write computed property)

145.24.14 toggleMask(index as Integer) as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Bit toggles, which are applied to the code after each transmit.
Notes: index from 0 to 32.
(Read and Write computed property)

145.24.15 zero(index as Integer) as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Pulse and Space times to represent a '0' bit, in microseconds
Notes: Index in range of 0 to 1.
(Read and Write computed property)

145.24.16 Constants

Encoding

Constant	Value	Description
kEncodingBiPhase	4	Bi-Phase, or Manchester encoding
kEncodingPulse	3	Pulse encoding, or Pulse Width Modulation
kEncodingRC5	5	RC5 - a type of Bi-Phase encoding
kEncodingRC6	6	RC6 - a type of Bi-Phase encoding
kEncodingSpace	2	Space encoding, or Pulse Distance Modulation
kEncodingUnknown	1	Unknown - the default value

Length Types

Constant	Value	Description
kLengthConstant	2	Constant - the bitstream and gap length is constant
kLengthUnknown	1	Unknown - the default value
kLengthVariable	3	Variable - the bitstream has a variable length with a constant gap

145.25 class PhidgetIRMBS

145.25.1 class PhidgetIRMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Infrared Remote class lets you read and transmit command codes from infrared remotes that the majority of household appliances use.
Example:

```
// read values from a ir Phidget
// MyIR is a subclass of PhidgetIRMBS with the events implemented.
// IR is a property of the window: IR As MyIR

IR = New MyIR
IR.open

// in MyIR:
Sub Attached() Handles Attached
System.DebugLog "Device attached: " + Me.DeviceSerialNumber.ToString
End Sub

Sub CodeReceived(code As String, bitCount As Integer, isRepeat As Boolean) Handles CodeReceived
System.DebugLog "code: " + code + ", " + "bitCount: " + bitCount.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: You can use this class to construct and transmit commands from scratch, or learn and retransmit codes from the remote controller of your appliance.
Subclass of the PhidgetMBS class.

- MBS Xojo Plugins, version 26.5pr4
- Rewritten Phidgets Plugin
- MBS REALbasic Plugins, version 10.6pr7

145.25.2 Methods

145.25.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.25.4 getLastCode(byref bitCount as UInt32) as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The last code the channel has received.
Notes: The code is represented by a hexadecimal string (array of bytes).

145.25.5 getLastLearnedCode(byref codeInfo as PhidgetIRCodeInfoMBS) as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The last code the channel has learned.
Notes: The code is represented by a hexadecimal string (array of bytes).
The codeInfo structure holds data that describes the learned code.

145.25.6 transmit(code as String, codeInfo as PhidgetIRCodeInfoMBS)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Transmits a code
Notes: code data is transmitted MSBit first.
MSByte is in array index 0 of code
LSBit is right justified, therefore, MSBit may be in bit position 0-7 (of array index 0) depending on the bit count.

code:code data
codeInfo:contains the data for characterizing the code.

145.25.7 transmitRaw(data as MemoryBlock, carrierFrequency as UInt32, dutyCycle as double, gap as UInt32)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Transmits raw data as a series of pulses and spaces.
Notes: data: data to send.
dataLen: length of the data array
carrierFrequency: carrier frequency in Hz
dutyCycle: the duty cycle
gap: the gap time.

data must start and end with a pulse.
Each element is a positive time in ŒºÊs
dataLength has a maximum length of 200, however, streams should be kept must shorter than this (less than 100ms between gaps).
dataLength must be an odd number
Leave carrierFrequency as 0 for default.
carrierFrequency has a range of 10kHz - 1MHz
Leave dutyCycle as 0 for default
dutyCycle can have a value between 0.1 and 0.5
Specifying a gap will guarantee a gap time (no transmitting) after data is sent.
gap time is in ŒºÊs
gap time can be set to 0

145.25.8 transmitRepeat

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Transmits a repeat of the last transmited code.
Notes: Depending on the CodeInfo structure, this may be a retransmission of the code itself, or there may be a special repeat code.

145.25.9 Events

145.25.10 CodeReceived(code as string, bitCount as Integer, isRepeat as Boolean)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This event is fired every time a code is received and correctly decoded.
Notes: code: The code string

bitCount: The length of the received code in bits
isRepeat: true if a repeat is detected

The code is represented by a hexadecimal string (array of bytes) with a length of 1/4 of bitCount.
The MSBit is considered to be the first bit received and will be in array index 0 of code
Repeat will be true if a repeat is detected (either timing wise or via a repeat code)
False repeasts can happen if two separate button presses happen close together

145.25.11 Learned(code as string, codeInfo as PhidgetIRCodeInfoMBS)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This event fires when a button has been held down long enough for the channel to have learned the CodeInfo values.
Notes: A code is usually learned after 1 second, or after 4 repeats.

145.25.12 RawDataReceived(data as MemoryBlock)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This event will fire every time the channel gets more data.
Notes: This will happen at most once every 8ms.

145.26 class PhidgetLCDMBS

145.26.1 class PhidgetLCDMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The LCD class allows you to control various liquid crystal displays.
Example:

```
// write a line of text on a graphic LCD
Var p As New PhidgetLCDMBS

// wait up to 5 seconds for the device
p.openWaitForAttachment(5000)

p.Backlight = 1
p.Clear
p.writeText(PhidgetLCDMBS.kFont6x12, 0, 0, "Hello from Xojo")
p.Flush

p.close
```

Notes: It offers control of displayed text as well as screen settings and custom character creation.
Subclass of the PhidgetMBS class.
Blog Entries

- MBS Xojo Plugins, version 25.0pr8
- Rewritten Phidgets Plugin

145.26.2 Methods

145.26.3 Clear

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Clears all pixels in the current frame buffer.
Notes: Changes made to the frame buffer must be flushed to the LCD screen using flush.

145.26.4 ClearAsync

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Clears all pixels in the current frame buffer.
Notes: Changes made to the frame buffer must be flushed to the LCD screen using flush.

Calls ClearAsyncCompleted event later.

145.26.5 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.26.6 copy(sourceFramebuffer as Integer, destFramebuffer as Integer, sourceX1 as Integer, sourceY1 as Integer, sourceX2 as Integer, sourceY2 as Integer, destX as Integer, destY as Integer, inverted as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Copies all pixels from a specified rectangular region to another.
Notes: sourceFramebuffer: Index number of the frame buffer containing the source rectangle
destFramebuffer: Index number of the frame buffer containing the destination rectangle
sourceX1: X coordinate of upper left corner of source rectangle
sourceY1: Y coordinate of upper left corner of source rectangle
sourceX2: X coordinate of bottom right corner of source rectangle
sourceY2: Y coordinate of bottom right corner of source rectangle
destX: X coordinate of upper left corner of destination rectangle
destY: Y coordinate of upper left corner of destination rectangle
inverted: If true, copied pixels are inverted

145.26.7 copyAsync(sourceFramebuffer as Integer, destFramebuffer as Integer, sourceX1 as Integer, sourceY1 as Integer, sourceX2 as Integer, sourceY2 as Integer, destX as Integer, destY as Integer, inverted as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Copies all pixels from a specified rectangular region to another.
Notes: sourceFramebuffer: Index number of the frame buffer containing the source rectangle
destFramebuffer: Index number of the frame buffer containing the destination rectangle
sourceX1: X coordinate of upper left corner of source rectangle
sourceY1: Y coordinate of upper left corner of source rectangle

sourceX2: X coordinate of bottom right corner of source rectangle
sourceY2: Y coordinate of bottom right corner of source rectangle
destX: X coordinate of upper left corner of destination rectangle
destY: Y coordinate of upper left corner of destination rectangle
inverted: If true, copied pixels are inverted

Calls copyAsyncCompleted event later.

145.26.8 drawLine(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Draws a straight line in the current frame buffer between two specified points.
Notes: Changes made to the frame buffer must be flushed to the LCD screen using flush.

x1: X coordinate of the first point
y1: Y coordinate of the first point
x2: X coordinate of the second point
y2: Y coordinate of the second point

145.26.9 drawLineAsync(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Draws a straight line in the current frame buffer between two specified points.
Notes: Changes made to the frame buffer must be flushed to the LCD screen using flush.

x1: X coordinate of the first point
y1: Y coordinate of the first point
x2: X coordinate of the second point
y2: Y coordinate of the second point

CallsdrawLineAsyncCompleted event later.

145.26.10 drawPixel(x as Integer, y as Integer, pixelState as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Draws, erases, or inverts a single specified pixel.
Notes: Changes made to the frame buffer must be flushed to the LCD screen using flush.

x: The X coordinate of the pixel
y: The Y coordinate of the pixel
pixelState: The new state of the pixel.

145.26.11 drawPixelAsync(x as Integer, y as Integer, pixelState as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Draws, erases, or inverts a single specified pixel.
Notes: Changes made to the frame buffer must be flushed to the LCD screen using flush.

x: The X coordinate of the pixel
y: The Y coordinate of the pixel
pixelState: The new state of the pixel.

Calls drawPixelAsyncCompleted event later.

145.26.12 drawRect(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, filled as Integer, inverted as Integer = 0)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Draws a rectangle in the current frame buffer using the specified points.
Notes: Changes made to the frame buffer must be flushed to the LCD screen using flush.

x1: The X coordinate of the top-left corner of the rectangle
y1: The Y coordinate of the top-left corner of the rectangle
x2: The X coordinate of the bottom-right corner of the rectangle
y2: The Y coordinate of the bottom-right corner of the rectangle
filled: If true, the rectangle will be solid. If false, just a single pixel outline.
inverted: If true, clears the region instead of drawing

145.26.13 drawRectAsync(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, filled as Integer, inverted as Integer = 0)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Draws a rectangle in the current frame buffer using the specified points.
Notes: Changes made to the frame buffer must be flushed to the LCD screen using flush.

x1: The X coordinate of the top-left corner of the rectangle
y1: The Y coordinate of the top-left corner of the rectangle
x2: The X coordinate of the bottom-right corner of the rectangle
y2: The Y coordinate of the bottom-right corner of the rectangle
filled: If true, the rectangle will be solid. If false, just a single pixel outline.
inverted: If true, clears the region instead of drawing

Calls drawRectAsyncCompleted event later.

145.26.14 Flush

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Flushes the buffered LCD contents to the LCD screen.

145.26.15 FlushAsync

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Flushes the buffered LCD contents to the LCD screen.
Notes: Calls FlushAsyncCompleted event later.

145.26.16 getFontSize(Font as Integer, byref Width as Integer, byref Height as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the size of the specified font.
Notes: font: The specified font
width: The width of the font

height: The height of the font

145.26.17 Initialize

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Initializes the Text LCD display.

145.26.18 MaxCharacters(font as Integer) as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum number of characters that can fit on the frame buffer for the specified font.
Notes: font: The specified font
maxCharacters: The maximum number of characters for the font

145.26.19 saveFrameBuffer(frameBuffer as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes the specified frame buffer to flash memory
Notes: Use sparingly. The flash memory is only designed to be written to 10,000 times before it may become unusable. This method can only be called one time each time the channel is opened.

145.26.20 saveFrameBufferAsync(frameBuffer as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes the specified frame buffer to flash memory
Notes: Use sparingly. The flash memory is only designed to be written to 10,000 times before it may become unusable. This method can only be called one time each time the channel is opened.

Calls saveFrameBufferAsyncCompleted event later.

145.26.21 setCharacterBitmap(Font as Integer, Character as String, Bitmap as MemoryBlock)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Create a bitmap and select a character to represent it.
Notes: Now, when you use the specific character, the bitmap will show in it's place.

font: The font the character belongs to
character: The character to be changed, in a null-terminated string.
bitmap: Bitmap array as Memoryblock.

145.26.22 setCharacterBitmapAsync(Font as Integer, Character as String, Bitmap as MemoryBlock)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Create a bitmap and select a character to represent it.
Notes: Now, when you use the specific character, the bitmap will show in it's place.

font: The font the character belongs to
character: The character to be changed, in a null-terminated string.
bitmap: Bitmap array as Memoryblock.

Calls setCharacterBitmapAsyncCompleted event later.

145.26.23 setFontSize(Font as Integer, Width as Integer, Height as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the size of the specified font.
Notes: font: The specified font
width: The width of the font
height: The height of the font

145.26.24 writeBitmap(xPosition as Integer, yPosition as Integer, xSize as Integer, ySize as Integer, Bitmap as MemoryBlock)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Draws a bitmap to the current frame buffer at the given location.
Notes: Each byte in the array represents one pixel in row-major order.
Changes made to the frame buffer must be flushed to the LCD screen using flush.

xPosition: The X coordinate of the bitmap
yPosition: The Y coordinate of the bitmap
xSize: The length of each row in the bitmap
ySize: The number of rows in the bitmap
bitmap: The bitmap to be drawn

145.26.25 writeBitmapAsync(xPosition as Integer, yPosition as Integer, xSize as Integer, ySize as Integer, Bitmap as MemoryBlock)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Draws a bitmap to the current frame buffer at the given location.
Notes: Each byte in the array represents one pixel in row-major order.
Changes made to the frame buffer must be flushed to the LCD screen using flush.

xPosition: The X coordinate of the bitmap
yPosition: The Y coordinate of the bitmap
xSize: The length of each row in the bitmap
ySize: The number of rows in the bitmap
bitmap: The bitmap to be drawn

Calls writeTextAsyncCompleted event later.

145.26.26 writeText(Font as Integer, xPosition as Integer, yPosition as Integer, Text as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes text to the current frame buffer at the specified location.
Notes: Changes made to the frame buffer must be flushed to the LCD screen using flush.

font: The font of the text
xPosition: The X position of the start of the text string
yPosition: The Y position of the start of the text string
text: The text to be written

145.26.27 writeTextAsync(Font as Integer, xPosition as Integer, yPosition as Integer, Text as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Write text asynchronously.
Notes: Writes text to the current frame buffer at the specified location.
Changes made to the frame buffer must be flushed to the LCD screen using flush.

font: The font of the text
xPosition: The X position of the start of the text string
yPosition: The Y position of the start of the text string
text: The text to be written

Calls writeTextAsyncCompleted event later.

145.26.28 Properties

145.26.29 AutoFlush as Boolean

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Allows setting the LCD to flush the screen automatically
Notes: Set to true to automatically flush the LCD screen after every message that writes to the LCD.
(Read and Write property)

145.26.30 Backlight as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Backlight affects the brightness of the LCD screen.
Notes: Backlight is bounded by MinBackLight and MaxBacklight.
(Read and Write property)

145.26.31 Contrast as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Contrast level of the text or graphic pixels.
Notes: A higher contrast will make the image darker.
Contrast is bounded by MinContrast and MaxContrast.
(Read and Write property)

145.26.32 CursorBlink as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When CursorBlink is true, the device will cause the cursor to periodically blink.
Notes: (Read and Write property)

145.26.33 CursorOn as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When CursorOn is true, the device will underline to the cursor position.
Notes: (Read and Write property)

145.26.34 FrameBuffer as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The frame buffer that is currently being used.
Notes: Commands sent to the device are performed on this buffer.
(Read and Write property)

145.26.35 Height as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The height of the LCD screen attached to the channel.
Notes: (Read only property)

145.26.36 MaxBacklight as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that Backlight can be set to.
Notes: (Read only property)

145.26.37 MaxContrast as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that Contrast can be set to.
Notes: (Read only property)

145.26.38 MinBacklight as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that Backlight can be set to.
Notes: (Read only property)

145.26.39 MinContrast as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that Contrast can be set to.
Notes: (Read only property)

145.26.40 ScreenSize as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The size of the LCD screen attached to the channel.
Notes: (Read and Write property)

145.26.41 Sleeping as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The on/off state of Sleeping.
Notes: Putting the device to sleep turns off the display and backlight in order to save power.
The device will still take commands while asleep, and will wake up if the screen is flushed, or if the contrast or backlight are changed.
When the device wakes up, it will return to its last known state, taking into account any changes that happened while asleep.
(Read and Write property)

145.26.42 Width as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The width of the LCD screen attached to the channel.
Notes: (Read only property)

145.26.43 Events

145.26.44 clearAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when clearAsync completes.

145.26.45 copyAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when copyAsync completes.

145.26.46 drawLineAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when drawLineAsync completes.

145.26.47 drawPixelAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when drawPixelAsync completes.

145.26.48 drawRectAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when drawRectAsync completes.

145.26.49 flushAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when flushAsync completes.

145.26.50 saveFrameBufferAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when saveFrameBufferAsync completes.

145.26.51 setCharacterBitmapAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when setCharacterBitmapAsync completes.

145.26.52 writeBitmapAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when writeBitmapAsync completes.

145.26.53 writeTextAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when writeTextAsync completes.

145.26.54 Constants

Fonts

Constant	Value	Description
kFont5x8	4	5px by 8px font
kFont6x10	3	6px by 10px font
kFont6x12	5	6px by 12px font
kFontUser1	1	User-defined font #1
kFontUser2	2	User-defined font #2

Pixel States

Constant	Value	Description
kPixelStateInvert	2	Invert the pixel state
kPixelStateOff	0	Pixel off state
kPixelStateOn	1	Pixel on state

Screen Sizes

Constant	Value	Description
kScreenSize1x16	4	1x16, One row, 16 column text screen
kScreenSize1x40	&ha	1x40, One row, 40 column text screen
kScreenSize1x8	2	1x8, One row, eight column text screen
kScreenSize2x16	5	2x16, Two row, 16 column text screen
kScreenSize2x20	7	2x20, Two row, 20 column text screen
kScreenSize2x24	9	2x24, Two row, 24 column text screen
kScreenSize2x40	&hb	2x40, Two row, 40 column text screen
kScreenSize2x8	3	2x8, Two row, eight column text screen
kScreenSize4x16	6	4x16, Four row, 16 column text screen
kScreenSize4x20	8	4x20, Four row, 20 column text screen.
kScreenSize4x40	&hc	4x40, Four row, 40 column text screen
kScreenSize64x128	&hd	64x128, 64px by 128px graphic screen
kScreenSizeNone	1	No Screen, Screen size unknown.

145.27 class PhidgetLEDArrayColorMBS

145.27.1 class PhidgetLEDArrayColorMBS

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: LED color values (RGBW - Red, Green, Blue, White).
Blog Entries

- News from the MBS Xojo Plugins Version 26.1

145.27.2 Properties

145.27.3 B as Integer

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Blue value.
Notes: (Read and Write property)

145.27.4 G as Integer

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Green value.
Notes: (Read and Write property)

145.27.5 R as Integer

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Red value.
Notes: (Read and Write property)

145.27.6 W as Integer

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: While value.
Notes: (Read and Write property)

145.28 class PhidgetLEDArrayMBS

145.28.1 class PhidgetLEDArrayMBS

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The class to handle a LED array.
Notes: Subclass of the PhidgetMBS class.

145.28.2 Methods

145.28.3 clearLEDs

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Turn off all LEDs. Any active animations will be stopped.

145.28.4 Constructor

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.28.5 setAnimation(animationID as Int32, pattern() as PhidgetLEDArrayColorMBS, StartAddress as UInt32, EndAddress as UInt32, Time as UInt32, animationType as Integer)

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Display an animation.
Notes: animationID: The ID of the animation.
pattern: The LED pattern to animate.
StartAddress: Which LED to start the animation from.
EndAddress: Which LED the animation will end on.
Time: Time between changes in ms.
animation: The animation type. See AnimationType* constants.

145.28.6 setLED(address as UInt32, ColorValue as PhidgetLEDArrayColorMBS, faceTime as UInt32)

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Set the color of a single of LED.
Notes: address: The address of the LED.
color: The color.
fadeTime: The time to fade from the previous state in milliseconds.

145.28.7 setLEDs(StartAddress as UInt32, EndAddress as UInt32, leds() as PhidgetLEDArrayColorMBS, fadeTime as UInt32)

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Set the colors of a segment of LEDs
Notes: startAddress: The address of the first LED in the segment.
endAddress: The address of the last LED in the segment.
pattern: The color pattern. This will be repeated or truncated as necessary to fill the space between startAddress and endAddress
fadeTime: The time to fade from the previous state in milliseconds.

145.28.8 setLEDsAsync(StartAddress as UInt32, EndAddress as UInt32, leds() as PhidgetLEDArrayColorMBS, fadeTime as UInt32)

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Set the colors of a segment of LEDs.
Notes: startAddress: The address of the first LED in the segment.
endAddress: The address of the last LED in the segment.
leds: The color pattern. This will be repeated or truncated as necessary to fill the space between startAddress and endAddress
fadeTime:The time to fade from the previous state in milliseconds.

Calls setLEDsCompleted event later.

145.28.9 stopAnimation(animationID as Int32)

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Disable the specified animation.
Notes: animationID: The ID of the animation to disable.

145.28.10 synchronizeAnimations

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Restart all animations at the same time.

145.28.11 Properties

145.28.12 Brightness as Double

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The brightness value will apply to all LEDs.
Notes: (Read and Write property)

145.28.13 ColorOrder as Integer

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Specify the order of colors expected by your LEDs.
Notes: (Read and Write property)

145.28.14 Gamma as Double

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The gamma value to apply to brightnesses.
Notes: PC monitors typically to use 2.2, Mac uses 1.8.
(Read and Write property)

145.28.15 MaxAddress as UInt32

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The highest LED address.
Notes: When using a ColorOrder with a white component (e.g., RGBW), this is reduced to 1535.
(Read only property)

145.28.16 MaxAnimationID as Integer

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The highest AnimationID.
Notes: (Read only property)

145.28.17 MaxAnimationPatternCount as UInt32

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum size of the LEDArrayColor array when using animations.
Notes: When using a ColorOrder with a white component (e.g., RGBW), this is reduced to 96.

(Read only property)

145.28.18 MaxBrightness as Double

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum brightness.
Notes: (Read only property)

145.28.19 MaxFadeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum fade time.
Notes: (Read only property)

145.28.20 MaxGamma as Double

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that gamma can be set to.
Notes: (Read only property)

145.28.21 MaxLEDCount as UInt32

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum size of the LEDArrayColor array when using setLED() or setLEDs().
Notes: When using a ColorOrder with a white component (e.g., RGBW), this is reduced to 1536.
(Read only property)

145.28.22 MinAddress as UInt32

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The lowest LED address..
Notes: (Read only property)

145.28.23 MinAnimationID as Integer

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The lowest AnimationID.
Notes: (Read only property)

145.28.24 MinAnimationPatternCount as UInt32

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum size of the LEDArrayColor array when using animations.
Notes: (Read only property)

145.28.25 MinBrightness as Double

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum brightness.
Notes: (Read only property)

145.28.26 MinFadeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum fade time.
Notes: (Read only property)

145.28.27 MinGamma as Double

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value gamma can be set to.
Notes: Gamma values less than 1 are unsuitable for most applications.
(Read only property)

145.28.28 MinLEDCount as UInt32

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum size of the LEDArrayColor array when using setLED() or setLEDs().
Notes: (Read only property)

145.28.29 PowerEnabled as Boolean

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Control power to all LEDs.
Notes: (Read and Write property)

145.28.30 Events

145.28.31 setLEDsCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called by setLEDsAsync method.

145.28.32 Constants

Animation Type

Constant	Value	Description
AnimationTypeForwardScroll	1	Forward Scroll Move the pattern in a positively incrementing direction
AnimationTypeForwardScrollMirror	4	Forward Scroll Mirror Flip the pattern and move it in a positively incrementing direction, start from the animation end point
AnimationTypeRandomize	3	Randomize Fades LEDs between colors in the supplied pattern, chosen at random.
AnimationTypeReverseScroll	2	Reverse Scroll Move the pattern in a decrementing direction
AnimationTypeReverseScrollMirror	5	Reverse Scroll Mirror Flip the pattern and move it in a decrementing direction, starting from animation end point

Color Order

Constant	Value	Description
ColorOrderGRB	2	Byte order GRB (WS2812B, SK6812)
ColorOrderGRBW	4	Byte order GRBW (SK6812RGBW)
ColorOrderRGB	1	Byte order RGB (WS2811)
ColorOrderRGBW	3	Byte order RGBW

145.29 class PhidgetLightSensorMBS

145.29.1 class PhidgetLightSensorMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Light Sensor class gathers data from the light sensor on a Phidget board.
Example:

```
// read values from a light sensor Phidget
// MyLightSensor is a subclass of PhidgetLightSensorMBS with the events implemented.
// LightSensor is a property of the window: LightSensor As MyLightSensor

LightSensor = New MyLightSensor
LightSensor.open

// in MyLightSensor:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub IlluminanceChanged(illuminance As Double) Handles IlluminanceChanged
System.DebugLog "illuminance: " + illuminance.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: If you're using a simple 0-5V sensor that does not have its own firmware, use the VoltageInput or VoltageRatioInput class instead, as specified for your device.
Subclass of the PhidgetMBS class.
Blog Entries

- Rewritten Phidgets Plugin

Xojo Developer Magazine

- 22.3, page 93: Phidgets, What are they and how to use them by Stefanie Juchmes-Simonis

145.29.2 Methods

145.29.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.29.4 Properties

145.29.5 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another IlluminanceChange event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
The timing between IlluminanceChange events can also affected by the IlluminanceChangeTrigger.

Unit: milliseconds (ms)
(Read and Write property)

145.29.6 Illuminance as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent illuminance value that the channel has reported.
Notes: This value will always be between MinIlluminance and MaxIlluminance.
(Read only property)

145.29.7 IlluminanceChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a IlluminanceChange event until the illuminance value has changed by the amount specified by the IlluminanceChangeTrigger.
Notes: Setting the IlluminanceChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering.

(Read and Write property)

145.29.8 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.29.9 MaxIlluminance as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value the IlluminanceChange event will report.
Notes: (Read only property)

145.29.10 MaxIlluminanceChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that IlluminanceChangeTrigger can be set to.
Notes: In lux.
(Read only property)

145.29.11 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.29.12 MinIlluminance as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value the IlluminanceChange event will report.
Notes: (Read only property)

145.29.13 MinIlluminanceChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that IlluminanceChangeTrigger can be set to.
Notes: (Read only property)

145.29.14 Events

145.29.15 IlluminanceChanged(illuminance as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent illuminance value the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a IlluminanceChangeTrigger has been set to a non-zero value, the IlluminanceChange event will not occur until the illuminance has changed by at least the IlluminanceChangeTrigger value.

illuminance: The current illuminance

145.30 class PhidgetLogMBS

145.30.1 class PhidgetLogMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The class hosting the log facilities.
Example:

```
// write Phidget library messages to a log file for debugging
Var logFile As FolderItem = SpecialFolder.Desktop.Child("phidget.log")
PhidgetLogMBS.enable(PhidgetLogMBS.LogLevelInfo, logFile.NativePath)
PhidgetLogMBS.Log(PhidgetLogMBS.LogLevelInfo, "MyApp started")

// later: PhidgetLogMBS.disable
```

145.30.2 Methods

145.30.3 addSource(source as String, LogLevel as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds a source to the Phidget logging system.
Notes: This is useful for declaring a source and setting its log level before sending any messages.

source: The source name
level: The log level of the source

145.30.4 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.30.5 Destructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The destructor.

145.30.6 disable

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Disables logging within the Phidget library.

145.30.7 disableNetwork

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Disable networking.

145.30.8 disableRotating

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Disables automatic rotation of the log file.

145.30.9 enable(LogLevel as Integer, destination as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables logging within the Phidget library.
Notes: LogLevel: The logging level
destination: The log file path, or "" for STDOUT

145.30.10 enableNetwork(address as string, port as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enable networking.

145.30.11 enableRotating

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables automatic rotation of the log file (the default).

145.30.12 getRotating(byref size as UInt64, byref keepCount as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the current log rotation parameters.
Notes: size: The file size above which the log file should be rotated.
keepCount: The number of log files that will be kept after rotation.

145.30.13 Log(LogLevel as Integer, Message as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes a message to the Phidget library log.
See also:

- 145.30.14 Log(LogLevel as Integer, Source as String, Message as String) 19686

145.30.14 Log(LogLevel as Integer, Source as String, Message as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes a message to the Phidget library log.
See also:

- 145.30.13 Log(LogLevel as Integer, Message as String) 19686

145.30.15 rotate

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Manually rotate the log file.
Notes: This will only have an effect if automatic rotation is disabled and the log file is larger than the

specified maximum file size.

145.30.16 setRotating(size as UInt64, keepCount as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets log rotation parameters.
Notes: size: The file size above which the file should be rotated in bytes. Min: 32768 (32 KiB) Def: 10485760 (10 MiB)
keepCount: The number of log files that should be kept after rotation. Min: 0 Def: 1 Max: 64

145.30.17 Sources as String()

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries current list of log sources.

145.30.18 Properties

145.30.19 isRotating as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Determines if the library is automatically rotating the log file.
Notes: (Read only property)

145.30.20 Level as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the log level for the phidget22 source..
Notes: (Read and Write property)

145.30.21 SourceLevel(source as String) as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the log level of the specified log source.
Notes: (Read and Write computed property)

145.30.22 Constants

Log Levels

Constant	Value	Description
LogLevelCritical	1	Critical
LogLevelDebug	5	Debug
LogLevelError	2	Errors
LogLevelInfo	4	Information
LogLevelVerbose	6	Verbose
LogLevelWarning	3	Warnings

145.31 class PhidgetMagnetometerMBS

145.31.1 class PhidgetMagnetometerMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Magnetometer class gathers magnetic compass data from Phidget boards.
Example:

```
// read values from a magnetometer Phidget
// MyMagnetometer is a subclass of PhidgetMagnetometerMBS with the events implemented.
// Magnetometer is a property of the window: Magnetometer As MyMagnetometer

Magnetometer = New MyMagnetometer
Magnetometer.open

// in MyMagnetometer:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub MagneticFieldChanged(magneticField() As Double, timestamp As Double) Handles MagneticFieldChanged
System.DebugLog "timestamp: " + timestamp.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: Phidget magnetometers usually have multiple sensors, each oriented in a different axis, so multiple dimensions of compass bearing can be recorded.

If the Phidget you're using also has a gyroscope and an accelerometer, you may want to use the Spatial class in order to get all of the data at the same time, in a single event.
Subclass of the PhidgetMBS class.
Blog Entries

- Rewritten Phidgets Plugin

145.31.2 Methods

145.31.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.31.4 MagneticField as Double()

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent field strength value that the channel has reported.
Notes: This value will always be between MinMagneticField and MaxMagneticField.

145.31.5 MaxMagneticField as Double()

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value the MagneticFieldChange event will report.Any readings outside this range will result in a Saturation event.
Notes: This check is done after calibration values have been applied, which will affect your magnetometer's range accordingly.

145.31.6 MinMagneticField as Double()

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value the MagneticFieldChange event will report.Any readings outside this range will result in a Saturation event.
Notes: This check is done after calibration values have been applied, which will affect your magnetometer's range accordingly.

145.31.7 resetCorrectionParameters

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Resets the CompassCorrectionParameters to their default values.
Notes: Due to physical location, hard and soft iron offsets, and even bias errors, your device should be calibrated. We have created a calibration program that will provide you with the CompassCorrectionParameters for your specific situation. See your device's User Guide for more information.

145.31.8 saveCorrectionParameters

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Saves the CalibrationParameters.
Notes: Due to physical location, hard and soft iron offsets, and even bias errors, your device should be calibrated. We have created a calibration program that will provide you with the CompassCorrectionParameters for your specific situation. See your device's User Guide for more information.

145.31.9 setCorrectionParameters(magneticField as double, offset0 as double, offset1 as double, offset2 as double, gain0 as double, gain1 as double, gain2 as double, T0 as double, T1 as double, T2 as double, T3 as double, T4 as double, T5 as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calibrate your device for the environment it will be used in.
Notes: Due to physical location, hard and soft iron offsets, and even bias errors, your device should be calibrated. We have created a calibration program that will provide you with the CompassCorrectionParameters for your specific situation. See your device's User Guide for more information.

magneticField: Ambient magnetic field value.
offset0: Provided by calibration program.
offset1: Provided by calibration program.
offset2: Provided by calibration program.
gain0: Provided by calibration program.
gain1: Provided by calibration program.
gain2: Provided by calibration program.
T0: Provided by calibration program.
T1: Provided by calibration program.
T2: Provided by calibration program.
T3: Provided by calibration program.
T4: Provided by calibration program.
T5: Provided by calibration program.

145.31.10 Properties

145.31.11 AxisCount as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The number of axes the channel can measure field strength on.
Notes: See your device's User Guide for more information about the number of axes and their orientation.
(Read only property)

145.31.12 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another MagneticFieldChange event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
The timing between MagneticFieldChange events can also affected by the MagneticFieldChangeTrigger.

Unit: milliseconds (ms)
(Read and Write property)

145.31.13 HeatingEnabled as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether self-heating temperature stabilization is enabled.
Notes: Set to true to enable the temperature stabilization feature of this device. This enables onboard heating elements to bring the board up to a known temperature to minimize ambient temerature effects on the sensor's reading. You can leave this setting false to conserve power consumption.This property is shared by any and all spatial-related objects on this device (Accelerometer, Gyroscope, Magnetometer, Spatial)
(Read and Write property)

145.31.14 MagneticFieldChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a MagneticFieldChange event until the field strength value has changed

by the amount specified by the MagneticFieldChangeTrigger.
Notes: Setting the MagneticFieldChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering
(Read and Write property)

145.31.15 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.31.16 MaxMagneticFieldChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that MagneticFieldChangeTrigger can be set to.
Notes: (Read only property)

145.31.17 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.31.18 MinMagneticFieldChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that MagneticFieldChangeTrigger can be set to.
Notes: (Read only property)

145.31.19 Timestamp as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent timestamp value that the channel has reported. This is an extremely accurate time measurement streamed from the device.
Notes: If your application requires a time measurement, you should use this value over a local software timestamp.
(Read only property)

145.31.20 Events

145.31.21 MagneticFieldChanged(magneticField() as double, timestamp as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent magnetic field values the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a MagneticFieldChangeTrigger has been set to a non-zero value, the MagneticFieldChange event will not occur until the field strength has changed by at least the MagneticFieldChangeTrigger value.

magneticField: The magnetic field values. Index from 0 to 2.
timestamp: The timestamp value

145.32 class PhidgetManagerMBS

145.32.1 class PhidgetManagerMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Phidget Manager allows tracking of which Phidgets are available to be controlled from the current program.
Notes: This is useful for listing all available Phidgets so you can select which ones to use at runtime.

You do not need to use a Phidget Manager if you know what Phidgets will be required for your application in advance.

Phidget channels that become available will each send an Attach event, and Phidgets that are removed from the system will send corresponding Detach events. If you are using a Phidget Manager, your program is responsible for keeping track of available Phidgets using these events.

Please use LoadLibrary shared method in PhidgetManagerMBS class to load Phidgets library before using the classes.

145.32.2 Methods

145.32.3 Close

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Closes a Phidget Manager that has been opened.

145.32.4 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.32.5 Destructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The destructor.

145.32.6 LoadLibrary(file as FolderItem) as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Loads the Phidgets library from given location.
Notes: Returns true on success or false on failure.
See LibraryLoadError property for error message.
See also:

- 145.32.7 LoadLibrary(path as String) as Boolean 19696

145.32.7 LoadLibrary(path as String) as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Loads the Phidgets library from given file path.
Example:

```
// where is the library?

#If TargetWindows
Const path = "Phidget22.dll"
#Else TargetMacOS Then
Const path = "/Library/Frameworks/Phidget22.framework"
#EndIf
```

```
If PhidgetManagerMBS.LoadLibrary(path) Then

MessageBox "OK"

Else

MessageBox PhidgetManagerMBS.LibraryLoadError
Return

End If
```

Notes: Returns true on success or false on failure.
See LibraryLoadError property for error message.
See also:

- 145.32.6 LoadLibrary(file as FolderItem) as Boolean 19696

145.32.8 Open

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Opens the Phidget Manager.
Notes: Be sure to register Attach and Detach event handlers for the Manager before opening it, to ensure you program doesn't miss the events reported for devices already connected to your system.

145.32.9 Properties

145.32.10 Handle as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

145.32.11 LibraryLoaded as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether the phidgets library was loaded.
Notes: (Read only property)

145.32.12 LibraryLoadError as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The last error message from LoadLibrary call.
Notes: (Read only property)

145.32.13 Events

145.32.14 Attached(phid as PhidgetMBS)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when a channel is attached.
Notes: Phidget channels you get from the manager are informational only, you can read information about them such as serial number, class, name, etc. but they are not opened. In order to interact with one, you must create and open a Phidget object of the correct type.

145.32.15 Detached(phid as PhidgetMBS)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when a channel is detached.
Notes: Phidget channels you get from the manager are informational only, you can read information about them such as serial number, class, name, etc. but they are not opened. In order to interact with one, you must create and open a Phidget object of the correct type.

145.32.16 WakeUp

MBS Phidgets Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Event called when waking up.

145.32.17 WillSleep

MBS Phidgets Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Event called when going to sleep.

145.33 class PhidgetMBS

145.33.1 class PhidgetMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The core Phidget class deals with functionality common to all Phidgets, such as opening and closing them, or setting Attach, Detach and Event handlers.
Notes: This class is also used to specify the associations between the Phidget software objects and their corresponding physical devices, and makes it possible to determine which Phidget is which in cases where it might otherwise be ambiguous.

This class contains various functions such as Release, Retain, and getParent designed to be used with the Phidget Manager. These specialized functions may be safely ignored if your application does not require a Manager. You can check the Manager API for more information.

All errors are reported as exceptions.
And MBS Plugin schedules all events to raise on main thread, so you can easily update GUI.

Please use LoadLibrary shared method in PhidgetManagerMBS class to load Phidgets library before using the classes
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- 22.3, page 93: Phidgets, What are they and how to use them by Stefanie Juchmes-Simonis

145.33.2 Methods

145.33.3 ChildDevices as PhidgetMBS()

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries child devices for hub.

145.33.4 close

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Closes a Phidget channel that has been opened.
Notes: Close will release the channel on the Phidget device, and should be called prior to delete.

145.33.5 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
Notes: Overwritten by subclasses.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

145.33.6 Destructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The destructor.

145.33.7 DeviceChannelCount(ChannelClass as Integer) as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the number of channels of the specified channel class on the device.
Notes: Pass kChannelClassNothing to get the total number of channels.

145.33.8 finalize(flags as Integer = 0)

MBS Phidgets Plugin, Plugin Version: 24.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Release memory and threads used by the Phidget library. Should be called prior to unloading the library from the address space.
Example:

```
Var InstanceCount As Integer = PhidgetMBS.InstanceCount // shows 0
If InstanceCount >0 Then
// something wrong. Still objects around!
Else
// explicit shutdown library
PhidgetMBS.finalize(0)
End If
```

Notes: This function is intended for use in special cases where it is desired for the Phidget library to be unloaded before a program's termination. All other API calls are unsafe after calling this.

flags: Reserved for future use. Pass 0.

Please do not call if you have Xojo Phidget objects around. Check InstanceCount please.

145.33.9 open

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Opens the Phidget channel.
Notes: The specific channel to be opened can be specified by setting any of the following properties:

DeviceSerialNumber
DeviceLabel
Channel
HubPort
IsHubPortDevice
ServerName
IsLocal
IsRemote

Open will return immediately, with the attachment process proceeding asynchronously. Use the Attach event or Attached property to determine when the channel is ready to use.

145.33.10 openWaitForAttachment(timeoutMs as UInt32 = 1000)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Opens the Phidget channel and waits a defined amount of time for the device to attach.
Notes: The specific channel to be opened can be specified by setting any of the following properties:

DeviceSerialNumber
DeviceLabel
Channel
HubPort
IsHubPortDevice
ServerName
IsLocal
IsRemote

OpenWaitForAttachment() will block until the channel is attached or a timeout occurs. A timeout value of 0 will wait forever.

145.33.11 Poll

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Checks for pending events to dispatch.
Notes: Our plugin dispatches events in two ways. If the event is raised on main thread, it will be raised directly. But if it arrives on other threads, it's queued and then dispatched via a timer on the main thread when there is idle time.
This poll method allows you to dispatch queued events now.

145.33.12 reboot

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reboots phidget.
Notes: Sends a reboot command to the device.

145.33.13 resetLibrary

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Closes all channels, and stops all threads.
Notes: The library is reset to a newly loaded state. All channel handles have been freed.
This function is intended for use in special cases where the library cannot be unloaded between program runs, such as LabVIEW and Unity Editor.

145.33.14 writeDeviceLabel(deviceLabel as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes a label to the device in the form of a string in the device flash memory.
Notes: This label can then be used to identify the device, and will persist across power cycles.

The label can be at most 10 UTF-16 code units. Most unicode characters take up a single code unit, but some, such as emoji, can take several.

Some older devices can not have their labels set from Windows. For these devices the label should be set from Linux or macOS.

Note: You should be careful when writing labels in your code, because the label is stored in flash which can only be re-written around 10,000 times before it will no longer write. If your program is complex, be sure to test it thoroughly before using WriteLabel to avoid accidentally burning out the flash.

Device labels work only for USB devices.

145.33.15 writeFlash

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes flash.

145.33.16 Properties

145.33.17 Attached as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the attached status of channel.
Notes: A Phidget is attached after it has been opened and the Phidget library finds and connects to the corresponding hardware device.
Most API calls are only valid on attached Phidgets.
(Read only property)
See also:

- 145.33.65 Attached 19717

145.33.18 Channel as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel index of the channel on the device.
Notes: Specifies the channel index to be opened. The default channel is 0. Set to kChannelAny to open any channel on the specified device.

If setting this property, it must be set before the channel is opened. The behaviour of setting this property while the channel is open is undefined.
(Read and Write property)

145.33.19 ChannelClass as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the channel class of the channel.
Notes: (Read only property)

145.33.20 ChannelClassName as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the name of the channel class the channel belongs to.

Notes: (Read only property)

145.33.21 ChannelName as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the channel's name.
Notes: This name serves as a description of the specific nature of the channel.
(Read only property)

145.33.22 ChannelPersistence as Boolean

MBS Phidgets Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Controls whether the state of this channel persists across attach and close.
Notes: By default, channels are reset on attach and close. Note that any defaults listed in the API must be set by the user when Persistence is enabled.
(Read only property)

145.33.23 ChannelSubclass as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the subclass for this channel.
Notes: Allows for identifying channels with specific characteristics without needing to know the exact device and channel index.
(Read only property)

145.33.24 ClientVersionMajor as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The major version of the client.
Notes: (Read only property)

145.33.25 ClientVersionMinor as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minor version of the client.
Notes: (Read only property)

145.33.26 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another change event.
Notes: Unit: milliseconds (ms)
(Read and Write property)

145.33.27 DataRate as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataRate is the frequency of events from the device.
Notes: The data rate is bounded by MinDataRate and MaxDataRate.
Changing DataRate will change the channel's DataInterval to a corresponding value, rounded to the nearest integer number of milliseconds.
The timing between events can also affected by the change trigger.
(Read and Write property)

145.33.28 DeviceClass as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the device class for the Phidget which this channel is a part of.
Notes: (Read only property)

145.33.29 DeviceClassName as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the name of the device class for the Phidget which this channel is a part of.
Notes: (Read only property)

145.33.30 DeviceID as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the DeviceID for the Phidget which this channel is a part of.
Notes: (Read only property)

145.33.31 DeviceLabel as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The device channel.
Notes: Gets the label of the Phidget which this channel is a part of. A device label is a custom string used to more easily identify a Phidget. Labels are written to a Phidget using writeDeviceLabel(), or by right-clicking the device and setting a label in the Phidget Control Panel for Windows.

Specifies the label of the Phidget to be opened. Leave un-set to open any label. A device label is a custom string used to more easily identify a Phidget. Labels are written to a Phidget using Phidget_writeDeviceLabel(), or by right-clicking the device and setting a label in the Phidget Control Panel for Windows.

If setting this property, it must be set before the channel is opened. The behaviour of setting this property while the channel is open is undefined.

Device labels work only for USB devices.
(Read and Write property)

145.33.32 DeviceName as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the name of the Phidget which this channel is a part of.
Notes: (Read only property)

145.33.33 DeviceSerialNumber as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The serial number of the Phidget which this channel is a part of.
Notes: If the channel is part of a VINT device, this will be the serial number of the VINT Hub the device is attached to.

Specifies the serial number of the Phidget to be opened. Leave un-set, or set to kSerialNumberAny to open any serial number.
If the channel is part of a VINT device, this will be the serial number of the VINT Hub the device is attached to.

If setting this property, it must be set before the channel is opened. The behaviour of setting this property while the channel is open is undefined.
(Read and Write property)

145.33.34 DeviceSKU as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the SKU (part number) of the Phidget which this channel is a part of.
Notes: (Read only property)

145.33.35 DeviceVersion as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the firmware version of the Phidget which this channel is a part of.
Notes: (Read only property)

145.33.36 Handle as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

145.33.37 Hub as PhidgetMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the hub that this channel is attached to.
Notes: (Read only property)

145.33.38 HubPort as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the hub port index of the VINT Hub port that the channel is attached to.
Notes: Specifies the hub port index of the VINT Hub port to open this channel on. Leave un-set, or set to kHubPortAny to open the channel on any VINT Hub port

If setting this property, it must be set before the channel is opened. The behaviour of setting this property while the channel is open is undefined.
(Read and Write property)

145.33.39 HubPortCount as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the number of VINT ports present on the VINT Hub that the channel is attached to.
Notes: (Read only property)

145.33.40 HubPortSpeed as UInt32

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Configures the communication speed for this VINT device.
Notes: Both the HubPortSupportsSetSpeed and VINTDeviceSupportsSetSpeed must be true in order to set the hub port speed.Available speeds are: 100000, 160000, 250000, 400000, 500000, 800000 and 1000000. Setting any other speed will select the nearest lower supported speed. The upper speed is bound by the lesser of MaxHubPortSpeed and MaxVINTDeviceSpeed. Set the speed to PHIDGET_HUBPORTSPEED_AUTO to enable Auto Set Speed on Hubs that support it (enabled by default).
(Read and Write property)

145.33.41 HubPortSupportsAutoSetSpeed as Boolean

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that the communication speed of this VINT port can be set automatically.
Notes: (Read only property)

145.33.42 HubPortSupportsSetSpeed as Boolean

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that the communication speed of this VINT port can be set.
Notes: (Read only property)

145.33.43 InstanceCount as Integer

MBS Phidgets Plugin, Plugin Version: 24.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries number of Xojo Phidget instances.
Example:

```
Var InstanceCount1 As Integer = PhidgetMBS.InstanceCount // shows 0

Var p As New PhidgetGyroscopeMBS

Var InstanceCount2 As Integer = PhidgetMBS.InstanceCount // shows 1

p = Nil

Var InstanceCount3 As Integer = PhidgetMBS.InstanceCount // shows 0

Break
```

Notes: The plugin has a counter to make sure we initialize automatically on the first object creation and track how many there are.
(Read only property)

145.33.44 IsChannel as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: True if the handle is for a channel.
Notes: Returns true if the PhidgetHandle is for a channel. Mostly for use alongside Phidget_getParent() to distinguish channel handles from device handles.
(Read only property)

145.33.45 IsHubPortDevice as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether this channel is a VINT Hub port channel, or part of a VINT device attached to a hub port.
Notes: Specifies whether this channel should be opened on a VINT Hub port directly, or on a VINT device attached to a hub port.

If setting this property, it must be set before the channel is opened. The behaviour of setting this property while the channel is open is undefined.
(Read and Write property)

145.33.46 IsLocal as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: True when this channel is attached directly on the local machine, or false otherwise.
Notes: Set to True if the channel is to be opened locally, and not over a network. If both this and IsRemote are set to False (the default), the channel will be opened either locally or remotely, on whichever matching channel is found first.

If setting this property, it must be set before the channel is opened. The behaviour of setting this property while the channel is open is undefined.
(Read and Write property)

145.33.47 IsOpen as Boolean

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns true if Phidget_open() has been called on this channel.
Notes: (Read only property)

145.33.48 IsRemote as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: True when this channel is attached via a Phidget network server, or false otherwise.
Notes: Set to True if the channel is to be opened remotely, rather than locally. If both this and IsLocal are set to False (the default), the channel will be opened either locally or remotely, on whichever matching channel is found first.

In order for your program to have access to remote Phidgets, you must use the Networking API to EnableServerDiscovery or AddServer.

If setting this property, it must be set before the channel is opened. The behaviour of setting this property while the channel is open is undefined.
(Read and Write property)

145.33.49 LibraryVersion as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the version of the Phidget library being used by the program in human readable form.
Notes: (Read only property)

145.33.50 LibraryVersionNumber as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the version of the Phidget library being used by the program as a version number string.
Notes: (Read only property)

145.33.51 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: (Read only property)

145.33.52 MaxDataRate as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataRate can be set to.
Notes: (Read only property)

145.33.53 MaxHubPortSpeed as UInt32

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The max communication speed of a high-speed capable VINT Port.
Notes: (Read only property)

145.33.54 MeshMode as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The mesh mode.
Notes: (Read and Write property)

145.33.55 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataRate can be set to.
Notes: (Read only property)

145.33.56 MinDataRate as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataRate can be set to.
Notes: (Read only property)

145.33.57 Parent as PhidgetMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the handle of the parent device of the given Phidget handle.
Notes: For example, this would refer to the device the channel is a part of, or the Hub that a device is plugged into.

This is useful when used alongside a Phidget Manager to create device trees like the one in the Phidget Control Panel.

Phidget_release() must be called on the handle returned by this function to release the reference created by this call.

This can be used to travel up the device tree and get device information at each step.
The root device will return a null handle
Parent handles always refer to devices. See IsChannel()
(Read only property)

145.33.58 ServerHostname as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the hostname of the Phidget network server for network attached Phidgets.
Notes: Fails if the channel is not connected to a Phidget network server.
(Read only property)

145.33.59 ServerName as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the name of the Phidget network server the channel is attached to, if any.
Notes: Fails if the channel is not connected to a Phidget network server.
(Read and Write property)

145.33.60 ServerPeerName as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the peer name of the channel's server.
Notes: Gets the peer name (address and port) of the Phidget server for network attached Phidgets, formatted as: address:port
Fails if the channel is not connected to a Phidget network server.
(Read only property)

145.33.61 ServerUniqueName as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the unique name for the server the channel is attached to, if any.
Notes: This is either a unique mDNS name, or the name specified in addServer
Fails if the channel is not connected to a Phidget network server.
(Read only property)

145.33.62 ServerVersionMajor as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The major version of the server.
Notes: (Read only property)

145.33.63 ServerVersionMinor as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minor version of the server.
Notes: (Read only property)

145.33.64 Events

145.33.65 Attached

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when the channel is attached to a physical channel on a Phidget.
Notes: This event is the recommended place to configuration properties of the channel such as the data interval or change trigger.
See also:

- 145.33.17 Attached as Boolean 19705

145.33.66 Detached

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when the channel is detached from a Phidget device channel.
Notes: This typically occurs when the Phidget device is removed from the system.

145.33.67 Error(errorCode as Integer, errorString as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This event is called when an error condition has been detected.
Notes: See the documentation for your specific channel class to see what error events it might throw.

145.33.68 PropertyChanged(propertyName as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when a property is changed externally from the user channel, usually from a network client attached to the same channel.

145.33.69 Constants

Constants

Constant	Value	Description
kChannelAny	-1	The constant for any channel. Pass to Channel to open any channel.
kDeviceClassVoltageInput	&H1D	ConstantsGroup: Device Class
kHubPortAny	-1	The constant for any port. Pass to HubPort to open any hub port.
kIRMaxCodeBitCount	&h80	One of the constants for IR sender/receiver.
kIRMaxCodeStrLength	&h21	One of the constants for IR sender/receiver.
kIRRawDataLongSpace	&hffffffff	One of the constants for IR sender/receiver.
kLabelAny	""	The constant to pick any label. Pass to DeviceLabel to open any label.
kSerialNumberAny	-1	The constant for any serial number. Pass to DeviceSerialNumber to open any serial number.
kServerAuthRequired	1	A flag constant for server.

Channel Class

Constant	Value	Description
kChannelClassAccelerometer	1	Accelerometer channel
kChannelClassBLDCMotor	&H23	BLDC motor channel
kChannelClassCapacitiveTouch	&He	Capacitive Touch channel
kChannelClassCurrentinput	2	Current input channel
kChannelClassCurrentoutput	&H26	Current output channel
kChannelClassDataAdapter	3	Data Adapter
kChannelClassDcmotor	4	DC motor channel
kChannelClassDictionary	&H24	Dictionary
kChannelClassDigitalInput	5	Digital input channel
kChannelClassDigitalOutput	6	Digital output channel
kChannelClassDistanceSensor	7	Distance sensor channel
kChannelClassEncoder	8	Encoder channel
kChannelClassFirmwareUpgrade	&H20	Firmware Upgrade
kChannelClassFrequencyCounter	9	Frequency counter channel
kChannelClassGeneric	&H21	Generic channel
kChannelClassGps	&Ha	GPS channel
kChannelClassGyroscope	&Hc	Gyroscope channel
kChannelClassHub	&Hd	VINT Hub channel
kChannelClassHumiditySensor	&Hf	Humidity sensor channel
kChannelClassIR	&H10	IR channel
kChannelClassLcd	&Hb	LCD channel
kChannelClassLEDArray	&H13	LED array
kChannelClassLightSensor	&H11	Light sensor channel
kChannelClassMagnetometer	&H12	Magnetometer channel
kChannelClassMotorPositionController	&H22	Motor position control channel.
kChannelClassMotorVelocityController	&H27	Motor Velocity Controller
kChannelClassNothing	0	Unknown
kChannelClassPhSensor	&H25	pH sensor channel
kChannelClassPowerguard	&H14	Power guard channel
kChannelClassPressureSensor	&H15	Pressure sensor channel
kChannelClassRCServo	&H16	RC Servo channel
kChannelClassResistanceInput	&H17	Resistance input channel
kChannelClassRFID	&H18	RFID channel
kChannelClassSoundSensor	&H19	Sound sensor channel
kChannelClassSpatial	&H1A	Spatial channel
kChannelClassStepper	&H1B	Stepper channel
kChannelClassTemperatureSensor	&H1C	Temperature sensor channel
kChannelClassVoltageInput	&H1D	Voltage input channel
kChannelClassVoltageOutput	&H1E	Voltage output channel
kChannelClassVoltageRatioInput	&H1F	Voltage ratio input channel

Channel Sub Class

Constant	Value	Description
kChannelSubClassDigitaloutputDutyCycle	&H10	Digital output duty cycle
kChannelSubClassDigitaloutputFrequency	&H12	Digital output frequency
kChannelSubClassDigitaloutputLedDriver	&H11	Digital output LED driver
kChannelSubClassEncoderModeSettable	&H60	Encoder IO mode settable
kChannelSubClassLCDGraphic	&H50	Graphic LCD
kChannelSubClassLCDText	&H51	Text LCD
kChannelSubClassNone	1	No subclass
kChannelSubClassRFIDNFC	&H80	RFID NFC
kChannelSubClassSpatialAhrs	&H70	Spatial AHRS/IMU
kChannelSubClassTemperaturesensorRtd	&H20	Temperature sensor RTD
kChannelSubClassTemperaturesensorThermocouple	&H21	Temperature sensor thermocouple
kChannelSubClassVoltageInputSensorPort	&H30	Voltage sensor port
kChannelSubClassVoltageRatioInputBridge	&H41	Voltage ratio bridge input
kChannelSubClassVoltageRatioInputSensorPort	&H40	Voltage ratio sensor port

Device Class

Constant	Value	Description
kDeviceClassAccelerometer	1	PhidgetAccelerometer device
kDeviceClassAdvancedServo	2	PhidgetAdvancedServo device
kDeviceClassAnalog	3	PhidgetAnalog device
kDeviceClassBridge	4	PhidgetBridge device
kDeviceClassCurrentOutput	&H1A	Current output
kDeviceClassDataAdapter	&H19	PhidgetDataAdapter device
kDeviceClassDictionary	&H18	Dictionary device
kDeviceClassEncoder	5	PhidgetEncoder device
kDeviceClassFirmwareUpgrade	&H17	Firmware Upgrade
kDeviceClassFrequencyCounter	6	PhidgetFrequencyCounter device
kDeviceClassGeneric	&H16	Generic class.
kDeviceClassGPS	7	PhidgetGPS device
kDeviceClassHub	8	Phidget VINT Hub device
kDeviceClassInterfaceKit	9	PhidgetInterfaceKit device
kDeviceClassIR	&Ha	PhidgetIR device
kDeviceClassLed	&Hb	PhidgetLED device
kDeviceClassLEDArray	&H0C	LED Array
kDeviceClassMotorControl	&Hd	PhidgetMotorControl device
kDeviceClassNothing	0	Unknown device.
kDeviceClassPhsensor	&He	PhidgetPHSensor device
kDeviceClassRFID	&Hf	PhidgetRFID device
kDeviceClassServo	&H10	PhidgetServo device
kDeviceClassSpatial	&H11	PhidgetSpatial device
kDeviceClassStepper	&H12	PhidgetStepper device
kDeviceClassTemperatureSensor	&H13	PhidgetTemperatureSensor device
kDeviceClassTextLCD	&H14	PhidgetTextLCD device
kDeviceClassVint	&H15	Phidget VINT Hub device

Error Codes

Constant	Value	Description
kError2Big	&H36	
kErrorAccess	7	Access (Permission) Issue: Access to the resource (file) is denied. This can happen when enabling logging.
kErrorAgain	&H16	
kErrorBadConnection	&H42	Bad Connection
kErrorBadCurrentReading	&H41	Bad Current Readings
kErrorBadPassword	&H25	
kErrorBadPowerSupply	&H3E	Bad Power Supply
kErrorBadVersion	&H37	
kErrorBusy	9	Resource Busy: Specified resource is in use. This error code is not normally used.
kErrorClosed	&H38	Closed: Channel was closed. This can happen if a channel is closed while openWaitForAttachment is waiting.
kErrorConnRef	&H23	
kErrorConnReset	&H2E	
kErrorDuplicate	&H1B	Duplicate: Duplicated request. Can happen with some Net API calls, such as trying to add the same server twice.
kErrorEof	&H1F	
kErrorEventBadConnection	&H1011	
kErrorEventBadPower	&H1008	
kErrorEventBadVersion	1	
kErrorEventBusy	2	
kErrorEventDispatch	4	
kErrorEventEnergyDump	&H100E	
kErrorEventEStop	&H1015	External Stop Condition
kErrorEventFailSafe	&H100C	
kErrorEventFailure	5	
kErrorEventFault	&H1014	Fault Condition
kErrorEventInvalidState	&H1010	
kErrorEventMotorStall	&H100F	
kErrorEventNetwork	3	
kErrorEventOk	&H1000	
kErrorEventOutOfRange	&H1007	
kErrorEventOutOfRangeHigh	&H1012	Out of Range High
kErrorEventOutOfRangeLow	&H1013	Out of Range Low
kErrorEventOverCurrent	&H1006	
kErrorEventOverrun	&H1002	
kErrorEventOverTemp	&H1005	
kErrorEventOverVoltage	&H100B	
kErrorEventPacketLost	&H1003	
kErrorEventSaturation	&H1009	
kErrorEventVoltageError	&H100D	
kErrorEventWrap	&H1004	
kErrorExist	&Ha	
kErrorFailSafe	&H3B	
kErrorFault	8	
kErrorFBig	&H11	
kErrorHallSensorError	&H40	Hall Sensor Error
kErrorHostUnreach	&H30	
kErrorInterrupted	4	Op Interrupted: The operation was interrupted; either from an error, or because the device was closed.
kErrorInvalid	&Hd	Invalid: Invalid or malformed command. This can be caused by sending a command to a device which is not supported in it's current configuration.
kErrorInvalidArg	&H15	Invalid Argument: One or more of the parameters passed to the function is not accepted by the channel in its current configuration. This may also be an indication that a NULL pointer was passed where a valid pointer is required.
kErrorInvalidPacket	&H35	
kErrorIO	5	

Hub Port Speed

Constant	Value	Description
kHubPortSpeedAuto	0	The value for auto speed.

Device IDs

Constant	Value	Description
kID1000	2	PhidgetServo 1-Motor (1000)
kID1001	3	PhidgetServo 4-Motor (1001)
kID1002	4	PhidgetAnalog 4-Output (1002)
kID1008	5	PhidgetAccelerometer 2-Axis (1008)
kID1010_1013_1018_1019	6	PhidgetInterfaceKit 8/8/8 (1010, 1013, 1018, 1019)
kID1011	7	PhidgetInterfaceKit 2/2/2 (1011)
kID1012	8	PhidgetInterfaceKit 0/16/16 (1012)
kID1014	9	PhidgetInterfaceKit 0/0/4 (1014)
kID1015	&ha	PhidgetLinearTouch (1015)
kID1016	&hb	PhidgetCircularTouch (1016)
kID1017	&hc	PhidgetInterfaceKit 0/0/8 (1017)
kID1023	&hd	PhidgetRFID (1023)
kID1024	&he	PhidgetRFID Read-Write (1024)
kID1030	&hf	PhidgetLED-64 (1030)
kID1031	&h10	PhidgetLED-64 Advanced (1031)
kID1032	&h11	PhidgetLED-64 Advanced (1032)
kID1040	&h12	PhidgetGPS (1040)
kID1041	&h13	PhidgetSpatial 0/0/3 Basic (1041)
kID1042	&h14	PhidgetSpatial 3/3/3 Basic (1042)
kID1043	&h15	PhidgetSpatial Precision 0/0/3 High Resolution (1043)
kID1044	&h16	PhidgetSpatial Precision 3/3/3 High Resolution (1044)
kID1045	&h17	PhidgetTemperatureSensor IR (1045)
kID1046	&h18	PhidgetBridge 4-Input (1046)
kID1047	&h19	PhidgetEncoder HighSpeed 4-Input (1047)
kID1048	&h1a	PhidgetTemperatureSensor 4-input (1048)
kID1049	&h1b	PhidgetSpatial 0/0/3 (1049)
kID1051	&h1c	PhidgetTemperatureSensor 1-Input (1051)
kID1052	&h1d	PhidgetEncoder Mechanical (1052)
kID1053	&h1e	PhidgetAccelerometer 2-Axis (1053)
kID1054	&h1f	PhidgetFrequencyCounter (1054)
kID1055	&h20	PhidgetIR (1055)
kID1056	&h21	PhidgetSpatial 3/3/3 (1056)
kID1057	&h22	PhidgetEncoder HighSpeed (1057)
kID1058	&h23	PhidgetPHSensor (1058)
kID1059	&h24	PhidgetAccelerometer 3-Axis (1059)
kID1060	&h25	PhidgetMotorControl LV (1060)
kID1061	&h26	PhidgetAdvancedServo 8-Motor (1061)
kID1062	&h27	PhidgetStepper Unipolar 4-Motor (1062)
kID1063	&h28	PhidgetStepper Bipolar 1-Motor (1063)
kID1064	&h29	PhidgetMotorControl HC (1064)
kID1065	&h2a	PhidgetMotorControl 1-Motor (1065)
kID1066	&h2b	PhidgetAdvancedServo 1-Motor (1066)
kID1067	&h2c	PhidgetStepper Bipolar HC (1067)
kID1202_1203	&h2d	PhidgetTextLCD 20x2 with PhidgetInterfaceKit 8/8/8 (1201, 1202, 1203)
kID1204	&h2e	PhidgetTextLCD Adapter (1204)
kID1215_1218	&h2f	PhidgetTextLCD 20x2 (1215/1216/1217/1218)
kID1219_1222	&h30	PhidgetTextLCD 20x2 with PhidgetInterfaceKit 0/8/8 (1219, 1220, 1221, 1222)
kIDADP0001	&h86	I2C Adapter Phidget
kIDADP0002	&ha0	SPI Adapter Phidget
kIDADP1000	&h31	pH Adapter
kIDADP1001	&h84	RS232 Adapter
kIDADPRS485_422	&h85	RS485/422 Prototype
kIDADPSerial	&h86	Serial Prototype
kIDCURLOOP	&h7a	4-20mA Output
kIDDAQ1000	&h33	Analog Input Module x8

Mesh Modes

Constant	Value	Description
kMeshModeRouter	1	Router mode
kMeshModeSleepyEndDevice	2	Sleepy end device mode

Timeouts

Constant	Value	Description
kTimeoutDefault	300000000	Pass to OpenWaitForAttachment() for the default timeout.
kTimeoutInfinite	0	Pass to OpenWaitForAttachment() for an infinite timeout.

145.34 class PhidgetMissingFunctionExceptionMBS

145.34.1 class PhidgetMissingFunctionExceptionMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The exception to report a missing function.
Notes: This exception type is raised when a library function should be called, but is not available.
Subclass of the RuntimeException class.
Blog Entries

- MonkeyBread Software Releases the MBS REALbasic plug-ins 9.2

145.35 class PhidgetMotorPositionControllerMBS

145.35.1 class PhidgetMotorPositionControllerMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Motor Position Controller class controlls the position, velocity and acceleration of the attached motor.
Example:

```
// move a motor to position 1000
Var p As New PhidgetMotorPositionControllerMBS

// wait up to 5 seconds for the device
p.openWaitForAttachment(5000)

p.TargetPosition = 1000
p.Engaged = True
Thread.SleepCurrent(3000) // give it time to move

p.close
```

Notes: It also contains various other control and monitoring functions that aid in the control of the motor.

For specifics on how to use this class, we recommend watching our video on the Phidget Motor Position Controller class.
Subclass of the PhidgetMBS class.
Blog Entries

- News from the MBS Xojo Plugins Version 25.0
- MBS Xojo Plugins, version 25.0pr8
- Rewritten Phidgets Plugin

145.35.2 Methods

145.35.3 addPositionOffset(positionOffset as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds an offset (positive or negative) to the current position.
Notes: Useful for zeroing position.

145.35.4 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.35.5 enableFailsafe(failsafeTime as UInt32)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables the failsafe feature for the channel, with a given failsafe time.
Notes: The failsafe feature is intended for use in applications where it is important for the channel to enter a known safe state if the program controlling it locks up or crashes. If you do not enable the failsafe feature, the channel will carry out whatever instructions it was last given until it is explicitly told to stop.

Enabling the failsafe feature starts a recurring failsafe timer for the channel. Once the failsafe timer is enabled, it must be reset within the specified time or the channel will enter a failsafe state. The failsafe timer may be reset either by calling this function again, or using the ResetFailsafe function. Resetting the failsafe timer will reload the timer with the specified failsafe time, starting when the message to reset the timer is received by the Phidget.

For example: if the failsafe is enabled with a failsafe time of 1000ms, you will have 1000ms to reset the failsafe timer. Every time the failsafe timer is reset, you will have 1000ms from that time to reset the failsafe again.

If the failsafe timer is not reset before it runs out, the channel will enter a failsafe state. For Motor Position Controller channels, this will disengage the controller. Once the channel enters the failsafe state, it will reject any further input until the channel is reopened.

To prevent the channel from falsely entering the failsafe state, we recommend resetting the failsafe timer as frequently as is practical for your applicaiton. A good rule of thumb is to not let more than a third of the failsafe time pass before resetting the timer.

Once the failsafe timer has been set, it cannot be disabled by any means other than closing and reopening the channel.

145.35.6 resetFailsafe

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Resets the failsafe timer, if one has been set. See EnableFailsafe for details.
Notes: This function will fail if no failsafe timer has been set for the channel.

145.35.7 setTargetVelocityAsync(targetVelocity as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets target velocity asynchronously.
Notes: Calls setTargetVelocityAsyncCompleted later.

145.35.8 Properties

145.35.9 Acceleration as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The rate at which the controller can change the motor's velocity.
Notes: Units for Position, VelocityLimit, Acceleration, and DeadBand can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
(Read and Write property)

145.35.10 ActiveCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The current limit that the controller is actively following.
Notes: The SurgeCurrentLimit, CurrentLimit, and temperature will impact this value.
(Read only property)

145.35.11 CurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Motor current limit
Notes: The controller will limit the current through the motor to this value.

Unit: amperes (A)
(Read and Write property)

145.35.12 CurrentRegulatorGain as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Current Regulator Gain.
Notes: Depending on power supply voltage and motor coil inductance, current through the motor can change relatively slowly or extremely rapidly. A physically larger DC Motor will typically have a lower inductance, requiring a higher current regulator gain. A higher power supply voltage will result in motor current changing more rapidly, requiring a higher current regulator gain. If the current regulator gain is too small, spikes in current will occur, causing large variations in torque, and possibly damaging the motor controller. If the current regulator gain is too high, the current will jitter, causing the motor to sound 'rough', especially when changing directions. Each DC Motor we sell specifies a suitable current regulator gain.
(Read and Write property)

145.35.13 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the controller will fire another CurrentChange event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
The timing between CurrentChange events can also affected by the CurrentChangeTrigger.

Unit: milliseconds (ms)
(Read and Write property)

145.35.14 DeadBand as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Depending on your system, it may not be possible to bring the position error (TargetPosition - Position) to zero.

Notes: A small error can lead to the motor continually 'hunting' for a target position, which can cause unwanted effects. By setting a non-zero DeadBand, the position controller will relax control of the motor within the deadband, preventing the 'hunting' behavior.
Units for Position, VelocityLimit, Acceleration, and DeadBand can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
(Read and Write property)

145.35.15 DutyCycle as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent duty cycle value that the controller has reported.
Notes: This value will be between -1 and 1 where a sign change (¬±) is indicitave of a direction change.
Note that DutyCycle is merely an indication of the average voltage across the motor. At a constant load, an increase in DutyCycle indicates an increase in motor speed.
The units of DutyCycle refer to 'duty cycle'. This is because the controller must rapidly switch the power on/off (i.e. change the duty cycle) in order to manipulate the voltage across the motor.

Unit: duty cycle (duty cycle)
(Read only property)

145.35.16 EnableExpectedPosition as Boolean

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When enabled, the ExpectedPosition will be sent back from the controller.
Notes: (Read and Write property)

145.35.17 Engaged as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When engaged, a motor has the ability to be positioned. When disengaged, no commands are sent to the motor.
Notes: This function is useful for completely relaxing a motor once it has reached the target position.
(Read and Write property)

145.35.18 ExpectedPosition as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The ExpectedPosition represents the current position the controller is tracking along the trapezoidal motion curve.
Notes: This controller uses trapezoidal motion profiling combined with a PID loop to accurately track position. The ExpectedPosition represents the current position the controller is tracking along the trapezoidal motion curve. The error of your PID loop is calculated by taking the difference of Position and ExpectedPosition. You can use this value to verify your controller is working as expected.

- Set EnableExpectedPosition to TRUE to enable the change event for this property.
- Use the RescaleFactor to convert the units of this property to more intuitive units, such as rotations or degrees.

(Read only property)

145.35.19 FailsafeBrakingEnabled as Boolean

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This setting allows you to choose whether motor will forcibly stop once it enters a FAILSAFE state.
Notes:

- A setting of FALSE will simply stop applying power to the motor, allowing it to spin down naturally.
- A setting of TRUE will apply braking up to the FailsafeCurrentLimit, actively stopping the motor

(Read and Write property)

145.35.20 FailsafeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When the controller enters a FAILSAFE state, the controller will limit the current through the motor to the FailsafeCurrentLimit value.
Notes: (Read and Write property)

145.35.21 FanMode as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The FanMode dictates the operating condition of the fan.
Notes: Choose between on, off, or automatic (based on temperature).
If the FanMode is set to automatic, the fan will turn on when the temperature reaches 70¬∞C and it will remain on until the temperature falls below 55¬∞C.
If the FanMode is off, the controller will still turn on the fan if the temperature reaches 85¬∞C and it will remain on until it falls below 70¬∞C.
(Read and Write property)

145.35.22 Inductance as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The controller will attempt to measure the inductance of your motor when opened.
Notes: This value is used to improve control of the motor.

Set this value during the Attach event to skip motor characterization (including the audible beeps). You can use a previously saved Inductance value, or information from your motor's datasheet.
(Read and Write property)

145.35.23 IOMode as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The encoder interface mode. Match the mode to the type of encoder you have attached.
Notes: It is recommended to only change this when the encoder disabled in order to avoid unexpected results.
(Read and Write property)

145.35.24 Kd as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Derivative gain constant.
Notes: A higher Kd will help reduce oscillations.

(Read and Write property)

145.35.25 Ki as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Integral gain constant.
Notes: The integral term will help eliminate steady-state error.
(Read and Write property)

145.35.26 Kp as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Proportional gain constant.
Notes: A small Kp value will result in a less responsive controller, however, if Kp is too high, the system can become unstable.
(Read and Write property)

145.35.27 MaxAcceleration as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that Acceleration can be set to.
Notes: Units for Position, VelocityLimit, Acceleration, and DeadBand can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
(Read only property)

145.35.28 MaxCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum current limit that can be set for the device.
Notes: Unit: amperes (A)
(Read only property)

145.35.29 MaxCurrentRegulatorGain as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum current regulator gain for the device.
Notes: (Read only property)

145.35.30 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.35.31 MaxFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: (Read only property)

145.35.32 MaxInductance as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that Inductance can be set to.
Notes: See Inductance for details.
(Read only property)

145.35.33 MaxPosition as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that TargetPosition can be set to.
Notes: Units for Position, VelocityLimit, Acceleration, and DeadBand can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.

(Read only property)

145.35.34 MaxStallVelocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The upper bound of StallVelocity.
Notes: (Read only property)

145.35.35 MaxSurgeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that SurgeCurrentLimit can be set to.
Notes: (Read only property)

145.35.36 MaxVelocityLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that VelocityLimit can be set to.
Notes: Units for Position, VelocityLimit, Acceleration, and DeadBand can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
(Read only property)

145.35.37 MinAcceleration as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that Acceleration can be set to.
Notes: Units for Position, VelocityLimit, Acceleration, and DeadBand can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
(Read only property)

145.35.38 MinCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum current limit that can be set for the device.
Notes: Unit: amperes (A)
(Read only property)

145.35.39 MinCurrentRegulatorGain as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum current regulator gain for the device.
Notes: (Read only property)

145.35.40 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.35.41 MinFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: (Read only property)

145.35.42 MinInductance as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that Inductance can be set to.
Notes: See Inductance for details.

(Read only property)

145.35.43 MinPosition as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that TargetPosition can be set to.
Notes: Units for Position, VelocityLimit, Acceleration, and DeadBand can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
(Read only property)

145.35.44 MinStallVelocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The lower bound of StallVelocity.
Notes: (Read only property)

145.35.45 MinSurgeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that SurgeCurrentLimit can be set to.
Notes: (Read only property)

145.35.46 MinVelocityLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that VelocityLimit can be set to.
Notes: Units for Position, VelocityLimit, Acceleration, and DeadBand can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
(Read only property)

145.35.47 NormalizePID as Boolean

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Set this parameter to true to adjust PID math to standardized units.
Notes: (Read and Write property)

145.35.48 Position as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent position value that the controller has reported.
Notes: This value will always be between MinPosition and MaxPosition.
Units for Position, VelocityLimit, Acceleration, and DeadBand can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
(Read only property)

145.35.49 PositionType as Integer

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Determines whether the controller uses the hall effect sensors or an encoder for position information.
Notes: This setting is locked in once the channel is Engaged and cannot be changed until the channel is reset.
(Read and Write property)

145.35.50 RescaleFactor as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Change the units of your parameters so that your application is more intuitive.
Notes: Units for Position, VelocityLimit, Acceleration, and DeadBand can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
(Read and Write property)

145.35.51 StallVelocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Before reading this description, it is important to note the difference between the units of StallVelocity and Velocity.
Notes: Velocity is a number between -1 and 1 with units of 'duty cycle'. It simply represents the average voltage across the motor.
StallVelocity represents a real velocity (e.g. m/s, RPM, etc.) and the units are determined by the RescaleFactor. With a RescaleFactor of 1, the default units would be in commutations per second.

If the load on your motor is large, your motor may begin rotating more slowly, or even fully stall. Depending on the voltage across your motor, this may result in a large amount of current through both the controller and the motor. In order to prevent damage in these situations, you can use the StallVelocity property.

The StallVelocity should be set to the lowest velocity you would expect from your motor. The controller will then monitor the motor's velocity, as well as the Velocity, and prevent a 'dangerous stall' from occuring. If the controller detects a dangerous stall, it will immediately disengage the motor (i.e. Engaged will be set to false) and an error will be reported to your program.

A 'dangerous stall' will occur faster when the Velocity is higher (i.e. when the average voltage across the motor is higher)
A 'dangerous stall' will occur faster as (StallVelocity - motor velocity) becomes larger.

Setting StallVelocity to 0 will turn off stall protection functionality.
(Read and Write property)

145.35.52 SurgeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The SurgeCurrentLimit allows for increased performance from your motor.
Notes: The controller will limit the current through your motor to the SurgeCurrentLimit briefly, then scale current down to the CurrentLimit.
View ActiveCurrentLimit for information about what current limit the controller is actively following.
(Read and Write property)

145.35.53 TargetPosition as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: If the controller is configured and the TargetPosition is set, the motor will try to reach the TargetPostiion.
Notes: If the DeadBand is non-zero, the final position of the motor may not match the TargetPosition
Units for Position, VelocityLimit, Acceleration, and DeadBand can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
(Read and Write property)

145.35.54 VelocityLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When moving, the motor velocity will be limited by this value.
Notes: VelocityLimit is bounded by MinVelocityLimit and MaxVelocityLimit.
Units for Position, VelocityLimit, Acceleration, and DeadBand can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
(Read and Write property)

145.35.55 Events

145.35.56 DutyCycleUpdated(dutyCycle as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent duty cycle value will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: This event will always occur when the DataInterval elapses. You can depend on this event for constant timing when implementing control loops in code. This is the last event to fire, giving you up-to-date access to all properties.

145.35.57 ExpectedPositionChanged(expectedPosition as double)

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The expected position changed.
Notes: The most recent position being tracked by the Position Control loop, which occurs when the DataIn-

terval has elapsed.

- Regardless of the DataInterval, this event will occur only when the expected position value has changed from the previous value reported.
- Use the RescaleFactor to convert the units of this property to more intuitive units, such as rotations or degrees.

145.35.58 PositionChanged(position as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent position value will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: Regardless of the DataInterval, this event will occur only when the position value has changed from the previous value reported.
Units for Position can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.

position: The position value

145.35.59 setTargetVelocityAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Called by setTargetVelocityAsync when completed.

145.35.60 Constants

Encoder interface mode

Constant	Value	Description
kEncoderIOModeCollector10K	5	Open Collector 10K, 10kŒ© pull-up resistors will be applied to the input lines.
kEncoderIOModeCollector2K2	4	Open Collector 2.2K, 2.2kŒ© pull-up resistors will be applied to the input lines.
kEncoderIOModeLineDriver10K	3	Line Driver 10K, 10kŒ© pull-down resistors will be applied to the input lines.
kEncoderIOModeLineDriver2K2	2	Line Driver 2.2K, 2.2kŒ© pull-down resistors will be applied to the input lines.
kEncoderIOModePushPull	1	Push-Pull, No additional pull-up or pull-down resistors will be applied to the input lines.

Fan Modes

Constant	Value	Description
kFanModeAuto	3	The fan will be automatically controlled based on temperature.
kFanModeOff	1	Turns the fan off.
kFanModeOn	2	Turns the fan on.

Position Types

Constant	Value	Description
kPositionTypeEncoder	1	Encoder.
kPositionTypeHallSensor	2	Hall sensor.

145.36 class PhidgetMotorVelocityControllerMBS

145.36.1 class PhidgetMotorVelocityControllerMBS

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Motor Velocity Controller class controls the velocity and acceleration of the attached motor.
Example:

```
// run a motor with a target velocity for two seconds
Var p As New PhidgetMotorVelocityControllerMBS

// wait up to 5 seconds for the device
p.openWaitForAttachment(5000)

p.TargetVelocity = 100
p.Engaged = True
Thread.SleepCurrent(2000)
p.Engaged = False

p.close
```

Notes: It also contains various other control and monitoring functions that aid in the control of the motor. Subclass of the PhidgetMBS class.

145.36.2 Methods

145.36.3 Constructor

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates an instance of a Phidget channel.
Notes: Once created the channel may need to be configured to match the physical device and channel index you want to attach to, and then be opened by calling Open().

145.36.4 enableFailsafe(failsafeTime as UInt32)

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables the failsafe feature for the channel, with the specified failsafe time.
Notes: Enabling the failsafe feature starts a recurring failsafe timer for the channel. Once the failsafe is enabled, the timer must be reset within the specified time or the channel will enter a failsafe state. For Motor Velocity Controller channels, this will disengage the motor. The failsafe timer can be reset by using any API call except for the following:

- PhidgetMotorVelocityController_setRescaleFactor()
- 'get' API calls

145.36.5 resetFailsafe

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Resets the failsafe timer, if one has been set. See PhidgetMotorVelocityController_enableFailsafe() for details.
Notes: This function will fail if no failsafe timer has been set for the channel.

145.36.6 Properties

145.36.7 Acceleration as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The rate at which the controller can change the motor's velocity.
Notes: Use the RescaleFactor to convert the units of this property to more intuitive units, such as rotations or degrees.
(Read and Write property)

145.36.8 ActiveCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The current limit that the controller is actively following.
Notes: The SurgeCurrentLimit, CurrentLimit, and temperature will impact this value.

(Read only property)

145.36.9 CurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The controller will limit the current through the motor to the CurrentLimit value.
Notes: View ActiveCurrentLimit for information about what current limit the controller is actively following.
(Read and Write property)

145.36.10 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another VelocityChange / DutyCycleUpdate event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
(Read and Write property)

145.36.11 DeadBand as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This parameter specifies a minimum Velocity below which your system will relax if the TargetVelocity is set to 0, to prevent unwanted jitter.
Notes: Use the RescaleFactor to convert the units of this property to more intuitive units, such as rotations or degrees.
(Read and Write property)

145.36.12 DutyCycle as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent DutyCycle value that the controller has reported.
Notes: This value will be between -1 and 1 where a sign change (¬±) is indicitave of a direction change.

DutyCycle is an indication of the average voltage across the motor. At a constant load, an increase in DutyCycle indicates an increase in motor speed.
(Read only property)

145.36.13 EnableExpectedVelocity as Boolean

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When enabled, the ExpectedVelocity will be sent back from the controller.
Notes: (Read and Write property)

145.36.14 Engaged as Boolean

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When engaged, the controller has the ability to be controlled.
Notes: When disengaged, the controller will stop powering to your motor, it will instead be in a freewheel state.
(Read and Write property)

145.36.15 ExpectedVelocity as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This controller uses trapezoidal motion profiling combined with a PID loop to accurately track velocity.
Notes: The ExpectedVelocity represents the current velocity the controller is tracking along the trapezoidal motion curve. The error of your PID loop is calculated by taking the difference of Velocity and ExpectedVelocity. You can use this value to verify your controller is working as expected.

- Set EnableExpectedVelocity to TRUE to enable the change event for this property.
- Use the RescaleFactor to convert the units of this property to more intuitive units, such as rotations or degrees.

(Read only property)

145.36.16 FailsafeBrakingEnabled as Boolean

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This setting allows you to choose whether motor will forcibly stop once it enters a FAILSAFE state.
Notes:

- A setting of FALSE will simply stop applying power to the motor, allowing it to spin down naturally.
- A setting of TRUE will apply braking up to the FailsafeCurrentLimit, actively stopping the motor

(Read and Write property)

145.36.17 FailsafeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When the controller enters a FAILSAFE state, the controller will limit the current through the motor to the FailsafeCurrentLimit value.
Notes: (Read and Write property)

145.36.18 Inductance as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Inductance value.
Notes: The controller will attempt to measure the inductance of your motor when opened. This value is used to improve control of the motor.

Set this value during the Attach event to skip motor characterization (including the audible beeps). You can use a previously saved Inductance value, or information from your motor's datasheet.
(Read and Write property)

145.36.19 Kd as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Derivative gain constant.
Notes: A higher Kd will help reduce oscillations.
(Read and Write property)

145.36.20 Ki as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Integral gain constant.
Notes: The integral term will help eliminate steady-state error.
(Read and Write property)

145.36.21 Kp as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Proportional gain constant.
Notes: A small Kp value will result in a less responsive controller, however, if Kp is too high, the system can become unstable.
(Read and Write property)

145.36.22 MaxAcceleration as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that Acceleration can be set to.
Notes: Use the RescaleFactor to convert the units of this property to more intuitive units, such as rotations or degrees.
(Read only property)

145.36.23 MaxCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum current limit that can be set for the device.
Notes: (Read only property)

145.36.24 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: (Read only property)

145.36.25 MaxFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that failsafeTime can be set to when calling enableFailsafe().
Notes: (Read only property)

145.36.26 MaxInductance as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that Inductance can be set to.
Notes: See Inductance for details.
(Read only property)

145.36.27 MaxStallVelocity as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The upper bound of StallVelocity.
Notes: (Read only property)

145.36.28 MaxSurgeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that SurgeCurrentLimit can be set to.
Notes: (Read only property)

145.36.29 MaxTargetVelocity as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that TargetVelocity can be set to.
Notes: Use the RescaleFactor to convert the units of this property to more intuitive units, such as rotations or degrees.
(Read only property)

145.36.30 MinAcceleration as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that Acceleration can be set to.
Notes: Use the RescaleFactor to convert the units of this property to more intuitive units, such as rotations or degrees.
(Read only property)

145.36.31 MinCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum current limit that can be set for the device.
Notes: (Read only property)

145.36.32 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: (Read only property)

145.36.33 MinFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that failsafeTime can be set to when calling enableFailsafe().
Notes: (Read only property)

145.36.34 MinInductance as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that Inductance can be set to.
Notes: See Inductance for details.
(Read only property)

145.36.35 MinStallVelocity as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The lower bound of StallVelocity.
Notes: (Read only property)

145.36.36 MinSurgeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that SurgeCurrentLimit can be set to.
Notes: (Read only property)

145.36.37 MinTargetVelocity as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that TargetVelocity can be set to.
Notes: Use the RescaleFactor to convert the units of this property to more intuitive units, such as rotations or degrees.
(Read only property)

145.36.38 PositionType as Integer

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Determines whether the controller uses the hall effect sensors or an encoder for velocity information.
Notes: This setting is locked in once the channel is Engaged and cannot be changed until the channel is reset.
(Read and Write property)

145.36.39 RescaleFactor as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Change the units of your parameters so that your application is more intuitive.
Notes: Units for Acceleration, DeadBand, ExpectedVelocity, TargetVelocity, and Velocity can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
(Read and Write property)

145.36.40 StallVelocity as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The lowest velocity you would expect from your motor.
Notes: Before reading this description, it is important to note the difference between the units of StallVelocity and DutyCycle.

- DutyCycle is a number between -1 and 1 with units of 'duty cycle'. It simply represents the average voltage across the motor.
- StallVelocity represents a real velocity (e.g. m/s, RPM, etc.) and the units are determined by the RescaleFactor. With a RescaleFactor of 1, the default units would be in commutations per second.

If the load on your motor is large, your motor may begin rotating more slowly, or even fully stall. Depending on the voltage across your motor, this may result in a large amount of current through both the controller and the motor. In order to prevent damage in these situations, you can use the StallVelocity property.

The StallVelocity should be set to the lowest velocity you would expect from your motor. The controller will then monitor the motor's velocity, as well as the DutyCycle, and prevent a 'dangerous stall' from occuring.

If the controller detects a dangerous stall, it will immediately disengage the motor (i.e. Engaged will be set to false) and an error will be reported to your program.

- A 'dangerous stall' will occur faster when the DutyCycle is higher (i.e. when the average voltage across the motor is higher)
- A 'dangerous stall' will occur faster as (StallVelocity - motor velocity) becomes larger .

Setting StallVelocity to 0 will turn off stall protection functionality.
(Read and Write property)

145.36.41 SurgeCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The SurgeCurrentLimit allows for increased performance from your motor. The controller will limit the current through your motor to the SurgeCurrentLimit briefly, then scale current down to the CurrentLimit.
Notes: View ActiveCurrentLimit for information about what current limit the controller is actively following.
(Read and Write property)

145.36.42 TargetVelocity as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When moving, the motor velocity will be limited by this value.
Notes: Use the RescaleFactor to convert the units of this property to more intuitive units, such as rotations or degrees.
(Read and Write property)

145.36.43 Velocity as Double

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent velocity value that the controller has reported.
Notes: Use the RescaleFactor to convert the units of this property to more intuitive units, such as rotations or degrees.
(Read only property)

145.36.44 Events

145.36.45 DutyCycleUpdated(dutyCycle as double)

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent duty cycle value will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: This event will always occur when the DataInterval elapses. You can depend on this event for constant timing when implementing control loops in code. This is the last event to fire, giving you up-to-date access to all properties.

145.36.46 ExpectedVelocityChanged(expectedVelocity as double)

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent velocity being tracked by the Velocity Control loop, which occurs when the DataInterval has elapsed.
Notes: Regardless of the DataInterval, this event will occur only when the velocity value has changed from the previous value reported.
Use the RescaleFactor to convert the units of this property to more intuitive units, such as rotations or degrees.

145.36.47 VelocityChanged(velocity as double)

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent velocity value will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: Use the RescaleFactor to convert the units of this property to more intuitive units, such as rotations or degrees.

145.36.48 Constants

Encoder interface mode

Constant	Value	Description
kEncoderIOModeCollector10K	5	Open Collector 10K, 10kŒ© pull-up resistors will be applied to the input lines.
kEncoderIOModeCollector2K2	4	Open Collector 2.2K, 2.2kŒ© pull-up resistors will be applied to the input lines.
kEncoderIOModeLineDriver10K	3	Line Driver 10K, 10kŒ© pull-down resistors will be applied to the input lines.
kEncoderIOModeLineDriver2K2	2	Line Driver 2.2K, 2.2kŒ© pull-down resistors will be applied to the input lines.
kEncoderIOModePushPull	1	Push-Pull, No additional pull-up or pull-down resistors will be applied to the input lines.

Fan Modes

Constant	Value	Description
kFanModeAuto	3	The fan will be automatically controlled based on temperature.
kFanModeOff	1	Turns the fan off.
kFanModeOn	2	Turns the fan on.

Position Types

Constant	Value	Description
kPositionTypeEncoder	1	Encoder.
kPositionTypeHallSensor	2	Hall sensor.

145.37 class PhidgetNetMBS

145.37.1 class PhidgetNetMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The class for managing servers.
Example:

```
// find Phidget network servers in the local network
// MyPhidgetNet is a subclass of PhidgetNetMBS with the ServerAdded event implemented.
// Net is a property of the window: Net As MyPhidgetNet
Net = New MyPhidgetNet
PhidgetNetMBS.enableServerDiscovery(PhidgetNetMBS.kServerTypeDeviceRemote)

// or add a known server directly:
// PhidgetNetMBS.addServer("lab", "192.168.1.50", 5661, "", 0)

// in MyPhidgetNet:
Sub ServerAdded(server As PhidgetServerMBS) Handles ServerAdded
System.DebugLog "Found server " + server.Name + " at " + server.Address + ":" + server.Port.ToString
End Sub
```

Notes: The Phidget NET class controls all network functionality of a Phidget program, and allows for the use of remote Phidgets in your program. It can be used to enable automated Phidget server discovery over the local network, and to connect to or reject specific servers.

For basic use of the Net class, the only functions you need to worry about are EnableServerDiscovery and AddServer. In most cases, you can use EnableServerDiscovery with server type kServerTypeDeviceRemote to automatically connect to Phidget servers on your local network. You can use AddServer to connect to servers that aren't discoverable on your local network.

To connect to a password-protected discoverable server on your local network, you can use SetServerPassword to specify the password to connect to that server.

If for some reason you need to prevent your program from discovering a non-password-protected server on your local network, you can call DisableServer directly after calling EnableServerDiscovery.

You must enable server discovery or add at least one server before setting other properties of this class, such as disabling servers, or setting server passwords. Similarly, server discovery must remain enabled, or at least one server must remain added, to maintain memory of those preferences.

145.37.2 Methods

145.37.3 addServer(serverName as String, address as String, port as Integer, password as String, Flags as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Registers a server that the client (your program) will try to connect to.
Notes: The client will continually try to connect to the server, increasing the time between each attempt to a maximum interval of 16 seconds.

This call is intended for use when server discovery is not enabled, or to connect to a server that is not discoverable.

The server name used by this function does not have to match the name of the server running on the host machine. Only the address, port, and password need to match.

This call will fail if a server with the same name has already been discovered.

This call will fail if SetServerPassword() has already been called with the same server name, as SetServerPassword() registers the server entry anticipating the discovery of the server.

145.37.4 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.37.5 Destructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The destructor.

145.37.6 disableServer(serverName as String, flags as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Prevents attempts to automatically connect to a server.
Notes: By default the client (your program) will continually attempt to connect to added or discovered servers.This call will disable those attempts, but will not close an already established connection.

145.37.7 disableServerDiscovery(serverType as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Disables the dynamic discovery of servers that publish their identity.
Example:

```
PhidgetNetMBS.disableServerDiscovery PhidgetNetMBS.kServerTypeDeviceRemote
```

Notes: DisableServerDiscovery() does not disconnect already established connections.

145.37.8 enableServer(serverName as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables attempts to connect to a discovered server, if attempts were previously disabled by DisableServer().
Notes: All servers are enabled by default.

This call will fail if the server was not previously added, disabled or discovered.

145.37.9 enableServerDiscovery(serverType as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables the dynamic discovery of servers that publish their identity to the network.
Example:

```
// start looking for remote devices
PhidgetNetMBS.enableServerDiscovery PhidgetNetMBS.kServerTypeDeviceRemote
```

Notes: Currently Multicast DNS is used to discover and publish Phidget servers.
To connect to remote Phidgets, call this function with server type kServerTypeDeviceRemote.

EnableServerDiscovery must be called once for each server type your program requires. Multiple calls for the same server type are ignored

This call will fail with the error code EPHIDGET_UNSUPPORTED if your computer does not have the required mDNS support. We recommend using Bonjour Print Services on Windows and Mac, or Avahi on Linux.

145.37.10 removeAllServers

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Removes all servers.
Example:

PhidgetNetMBS.removeAllServers

145.37.11 removeServer(serverName as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Removes a registration for a server that the client (your program) is trying to connect to.
Notes: If the client is currently connected to the server, the connection will be closed.

If the server was discovered (not added by AddServer()), the connection may be reestablished if and when the server is rediscovered. DisableServer() should be used to prevent the reconnection of a discovered server

145.37.12 setServerPassword(serverName as String, password as String)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the password that will be used to attempt to connect to the server.
Notes: If the server has not already been added or discovered, a placeholder server entry will be registered to use this password on the server once it is discovered.

serverName: The name of the server

password: The password to use for the server (empty string if no password)

145.37.13 Events

145.37.14 ServerAdded(server as PhidgetServerMBS)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Subscribe to this event if you would like to know when a server has been added.

145.37.15 ServerRemoved(server as PhidgetServerMBS)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Subscribe to this event if you would like to know when a server has been removed.

145.37.16 Constants

Server Types

Constant	Value	Description
kServerTypeDevice	2	Device
kServerTypeDeviceListener	1	Device Listener
kServerTypeDeviceRemote	3	Phidget22 Server Server discovery with this server type allows discovery of servers hosting Phidget devices. Enabling server discovery with this server type allows automated connection to these servers, and the Phidgets connected to them. Enabling server discovery with this server type will also enable ServerAdded and ServerRemoved events for this server type.
kServerTypeNone	0	
kServerTypeSBC	7	Phidget SBC Server discovery with this server type detects the presence of Phidget SBCs on the network. Enabling server discovery with this server type will enable ServerAdded and ServerRemoved events for this server type.
kServerTypeWww	5	WWW
kServerTypeWwwListener	4	WWW Listener
kServerTypeWwwRemote	6	Phidget22 Web server Server discovery with this server type detects the presence of Phidget web servers used to communicate with in-browser JavaScript. Enabling server discovery with this server type will enable ServerAdded and ServerRemoved events for this server type.

145.38 class PhidgetNotInitialzedExceptionMBS

145.38.1 class PhidgetNotInitialzedExceptionMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The exception to report an access of a not initialized object.
Notes: We raise this exception if handle is zero, so the object was not properly initialized.
Subclass of the RuntimeException class.
Blog Entries

- MonkeyBread Software Releases the MBS REALbasic plug-ins 9.2

145.39 class PhidgetPHSensorMBS

145.39.1 class PhidgetPHSensorMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The PH Sensor class gathers data from a pH sensor type Phidget board.
Example:

```
// read values from a phsensor Phidget
// MyPHSensor is a subclass of PhidgetPHSensorMBS with the events implemented.
// PHSensor is a property of the window: PHSensor As MyPHSensor

PHSensor = New MyPHSensor
PHSensor.open

// in MyPHSensor:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub PHChanged(PH As Double) Handles PHChanged
System.DebugLog "PH: " + PH.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: If you're using a simple 0-5V sensor that does not have its own firmware, use the VoltageInput or VoltageRatioInput class instead, as specified for your device.
Subclass of the PhidgetMBS class.

- Rewritten Phidgets Plugin

145.39.2 Methods

145.39.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.39.4 Properties

145.39.5 CorrectionTemperature as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Set this property to the measured temperature of the solution to correct the slope of the pH conversion for temperature.
Notes: Unit: degrees celsius (¬∞C)
(Read and Write property)

145.39.6 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another PHChange event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
The timing between PHChange events can also affected by the PHChangeTrigger.

Unit: milliseconds (ms)
(Read and Write property)

145.39.7 MaxCorrectionTemperature as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that CorrectionTemperature can be set to.
Notes: Unit: degrees celsius (¬∞C)
(Read only property)

145.39.8 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)

(Read only property)

145.39.9 MaxPH as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value the PHChange event will report.
Notes: (Read only property)

145.39.10 MaxPHChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that PHChangeTrigger can be set to.
Notes: Unit: pH (pH)
(Read only property)

145.39.11 MinCorrectionTemperature as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that CorrectionTemperature can be set to.
Notes: Unit: degrees celsius (¬∞C)
(Read only property)

145.39.12 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.39.13 MinPH as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value the PHChange event will report.
Notes: (Read only property)

145.39.14 MinPHChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that PHChangeTrigger can be set to.
Notes: Unit: pH (pH)
(Read only property)

145.39.15 PH as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent pH value that the channel has reported.
Notes: This value will always be between MinPH and MaxPH.
(Read only property)

145.39.16 PHChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a PHChange event until the pH value has changed by the amount specified by the PHChangeTrigger.
Notes: Setting the PHChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering
Unit: pH (pH)
(Read and Write property)

145.39.17 Events

145.39.18 PHChanged(PH as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent pH value the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a PHChangeTrigger has been set to a non-zero value, the PHChange event will not occur until the pH has changed by at least the PHChangeTrigger value.

PH: The current pH.

145.40 class PhidgetPowerGuardMBS

145.40.1 class PhidgetPowerGuardMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Power Guard class controls the safety features and thresholds of a programmable power guard Phidget board.
Example:

```
// turn on the output of a Power Guard with over-voltage protection and failsafe
Var guard As New PhidgetPowerGuardMBS
guard.openWaitForAttachment(5000)

guard.OverVoltage = 13.0 // volts
guard.enableFailsafe(1000) // turn off if the app doesn't call resetFailsafe within 1 second
guard.PowerEnabled = True

// call guard.resetFailsafe regularly, e.g. in a timer every 500 ms
```

Notes: Subclass of the PhidgetMBS class.

- Rewritten Phidgets Plugin

145.40.2 Methods

145.40.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.40.4 enableFailsafe(failsafeTime as UInt32)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables the failsafe feature for the channel, with a given failsafe time.
Notes: The failsafe feature is intended for use in applications where it is important for the channel to enter a known safe state if the program controlling it locks up or crashes. If you do not enable the failsafe feature, the channel will carry out whatever instructions it was last given until it is explicitly told to stop.

Enabling the failsafe feature starts a recurring failsafe timer for the channel. Once the failsafe timer is enabled, it must be reset within the specified time or the channel will enter a failsafe state. The failsafe timer may be reset either by calling this function again, or using the ResetFailsafe function. Resetting the failsafe timer will reload the timer with the specified failsafe time, starting when the message to reset the timer is received by the Phidget.

For example: if the failsafe is enabled with a failsafe time of 1000ms, you will have 1000ms to reset the failsafe timer. Every time the failsafe timer is reset, you will have 1000ms from that time to reset the failsafe again.

If the failsafe timer is not reset before it runs out, the channel will enter a failsafe state. For PowerGuard channels, this will disable the output. Once the channel enters the failsafe state, it will reject any further input until the channel is reopened.

To prevent the channel from falsely entering the failsafe state, we recommend resetting the failsafe timer as frequently as is practical for your applicaiton. A good rule of thumb is to not let more than a third of the failsafe time pass before resetting the timer.

Once the failsafe timer has been set, it cannot be disabled by any means other than closing and reopening the channel.

145.40.5 resetFailsafe

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Resets the failsafe timer, if one has been set. See EnableFailsafe for details.
Notes: This function will fail if no failsafe timer has been set for the channel.

145.40.6 Properties

145.40.7 FanMode as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The FanMode dictates the operating condition of the fan.
Notes: Choose between on, off, or automatic (based on temperature).
If the FanMode is set to automatic, the fan will turn on when the temperature reaches 70¬∞C and it will remain on until the temperature falls below 55¬∞C.
If the FanMode is off, the device will still turn on the fan if the temperature reaches 85¬∞C and it will remain on until it falls below 70¬∞C.

(Read and Write property)

145.40.8 MaxFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: (Read only property)

145.40.9 MaxOverVoltage as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that OverVoltage can be set to.
Notes: Unit: volts (V)
(Read only property)

145.40.10 MinFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: (Read only property)

145.40.11 MinOverVoltage as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that OverVoltage can be set to.
Notes: Unit: volts (V)
(Read only property)

145.40.12 OverVoltage as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The device constantly monitors the output voltage, and if it exceeds the OverVoltage value, it will disconnect the input from the output.
Notes: This functionality is critical for protecting power supplies from regenerated voltage coming from motors. Many power supplies assume that a higher than output expected voltage is related to an internal failure to the power supply, and will permanently disable themselves to protect the system. A typical safe value is to set OverVoltage to 1-2 volts higher than the output voltage of the supply. For instance, a 12V supply would be protected by setting OverVoltage to 13V.
The device will connect the input to the output again when the voltage drops to (OverVoltage - 1V)
Unit: volts (V)
(Read and Write property)

145.40.13 PowerEnabled as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When PowerEnabled is true, the device will connect the input to the output and begin monitoring.
Notes: The output voltage is constantly monitored and will be automatically disconnected from the input when the output exceeds the OverVoltage value.
PowerEnabled allows the device to operate as a Solid State Relay, powering on or off all devices connected to the output.
(Read and Write property)

145.40.14 Constants

Fan Modes

Constant	Value	Description
kFanModeAuto	3	The fan will be automatically controlled based on temperature.
kFanModeOff	1	Turns the fan off.
kFanModeOn	2	Turns the fan on.

145.41 class PhidgetPressureSensorMBS

145.41.1 class PhidgetPressureSensorMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Pressure Sensor class gathers data from the pressure sensor on a Phidget board.
Example:

```
// read values from a pressure sensor Phidget
// MyPressureSensor is a subclass of PhidgetPressureSensorMBS with the events implemented.
// PressureSensor is a property of the window: PressureSensor As MyPressureSensor

PressureSensor = New MyPressureSensor
PressureSensor.open

// in MyPressureSensor:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub PressureChanged(pressure As Double) Handles PressureChanged
System.DebugLog "pressure: " + pressure.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: If you're using a simple 0-5V sensor that does not have its own firmware, use the VoltageInput or VoltageRatioInput class instead, as specified for your device.
Subclass of the PhidgetMBS class.

145.41.2 Methods

145.41.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.41.4 Properties

145.41.5 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another PressureChange event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
The timing between PressureChange events can also affected by the PressureChangeTrigger.

Unit: milliseconds (ms)
(Read and Write property)

145.41.6 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.41.7 MaxPressure as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value the PressureChange event will report.
Notes: Unit: kilopascals (kPa)
(Read only property)

145.41.8 MaxPressureChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that PressureChangeTrigger can be set to.
Notes: Unit: kilopascals (kPa)
(Read only property)

145.41.9 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.41.10 MinPressure as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value the PressureChange event will report.
Notes: Unit: kilopascals (kPa)
(Read only property)

145.41.11 MinPressureChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that PressureChangeTrigger can be set to.
Notes: Unit: kilopascals (kPa)
(Read only property)

145.41.12 Pressure as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent pressure value that the channel has reported.
Notes: This value will always be between MinPressure and MaxPressure.
Unit: kilopascals (kPa)
(Read only property)

145.41.13 PressureChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a PressureChange event until the pressure value has changed by the amount specified by the PressureChangeTrigger.
Notes: Setting the PressureChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering.
Unit: kilopascals (kPa)
(Read and Write property)

145.41.14 Events

145.41.15 PressureChanged(pressure as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent pressure value the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a PressureChangeTrigger has been set to a non-zero value, the PressureChange event will not occur until the pressure has changed by at least the PressureChangeTrigger value.

145.42 class PhidgetRCServoMBS

145.42.1 class PhidgetRCServoMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The RC Servo class controls the signal being sent to the servo motors from the Phidget controller in order to control their position.
Example:

```
// move a servo to 90 degrees
Var p As New PhidgetRCServoMBS

// wait up to 5 seconds for the device
p.openWaitForAttachment(5000)

p.TargetPosition = 90
p.Engaged = True
Thread.SleepCurrent(2000) // give it time to move

p.close
```

Notes: This class provides control of the position, velocity, acceleration, and supply voltage of the attached servo.
Subclass of the PhidgetMBS class.

- Rewritten Phidgets Plugin

145.42.2 Methods

145.42.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.42.4 enableFailsafe(failsafeTime as UInt32)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables the failsafe feature for the channel, with a given failsafe time.

Notes: The failsafe feature is intended for use in applications where it is important for the channel to enter a known safe state if the program controlling it locks up or crashes. If you do not enable the failsafe feature, the channel will carry out whatever instructions it was last given until it is explicitly told to stop.

Enabling the failsafe feature starts a recurring failsafe timer for the channel. Once the failsafe timer is enabled, it must be reset within the specified time or the channel will enter a failsafe state. The failsafe timer may be reset either by calling this function again, or using the ResetFailsafe function. Resetting the failsafe timer will reload the timer with the specified failsafe time, starting when the message to reset the timer is received by the Phidget.

For example: if the failsafe is enabled with a failsafe time of 1000ms, you will have 1000ms to reset the failsafe timer. Every time the failsafe timer is reset, you will have 1000ms from that time to reset the failsafe again.

If the failsafe timer is not reset before it runs out, the channel will enter a failsafe state. For RC Servo channels, this will disengage the controller. Once the channel enters the failsafe state, it will reject any further input until the channel is reopened.

To prevent the channel from falsely entering the failsafe state, we recommend resetting the failsafe timer as frequently as is practical for your applicaiton. A good rule of thumb is to not let more than a third of the failsafe time pass before resetting the timer.

Once the failsafe timer has been set, it cannot be disabled by any means other than closing and reopening the channel.

145.42.5 resetFailsafe

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Resets the failsafe timer, if one has been set. See EnableFailsafe for details.
Notes: This function will fail if no failsafe timer has been set for the channel.

145.42.6 setTargetPositionAsync(targetPosition as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the target position asynchronously.
Notes: Calls the setTargetPositionAsyncCompleted event later.

145.42.7 Properties

145.42.8 Acceleration as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function:

When changing velocity, the RC servo motor will accelerate/decelerate at this rate.
The acceleration is bounded by MaxAcceleration and MinAcceleration.
Notes:

Using the default settings this acceleration will correspond acceleration of servo arm in degrees/s2, for many standard RC servos.
SpeedRampingState controls whether or not the acceleration value is actually applied when trying to reach a target position.
There is a practical limit on how fast your RC servo motor can accelerate. This is based on the load and physical design of the motor.
The units for Position,Velocity, and Acceleration are configured by scaling the internal timing (set with MinPulseWidth and MaxPulseWidth) to a user specified range with MinPosition and MaxPosition.

See TargetPosition for a deeper explanation of how the settings of your RC Servo controller interact to move your servo.
(Read and Write property)

145.42.9 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the controller will fire another PositionChange event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.

Unit: milliseconds (ms)
(Read and Write property)

145.42.10 Engaged as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Phidget return code.

Notes: When engaged, a RC servo motor has the ability to be positioned. When disengaged, no commands are sent to the RC servo motor.

There is no position feedback to the controller, so the RC servo motor will immediately snap to the TargetPosition after being engaged from a disengaged state.
This property is useful for relaxing a servo once it has reached a given position.
If you are concerned about tracking position accurately, you should not disengage the motor while IsMoving is true.
(Read and Write property)

145.42.11 IsMoving as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: IsMoving returns true if the RC servo motor is currently in motion.
Notes: The controller cannot know if the RC servo motor is physically moving. When <code >IsMoving is false, it simply means there are no commands in the pipeline to the RC servo motor.
(Read only property)

145.42.12 MaxAcceleration as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum acceleration that Acceleration can be set to.
Notes: This value depends on MinPosition/MaxPosition and MinPulseWidth/MaxPulseWidth.

See TargetPosition for a deeper explanation of how the settings of your RC Servo controller interact to move your servo.
(Read only property)

145.42.13 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.42.14 MaxFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: (Read only property)

145.42.15 MaxPosition as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum position TargetPosition can be set to.
Notes: The units for Position,Velocity, and Acceleration are configured by scaling the internal timing (set with MinPulseWidth and MaxPulseWidth) to a user specified range with MinPosition and MaxPosition.

See TargetPosition for a deeper explanation of how the settings of your RC Servo controller interact to move your servo.
(Read and Write property)

145.42.16 MaxPulseWidth as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The MaxPulseWidth represents the maximum pulse width that your RC servo motor specifies.
Notes: This value can be found in the data sheet of most RC servo motors.
The units for Position,Velocity, and Acceleration are configured by scaling the internal timing (set with MinPulseWidth and MaxPulseWidth) to a user specified range with MinPosition and MaxPosition.

See TargetPosition for a deeper explanation of how the settings of your RC Servo controller interact to move your servo.
(Read and Write property)

145.42.17 MaxPulseWidthLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum pulse width that MaxPulseWidth can be set to.
Notes: See TargetPosition for a deeper explanation of how the settings of your RC Servo controller interact

to move your servo.
(Read only property)

145.42.18 MaxTorque as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that Torque can be set to.
Notes: Torque is a ratio of the maximum available torque, therefore the minimum torque is a unitless constant.
(Read only property)

145.42.19 MaxVelocityLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum velocity VelocityLimit can be set to.
Notes: This value depends on MinPosition/MaxPosition and MinPulseWidth/MaxPulseWidth.
See TargetPosition for a deeper explanation of how the settings of your RC Servo controller interact to move your servo.
(Read only property)

145.42.20 MinAcceleration as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that Acceleration can be set to.
Notes: This value depends on MinPosition/MaxPosition and MinPulseWidth/MaxPulseWidth.

See TargetPosition for a deeper explanation of how the settings of your RC Servo controller interact to move your servo.
(Read only property)

145.42.21 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.42.22 MinFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: (Read only property)

145.42.23 MinPosition as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum position that TargetPosition can be set to.
Notes: The units for Position,Velocity, and Acceleration are configured by scaling the internal timing (set with MinPulseWidth and MaxPulseWidth) to a user specified range with MinPosition and MaxPosition.

See TargetPosition for a deeper explanation of how the settings of your RC Servo controller interact to move your servo.
(Read and Write property)

145.42.24 MinPulseWidth as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The MinPulseWidth represents the minimum pulse width that your RC servo motor specifies.
Notes: This value can be found in the data sheet of most RC servo motors.
The units for Position,Velocity, and Acceleration are configured by scaling the internal timing (set with MinPulseWidth and MaxPulseWidth) to a user specified range with MinPosition and MaxPosition.

See TargetPosition for a deeper explanation of how the settings of your RC Servo controller interact to move your servo.
(Read and Write property)

145.42.25 MinPulseWidthLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum pulse width that MinPulseWidth can be set to.
Notes: See TargetPosition for a deeper explanation of how the settings of your RC Servo controller interact to move your servo.
(Read only property)

145.42.26 MinTorque as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that Torque can be set to.
Notes: Torque is a ratio of the maximum available torque, therefore the minimum torque is a unitless constant.
(Read only property)

145.42.27 MinVelocityLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum velocity VelocityLimit can be set to.
Notes: See TargetPosition for a deeper explanation of how the settings of your RC Servo controller interact to move your servo.
(Read only property)

145.42.28 Position as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent position of the RC servo motor that the controller has reported.
Notes: This value will always be between MinPosition and MaxPosition.
Using the default settings this position will correspond to the rotation of the servo arm in degrees, for many standard RC servos.

See TargetPosition for a deeper explanation of how the settings of your RC Servo controller interact to move your servo.

(Read only property)

145.42.29 SpeedRampingState as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The speed ramping state value
Notes: When speed ramping state is enabled, the controller will take the Acceleration and Velocity properties into account when moving the RC servo motor, usually resulting in smooth motion. If speed ramping state is not enabled, the controller will simply set the RC servo motor to the requested position.
(Read and Write property)

145.42.30 TargetPosition as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The target position.
Notes: If the RC servo motor is configured and TargetPosition is set, the controller will continuously try to reach targeted position.

The target position is bounded by MinPosition and MaxPosition.
Using the default settings this position will correspond to the rotation of the servo arm in degrees, for many standard RC servos.
If the RC servo motor is not engaged, then the position cannot be read.
The position can still be set while the RC servo motor is not engaged. Once engaged, the RC servo motor will snap to position, assuming it is not there already.
The units for Position,Velocity, and Acceleration are configured by scaling the internal timing (set with MinPulseWidth and MaxPulseWidth) to a user specified range with MinPosition and MaxPosition.

Position and Pulse Width

An RC servo motor's position is controlled using a type of Pulse Width Modulation, sending voltage pulses of a given time span, or Pulse Width to the servo.
The servo translates the Pulse Width of the control signal to a corresponding position of the servo arm.
Knowing this, a servo's range of motion can be thought of in terms of a MinPulseWidth and a MaxPulseWidth corresponding to range of pulse widths that produce the servo arm's full range of movement.
In Phidget22, you can adjust the MinPulseWidth and MaxPulseWidth stored by the library to match the desired range of movement you expect from your servo.
Since directly setting the timing of RC servo pulse widths is not very intuitive for most purpses, we map these pulse widths to a user-defied Minimum and Maximum Position.This allows you to define the servo's position in terms best suited to your application, such as degrees, fractions of a rotation, or even some

measure of speed for a continuous-rotation servo.
By setting the servo's Target Position to MaxPosition, the controller will send pulses of MaxPulseWidth to the servo.
Similarly, MinPosition will send pulses of MinPulseWidth to the servo
MaxPosition can be set smaller than MinPosition to invert movement of the servo, if it helps your application.
Setting a TargetPosition will transate the position between MinPosition and MaxPosition to a corresponding Pulse Width between MinPulseWidth and MaxPulseWidth, in turn sending the servo arm to the desired position.
Setting VelocityLimit and Acceleration for your servo will limit the rate of change of the servo's position in terms of one UserUnit per second (or /s2). Here, a UserUnit is whatever distance is maked by the change of the TargetPosition by 1.0

Adjusting the Servo's Limits

To tune your program to a specific servo:
First adjust the servo's range of motion by setting the MaxPulseWidth and MinPulseWidth. You can use the default values for these (or the ones on your servo's datasheet) as a starting point.
Send the servo to MaxPosition and MinPosition to check the results. Repeat steps 1 and 2 as nessesarry.
Set the MaxPosition and MinPosition to match whatever numbers you find best suited to your application.
(Read and Write property)

145.42.31 Torque as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Torque is a ratio of the maximum available torque.
Notes: The torque is bounded by MinTorque and MaxTorque
Increasing the torque will increase the speed and power consumption of the RC servo motor.
(Read and Write property)

145.42.32 Velocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The velocity that the RC servo motor is being driven at.
Notes: A negative value means the RC servo motor is moving towards a lower position.
The velocity range of the RC servo motor will be from -VelocityLimit to VelocityLimit, depending on direction.
This is not the actual physical velocity of the RC servo motor.

See TargetPosition for a deeper explanation of how the settings of your RC Servo controller interact to move your servo.
(Read only property)

145.42.33 VelocityLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When moving, the RC servo motor velocity will be limited by this value.
Notes: The velocity limit is bounded by MinVelocityLimit and MaxVelocityLimit.
Using the default settings this velocity will correspond to the maximum speed of rotation of servo arm in degrees/s, for many standard RC servos.
SpeedRampingState controls whether or not the velocity limit value is actually applied when trying to reach a target position.
The velocity range of the RC servo motor will be from -VelocityLimit to VelocityLimit, depending on direction.
Note that when this value is set to 0, the RC servo motor will not move.
There is a practical limit on how fast your servo can rotate, based on the physical design of the motor.
The units for Position,Velocity, and Acceleration are configured by scaling the internal timing (set with MinPulseWidth and MaxPulseWidth) to a user specified range with MinPosition and MaxPosition.

See TargetPosition for a deeper explanation of how the settings of your RC Servo controller interact to move your servo.
(Read and Write property)

145.42.34 Voltage as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The supply voltage for the RC servo motor.
Notes: If your controller supports multiple RC servo motors, every motor will have the same supply voltage. It is not possible to set individual supply voltages.
(Read and Write property)

145.42.35 Events

145.42.36 PositionChanged(position as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: An event that occurs when the position changes on a RC servo motor.
Notes: position: The position value

145.42.37 setTargetPositionAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when setTargetPositionAsync completes.

145.42.38 TargetPositionReached(position as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when the RC servo motor has reached the TargetPosition.
Notes: The controller cannot know if the RC servo motor has physically reached the target position. When TargetPosition is reached, it simply means the controller pulse width output is matching its target.

145.42.39 VelocityChanged(velocity as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: An event that occurs when the velocity changes on a RC servo motor.
Notes: velocity: The velocity value

145.42.40 Constants

Voltages

Constant	Value	Description
kVoltage5V	1	Run all servos on 5V DC
kVoltage6V	2	Run all servos on 6V DC
kVoltage7_4V	3	Run all servos on 7.4V DC

145.43 class PhidgetResistanceInputMBS

145.43.1 class PhidgetResistanceInputMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Resistance Input class measures the resistance of a circuit connected to the Phidget, which is used to read resistance-based sensors such as platinum RTDs.
Example:

```
// read values from a resistance input Phidget
// MyResistanceInput is a subclass of PhidgetResistanceInputMBS with the events implemented.
// ResistanceInput is a property of the window: ResistanceInput As MyResistanceInput

ResistanceInput = New MyResistanceInput
ResistanceInput.open

// in MyResistanceInput:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub ResistanceChanged(resistance As Double) Handles ResistanceChanged
System.DebugLog "resistance: " + resistance.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: Subclass of the PhidgetMBS class.

- Rewritten Phidgets Plugin

145.43.2 Methods

145.43.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.43.4 Properties

145.43.5 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another ResistanceChange event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
The timing between ResistanceChange events can also affected by the ResistanceChangeTrigger.

Unit: milliseconds (ms)
(Read and Write property)

145.43.6 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.43.7 MaxResistance as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value the ResistanceChange event will report.
Notes: Unit: ohms (Œ©)
(Read only property)

145.43.8 MaxResistanceChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that ResistanceChangeTrigger can be set to.
Notes: Unit: ohms (Œ©)
(Read only property)

145.43.9 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.43.10 MinResistance as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value the ResistanceChange event will report.
Notes: When the device is also being used as a TemperatureSensor the MinResistance and MaxResistance will not represent the true input range. This is a side effect of increasing accuracy on the temperature channel.
Unit: ohms (Œ©)
(Read only property)

145.43.11 MinResistanceChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that the ResistanceChangeTrigger can be set to.
Notes: Unit: ohms (Œ©)
(Read only property)

145.43.12 Resistance as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent resistance value that the channel has reported.
Notes: This value will always be between MinResistance and MaxResistance.
The Resistance value will change when the device is also being used as a temperature sensor. This is a side effect of increasing accuracy on the temperature channel.
Unit: ohms (Œ©)
(Read only property)

145.43.13 ResistanceChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a ResistanceChange event until the resistance value has changed by the amount specified by the ResistanceChangeTrigger.
Notes: Setting the ResistanceChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering

Unit: ohms (Œ©)
(Read and Write property)

145.43.14 RTDWireSetup as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Select the RTD wiring configuration.
Notes: More information about RTD wiring can be found in the user guide.
(Read and Write property)

145.43.15 Events

145.43.16 ResistanceChanged(resistance as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent resistance value the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a ResistanceChangeTrigger has been set to a non-zero value, the ResistanceChange event will not occur until the resistance has changed by at least the ResistanceChangeTrigger value.

resistance: The resistance value

145.43.17 Constants

RTD wiring configuration

Constant	Value	Description
RTD_WIRE_SETUP_2WIRE	1	Configures the device to make resistance calculations based on a 2-wire RTD setup.
RTD_WIRE_SETUP_3WIRE	2	Configures the device to make resistance calculations based on a 3-wire RTD setup.
RTD_WIRE_SETUP_4WIRE	3	Configures the device to make resistance calculations based on a 4-wire RTD setup.

145.44 class PhidgetRFIDMBS

145.44.1 class PhidgetRFIDMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The RFID class provides methods for Phidget RFID boards to read and write (if writing is supported) to RFID tags.
Example:

```
// read values from a rfid Phidget
// MyRFID is a subclass of PhidgetRFIDMBS with the events implemented.
// RFID is a property of the window: RFID As MyRFID

RFID = New MyRFID
RFID.open

// in MyRFID:
Sub Attached() Handles Attached
System.DebugLog "Device attached: " + Me.DeviceSerialNumber.ToString
End Sub

Sub TagFound(tag As String, protocol As Integer) Handles TagFound
System.DebugLog "tag: " + tag + ", " + "protocol: " + protocol.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: Subclass of the PhidgetMBS class.
Blog Entries

- Rewritten Phidgets Plugin

145.44.2 Methods

145.44.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.44.4 LastTag(byref tagString as String, byref protocol as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the most recently read tag's data, even if that tag is no longer within read range.
Notes: Only valid after at least one tag has been read.

tagString: The data stored on the most recently read tag
protocol: Protocol of the most recently read tag

145.44.5 Write(tagString as String, protocol as Integer, lockTag as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes data to the tag being currently read by the reader.
Notes: You cannot write to a read-only or locked tag.

tagString: The data to write to the tag
protocol: The communication protocol to use
lockTag: If true, permanently locks the tag so that it cannot be re-written after this write.

145.44.6 Properties

145.44.7 AntennaEnabled as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The on/off state of the antenna.
Notes: You can turn the antenna off to save power.
You must turn the antenna on in order to detect and read RFID tags.
(Read and Write property)

145.44.8 TagPresent as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This property is true if a compatibile RFID tag is being read by the reader.
Notes: TagPresent will remain true until the tag is out of range and can no longer be read.

(Read only property)

145.44.9 Events

145.44.10 TagFound(tag as String, protocol as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when an RFID tag is read.
Notes: Tag: Data from the tag
Protocol: Communication protocol of the tag

145.44.11 TagLost(tag as String, protocol as Integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when an RFID tag that was being read is removed from the read range.
Notes: Tag: Data from the lost tag
Protocol: Communication protocol of the lost tag

145.44.12 Constants

Protocols

Constant	Value	Description
kProtocolEM4100	1	EM4100
kProtocolISO11785_FDX_B	2	ISO11785 FDX B
kProtocolPhidgets	3	PhidgetTAG

145.45 class PhidgetServerMBS

145.45.1 class PhidgetServerMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The class to describe a known server.
Example:

```
// find Phidget network servers in the local network
// MyPhidgetNet is a subclass of PhidgetNetMBS with the ServerAdded event implemented.
// Net is a property of the window: Net As MyPhidgetNet
Net = New MyPhidgetNet
PhidgetNetMBS.enableServerDiscovery(PhidgetNetMBS.kServerTypeDeviceRemote)

// in MyPhidgetNet:
Sub ServerAdded(Server As PhidgetServerMBS) Handles ServerAdded
System.DebugLog "Server " + Server.Name + " at " + Server.Address + ":" + Server.Port.ToString + " ("
+ Server.ServerType + ")"
End Sub
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

145.45.2 Methods

145.45.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

145.45.4 Destructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The destructor.

145.45.5 Properties

145.45.6 Address as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The address of the server.
Notes: (Read only property)

145.45.7 Flags as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Flags describing the server state.
Notes: Flag is 1, if the server requires a password to authenticate.
(Read only property)

145.45.8 Host as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The hostname of the server.
Notes: (Read only property)

145.45.9 Name as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The name of the server.
Notes: (Read only property)

145.45.10 Port as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The port number of the server.
Notes: (Read only property)

145.45.11 ServerType as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Name of the server type.
Notes: (Read only property)

145.45.12 Type as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The server type.
Notes: (Read only property)

145.45.13 Constants

Server Types

Constant	Value	Description
kServerTypeDevice	2	Device
kServerTypeDeviceListener	1	Device Listener
kServerTypeDeviceRemote	3	Phidget22 Server Server discovery with this server type allows discovery of servers hosting Phidget devices. Enabling server discovery with this server type allows automated connection to these servers, and the Phidgets connected to them. Enabling server discovery with this server type will also enable ServerAdded and ServerRemoved events for this server type.
kServerTypeNone	0	
kServerTypeSBC	7	Phidget SBC Server discovery with this server type detects the presence of Phidget SBCs on the network. Enabling server discovery with this server type will enable ServerAdded and ServerRemoved events for this server type.
kServerTypeWww	5	WWW
kServerTypeWwwListener	4	WWW Listener
kServerTypeWwwRemote	6	Phidget22 Web server Server discovery with this server type detects the presence of Phidget web servers used to communicate with in-browser JavaScript. Enabling server discovery with this server type will enable ServerAdded and ServerRemoved events for this server type.

145.46 class PhidgetSoundSensorMBS

145.46.1 class PhidgetSoundSensorMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Sound Sensor class gathers data from the sound sensor on a Phidget board.
Example:

```
// read values from a sound sensor Phidget
// MySoundSensor is a subclass of PhidgetSoundSensorMBS with the events implemented.
// SoundSensor is a property of the window: SoundSensor As MySoundSensor

SoundSensor = New MySoundSensor
SoundSensor.open

// in MySoundSensor:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub SPLChanged(dB As Double, dBA As Double, dBC As Double, octaves() As Double) Handles SPLChanged
System.DebugLog "dB: " + dB.ToString + ", " + "dBA: " + dBA.ToString + ", " + "dBC: " + dBC.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: If you're using a simple 0-5V sensor that does not have its own firmware, use the VoltageInput or VoltageRatioInput class instead, as specified for your device.
Subclass of the PhidgetMBS class.

- Rewritten Phidgets Plugin

145.46.2 Methods

145.46.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.46.4 Octaves as Double()

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The unweighted value of each frequency band.
Notes: The following frequency bands are represented:
octaves [0] = 31.5 Hz
octaves [1] = 63 Hz
octaves [2] = 125 Hz
octaves [3] = 250 Hz
octaves [4] = 500 Hz
octaves [5] = 1 kHz
octaves [6] = 2 kHz
octaves [7] = 4 kHz
octaves [8] = 8 kHz
octaves [9] = 16 kHz

145.46.5 Properties

145.46.6 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another SPLChange event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
The timing between SPLChange events can also affected by the SPLChangeTrigger.

Unit: milliseconds (ms)
(Read and Write property)

145.46.7 dB as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent dB SPL value that has been calculated.
Notes: This value is bounded by MaxdB.
(Read only property)

145.46.8 dBA as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent dBA SPL value that has been calculated.
Notes: The dBA SPL value is calculated by applying a A-weighted filter to the Octaves data.
(Read only property)

145.46.9 dBC as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent dBC SPL value that has been calculated.
Notes: The dBC SPL value is calculated by applying a C-weighted filter to the Octaves data.
(Read only property)

145.46.10 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.46.11 MaxdB as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value the SPLChange event will report.
Notes: (Read only property)

145.46.12 MaxSPLChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that SPLChangeTrigger can be set to.
Notes: (Read only property)

145.46.13 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.46.14 MinSPLChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that SPLChangeTrigger can be set to.
Notes: (Read only property)

145.46.15 NoiseFloor as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum SPL value that the channel can accurately measure.
Notes: Input SPLs below this level will not produce an output from the microphone.
(Read only property)

145.46.16 SPLChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a SPLChange event until the dB value has changed by the amount specified by the SPLChangeTrigger.
Notes: Setting the SPLChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering
(Read and Write property)

145.46.17 SPLRange as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When selecting a range, first decide how sensitive you want the microphone to be.
Notes: Select a smaller range when you want more sensitivity from the microphone.
If a Saturation event occurrs, increase the range.
(Read and Write property)

145.46.18 Events

145.46.19 SPLChanged(dB as Double, dBA as Double, dBC as Double, octaves() as Double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent SPL values the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a SPLChangeTrigger has been set to a non-zero value, the SPLChange event will not occur until the dB SPL value has changed by at least the SPLChangeTrigger value.
The dB SPL value is calculated from the Octaves data.
The dBA SPL value is calculated by applying a A-weighted filter to the Octaves data.
The dBC SPL value is calculated by applying a C-weighted filter to the Octaves data.
The following frequency bands are represented:

octaves [0] = 31.5 Hz
octaves [1] = 63 Hz
octaves [2] = 125 Hz
octaves [3] = 250 Hz
octaves [4] = 500 Hz
octaves [5] = 1 kHz
octaves [6] = 2 kHz
octaves [7] = 4 kHz
octaves [8] = 8 kHz
octaves [9] = 16 kHz

dB: The dB SPL value.
dBA: The dBA SPL value.
dBC: The dBC SPL value.
Octaves: The dB SPL value for each band.

145.46.20 Constants

The measurement range.

Constant	Value	Description
SPLRange102dB	1	Range 102dB
SPLRange82dB	2	Range 82dB

145.47 class PhidgetSpatialMBS

145.47.1 class PhidgetSpatialMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Spatial class simultaneously gathers data from the accelerometer, gyroscope and magnetometer on a Phidget board.
Example:

```
// read values from a spatial Phidget
// MySpatial is a subclass of PhidgetSpatialMBS with the events implemented.
// Spatial is a property of the window: Spatial As MySpatial

Spatial = New MySpatial
Spatial.open

// in MySpatial:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub SpatialData(acceleration() As Double, angularRate() As Double, magneticField() As Double, timestamp As Double) Handles SpatialData
System.DebugLog "timestamp: " + timestamp.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: You can also use the individual classes for these sensors if you want to handle the data in separate events.
Subclass of the PhidgetMBS class.

145.47.2 Methods

145.47.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.47.4 getEulerAngles(byref pitch as double, byref roll as double, byref heading as double)

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the latest device orientation in the form of Euler angles.
Notes: Pitch, roll, and yaw.

145.47.5 getQuaternion(byref x as double, byref y as double, byref z as double, byref w as double)

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Gets the latest AHRS/IMU quaternion sent from the device.

145.47.6 MaxAcceleration as Double()

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum acceleration the sensor will measure.
Notes: Returns an array with 3 double values.

145.47.7 MaxAngularRate as Double()

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum angular rate the sensor will measure.
Notes: Returns an array with 3 double values.

145.47.8 MaxMagneticField as Double()

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum field strength the sensor will measure.
Notes: Returns an array with 3 double values.

145.47.9 MinAcceleration as Double()

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum acceleration the sensor will measure.

145.47.10 MinAngularRate as Double()

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum angular rate the sensor will measure.

145.47.11 MinMagneticField as Double()

MBS Phidgets Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum field strength the sensor will measure.
Notes: Returns an array with 3 double values.

145.47.12 resetMagnetometerCorrectionParameters

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Resets the MagnetometerCorrectionParameters to their default values.
Notes: Due to physical location, hard and soft iron offsets, and even bias errors, your device should be

calibrated. We have created a calibration program that will provide you with the MagnetometerCorrectionParameters for your specific situation. See your device's User Guide for more information.

145.47.13 saveMagnetometerCorrectionParameters

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Saves the MagnetometerCorrectionParameters.
Notes: Due to physical location, hard and soft iron offsets, and even bias errors, your device should be calibrated. We have created a calibration program that will provide you with the MagnetometerCorrectionParameters for your specific situation. See your device's User Guide for more information.

145.47.14 setAHRSParameters(angularVelocityThreshold as double, AngularVelocityDeltaThreshold as double, accelerationThreshold as double, magTime as double, accelTime as double, biasTime as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calibrate your device for the environment it will be used in.
Notes: Setting these parameters will allow you to tune the AHRS algorithm on the device to your specific application.

angularVelocityThreshold: The maximum angular velocity reading where the device is assumed to be "at rest"
AngularVelocityDeltaThreshold: The acceptable amount of change in angular velocity between measurements before movement is assumed.
accelerationThreshold: The maximum acceleration applied to the device (minus gravity) where it is assumed to be "at rest". This is also the maximum acceleration allowable before the device stops correcting to the acceleration vector.
magTime: The time it will take to correct the heading 95% of the way to aligning with the compass (in seconds),up to 15 degrees of error. Beyond 15 degrees, this is the time it will take for the bearing to move 45 degrees towards the compass reading. Remember you can zero the algorithm at any time to instantly realign the spatial with acceleration and magnetic field vectors regardless of magnitude.
accelTime: The time it will take to correct the pitch and roll 95% of the way to aligning with the accelerometer (in seconds).
biasTime: The time it will take to have the gyro biases settle to within 95% of the measured steady state (in seconds).

145.47.15 setMagnetometerCorrectionParameters(magneticField as double, offset0 as double, offset1 as double, offset2 as double, gain0 as double, gain1 as double, gain2 as double, T0 as double, T1 as double, T2 as double, T3 as double, T4 as double, T5 as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calibrate your device for the environment it will be used in.
Notes: Due to physical location, hard and soft iron offsets, and even bias errors, your device should be calibrated. We have created a calibration program that will provide you with the MagnetometerCorrectionParameters for your specific situation. See your device's User Guide for more information.

magneticField: Ambient magnetic field value.
offset0: Provided by calibration program.
offset1: Provided by calibration program.
offset2: Provided by calibration program.
gain0: Provided by calibration program.
gain1: Provided by calibration program.
gain2: Provided by calibration program.
T0: Provided by calibration program.
T1: Provided by calibration program.
T2: Provided by calibration program.
T3: Provided by calibration program.
T4: Provided by calibration program.
T5: Provided by calibration program.

145.47.16 zeroAlgorithm

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Zeros the AHRS algorithm.

145.47.17 zeroGyro

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Re-zeros the gyroscope in 1-2 seconds.
Notes: The device must be stationary when zeroing.
The angular rate will be reported as 0.0¬∞/s while zeroing.
Zeroing the gyroscope is a method of compensating for the drift that is inherent to all gyroscopes. See your device's User Guide for more information on dealing with drift.

145.47.18 Properties

145.47.19 Algorithm as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Selects the IMU/AHRS algorithm.
Notes: (Read and Write property)

145.47.20 AlgorithmMagnetometerGain as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The gain for the magnetometer in the AHRS algorithm.
Notes: Lower gains reduce sensor noise while slowing response time.
(Read and Write property)

145.47.21 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another SpatialData event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.

Unit: milliseconds (ms)
(Read and Write property)

145.47.22 HeatingEnabled as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether self-heating temperature stabilization is enabled.
Notes: Set to true to enable the temperature stabilization feature of this device.
This enables on-board heating elements to bring the board up to a known temperature to minimize ambient

temperature effects on the sensor's reading. You can leave this setting false to conserve power consumption.This property is shared by any and all spatial-related objects on this device (Accelerometer, Gyroscope, Magnetometer, Spatial)
(Read and Write property)

145.47.23 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.47.24 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.47.25 Precision as Integer

MBS Phidgets Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The precision requested.
Notes: (Read and Write property)

145.47.26 Events

145.47.27 AlgorithmData(quaternion() as double, timestamp as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent IMU/AHRS Quaternion will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: quaternion: The quaternion value - [x, y, z, w]

timestamp: The timestamp value

145.47.28 SpatialData(acceleration() as double, angularRate() as double, magneticField() as double, timestamp as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent values that your channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: acceleration: The acceleration vaulues
angularRate: The angular rate values
magneticField: The field strength values
timestamp: The timestamp value

145.47.29 Constants

Filter Types

Constant	Value	Description
kFilterTypeLogicLevel	2	Logic level
kFilterTypeZeroCrossing	1	Zero crossing

Input Modes

Constant	Value	Description
kInputModeNPN	1	For interfacing NPN digital sensors.
kInputModePNP	2	For interfacing PNP digital sensors.

Power Supply

Constant	Value	Description
kPowerSupply12V	2	The sensor is provided with 12 volts
kPowerSupply24V	3	The sensor is provided with 24 volts
kPowerSupply5V	4	The sensor is provided with 5 volts
kPowerSupplyOff	1	Switch the sensor power supply off.

Precision

Constant	Value	Description
kPrecisionHigh	1	High
kPrecisionHybrid	0	Hybrid
kPrecisionLow	2	Low

Spatial Algorithm

Constant	Value	Description
kSpatialAlgorithmAHRS	1	AHRS algorithm, incorporating magnetometer data for yaw correction.
kSpatialAlgorithmIMU	2	IMU algorithm, using gyro and accelerometer, but not magnetometer.
kSpatialAlgorithmNone	0	No AHRS algorithm is used.

145.48 class PhidgetStepperMBS

145.48.1 class PhidgetStepperMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Stepper class powers and controls the stepper motor connected to the Phidget controller, allowing you to change the position, velocity, acceleration, and current limit.
Example:

```
// move a stepper motor to position 1000
Var p As New PhidgetStepperMBS

// wait up to 5 seconds for the device
p.openWaitForAttachment(5000)

p.TargetPosition = 1000
p.Engaged = True
Thread.SleepCurrent(3000) // give it time to move

p.close
```

Notes: Subclass of the PhidgetMBS class.
Blog Entries

- Rewritten Phidgets Plugin

145.48.2 Methods

145.48.3 addPositionOffset(positionOffset as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds an offset (positive or negative) to the current position and target position.
Notes: This is especially useful for zeroing position.

145.48.4 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.48.5 enableFailsafe(failsafeTime as UInt32)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables the failsafe feature for the channel, with a given failsafe time.
Notes: The failsafe feature is intended for use in applications where it is important for the channel to enter a known safe state if the program controlling it locks up or crashes. If you do not enable the failsafe feature, the channel will carry out whatever instructions it was last given until it is explicitly told to stop.

Enabling the failsafe feature starts a recurring failsafe timer for the channel. Once the failsafe timer is enabled, it must be reset within the specified time or the channel will enter a failsafe state. The failsafe timer may be reset either by calling this function again, or using the ResetFailsafe function. Resetting the failsafe timer will reload the timer with the specified failsafe time, starting when the message to reset the timer is received by the Phidget.

For example: if the failsafe is enabled with a failsafe time of 1000ms, you will have 1000ms to reset the failsafe timer. Every time the failsafe timer is reset, you will have 1000ms from that time to reset the failsafe again.

If the failsafe timer is not reset before it runs out, the channel will enter a failsafe state. For Stepper channels, this will disengage the motor. Once the channel enters the failsafe state, it will reject any further input until the channel is reopened.

To prevent the channel from falsely entering the failsafe state, we recommend resetting the failsafe timer as frequently as is practical for your applicaiton. A good rule of thumb is to not let more than a third of the failsafe time pass before resetting the timer.

Once the failsafe timer has been set, it cannot be disabled by any means other than closing and reopening the channel.

145.48.6 resetFailsafe

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Resets the failsafe timer, if one has been set. See EnableFailsafe for details.
Notes: This function will fail if no failsafe timer has been set for the channel.

145.48.7 setTargetPositionAsync(targetPosition as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets target position asynchronously.
Notes: If the controller is configured and the TargetPosition is set, the Stepper motor will move towards the TargetPosition at the specified Acceleration and Velocity.

TargetPosition is only used when the ControlMode is set to step mode.
Units for Position, Velocity, and Acceleration can be set by the user through the RescaleFactor.The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
The default units for this motor controller are 1/16steps per count.

Calls setTargetPositionAsyncCompleted event later when done.

145.48.8 Properties

145.48.9 Acceleration as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The rate at which the controller can change the motor's Velocity.
Notes: Units for Position, Velocity, and Acceleration can be set by the user through the RescaleFactor.The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
The default units for this motor controller are 1/16steps per count.
Changing the acceleration value while the stepper is in motion (especially at speeds higher than 1000 1/16th steps/s) can cause unpredictable results due to the inability of the processor tocalculate a new acceleration curve quickly enough. Generally you should wait until the motor is stationary until calling this function.
(Read and Write property)

145.48.10 ControlMode as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Use step mode when you want to set a TargetPosition for the Stepper motor.
Notes: Use run mode when you simply want the Stepper motor to rotate continuously in a specific direction.Changing the control mode while the motor is running will result in the following behaviour:
Step ->Run : The motor will keep moving in the direction it's currently going, and will accelerate to max velocity.
Run ->Step : The motor will set the target position to infinity in the direction it's currently going, at the

current velocity.
(Read and Write property)

145.48.11 CurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The current through the motor will be limited by the CurrentLimit.
Notes: See your Stepper motor's data sheet for more information about what value the CurrentLimit should be.

Unit: amperes (A)
(Read and Write property)

145.48.12 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the controller will fire another PositionChange/VelocityChange event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.

Unit: milliseconds (ms)
(Read and Write property)

145.48.13 Engaged as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When this property is true, the controller will supply power to the motor coils.
Notes: The controller must be Engaged in order to move the Stepper motor, or have it hold position.
(Read and Write property)

145.48.14 HoldingCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The HoldingCurrentLimit will activate when the TargetPosition has been reached.
Notes: It will limit current through the motor.
When the motor is not stopped, the current through the motor is limited by the CurrentLimit.
If no HoldingCurrentLimit is specified, the CurrentLimit value will persist when the motor is stopped.
Reference your controller's User Guide for more information about how the HoldingCurrentLimit and CurrentLimit can be used in your application.
(Read and Write property)

145.48.15 IsMoving as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: IsMoving returns true while the controller is sending commands to the motor.
Notes: Note: there is no feedback to the controller, so it does not know whether the motor shaft is actually moving or not.
(Read only property)

145.48.16 MaxAcceleration as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that Acceleration can be set to.
Notes: Units for Position, Velocity, and Acceleration can be set by the user through the RescaleFactor.The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
The default units for this motor controller are 1/16steps per count.
(Read only property)

145.48.17 MaxCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that CurrentLimit and HoldingCurrentLimit can be set to.
Notes: Reference your controller's User Guide for more information about how the HoldingCurrentLimit and CurrentLimit can be used in your application.

Unit: amperes (A)
(Read only property)

145.48.18 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.48.19 MaxFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: in milliseconds.
(Read only property)

145.48.20 MaxPosition as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that TargetPosition can be set to.
Notes: Units for Position, Velocity, and Acceleration can be set by the user through the RescaleFactor.The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
The default units for this motor controller are 1/16steps per count.
(Read only property)

145.48.21 MaxVelocityLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that VelocityLimit can be set to.
Notes: Units for Position, Velocity, and Acceleration can be set by the user through the RescaleFactor.The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
The default units for this motor controller are 1/16steps per count.
(Read only property)

145.48.22 MinAcceleration as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that Acceleration can be set to.
Notes: Units for Position, Velocity, and Acceleration can be set by the user through the RescaleFactor.The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
The default units for this motor controller are 1/16steps per count.
(Read only property)

145.48.23 MinCurrentLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that CurrentLimit and HoldingCurrentLimit can be set to.
Notes: Reference your controller's User Guide for more information about how the HoldingCurrentLimit and CurrentLimit can be used in your application.

Unit: amperes (A)
(Read only property)

145.48.24 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.48.25 MinFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: in milliseconds.
(Read only property)

145.48.26 MinPosition as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that TargetPosition can be set to.
Notes: Units for Position, Velocity, and Acceleration can be set by the user through the RescaleFactor.The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
The default units for this motor controller are 1/16steps per count.
(Read only property)

145.48.27 MinVelocityLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that VelocityLimit can be set to.
Notes: Units for Position, Velocity, and Acceleration can be set by the user through the RescaleFactor.The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
The default units for this motor controller are 1/16steps per count.
(Read only property)

145.48.28 Position as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent position value that the controller has reported.
Notes: This value will always be between MinPosition and MaxPosition.
Units for Position, Velocity, and Acceleration can be set by the user through the RescaleFactor.The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
The default units for this motor controller are 1/16steps per count.
(Read only property)

145.48.29 RescaleFactor as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Applies a factor to the [user units] per step to all movement parameters to make the units in your application is more intuitive.
Notes: For example, starting from position 0 and setting a new position with a rescale factor, the stepper will move Position / RescaleFactor steps.

In this way, units for Position, Velocity, and Acceleration can be set by the user through the RescaleFactor. The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
The default units for this motor controller are 1/16steps per count.
(Read and Write property)

145.48.30 TargetPosition as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: If the controller is configured and the TargetPosition is set, the Stepper motor will move towards the TargetPosition at the specified Acceleration and Velocity.
Notes: TargetPosition is only used when the ControlMode is set to step mode.
Units for Position, Velocity, and Acceleration can be set by the user through the RescaleFactor.The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
The default units for this motor controller are 1/16steps per count.
(Read and Write property)

145.48.31 Velocity as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent velocity value that the controller has reported.
Notes: This value is bounded by MinVelocityLimit and MaxVelocityLimit.
Units for Position, Velocity, and Acceleration can be set by the user through the RescaleFactor.The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.
The default units for this motor controller are 1/16steps per count.
(Read only property)

145.48.32 VelocityLimit as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: When moving, the Stepper motor velocity will be limited by this value.
Notes: The VelocityLimit is bounded by MinVelocityLimit and MaxVelocityLimit.
When in step mode, the MinVelocityLimit has a value of 0. This is because the sign (¬±) of the TargetPosition will indicate the direction.
When in run mode, the MinVelocityLimit has a value of -MaxVelocityLimit. This is because there is no target position, so the direction is defined by the sign (¬±) of the VelocityLimit.
Units for Position, Velocity, and Acceleration can be set by the user through the RescaleFactor.The RescaleFactor allows you to use more intuitive units such as rotations, or degrees.

The default units for this motor controller are 1/16steps per count.
(Read and Write property)

145.48.33 Events

145.48.34 PositionChanged(position as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when the controller updates the stepper motor position.
Notes: This event will still fire even if the motor is blocked from physically moving or misses steps.

145.48.35 setTargetPositionAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when target position is set asynchronously.

145.48.36 Stopped

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when the motor controller stops.
Notes: The motor may still be physically moving if the inertia is great enough to make it misstep.

145.48.37 VelocityChanged(velocity as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Occurs when the stepper motor velocity changes.
Notes: velocity: Velocity of the stepper. Sign indicates direction.

145.48.38 Constants

Control Modes

Constant	Value	Description
kControlModeRun	1	Control the motor by selecting a target velocity (sign indicates direction). The motor will rotate continously in the chosen direction.
kControlModeStep	0	Control the motor by setting a target position.

145.49 class PhidgetTemperatureSensorMBS

145.49.1 class PhidgetTemperatureSensorMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Temperature Sensor class gathers data from the temperature sensor on a Phidget board. # **Example:**

```
// read values from a temperature sensor Phidget
// MyTemperatureSensor is a subclass of PhidgetTemperatureSensorMBS with the events implemented.
// TemperatureSensor is a property of the window: TemperatureSensor As MyTemperatureSensor

TemperatureSensor = New MyTemperatureSensor
TemperatureSensor.open

// in MyTemperatureSensor:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub TemperatureChanged(temperature As Double) Handles TemperatureChanged
System.DebugLog "temperature: " + temperature.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: This includes on-board ambient temperature sensors, connected thermocouples or platinum RTDs, and IR temperature sensors. This class is also used to measure the temperature on some high-power Phidget boards such as motor controllers for safety reasons.

If you're using a simple 0-5V sensor that does not have its own firmware, use the VoltageInput or VoltageRatioInput class instead, as specified for your device.
Subclass of the PhidgetMBS class.

Notes: In degrees celsius.
(Read only property)

145.49.11 MinTemperatureChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that TemperatureChangeTrigger can be set to.
Notes: (Read only property)

145.49.12 RTDType as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The RTDType must correspond to the RTD type you are using in your application.
Notes: If you are unsure which RTDType to use, visit your device's User Guide for more information.

(Read and Write property)

145.49.13 RTDWireSetup as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The RTDWireSetup must correspond to the wire configuration you are using in your application.
Notes: If you are unsure which RTDWireSetup to use, visit your device's User Guide for more information.
(Read and Write property)

145.49.14 Temperature as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent temperature value that the channel has reported.
Notes: This value will always be between MinTemperature and MaxTemperature.
in degrees celsius.
(Read only property)

145.49.15 TemperatureChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a TemperatureChange event until the temperature value has changed by the amount specified by the TemperatureChangeTrigger.
Notes: Setting the TemperatureChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering.
In degrees celsius.
(Read and Write property)

145.49.16 ThermocoupleType as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The ThermocoupleType must correspond to the thermocouple type you are using in your application.

Notes: If you are unsure which ThermocoupleType to use, visit the Thermocouple Primer for more information.
(Read and Write property)

145.49.17 Events

145.49.18 TemperatureChanged(temperature as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent temperature value the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a TemperatureChangeTrigger has been set to a non-zero value, the TemperatureChange event will not occur until the temperature has changed by at least the TemperatureChangeTrigger value.

145.49.19 Constants

RTD Sensor Types

Constant	Value	Description
kRTDTypePT1000_3850	2	Configures the RTD type as a PT1000 with a 3850ppm curve.
kRTDTypePT1000_3920	4	Configures the RTD type as a PT100 with a 3920ppm curve.
kRTDTypePT100_3850	1	Configures the RTD type as a PT100 with a 3850ppm curve.
kRTDTypePT100_3920	3	Configures the RTD type as a PT100 with a 3920ppm curve.

RTD wiring configuration

Constant	Value	Description
kRTDWireSetup2Wire	1	Configures the device to make resistance calculations based on a 2-wire RTD setup.
kRTDWireSetup3Wire	2	Configures the device to make resistance calculations based on a 3-wire RTD setup.
kRTDWireSetup4Wire	3	Configures the device to make resistance calculations based on a 4-wire RTD setup.

Thermocouple Types

Constant	Value	Description
kThermoCoupleTypeE	3	Configures the thermocouple input as a E-Type thermocouple.
kThermoCoupleTypeJ	1	Configures the thermocouple input as a J-Type thermocouple.
kThermoCoupleTypeK	2	Configures the thermocouple input as a K-Type thermocouple.
kThermoCoupleTypeT	4	Configures the thermocouple input as a T-Type thermocouple.

145.50 class PhidgetUnitInfoMBS

145.50.1 class PhidgetUnitInfoMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The name, symbol, and Phidgets enumeration of the units of the sensor value calculated from the analog sensor's measurements.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

145.50.2 Methods

145.50.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

145.50.4 Destructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The destructor.

145.50.5 Properties

145.50.6 Name as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The name.
Notes: (Read only property)

145.50.7 Symbol as String

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The symbol.
Notes: (Read only property)

145.50.8 Unit as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The unit.
Notes: (Read only property)

145.50.9 Constants

Units

Constant	Value	Description
kUnitAmpere	10	Ampere
kUnitBoolean	1	Boolean
kUnitCentimeter	5	Centimeter
kUnitDecibel	3	Decibel
kUnitDegreeCelcius	13	Degree Celcius
kUnitGauss	15	Gauss
kUnitGram	7	gram
kUnitKilogram	8	Kilogram
kUnitKiloPascal	11	Kilo Pascal
kUnitLux	14	Lux
kUnitMeter	6	Meter
kUnitMilliampere	9	Milliampere
kUnitMillimeter	4	Millimeter
kUnitNone	0	Unitless
kUnitPercent	2	Percent
kUnitPH	16	pH
kUnitVolt	12	Volt
kUnitWatt	17	Watt

145.51 class PhidgetVoltageInputMBS

145.51.1 class PhidgetVoltageInputMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Voltage Input class measures the voltage across the input of a Phidget with a voltage input.
Example:

```
// read values from a voltage input Phidget
// MyVoltageInput is a subclass of PhidgetVoltageInputMBS with the events implemented.
// VoltageInput is a property of the window: VoltageInput As MyVoltageInput

VoltageInput = New MyVoltageInput
VoltageInput.open

// in MyVoltageInput:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub VoltageChanged(voltage As Double) Handles VoltageChanged
System.DebugLog "voltage: " + voltage.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: This may be a sensor designed to measure voltage directly, or it could be an input designed to interface with 0-5V sensors.

For 0-5V sensors, this class supports conversion to sensor data with units specific to the Phidget sensor being used, to make reading these sensors easy.
Subclass of the PhidgetMBS class.

145.51.2 Methods

145.51.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.51.4 Properties

145.51.5 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
The timing between events can also affected by the change trigger values.

Unit: milliseconds (ms)
(Read and Write property)

145.51.6 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.51.7 MaxVoltage as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value the VoltageChange event will report.
Notes: In volts.
(Read only property)

145.51.8 MaxVoltageChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that VoltageChangeTrigger can be set to.
Notes: In volts.
(Read only property)

145.51.9 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.51.10 MinVoltage as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value the VoltageChange event will report.
Notes: In volts.
(Read only property)

145.51.11 MinVoltageChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that VoltageChangeTrigger can be set to.
Notes: In volts.
(Read only property)

145.51.12 PowerSupply as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Choose the power supply voltage.
Notes: Set this to the voltage specified in the attached sensor's data sheet to power it.
Set to POWER_SUPPLY_OFF to turn off the supply to save power.
(Read and Write property)

145.51.13 SensorType as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: We sell a variety of analog sensors that do not have their own API, they simply output a voltage that can be converted to a digital value using a specific formula.
Notes: By matching the SensorType to your analog sensor, the correct formula will automatically be applied to data when you get the SensorValue or subscribe to the SensorChange event.

- The SensorChange event has its own change trigger associated with it: SensorValueChangeTrigger.
- Any data from getting the SensorValue or subscribing to the SensorChange event will have a SensorUnit associated with it.

Note: Unlike other properties such as DeviceSerialNumber or Channel, SensorType is set after the device is opened, not before.
(Read and Write property)

145.51.14 SensorUnit as PhidgetUnitInfoMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The unit of measurement that applies to the sensor values of the SensorType that has been selected.
Notes: Helps keep track of the type of information being calculated from the voltage input.
(Read only property)

145.51.15 SensorValue as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent sensor value that the channel has reported.
Notes: Use SensorUnit to get the measurement units that are associated with the SensorValue.

(Read only property)

145.51.16 SensorValueChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a SensorChange event until the sensor value has changed by the amount specified by the SensorValueChangeTrigger.
Notes: Setting the SensorChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering
(Read and Write property)

145.51.17 Voltage as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent voltage value that the channel has reported.
Notes: This value will always be between MinVoltage and MaxVoltage.
In volts.
(Read only property)

145.51.18 VoltageChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a VoltageChange event until the voltage value has changed by the amount specified by the VoltageChangeTrigger.
Notes: Setting the VoltageChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering.
In volts.
(Read and Write property)

145.51.19 VoltageRange as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The voltage range you choose should allow you to measure the full range of your input signal.

Notes: A larger VoltageRange equates to less resolution.
If a Saturation event occurs, increase the voltage range.
(Read and Write property)

145.51.20 Events

145.51.21 SensorChanged(sensorValue as double, sensorUnit as PhidgetUnitInfoMBS)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent sensor value the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a SensorValueChangeTrigger has been set to a non-zero value, the SensorChange event will not occur until the sensor value has changed by at least the SensorValueChangeTrigger value.
This event only fires when SensorType is not set to kSensorTypeVoltage.

145.51.22 VoltageChanged(voltage as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent voltage value the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a VoltageChangeTrigger has been set to a non-zero value, the VoltageChange event will not occur until the voltage has changed by at least the VoltageChangeTrigger value.
If SensorType is supported and set to anything other then kSensorTypeVoltage, this event will not fire.
In volts.

145.51.23 Constants

Power Supply

Constant	Value	Description
kPowerSupply12V	2	The sensor is provided with 12 volts
kPowerSupply24V	3	The sensor is provided with 24 volts
kPowerSupply5V	4	The sensor is provided with 5 volts
kPowerSupplyOff	1	Switch the sensor power supply off.

Sensor Types

Constant	Value	Description
kSensorType1114	&h2b84	1114 - Temperature Sensor
kSensorType1117	&h2ba2	1117 - Voltage Sensor
kSensorType1123	&h2bde	1123 - Precision Voltage Sensor
kSensorType1127	&h2c06	1127 - Precision Light Sensor
kSensorType1130ORP	&h2c26	1130 - ORP Adapter
kSensorType1130PH	&h2c25	1130 - pH Adapter
kSensorType1132	&h2c38	1132 - 4-20mA Adapter
kSensorType1133	&h2c42	1133 - Sound Sensor
kSensorType1135	&h2c56	1135 - Precision Voltage Sensor
kSensorType1142	&h2c9c	1142 - Light Sensor 1000 lux
kSensorType1143	&h2ca6	1143 - Light Sensor 70000 lux
kSensorType3500	&h88b8	3500 - AC Current Sensor 10Amp
kSensorType3501	&h88c2	3501 - AC Current Sensor 25Amp
kSensorType3502	&h88cc	3502 - AC Current Sensor 50Amp
kSensorType3503	&h88d6	3503 - AC Current Sensor 100Amp
kSensorType3507	&h88fe	3507 - AC Voltage Sensor 0-250V (50Hz)
kSensorType3508	&h8908	3508 - AC Voltage Sensor 0-250V (60Hz)
kSensorType3509	&h8912	3509 - DC Voltage Sensor 0-200V
kSensorType3510	&h891c	3510 - DC Voltage Sensor 0-75V
kSensorType3511	&h8926	3511 - DC Current Sensor 0-10mA
kSensorType3512	&h8930	3512 - DC Current Sensor 0-100mA
kSensorType3513	&h893a	3513 - DC Current Sensor 0-1A
kSensorType3514	&h8944	3514 - AC Active Power Sensor 0-250V*0-30A (50Hz)
kSensorType3515	&h894e	3515 - AC Active Power Sensor 0-250V*0-30A (60Hz)
kSensorType3516	&h8958	3516 - AC Active Power Sensor 0-250V*0-5A (50Hz)
kSensorType3517	&h8962	3517 - AC Active Power Sensor 0-250V*0-5A (60Hz)
kSensorType3518	&h896c	3518 - AC Active Power Sensor 0-110V*0-5A (60Hz)
kSensorType3519	&h8976	3519 - AC Active Power Sensor 0-110V*0-15A (60Hz)
kSensorType3584	&h8c00	3584 - 0-50A DC Current Transducer
kSensorType3585	&h8c0a	3585 - 0-100A DC Current Transducer
kSensorType3586	&h8c14	3586 - 0-250A DC Current Transducer
kSensorType3587	&h8c1e	3587 - +-50A DC Current Transducer
kSensorType3588	&h8c28	3588 - +-100A DC Current Transducer
kSensorType3589	&h8c32	3589 - +-250A DC Current Transducer
kSensorTypeMOT2002High	&h4e36	MOT2002 - Motion Sensor High Sensitivity
kSensorTypeMOT2002Low	&h4e34	MOT2002 - Motion Sensor Low Sensitivity
kSensorTypeMOT2002Med	&h4e35	MOT2002 - Motion Sensor Medium Sensitivity
kSensorTypeVCP4114	&ha0b4	VCP4114 - +-25A DC Current Transducer
kSensorTypeVoltage	0	Generic voltage sensor, Default. Configures the channel to be a generic voltage sensor. Unit is volts.

Voltage Ranges

Constant	Value	Description
kVoltageRange1000mV	6	Range ¬±1000mV DC
kVoltageRange10mV	1	Range ¬±10mV DC
kVoltageRange15V	9	Range ¬±15V DC
kVoltageRange200mV	3	Range ¬±200mV DC
kVoltageRange2V	7	Range ¬±2V DC
kVoltageRange312_5mV	4	Range ¬±312.5mV DC
kVoltageRange400mV	5	Range ¬±400mV DC
kVoltageRange40mV	2	Range ¬±40mV DC
kVoltageRange40V	10	Range ¬±40V DC
kVoltageRange5V	8	Range ¬±5V DC
kVoltageRangeAUTO	11	Auto-range mode changes based on the present voltage measurements.

145.52 class PhidgetVoltageOutputMBS

145.52.1 class PhidgetVoltageOutputMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Voltage Output class controls the variable DC voltage output on a Phidget board.
Example:

```
// set an analog output to 2.5 volts
Var p As New PhidgetVoltageOutputMBS

// wait up to 5 seconds for the device
p.openWaitForAttachment(5000)

p.Voltage = 2.5
p.Enabled = True

p.close
```

Notes: This class provides settings for the output voltage as well as various safety controls.
Subclass of the PhidgetMBS class.

- Rewritten Phidgets Plugin

145.52.2 Methods

145.52.3 Constructor

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.

145.52.4 enableFailsafe(failsafeTime as UInt32)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enables the failsafe feature for the channel, with a given failsafe time.
Notes: The failsafe feature is intended for use in applications where it is important for the channel to enter a known safe state if the program controlling it locks up or crashes. If you do not enable the fail-

safe feature, the channel will carry out whatever instructions it was last given until it is explicitly told to stop.

Enabling the failsafe feature starts a recurring failsafe timer for the channel. Once the failsafe timer is enabled, it must be reset within the specified time or the channel will enter a failsafe state. The failsafe timer may be reset either by calling this function again, or using the ResetFailsafe function. Resetting the failsafe timer will reload the timer with the specified failsafe time, starting when the message to reset the timer is received by the Phidget.

For example: if the failsafe is enabled with a failsafe time of 1000ms, you will have 1000ms to reset the failsafe timer. Every time the failsafe timer is reset, you will have 1000ms from that time to reset the failsafe again.

If the failsafe timer is not reset before it runs out, the channel will enter a failsafe state. For Voltage Output channels, this will set the output voltage to 0V. Once the channel enters the failsafe state, it will reject any further input until the channel is reopened.

To prevent the channel from falsely entering the failsafe state, we recommend resetting the failsafe timer as frequently as is practical for your applicaiton. A good rule of thumb is to not let more than a third of the failsafe time pass before resetting the timer.

Once the failsafe timer has been set, it cannot be disabled by any means other than closing and reopening the channel.

145.52.5 resetFailsafe

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Resets the failsafe timer, if one has been set.
Notes: See EnableFailsafe for details.
This function will fail if no failsafe timer has been set for the channel.

145.52.6 setVoltageAsync(targetVelocity as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the voltage value that the channel will output.
Notes: The Voltage value is bounded by MinVoltage and MaxVoltage.
The voltage value will not be output until Enabled is set to true.

Run asynchronously in the background and calls setVoltageAsyncCompleted event when done.

145.52.7 Properties

145.52.8 Enabled as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enable the output voltage by setting Enabled to true.
Notes: Disable the output by seting Enabled to false to save power.
(Read and Write property)

145.52.9 MaxFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: In milliseconds.
(Read only property)

145.52.10 MaxVoltage as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that Voltage can be set to.
Notes: In volts.
(Read only property)

145.52.11 MinFailsafeTime as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that failsafeTime can be set to when calling EnableFailsafe.
Notes: In milliseconds.
(Read only property)

145.52.12 MinVoltage as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that Voltage can be set to.
Notes: In volts.
(Read only property)

145.52.13 Voltage as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The voltage value that the channel will output.
Notes: The Voltage value is bounded by MinVoltage and MaxVoltage.
The voltage value will not be output until Enabled is set to true.
(Read and Write property)

145.52.14 VoltageOutputRange as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Choose a VoltageOutputRange that best suits your application.
Notes: Changing the VoltageOutputRange will also affect the MinVoltage and MaxVoltage values.
(Read and Write property)

145.52.15 Events

145.52.16 setVoltageAsyncCompleted(ReturnCode as integer)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called by setVoltageAsync.

145.52.17 Constants

Output Voltage Range

Constant	Value	Description
kVoltageOutputRange10V	1	¬±10V DC
kVoltageOutputRange5V	2	0-5V DC

145.53 class PhidgetVoltageRatioInputMBS

145.53.1 class PhidgetVoltageRatioInputMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Voltage Ratio Input class is used for measuring the ratio between the voltage supplied to and the voltage returned from an attached sensor or device.
Example:

```
// read values from a voltage ratio input Phidget
// MyVoltageRatioInput is a subclass of PhidgetVoltageRatioInputMBS with the events implemented.
// VoltageRatioInput is a property of the window: VoltageRatioInput As MyVoltageRatioInput

VoltageRatioInput = New MyVoltageRatioInput
VoltageRatioInput.open

// in MyVoltageRatioInput:
Sub Attached() Handles Attached
Me.DataInterval = 1000 // one value per second
End Sub

Sub VoltageRatioChanged(voltageRatio As Double) Handles VoltageRatioChanged
System.DebugLog "voltageRatio: " + voltageRatio.ToString
End Sub

Sub Error(errorCode As Integer, errorString As String) Handles Error
System.DebugLog "Error " + errorCode.ToString + ": " + errorString
End Sub
```

Notes: This is useful for interfacing with ratiometric sensors or wheatstone bridge based sensors.

For ratiometric sensors, this class supports conversion to sensor data with units specific to the Phidget sensor being used, to make reading these sensors easy.
Subclass of the PhidgetMBS class.

145.53.4 Properties

145.53.5 BridgeEnabled as Boolean

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enable power to and data from the input by setting BridgeEnabled to true.
Notes: (Read and Write property)

145.53.6 BridgeGain as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Choose a BridgeGain that best suits your application.
Notes: For more information about the range and accuracy of each BridgeGain to decide which best suits your application, see your device's User Guide.
(Read and Write property)

145.53.7 DataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The DataInterval is the time that must elapse before the channel will fire another event.
Notes: The data interval is bounded by MinDataInterval and MaxDataInterval.
The timing between events can also affected by the change trigger.

Unit: milliseconds (ms)
(Read and Write property)

145.53.8 MaxDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.53.9 MaxVoltageRatio as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value the VoltageRatioChange event will report.
Notes: (Read only property)

145.53.10 MaxVoltageRatioChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum value that VoltageRatioChangeTrigger can be set to.
Notes: (Read only property)

145.53.11 MinDataInterval as UInt32

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that DataInterval can be set to.
Notes: Unit: milliseconds (ms)
(Read only property)

145.53.12 MinVoltageRatio as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value the VoltageRatioChange event will report.
Notes: (Read only property)

145.53.13 MinVoltageRatioChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The minimum value that VoltageRatioChangeTrigger can be set to.
Notes: (Read only property)

145.53.14 SensorType as Integer

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries sensor type.
Notes: We sell a variety of analog sensors that do not have their own API, they simply output a voltage that can be converted to a digital value using a specific formula. By matching the SensorType to your analog sensor, the correct formula will automatically be applied to data when you get the SensorValue or subscribe to the SensorChange event.

The SensorChange event has its own change trigger associated with it: SensorValueChangeTrigger.

Any data from getting the SensorValue or subscribing to the SensorChange event will have a SensorUnit associated with it.

Note: Unlike other properties such as DeviceSerialNumber or Channel, SensorType is set after the device is opened, not before.
(Read and Write property)

145.53.15 SensorUnit as PhidgetUnitInfoMBS

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The unit of measurement that applies to the sensor values of the SensorType that has been selected.
Notes: Helps keep track of the type of information being calculated from the voltage ratio input.
(Read only property)

145.53.16 SensorValue as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent sensor value that the channel has reported.
Notes: Use SensorUnit to get the measurement units that are associated with the SensorValue.
(Read only property)

145.53.17 SensorValueChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a SensorChange event until the sensor value has changed by the amount specified by the SensorValueChangeTrigger.
Notes: Setting the SensorChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering
(Read and Write property)

145.53.18 VoltageRatio as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent voltage ratio value that the channel has reported.
Notes: This value will always be between MinVoltageRatio and MaxVoltageRatio.
(Read only property)

145.53.19 VoltageRatioChangeTrigger as Double

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The channel will not issue a VoltageRatioChange event until the voltage ratio value has changed by the amount specified by the VoltageRatioChangeTrigger.
Notes: Setting the VoltageRatioChangeTrigger to 0 will result in the channel firing events every DataInterval. This is useful for applications that implement their own data filtering
(Read and Write property)

145.53.20 Events

145.53.21 SensorChanged(sensorValue as double, sensorUnit as PhidgetUnitInfoMBS)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent sensor value the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a SensorValueChangeTrigger has been set to a non-zero value, the SensorChange event will not occur until the sensor value has changed by at least the SensorValueChangeTrigger value.
This event only fires when SensorType is not set to SENSOR_TYPE_VOLTAGERATIO

sensorValue: The sensor value
sensorUnit: The sensor unit information corresponding to the SensorValue.
Helps keep track of the type of information being calculated from the voltage ratio input.

145.53.22 VoltageRatioChanged(voltageRatio as double)

MBS Phidgets Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The most recent voltage ratio value the channel has measured will be reported in this event, which occurs when the DataInterval has elapsed.
Notes: If a VoltageRatioChangeTrigger has been set to a non-zero value, the VoltageRatioChange event will not occur until the voltage has changed by at least the VoltageRatioChangeTrigger value.
If SensorType is supported and set to anything other then SENSOR_TYPE_VOLTAGERATIO, this event will not fire.

145.53.23 Constants

Bridge gain amplification

Constant	Value	Description
kBridgeGain1	1	1x Amplification
kBridgeGain128	8	128x Amplification
kBridgeGain16	5	16x Amplification
kBridgeGain2	2	2x Amplification
kBridgeGain32	6	32x Amplification
kBridgeGain4	3	4x Amplification
kBridgeGain64	7	64x Amplification
kBridgeGain8	4	8x Amplification

Sensor Types

Constant	Value	Description
kSensorType1101_Sharp_2D120X	&h2b03	1101 - IR Distance Adapter, with Sharp Distance Sensor 2D120X (4-30cm
kSensorType1101_Sharp_2Y0A02	&h2b05	1101 - IR Distance Adapter, with Sharp Distance Sensor 2Y0A02 (20-150
kSensorType1101_Sharp_2Y0A21	&h2b04	1101 - IR Distance Adapter, with Sharp Distance Sensor 2Y0A21 (10-80c
kSensorType1102	&h2b0c	1102 - IR Reflective Sensor 5mm
kSensorType1103	&h2b16	1103 - IR Reflective Sensor 10cm
kSensorType1104	&h2b20	1104 - Vibration Sensor
kSensorType1105	&h2b2a	1105 - Light Sensor
kSensorType1106	&h2b34	1106 - Force Sensor
kSensorType1107	&h2b3e	1107 - Humidity Sensor
kSensorType1108	&h2b48	1108 - Magnetic Sensor
kSensorType1109	&h2b52	1109 - Rotation Sensor
kSensorType1110	&h2b5c	1110 - Touch Sensor
kSensorType1111	&h2b66	1111 - Motion Sensor
kSensorType1112	&h2b70	1112 - Slider 60
kSensorType1113	&h2b7a	1113 - Mini Joy Stick Sensor
kSensorType1115	&h2b8e	1115 - Pressure Sensor
kSensorType1116	&h2b98	1116 - Multi-turn Rotation Sensor
kSensorType1118_AC	&h2bad	1118 - 50Amp Current Sensor AC
kSensorType1118_DC	&h2bae	1118 - 50Amp Current Sensor DC
kSensorType1119_AC	&h2bb7	1119 - 20Amp Current Sensor AC
kSensorType1119_DC	&h2bb8	1119 - 20Amp Current Sensor DC
kSensorType1120	&h2bc0	1120 - FlexiForce Adapter
kSensorType1121	&h2bca	1121 - Voltage Divider
kSensorType1122_AC	&h2bd5	1122 - 30 Amp Current Sensor AC
kSensorType1122_DC	&h2bd6	1122 - 30 Amp Current Sensor DC
kSensorType1124	&h2be8	1124 - Precision Temperature Sensor
kSensorType1125_Humidity	&h2bf3	1125 - Humidity Sensor
kSensorType1125_Temperature	&h2bf4	1125 - Temperature Sensor
kSensorType1126	&h2bfc	1126 - Differential Air Pressure Sensor +- 25kPa
kSensorType1128	&h2c10	1128 - MaxBotix EZ-1 Sonar Sensor
kSensorType1129	&h2c1a	1129 - Touch Sensor
kSensorType1131	&h2c2e	1131 - Thin Force Sensor
kSensorType1134	&h2c4c	1134 - Switchable Voltage Divider
kSensorType1136	&h2c60	1136 - Differential Air Pressure Sensor +-2 kPa
kSensorType1137	&h2c6a	1137 - Differential Air Pressure Sensor +-7 kPa
kSensorType1138	&h2c74	1138 - Differential Air Pressure Sensor 50 kPa
kSensorType1139	&h2c7e	1139 - Differential Air Pressure Sensor 100 kPa
kSensorType1140	&h2c88	1140 - Absolute Air Pressure Sensor 20-400 kPa
kSensorType1141	&h2c92	1141 - Absolute Air Pressure Sensor 15-115 kPa
kSensorType1146	&h2cc4	1146 - IR Reflective Sensor 1-4mm
kSensorType3120	&h79e0	3120 - Compression Load Cell (0-4.5 kg)
kSensorType3121	&h79ea	3121 - Compression Load Cell (0-11.3 kg)
kSensorType3122	&h79f4	3122 - Compression Load Cell (0-22.7 kg)
kSensorType3123	&h79fe	3123 - Compression Load Cell (0-45.3 kg)
kSensorType3130	&h7a44	3130 - Relative Humidity Sensor
kSensorType3520	&h8980	3520 - Sharp Distance Sensor (4-30cm)
kSensorType3521	&h898a	3521 - Sharp Distance Sensor (10-80cm)
kSensorType3522	&h8994	3522 - Sharp Distance Sensor (20-150cm)
kSensorTypeVoltageRatio	0	Generic ratiometric sensor, Default. Configures the channel to be a ge ratiometric sensor. Unit is volts/volt.

Chapter 146

Photos

146.1 control DesktopPHLivePhotoControlMBS

146.1.1 control DesktopPHLivePhotoControlMBS

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A view that displays a Live Photo—a picture that also includes motion and sound from the moments just before and after its capture.
Notes: Use a Live Photo view to display the photo and control playback of its motion and sound content.

In macOS, Live Photo objects are available only when editing Live Photo content in a photo editing extension that runs in the Photos app—see the PHContentEditingInputMBS class to access Live Photo content in an editing session.

By default, a Live Photo view uses its own gesture recognizer to allow the user to play the motion and sound content of a Live Photo with the same interactions and visual effects seen in the Photos app. To customize this gesture recognizer—for example, to install it on a different view for proper event handling in your app,Äôs view hierarchy—use the playbackGestureRecognizer property.

To animate the view briefly to hint that a picture is a Live Photo, use the startPlayback method with the PlaybackStyleHint option.

146.1.2 Methods

146.1.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether this control is available.

146.1.4 startPlayback(style as integer)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Begins playback of Live Photo content in the view.
Notes: style: An option for how much of the Live Photo,Äôs motion and sound content to play. See PHLivePhotoViewPlaybackStyle.

Use the style parameter to choose whether to play the full motion and sound content of the Live Photo or only a brief section.

Typically, an app does not need to directly control playback, because a Live Photo view provides interactive playback control. Use this method only when non-interactive playback is appropriate—for example, to briefly animate the content to indicate that a view contains a Live Photo rather than a still image.

146.1.5 stopPlayback

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Ends playback of Live Photo content in the view.
See also:

- 146.1.6 stopPlayback(animated as boolean) 19856

146.1.6 stopPlayback(animated as boolean)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Ends playback of Live Photo content in the view.
See also:

- 146.1.5 stopPlayback 19856

146.1.7 Properties

146.1.8 audioVolume as Single

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The audio gain to apply to the Live Photo,Äôs movie content during playback.
Notes: Values for this property must be between 0.0 and 1.0, inclusive. A value of 1.0 (the default) plays audio content from the Live Photo at full volume (relative to the system volume). A value of 0.0 is equivalent to setting the muted property to true.
(Read and Write property)

146.1.9 ContentMode as Integer

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The content mode.
Notes: (Read and Write property)

146.1.10 LivePhoto as PHLivePhotoMBS

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Live Photo displayed in the view.
Notes: (Read and Write property)

146.1.11 livePhotoBadgeView as NSViewMBS

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A view for displaying Live Photo status.
Notes: The PHLivePhotoViewMBS uses this subview to display icons indicating the existence or status of Live Photo content. Photos manages the content displayed in the badge view, so you don,Äôt need to do anything with view,Äôs content—instead, this property provides access to the badge view so you can change where it appears in your view hierarchy if needed. For example, if you display a Live Photo view within a scroll view, you can move the badge view so that its position remains constant while the scroll view scrolls.

(Read only property)

146.1.12 muted as Boolean

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that determines whether the view plays the audio content of its Live Photo.
Notes: The default value is false, indicating that the view plays audio content along with the motion content of its Live Photo. Change this value to true to play motion content but not audio content.
(Read and Write property)

146.1.13 View as NSViewMBS

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

146.1.14 Events

146.1.15 BoundsChanged

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

146.1.16 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

146.1.17 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

146.1.18 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

146.1.19 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS Mac64bit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

146.1.20 didEndPlaybackWithStyle(playbackStyle as Integer)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate that Live Photo playback has ended.
Notes: playbackStyle: The style of playback, indicating whether the content was played in full or briefly previewed.

146.1.21 FocusLost

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

146.1.22 FocusReceived

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

146.1.23 FrameChanged

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

146.1.24 MenuBarSelected

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

146.1.25 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

146.1.26 MouseDrag(x as Integer, y as Integer)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

146.1.27 MouseUp(x As Integer, y As Integer)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

146.1.28 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

146.1.29 ScaleFactorChanged(NewFactor as double)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

146.1.30 willBeginPlaybackWithStyle(playbackStyle as Integer)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Notifies the control that Live Photo playback is about to begin.
Notes: playbackStyle: The style of playback, indicating whether the content is to be played in full or briefly previewed.

146.1.31 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS Mac64bit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

146.1.32 Constants

Content Modes

Constant	Value	Description
ContentModeAspectFill	1	Aspect Fill.
ContentModeAspectFit	0	Aspect Fit.

Playback Styles

Constant	Value	Description
PlaybackStyleFull	1	Plays back the entire motion and sound content of the Live Photo, including transition effects at the start and end.
PlaybackStyleHint	2	Plays back only a brief section of the motion content of the Live Photo, without sound.
PlaybackStyleUndefined	0	This value is invalid for use.

146.2 control DesktopPHPickerControlMBS

146.2.1 control DesktopPHPickerControlMBS

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The Xojo control to host a PHPickerViewController on a Xojo window.
Notes: Please implement Configure event to provide the PHPickerConfigurationMBS object to use.

Since the PHPicker view is running in a different process and only shown inside your application, the events for contextual menus, focus and mouse events don't fire.
Blog Entries

146.2.2 Properties

146.2.3 Controller as PHPickerViewControllerMBS

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The reference to the underlaying PHPickerViewController.
Notes: (Read only property)

146.2.4 View as NSViewMBS

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The view used.
Notes: Access properties of the view hosted in the control via this variable.
(Read only property)

146.2.5 Events

146.2.6 BoundsChanged

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

146.2.7 Closing

Plugin Version: 25.1, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

146.2.8 Configure as PHPickerConfigurationMBS

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: Queries the configuration to use.
Notes: Please return the PHPickerConfigurationMBS object to use for the control.
This is called before the open event.

146.2.9 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 25.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

146.2.10 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 25.1, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

146.2.11 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

146.2.12 didFinishPicking(Result() as PHPickerResultMBS)

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate that the user completed a selection or dismissed the picker using the cancel button.
Notes: picker: The currently presented picker view controller.
results: The results of the user,Äôs selections.

The system doesn,Äôt automatically dismiss the picker after calling this method, but the plugin does.

It may happen that the user manages to dismiss the dialog without this event running. Seems to be a bug in iOS. So you can catch the viewDidDisappear event and do any cleanup there, if the didFinishPicking event did not fire before.

146.2.13 FocusLost

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

146.2.14 FocusReceived

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.

Notes:

This only fires if the control itself got focus and not a sub control.

146.2.15 FrameChanged

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

146.2.16 MenuBarSelected

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

146.2.17 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

146.2.18 MouseDrag(x as Integer, y as Integer)

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.

As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

146.2.19 MouseUp(x As Integer, y As Integer)

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

146.2.20 Opening

Plugin Version: 25.1, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

146.2.21 ScaleFactorChanged(NewFactor as double)

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

146.2.22 viewDidAppear

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The view appeared.

146.2.23 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

146.3 class PHAdjustmentDataMBS

146.3.1 class PHAdjustmentDataMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A description of the edits made to an asset's photo, video, or Live Photo content, which allows your app to reconstruct or revert the effects of prior editing sessions.
Example:

```
// describe your edit, so your app can change it again later
Var settings As String = " { ""brightness"":0.2,""contrast"":1.1 } "
Var adjustment As New PHAdjustmentDataMBS("com.example.myapp.filter", "1.0", settings)

MessageBox adjustment.formatIdentifier + " " + adjustment.formatVersion + ": " + adjustment.data.StringValue(0, adjustment.data.Size)
// this is meant for the adjustmentData of a PHContentEditingOutputMBS when saving an edit
```

Notes: When a user edits an asset, Photos saves a PHAdjustmentData object along with the modified image or video data. This object provides an application-defined ‚Äúrecipe‚Äù you can use to reconstruct the edit. For example, if your app applies filters to a photo, you might might create adjustment data that identifies which filters the user picked, the parameters for each, and the order to apply the filters in. Later, the user can resume working with those filters and parameters by using your app or another app that understands your adjustment data format. When iCloud Photos is enabled, a user can revert or resume edits made on a different device.

You work with adjustment data when editing an asset, using either the requestContentEditingInputWithOptions method or a photo extension view controller that implements the PHContentEditingController protocol.

- When you begin an edit (through a PHContentEditingInputMBS object), examine the editing input‚Äôs adjustmentData property to decide whether the last edit made to the asset is compatible with your app. If so, you can allow the user to resume working with that edit. If not, you can make further edits to the last saved version of the photo.

- When you commit an edit (through a PHContentEditingOutputMBS object), provide a new adjustment whose data represents the changes your app made.

For each asset, Photos stores only one PHAdjustmentDataMBS object, representing the most recent edit made to the asset‚Äôs content.

146.3.2 Methods

146.3.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.11 or newer.

146.3.4 Constructor(formatIdentifier as string, formatVersion as string, data as Memoryblock)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes an adjustment object with the specified format and data.
Notes: formatIdentifier: A string that uniquely identifies the format of the adjustment data.
formatVersion: A version number for the adjustment data format.
data: A serialized form of whatever information is needed to reconstruct the adjustment.

Returns an initialized adjustment object.

To uniquely identify the adjustments your app makes, use the formatIdentifier and formatVersion parameters. These parameters help you determine whether and how to interpret the adjustment data when working with an edited asset later. For best results, use reverse-DNS-style identifiers and monotonically increasing version numbers.
For example, in the first version of your app, you might save adjustment data using the identifier com.example.myApp and version 1.0. If a later version of your app adds incompatible information to the adjustment data, you can use the same identifier and increase the version number to 2.0.

Use the data parameter to store whatever information is useful to your app for reconstructing an edit. For example, if your app applies Core Image filters to photos, you can use this parameter to store a serialized property list that describes the filters and their parameters.

Because Photos limits the size of adjustment data, you should keep your edit information short and descriptive. Don,Äôt use image data to describe an edit—instead, save only the minimal information that is needed to recreate the edit.
Your app must provide a non-empty Memoryblock for the data parameter. If you cannot provide relevant data to describe an edit, you may pass data that encodes an NSUUID object.

146.3.5 Properties

146.3.6 data as Memoryblock

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Data that contains the information necessary to reconstruct the adjustment.
Notes: Use this property to resume working with the last edit that was made to an asset. For example, if your app applies Core Image filters to photos, this property may hold a serialized property list that describes the filters and their parameters. Use the formatIdentifier and formatVersion properties to determine whether the adjustment data saved with an asset is in a format that your app can understand.
(Read only property)

146.3.7 formatIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A string uniquely identifying the format of the adjustment data.
Notes: Set this identifier when you create an adjustment object with the constructor. For best results, identify your organization or product using a reverse-DNS-style name, such as com.example.myApp.

Read this property, and the formatVersion property, to determine whether the adjustment data saved with an asset was created by your app or is otherwise compatible with your app.
(Read only property)

146.3.8 formatVersion as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A version number for the adjustment data format.
Notes: Set this identifier when creating an adjustment object with the constructor.
Read this property, and the formatIdentifier property, to determine whether the adjustment data saved with an asset was created by your app or is otherwise compatible with your app.
For example, in the first version of your app, you might save adjustment data using the identifier com.example.myApp and version 1.0. If a later version of your app adds incompatible information to the adjustment data, you can use the same identifier and increase the version number to 2.0.
(Read only property)

146.3.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.4 class PHAssetChangeRequestMBS

146.4.1 class PHAssetChangeRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A request to create, delete, change metadata for, or edit the content of a Photos asset, for use in a photo library change block.
Example:

```
// import a picture file into the Photos library
// The app needs Photos access, see PHPhotoLibraryMBS.requestAuthorization.
Var error As NSErrorMBS
If PHPhotoLibraryMBS.sharedPhotoLibrary.performChangesAndWait(AddressOf AddPhoto, error) Then
MessageBox "Photo added."
ElseIf error <>Nil Then
MessageBox error.localizedDescription
End If

// a method in the window:
Sub AddPhoto(tag As Variant)
// runs inside the change block, only create change requests here
Var request As PHAssetChangeRequestMBS = PHAssetChangeRequestMBS.creationRequestForAssetFromImageAtFile(SpecialFolder.Desktop.Child("photo.jpg"))
request.Favorite = True
End Sub
```

Notes: You use the PHAssetChangeRequest class to request changes for PHAssetMBS objects. To make changes to assets in the Photos library, create a change request by using the appropriate class method for the change you want to perform.

- Call one of the methods listed in Adding New Assets to create a new asset from an image or video file.
- Call the deleteAssets: method to delete existing assets.
- Call the changeRequestForAsset: method to modify an asset,Äôs content or metadata.

A change request for creating or modifying an asset works like a mutable version of the asset object. Use the change request,Äôs properties to request changes to the corresponding properties of the asset itself.

After Photos runs the change block and calls your completion handler, the asset,Äôs state reflects the changes that you requested in the block.

If you create or use a change request object outside a photo library change block, Photos raises an Objective-C exception. For details on change blocks, see PHPhotoLibraryMBS.

146.4.2 Methods

146.4.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.15 or newer.

146.4.4 changeRequestForAsset(asset as PHAssetMBS) as PHAssetChangeRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a request for modifying the specified asset.
Notes: asset: The asset to be modified.

Returns an asset change request.

Before editing an asset, use its canPerformEditOperation method to see if the asset allows editing.

After you create a change request within a photo library change block, propose changes to the original asset,Äôs properties by setting the corresponding properties of the change request. After Photos runs your change block, the asset,Äôs properties reflect your changes. For details on change blocks, see PHPhotoLibraryMBS.

To edit an asset,Äôs image or video content, first begin a content editing session with the asset,Äôs requestContentEditingInputWithOptions method. You commit a content edit by setting the contentEditingOutput property of a change request within a change block. For more information about asset content editing, see PHAssetMBS.

146.4.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.4.6 creationRequestForAssetFromImage(image as NSImageMBS) as PHAssetChangeRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a request for adding a new image asset to the Photos library.
Notes: image: An image.

Returns an asset creation request.

Call this method within a photo library change block to create a new asset. For details on change blocks, see PHPhotoLibraryMBS.
To reference the newly created asset later in the same change block or after the change block completes, use the placeholderForCreatedAsset property to retrieve a placeholder object.

146.4.7 creationRequestForAssetFromImageAtFile(file as FolderItem) as PHAssetChangeRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a request for adding a new image asset to the Photos library, using the image file at the specified URL.
Notes: file: A URL for an image file.

Returns an asset creation request.

Call this method within a photo library change block to create a new asset. For details on change blocks, see PHPhotoLibraryMBS.

To set metadata properties of the newly created asset, use the corresponding properties of the change request (listed in Modifying Assets). To reference the newly created asset later in the same change block or after the change block completes, use the placeholderForCreatedAsset property to retrieve a placeholder object.

146.4.8 creationRequestForAssetFromVideoAtFileURL(file as FolderItem) as PHAssetChangeRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a request for adding a new video asset to the Photos library, using the video file at the specified URL.
Notes: file: A folderitem for a video file.

Returns an asset creation request.

Call this method within a photo library change block to create a new asset. For details on change blocks,

see PHPhotoLibraryMBS.

To set metadata properties of the newly created asset, use the corresponding properties of the change request (listed in Modifying Assets). To reference the newly created asset later in the same change block or after the change block completes, use the placeholderForCreatedAsset property to retrieve a placeholder object.

146.4.9 deleteAssets(assets() as PHAssetMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Requests that the specified assets be deleted.
Notes: assets: An array of PHAssetMBS objects to be deleted.

Call this method within a photo library change block to delete assets. For details on change blocks, see PHPhotoLibraryMBS.

146.4.10 revertAssetContentToOriginal

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Request to revert any edits made to the asset,Äôs content.
Notes: When an asset has been edited, Photos stores multiple versions of the asset: the original version of the asset as it was first captured or imported, and the input and output of the most recent edit. (You work with asset versions when requesting to edit an asset,Äôs content—see PHContentEditingInputRequestOptions.) Call this method to revert to the original version of the asset, discarding all edits.

This request fails if original content for the asset is not available on the current device (for example, if iCloud Photo Library is enabled and the user has edited the asset on a different device). Use PHAssetResourceManagerMBS to ensure that original asset content is downloaded to the current device before making this request.

146.4.11 Properties

146.4.12 contentEditingOutput as PHContentEditingOutputMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The output of an asset content editing session.
Notes: To edit an asset,Äôs image or video content, you must first begin a content editing session with the asset,Äôs requestContentEditingInputWithOptions method. You commit a content edit by setting the contentEditingOutput property of a change request within a change block. For more information about asset content editing, see PHAssetMBS.

(Read and Write property)

146.4.13 creationDate as Date

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The date and time at which the asset claims to have been originally created.
Notes: Set this property to change the creation date of an asset.
(Read and Write property)

146.4.14 creationDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The date and time at which the asset claims to have been originally created.
Notes: Set this property to change the creation date of an asset.
(Read and Write property)

146.4.15 Favorite as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the asset is marked as one of the user,Äôs favorites.
Notes: (Read and Write property)

146.4.16 Hidden as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the asset is hidden in collections.
Notes: Hidden assets do not appear in the Moments interface in the Photos app.
(Read and Write property)

146.4.17 location as Variant

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The location information saved with the asset.
Notes: Typically, an asset,Äôs location metadata identifies the place where the asset was captured. Use

this property to provide a different location.

We pass result, the CLLocationMBS object, as variant to avoid plugin dependencies.
(Read and Write property)

146.4.18 placeholderForCreatedAsset as PHObjectPlaceholderMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A placeholder object for the asset that the change request creates.
Notes: Use this property if you need to reference the asset created by a change request within the same change block.
(Read only property)

146.5 class PHAssetCollectionChangeRequestMBS

146.5.1 class PHAssetCollectionChangeRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A request to create, delete, or modify a Photos asset collection, for use in a photo library change block.
Example:

```
// create a new album with the 10 newest photos
// The app needs Photos access, see PHPhotoLibraryMBS.requestAuthorization.
Var error As NSErrorMBS
If PHPhotoLibraryMBS.sharedPhotoLibrary.performChangesAndWait(AddressOf CreateAlbum, error) Then
MessageBox "Album created."
ElseIf error <>Nil Then
MessageBox error.localizedDescription
End If

// a method in the window:
Sub CreateAlbum(tag As Variant)
Var options As New PHFetchOptionsMBS
options.fetchLimit = 10
Var sorting() As NSSortDescriptorMBS
sorting.Add NSSortDescriptorMBS.sortDescriptorWithKey("creationDate", False)
options.setSortDescriptors sorting

Var result As PHFetchResultMBS = PHAssetMBS.fetchAssetsWithMediaType(PHAssetMBS.MediaType-
Image, options)
Var assets() As PHAssetMBS
For i As Integer = 0 To result.count - 1
assets.Add PHAssetMBS(result.objectAtIndex(i))
Next

Var request As PHAssetCollectionChangeRequestMBS = PHAssetCollectionChangeRequestMBS.creation-
RequestForAssetCollectionWithTitle("Newest Photos")
request.addAssets assets
End Sub
```

Notes: You use the PHAssetCollectionChangeRequestMBS class to request changes for PHAssetCollection-MBS objects. To make changes to asset collections (such as user-created albums) in the Photos library, create a change request using the appropriate class method for the change you want to perform.

- Call the creationRequestForAssetCollectionWithTitle: method to create a new asset collection.
- Call the deleteAssetCollections: method to delete existing asset collections.

- Call the changeRequestForAssetCollection: or changeRequestForAssetCollection:assets: method to modify a collection,Äôs metadata or list of member assets.

Before creating a change request, use the canPerformEditOperation: method to verify that the collection allows the edit operation you,Äôre requesting. If you attempt to perform an unsupported edit operation, Photos throws an exception.
A change request for creating or modifying an asset collection works like a mutable version of the asset collection object. Use the change request,Äôs properties and instance methods to request changes to the asset collection itself.

After Photos runs the change block and calls your completion handler, the asset collection,Äôs state reflects the changes you requested in the block.
If you create or use a change request object outside a photo library change block, Photos raises an Objective-C exception. For details on change blocks, see PHPhotoLibraryMBS.
Subclass of the PHChangeRequestMBS class.

146.5.2 Methods

146.5.3 addAsset(asset as PHAssetMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Add the specified asset to the asset collection.
Notes: asset: The PHAsset object to be added to the asset collection.

If you created the change request with a snapshot of the asset collection,Äôs contents using the changeRequestForAssetCollection method, Photos inserts the new assets after the existing assets in the collection. Otherwise, the arrangement of the new assets relative to others in the collection is undefined.

Assets from My Photo Stream or iCloud Shared Albums and assets synced to the device through iTunes cannot be added to collections. Transient asset collections (such as those created with the transientAssetCollectionWithAssets method) do not support adding or removing content.

146.5.4 addAssets(assets() as PHAssetMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Add the specified assets to the asset collection.
Notes: assets: An array of PHAsset objects to be added to the asset collection.

If you created the change request with a snapshot of the asset collection,Äôs contents using the changeRequestForAssetCollection method, Photos inserts the new assets after the existing assets in the collection.

Otherwise, the arrangement of the new assets relative to others in the collection is undefined.

Assets from My Photo Stream or iCloud Shared Albums and assets synced to the device through iTunes cannot be added to collections. Transient asset collections (such as those created with the transientAssetCollectionWithAssets method) do not support adding or removing content.

146.5.5 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.15 or newer.

146.5.6 changeRequestForAssetCollection(assetCollection as PHAssetCollectionMBS) as PHAssetCollectionChangeRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a request for modifying the specified asset collection.
Notes: assetCollection: The asset collection to be modified.

Returns an asset collection change request.

After you create a change request within a photo library change block, propose changes to the collection,Äôs title or list of member assets with the properties and instance methods of the change request. After Photos runs your change block, the asset collection reflects your changes. For details on change blocks, see PHPhotoLibraryMBS.

Use this method when modifying an asset collection,Äôs metadata or when adding or removing assets without regard to their arrangement. To work with indexes in the list of member assets, use the changeRequestForAssetCollection method instead.
See also:

- 146.5.7 changeRequestForAssetCollection(assetCollection as PHAssetCollectionMBS, assets as PHFetchResultMBS) as PHAssetCollectionChangeRequestMBS 19881

146.5.7 changeRequestForAssetCollection(assetCollection as PHAssetCollectionMBS, assets as PHFetchResultMBS) as PHAssetCollectionChangeRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a request for modifying the specified asset collection, with a fetch result for tracking changes.
Notes: assetCollection: The asset collection to be modified.
assets: A fetch result listing the assets in the collection.

Returns an asset collection change request.

After you create a change request within a photo library change block, you propose changes to the collection,Äôs title or list of member assets with the properties and instance methods of the change request. After Photos runs your change block, the asset collection reflects your changes. For details on change blocks, see PHPhotoLibraryMBS.

Use this method when you need to insert, remove, or rearrange assets at specified indexes in the asset collection,Äôs list of member assets. By passing in a fetch result reflecting what your app sees as the current state of the collection,Äôs membership, the Photos framework can ensure that the indexes you specify are valid even if the collection has changed since you last fetched it. If you don,Äôt need to work with indexes in the list of member assets, you can use the changeRequestForAssetCollection method instead.
See also:

- 146.5.6 changeRequestForAssetCollection(assetCollection as PHAssetCollectionMBS) as PHAssetCollectionChangeRequestMBS 19881

146.5.8 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.5.9 creationRequestForAssetCollectionWithTitle(title as string) as PHAssetCollectionChangeRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a request for adding a new asset collection to the Photos library.
Notes: image: A name for the new asset collection.

Returns an asset collection creation request.

Call this method within a photo library change block to create a new asset collection. For details on change blocks, see PHPhotoLibraryMBS.
To add assets to the newly created asset collection or change its title, use the methods listed in Modifying Asset Collections. To reference the newly created asset collection later in the same change block or after

the change block completes, use the placeholderForCreatedAssetCollection property to retrieve a placeholder object.

146.5.10 deleteAssetCollections(Collections() as PHCollectionListMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Requests that the specified asset collections be deleted.
Notes: assetCollections: An array of PHAssetCollectionMBS objects to be deleted.

Call this method within a photo library change block to delete asset collections. For details on change blocks, see PHPhotoLibraryMBS.

146.5.11 insertAsset(asset as PHAssetMBS, index as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Insert the specified asset into the collection at the specified indexes.
Notes: asset: A PHAssetMBS object to be inserted into the asset collection.
index: The index at which the asset should be inserted. The count of locations in this index set must equal the count of assets.

To ensure that the index set you specify is valid even if the asset collection has changed since you fetched it, create a change request with a snapshot of the asset collection,Äôs contents using the changeRequestForAssetCollection method before inserting assets.

For a detailed discussion of how the index set you specify maps to insertions in the list of assets, see the similar NSMutableArray method insertObjects.

Assets from My Photo Stream or iCloud Shared Albums and assets synced to the device through iTunes cannot be added to collections. Transient asset collections (such as those created with the transientAssetCollectionWithAssets method) do not support adding or removing content.

146.5.12 insertAssets(assets() as PHAssetMBS, indexes as NSIndexSetMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Inserts the specified assets into the collection at the specified indexes.
Notes: assets: An array of PHAssetMBS objects to be inserted into the asset collection.
indexes: The indexes at which the assets should be inserted. The count of locations in this index set must

equal the count of assets.

To ensure that the index set you specify is valid even if the asset collection has changed since you fetched it, create a change request with a snapshot of the asset collection,Äôs contents using the changeRequestForAssetCollection method before inserting assets.

For a detailed discussion of how the index set you specify maps to insertions in the list of assets, see the similar NSMutableArray method insertObjects.

Assets from My Photo Stream or iCloud Shared Albums and assets synced to the device through iTunes cannot be added to collections. Transient asset collections (such as those created with the transientAssetCollectionWithAssets method) do not support adding or removing content.

146.5.13 moveAsset(fromIndex as Integer, toIndex as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Move the asset at the specified index in the asset collection to a new index.
Notes: fromIndex: The indexes of the asset to be moved in the asset collection.
toIndex: The index at which to place the moved asset, relative to the collection,Äôs ordering after removing the items at indexes.

When you call this method, Photos first removes the items in the indexes parameter from the collection, and then inserts them at the location specified by the toIndex parameter.
To ensure that the index set you specify is valid even if the asset collection has changed since you fetched it, create a change request with a snapshot of the asset collection,Äôs contents using the changeRequestForAssetCollection method before rearranging assets.

146.5.14 moveAssets(fromIndexes as NSIndexSetMBS, toIndex as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Moves the assets at the specified indexes in the asset collection to a new index.
Notes: fromIndexes: The indexes of the assets to be moved in the asset collection.
toIndex: The index at which to place the moved assets, relative to the collection,Äôs ordering after removing the items at indexes.

When you call this method, Photos first removes the items in the indexes parameter from the collection, and then inserts them at the location specified by the toIndex parameter.
To ensure that the index set you specify is valid even if the asset collection has changed since you fetched it, create a change request with a snapshot of the asset collection,Äôs contents using the changeRequestForAssetCollection method before rearranging assets.

146.5.15 removeAsset(asset as PHAssetMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Removes the specified asset from the asset collection.
Notes: asset: A PHAssetMBS object to be removed from the asset collection.

This method removes assets from the collection based on their identity (determined by the localIdentifier property of each asset). To remove objects at specified indexes, use the removeAssets method.

Transient asset collections (such as those created with the transientAssetCollectionWithAssets:title: method) do not support adding or removing content.
See also:

- 146.5.16 removeAsset(AtIndex as Integer) 19885

146.5.16 removeAsset(AtIndex as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Removes the asset at the specified index from the asset collection.
Notes: index: The index of the asset to be removed from the asset collection.

To ensure that the index set you specify is valid even if the asset collection has changed since you fetched it, create a change request with a snapshot of the asset collection,Äôs contents using the changeRequestForAssetCollection method before removing assets. To remove objects based on their identities (without regard to their indexes in the collection), use the removeAssets: method.

Transient asset collections (such as those created with the transientAssetCollectionWithAssets method) do not support adding or removing content.
See also:

- 146.5.15 removeAsset(asset as PHAssetMBS) 19885

146.5.17 removeAssets(assets() as PHAssetMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Removes the specified assets from the asset collection.
Notes: assets: An array of PHAssetMBS objects to be removed from the asset collection.

This method removes assets from the collection based on their identity (determined by the localIdentifier property of each asset). To remove objects at specified indexes, use the removeAssets method.

Transient asset collections (such as those created with the transientAssetCollectionWithAssets:title: method) do not support adding or removing content.
See also:

- 146.5.18 removeAssets(AtIndexes as NSIndexSetMBS) 19886

146.5.18 removeAssets(AtIndexes as NSIndexSetMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Removes the assets at the specified indexes from the asset collection.
Notes: indexes: The indexes of the assets to be removed from the asset collection.

To ensure that the index set you specify is valid even if the asset collection has changed since you fetched it, create a change request with a snapshot of the asset collection,Äôs contents using the changeRequestForAssetCollection method before removing assets. To remove objects based on their identities (without regard to their indexes in the collection), use the removeAssets: method.

Transient asset collections (such as those created with the transientAssetCollectionWithAssets method) do not support adding or removing content.
See also:

- 146.5.17 removeAssets(assets() as PHAssetMBS) 19885

146.5.19 replaceAsset(AtIndex as Integer, asset as PHAssetMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Replaces the asset at the specified index in the asset collection with the specified asset.
Notes: index: The index of the asset to be replaced in the asset collection.
asset: A PHAssetMBS object to be inserted into (or moved within) the asset collection.

To ensure that the index set you specify is valid even if the asset collection has changed since you fetched it, create a change request with a snapshot of the asset collection,Äôs contents using the changeRequestForAssetCollection method before rearranging assets.

Assets from My Photo Stream or iCloud Shared Albums and assets synced to the device through iTunes cannot be added to collections. Transient asset collections (such as those created with the transientAssetCollectionWithAssets method) do not support adding or removing content.

146.5.20 replaceAssets(AtIndexes as NSIndexSetMBS, assets() as PHAssetMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Replaces the assets at the specified indexes in the asset collection with the specified assets.
Notes: indexes: The indexes of the assets to be replaced in the asset collection.
assets: An array of PHAssetMBS objects to be inserted into (or moved within) the asset collection.

To ensure that the index set you specify is valid even if the asset collection has changed since you fetched it, create a change request with a snapshot of the asset collection,Äôs contents using the changeRequestForAssetCollection method before rearranging assets.

Assets from My Photo Stream or iCloud Shared Albums and assets synced to the device through iTunes cannot be added to collections. Transient asset collections (such as those created with the transientAssetCollectionWithAssets method) do not support adding or removing content.

146.5.21 Properties

146.5.22 placeholderForCreatedAssetCollection as PHObjectPlaceholderMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A placeholder object for the asset collection that the change request creates.
Notes: Use this property if you need to reference the asset collection created by a change request within the same change block.
(Read only property)

146.5.23 title as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The displayed name of the asset collection.
Notes: Set this property to change the asset collection,Äôs title.
(Read and Write property)

146.6 class PHAssetCollectionMBS

146.6.1 class PHAssetCollectionMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A representation of a Photos asset grouping, such as a moment, user-created album, or smart album.
Example:

```
// list the albums of the user in the Photos library with the number of items
// The app needs Photos access, see PHPhotoLibraryMBS.requestAuthorization.
Var albums As PHFetchResultMBS = PHAssetCollectionMBS.fetchAssetCollectionsWithType(PHAssetCollectionMBS.TypeAlbum, PHAssetCollectionMBS.SubtypeAny)
Var lines() As String

For i As Integer = 0 To albums.count - 1
Var album As PHAssetCollectionMBS = PHAssetCollectionMBS(albums.objectAtIndex(i))
Var assets As PHFetchResultMBS = PHAssetMBS.fetchAssetsInAssetCollection(album)
lines.Add album.localizedTitle + ": " + assets.count.ToString
Next

MessageBox String.FromArray(lines, EndOfLine)
```

Notes: In the Photos framework, collection objects (including asset collections) do not directly reference their member objects, and there are no other objects that directly reference collection objects. To retrieve the members of an asset collection, fetch them with a PHAsset class method such as fetchAssetsInAssetCollection. To find asset collections, use one of the methods listed in Fetching Asset Collections.

Important
Accessing or modifying the Photos library requires explicit authorization from the user. The first time you call one of the methods listed in Fetching Asset Collections, Photos automatically prompts the user for authorization. (Alternatively, you can use the PHPhotoLibraryMBS.requestAuthorization method to prompt the user at a time of your choosing.)

Your app,Äôs Info.plist file must provide a value for the NSPhotoLibraryUsageDescription key that explains to the user why your app is requesting Photos access. Apps linked on or after iOS 10.0 will crash if this key is not present.

Like assets and collection lists, asset collections are immutable. To create, rename, or delete asset collections, or to add, remove, or rearrange members in an asset collection, create a PHAssetCollectionChangeRequestMBS object within a photo library change block. For details on using change requests and change blocks to update the photo library, see PHPhotoLibraryMBS.
Subclass of the PHCollectionMBS class.

146.6.2 Methods

146.6.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.6.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.6.5 fetchAssetCollectionsContainingAsset(asset as PHAssetMBS, type as Integer, options as PHFetchOptionsMBS = nil) as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves asset collections of the specified type containing the specified asset.
Notes: asset: A Photos asset.
type: An asset collection type, such as an album or a moment. See Type constants.
options: Options that specify a filter predicate and sort order for the fetched asset collections, or nil to use default options. For details, see PHFetchOptionsMBS.

Returns a fetch result that contains the requested PHAssetCollectionMBS objects, or an empty fetch result if no objects match the request.

146.6.6 fetchAssetCollectionsWithALAssetGroupURLs(assetGroupURLs() as string, options as PHFetchOptionsMBS = nil) as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves asset collections using URLs provided by the Assets Library framework.
Notes: assetGroupURLs: An array of URLs, each an asset group URL that was previously retrieved from an ALAssetsGroupMBS object.

options: Options that specify a filter predicate and sort order for the fetched asset collections, or nil to use default options. For details, see PHFetchOptionsMBS.

Returns a fetch result that contains the requested PHAssetCollectionMBS objects, or an empty fetch result if no objects match the request.

The Assets Library framework is deprecated in iOS 8.0 and later, replaced by the Photos framework. Use this method if your app has previously stored URLs from ALAssetsGroupMBS objects and you need to retrieve the corresponding Photos framework objects.

146.6.7 fetchAssetCollectionsWithLocalIdentifiers(identifiers() as string, options as PHFetchOptionsMBS = nil) as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves asset collections with the specified unique identifiers.
Notes: identifiers: An array of strings, each the localIdentifier string of an asset collection.
options: Options that specify a filter predicate and sort order for the fetched asset collections, or nil to use default options. For details, see PHFetchOptionsMBS.

Returns a fetch result that contains the requested PHAssetCollectionMBS objects, or an empty fetch result if no objects match the request.

146.6.8 fetchAssetCollectionsWithType(type as Integer, subType as integer, options as PHFetchOptionsMBS = nil) as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves asset collections of the specified type and subtype.
Notes: type: A type of asset collection, such as an album or a moment. See Type constants.
subtype: A subtype of asset collection. See Subtype constants.
options: Options that specify a filter predicate and sort order for the fetched asset collections, or nil to use default options. For details, see PHFetchOptionsMBS.

Returns a fetch result that contains the requested PHAssetCollectionMBS objects, or an empty fetch result if no objects match the request.

By default, the returned PHFetchResultMBS object contains all asset collections with the specified type and subtype. To retrieve a more specific set of asset collections, provide a PHFetchOptionsMBS object containing a filter predicate.

146.6.9 localizedLocationNames as String()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The names of locations grouped by the collection (an array of strings).
Notes: This property applies only to asset collections whose type is PHAssetCollectionTypeMoment. The Photos app automatically creates moments to group assets by time and location. A moment might group assets captured in multiple locations, so this array can contain multiple names. For other asset collection types, this property,Äôs value is nil.

146.6.10 transientAssetCollectionWithAssetFetchResult(fetchResult as PHAssetMBS, title as string) as PHAssetCollectionMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a temporary asset collection containing the assets from the specified fetch result.
Notes: fetchResult: A fetch result containing one or more PHAssetMBS objects.
title: A name for the new temporary asset collection.

Returns a new asset collection.

Transient asset collections are not saved to local storage or iCloud and do not appear in the Photos application or other apps using the Photos framework. A transient collection can be useful if you,Äôve designed a UI for displaying the contents of a collection and want to display an arbitrary set of assets.

146.6.11 transientAssetCollectionWithAssets(assets() as PHAssetMBS, title as string) as PHAssetCollectionMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a temporary asset collection containing the specified assets.
Notes: assets: An array of PHAssetMBS objects.
title: A name for the new temporary asset collection.

Returns a new asset collection.

Transient asset collections are not saved to local storage or iCloud and do not appear in the Photos app or other apps using the Photos framework. A transient collection can be useful if you,Äôve designed a UI for displaying the contents of a collection and want to display an arbitrary set of assets.

146.6.12 Properties

146.6.13 approximateLocation as Variant

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A location representing those of all assets in the collection.
Notes: The Photos app automatically creates moments to group assets by time and location. A moment can contain photos from several locations in close proximity. In such cases, this property describes the general area containing the locations of all assets in the moment.
This property applies only to asset collections whose type is TypeMoment. For other asset collection types, this property,Äôs value is nil.

We pass result, the CLLocationMBS object, as variant to avoid plugin dependencies.
(Read only property)

146.6.14 assetCollectionSubtype as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The subtype of the asset collection.
Notes: Use subtypes to make minor distinctions between collections of the same type. For albums, for example, you might distinguish user-created albums from those synced from iPhoto. See Subtype constants for possible values.
(Read only property)

146.6.15 assetCollectionType as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The type of the asset collection, such as an album or a moment.
Notes: (Read only property)

146.6.16 endDate as Date

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The latest creation date among all assets in the asset collection.
Notes: This property applies only to asset collections whose type is TypeMoment. For other asset collection types, this property,Äôs value is nil.
(Read only property)

146.6.17 endDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The latest creation date among all assets in the asset collection.
Notes: This property applies only to asset collections whose type is TypeMoment. For other asset collection types, this property,Äôs value is nil.
(Read only property)

146.6.18 estimatedAssetCount as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The estimated number of assets in the asset collection.
Notes: This count may not match the current number of assets in the collection. To get the most recent count, fetch the collection,Äôs assets with the fetchAssetsInAssetCollection method and read the count property of the fetch result.
If asset count information is not available for the collection, this property,Äôs value is NSNotFound.
(Read only property)

146.6.19 startDate as Date

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The earliest creation date among all assets in the asset collection.
Notes: This property applies only to asset collections whose type is TypeMoment. For other asset collection types, this property,Äôs value is nil.
(Read only property)

146.6.20 startDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The earliest creation date among all assets in the asset collection.
Notes: This property applies only to asset collections whose type is TypeMoment. For other asset collection types, this property,Äôs value is nil.
(Read only property)

146.6.21 Constants

SubTypes

Constant	Value	Description
SubtypeAlbumCloudShared	101	An iCloud Shared Photo Stream.
SubtypeAlbumImported	6	An album imported from a camera or external storage.
SubtypeAlbumMyPhotoStream	100	The user,Äôs personal iCloud Photo Stream.
SubtypeAlbumRegular	2	An album created in the Photos app.
SubtypeAlbumSyncedAlbum	5	An album synced to the device from iPhoto.
SubtypeAlbumSyncedEvent	3	An Event synced to the device from iPhoto.
SubtypeAlbumSyncedFaces	4	A Faces group synced to the device from iPhoto.
SubtypeAny	-1	A bit mask representing all possible subtypes.
SubtypeSmartAlbumAllHidden	205	A smart album that groups all assets hidden from the Moments view i Photos app.
SubtypeSmartAlbumAnimated	214	A smart album that groups all image animation assets.
SubtypeSmartAlbumBursts	207	A smart album that groups all burst photo sequences in the photo librar
SubtypeSmartAlbumCinematic	218	A Smart Album that groups all cinematic photo assets.
SubtypeSmartAlbumDepthEffect	212	A smart album that groups all images captured using the Depth Effect ca mode on compatible devices.
SubtypeSmartAlbumFavorites	203	A smart album that groups all assets that the user has marked as favorit
SubtypeSmartAlbumGeneric	200	A smart album of no more specific subtype.
SubtypeSmartAlbumLivePhotos	213	A smart album that groups all Live Photo assets.
SubtypeSmartAlbumLongExposures	215	A smart album that groups all Live Photo assets where the Long Exp variation is enabled.
SubtypeSmartAlbumPanoramas	201	A smart album that groups all panorama photos in the photo library.
SubtypeSmartAlbumRAW	217	A Smart Album that groups all RAW assets in the photo library.
SubtypeSmartAlbumRecentlyAdded	206	A smart album that groups assets that were recently added to the photo lib
SubtypeSmartAlbumScreenshots	211	A smart album that groups all images captured using the device,Äôs scree function.
SubtypeSmartAlbumSelfPortraits	210	A smart album that groups all photos and videos captured using the devic front-facing camera.
SubtypeSmartAlbumSlomoVideos	208	A smart album that groups all Slow-Mo videos in the photo library.
SubtypeSmartAlbumSpatial	219	A Smart Album that groups spatial videos in the photo library.
SubtypeSmartAlbumTimelapses	204	A smart album that groups all time-lapse videos in the photo library.
SubtypeSmartAlbumUnableToUpload	216	Unable to upload album.
SubtypeSmartAlbumUserLibrary	209	A smart album that groups all assets that originate in the user,Äôs own li (as opposed to assets from iCloud Shared Albums).
SubtypeSmartAlbumVideos	202	A smart album that groups all video assets in the photo library.

Types

Constant	Value	Description
TypeAlbum	1	An album in the Photos app.
TypeMoment	3	A moment in the Photos app. Deprecated by Apple.
TypeSmartAlbum	2	A smart album whose contents update dynamically.

146.7 class PHAssetCreationRequestMBS

146.7.1 class PHAssetCreationRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A request to create a new Photos asset from underlying data resources, for use in a photo library change block.
Example:

```
// import a photo and keep its original file name in the library
// The app needs Photos access, see PHPhotoLibraryMBS.requestAuthorization.
Var error As NSErrorMBS
If Not PHPhotoLibraryMBS.sharedPhotoLibrary.performChangesAndWait(AddressOf ImportPhoto, error)
And error <>Nil Then
MessageBox error.localizedDescription
End If

// a method in the window:
Sub ImportPhoto(tag As Variant)
Var options As New PHAssetResourceCreationOptionsMBS
options.originalFilename = "Holiday 2025.jpg"

Var request As PHAssetCreationRequestMBS = PHAssetCreationRequestMBS.creationRequestForAsset
request.addResource(PHAssetCreationRequestMBS.TypePhoto, SpecialFolder.Desktop.Child("IMG_1234.jpg"),
options)
End Sub
```

Notes: A PHAssetCreationRequestMBS object, used within a photo library change block, constructs a new photo or video asset from data resources, and adds it to the Photos library. This class works in terms of the raw data resources that together form an asset, so you can use it together with the PHAssetResource class to perform a complete copy (or backup and restore) of an asset,Ăôs underlying resources. To instead simply create a new asset from an image object, image file, or video file, see the superclass PHAssetChangeRequestMBS.

To create a new asset from data resources, first start a change block using the shared PHPhotoLibraryMBS method performChanges or performChangesAndWait. Then, within the change block:

1. Within the change block, create a new asset creation request with the creationRequestForAsset method.
2. Add image, video, or data resources using the methods listed in Providing Data Resources for the New Asset.
3. (Optional.) Set metadata for the new asset using methods and properties of the superclass PHAssetChangeRequestMBS.

After Photos runs the change block and calls your completion handler, the new asset is created in the Photos library.

If you instantiate or use this class outside a photo library change block, Photos throws an exception. For details on change blocks, see PHPhotoLibrary.
Subclass of the PHAssetChangeRequestMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

146.7.2 Methods

146.7.3 addResource(type as Integer, data as MemoryBlock, options as PHAssetResourceCreationOptionsMBS = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Adds a data resource to the asset being created, using the specified data.
Notes: type: The role of this data resource in constructing an asset. For details, see type constants.
data: The data for the asset resource.
options: Options affecting how Photos constructs the asset resource and incorporates its data into the Photos library. For details, see PHAssetResourceCreationOptionsMBS class.

Photos imports the asset resource data only when it executes the PHPhotoLibraryMBS change block in which you create a PHAssetCreationRequest object and call this method. If you attempt to create an asset with invalid data or an invalid combination of resources, Photos reports an error in the completion handler of your PHPhotoLibraryMBS call.

- 146.7.5 addResource(type as Integer, file as FolderItem, options as PHAssetResourceCreationOptionsMBS = nil) 19897

146.7.4 addResource(type as Integer, data as String, options as PHAssetResourceCreationOptionsMBS = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Adds a data resource to the asset being created, using the specified data.
Notes: type: The role of this data resource in constructing an asset. For details, see type constants.
data: The data for the asset resource.
options: Options affecting how Photos constructs the asset resource and incorporates its data into the Photos library. For details, see PHAssetResourceCreationOptionsMBS class.

Photos imports the asset resource data only when it executes the PHPhotoLibraryMBS change block in which you create a PHAssetCreationRequest object and call this method. If you attempt to create an asset with invalid data or an invalid combination of resources, Photos reports an error in the completion handler of your PHPhotoLibraryMBS call.
See also:

- 146.7.3 addResource(type as Integer, data as MemoryBlock, options as PHAssetResourceCreationOptionsMBS = nil) 19896
- 146.7.5 addResource(type as Integer, file as FolderItem, options as PHAssetResourceCreationOptionsMBS = nil) 19897

146.7.5 addResource(type as Integer, file as FolderItem, options as PHAssetResourceCreationOptionsMBS = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Adds a data resource to the asset being created, using the file at the specified URL.
Notes: type: The role of this data resource in constructing an asset. For details, see type constants.
file: The URL to a local file containing data for the asset resource.
options: Options affecting how Photos constructs the asset resource and incorporates its data into the Photos library. For details, see PHAssetResourceCreationOptionsMBS.

Photos imports the asset resource data only when it executes the PHPhotoLibrary change block in which you create a PHAssetCreationRequestMBS object and call this method. If you attempt to create an asset with invalid data or an invalid combination of resources, Photos reports an error in the completion handler of your PHPhotoLibraryMBS call.
See also:

- 146.7.3 addResource(type as Integer, data as MemoryBlock, options as PHAssetResourceCreationOptionsMBS = nil) 19896
- 146.7.4 addResource(type as Integer, data as String, options as PHAssetResourceCreationOptionsMBS = nil) 19896

146.7.6 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.15 or newer.

146.7.7 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

146.7.8 creationRequestForAsset as PHAssetCreationRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a request for adding a new asset to the Photos library using asset resources.
Notes: Call this method within a photo library change block to create a new asset. For details on change blocks, see PHPhotoLibraryMBS. After calling this method, and before returning from the change block use the methods listed in Providing Data Resources for the New Asset to specify one or more data resources for the asset.

To set metadata properties of the newly created asset, use the corresponding properties of the change request (provided by the superclass PHAssetChangeRequestMBS and listed in Modifying Assets). To reference the newly created asset later in the same change block or after the change block completes, use the placeholderForCreatedAsset property to retrieve a placeholder object.

146.7.9 supportsAssetResourceTypes(types() as Integer) as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean value indicating whether Photos supports creating an asset with the specified combination of resource types.
Notes: types: An array of numbers, each the raw value of a PHAssetResourceType identifier.
Return true if Photos supports the specified combination of resource types; otherwise, false.

When you request creation of an asset from resource data, Photos does not validate that the resources can construct a complete asset until the complete PHPhotoLibrary performChanges change block executes. (If an asset cannot be constructed from the provided resources, Photos calls the completionHandler you provide in that method with an error describing the failure.) To perform preflight validation before executing an asset creation request, use this method to verify that the set of resource types from which you want to create an asset are correct.

This method verifies only that the collection of asset resource types is valid (for example, ensuring that you do not attempt to construct a photo asset without image data), so it is still possible for an asset creation request to fail if the data itself is incomplete or invalid. However, calling by using this method you can avoid some kinds of asset creation failure before performing the expensive operation of reading (and potentially downloading or transmitting) asset resource data.

146.7.10 Constants

Resource Types

Constant	Value	Description
TypeAdjustmentBasePairedVideo	11	The resource provides an unaltered version of the video data for a Live Phot asset for use in reconstructing recent edits. Requires MacOS 10.15 or newer.
TypeAdjustmentBasePhoto	8	The resource provides an unaltered version of its photo asset for use in for us in reconstructing recent edits.
TypeAdjustmentBaseVideo	12	The resource provides an unaltered version of the video data for video asset fo use in reconstructing recent edits. Requires MacOS 10.15 or newer.
TypeAdjustmentData	7	The resource provides data for use in reconstructing recent edits to its asset.
TypeAlternatePhoto	4	The resource provides photo data that is not the primary form of its asset.
TypeAudio	3	The resource provides original audio data for its asset.
TypeFullSizePairedVideo	10	The resource provides the current video data component of a Live Photo asset Requires MacOS 10.15 or newer.
TypeFullSizePhoto	5	The resource provides photo data at the highest available size and quality fo its asset.
TypeFullSizeVideo	6	The resource provides video data at the highest available size and quality fo its asset.
TypePairedVideo	9	The resource provides the original video data component of a Live Photo asset
TypePhoto	1	The resource provides original photo data for its asset.
TypePhotoProxy	19	This is a photo proxy.
TypeVideo	2	The resource provides original video data for its asset.

146.8 class PHAssetMBS

146.8.1 class PHAssetMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The class representating of an image, video, or Live Photo in the Photos library.
Example:

```
// show details of the newest photo in the Photos library
// The app needs Photos access, see PHPhotoLibraryMBS.requestAuthorization.
Var options As New PHFetchOptionsMBS
Var sorting() As NSSortDescriptorMBS
sorting.Add NSSortDescriptorMBS.sortDescriptorWithKey("creationDate", False)
options.setSortDescriptors sorting
options.fetchLimit = 1

Var result As PHFetchResultMBS = PHAssetMBS.fetchAssetsWithMediaType(PHAssetMBS.MediaType-
Image, options)
If result.count = 0 Then Return
Var asset As PHAssetMBS = PHAssetMBS(result.firstObject)

Var info As String = asset.pixelWidth.ToString + " x " + asset.pixelHeight.ToString + ", taken " + as-
set.creationDateTime.ToString + ", favorite: " + asset.Favorite.ToString
If asset.location IsA CLLocationMBS Then
Var loc As CLLocationMBS = asset.location
info = info + EndOfLine + "Location: " + loc.latitude.ToString + ", " + loc.longitude.ToString
End If
MessageBox info
```

Notes: You fetch assets to begin working with them. Use the class methods listed in Fetching Assets to retrieve one or more PHAsset instances representing the assets you want to display or edit.

Assets contain only metadata. The underlying image or video data for any given asset might not be stored on the local device. However, depending on how you plan to use this data, you may not need to download all of it. If you need to populate a collection view with thumbnail images, the Photos framework can manage downloading, generating, and caching thumbnails for each asset. For details, see PHImageManagerMBS.

Asset objects are immutable. To edit an asset,Äôs metadata (such as marking it as a favorite photo), create a PHAssetChangeRequestMBS object within a photo library change block. For more details on using change requests and change blocks to update the photo library, see PHPhotoLibraryMBS.
Subclass of the PHObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 25.1pr7

146.8.2 Methods

146.8.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.8.4 cancelContentEditingInputRequest(requestID as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Cancels a request for editing the asset,Äôs content.
Notes: requestID: The numeric identifier of the request to be canceled.

When you request asset editing information with the requestContentEditingInputWithOptions method, the asset returns a numeric identifier for the request. To cancel the request before it completes, provide this identifier when calling the cancelContentEditingInputRequest method.

146.8.5 canPerformEditOperation(editOperation as Integer) as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns whether the asset supports the specified editing operation.
Notes: editOperation: The operation to be tested.

Returns true if the asset supports the specified editing operation; otherwise, false.

If an asset supports editing, you can create a PHAssetChangeRequestMBS object inside a PHPhotoLibraryMBS change block to submit a change.

146.8.6 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

146.8.7 fetchAssets(options as PHFetchOptionsMBS = nil) as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves all assets matching the specified options.
Notes: options: Options that specify a filter predicate and sort order for the fetched assets, or nil to use default options. For details, see PHFetchOptionsMBS class.

Returns a fetch result that contains the requested PHAsset objects, or an empty fetch result if no objects match the request.

By default, fetch results do not include photos synced to the device through iTunes or stored in iCloud Shared Albums. To change this behavior, use the includeAssetSourceTypes property in the options parameter.

146.8.8 fetchAssetsInAssetCollection(assetCollection as PHAssetCollectionMBS, options as PHFetchOptionsMBS = nil) as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves assets from the specified asset collection.
Notes: assetCollection: The asset collection from which to fetch assets.
options: Options that specify a filter predicate and sort order for the fetched assets, or nil to use default options. For details, see PHFetchOptionsMBS class.

Returns a fetch result that contains the requested PHAsset objects, or an empty fetch result if no objects match the request.

By default, the returned PHFetchResultMBS object contains all assets in the specified collection. To retrieve a more specific set of assets, provide a PHFetchOptionsMBS object containing a filter predicate.

146.8.9 fetchAssetsWithBurstIdentifier(burstIdentifier as String, options as PHFetchOptionsMBS = nil) as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves assets with the specified burst photo sequence identifier.
Notes: burstIdentifier: A burst identifier string, as provided by the burstIdentifier property of an asset.
options: Options that specify a filter predicate and sort order for the fetched assets, or nil to use default options. For details, see PHFetchOptionsMBS.

Returns a fetch result that contains the requested PHAsset objects, or an empty fetch result if no objects match the request.

A burst photo sequence, as seen in the Photos app, corresponds to a group of Photos assets that share the same burstIdentifier string.

By default, the returned PHFetchResultMBS object contains only the representative asset and any user-picked photos from the burst sequence. To retrieve all photos in the burst sequence, provide a PHFetchOptionsMBS object containing a filter predicate.

146.8.10 fetchAssetsWithLocalIdentifiers(identifiers() as String, options as PHFetchOptionsMBS = nil) as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves assets with the specified local-device-specific unique identifiers.
Notes: identifiers: An array of strings, each the localIdentifier string of an asset.
options: Options that specify a filter predicate and sort order for the fetched assets, or nil to use default options. For details, see PHFetchOptionsMBS class.

Returns a fetch result that contains the requested PHAsset objects, or an empty fetch result if no objects match the request.

146.8.11 fetchAssetsWithMediaType(mediaType as Integer, options as PHFetchOptionsMBS = nil) as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves assets with the specified media type.
Notes: mediaType: A media type, such as image or video. See type constants.
options: Options that specify a filter predicate and sort order for the fetched assets, or nil to use default options. For details, see PHFetchOptionsMBS.

Returns a fetch result that contains the requested PHAsset objects, or an empty fetch result if no objects match the request.

By default, the returned PHFetchResultMBS object contains all assets with the specified type. To retrieve a more specific set of assets, provide a PHFetchOptionsMBS object containing a filter predicate.

By default, fetch results do not include photos synced to the device through iTunes or stored in iCloud Shared Albums. To change this behavior, use the includeAssetSourceTypes property in the options parameter.

146.8.12 fetchKeyAssetsInAssetCollection(assetCollection as PHAssetCollectionMBS, options as PHFetchOptionsMBS = nil) as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves assets marked as key assets in the specified asset collection.
Notes: assetCollection: The asset collection from which to fetch assets.
options: Options that specify a filter predicate and sort order for the fetched assets, or nil to use default options. For details, see PHFetchOptionsMBS class.

Returns a fetch result that contains the requested PHAsset objects, or an empty fetch result or nil if no objects match the request.

Most asset collections contain a key asset, which the Photos app displays as a proxy for the collection. Different types of asset collections have different ways of specifying one or more key assets. For example, in the Camera Roll collection, the most recently captured photo or video is the key asset.

This method returns nil if the assetCollection parameter references a transient asset collection (such as one created with the transientAssetCollectionWithAssets method).

146.8.13 PHContentEditingInputCancelledKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys indicating the status of an asset content editing request.
Notes: A Boolean value indicating whether the image request was canceled. (boolean)

If you call the cancelContentEditingInputRequest method to cancel a request, Photos calls your result handler delegate with the value true for this key.

146.8.14 PHContentEditingInputErrorKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys indicating the status of an asset content editing request.
Notes: An error that occurred while attempting to load the asset data, NSErrorMBS.

Photos provides an error object for this key if it cannot provide asset data for your handler block,Äôs contentEditingInput parameter. Examine the error object for information about the cause of the error.

146.8.15 PHContentEditingInputResultIsInCloudKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys indicating the status of an asset content editing request.
Notes: A Boolean value indicating whether the asset data is stored on the local device or must be downloaded from iCloud.

If true, no asset data was provided because the asset data must be downloaded from iCloud. To do this, submit another request, specifying true for the networkAccessAllowed option.

146.8.16 requestContentEditingInputWithOptions(options as PHContentEditingInputRequestOptionsMBS, CompletionDelegate as RequestContentEditingInputWithOptionsCompletedMBS, tag as variant = nil) as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Requests asset information for beginning a content editing session.
Notes: options: Options affecting how Photos handles an edit session request.

Returns a numeric identifier for the request. Pass this identifier to the cancelContentEditingInputRequest method if you need to cancel the request before it completes.

When you call this method, Photos downloads the asset,Äôs image or video data (if necessary) and prepares it for editing, then calls your completionHandler ddelegate to provide a PHContentEditingInputMBS object you use for editing.

To complete the edit, create a PHContentEditingOutputMBS object from the editing input to provide the edited asset data. Then, commit the edit by posting a change block to the shared PHPhotoLibrary object. In the block, create a PHAssetChangeRequestMBS object and set its contentEditingOutput property to the editing output you created.

146.8.17 Properties

146.8.18 adjustmentFormatIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop & iOS.

Function: The identifier that describes the adjustment format.
Notes: Requires macOS 12.0 or iOS 15.0.

(Read only property)

146.8.19 burstIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The unique identifier shared by photo assets from the same burst sequence.
Notes: When the user takes a sequence of photos in burst mode with the Camera app (on supported devices), the Photos app user interface groups the resulting assets together. The Photos framework identifies a burst sequence as a group of assets sharing the same burst identifier string.
(Read only property)

146.8.20 burstSelectionTypes as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The selection type of the asset in a burst photo sequence.
Notes: When the user takes a sequence of photos in burst mode with the Camera app (on supported devices), the Photos app user interface groups the resulting assets together and allows the user to select favorite members of the sequence. Photos also automatically marks members of the sequence as potential user favorites. See PHAssetBurstSelectionType for possible values.

Because an asset may have more than one selection type, you use bit masks to identify an asset.
(Read only property)

146.8.21 creationDate as Date

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The date and time at which the asset was originally created.
Notes: (Read only property)

146.8.22 creationDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The date and time at which the asset was originally created.
Notes: (Read only property)

146.8.23 duration as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The duration, in seconds, of the video asset.
Notes: For photo assets, the duration is always zero.
(Read only property)

146.8.24 Favorite as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the user has marked the asset as a favorite.
Notes: (Read only property)

146.8.25 hasAdjustments as Boolean

MBS Mac64bit Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the asset contains adjustment data.
Notes: Requires macOS 12.0 and iOS 15.0.
(Read only property)

146.8.26 Hidden as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the user has hidden the asset.
Notes: Hidden assets do not appear in the Moments interface in the Photos app and are not returned when fetching the contents of a moment collection.
(Read only property)

146.8.27 location as Variant

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The location information saved with the asset.
Notes: Typically, an asset,Äôs location metadata identifies the place where the asset was captured.

We pass result, the CLLocationMBS object, as variant to avoid plugin dependencies.
(Read only property)

146.8.28 mediaSubtypes as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The subtypes of the asset, identifying special kinds of assets such as panoramic photo or high-framerate video.
Notes: See subtype constants for possible values.
Because an asset may have more than one subtype, you use these values as bit masks to identify an asset.
(Read only property)

146.8.29 mediaType as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The type of the asset, such as video or audio.
Notes: See Type constants.
(Read only property)

146.8.30 modificationDate as Date

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The date and time at which the asset was last modified.
Notes: Photos updates the modification date when an asset,Äôs image or video content or metadata changes.
(Read only property)

146.8.31 modificationDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The date and time at which the asset was last modified.
Notes: Photos updates the modification date when an asset,Äôs image or video content or metadata changes.
(Read only property)

146.8.32 pixelHeight as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The height, in pixels, of the asset,Äôs image or video data.
Notes: If the asset,Äôs content has been edited, this property describes the size of the current version of the asset.
(Read only property)

146.8.33 pixelWidth as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The width, in pixels, of the asset,Äôs image or video data.
Notes: If the asset,Äôs content has been edited, this property describes the size of the current version of the asset.
(Read only property)

146.8.34 playbackStyle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The playback style for the asset.
Notes: (Read only property)

146.8.35 RepresentsBurst as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the asset is the representative photo from a burst photo sequence.
Notes: When the user takes a sequence of photos in burst mode with the Camera app (on supported devices), the Photos app user interface groups the resulting assets together. One asset represents the entire sequence in displayed collections.
(Read only property)

146.8.36 sourceType as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The means by which the asset entered the user,Äôs Photos library.
Notes: Assets from some sources can be edited, deleted, or added to collections; assets from other sources do not support these operations. For details, see SourceType constants.
(Read only property)

146.8.37 Constants

Burst Selection Type

Constant	Value	Description
BurstSelectionTypeAutoPick	1	Photos has automatically identified the asset as a potential user favorite.
BurstSelectionTypeNone	0	The asset is not marked as a favorite member of its burst sequence or is not a member of a burst sequence.
BurstSelectionTypeUserPick	2	The user has marked the asset as a favorite member of its burst sequence.

Edit Operations

Constant	Value	Description
EditOperationContent	2	The asset,Äôs photo or video content can be edited.
EditOperationDelete	1	The asset can be deleted from the photo library.
EditOperationProperties	3	The asset,Äôs metadata properties can be edited.

Media Subtypes

Constant	Value	Description
MediaSubtypeNone	0	The asset has no subtype. This is the default subtype for most photo and video assets.
MediaSubtypePhotoDepthEffect	16	The asset is a photo captured with the Camera app's Portrait mode effect.
MediaSubtypePhotoHDR	2	The asset is a High Dynamic Range photo.
MediaSubtypePhotoLive	8	The asset is a Live Photo that includes movement and sounds from the m just before and after its capture. To display a Live Photo asset with its associated video content, ret PHLivePhotoMBS object using the PHImageManagerMBS class and a to a PHLivePhotoViewMBS object.
MediaSubtypePhotoPanorama	1	The asset is a large-format panorama photo.
MediaSubtypePhotoScreenshot	4	The asset is an image captured with the device,Äôs screenshot feature.
MediaSubtypeSpatialMedia	1024	The asset is a spatial video.
MediaSubtypeVideoCinematic	&h200000	The asset is a cinematic video.
MediaSubtypeVideoHighFrameRate	&h20000	The asset is a high-frame-rate video. High-frame-rate videos are created by the Slow-Mo feature in the Cam on an iOS device.
MediaSubtypeVideoStreamed	&h10000	The asset is a video whose contents are always streamed over a netwo nection. This subtype identifies video assets that are never stored on the local such as shared videos in a subscribed iCloud Photo Stream.
MediaSubtypeVideoTimelapse	&h40000	The asset is a time-lapse video.

Media Types

Constant	Value	Description
MediaTypeAudio	3	The asset is an audio file.
MediaTypeImage	1	The asset is a photo or other static image.
MediaTypeUnknown	0	The asset,Äôs type is unknown.
MediaTypeVideo	2	The asset is a video file.

Asset Playback Styles

Constant	Value	Description
PlaybackStyleImage	1	The asset should be displayed as a still image.
PlaybackStyleImageAnimated	2	The asset should be displayed as an animated image.
PlaybackStyleLivePhoto	3	The asset should be displayed as a Live Photo.
PlaybackStyleUnsupported	0	The asset has an unsupported or undefined media playback type.
PlaybackStyleVideo	4	The asset should be displayed as a video.
PlaybackStyleVideoLooping	5	The asset should be displayed as a looping video.

Source Types

Constant	Value	Description
SourceTypeCloudShared	2	The asset originates from an iCloud Shared Album. Assets from shared albums cannot be edited and do not appear in Moments collections.
SourceTypeiTunesSynced	4	The asset originates from a Mac or PC and is present on the device through iTunes sync. iTunes-synced assets cannot be edited or deleted.
SourceTypeNone	0	Source information is not available for the asset.
SourceTypeUserLibrary	1	The asset is part of the user,Äôs main Photos library. The main library contains both assets that originate on the device (such as photos and videos captured with the Camera app or screenshots) and assets synchronized through iCloud Photo Library or My Photo Stream. These assets appear in Moments collections and can be edited or deleted.

146.8.38 Delegates

146.8.39 RequestContentEditingInputWithOptionsCompletedMBS(Asset as PHAssetMBS, Options as PHContentEditingInputRequestOptionsMBS, tag as variant, contentEditingInput as PHContentEditingInputMBS, info as Dictionary)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate that Photos calls when the requested asset editing information is ready.
Notes: contentEditingInput: An object that describes the asset for editing and provides methods for loading the image or video content to be edited.
info: A dictionary providing information about the status of the request. See Editing Request Info Keys for

possible keys and values.

146.9 class PHAssetResourceCreationOptionsMBS

146.9.1 class PHAssetResourceCreationOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A set of options affecting the creation of a new Photos asset from underlying resources.
Example:

```
// move a video file into the Photos library instead of copying it
// The app needs Photos access, see PHPhotoLibraryMBS.requestAuthorization.
Var error As NSErrorMBS
Call PHPhotoLibraryMBS.sharedPhotoLibrary.performChangesAndWait(AddressOf ImportVideo, error)

// a method in the window:
Sub ImportVideo(tag As Variant)
Var options As New PHAssetResourceCreationOptionsMBS
options.shouldMoveFile = True // the file is gone from the desktop afterwards
options.originalFilename = "Birthday.mov"

Var request As PHAssetCreationRequestMBS = PHAssetCreationRequestMBS.creationRequestForAsset
request.addResource(PHAssetCreationRequestMBS.TypeVideo, SpecialFolder.Desktop.Child("Birthday.mov"),
options)
End Sub
```

Notes: You use this class when creating an asset for addition to the Photos library with a PHAssetCreationRequestMBS object.

146.9.2 Methods

146.9.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.15 or newer.

146.9.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.9.5 copy as PHAssetResourceCreationOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Copies the options object.

146.9.6 Properties

146.9.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.9.8 originalFilename as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The filename for the asset resource being created.
Notes: You can use this property to track the original name of the file from which you import an asset resource even if you use the addResourceWithType method to create a resource from data instead of from a file. After creating the asset, this information is available in the originalFilename property of the corresponding PHAssetResourceMBS object.

If you do not specify a value for this property and are using the addResourceWithType method to create a resource, Photos infers the filename from that method,Äôs fileURL parameter. Otherwise, Photos automatically generates a filename.
(Read and Write property)

146.9.9 shouldMoveFile as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether Photos moves or duplicates files when creating an asset resource.
Notes: This property applies only when creating an asset resource with the addResourceWithType method. If this value is true, Photos moves the specified file into the Photos library to create the asset resource, removing the original file after the asset has been successfully created. When using this option, Photos does not make an intermediary copy of the resource data, so no additional storage space is required.

If this value is false (the default), Photos copies the contents of the original file into the Photos library.

Attempting to move a file that is currently open or has hard links fails.
(Read and Write property)

146.9.10 uniformTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The uniform type identifier for the resource.
Notes: If you do not specify a value for this property, Photos infers the data type from the type value you specify when adding the resource to a creation request.
For details in uniform type identifiers, see Uniform Type Identifiers Overview.
(Read and Write property)

146.10 class PHAssetResourceManagerMBS

146.10.1 class PHAssetResourceManagerMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A resource manager for the data storage underlying a Photos asset.
Example:

```
// export the original file of a photo to the desktop
// asset is a PHAssetMBS, e.g. from PHAssetMBS.fetchAssetsWithMediaType
Var asset As PHAssetMBS // your asset
If asset = Nil Then Return

Var resources() As PHAssetResourceMBS = PHAssetResourceMBS.assetResourcesForAsset(asset)
If resources.Count = 0 Then Return
Var resource As PHAssetResourceMBS = resources(0)

Var options As New PHAssetResourceRequestOptionsMBS
options.NetworkAccessAllowed = True
Var file As FolderItem = SpecialFolder.Desktop.Child(resource.originalFilename)
PHAssetResourceManagerMBS.defaultManager.writeDataForAssetResource(resource, file, options, AddressOf ExportDone)

// a method in the window:
Sub ExportDone(resource As PHAssetResourceMBS, options As PHAssetResourceRequestOptionsMBS, File As FolderItem, Error As NSErrorMBS, Tag As Variant)
If Error <>Nil Then
System.DebugLog Error.localizedDescription
Else
System.DebugLog "Exported " + File.Name
End If
End Sub
```

Notes: An asset can have multiple underlying data resources—for example, both original and edited versions—each of which is represented by a PHAssetResourceMBS object. Unlike the PHImageManagerMBS class, which provides and caches the primary representations of assets as thumbnails, image objects, or video objects, the asset resource manager provides direct access to these underlying data resources.

Available in MacOS 10.15 or newer.

146.10.2 Methods

146.10.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.15 or newer.

146.10.4 cancelDataRequest(requestID as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Cancels an asynchronous request.
Notes: requestID: The numeric identifier of the request to be canceled.

When you perform an asynchronous request for asset resource data using the requestDataForAssetResource method, the image manager returns a numeric identifier for the request. To cancel the request before it completes, provide this identifier when calling the cancelDataRequest method.

146.10.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.10.6 defaultManager as PHAssetResourceManagerMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the shared asset resource manager object.
Notes: This method always returns the same asset resource manager object, which is shared for all uses in your app.

146.10.7 requestDataForAssetResource(resource as PHAssetResourceMBS, options as PHAssetResourceRequestOptionsMBS, DataReceivedHandler as RequestDataForAssetResourceDataReceivedMBS, CompleteHandler as RequestDataForAssetResourceCompletedMBS, tag as variant = nil) as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Requests the underlying data for the specified asset resource, to be delivered asynchronously.
Notes: resource: The asset resource for which to request data.
options: Options specifying how Photos should handle the request and notify your app of progress. For details, see PHAssetResourceRequestOptionsMBS.

Returns a numeric identifier for the request. If you need to cancel the request before it completes, pass this identifier to the cancelDataRequest: method.

When you call this method, Photos begins asynchronously reading the underlying data for the asset resource. Depending on the options you specify and the current state of the asset, Photos may download asset data from the network.

While reading (or downloading) asset resource data, Photos calls your handler block at least once, progressively providing chunks of data. After reading all of the data, Photos calls your completionHandler block to indicate that the data is complete. (At this point, the complete data for the asset is the concatenation of the data parameters from all calls to your handler block.) If Photos cannot finish reading or downloading asset resource data, it calls your completionHandler block with a description of the error. Photos can also call the completionHandler block with a non-nil error when the data is complete if the user cancels downloading.

146.10.8 writeDataForAssetResource(resource as PHAssetResourceMBS, file as FolderItem, options as PHAssetResourceRequestOptionsMBS, CompleteHandler as WriteDataForAssetResourceCompletedMBS, tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Requests the underlying data for the specified asset resource, to be asynchronously written to a local file.
Notes: resource: The asset resource for which to request data.
fileURL: A URL identifying the local filename at which to write the asset resource,Äôs data.
options: Options specifying how Photos should handle the request and notify your app of progress. For details, see PHAssetResourceRequestOptionsMBS.

When you call this method, Photos begins asynchronously reading the underlying data for the asset resource. Depending on the options you specify and the current state of the asset, Photos may download asset data

from the network.

While reading (or downloading) asset resource data, Photos progressively writes the data into the specified file. After writing all of the data, or if an error prevents reading all of the data, Photos calls your delegate.

146.10.9 Properties

146.10.10 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.10.11 Constants

Constants

Constant	Value	Description
PHInvalidAssetResourceDataRequestID	0	The invalid request ID.

146.10.12 Delegates

146.10.13 RequestDataForAssetResourceCompletedMBS(resource as PHAssetResourceMBS, options as PHAssetResourceRequestOptionsMBS, Error as NSErrorMBS, Tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate that photos calls after the request has been fulfilled or has failed.
Notes: error: If the request has failed, an NSErrorMBS object describing the failure; otherwise nil.

146.10.14 RequestDataForAssetResourceDataReceivedMBS(resource as PHAssetResourceMBS, options as PHAssetResourceRequestOptionsMBS, Data as MemoryBlock, Tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate that Photos calls to provide the requested data.
Notes: data: The requested asset resource data.

146.10.15 WriteDataForAssetResourceCompletedMBS(resource as PHAssetResourceMBS, options as PHAssetResourceRequestOptionsMBS, File as FolderItem, Error as NSErrorMBS, Tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate that photos calls after the request has been fulfilled or has failed.
Notes: error: If the request has failed, an NSErrorMBS object describing the failure; otherwise nil.

146.11 class PHAssetResourceMBS

146.11.1 class PHAssetResourceMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An underlying data resource associated with a photo, video, or Live Photo asset in the Photos library.
Example:

```
// list the files behind a photo, e.g. original and edited version
// asset is a PHAssetMBS, e.g. from PHAssetMBS.fetchAssetsWithMediaType
Var asset As PHAssetMBS // your asset
If asset = Nil Then Return

Var lines() As String
For Each resource As PHAssetResourceMBS In PHAssetResourceMBS.assetResourcesForAsset(asset)
lines.Add resource.originalFilename + " (" + resource.uniformTypeIdentifier + ", " + _
resource.pixelWidth.ToString + " x " + resource.pixelHeight.ToString + ", type " + resource.Type.ToString
+ ")"
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Each PHAssetMBS object references one or more resources. Use these objects to work with those resources directly, like when backing up or restoring assets.

- A photo asset can contain both JPEG and RAW files representing the same photo.
- A Live Photo asset contains both still photo and video resources.
- An edited asset contains resources representing asset content before and after the edit, as well as a resource corresponding to the PHAdjustmentDataMBS object that describes the edit.

To work with the data contained in an asset resource, fetch it using the PHAssetResourceManagerMBS class. This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 25.1pr7

146.11.2 Methods

146.11.3 assetResourcesForAsset(asset as PHAssetMBS) as PHAssetResourceMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the list of data resources associated with an asset.
Notes: asset: A photo or video asset in the Photos library.

Returns the asset,Äôs resources.

Asset resource objects describe the data files that an asset represents. An asset can contain multiple resources—for example, an edited photo asset contains resources for both the original and edited images, as well as for the PHAdjustmentDataMBS object describing the edit. To work with one of these files, fetch the underlying data using the PHAssetResourceManagerMBS class.

146.11.4 assetResourcesForLivePhoto(livePhoto as PHLivePhotoMBS) as PHAssetResourceMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the list of data resources associated with a Live Photo object.
Notes: livePhoto: A Live Photo object.

Returns the underlying resources that constitute the Live Photo.

A Live Photo is a picture, taken with a compatible device, that includes movement and sound from the moments just before and after its capture. A PHLivePhoto object represents the displayable combination of image, motion, and sound data. You can obtain such objects from the Photos library using the PHImageManagerMBS class or construct them from asset resources exported from a Photos library using the PHLivePhotoMBS class.

Use this method to export the underlying resources that constitute a Live Photo. For example, a social networking app can retrieve those data files and upload them to a server. Then, on another user,Äôs device, the app downloads those data files and uses the PHLivePhoto class to re-create a Live Photo object for display using the PHLivePhotoViewMBS class.

146.11.5 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.15 or newer.

146.11.6 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

146.11.7 Properties

146.11.8 assetLocalIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The unique identifier for the asset object this resource is associated with.
Notes: This property,Äôs value corresponds to the localIdentifier property of the PHAssetMBS object that owns this asset resource. If you,Äôve obtained an asset resource without a reference to its owning asset, use the fetchAssetsWithLocalIdentifiers method with this identifier to retrieve the correct PHAssetMBS object.
(Read only property)

146.11.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.11.10 originalFilename as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The original filename of the asset resource from when it was created or imported.
Notes: (Read only property)

146.11.11 pixelHeight as Integer

MBS Mac64bit Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop & iOS.

Function: The height of the resource, in pixels.
Notes: Requires macOS 13.0 or iOS 16.0.
(Read only property)

146.11.12 pixelWidth as Integer

MBS Mac64bit Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop & iOS.

Function: The width of the resource, in pixels.
Notes: Requires macOS 13.0 or iOS 16.0.
(Read only property)

146.11.13 Type as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The relationship of this asset resource to its owning asset.
Notes: An asset can contain multiple resources, and different resources contribute to the asset in different ways. For details and examples, see resource types.
(Read only property)

146.11.14 uniformTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The uniform type identifier for the asset resource,Äôs image or video data.
Notes: For more information, see Uniform Type Identifiers Overview in Apple's documentation.
(Read only property)

146.12 class PHAssetResourceRequestOptionsMBS

146.12.1 class PHAssetResourceRequestOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A set of options affecting the delivery of underlying asset data that you request from the asset resource manager.
Example:

```
// allow downloading the original from iCloud when exporting a photo
Var options As New PHAssetResourceRequestOptionsMBS
options.NetworkAccessAllowed = True

// pass options to PHAssetResourceManagerMBS.writeDataForAssetResource or requestDataForAssetResource, see there
```

Notes: You use this class when requesting the underlying data for photo, video, and Live Photo asset resources from a PHAssetResourceManagerMBS object.

Requires MacOS 10.15 or newer.

146.12.2 Methods

146.12.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.15 or newer.

146.12.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.12.5 copy as PHAssetResourceRequestOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the request options.

146.12.6 Destructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

146.12.7 SetProgressHandler(ProgressHandler as ProgressHandlerMBS, tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the delegate that Photos calls periodically while downloading the asset resource data.
Notes: If you request an asset resource whose data is not on the local device, and you have enabled downloading with the networkAccessAllowed property, Photos calls your block periodically to report progress.

146.12.8 Properties

146.12.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.12.10 NetworkAccessAllowed as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that specifies whether Photos can download the requested asset resource data from iCloud.
Notes: If true, and the requested resource data is not stored on the local device, Photos downloads that data from iCloud. To be notified of the download,Äôs progress, use the progressHandler property to provide a block that Photos calls periodically while downloading the resource data. If false (the default), and the resource data is not on the local device, Photos calls the completionHandler block you provided in your request, with an NSErrorMBS object indicating that the resource requires network access.
(Read and Write property)

146.12.11 ProgressHandler as ProgressHandlerMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The delegate that Photos calls periodically while downloading the asset resource data.
Notes: If you request an asset resource whose data is not on the local device, and you have enabled downloading with the networkAccessAllowed property, Photos calls your block periodically to report progress.
(Read and Write property)

146.12.12 Delegates

146.12.13 ProgressHandlerMBS(progress as double, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The delegate that Photos calls while downloading asset resource data from iCloud. Used by the progressHandler property.
Notes: If you request an asset resource whose data is not on the local device, and you have enabled downloading with the networkAccessAllowed property, Photos calls your block periodically to report progress.

progress: A floating-point value indicating the progress of the download. A value of 0.0 indicates that the download has just started, and a value of 1.0 indicates the download is complete.

146.13 class PHCachingImageManagerMBS

146.13.1 class PHCachingImageManagerMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An object that facilitates retrieving or generating preview thumbnails, optimized for batch preloading large numbers of assets.
Example:

```
// prepare thumbnails for the next photos to show in a grid
// Cache is a property of the window: Cache As PHCachingImageManagerMBS
// The app needs Photos access, see PHPhotoLibraryMBS.requestAuthorization.
Cache = New PHCachingImageManagerMBS

Var result As PHFetchResultMBS = PHAssetMBS.fetchAssetsWithMediaType(PHAssetMBS.MediaTypeImage)
Var assets() As PHAssetMBS
For i As Integer = 0 To Min(49, result.count - 1)
assets.Add PHAssetMBS(result.objectAtIndex(i))
Next

Cache.startCachingImagesForAssets(assets, New CGSizeMBS(200, 200), PHImageManagerMBS.ContentModeAspectFill)

// later, when they scrolled out of view:
// Cache.stopCachingImagesForAssets(assets, New CGSizeMBS(200, 200), PHImageManagerMBS.ContentModeAspectFill)
```

Notes: For quick performance when you are working with many assets, a caching image manager can prepare asset images in the background in order to eliminate delays when you later request individual images. For example, use a caching image manager when you want to populate a collection view or similar UI with thumbnails of photo or video assets.

Much of the key functionality of the PHCachingImageManager class is defined by its superclass, PHImageManagerMBS. For details, see PHImageManagerMBS.

To use a caching image manager:
1. Create a PHCachingImageManager instance. (This step replaces using the shared PHImageManager instance.)
2. Use PHAsset class methods to fetch the assets you,Äôre interested in.
3. To prepare images for those assets, call the startCachingImagesForAssets:targetSize:contentMode:options: method with the target size, content mode, and options you plan to use when later requesting images for each individual asset.
4. When you need an image for an individual asset, call the requestImageForAsset:targetSize:contentMode:options:resultHandler: method, and pass the same parameters you used when preparing that asset.

If the image you request is among those already prepared, the PHCachingImageManager object immediately returns that image. Otherwise, Photos prepares the image on demand and caches it for later use.
Subclass of the PHImageManagerMBS class.

146.13.2 Methods

146.13.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.15 or newer.

146.13.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.13.5 startCachingImagesForAssets(assets() as PHAssetMBS, targetSize as CGSizeMBS, contentMode as Integer, options as PHImageRequestOptionsMBS = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Prepares image representations of the specified assets for later use.
Notes: assets: An array of PHAssetMBS objects for which to prepare image representations.
targetSize: The size of the images to be prepared.
contentMode: An option for how to fit the images to the aspect ratio of the requested size. For details, see PHImageContentMode.
options: Options specifying how Photos should handle the request, format the requested images, and notify your app of progress or errors. For details, see PHImageRequestOptions.

When you call this method, Photos begins to fetch image data and generates thumbnail images on a background thread. At any time afterward, you can use the requestImageForAsset:targetSize method to request individual images from the cache. If Photos has finished preparing a requested image, that method provides the image immediately.

Photos caches images with the exact target size, content mode, and options you specify in this method. If you later request an image with, for example, a different target size than you passed when calling this

method, Photos cannot make use of the cache and so it must fetch or generate a new image.

146.13.6 stopCachingImagesForAllAssets

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Cancels all image preparation that is currently in progress.

146.13.7 stopCachingImagesForAssets(assets() as PHAssetMBS, targetSize as CGSizeMBS, contentMode as Integer, options as PHImageRequestOptionsMBS = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Cancels image preparation for the specified assets and options.
Notes: assets: The array of specific PHAssetMBS objects for which image preparation is in progress but is no longer needed.
targetSize: The target size with which you requested image preparation.
contentMode: The content mode with which you requested image preparation.
options: The options with which you requested image preparation.

This method cancels image preparation for the specified assets with the specified options. Use it when image preparation that might be in progress is no longer needed. For example, if you prepare images for a collection view filled with photo thumbnails and then the user chooses a different thumbnail size for your collection view, call this method to cancel generating thumbnail images at the old size.

146.13.8 Properties

146.13.9 allowsCachingHighQualityImages as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the image manager prepares high-quality images.
Notes: If true (the default), the image manager prepares images at high quality. This option produces better images, at a high performance cost.
For faster performance when preparing large numbers of images—such as while the user is scrolling quickly through a collection of thumbnails—set this property to false.
(Read and Write property)

146.14 class PHChangeMBS

146.14.1 class PHChangeMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A description of a change that occurred in the photo library.
Notes: Photos provides PHChangeMBS objects to notify your app of changes to the assets and collections managed by the Photos app. To receive change information, implement the DidChange event in your PHPhotoLibraryMBS subclass.

After Photos provides you with a change object, you use its methods to get a change details object. Call the changeDetailsForObject or changeDetailsForFetchResult method, passing an asset or collection object you,Äôve previously fetched or a fetch result containing several such objects. The resulting PHObjectChangeDetailsMBS or PHFetchResultChangeDetailsMBS object describes any changes that have happened to the object or fetch result since you last fetched it.

146.14.2 Methods

146.14.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.14.4 changeDetailsForFetchResult(FetchResult as PHFetchResultMBS) as PHFetchResultChangeDetailsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns detailed change information for a fetch result.
Notes: object: A fetch result.

Returns a change details object, or nil if there have been no changes affecting the fetch result,Äôs contents.

When Photos calls your change observer,Äôs photoLibraryDidChange method, call the changeDetailsForObject method to get detailed change information about the results of a fetch you,Äôve previously performed. If there have been any changes in the Photos library affecting the fetch, the resulting PHFetchResultChangeDetailsMBS object tells you if any contents in the fetch result have been added, removed, or changed since you fetched it. If there have been no changes since you performed the fetch, this method returns nil.

Typically, if your app displays the members of a collection (such as an album or moment), you use a method such as fetchAssetsInAssetCollection to retrieve those members and then keep the resulting PHFetchResultMBS object. You can then pass that fetch result to this method to learn about changes to the collection, such as whether new members have been added to it (and which indexes to insert them at in your UI).

To find out about changes to an object,Äôs properties, such as a collection,Äôs title or an asset,Äôs metadata, use the changeDetailsForObject: method.

146.14.5 changeDetailsForObject(PHObject as PHObjectMBS) as PHObjectChangeDetailsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns detailed change information for the specified asset or collection.
Notes: object: A PHAssetMBS, PHAssetCollectionMBS, or PHCollectionListMBS object.

Returns a change details object, or nil if there have been no changes to the specified asset or collection.

When Photos calls your change observer,Äôs photoLibraryDidChange: method, call the changeDetailsForObject method to get detailed change information about an asset or collection you,Äôve previously fetched. If the asset or collection has changed since you last fetched it, the resulting PHObjectChangeDetailsMBS object describes the changes. If there are no changes between the fetched object and the current state of the asset or collection it represents in the Photos library, this method returns nil.
For an asset collection or collection list, this method and the PHObjectChangeDetailsMBS object it returns describe changes only to the collection,Äôs properties. If you are instead interested in changes to the collection,Äôs membership, use the changeDetailsForFetchResult method.

146.14.6 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.14.7 Properties

146.14.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.15 class PHChangeRequestMBS

146.15.1 class PHChangeRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A request to create, delete, change metadata for, or edit the content of a Photos asset, for use in a photo library change delegate.
Notes: You use the PHAssetChangeRequestMBS class to request changes for PHAssetMBS objects. To make changes to assets in the Photos library, create a change request by using the appropriate class method for the change you want to perform.

- Call one of the methods listed in Adding New Assets to create a new asset from an image or video file.
- Call the deleteAssets: method to delete existing assets.
- Call the changeRequestForAsset: method to modify an asset,Äôs content or metadata.

A change request for creating or modifying an asset works like a mutable version of the asset object. Use the change request,Äôs properties to request changes to the corresponding properties of the asset itself.

After Photos runs the change block and calls your completion handler, the asset,Äôs state reflects the changes that you requested in the block.

If you create or use a change request object outside a photo library change block, Photos raises an Objective-C exception. For details on change blocks, see PHPhotoLibraryMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

146.15.2 Methods

146.15.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.15 or newer.

146.15.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

146.15.5 Properties

146.15.6 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.16 class PHCloudIdentifierMBS

146.16.1 class PHCloudIdentifierMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A cloud identifier for a Photos project extension.
Notes: The user can choose to store Photos project extensions in iCloud. The cloud identifier uniquely references project extensions in the cloud by string serialization. When a project's global identifier can't be determined from its local identifier, the notFoundIdentifier identifier is provided in that array slot.

146.16.2 Methods

146.16.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.16.4 Constructor(stringValue as String)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Deserializes a cloud identifier from its string value.

146.16.5 notFoundIdentifier as PHCloudIdentifierMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The global identifier used in an array slot for items that couldn't be found.

146.16.6 Properties

146.16.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.16.8 stringValue as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A string version of the cloud identifier to use in serialization.
Notes: (Read only property)

146.17 class PHCollectionListChangeRequestMBS

146.17.1 class PHCollectionListChangeRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A request to create, delete, or modify a Photos collection list, for use in a photo library change block.
Example:

```
// create a folder in Photos to organize albums
// The app needs Photos access, see PHPhotoLibraryMBS.requestAuthorization.
Var error As NSErrorMBS
If PHPhotoLibraryMBS.sharedPhotoLibrary.performChangesAndWait(AddressOf CreateFolder, error) Then
MessageBox "Folder created."
ElseIf error <>Nil Then
MessageBox error.localizedDescription
End If

// a method in the window:
Sub CreateFolder(tag As Variant)
Var request As PHCollectionListChangeRequestMBS = PHCollectionListChangeRequestMBS.creationRequestForCollectionListWithTitle("Travel")
// add albums with request.addChildCollections
End Sub
```

Notes: You use the PHCollectionListChangeRequest class to request changes for PHCollectionList objects. To make changes to collection lists (such as folders containing user-created albums) in the Photos library, create a change request using the appropriate class method for the change you want to perform.

- Call the creationRequestForCollectionListWithTitle method to create a new asset collection.
- Call the deleteCollectionLists: method to delete existing asset collections.
- Call the changeRequestForCollectionList: or changeRequestForCollectionList method to modify a collection,Äôs metadata or its list of child collections.

Before creating a change request, use the canPerformEditOperation: method to verify that the collection allows the edit operation you,Äôre requesting. If you attempt to perform an unsupported edit operation, Photos throws an exception.
A change request for creating or modifying a collection list works like a mutable version of the collection list object. Use the change request,Äôs properties and instance methods to request changes to the collection list itself.

After Photos runs the change delegate and calls your completion handler, the collection list,Äôs state reflects the changes you requested in the delegate.

If you create or use a change request object outside a photo library change delegate, Photos raises an Objective-C exception. For details on change delegates, see PHPhotoLibraryMBS.
Subclass of the PHChangeRequestMBS class.

146.17.2 Methods

146.17.3 addChildCollections(collections() as PHCollectionMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Add the specified collections as children of the collection list.
Notes: collections: An array of PHCollectionMBS objects (asset collections or other collection lists) to be added to the collection list.

If you created the change request with a snapshot of the collection list,Äôs contents using the changeRequestForCollectionList method, Photos inserts the new children after the existing child collections in the collection list. Otherwise, the arrangement of the new children relative to others in the collection is undefined.

146.17.4 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.15 or newer.

146.17.5 changeRequestForCollectionList(collectionList as PHCollectionListMBS) as PHCollectionListChangeRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a request for modifying the specified collection list.
Notes: collectionList: The collection list to be modified.

Returns a collection list change request.

After you create a change request within a photo library change block, propose changes to the collection,Äôs title or list of child collections with the properties and instance methods of the change request. After Photos runs your change block, the collection list reflects your changes. For details on change blocks, see PHPhotoLibraryMBS.
Use this method when modifying a collection list,Äôs metadata or when adding or removing child collections

without regard to their arrangement. To work with indexes in the list of child collections, use the changeRequestForCollectionList method instead.
See also:

- 146.17.6 changeRequestForCollectionList(collectionList as PHCollectionListMBS, childCollections as PHFetchResultMBS) as PHCollectionListChangeRequestMBS 19940

146.17.6 changeRequestForCollectionList(collectionList as PHCollectionListMBS, childCollections as PHFetchResultMBS) as PHCollectionListChangeRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a request for modifying the specified collection list, with a fetch result for tracking changes.
Notes: collectionList: The collection list to be modified.
childCollections: A fetch result listing the child collections in the collection.

Returns a collection list change request.

After you create a change request within a photo library change block, propose changes to the collection,Äôs title or list of child collections with the properties and instance methods of the change request. After Photos runs your change block, the collection list reflects your changes. For details on change blocks, see PHPhotoLibraryMBS.

Use this method when you need to insert, remove, or rearrange collections at specified indexes in the collection list. By passing in a fetch result reflecting what your app sees as the current state of the collection,Äôs membership, the Photos framework can ensure that the indexes you specify are valid even if the collection has changed since you last fetched it. If you don,Äôt need to work with indexes in the list of child collections, you can use the changeRequestForCollectionList method instead.
See also:

- 146.17.5 changeRequestForCollectionList(collectionList as PHCollectionListMBS) as PHCollectionListChangeRequestMBS 19939

146.17.7 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.17.8 creationRequestForCollectionListWithTitle(title as string) as PHCollectionListChangeRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a request for adding a new collection list to the Photos library.
Notes: title: A name for the new collection list.

Returns a collection list creation request.

Call this method within a photo library change block to create a new collection list. For details on change blocks, see PHPhotoLibraryMBS.
To add collections to the newly created collection list or to change its title, use the methods listed in Modifying Collection Lists. To reference the newly created collection collection list later in the same change delegate or after the change delegate completes, use the placeholderForCreatedCollectionListMBS property to retrieve a placeholder object.

146.17.9 deleteCollectionLists(collectionLists() as PHCollectionListMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Requests to delete the specified asset collections.
Notes: collectionLists: An array of PHCollectionListMBS objects to be deleted.

Call this method within a photo library change block to delete collection lists. For details on change blocks, see PHPhotoLibraryMBS.

Deleting a collection list also deletes any child collections it contains. To preserve those collections, remove them from the collection list (with the removeChildCollections or removeChildCollectionsAtIndexes method) before deleting it. Deleting a collection list does not delete assets contained in its child collections.

146.17.10 insertChildCollections(collections() as PHCollectionMBS, indexes as NSIndexSetMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Inserts the specified collections into the collection list at the specified indexes.
Notes: collections: An array of PHCollectionMBS objects (asset collections or other collection lists) to be inserted into the collection list.
indexes: The indexes at which the collections should be inserted. The count of locations in this index set must equal the count of collections.

To ensure that the index set you specify is valid even if the collection list has changed since you fetched it, create a change request with a snapshot of the collection list,Äôs contents using the changeRequestForCollectionList method before inserting child collections.
For a detailed discussion of how the index set you specify maps to insertions in the collection list, see the similar NSMutableArray method insertObjects.

146.17.11 moveChildCollections(AtIndexes as NSIndexSetMBS, toIndex as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Moves the child collections at the specified indexes in the collection list to a new index.
Notes: indexes: The indexes of the child collections to be moved in the collection list.
toIndex: The index at which to place the moved child collections, relative to the collection list,Äôs ordering after removing the items at indexes.

When you call this method, Photos first removes the items in the indexes parameter from the collection, and then inserts them at the location specified by the toIndex parameter.
To ensure that the index set you specify is valid even if the collection list has changed since you fetched it, create a change request with a snapshot of the collection list,Äôs contents using the changeRequestForCollectionList method before rearranging child collections.

146.17.12 removeChildCollections(AtIndexes as NSIndexSetMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Removes the child collections at the specified indexes from the collection list.
Notes: indexes: The indexes of the child collections to be removed from the collection list.

To ensure that the index set you specify is valid even if the collection list has changed since you fetched it, create a change request with a snapshot of the collection list,Äôs contents using the changeRequestForCollectionList method before removing child collections. To remove objects based on their identities (without regard to their indexes in the collection), use the removeChildCollections method.
See also:

- 146.17.13 removeChildCollections(collections() as PHCollectionMBS) 19942

146.17.13 removeChildCollections(collections() as PHCollectionMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Removes the specified child collections from the collection list.
Notes: collections: An array of PHCollectionMBS objects (asset collections or other collection lists) to be

removed from the collection list.

This method removes child collections from the collection list based on their identity (determined by the localIdentifier property of each collection). To remove objects at specified indexes, use the removeChildCollections method.
See also:

- 146.17.12 removeChildCollections(AtIndexes as NSIndexSetMBS) 19942

146.17.14 replaceChildCollections(AtIndexes as NSIndexSetMBS, ChildCollections() as PHCollectionMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Replaces the child collections at the specified indexes in the collection list with the specified collections.
Notes: indexes: The indexes of the child collections to be replaced in the collection list.
collections: An array of PHCollectionMBS objects (asset collections or other collection lists) to be inserted into (or moved within) the collection list.

To ensure that the index set you specify is valid even if the collection list has changed since you fetched it, create a change request with a snapshot of the collection list,Äôs contents using the changeRequestForCollectionList method before rearranging child collections.

146.17.15 Properties

146.17.16 placeholderForCreatedCollectionList as PHObjectPlaceholderMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A placeholder object for the collection list that the change request creates.
Notes: Use this property if you need to reference the collection created by a change request within the same change block. For details on change blocks, see PHPhotoLibraryMBS.
(Read only property)

146.17.17 title as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The displayed name of the collection list.
Notes: Set this property to change the collection list,Äôs title.

(Read and Write property)

146.18 class PHCollectionListMBS

146.18.1 class PHCollectionListMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A group containing Photos asset collections, such as Moments, Years, or folders of user-created albums.
Example:

```
// list the folders the user created in Photos and the albums inside
// The app needs Photos access, see PHPhotoLibraryMBS.requestAuthorization.
Var folders As PHFetchResultMBS = PHCollectionListMBS.fetchCollectionListsWithType(PHCollection-
ListMBS.TypeFolder, PHCollectionListMBS.SubtypeRegularFolder)
Var lines() As String

For i As Integer = 0 To folders.count - 1
Var folder As PHCollectionListMBS = PHCollectionListMBS(folders.objectAtIndex(i))
lines.Add folder.localizedTitle
Var children As PHFetchResultMBS = PHCollectionMBS.fetchCollectionsInCollectionList(folder)
For j As Integer = 0 To children.count - 1
lines.Add " " + PHCollectionMBS(children.objectAtIndex(j)).localizedTitle
Next
Next

MessageBox String.FromArray(lines, EndOfLine)
```

Notes: In the Photos framework, collection objects (including asset collections) do not directly reference their member objects, and there are no other objects that directly reference collection objects. To retrieve the members of a collection list, fetch them with a PHCollectionMBS class method such as fetchCollection-sInCollectionList. To find objects at the root of the collection list hierarchy (such as album folders with no parent folders), use the fetchTopLevelUserCollectionsWithOptions method.

Accessing or modifying the Photos library requires explicit authorization from the user. The first time you call one of the methods listed in Fetching Collection Lists, Photos automatically prompts the user for authorization. (Alternatively, you can use the PHPhotoLibraryMBS requestAuthorization: method to prompt the user at a time of your choosing.)

Your app,Äôs Info.plist file must provide a value for the NSPhotoLibraryUsageDescription key that explains to the user why your app is requesting Photos access. Apps linked on or after iOS 10.0 will crash if this key is not present.

Like assets and asset collections, collection lists are immutable. To create, rename, or delete collection lists, or to add, remove, or rearrange members in a collection list, create a PHCollectionListChangeRequestMBS object within a photo library change block. For details on using change requests and change blocks to update

the photo library, see PHPhotoLibraryMBS.
Subclass of the PHCollectionMBS class.

146.18.2 Methods

146.18.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.18.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.18.5 fetchCollectionListsContainingCollection(collection as PHCollectionMBS, options as PHFetchOptionsMBS = nil) as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves collection lists that contain the specified collection.
Notes: collection: An asset collection or another collection list.
options: Options that specify a filter predicate and sort order for the fetched collection lists, or nil to use default options. For details, see PHFetchOptionsMBS class.

Returns a fetch result that contains the requested PHCollectionList objects, or an empty fetch result if no objects match the request.

Different kinds of collections have different containment possibilities. For example, an asset collection whose type is TypeAlbum may be contained in a folder, or have no containing collection list. A folder, in turn, may be contained in another folder. An asset collection whose type is TypeMoment is always contained by two collection lists: a moment cluster and a moment year.

146.18.6 fetchCollectionListsWithLocalIdentifiers(identifiers() as string, options as PHFetchOptionsMBS = nil) as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves collection lists with the specified local-device-specific unique identifiers.
Notes: identifiers: An array of strings, each the localIdentifier string of a collection list.
options: Options that specify a filter predicate and sort order for the fetched collection lists, or nil to use default options. For details, see PHFetchOptionsMBS.

Returns a fetch result that contains the requested PHCollectionListMBS objects, or an empty fetch result if no objects match the request.

146.18.7 fetchCollectionListsWithType(collectionListType as Integer, subtype as Integer, options as PHFetchOptionsMBS = nil) as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves collection lists of the specified type.
Notes: collectionListType: A type of collection list. See PHCollectionListType.
subtype: A subtype of collection list. See PHCollectionListSubtype.
options: Options that specify a filter predicate and sort order for the fetched collection lists, or nil to use default options. For details, see PHFetchOptionsMBS.

Returns a fetch result that contains the requested PHCollectionListMBS objects, or an empty fetch result if no objects match the request.

By default, the returned PHFetchResult object contains all collection lists with the specified type and subtype. To retrieve a more specific set of collection lists, provide a PHFetchOptionsMBS object containing a filter predicate.

146.18.8 localizedLocationNames as String()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The names of locations grouped by the collection (an array of strings).
Notes: For a collection list representing a group of moments, as seen in the Collections view in the Photos app, this property lists the location names associated with each moment in the group. For other types of collection list, this property,Äôs value is nil.

146.18.9 transientCollectionListWithCollections(collections() as PHCollectionMBS, title as String) as PHCollectionListMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a temporary collection list that contains the specified asset collections.
Notes: collections: An array of PHAssetCollectionMBS objects.
title: A name for the new temporary collection list.

Returns a new collection list.

Transient collection lists are not saved to local storage or iCloud and do not appear in the Photos application or other apps using the Photos framework. A transient collection can be useful if you,Äôve designed a UI for displaying the contents of a collection list and want to display an arbitrary set of collections.

146.18.10 transientCollectionListWithCollectionsFetchResult(fetchResult as PHFetchResultMBS, title as String) as PHCollectionListMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a temporary collection list containing the asset collections in the specified fetch result.
Notes: fetchResult: A fetch result that contains one or more PHAssetCollection objects.
title: A name for the new temporary collection list.

Returns a new collection list.

Transient collection lists are not saved to local storage or iCloud and do not appear in the Photos application or other apps using the Photos framework. A transient collection can be useful if you,Äôve designed a UI for displaying the contents of a collection list and want to display an arbitrary set of collections.

146.18.11 Properties

146.18.12 collectionListSubtype as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The type of asset collection grouping the collection list represents.
Notes: Use subtypes to make minor distinctions between collection lists of the same type, such as moment clusters and moment years. See Subtype constants.
(Read only property)

146.18.13 collectionListType as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The type of asset collection group that the collection list represents.
Notes: A collection list may represent an upper level of the Moments hierarchy shown in the Photos app, a folder that contains albums, or a smart folder synced from iPhoto.
(Read only property)

146.18.14 endDate as Date

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The latest creation date among all assets in the collection list.
Notes: This property applies only to collection lists whose type is TypeMomentList. For other collection list types, this property,Äôs value is nil.
(Read only property)

146.18.15 endDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The latest creation date among all assets in the collection list.
Notes: This property applies only to collection lists whose type is TypeMomentList. For other collection list types, this property,Äôs value is nil.
(Read only property)

146.18.16 startDate as Date

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The earliest creation date among all assets in the collection list.
Notes: This property applies only to collection lists whose type is TypeMomentList. For other collection list types, this property,Äôs value is nil.
(Read only property)

146.18.17 startDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The earliest creation date among all assets in the collection list.
Notes: This property applies only to collection lists whose type is TypeMomentList. For other collection

list types, this property,Äôs value is nil.
(Read only property)

146.18.18 Constants

Sub Types

Constant	Value	Description
SubtypeAny	-1	Use this value to fetch collection lists of all possible subtypes.
SubtypeMomentListCluster	1	The collection list is a moment cluster, grouping several related moments.
SubtypeMomentListYear	2	The collection list is a moment year, grouping all moments from one or more calendar years.
SubtypeRegularFolder	100	The collection list is a folder containing albums or other folders.
SubtypeSmartFolderEvents	200	The collection list is a smart folder containing one or more Events synced from iPhoto.
SubtypeSmartFolderFaces	201	The collection list is a smart folder containing one or more Faces synced from iPhoto.

Types

Constant	Value	Description
TypeFolder	2	A folder containing asset collections of type PHAssetCollectionTypeAlbum or PHAssetCollectionTypeSmartAlbum.
TypeMomentList	1	A group of asset collections of type PHAssetCollectionTypeMoment. Moment lists include both moment clusters and moment years. Moment clusters appear as ,ÄúCollections,Äù in the Photos app, grouping individual moments. Years group all moments containing assets created in the same calendar year.
TypeSmartFolder	3	A smart folder synced to the device.

146.19 class PHCollectionMBS

146.19.1 class PHCollectionMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The abstract superclass for Photos asset collections and collection lists.
Example:

```
// list the albums and folders the user created in the Photos app
// The app needs Photos access, see PHPhotoLibraryMBS.requestAuthorization.
Var result As PHFetchResultMBS = PHCollectionMBS.fetchTopLevelUserCollections
Var lines() As String
For i As Integer = 0 To result.count - 1
Var c As PHCollectionMBS = result.objectAtIndex(i)
lines.Add c.localizedTitle + If(c.canContainCollections, " (folder)", " (album)")
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: You do not create or work with instances of this class directly. Instead, use one of its two concrete subclasses, PHAssetCollectionMBS or PHCollectionListMBS.

- A PHAssetCollectionMBS object represents a collection of photo or video assets, such as an album, moment, or Shared Photo Stream.
- A PHCollectionListMBS object represents a collection that contains other collections, such as a a folder containing albums or the set of all moments in a calendar year.

Accessing or modifying the Photos library requires explicit authorization from the user. The first time you call one of the methods listed in Fetching Collections, Photos automatically prompts the user for authorization. (Alternatively, you can use the PHPhotoLibraryMBS requestAuthorization method to prompt the user at a time of your choosing.)

Your app,Äôs Info.plist file must provide a value for the NSPhotoLibraryUsageDescription key that explains to the user why your app is requesting Photos access. Apps linked on or after iOS 10.0 will crash if this key is not present.
Subclass of the PHObjectMBS class.

146.19.2 Methods

146.19.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.19.4 canPerformEditOperation(anOperation as Integer) as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns whether the collection supports the specified editing operation.
Notes: anOperation: A bit mask of editing operations to be tested.

Returns true if the asset supports the specified editing operation; otherwise, false.

If an asset collection or collection list supports editing, you can create a PHAssetCollectionChangeRequestMBS or PHCollectionListChangeRequestMBS object inside a PHPhotoLibraryMBS change block to submit a change.

146.19.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.19.6 fetchCollectionsInCollectionList(collectionList as PHCollectionListMBS, options as PHFetchOptionsMBS = nil) as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves collections from the specified collection list.
Notes: collectionList: The collection list from which to fetch collections.
options: Options that specify a filter predicate and sort order for the fetched collections, or nil to use default options. For details, see PHFetchOptionsMBS.

Returns a fetch result that contains the requested PHCollectionMBS objects, or an empty fetch result if no objects match the request.

By default, the returned PHFetchResultMBS object contains all collections in the specified collection list. To retrieve a more specific set of assets, provide a PHFetchOptionsMBS object that contains a filter predicate.

146.19.7 fetchTopLevelUserCollections(options as PHFetchOptionsMBS = nil) as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves collections from the root of the photo library,Äôs hierarchy of user-created albums and folders.
Notes: options: Options that specify a filter predicate and sort order for the fetched collections, or nil to use default options. For details, see PHFetchOptionsMBS.

Returns a fetch result that contains the requested PHCollection objects, or an empty fetch result if no objects match the request.

146.19.8 Properties

146.19.9 canContainAssets as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the collection can contain assets.
Notes: If this value is true, the collection is a PHAssetCollection object; otherwise, false. For details on asset collections, see PHAssetCollectionMBS.
(Read only property)

146.19.10 canContainCollections as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the collection can contain other collections.
Notes: If this value is true, the collection is a PHCollectionList object; otherwise, false. For details on collection lists, see PHCollectionListMBS.
(Read only property)

146.19.11 localizedTitle as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The localized name of the collection.
Notes: This property,Äôs value can be either a user-supplied name for a user-created collection, or the localized name of a collection built into the Photos app.
(Read only property)

146.19.12 Constants

Edit Operations

Constant	Value	Description
EditOperationAddContent	3	The collection supports adding items that already exist elsewhere in the photo library.
EditOperationCreateContent	4	The collection supports creating new items.
EditOperationDelete	6	The collection itself can be deleted.
EditOperationDeleteContent	1	The collection supports deleting the items it contains.
EditOperationRearrangeContent	5	The collection supports reordering the arrangement of items it contains.
EditOperationRemoveContent	2	The collection supports removing the items it contains.
EditOperationRename	7	The collection itself can be renamed.

146.20 class PHContentEditingInputMBS

146.20.1 class PHContentEditingInputMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A container that provides information about and access to the image, video, or Live Photo content of an asset to be edited.
Example:

```
// get the full size image of a photo for editing
// asset is a PHAssetMBS, e.g. from PHAssetMBS.fetchAssetsWithMediaType
// Asset is a property of the window: Asset As PHAssetMBS
If Asset = Nil Then Return

Var options As New PHContentEditingInputRequestOptionsMBS
options.NetworkAccessAllowed = True
Call Asset.requestContentEditingInputWithOptions(options, AddressOf GotEditingInput)

// a method in the window:
Sub GotEditingInput(Asset As PHAssetMBS, Options As PHContentEditingInputRequestOptionsMBS, tag
As Variant, contentEditingInput As PHContentEditingInputMBS, info As Dictionary)
If contentEditingInput = Nil Then Return
System.DebugLog "Image: " + contentEditingInput.fullSizeImageURL + ", type " + contentEditingIn-
put.uniformTypeIdentifier
End Sub
```

Notes: To edit an asset,Äôs photo or video content:

1. Fetch a PHAsset object that represents the photo or video to be edited.
2. Call the asset,Äôs requestContentEditingInputWithOptions method to retrieve a PHContentEditingInputMBS object.
3. Apply your edits to the asset. To allow a user to continue working with the edit later (for example, to adjust the parameters of a photo filter), create a PHAdjustmentDataMBS object describing the changes.
4. Initialize a PHContentEditingOutputMBS object. For photo- or video-only assets, use the editing output,Äôs properties to provide edited asset data. For Live Photo assets, create a PHLivePhotoEditingContextMBS object to edit the Live Photo content.
5. Use a photo library change block to commit the edit. In the block, create a PHAssetChangeRequestMBS object and set its contentEditingOutput property to the editing output that you created. For more details, see PHPhotoLibraryMBS.

You can also edit assets from photo editing extensions. In this case, instead of working with a PHAsset object, you implement methods in the PHContentEditingControllerMBS protocol. Photos provides a PHContentEditingInputMBS object when your extension begins editing. When editing is complete, Photos requests a PHContentEditingOutputMBS object that contains the edited asset content.

146.20.2 Methods

146.20.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.11 or newer.

146.20.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.20.5 Properties

146.20.6 adjustmentData as PHAdjustmentDataMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An object that describes the most recent edit to the asset,Äôs content.
Notes: Adjustment data describes the ,Äúrecipe,Äù for the last edit made to an asset,Äôs photo or video content. For example, a photo editing app can use this property to read information about a set of filters applied to a photo. With this information, your app can later allow a user to change the filter parameters.
(Read only property)

146.20.7 audiovisualAsset as Variant

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The video asset, as an AVAssetMBS object.
Notes: This object provides access to the video asset as a collection of tracks and metadata. For details on working with AVAssetMBS objects.

We pass result, the AVAssetMBS object, as variant to avoid plugin dependencies.
(Read only property)

146.20.8 creationDate as Date

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The date and time when the asset was originally created.
Notes: (Read only property)

146.20.9 creationDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: The date and time when the asset was originally created.
Notes: (Read only property)

146.20.10 displaySizeImage as NSImageMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An image of the asset,Äôs contents, appropriately sized for display.
Notes: This property does not provide the full-sized image for a photo asset but rather a scaled-down image appropriate for use in a photo editing user interface. To load the full-sized asset image, use the fullSizeImageURL property.
(Read only property)

146.20.11 fullSizeImageOrientation as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The Exif display orientation of the full-size image file.
Notes: This property's value is a raw numeric value describing the encoded image orientation according to the TIFF and Exif specifications. To more easily work with such values, convert this value to the CGImagePropertyOrientation type.
(Read only property)

146.20.12 fullSizeImageURL as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The URL to a file that contains the full-sized image data.
Notes: Typically, your app or extension does not need to load a full-sized image for use in an editing UI. Instead, use the displaySizeImage property to retrieve an image suitable for screen display. You can then load the full-sized image on a background queue so that it will be ready by the time the user finishes editing

the display-size image. At that time, apply the user,Äôs adjustments to the full-sized image and then use the PHContentEditingOutputMBS class to commit the edit to the photo library.
(Read only property)

146.20.13 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.20.14 livePhoto as PHLivePhotoMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The unedited Live Photo content of the editing input.
Notes: To edit the video and photo content of the Live Photo, create a PHLivePhotoEditingContextMBS object using this PHContentEditingInputMBS object.
If the editing input does not represent a Live Photo, this property,Äôs value is nil, indicating that you cannot use this PHContentEditingInputMBS object to create a Live Photo editing context.
(Read only property)

146.20.15 location as Variant

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The location information that was saved with the asset.
Notes: Typically, an asset,Äôs location metadata identifies the place where the asset was captured.

We pass result, the CLLocationMBS object, as variant to avoid plugin dependencies.
(Read only property)

146.20.16 mediaSubtypes as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The subtypes of the asset, identifying special kinds of assets such as a panoramic photo or a high-frame-rate video.
Notes: See MediaSubtype* constants for possible values.
Because an asset can have more than one subtype, use these values as bit masks to identify an asset.

(Read only property)

146.20.17 mediaType as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The type of the asset, such as video or audio.
Notes: See MediaType* constants.
(Read only property)

146.20.18 playbackStyle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The playback style for the asset.
Notes: (Read only property)

146.20.19 uniformTypeIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The uniform type identifier for the asset,Äôs image or video data.
Notes: (Read only property)

146.20.20 Constants

Asset Playback Styles

Constant	Value	Description
PlaybackStyleImage	1	The asset should be displayed as a still image.
PlaybackStyleImageAnimated	2	The asset should be displayed as an animated image.
PlaybackStyleLivePhoto	3	The asset should be displayed as a Live Photo.
PlaybackStyleUnsupported	0	The asset has an unsupported or undefined media playback type.
PlaybackStyleVideo	4	The asset should be displayed as a video.
PlaybackStyleVideoLooping	5	The asset should be displayed as a looping video.

146.21 class PHContentEditingInputRequestOptionsMBS

146.21.1 class PHContentEditingInputRequestOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A set of options affecting the delivery of image or video data when you request to edit the content of a Photos asset.
Example:

```
// allow downloading the original from iCloud when requesting a photo for editing
Var options As New PHContentEditingInputRequestOptionsMBS
options.NetworkAccessAllowed = True

// pass options to PHAssetMBS.requestContentEditingInputWithOptions, see PHContentEditingInputMBS
```

Notes: You use the PHContentEditingInputRequestOptionsMBS class with the requestContentEditingInputWithOptions method for editing the contents of a PHAssetMBS object.
This class does not affect photo editing extensions.

146.21.2 Methods

146.21.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.15 or newer.

146.21.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.21.5 Destructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

146.21.6 SetCanHandleAdjustmentData(CanHandleAdjustmentData as CanHandleAdjustmentDataMBS, tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets delegate to be called when Photos needs to determine whether your app can continue previous edits made to an asset.
Notes: When an asset is edited, Photos stores a PHAdjustmentDataMBS object provided by the app or extension that edited the asset. This object provides all information necessary to reconstruct the edited asset using the original asset data. When your app requests to edit an asset, Photos calls this block to inquire whether your app can handle the asset,Äôs past adjustments.

146.21.7 SetProgressHandler(ProgressHandler as ProgressHandlerMBS, tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the delegate Photos calls periodically while downloading the asset.
Notes: If you request an asset whose data is not on the local device, and have enabled downloading with the networkAccessAllowed property, Photos calls your block periodically to report progress and allow canceling the download.

146.21.8 Properties

146.21.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.21.10 NetworkAccessAllowed as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that specifies whether Photos can download the requested asset from iCloud if needed.
Notes: If true (the default), Photos downloads the asset requested for editing if it is not stored on the local device. To be notified of the download,Äôs progress, use the PHContentEditingInputRequestOptionsMBS property to provide a delegate that Photos calls periodically while downloading the asset.
(Read and Write property)

146.21.11 ProgressHandler as ProgressHandlerMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate Photos calls periodically while downloading the asset.
Notes: If you request an asset whose data is not on the local device, and have enabled downloading with the networkAccessAllowed property, Photos calls your block periodically to report progress and allow canceling the download.
(Read and Write property)

146.21.12 Delegates

146.21.13 CanHandleAdjustmentDataMBS(adjustmentData as PHAdjustmentDataMBS, tag as Variant) as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The delegate takes the following parameter.
Notes: adjustmentData: A PHAdjustmentDataMBS object you can use to determine whether your app can work with past edits made to the asset. Typically, you make this decision based on the adjustment data,Äôs formatIdentifier and formatVersion properties.

If your method returns true, Photos provides the original asset data for editing. Your app uses the adjustment data to alter, add to, or reapply previous edits. (For example, an adjustment data may describe filters applied to a photo. Your app reapplies those filters and allows the user to change filter parameters, add new filters, or remove filters.)
If your method returns false, Photos provides the most recent asset data—the rendered output of all previous edits—for editing.

146.21.14 ProgressHandlerMBS(progress as double, byref stop as boolean, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The delegate takes the following parameters.
Notes: progress: A floating-point value indicating the progress of the download. A value of 0.0 indicates the download has just started, and a value of 1.0 indicates the download is complete.
stop: Set stop to true inside the block to cancel the download.

146.22 class PHContentEditingOutputMBS

146.22.1 class PHContentEditingOutputMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A container to which you provide the results of editing the photo, video, or Live Photo content of a Photos asset.
Notes: To edit an asset,Äôs photo or video content:

1. Fetch a PHAssetMBS object that represents the photo or video to be edited.
2. Call the asset,Äôs requestContentEditingInputWithOptions method to retrieve a PHContentEditingInputMBS object. This object provides information about the asset, the asset data to be edited, and a preview image for display.
3. Apply your edits to the asset. To allow a user to continue working with the edit later (for example, to adjust the parameters of a photo filter), create a PHAdjustmentDataMBS object describing the changes.
4. Initialize a PHContentEditingOutput object. For photo- or video-only assets, provide the edited content with the renderedContentURL property. For Live Photo assets, create a PHLivePhotoEditingContext object to edit the Live Photo content and pass your content editing output to the saveLivePhotoToOutput method. For all asset types, provide your adjustment data with the adjustmentData property of the content editing output.
5. Use a photo library change block to commit the edit. (For details, see PHPhotoLibraryMBS.) In the block, create a PHAssetChangeRequestMBS object and set its contentEditingOutput property to the editing output that you created.

Each PHPhotoLibraryperformChanges call prompts the user for permission to edit the contents of the photo library—to edit multiple assets in one batch, create multiple PHAssetChangeRequest objects within the same change block, each with its own corresponding PHContentEditingOutput object.

You can also edit assets from photo editing extensions. In this case, instead of working with a PHAssetMBS object, you implement methods in the PHContentEditingController protocol. Photos provides a PHContentEditingOutputMBS object when your extension begins editing. When editing is complete, Photos requests a PHContentEditingOutputMBS object that contains the edited asset content.

Requires MacOS 10.11 or newer.

146.22.2 Methods

146.22.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.11 or newer.

146.22.4 Constructor(contentEditingInput as PHContentEditingInputMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an editing output from the specified editing input.
Notes: contentEditingInput: An object providing information about the asset to be edited.

Returns an initialized content editing output.

To complete the edit, use the renderedContentURL property to provide the edited asset content. Then, use the PHAssetChangeRequestMBS class or PHContentEditingController protocol to commit the edit to storage.
See also:

- 146.22.5 Constructor(placeholderForCreatedAsset as PHObjectPlaceholderMBS) 19964

146.22.5 Constructor(placeholderForCreatedAsset as PHObjectPlaceholderMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an editing output for use in adding a new asset to the photo library.
Notes: placeholderForCreatedAsset: A placeholder object that ties the editing output to a PHAssetChangeRequest object for creating a new asset.

Returns an initialized content editing output.

Use this method if you want to add a new asset to the Photos library with edited content, as opposed to editing the content of an asset after adding it to the library. For example, you might use this option if your app applies filters to photos it captures with the device camera—instead of saving only the filtered image to the Photos library, your app can save both the filtered and the original image, allowing the user to revert to the original image or apply different filters later.
See also:

- 146.22.4 Constructor(contentEditingInput as PHContentEditingInputMBS) 19964

146.22.6 Properties

146.22.7 adjustmentData as PHAdjustmentDataMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An object describing the changes made to the asset.
Notes: You use adjustment data to describe the ‚Äúrecipe‚Äù for an edit that later edits can make use of. For example, a photo editing app can use this property to save information about the filters applied to a

photo. Later, the same app (or another app that understands its adjustment data format) can load the filter information, change the filter parameters, and reapply the filters to the original photo.

If you write new asset content to the URL specified by the renderedContentURL property, you must also provide a new, distinct PHAdjustmentDataMBS object describing your edit. Passing a preexisting adjustment data object (that describes an earlier edit) results in undefined behavior.
(Read only property)

146.22.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.22.9 renderedContentURL as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The URL at which to write a file containing edited asset content.
Notes: Read this property to find a URL for writing edited asset content. Then, if editing a photo asset, write the altered photo image to a file in JPEG format at this URL. If editing a video asset, export the video to a QuickTime (.mov) file at this URL.

Edited asset content must incorporate (or ,Äúbake in,Äù) the intended orientation of the asset. That is, the orientation metadata (if any) that you write in the output image or video file must declare the ,Äúup,Äù orientation, and the image or video data must appear right-side up when presented without orientation metadata.

For Live Photo content, you don,Äôt write output to this URL. Instead, pass the editing output object to the saveLivePhotoToOutput method.
(Read only property)

146.23 class PHFetchOptionsMBS

146.23.1 class PHFetchOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A set of options that affect the filtering, sorting, and management of results that Photos returns when you fetch asset or collection objects.
Example:

```
// fetch the 10 newest pictures from the photo library
Var options As New PHFetchOptionsMBS
options.fetchLimit = 10
Var sort() As NSSortDescriptorMBS
sort.Add New NSSortDescriptorMBS("creationDate", False) // newest first
options.setSortDescriptors sort

Var result As PHFetchResultMBS = PHAssetMBS.fetchAssetsWithMediaType(PHAssetMBS.MediaType-
Image, options)
For i As Integer = 0 To result.count - 1
Var asset As PHAssetMBS = result.objectAtIndex(i)
System.DebugLog asset.creationDateTime.SQLDateTime
Next
```

Notes: Using class methods on the PHAssetMBS, PHCollectionMBS, PHAssetCollectionMBS, and PHCollectionListMBS classes to fetch assets or collections produces a PHFetchResultMBS object containing the requested objects. The options you specify control which objects the fetch result includes, how those objects are arranged in the fetch result, and how Photos should notify your app of changes to the fetch result.

Photos supports only a restricted set of keys for the predicate and sortDescriptors properties. The set of available keys depends on which class you,Äôre using to fetch assets or collections—see Table 1 for the list of keys supported by each class.

Supported predicate and sort descriptor keys

Class for Fetch Method	Supported Keys
PHAsset	SELF, localIdentifier, creationDate, modificationDate, mediaType, mediaSubtypes, duration, pixelWidth, pixelHeight, favorite (or isFavorite), hidden (or isHidden), burstIdentifier
PHAssetCollection	SELF, localIdentifier, localizedTitle (or title), startDate, endDate, estimatedAssetCount
PHCollectionList	SELF, localIdentifier, localizedTitle (or title), startDate, endDate
PHCollection (can fetch a mix of PHCollectionList and PHAssetCollection objects)	SELF, localIdentifier, localizedTitle (or title), startDate, endDate

Available in MacOS 10.13 or newer.

146.23.2 Methods

146.23.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.23.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.23.5 copy as PHFetchOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the object.

146.23.6 setSortDescriptors(sortDescriptors() as NSSortDescriptorMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the list of sort descriptors, specifying an order for the fetched objects.

146.23.7 sortDescriptors as NSSortDescriptorMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A list of sort descriptors, specifying an order for the fetched objects.

146.23.8 Properties

146.23.9 fetchLimit as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum number of objects to include in the fetch result.
Notes: With the default fetch limit of zero, Photos returns all requested assets or collections in a fetch result. Change this value to fetch more efficiently in situations where a potentially very large result is not needed. For example, to fetch only the most recently captured asset, call the fetchAssetsWithOptions method, using the sortDescriptors property to sort in descending date order, and setting a fetch limit of one.
(Read and Write property)

146.23.10 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.23.11 includeAllBurstAssets as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the fetch result includes all assets from burst photo sequences.
Notes: When the user takes a sequence of photos in burst mode with the Camera app (on supported devices), the Photos app user interface groups the resulting assets together and allows the user to select favorite members of the sequence. Photos also automatically marks members of the sequence as potential user favorites.

If the value is false (the default), fetches that include burst photo sequences return only the user-picked members and representative asset of each sequence. If the value is true, such fetches include all assets in each sequence.
(Read and Write property)

146.23.12 includeAssetSourceTypes as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The set of source types for which to include assets in the fetch result.
Notes: Asset source types identify the means by which an asset enters the Photos library, and affect the possible actions you can perform on an asset. For example, assets synced from iTunes cannot be edited or deleted.

The SourceType type is an option set—to include multiple source types in the same query, combine type constants with the bitwise OR operator. See SourceType constants in PHAssetMBS class.

(Read and Write property)

146.23.13 includeHiddenAssets as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the fetch result includes assets marked as hidden.
Notes: If the value is false (the default), fetches exclude assets whose hidden property is true. If the value is true, fetches include all assets regardless of their hidden state.
(Read and Write property)

146.23.14 predicate as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A predicate that specifies which properties to select results by and that also specifies any constraints on selection.
Notes: Construct a predicate with the properties of the class of objects that you want to fetch
(Read and Write property)

146.23.15 wantsIncrementalChangeDetails as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether your app receives detailed change information for the objects in the fetch result.
Notes: If you have registered a change observer with the shared PHPhotoLibraryMBS object, fetching assets or collections automatically registers your observer to receive information about later changes to the fetch result and about the objects it contains. For a fetch result, change information (a PHFetchResultChangeDetailsMBS object) can include a detailed list of incremental differences from the previous state of the fetch result, such as new photos captured since the original fetch.

If true (the default), Photos sends detailed incremental changes when such information is available. If false, Photos tells your app only when the fetch result has changed (in which case you can perform the fetch again to receive updated results).
(Read and Write property)

146.24 class PHFetchResultChangeDetailsMBS

146.24.1 class PHFetchResultChangeDetailsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A description of changes that occurred in the set of asset or collection objects listed in a fetch result.
Notes: A PHFetchResultChangeDetailsMBS object provides detailed information about the differences between two fetch results—one that you previously obtained and an updated one that would result if you performed the same fetch again. The change details object provides information useful for updating a UI that lists the contents of a fetch result, such as the indexes of added, removed, and rearranged objects.

146.24.2 Methods

146.24.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.24.4 changeDetailsFromFetchResult(fromResult as PHFetchResultMBS, toFetchResult as PHFetchResultMBS, changedObjects() as PHObjectMBS) as PHFetchResultChangeDetailsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a change details object that summarizes the differences between two fetch results.
Notes: fromResult: A fetch result to be treated as the ‚Äúbefore‚Äù state in the resulting change details object.
toResult: A fetch result to be treated as the ‚Äúafter‚Äù state in the resulting change details object.
changedObjects: An collection of objects to manually note as changed between the two fetch results.

Typically, you use the PHChangeMBS class to retrieve PHFetchResultChangeDetailsMBS objects describing any changes that have occurred since you performed a fetch, but you can also use this method to get a change details object that summarizes the difference between two arbitrary PHFetchResultMBS objects. In this case, Photos cannot automatically determine when the same objects are present in both fetch results but those objects‚Äô content has changed, so the changedIndexes and changedObjects properties are empty.

However, you can use the changedObjects parameter to manually note objects as changed. For example, consider a view controller that maintains a base fetch result representing a list of albums, and a transient

collection that filters the list according to the user,Äôs search terms.

146.24.5 changedObjects() as PHObjectMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The objects in the fetch result whose content or metadata have been updated.
Notes: An array of PHAssetMBS, PHAssetCollectionMBS, or PHCollectionListMBS objects.
If the hasIncrementalChanges property,Äôs value is false, this property,Äôs value is nil.

146.24.6 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.24.7 enumerateMoves(theDelegate as enumerateMovesHandlerMBS, Tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Runs the specified block for each case where an object has moved from one index to another in the fetch result.
Notes: The toIndex parameter in the handler block is relative to the state of the fetch result after you,Äôve applied the changes described by the removedIndexes, insertedIndexes and changedIndexes properties. Therefore, if you use this method to update a collection view or similar user interface displaying the contents of the fetch result, update your UI to reflect insertions, removals, and changes before you process moves.

146.24.8 insertedObjects() as PHObjectMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The new items that have been inserted in the fetch result.
Notes: This array can contain PHAssetMBS, PHAssetCollectionMBS or PHCollectionListMBS objects, or some combination thereof.
If the hasIncrementalChanges property,Äôs value is false, this property,Äôs value is nil.

146.24.9 removedObjects() as PHObjectMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The items that have been removed from the fetch result.
Notes: This array can contain PHAssetMBS, PHAssetCollectionMBS, or PHCollectionListMBS objects, or some combination thereof.
If the hasIncrementalChanges property,Äôs value is false, this property,Äôs value is nil.

146.24.10 Properties

146.24.11 changedIndexes as NSIndexSetMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The indexes of objects in the fetch result whose content or metadata have been updated.
Notes: Use this index set to update elements in a collection view or similar user interface that displays the contents of the fetch result. These indexes are relative to the original fetch result (the fetchResultBeforeChanges property) after you,Äôve applied the changes described by the removedIndexes and insertedIndexes properties; when updating your app,Äôs interface, apply changes after removals and insertions and before moves.

If the hasIncrementalChanges property,Äôs value is false, this property,Äôs value is nil.
(Read only property)

146.24.12 fetchResultAfterChanges as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The current fetch result, incorporating recent changes.
Notes: You can use this object to inspect the current state of the fetched objects even if the hasIncrementalChanges property,Äôs value is false. Using this fetch result is equivalent to performing once more the same fetch that returned the original fetch result.
(Read only property)

146.24.13 fetchResultBeforeChanges as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The original fetch result, without recent changes.
Notes: This property,Äôs value is the same object you passed to the changeDetailsForFetchResult method to request change details.

(Read only property)

146.24.14 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.24.15 hasIncrementalChanges as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether changes to the fetch result can be described incrementally.
Notes: If this value is true, use the insertedIndexes, removedIndexes, and changedIndexes properties (or the insertedObjects, removedObjects, and changedObjects properties) to find out which objects in the fetch result have been added, removed, or updated. You can also use the hasMoves property and enumerateMoves method to find out which objects in the fetch result have been rearranged. These properties can be useful for updating a collection view or similar interface that displays the fetch result,Äôs contents.

If this value is false, the fetch result is too different from its original state for incremental change information to be meaningful. Use the fetchResultAfterChanges property to get the fetch result,Äôs current membership. (If displaying the fetch result,Äôs contents, reload your user interface to match the new fetch result.)
(Read only property)

146.24.16 hasMoves as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether objects have been rearranged in the fetch result.
Notes: If this value is true, use the enumerateMoves method to find out which elements have been moved and what their new indexes are.
(Read only property)

146.24.17 insertedIndexes as NSIndexSetMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The indexes where new objects have been inserted in the fetch result.
Notes: Use this index set can to insert elements in a collection view or similar user interface that displays

the contents of the fetch result. These indexes are relative to the original fetch result (the fetchResultBeforeChanges property) after you,Äôve applied the changes described by the removedIndexes property; when updating your app,Äôs interface, apply insertions after removals and before changes and moves.

If the hasIncrementalChanges property,Äôs value is false, this property,Äôs value is nil.
(Read only property)

146.24.18 removedIndexes as NSIndexSetMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The indexes from which objects have been removed from the fetch result.
Notes: Use this index set to remove elements from a collection view or similar user interface that displays the contents of the fetch result. These indexes are relative to the original fetch result (the fetchResultBeforeChanges property); when updating your app,Äôs interface, apply removals before insertions, changes, and moves.
If the hasIncrementalChanges property,Äôs value is false, this property,Äôs value is nil.
(Read only property)

146.24.19 Delegates

146.24.20 enumerateMovesHandlerMBS(fromIndex as Integer, toIndex as Integer, tag as variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate that Photos calls to provide details about which objects in the fetch result have moved to which indexes.
Notes: fromIndex: The index of an object in the original fetch result.
toIndex: The index to which the object has moved in the new fetch result.

146.25 class PHFetchResultMBS

146.25.1 class PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An ordered list of assets or collections returned from a Photos fetch method.
Example:

```
// count photos and videos and get the newest photo
// The app needs Photos access, see PHPhotoLibraryMBS.requestAuthorization.
Var options As New PHFetchOptionsMBS
Var sorting() As NSSortDescriptorMBS
sorting.Add NSSortDescriptorMBS.sortDescriptorWithKey("creationDate", False)
options.setSortDescriptors sorting

Var photos As PHFetchResultMBS = PHAssetMBS.fetchAssetsWithMediaType(PHAssetMBS.MediaType-
Image, options)
Var videos As PHFetchResultMBS = PHAssetMBS.fetchAssetsWithMediaType(PHAssetMBS.MediaType-
Video)

Var newest As PHAssetMBS = PHAssetMBS(photos.firstObject)
Var info As String = photos.count.ToString + " photos, " + videos.count.ToString + " videos"
If newest <>Nil Then info = info + EndOfLine + "Newest from " + newest.creationDateTime.ToString
MessageBox info
```

Notes: When you use class methods on the PHAssetMBS, PHCollectionMBS, PHAssetCollectionMBS, and PHCollectionListMBS classes to retrieve objects, Photos provides the resulting objects in a fetch result. You access the contents of a fetch result with various methods. Unlike an array, however, a PHFetchResult object dynamically loads its contents from the Photos library as needed, providing optimal performance even when handling a large number of results.

A fetch result provides thread-safe access to its contents. After a fetch, the fetch result,Äôs count value is constant, and all objects in the fetch result keep the same localIdentifier value. (To get updated content for a fetch, register a change observer with the shared PHPhotoLibraryMBS object.)

A fetch result caches its contents, keeping a batch of objects around the most recently accessed index. Because objects outside of the batch are no longer cached, accessing these objects results in refetching those objects. This process can result in changes to values previously read from those objects.

- Show Live Photos in your Xojo application

146.25.2 Methods

146.25.3 allObjects as Variant()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Queries all objects as array.

146.25.4 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.25.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.25.6 containsObject(anObject as Variant) as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns whether the specified object is present in the fetch result.
Notes: anObject: An object.

Returns true if anObject is present in the fetch result, otherwise false.

This method determines whether anObject is present in the fetch result by sending an isEqual: message to each of the fetch result,Äôs objects (and passing anObject as the parameter to each isEqual message).

146.25.7 copy as PHFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the result set.

146.25.8 countOfAssetsWithMediaType(MediaType as Integer) as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the number of assets in the fetch result of a specified type.
Notes: mediaType: The type of assets to count, such as image or video. See MediaType constants.

Returns the number of assets in the fetch result of the specified type.

The first time you call this method, Photos enumerates the contents of the fetch result to count those of the specified type, then caches the result. Subsequent calls with the same mediaType parameter return the cached value.
This method counts only the PHAssetMBS objects in a fetch result. If a fetch result contains only PHAssetCollectionMBS or PHCollectionListMBS objects, the return value is 0.

146.25.9 indexOfObject(anObject as Variant) as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the lowest index whose corresponding object in the fetch result is equal to the specified object.
Notes: anObject: An object.

Returns the lowest index whose corresponding object in the fetch result is equal to anObject, or NSNotFound if no such object is in the fetch result.

Starting at index 0, this method sends an isEqual message to each object in the fetch result until it finds a match or reaches the end of the fetch result. This method passes the anObject parameter to each isEqual message.
See also:

- 146.25.10 indexOfObject(anObject as Variant, range as NSRangeMBS) as Integer 19977

146.25.10 indexOfObject(anObject as Variant, range as NSRangeMBS) as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the lowest index within the specified range whose corresponding object in the fetch result is equal to the specified object.
Notes: anObject: An object.
range: The range of indexes in the fetch result within which to search for anObject.

Returns the lowest index within range whose corresponding object in the fetch result is equal to anObject, or NSNotFound if no such object is in the fetch result.

Starting at range.location, this method sends an isEqual message to each object in the fetch result until it finds a match or reaches the end of the fetch result. This method passes the anObject parameter to each isEqual message.
Raises an exception (NSExceptionMBS class) if the range parameter represents a range that doesn,Äôt exist in the fetch result.
See also:

- 146.25.9 indexOfObject(anObject as Variant) as Integer 19977

146.25.11 objectAtIndex(index as Integer) as Variant

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the object located at the specified index.
Notes: index: An index within the bounds of the fetch result.

Returns the object located at index in the fetch result.

Raises an exception (NSExceptionMBS class) if index is beyond the end of the fetch result (that is, greater than or equal to the value of the count property).

146.25.12 objectsAtIndexes(indexes as NSIndexSetMBS) as Variant()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns an array containing the objects in the fetch result at the indexes in the specified index set.
Notes: indexes: An index set containing indexes within the bounds of the fetch result.

Returns an array containing the objects in the fetch result at the indexes specified by indexes.

The ordering of the returned array follows the index set. That is, in the returned array, an object with a higher index in the index set comes after any object with a smaller index in the index set.
Raises an exception (NSExceptionMBS) if any index in the index set is beyond the end of the fetch result (that is, greater than or equal to the value of the count property).

146.25.13 Properties

146.25.14 count as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The number of objects in the fetch result.
Notes: (Read only property)

146.25.15 firstObject as Variant

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The first object in the fetch result.
Notes: You specify the ordering of a fetch result in the PHFetchOptionsMBS object you pass to a fetch method.
Returns nil if the fetch result is empty.
(Read only property)

146.25.16 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.25.17 lastObject as Variant

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The last object in the fetch result.
Notes: You specify the ordering of a fetch result in the PHFetchOptionsMBS object you pass to a fetch method.
Returns nil if the fetch result is empty.
(Read only property)

146.25.18 Constants

Edit Operation

Constant	Value	Description
EditOperationContent	2	The asset,Äôs photo or video content can be edited. To begin the process of editing an asset, use the requestContentEditingInputWithOptions method.
EditOperationDelete	1	The asset can be deleted from the photo library. To delete one or more assets, create a change request with the deleteAssets method inside a PHPhotoLibrary change block.
EditOperationProperties	3	The asset,Äôs metadata properties can be edited. To change an asset,Äôs properties, create a change request with the changeRequestForAsset method inside a PHPhotoLibraryMBS change block.

Media Types

Constant	Value	Description
MediaTypeAudio	3	The asset is an audio file.
MediaTypeImage	1	The asset is a photo or other static image.
MediaTypeUnknown	0	The asset,Äôs type is unknown.
MediaTypeVideo	2	The asset is a video file.

Asset Playback Styles

Constant	Value	Description
PlaybackStyleImage	1	The asset should be displayed as a still image.
PlaybackStyleImageAnimated	2	The asset should be displayed as an animated image.
PlaybackStyleLivePhoto	3	The asset should be displayed as a Live Photo.
PlaybackStyleUnsupported	0	The asset has an unsupported or undefined media playback type.
PlaybackStyleVideo	4	The asset should be displayed as a video.
PlaybackStyleVideoLooping	5	The asset should be displayed as a looping video.

146.26 class PHImageManagerMBS

146.26.1 class PHImageManagerMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An object that facilitates retrieving or generating preview thumbnails and asset data.
Example:

```
// load a thumbnail of the newest picture in the photo library
Var options As New PHFetchOptionsMBS
options.fetchLimit = 1
Var sort() As NSSortDescriptorMBS
sort.Add New NSSortDescriptorMBS("creationDate", False)
options.setSortDescriptors sort

Var result As PHFetchResultMBS = PHAssetMBS.fetchAssetsWithMediaType(PHAssetMBS.MediaType-
Image, options)
If result.count = 0 Then Return

Var asset As PHAssetMBS = result.firstObject
Var info As Dictionary
Var image As NSImageMBS = PHImageManagerMBS.defaultManager.RequestImageForAssetSync(asset,
CGSizeMBS.Make(300, 300), PHImageManagerMBS.ContentModeAspectFit, Nil, info)

If image <>Nil Then
Var pic As Picture = image.CopyPictureWithAlpha
// show pic in a Canvas or ImageViewer
End If
```

Notes: Use these methods to fetch full-size photo assets or thumbnail images, or to retrieve AVFoundation objects for playing, exporting, and manipulating video assets.

To load image or video data:
1. Use the PHAsset class to fetch the asset you,Äôre interested in.
2. Call the defaultManager method to retrieve the shared image manager object.
3. Use one of the methods listed in Requesting Images and Requesting Video Objects to load the asset,Äôs image or video data.

The image manager caches the asset images and data it provides, so later requests for the same assets with similar parameters will return results more quickly.

If you need to load image data for many assets together, use the PHCachingImageManagerMBS class to ,Äúpreheat,Äù the cache by loading images you expect to need soon. For example, when populating a collection view with photo asset thumbnails, you can cache images ahead of the current scroll position.

Available in MacOS 10.13 or later.

- Show Live Photos in your Xojo application

146.26.2 Methods

146.26.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.26.4 cancelImageRequest(requestID as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Cancels an asynchronous request.
Notes: requestID: The numeric identifier of the request to be canceled.

When you perform an asynchronous request for image data using the requestImageForAsset method, or for a video object using one of the methods listed in Requesting Video Objects, the image manager returns a numeric identifier for the request. To cancel the request before it completes, provide this identifier when calling the cancelImageRequest method.

146.26.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.26.6 defaultManager as PHImageManagerMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the shared image manager object.
Notes: This method always returns the same image manager object, which is shared for all uses in your app.

146.26.7 MaximumSize as CGSizeMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A special value for requesting original image data or the largest rendered image available.
Notes: When you use the PHImageManagerMaximumSize option, Photos provides the largest image available for the asset without scaling or cropping. (That is, it ignores the resizeMode option.)

146.26.8 PHImageCancelledKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for the info dictionary.
Notes: A key whose value indicates whether the image request was canceled.

This key provides information about an image loading result in the resultHandler block for methods listed in Requesting Images. The corresponding value is a Boolean value.If you call the cancelImageRequest method to cancel a request, Photos calls your result handler block with the value true for this key.

146.26.9 PHImageErrorKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for the info dictionary.
Notes: A key whose value is an error that occurred when Photos attempted to load the image.

This key provides information about an image loading result in the resultHandler block for methods listed in Requesting Images. The corresponding value is an NSErrorMBS object.Photos provides an error object for this key if it cannot provide an image for your handler block,Äôs result parameter. Examine the error object for information about the cause of the error.

146.26.10 PHImageResultIsDegradedKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for the info dictionary.
Notes: A key whose value indicates whether the result image is a low-quality substitute for the requested image.

This key provides information about an image loading result in the resultHandler block for methods listed in Requesting Images. The corresponding value is a Boolean value. If true, the result parameter of your

resultHandler block contains a low-quality image because Photos could not yet provide a higher-quality image. Depending on your settings in the PHImageRequestOptions object that you provided with the request, Photos may call your result handler delegate again to provide a higher-quality image.

146.26.11 PHImageResultIsInCloudKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for the info dictionary.
Notes: A key whose value indicates whether photo asset data is stored on the local device or must be downloaded from iCloud.

This key provides information about an image loading result in the resultHandler delegate for methods listed in Requesting Images. The corresponding value is a Boolean value.

If true, no image was provided, because the asset data must be downloaded from iCloud. To download the data, submit another request, and specify true for the networkAccessAllowed option.

146.26.12 PHImageResultRequestIDKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for the info dictionary.
Notes: A key whose value is a unique identifier for the image request.

This key provides information about an image loading result in the resultHandler block for methods listed in Requesting Images. The corresponding value is an integer value. This identifier matches that returned when making a request. You can use it with the cancelImageRequest method to cancel requests with pending results that are no longer needed.

146.26.13 RequestAVAssetForVideo(asset as PHAssetMBS, options as PHVideoRequestOptionsMBS, exportPreset as String, CompletionHandler as RequestAVAssetForVideoCompletedMBS, tag as Variant = nil) as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Requests AVFoundation objects representing the video asset,Äôs content and state, to be loaded asynchronously.
Notes: asset: The video asset for which video objects are to be loaded.
options: Options specifying how Photos should handle the request and notify your app of progress or errors.

For details, see PHVideoRequestOptionsMBS class.

Returns a numeric identifier for the request. If you need to cancel the request before it completes, pass this identifier to the cancelImageRequest method.

When you call this method, Photos downloads the video data (if necessary) and creates AVFoundation objects. It then calls your resultHandler block to provide the requested video.

Use this method when you want to work with the arrangement of audio and video tracks that an asset contains. If you plan to use the asset only for playback, call the requestPlayerItemForVideo method. If you plan to export the asset data, call the requestExportSessionForVideo method.

146.26.14 RequestExportSessionForVideo(asset as PHAssetMBS, options as PHVideoRequestOptionsMBS, exportPreset as String, CompletionHandler as RequestExportSessionForVideoCompletedMBS, tag as Variant = nil) as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Requests an export session for writing the video asset,Äôs data to a file, to be loaded asynchronously.
Notes: asset: The video asset for which an export session is to be created.
options: Options specifying how Photos should handle the request and notify your app of progress or errors. For details, see PHVideoRequestOptionsMBS.
exportPreset: The export preset name for exporting the asset. For available presets, see AVAssetExportSessionMBS.

A numeric identifier for the request. If you need to cancel the request before it completes, pass this identifier to the cancelImageRequest method.

When you call this method, Photos downloads the video data (if necessary) and creates an export session. It then calls your resultHandler delegate to provide the requested video.
For additional export options, use the requestAVAssetForVideo method and then create AVAssetReader and AVAssetWriterMBS objects to transcode and output the video asset,Äôs data.

146.26.15 RequestImageDataAndOrientationForAsset(asset as PHAssetMBS, options as PHImageRequestOptionsMBS, CompletionHandler as RequestImageForAssetCompletedMBS, tag as Variant = nil) as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Requests the largest represented image as data bytes and EXIF orientation for the specified asset.
Notes: asset: The asset for which to load image data.
options: Options specifying how Photos should handle the request, format the requested image, and notify your app of progress or errors.

If PHImageRequestOptionsMBS.VersionCurrent is requested and the asset has adjustments, the largest rendered image data is returned. In all other cases, the original image data is returned.
For further details, see PHImageRequestOptionsMBS class.

Returns a numeric identifier for the request. If you need to cancel the request before it completes, pass this identifier to the cancelImageRequest method.

When you call this method, Photos loads the largest available representation of the image asset, then calls your resultHandler block to provide the requested data. Depending on the options you specify and the current state of the asset, Photos may download asset data from the network.

By default, this method executes asynchronously. If you call it from a background thread, you may change the synchronous property of the options parameter to true to block the calling thread until either the requested image is ready or an error occurs, at which time Photos calls your result handler. This method ignores the deliveryMode option—Photos calls your result handler block exactly once.

If the version option is set to PHImageRequestOptionsMBS.VersionCurrent, Photos provides rendered image data, including the results of any edits that have been made to the asset content. Otherwise, Photos provides the originally captured image data for the asset.

146.26.16 RequestImageForAsset(asset as PHAssetMBS, targetSize as CGSizeMBS, contentMode as Integer, options as PHImageRequestOptionsMBS, CompletionHandler as RequestImageForAssetCompletedMBS, tag as Variant = nil) as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Requests an image representation for the specified asset.
Notes: asset: The asset whose image data is to be loaded.
targetSize: The target size of image to be returned.
contentMode: An option for how to fit the image to the aspect ratio of the requested size. For details, see PHImageContentMode.
options: Options specifying how Photos should handle the request, format the requested image, and notify your app of progress or errors. For details, see PHImageRequestOptionsMBS class.

Returns a numeric identifier for the request. If you need to cancel the request before it completes, pass this

identifier to the cancelImageRequest method.

When you call this method, Photos loads or generates an image of the asset at, or near, the size you specify. Next, it calls your resultHandler block to provide the requested image. To serve your request more quickly, Photos may provide an image that is slightly larger than the target size—either because such an image is already cached or because it can be generated more efficiently. Depending on the options you specify and the current state of the asset, Photos may download asset data from the network.

By default, this method executes asynchronously. If you call it from a background thread you may change the synchronous property of the options parameter to true to block the calling thread until either the requested image is ready or an error occurs, at which time Photos calls your result handler.

For an asynchronous request, Photos may call your result handler block more than once. Photos first calls the block to provide a low-quality image suitable for displaying temporarily while it prepares a high-quality image. (If low-quality image data is immediately available, the first call may occur before the method returns.) When the high-quality image is ready, Photos calls your result handler again to provide it. If the image manager has already cached the requested image at full quality, Photos calls your result handler only once. The PHImageResultIsDegradedKey key in the result handler,Äôs info parameter indicates when Photos is providing a temporary low-quality image.

You can use this method for both photo and video assets —for a video asset, an image request provides a thumbnail image or poster frame.

146.26.17 RequestImageForAssetSync(asset as PHAssetMBS, targetSize as CGSizeMBS, contentMode as Integer, options as PHImageRequestOptionsMBS, byref Info as Dictionary) as NSImageMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Requests an image representation for the specified asset synchronously.
Notes: asset: The asset whose image data is to be loaded.
targetSize: The target size of image to be returned.
contentMode: An option for how to fit the image to the aspect ratio of the requested size. For details, see PHImageContentMode.
options: Options specifying how Photos should handle the request, format the requested image, and notify your app of progress or errors. For details, see PHImageRequestOptionsMBS class.

Returns the image.

146.26.18 RequestLivePhotoForAsset(asset as PHAssetMBS, targetSize as CGSizeMBS, contentMode as Integer, options as PHLivePhotoRequestOptionsMBS, CompletionHandler as RequestLivePhotoForAssetCompletedMBS, tag as Variant = nil) as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Requests a Live Photo representation for the specified asset.
Notes: asset: The asset whose Live Photo data is to be loaded.
targetSize: The target size of Live Photo to be returned.
contentMode: An option for how to fit the image to the aspect ratio of the requested size. For details, see PHImageContentMode.
options: Options specifying how Photos should handle the request, format the requested image, and notify your app of progress or errors. For details, see PHLivePhotoRequestOptionsMBS class.

Returns a numeric identifier for the request. If you need to cancel the request before it completes, pass this identifier to the cancelImageRequest method.

A Live Photo is a picture, taken with a supported device, that includes movement and sound from the moments just before and after its capture. Much like how a UIImage object represents a ready-to-use form of an image, a PHLivePhotoMBS object represents a Live Photo whose image, motion, and sound data are prepared for display. Use this method to request an asset,Äôs Live Photo form; after Photos calls your resultHandler delegate to provide the Live Photo, you can display it using the PHLivePhotoViewMBS class.

Use this method only when you plan to display the motion and sound content associated with a Live Photo. In contexts where you need only a still image for a Live Photo asset—for example, when loading thumbnails to display in a photo chooser interface—use the requestImageForAsset method instead.

When you call this method, Photos loads or generates a PHLivePhotoMBS object for the asset at, or near, the size you specify. Next, it calls your resultHandler block to provide the requested image. To serve your request more quickly, Photos may provide an image that is slightly larger than the target size—either because such an image is already cached or because it can be generated more efficiently. Depending on the options you specify and the current state of the asset, Photos may download asset data from the network. This method always executes asynchronously.

Photos may call your result handler block more than once. Photos first calls the block to provide a low-quality image suitable for displaying temporarily while it prepares a high-quality image. (If low-quality image data is immediately available, the first call may occur before the method returns.) When the high-quality image is ready, Photos calls your result handler again to provide it. If the image manager has already cached the requested image at full quality, Photos calls your result handler only once. The PHImageResultIsDegradedKey key in the result handler,Äôs info parameter indicates when Photos is providing a temporary low-quality image.

146.26.19 RequestPlayerItemForVideo(asset as PHAssetMBS, options as PHVideoRequestOptionsMBS, CompletionHandler as RequestPlayerItemForVideoCompletedMBS, tag as Variant = nil) as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Requests a representation of the video asset for playback, to be loaded asynchronously.
Notes: asset: The video asset to be played back.
options: Options specifying how Photos should handle the request and notify your app of progress or errors. For details, see PHVideoRequestOptionsMBS.

A numeric identifier for the request. If you need to cancel the request before it completes, pass this identifier to the cancelImageRequest method.

When you call this method, Photos downloads the video data (if necessary) and creates a player item. It then calls your resultHandler block to provide the requested video.

Use this method when you want to simply play back the video asset as it currently exists. For more detailed options or to work with the asset,Äôs audio and video tracks, use the requestAVAssetForVideo method instead.

146.26.20 Properties

146.26.21 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.26.22 Constants

Constants

Constant	Value	Description
PHInvalidImageRequestID	0	A special value provided for asynchronous image requests that cannot be canceled.

Content Modes

Constant	Value	Description
ContentModeAspectFill	1	Scales the image so that it completely fills the target size.
ContentModeAspectFit	0	Scales the image so that its larger dimension fits the target size.
ContentModeDefault	0	Fits the image to the requested size using the default option, PHImageContentModeAspectFit. Use this content mode when requesting a full-sized image using the PHImageManagerMBS.MaximumSize value for the target size. In this case, the image manager does not scale or crop the image.

146.26.23 Delegates

146.26.24 RequestAVAssetForVideoCompletedMBS(asset as PHAssetMBS, options as PHVideoRequestOptionsMBS, AVAsset as Variant, AVAudioMix as Variant, info as Dictionary, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate that Photos calls after loading the asset,Äôs data.
Notes: asset: An object that provides access to the video asset as a collection of tracks and metadata. For details on working with AVAsset objects, see AVFoundation Programming Guide.
audioMix: Use this object to rearrange the asset,Äôs audio tracks, edit additional audio into the mix, or configure an AVAssetReaderOutput object for exporting the asset,Äôs audio data. If nil, the asset uses a default audio mix.
info: A dictionary providing information about the status of the request. See Image Result Info Keys for possible keys and values.

We pass AVAsset, the AVAssetMBS object, as variant to avoid plugin dependencies.
Same for AVAudioMix with AVAudioMixMBS object.

146.26.25 RequestExportSessionForVideoCompletedMBS(asset as PHAssetMBS, options as PHVideoRequestOptionsMBS, exportPreset as string, exportSession as Variant, info as Dictionary, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate that Photos calls after loading the asset,Äôs data and preparing the export session.
Notes: exportSession: An AVAssetExportSessionMBS object that you can use for writing the video asset,Äôs data to a file.
info: A dictionary that provides information about the status of the request. See Image Result Info Keys for possible keys and values.

We pass AVAsset, the AVAssetExportSessionMBS object, as variant to avoid plugin dependencies.

146.26.26 RequestImageDataAndOrientationForAssetCompletedMBS(asset as PHAssetMBS, options as PHImageRequestOptionsMBS, imageData as MemoryBlock, dataUTI as String, orientation as Integer, info as Dictionary, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate called, exactly once, when image loading is complete, providing the requested image or information about the status of the request.
Notes: imageData: The requested image.
dataUTI: The uniform type identifier for the image.
orientation: The EXIF orientation for the image, as a CGImagePropertyOrientation.
info: A dictionary providing information about the status of the request.

146.26.27 RequestImageForAssetCompletedMBS(asset as PHAssetMBS, options as PHImageRequestOptionsMBS, result as NSImageMBS, info as Dictionary, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate to be called when image loading is complete, providing the requested image or information about the status of the request.
Notes: result: The requested image.
info: A dictionary providing information about the status of the request. See Image Result Info Keys for possible keys and values.

146.26.28 RequestLivePhotoForAssetCompletedMBS(asset as PHAssetMBS, options as PHImageRequestOptionsMBS, livePhoto as PHLivePhotoMBS, info as Dictionary, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate to be called when image loading is complete, providing the requested image or information about the status of the request.
Notes: result: The requested Live Photo object.
info: A dictionary providing information about the status of the request. See Image Result Info Keys for possible keys and values.

146.26.29 RequestPlayerItemForVideoCompletedMBS(asset as PHAssetMBS, options as PHVideoRequestOptionsMBS, playerItem as Variant, info as Dictionary, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate Photos calls after loading the asset,Äôs data and preparing the player item.
Notes: playerItem: An AVPlayerItemMBS object that you can use for playing back the video asset.
info: A dictionary providing information about the status of the request. See Image Result Info Keys for possible keys and values.

We pass playerItem, the AVPlayerItemMBS object, as variant to avoid plugin dependencies.

146.27 class PHImageRequestOptionsMBS

146.27.1 class PHImageRequestOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A set of options affecting the delivery of still image representations of Photos assets you request from an image manager.
Example:

```
// load a high quality preview of a photo, downloading from iCloud if needed
// asset is a PHAssetMBS, e.g. from PHAssetMBS.fetchAssetsWithMediaType
Var asset As PHAssetMBS // your asset
If asset = Nil Then Return

Var options As New PHImageRequestOptionsMBS
options.DeliveryMode = PHImageRequestOptionsMBS.DeliveryModeHighQualityFormat
options.ResizeMode = PHImageRequestOptionsMBS.ResizeModeExact
options.NetworkAccessAllowed = True

Var info As Dictionary
Var image As NSImageMBS = PHImageManagerMBS.defaultManager.RequestImageForAssetSync(asset,
New CGSizeMBS(800, 800), PHImageManagerMBS.ContentModeAspectFit, options, info)
If image <>Nil Then
Var pic As Picture = image.CopyPicture
// show pic in a Canvas or ImageViewer
End If
```

Notes: Available on macOS 10.13 or newer.
Blog Entries

- MBS Xojo Plugins, version 25.1pr7

146.27.2 Methods

146.27.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.27.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.27.5 copy as PHImageRequestOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the request.

146.27.6 Destructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

146.27.7 SetProgressHandler(ProgressHandler as ProgressHandlerMBS, tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the delegate that Photos calls periodically while downloading the image.
Notes: If you request an image whose data is not on the local device, and you have enabled downloading with the networkAccessAllowed property, Photos calls your delegate periodically to report progress and to allow you to cancel the download.

146.27.8 Properties

146.27.9 allowSecondaryDegradedImage as Boolean

MBS Mac64bit Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop & iOS.

Function: In addition to the initial degraded result, an additional degraded result will be returned if conditions permit.
Notes: (Read and Write property)

146.27.10 DeliveryMode as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The requested image quality and delivery priority.
Notes: Use this property to tell Photos to provide an image quickly (possibly sacrificing image quality), to provide a high-quality image (possibly sacrificing speed), or to provide both automatically if needed. See DeliveryMode constants.
(Read and Write property)

146.27.11 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.27.12 NetworkAccessAllowed as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that specifies whether Photos can download the requested image from iCloud.
Notes: If true, and the requested image is not stored on the local device, Photos downloads the image from iCloud. To be notified of the download,Äôs progress, use the progressHandler property to provide a delegate that Photos calls periodically while downloading the image. If false (the default), and the image is not on the local device, the PHImageResultIsInCloudKey value in the result handler,Äôs info dictionary indicates that the image is not available unless you enable network access.
(Read and Write property)

146.27.13 normalizedCropRect as CGRectMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A rectangle for requesting a cropped version of the original image.
Notes: To request a cropped image, specify the crop rectangle in a unit coordinate space relative to the image. In this coordinate system, the point { 0.0,0.0 } refers to the upper left corner of the image, and the point { 1.0,1.0 } refers to the opposite corner regardless of the image,Äôs aspect ratio.
This property defaults to zero rectangle, which specifies no cropping.
If you specify a crop rectangle, you must also specify the PHImageRequestOptionsResizeModeExact option for the resizeMode property.
(Read and Write property)

146.27.14 ProgressHandler as ProgressHandlerMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The delegate that Photos calls periodically while downloading the image.
Notes: If you request an image whose data is not on the local device, and you have enabled downloading with the networkAccessAllowed property, Photos calls your delegate periodically to report progress and to allow you to cancel the download.
(Read and Write property)

146.27.15 ResizeMode as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A mode that specifies how to resize the requested image.
Notes: Use this property to choose how to fit the image to the target size you specified when requesting image data. See PHImageRequestOptionsResizeMode.
(Read and Write property)

146.27.16 Synchronous as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether Photos processes the image request synchronously.
Notes: If false (the default), the requestImageForAsset method returns immediately. Depending on the deliveryMode property, Photos may call your resultHandler delegate before the method returns, at some later time, or both.
If true, the requestImageForAsset method blocks the calling thread until image data is ready or an error occurs. Photos calls your result handler delegate exactly once.

Perform synchronous requests from a background thread only.
(Read and Write property)

146.27.17 Version as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The version of the image to be requested.
Notes: Use this property to request a version of the image with or without adjustments, or to request high-quality original data (for example, a RAW file) if such is available. See Version constants.
(Read and Write property)

146.27.18 Constants

Delivery Modes

Constant	Value	Description
DeliveryModeFastFormat	2	Photos provides only a fast-loading image, possibly sacrificing image quality.
DeliveryModeHighQualityFormat	1	Photos provides only the highest-quality image available, regardless of how much time it takes to load.
DeliveryModeOpportunistic	0	Photos automatically provides one or more results in order to balance image quality and responsiveness.

Resize Mode

Constant	Value	Description
ResizeModeExact	2	Photos resizes the image to match the target size exactly. Resizing to exactly match a target size is less efficient than using the fast resizing option. You must choose this option if you use the normalizedCropRect property to request a cropped image.
ResizeModeFast	1	Photos efficiently resizes the image to a size similar to, or slightly larger than, the target size. With this option, Photos can use image subsampling to quickly provide an image at a size roughly matching the target size.
ResizeModeNone	0	Photos does not resize the image asset.

Version Modes

Constant	Value	Description
VersionCurrent	0	Request the most recent version of the image asset (the one that reflects all edits).
VersionOriginal	2	Request the original, highest-fidelity version of the image asset.
VersionUnadjusted	1	Request a version of the image asset without adjustments.

146.27.19 Delegates

146.27.20 ProgressHandlerMBS(progress as double, error as NSErrorMBS, byref stop as boolean, info as Dictionary, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The delegate that Photos calls while downloading asset data from iCloud. Used by the progressHandler property.
Notes: If you request an image whose data is not on the local device, and you have enabled downloading with the networkAccessAllowed property, Photos calls your block periodically to report progress and to allow you to cancel the download.

Photos calls this block in an arbitrary serial queue. Dispatch to the main thread if your handler needs to update the user interface.

The method takes the following parameters:
progress: A floating-point value indicating the progress of the download. A value of 0.0 indicates that the download has just started, and a value of 1.0 indicates the download is complete.
error: An NSErrorMBS object describing an error that occurred when attempting to download the image, or nil if no errors have occurred.
stop: A pointer to a Boolean value. To cancel the download, set stop to true inside the block.
info: A dictionary providing additional information about the status of the image request. See Image Result Info Keys for possible keys and values. For example, a true value for the key PHImageResultIsDegradedKey indicates that Photos may send the full-quality version of the image later, depending on the value of the image request,Äôs deliveryMode property.

If the method call is asynchronously dispatched to main thread, the stop property does not work.

146.28 control PHLivePhotoControlMBS

146.28.1 control PHLivePhotoControlMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: A view that displays a Live Photo—a picture that also includes motion and sound from the moments just before and after its capture.
Notes: Use a Live Photo view to display the photo and control playback of its motion and sound content.

In macOS, Live Photo objects are available only when editing Live Photo content in a photo editing extension that runs in the Photos app—see the PHContentEditingInputMBS class to access Live Photo content in an editing session.

By default, a Live Photo view uses its own gesture recognizer to allow the user to play the motion and sound content of a Live Photo with the same interactions and visual effects seen in the Photos app. To customize this gesture recognizer—for example, to install it on a different view for proper event handling in your app,Äôs view hierarchy—use the playbackGestureRecognizer property.

To animate the view briefly to hint that a picture is a Live Photo, use the startPlayback method with the PlaybackStyleHint option.

146.28.2 Methods

146.28.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: Whether this control is available.

146.28.4 startPlayback(style as integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Begins playback of Live Photo content in the view.
Notes: style: An option for how much of the Live Photo,Äôs motion and sound content to play. See PHLivePhotoViewPlaybackStyle.

Use the style parameter to choose whether to play the full motion and sound content of the Live Photo or only a brief section.

Typically, an app does not need to directly control playback, because a Live Photo view provides interactive playback control. Use this method only when non-interactive playback is appropriate—for example, to briefly animate the content to indicate that a view contains a Live Photo rather than a still image.

146.28.5 stopPlayback

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Ends playback of Live Photo content in the view.
See also:

- 146.28.6 stopPlayback(animated as boolean) 20000

146.28.6 stopPlayback(animated as boolean)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Ends playback of Live Photo content in the view.
See also:

- 146.28.5 stopPlayback 20000

146.28.7 Properties

146.28.8 audioVolume as Single

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The audio gain to apply to the Live Photo,Äôs movie content during playback.
Notes: Values for this property must be between 0.0 and 1.0, inclusive. A value of 1.0 (the default) plays audio content from the Live Photo at full volume (relative to the system volume). A value of 0.0 is equivalent to setting the muted property to true.

(Read and Write property)

146.28.9 ContentMode as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The content mode.
Notes: (Read and Write property)

146.28.10 LivePhoto as PHLivePhotoMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The Live Photo displayed in the view.
Notes: (Read and Write property)

146.28.11 livePhotoBadgeView as NSViewMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: A view for displaying Live Photo status.
Notes: The PHLivePhotoViewMBS uses this subview to display icons indicating the existence or status of Live Photo content. Photos manages the content displayed in the badge view, so you don,Äôt need to do anything with view,Äôs content—instead, this property provides access to the badge view so you can change where it appears in your view hierarchy if needed. For example, if you display a Live Photo view within a scroll view, you can move the badge view so that its position remains constant while the scroll view scrolls.
(Read only property)

146.28.12 muted as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that determines whether the view plays the audio content of its Live Photo.
Notes: The default value is false, indicating that the view plays audio content along with the motion content of its Live Photo. Change this value to true to play motion content but not audio content.
(Read and Write property)

146.28.13 View as NSViewMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

146.28.14 Events

146.28.15 BoundsChanged

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

146.28.16 Close

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

146.28.17 Closing

Plugin Version: 20.2, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

146.28.18 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS Mac64bit Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

146.28.19 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

146.28.20 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS Mac64bit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

146.28.21 didEndPlaybackWithStyle(playbackStyle as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate that Live Photo playback has ended.
Notes: playbackStyle: The style of playback, indicating whether the content was played in full or briefly previewed.

146.28.22 EnableMenuItems

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

146.28.23 FocusLost

Plugin Version: 20.2, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

146.28.24 FocusReceived

Plugin Version: 20.2, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

146.28.25 FrameChanged

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

146.28.26 GotFocus

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

146.28.27 LostFocus

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

146.28.28 MenuBarSelected

Plugin Version: 20.2, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

146.28.29 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

146.28.30 MouseDrag(x as Integer, y as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

146.28.31 MouseUp(x As Integer, y As Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

146.28.32 Open

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

146.28.33 Opening

Plugin Version: 20.2, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

146.28.34 ScaleFactorChanged(NewFactor as double)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

146.28.35 willBeginPlaybackWithStyle(playbackStyle as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Notifies the control that Live Photo playback is about to begin.
Notes: playbackStyle: The style of playback, indicating whether the content is to be played in full or briefly previewed.

146.28.36 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS Mac64bit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

146.28.37 Constants

Content Modes

Constant	Value	Description
ContentModeAspectFill	1	Aspect Fill.
ContentModeAspectFit	0	Aspect Fit.

Playback Styles

Constant	Value	Description
PlaybackStyleFull	1	Plays back the entire motion and sound content of the Live Photo, including transition effects at the start and end.
PlaybackStyleHint	2	Plays back only a brief section of the motion content of the Live Photo, without sound.
PlaybackStyleUndefined	0	This value is invalid for use.

146.29 class PHLivePhotoEditingContextMBS

146.29.1 class PHLivePhotoEditingContextMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An editing session for modifying the photo, video, and audio content of a Live Photo.
Notes: A Live Photo is a picture, captured by a supported iOS device, that includes motion and sound from the moments just before and after it was taken. Editing the content of a Live Photo works much like editing other asset types:

1. In an app using the Photos framework, fetch a PHAsset object that represents the Live Photo to edit, and use that object,Äôs requestContentEditingInputWithOptions method to retrieve a PHContentEditingInputMBS object.
In a photo editing extension that runs within the Photos app, your extension,Äôs main view controller (which adopts the PHContentEditingController protocol) receives a PHContentEditingInputMBS object when the user chooses to edit a Live Photo with your extension.
2. Create a Live Photo editing context with the initWithLivePhotoEditingInput initializer.
You can create a Live Photo editing context only from PHContentEditingInputMBS object that represents a Live Photo. Use the livePhoto property of the editing input to verify that it has live Photo content.
3. Use the frameProcessor property to define a block to be used in processing the Live Photo,Äôs visual content. Photos will call this block repeatedly to process each frame of the Live Photo,Äôs video and still photo content.
4. Create a PHContentEditingOutputMBS object to store the results of your edit, then call the saveLivePhotoToOutput:options to process the Live Photo and save it to your editing output object. This method applies your frameProcessor to each frame.
Note
You can also use the prepareLivePhotoForPlaybackWithTargetSize method to process a preview-quality version of the Live Photo to display in your app,Äôs UI during editing.
5. To allow a user to continue working with the edit later (for example, to adjust the parameters of a filter), create a PHAdjustmentDataMBS object describing your changes, and store it in the adjustmentData property of your editing output.
6. In an app using the Photos framework, use a photo library change block to commit the edit. (For details, see PHPhotoLibrary.) In the block, create a PHAssetChangeRequestMBS object and set its contentEditingOutput property to the editing output that you created.
In a photo editing extension, provide the PHContentEditingOutputMBS object that you created in your main view controller,Äôs finishContentEditing method.

When you use either of the methods listed in Processing an Editing Context,Äôs Live Photo, Photos calls your frameProcessor delegate repeatedly to process each frame of the Live Photo,Äôs video and still photo content. In that block, a PHLivePhotoFrameMBS object provides the Live Photo,Äôs existing content as a CIImageMBS object. You use Core Image to modify the image, then provide the result of your edits by returning a CIImageMBS object representing the result of processing the input image.

Core Image provides several ways to process the Live Photo,Äôs visual content. You can use the built-in filters listed in Core Image Filter Reference or create CIFilterMBS subclasses using custom graphics kernel

code. Or, to use other image processing technologies, you can directly access and modify image content in pixel buffers, Metal textures, or IOSurfaceRef objects with a custom CIImageProcessorKernel subclass.

146.29.2 Methods

146.29.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.12 or newer.

146.29.4 cancel

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Aborts any Live Photo processing in progress.
Notes: This method applies only after you,Äôve begun processing a Live Photo for display or output with the initWithLivePhotoEditingInput or saveLivePhotoToOutput method. After you call this method, Photos calls your completion handler and provides an error with the PHLivePhotoEditingErrorCodeAborted error code.

146.29.5 Constructor(livePhotoInput as PHContentEditingInputMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a Live Photo editing context for the specified editing input.
Notes: livePhotoInput: A content editing input object representing the Live Photo for which to perform editing.

Returns a new Live Photo editing context, or nil if the provided content editing input does not represent a Live Photo.

In an app using the Photos framework, you obtain a PHContentEditingInputMBS object by calling requestContentEditingInputWithOptions method of a PHAssetMBS object that you,Äôve previously fetched.
In a photo editing extension that runs within the Photos app, your extension,Äôs main view controller (which adopts the PHContentEditingController protocol) receives a PHContentEditingInputMBS object when the user chooses to edit a Live Photo with your extension.

You can create a Live Photo editing context only from PHContentEditingInputMBS object that represents a Live Photo. Use the livePhoto property of the editing input to verify that it has live Photo content.

146.29.6 PHLivePhotoShouldRenderAtPlaybackTime as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies whether processing should occur during or before playback.
Notes: The value for this key is an NSNumber object with a Boolean value. With the default value of false, Photos always renders your edits immediately when you call the Constructor, calling your frameProcessor block for each frame in the Live Photo,Äôs video and still photo content.

When you specify a value of true, Photos can defer rendering until playback time, calling your frameProcessor block only for photo and video frames that need to be displayed. However, in this case Photos may still choose to pre-render your edits if needed.

This option does not apply when rendering for output with the saveLivePhotoToOutput method.

146.29.7 prepareLivePhotoForPlayback(targetSize as CGSizeMBS, options as Dictionary = nil, completionHandler as PrepareLivePhotoForPlaybackCompletedMBS, tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Processes a Live Photo with your edits for viewing.
Notes: targetSize: The size of the view in which you plan to preview the edited Live Photo output.
options: Options that affect Live Photo rendering. See Live Photo Processing Options.

Use this method to generate preview versions of the edited Live Photo—for example, to display in your editing UI.

146.29.8 saveLivePhotoToOutput(ContentEditingOutput as PHContentEditingOutputMBS, options as Dictionary = nil, completionHandler as PrepareLivePhotoForPlaybackCompletedMBS, tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Processes and saves a full-quality Live Photo as the output of your editing session.
Notes: output: The photo editing output to receive the rendered Live Photo, created from the same PHContentEditingInputMBS object you used to begin this Live Photo editing context.
options: Options that affect Live Photo rendering. See Live Photo Processing Options.

Use this method when you have finished an editing session and need to provide rendered output in a PHContentEditingOutputMBS object. Unlike when rendering output for a photo or video asset, you don,Äôt need to provide rendered output using the renderedContentURL property of the editing output object. Instead, create a PHContentEditingOutputMBS object using the Constructor initializer, passing the same PHContentEditingInputMBS object you used in the FrameProcessing delegate initializer to start this Live Photo editing context. Then pass that editing output object to this method, and Photos renders the Live Photo and provides it to the editing output.

Don,Äôt forget to describe your edits in a PHAdjustmentDataMBS object and provide that to the adjustmentData property of your content editing output. Providing adjustment data allows your app (or photo editing extension) to non-destructively resume working with an edit later, whether on the same device or on another Mac or iOS device using iCloud Photo Library.

After this method,Äôs completion handler signals successful rendering, you use the content editing output to complete the edit. In an app using the Photos framework, create a PHAssetChangeRequestMBS object inside a changes, and set its contentEditingOutput property to your editing output. In a photo editing extension running in the Photos app, your main view controller provides content editing output when requested by the finishContentEditing method.

146.29.9 SetFrameProcessor(FrameProcessor as FrameProcessorMBS, tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets a delegate to be called by Photos for processing each frame of the Live Photo,Äôs visual content.
Notes: Use this property to define the image processing to be performed on each frame of the Live Photo. Setting this property does not begin processing; instead, after you call one of the methods listed in Processing an Editing Context,Äôs Live Photo, Photos executes your block repeatedly to process each frame of the Live Photo,Äôs video and still photo content.

In your frame processor block, use the image property of the provided PHLivePhotoFrameMBS object to access the image to be processed, and return a CIImageMBS object representing the result of your processing. For example, the following code sets up a processor block to apply a simple sepia-tone filter, then calls the saveLivePhotoToOutput method to begin processing the Live Photo for output.

146.29.10 Properties

146.29.11 audioVolume as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The audio gain to apply to the processed Live Photo.
Notes: Values must be between 0.0 and 1.0, inclusive. A value of 1.0 (the default) leaves the audio content of the Live Photo unchanged. A value of 0.0 mutes all audio in the output Live Photo.
Setting this property does not process the Live Photo content; instead, it sets the audio gain to be applied when you later process the Live Photo using one of the methods listed in Processing an Editing Context,Äôs Live Photo.
(Read and Write property)

146.29.12 duration as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The duration, in seconds, of the Live Photo.
Notes: (Read only property)

146.29.13 fullSizeImage as Variant

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The unedited still photo content of the Live Photo.
Notes: Value is CIImageMBS.
Use this property to display the unedited Live Photo,Äôs photo content, or to provide still-image previews in your editing UI.

For the best interactive editing performance, use a Metal, OpenGL, or OpenGL ES view and corresponding Core Image context to render editing results. See Processing Images in Core Image Programming Guide for details and examples.

This image does not reflect the Live Photo,Äôs orientation metadata. Adjust your rendering based on the orientation property to ensure that the image appears to the user in the correct orientation.
(Read only property)

146.29.14 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.29.15 orientation as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The image orientation of the Live Photo.
Notes: This fullSizeImage object does not reflect the Live Photo,Äôs orientation metadata. Use this property when displaying that image to ensure that it appears to the user in the correct orientation.
(Read only property)

146.29.16 photoTime as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The offset, in seconds, from the beginning of the Live Photo,Äôs duration to the time corresponding to its still photo.
Notes: To create time-based effects in your frameProcessor block, use this property together with the duration property.
(Read only property)

146.29.17 Delegates

146.29.18 FrameProcessorMBS(frame as PHLivePhotoFrameMBS, byref error as NSErrorMBS, tag as Variant) as Variant

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The delegate for a block Photos calls to process Live Photo frames.
Notes: Result of delegate method must be a CIImageMBS object.

To apply edits to a Live Photo, define a block with this signature and assign it to the frameProcessor property of a Live Photo editing context. Then call the initWithLivePhotoEditingInput: to prepare a preview-quality version of your edits for display, or the saveLivePhotoToOutput method to produce full-quality final output. When you call one of those methods, Photos calls your frame processor block repeatedly—processing each frame of the Live Photo,Äôs video content as well as its still photo content—to render the output.

This delegates takes the following parameters:

frame: A PHLivePhotoFrameMBS object describing the frame image to be processed.
error: If your delegate cannot successfully process the frame, set this to an error object describing the failure.

Your block should return a CIImageMBS object representing the result of your edits, or nil to indicate that your image processing has failed and the Live Photo edit should be aborted. Use the frame parameter,Äôs

image property to access the image to be edited.

146.29.19 PrepareLivePhotoForPlaybackCompletedMBS(options as Dictionary, livePhoto as PHLivePhotoMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate that Photos calls on the main queue after processing is complete.
Notes: livePhoto: The rendered Live Photo, suitable for displaying in a PHLivePhotoViewMBS object.
error: If preparing the edited Live Photo for display succeeds, this parameter is nil. If processing fails, the livePhoto parameter is nil, and this parameter contains an error object describing the failure.

146.29.20 SaveLivePhotoToOutputCompletedMBS(output as PHContentEditingOutputMBS, options as Dictionary, success as Boolean, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate that Photos calls on the main queue after rendering is complete.
Notes: success: True if rendering succeeds; otherwise false.
error: If rendering succeeds, this parameter is nil. If rendering fails, this parameter contains an error object describing the failure.

146.30 class PHLivePhotoFrameMBS

146.30.1 class PHLivePhotoFrameMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A container that provides image content for a single frame of a Live Photo in an editing context.
Notes: You don,Äôt create classes that implement this protocol. Instead, you provide a frameProcessor block when editing a Live Photo with the PHLivePhotoEditingContextMBS class. When you process your edits for output or display, Photos calls your block repeatedly to process each frame of the Live Photo,Äôs video and still photo content. On each call, Photos provides the frame,Äôs image content and associated information in an object that adopts this protocol. In that block, you use that object,Äôs image property to access the image to be edited, then perform your edits and return another CIImageMBS object representing the result of processing the input image.

Requires macOS 10.12 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

146.30.2 Methods

146.30.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.12 or newer.

146.30.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

146.30.5 Properties

146.30.6 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.30.7 Image as Variant

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The image content of the frame to be processed.
Notes: Value is CIImageMBS object.
Core Image provides several ways to perform your adjustments to this image:

- Create a single CIFilterMBS object, or a chain of filters. Set this image as the kCIInputImageKey parameter of the first filter in the chain, and use the last filter,Äôs outputImage property to access the result. Each CIFilter object can be a built-in filter or a custom filter subclass that you create.
- Use the imageByApplyingFilter method to conveniently apply one of the many built-in Core Image filters.
- Access pixel buffers directly and apply custom image processing using a custom CIImageProcessorKernelMBS subclass.

In all cases, you obtain another CIImageMBS object representing the result of your adjustments. Return that image from your frameProcessor block. (See the frameProcessor description for example code.)
(Read only property)

146.30.8 renderScale as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The scale factor of the frame image relative to the Live Photo,Äôs photo content.
Notes: Photos calls your frameProcessor block repeatedly, both to process each frame of the Live Photo,Äôs video content and to process the Live Photo,Äôs still photo content. Video frames can be a different size than still photo content—use this value to scale any of your image processing parameters that depend on the image,Äôs size.
(Read only property)

146.30.9 time as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The time offset, in seconds, of this frame relative to the start of the Live Photo.
Notes: You can use this value to vary your image processing over time, creating animated effects.
(Read only property)

146.30.10 Type as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The type of image content in this frame.
Notes: Photos calls your frameProcessor block repeatedly, both to process each frame of the Live Photo,Äôs video content and to process the Live Photo,Äôs still photo content. Use this property to distinguish photo content from video frames—for example, to add a watermark only to still photo content.
(Read only property)

146.30.11 Constants

Types

Constant	Value	Description
TypePhoto	0	The image is a still photo.
TypeVideo	1	The image is a single frame from the Live Photo,Äôs video content.

146.31 class PHLivePhotoMBS

146.31.1 class PHLivePhotoMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A displayable representation of a Live Photo—a picture that includes motion and sound from the moments just before and after its capture.
Notes: In macOS, you can use this class to display edits in progress for Live Photo content in a photo editing extension.

For guidance on how to integrate Live Photos with your app,Äôs user experience, see Live Photos in iOS Human Interface Guidelines.

The PHLivePhotoMBS class serves in much the same role for Live Photos as the NSImageMBS class serves for static images. A NSImageMBS object represents not the data file an image is loaded from, but instead a ready-to-use image that can be displayed in a view—similarly, a PHLivePhotoMBS object represents a Live Photo ready to display with motion and sound using a PHLivePhotoViewMBS object, not an entry in the Photos library or the data resources that constitute a Live Photo. (To work with Live Photos as elements of the Photos library, use the PHAsset class. To work with the data files that constitute a Live Photo, use the PHAssetResourceMBS class.)
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- The Top 10 from the MBS Xojo Plugins in 2022
- News from the MBS Xojo Plugins Version 22.5

146.31.2 Methods

146.31.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.12 or newer.

146.31.4 cancelLivePhotoRequestWithRequestID(requestID as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Cancels an asynchronous request.
Notes: requestID: The numeric identifier of the request to be canceled.

When you use the requestLivePhotoWithResourceFileURLs method to asynchronously load a Live Photo from resource files, the method returns a numeric identifier for the request. To cancel the request before it completes, provide the identifier when calling the cancelLivePhotoRequestWithRequestID method.

146.31.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

146.31.6 copy as PHLivePhotoMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the object.

146.31.7 PHLivePhotoInfoCancelledKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for the info dictionary in RequestLivePhotoWithResourceFileURLsMBS delegate.
Notes: A Boolean value indicating whether the Live Photo loading request was canceled.

146.31.8 PHLivePhotoInfoErrorKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for the info dictionary in RequestLivePhotoWithResourceFileURLsMBS delegate.
Notes: An error that occurred while attempting to load the requested Live Photo.

146.31.9 PHLivePhotoInfoIsDegradedKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for the info dictionary in RequestLivePhotoWithResourceFileURLsMBS delegate.

Notes: A Boolean value indicating whether the result Live Photo is a low-quality substitute for the requested Live Photo.

If true, the result parameter of your resultHandler block contains a still or low-quality Live Photo, and Photos will call your result delegate method again to provide the full motion and sound content of the Live Photo. If false, Photos has provided all possible data and will not call your result handler again.

146.31.10 requestLivePhotoWithResourceFileURLs(Files() as FolderItem, placeholderImage as NSImageMBS = nil, targetSize as CGSizeMBS, contentMode as Integer, theDelegate as RequestLivePhotoWithResourceFileURLsMBS, Tag as Variant = nil) as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Asynchronously loads a Live Photo from the specified resource files.
Notes: fileURLs: An array of Folderitems containing the resource URLs that constitute a Live Photo, as obtained using the PHAssetResource class.
image: A static image to represent the Live Photo before its full content has been loaded and validated.
targetSize: The target size of Live Photo to be returned. Pass zero size to obtain the requested Live Photo at its original size.
contentMode: An option for how to fit the image to the aspect ratio of the requested size. For details, see PHLivePhotoMBS class.
See also:

- 146.31.11 requestLivePhotoWithResourceFileURLs(fileURLs() as String, placeholderImage as NSImageMBS = nil, targetSize as CGSizeMBS, contentMode as Integer, theDelegate as RequestLivePhotoWithResourceFileURLsMBS, Tag as Variant = nil) as Integer 20020

146.31.11 requestLivePhotoWithResourceFileURLs(fileURLs() as String, placeholderImage as NSImageMBS = nil, targetSize as CGSizeMBS, contentMode as Integer, theDelegate as RequestLivePhotoWithResourceFileURLsMBS, Tag as Variant = nil) as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Asynchronously loads a Live Photo from the specified resource files.
Notes: fileURLs: An array of Folderitems containing the resource URLs that constitute a Live Photo, as obtained using the PHAssetResource class.
image: A static image to represent the Live Photo before its full content has been loaded and validated.
targetSize: The target size of Live Photo to be returned. Pass zero size to obtain the requested Live Photo at its original size.
contentMode: An option for how to fit the image to the aspect ratio of the requested size. For details, see PHLivePhotoMBS class.
See also:

- 146.31.10 requestLivePhotoWithResourceFileURLs(Files() as FolderItem, placeholderImage as NSImageMBS = nil, targetSize as CGSizeMBS, contentMode as Integer, theDelegate as RequestLivePhotoWithResourceFileURLsMBS, Tag as Variant = nil) as Integer 20020

146.31.12 Properties

146.31.13 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.31.14 Height as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The size, in pixels, of the Live Photo.
Notes: (Read only property)

146.31.15 Width as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The size, in pixels, of the Live Photo.
Notes: (Read only property)

146.31.16 Constants

Constants

Constant	Value	Description
RequestIDInvalid	0	The value for an invalid request ID.

Content Modes

Constant	Value	Description
ContentModeAspectFill	1	Scales the image so that it completely fills the target size.
ContentModeAspectFit	0	Scales the image so that its larger dimension fits the target size.
ContentModeDefault	0	Fits the image to the requested size using the default option, ContentModeAspectFit.

146.31.17 Delegates

146.31.18 RequestLivePhotoWithResourceFileURLsMBS(LivePhoto as PHLivePhotoMBS, placeholderImage as NSImageMBS, targetSize as CGSizeMBS, contentMode as Integer, tag as variant, info as Dictionary)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The method called when live photo is loaded.
Notes: LivePhoto: The requested Live Photo object.
info: A dictionary providing information about the status of the request. See PHLivePhotoMBS class for possible keys and values.

Method may be called twice if there is a low res and high res version.

146.32 class PHLivePhotoRequestOptionsMBS

146.32.1 class PHLivePhotoRequestOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A set of options affecting the delivery of Live Photo assets you request from an image manager.
Example:

```
// load a Live Photo in high quality, also from iCloud
// asset is a PHAssetMBS with a Live Photo
Var asset As PHAssetMBS // your asset
If asset = Nil Then Return

Var options As New PHLivePhotoRequestOptionsMBS
options.DeliveryMode = PHImageRequestOptionsMBS.DeliveryModeHighQualityFormat
options.NetworkAccessAllowed = True
Call PHImageManagerMBS.defaultManager.RequestLivePhotoForAsset(asset, New CGSizeMBS(800, 800),
PHImageManagerMBS.ContentModeAspectFit, options, AddressOf GotLivePhoto)

// a method in the window:
Sub GotLivePhoto(asset As PHAssetMBS, options As PHImageRequestOptionsMBS, livePhoto As PHLivePho-
toMBS, info As Dictionary, tag As Variant)
If livePhoto <>Nil Then System.DebugLog "Live Photo loaded."
End Sub
```

Notes: A Live Photo is a picture that includes movement and sound from the moments just before and after its capture.
Available in MacOS 10.15 or newer.

146.32.2 Methods

146.32.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.15 or newer.

146.32.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.32.5 copy as PHLivePhotoRequestOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the options object.

146.32.6 Destructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

146.32.7 SetProgressHandler(ProgressHandler as ProgressHandlerMBS, tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the delegate which Photos calls periodically while downloading the Live Photo.
Notes: If you request a Live Photo whose data is not on the local device, and you have enabled downloading with the PHLivePhotoRequestOptionsMBS property, Photos calls your block periodically to report progress and to allow you to cancel the download.

146.32.8 Properties

146.32.9 DeliveryMode as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The requested Live Photo quality and delivery priority.
Notes: Use this property to tell Photos to provide a Live Photo quickly (possibly sacrificing image quality), to provide a high-quality Live Photo (possibly sacrificing speed), or to provide both automatically if needed. See DeliveryMode constants.
(Read and Write property)

146.32.10 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.32.11 NetworkAccessAllowed as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that specifies whether Photos can download the requested Live Photo data from iCloud.
Notes: If true, and the requested Live Photo data is not stored on the local device, Photos downloads that data from iCloud. To be notified of the download,Äôs progress, use the progressHandler property to provide a block that Photos calls periodically while downloading. If false (the default), and the Live Photo data is not on the local device, the PHImageResultIsInCloudKey value in the result handler,Äôs info dictionary indicates that the data is not available unless you enable network access.
(Read and Write property)

146.32.12 ProgressHandler as ProgressHandlerMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The delegate which Photos calls periodically while downloading the Live Photo.
Notes: If you request a Live Photo whose data is not on the local device, and you have enabled downloading with the PHLivePhotoRequestOptionsMBS property, Photos calls your block periodically to report progress and to allow you to cancel the download.
(Read and Write property)

146.32.13 Version as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The version of the Live Photo to be requested.
Notes: Use this property to request a version of the Live Photo with or without adjustments. See Version constants.
(Read and Write property)

146.32.14 Constants

Delivery Modes

Constant	Value	Description
DeliveryModeFastFormat	2	Photos provides only a fast-loading image, possibly sacrificing image quality.
DeliveryModeHighQualityFormat	1	Photos provides only the highest-quality image available, regardless of how much time it takes to load.
DeliveryModeOpportunistic	0	Photos automatically provides one or more results in order to balance image quality and responsiveness.

Version Type

Constant	Value	Description
VersionCurrent	0	Request the most recent version of the image asset (the one that reflects all edits).
VersionOriginal	2	Request the original, highest-fidelity version of the image asset.
VersionUnadjusted	1	Request a version of the image asset without adjustments.

146.32.15 Delegates

146.32.16 ProgressHandlerMBS(progress as double, error as NSErrorMBS, byref stop as boolean, info as Dictionary, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate that Photos calls periodically while downloading the Live Photo..
Notes: If you request a Live Photo whose data is not on the local device, and you have enabled downloading with the progressHandler property in PHLivePhotoRequestOptionsMBS class, Photos calls your block periodically to report progress and to allow you to cancel the download.

progress: A floating-point value indicating the progress of the download. A value of 0.0 indicates that the download has just started, and a value of 1.0 indicates the download is complete.
error: An NSErrorMBS object describing an error that occurred when attempting to download the image, or nil if no errors have occurred.
stop: A Boolean value. To cancel the download, set stop to true inside the method.
info: A dictionary providing additional information about the status of the image request. See Image Result Info Keys for possible keys and values. For example, a true value for the key PHImageResultIsDegradedKey indicates that Photos may send the full-quality version of the image later, depending on the value of the image request,Äôs deliveryMode property.

If this method is dispatched asynchronously to the main thread, the stop property doesn't work.

146.33 class PHObjectChangeDetailsMBS

146.33.1 class PHObjectChangeDetailsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A description of changes that occurred in an asset or collection object.
Notes: A PHObjectChangeDetailsMBS object provides detailed information about differences between two states of an asset or collection object—one that you previously obtained and an updated state that would result if you fetched that entity again. You observe changes via events in PHPhotoLibraryMBS object. When Photos notifies your observer of a change, you get change details by passing the object you,Äôre interested in to the changeDetailsForObject method.

For an asset collection or collection list, a PHObjectChangeDetailsMBS object describe changes only to the collection,Äôs properties. If you are instead interested in changes to the collection,Äôs membership, fetch the collection,Äôs contents and use the changeDetailsForFetchResult: method to track changes to the fetch result.

Needs macOS 10.13 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

146.33.2 Methods

146.33.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.33.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

146.33.5 Properties

146.33.6 assetContentChanged as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the asset,Äôs photo or video content has changed.
Notes: If this value true, you can use the PHImageManagerMBS class to retrieve updated content.
This value is false if the asset has not changed or if the change details do not refer to a PHAssetMBS object.
(Read only property)

146.33.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.33.8 objectAfterChanges as PHObjectMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An object that reflects the current state of the asset or collection it represents.
Notes: Read this object,Äôs properties to retrieve updated metadata for the asset or collection. Using this object is equivalent to repeating the same fetch that returned the original object.
(Read only property)

146.33.9 objectBeforeChanges as PHObjectMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An object that reflects the original state of the asset or collection it represents.
Notes: This property,Äôs value is the same object you passed to the changeDetailsForObject to request change details.
(Read only property)

146.33.10 objectWasDeleted as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the object has been deleted from the Photos library.

Notes: If this value is true, the asset or collection has been permanently deleted from the Photos library.

To instead track the removal of assets from collections (or collections from collection lists), fetch the collection,Äôs contents and use the changeDetailsForFetchResult method to track changes to the fetch result. (Read only property)

146.34 class PHObjectMBS

146.34.1 class PHObjectMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The abstract superclass for Photos model objects (assets and collections).
Notes: You do not create or use instances of this class directly. Instead, work with instances of its concrete subclasses —PHAssetMBS, PHAssetCollectionMBS, PHCollectionListMBS, and PHObjectPlaceholderMBS.

Because the PHObjectMBS class implements the isEqual and hash methods in terms of its localIdentifier property, you can use techniques that depend on these methods to keep track of asset and collection objects. This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

146.34.2 Methods

146.34.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.34.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

146.34.5 copy as PHObjectMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the object.

146.34.6 Properties

146.34.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.34.8 localIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A unique string that persistently identifies the object.
Notes: Use this string to find the object by using the fetchAssetsWithLocalIdentifiers, fetchAssetCollectionsWithLocalIdentifiers, or fetchCollectionListsWithLocalIdentifiers method.
(Read only property)

146.35 class PHObjectPlaceholderMBS

146.35.1 class PHObjectPlaceholderMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A read-only proxy representing a Photos asset or collection object yet to be created by a change request.
Notes: You obtain object placeholders when you use change requests to create assets, collections, or collection lists. After the change request completes, you can use the object placeholder to fetch the newly created object. You can also use an object placeholder to make additional change requests involving the object to be created.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

146.35.2 Methods

146.35.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.15 or newer.

146.35.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

146.35.5 Properties

146.35.6 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.36 class PHPhotoLibraryMBS

146.36.1 class PHPhotoLibraryMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A shared object that manages access and changes to the user,Äôs shared photo library.
Example:

```
// count the pictures in the photo library
// Your app needs permission for the photo library (NSPhotoLibraryUsageDescription in Info.plist).
If PHPhotoLibraryMBS.authorizationStatus <>PHPhotoLibraryMBS.PHAuthorizationStatusAuthorized Then
MessageBox "No access to the photo library."
Return
End If

Var result As PHFetchResultMBS = PHAssetMBS.fetchAssetsWithMediaType(PHAssetMBS.MediaType-
Image)
MessageBox result.count.ToString + " pictures"
```

Notes: The shared PHPhotoLibraryMBS object represents the entire set of assets and collections managed by the Photos app, including both assets stored on the local device and (if enabled) those stored in iCloud Photos. You use this object for the following tasks:

- Getting or verifying the user's permission for your app to access Photos content.
- Making changes to assets and collections; for example, editing asset metadata or content, inserting new assets, or rearranging the members of a collection.
- Registering for update messages sent when changes are made to the library.

Requires MacOS 10.13 or newer.

146.36.2 Methods

146.36.3 authorizationStatus as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns information about your app,Äôs authorization to access the user,Äôs photo library.
Notes: Returns the current authorization status.

Accessing the photo library always requires explicit permission from the user. The first time your app uses PHAssetMBS, PHCollectionMBS, PHAssetCollectionMBS, or PHCollectionListMBS methods to fetch content from the library, or uses one of the methods listed in Applying Changes to the Photo Library to request changes to library content, Photos automatically and asynchronously prompts the user to request authorization.

Important
Your app,Äôs Info.plist file must provide a value for the NSPhotoLibraryUsageDescription key that explains to the user why your app is requesting Photos access. Apps linked on or after iOS 10 will crash if this key is not present.

After the user grants permission, the system remembers the choice for future use in your app, but the user can change this choice at any time using the Settings app. If the user has denied your app photo library access, not yet responded to the permission prompt, or cannot grant access due to restrictions, any attempts to fetch photo library content will return empty PHFetchResultMBS objects, and any attempts to perform changes to the photo library will fail.

Tip
Use the DidChange event to observe photo library changes before fetching content. After the user grants access to the photo library for your app, Photos sends change messages for any empty fetch results you retrieved beforehand, notifying you that library content for those fetches is now available.

If this method returns PHAuthorizationStatusNotDetermined, you can call the requestAuthorization method to prompt the user for photo library access permission.

146.36.4 authorizationStatusForAccessLevel(accessLevel as Integer) as Integer

MBS Mac64bit Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns information about your app,Äôs authorization to access the user,Äôs photo library.
Notes: You may have the possibility that you may not be allowed to read & write, but be allowed to add only.

Returns one of the PHAuthorizationStatus* constants.

146.36.5 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.36.6 cloudIdentifiersForLocalIdentifiers(localIdentifiers() as String) as PHCloudIdentifierMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Queries cloud identifiers for local identifiers.

146.36.7 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.36.8 Destructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

146.36.9 localIdentifiersForCloudIdentifiers(cloudIdentifiers() as PHCloudIdentifierMBS) as String()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Queries local identifiers for cloud identifiers.

146.36.10 performChanges(ChangeBlock as ChangeBlockMBS, CompletionHandler as ChangeCompletionHandlerMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Asynchronously runs a block that requests changes to be performed in the photo library.
Notes: We call back to main thread for the completion delegate, so please keep main thread available.

Please use #Pragma StackOverflowChecking false and #Pragma BackgroundTasks false in the change block method to disable stack checking and background activities.

Otherwise you may have a stack overflow exception before any code runs.

146.36.11 performChangesAndWait(ChangeBlock as ChangeBlockMBS, byref Error as NSErrorMBS, tag as Variant = nil) as Boolean

MBS Mac64bit Plugin, Plugin Version: 25.4, Platform: macOS, Targets: Desktop & iOS.

Function: Synchronously runs a block that requests changes to be performed in the photo library.
Notes: Returns true on success.

Please use #Pragma StackOverflowChecking false and #Pragma BackgroundTasks false in the change block method to disable stack checking and background activities.

Otherwise you may have a stack overflow exception before any code runs.

146.36.12 PHLocalIdentifierNotFound as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the error constants.
Notes: The local identifier was not found.

146.36.13 PHPhotosErrorDomain as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The error domain for Photos errors.

146.36.14 requestAuthorization(CompletionHandler as RequestAuthorizationCompletedMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Requests the user,Äôs permission, if needed, to access the photo library.
Notes: CompletionHandler: Photos calls this delegate upon determining your app,Äôs authorization to access the photo library.

Accessing the photo library always requires explicit permission from the user. The first time your app uses PHAssetMBS, PHCollectionMBS, PHAssetCollectionMBS, or PHCollectionListMBS methods to fetch content from the library, or uses one of the methods listed in Applying Changes to the Photo Library to request changes to library content, Photos automatically and asynchronously prompts the user to request authorization. Alternatively, you can call this method to prompt the user at a time of your choosing.

Important:
Your app,Äôs Info.plist file must provide a value for the NSPhotoLibraryUsageDescription key that explains to the user why your app is requesting Photos access. Apps linked on or after iOS 10 will crash if this key is not present.

After the user grants permission, the system remembers the choice for future use in your app, but the user can change this choice at any time using the Settings app. If the user has denied your app photo library access, not yet responded to the permission prompt, or cannot grant access due to restrictions, any attempts to fetch photo library content will return empty PHFetchResultMBS objects, and any attempts to perform changes to the photo library will fail.

Use the DidChange event to observe photo library changes before fetching content. After the user grants access to the photo library for your app, Photos sends change messages for any empty fetch results you retrieved beforehand, notifying you that library content for those fetches is now available.

This method always returns immediately. If the user has previously granted or denied photo library access permission, it executes the delegate when called; otherwise, it displays an alert and executes the block only after the user has responded to the alert.

146.36.15 requestAuthorizationForAccessLevel(accessLevel as Integer, CompletionHandler as RequestAuthorizationCompletedMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop & iOS.

Function: Requests the user,Äôs permission, if needed, to access the photo library.
Notes: Like requestAuthorization, but can ask for either read & write or for add-only mode.
Please pass PHAccessLevelReadWrite or PHAccessLevelAddOnly constants.

146.36.16 sharedPhotoLibrary as PHPhotoLibraryMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieves the shared photo library object.
Notes: The singleton photo library object.

146.36.17 Properties

146.36.18 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.36.19 unavailabilityReason as NSErrorMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The error object to give reason for unavailability.
Notes: (Read only property)

146.36.20 Events

146.36.21 DidBecomeUnavailable

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The Photos library did become unavailable.

146.36.22 DidChange(changes as PHChangeMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function:

Tells you that a set of changes has occurred in the Photos library.
Required.
Notes:

change: An object representing the changes.

Use the provided PHChangeMBS object to find out which, if any, of the albums or collections you,Äôre interested in have changed and get detailed change information. Call the change object,Äôs changeDetailsForObject method to get information about changes to an asset,Äôs contents or metadata properties or about a collection,Äôs metadata properties. Call the change object,Äôs changeDetailsForFetchResult to get information about changes to a collection,Äôs list of members (or to any other fetch result).

146.36.23 Constants

Access Levels

Constant	Value	Description
PHAccessLevelAddOnly	1	You can only add photos.
PHAccessLevelReadWrite	2	You can read and write.

Authorization Status

Constant	Value	Description
PHAuthorizationStatusAuthorized	3	The user has explicitly granted your app access to the photo library.
PHAuthorizationStatusDenied	2	The user has explicitly denied your app access to the photo library.
PHAuthorizationStatusNotDetermined	0	Explicit user permission is required for photo library access, but the us not yet granted or denied such permission.
PHAuthorizationStatusRestricted	1	Your app is not authorized to access the photo library, and the user c grant such permission.

Errors

Constant	Value	Description
PHPhotosErrorInvalid	-1	Invalid error?
PHPhotosErrorLibraryVolumeOffline	3114	Library volume offline.
PHPhotosErrorRelinquishingLibraryBundleToWriter	3142	Relinquishing library bundle to writer
PHPhotosErrorSwitchingSystemPhotoLibrary	3143	Failed to switch system photo library.
PHPhotosErrorUserCancelled	3072	The user cancelled.

146.36.24 Delegates

146.36.25 ChangeBlockMBS(tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate that requests changes to be performed.
Notes: This delegate takes no parameters and has no return value.

146.36.26 ChangeCompletionHandlerMBS(success as boolean, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A delegate that Photos calls after the change block completes and Photos performs the requested changes.
Notes: success: True if Photos successfully applied the changes requested in the block; otherwise, false.
error: If an error occurs, an NSError object describing the error; otherwise, nil.

146.36.27 RequestAuthorizationCompletedMBS(Status as Integer, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 26.5, Platform: macOS, Targets: All.

Function: The delegate to call when authorization request finished.

146.37 class PHPickerConfigurationMBS

146.37.1 class PHPickerConfigurationMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: An object that contains information about how to configure a picker view controller.
Example:

```
// let the user pick up to 5 photos
// MyPicker is a subclass of PHPickerViewControllerMBS with the didFinishPicking event implemented.
// Picker is a property of the window: Picker As MyPicker
Var config As New PHPickerConfigurationMBS
config.SelectionLimit = 5 // 0 = no limit
config.Selection = PHPickerConfigurationMBS.SelectionOrdered
config.Filter = PHPickerFilterMBS.imagesFilter

Picker = New MyPicker(config)
Picker.Present

// in MyPicker:
Sub didFinishPicking(Result() As PHPickerResultMBS) Handles didFinishPicking
For Each r As PHPickerResultMBS In Result
System.DebugLog "Picked: " + r.assetIdentifier + " " + String.FromArray(r.TypeIdentifiers, ", ")
Next
Me.Dismiss
End Sub
```

146.37.2 Methods

146.37.3 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: Creates a new configuration object.
Notes: This configuration doesn,Äôt return asset identifiers. To create configuration object with the system photo library use the other constructor.
See also:

- 146.37.4 Constructor(PhotoLibrary as Variant) 20042

146.37.4 Constructor(PhotoLibrary as Variant)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: Creates a new configuration object for a photo library.
Notes: photoLibrary: The library from which to pick photos and videos.

Please pass a PHPhotoLibraryMBS class.
See also:

- 146.37.3 Constructor 20041

146.37.5 copy as PHPickerConfigurationMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: Creates a copy of the configuration object.

146.37.6 preselectedAssetIdentifiers as String()

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: An array of asset identifiers to preselect in the picker.

146.37.7 setPreselectedAssetIdentifiers(Identifiers() as String)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: Sets an array of asset identifiers to preselect in the picker.
Notes: Preselection works only when initializing a PHPickerConfigurationMBS object with a photo library. Otherwise, the system returns an error.

The number of preselected asset identifiers can exceed your selection limit. The system disables the done action until the selection count is lower than selectionLimit.
Additionally, when you configure a picker with preselected identifiers:

Results include all preselected identifiers when canceling the picker.
Results don,Äôt include item providers for preselected assets that remain selected.
When deselecting all assets, the system keeps the done action enabled.

146.37.8 Properties

146.37.9 DisabledCapabilities as Integer

MBS iOS Plugin, Plugin Version: 23.4, Platform: iOS, Targets: Desktop & iOS.

Function: Capabilities of the picker that should be disabled.
Notes: Default is CapabilitiesNone.
For macOS 14 and iOS 17 or newer.
(Read and Write property)

146.37.10 Filter as PHPickerFilterMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: The filter you apply to restrict the asset types the picker displays.
Notes: By default, a configuration object displays all asset types: images, Live Photos, and videos.
(Read and Write property)

146.37.11 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.37.12 Mode as Integer

MBS iOS Plugin, Plugin Version: 23.4, Platform: iOS, Targets: Desktop & iOS.

Function: The mode of the picker.
Notes: Default is ModeDefault.
For macOS 14 and iOS 17 or newer.
(Read and Write property)

146.37.13 PreferredAssetRepresentationMode as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: A mode that determines which representation to use if an asset contains more than one.
Notes: An asset can contain many representations under the same uniform type identifier, or you can prefer a specific format. This mode determines which representation a result uses if many exist.

The system may perform additional transcoding to convert the asset you request to the compatable representation. Use PHPickerConfigurationMBS.AssetRepresentationModeCurrent to avoid transcoding, if possible.
(Read and Write property)

146.37.14 Selection as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: The selection behavior for the picker.
Notes: (Read and Write property)

146.37.15 SelectionLimit as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: The maximum number of selections the user can make.
Notes: The default value is 1. Setting the value to 0 sets the selection limit to the maximum that the system supports.
(Read and Write property)

146.37.16 Constants

Asset Representation Modes

Constant	Value	Description
AssetRepresentationModeAutomatic	0	A mode that indicates that the system chooses the appropriate asset repr tation.
AssetRepresentationModeCompatible	2	A mode that uses the most compatible asset representation.
AssetRepresentationModeCurrent	1	A mode that uses the current representation to avoid transcoding, if poss

Capabilities

Constant	Value	Description
CapabilitiesCollectionNavigation	4	The sidebar or the albums tab.
CapabilitiesNone	0	No specified capabilities.
CapabilitiesSearch	1	The search bar.
CapabilitiesSelectionActions	8	The "Cancel" and the "Add" (if possible) button.
CapabilitiesSensitivityAnalysisIntervention	16	Show intervention UI explaining potential risks for kids or teens if a asset is selected. Analysis and intervention will only be performed if nications Safety" is enabled in ScreenTime.
CapabilitiesStagingArea	2	The staging area.

Modes

Constant	Value	Description
ModeCompact	1	Compact picker mode (single row).
ModeDefault	0	Default picker mode.

Selection Behavior

Constant	Value	Description
SelectionContinuous	2	Selection can be delivered continuously. For macOS 14 and iOS 17 or newer.
SelectionContinuousAndOrdered	3	Selection can be delivered continuously and uses the selection order made by the user. Selected assets are numbered. For macOS 14 and iOS 17 or newer.
SelectionDefault	0	Uses the default selection behavior.
SelectionOrdered	1	Uses the selection order made by the user, numbering the selected assets.

146.38 control PHPickerControlMBS

146.38.1 control PHPickerControlMBS

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The Xojo control to host a PHPickerViewController on a Xojo window.
Notes: Please implement Configure event to provide the PHPickerConfigurationMBS object to use.

Since the PHPicker view is running in a different process and only shown inside your application, the events for contextual menus, focus and mouse events don't fire.

- MBS Xojo Plugins, version 25.1pr1

Xojo Developer Magazine

- 23.4, page 11: News
- 23.3, page 10: News

146.38.2 Properties

146.38.3 Controller as PHPickerViewControllerMBS

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The reference to the underlaying PHPickerViewController.
Notes: (Read only property)

146.38.4 View as NSViewMBS

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The view used.
Notes: Access properties of the view hosted in the control via this variable.
(Read only property)

146.38.5 Events

146.38.6 BoundsChanged

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

146.38.7 Close

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

146.38.8 Closing

Plugin Version: 25.1, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

146.38.9 Configure as PHPickerConfigurationMBS

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: Queries the configuration to use.
Notes: Please return the PHPickerConfigurationMBS object to use for the control.
This is called before the open event.

146.38.10 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

146.38.11 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

146.38.12 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

146.38.13 didFinishPicking(Result() as PHPickerResultMBS)

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate that the user completed a selection or dismissed the picker using the cancel button.
Notes: picker: The currently presented picker view controller.
results: The results of the user,Äôs selections.

The system doesn,Äôt automatically dismiss the picker after calling this method, but the plugin does.

It may happen that the user manages to dismiss the dialog without this event running. Seems to be a bug in iOS. So you can catch the viewDidDisappear event and do any cleanup there, if the didFinishPicking event did not fire before.

146.38.14 EnableMenuItems

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

146.38.15 FocusLost

Plugin Version: 25.1, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

146.38.16 FocusReceived

Plugin Version: 25.1, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

146.38.17 FrameChanged

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

146.38.18 GotFocus

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

146.38.19 LostFocus

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

146.38.20 MenuBarSelected

Plugin Version: 25.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

146.38.21 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

146.38.22 MouseDrag(x as Integer, y as Integer)

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.

As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

146.38.23 MouseUp(x As Integer, y As Integer)

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

146.38.24 Open

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

146.38.25 Opening

Plugin Version: 25.1, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

146.38.26 ScaleFactorChanged(NewFactor as double)

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

146.38.27 viewDidAppear

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: The view appeared.

146.38.28 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS iOS Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

146.39 class PHPickerFilterMBS

146.39.1 class PHPickerFilterMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: A type that defines the filter to apply to the photo library.
Example:

```
// show only photos and live photos in the picker, but no videos
// Picker is a property of the window: Picker As PHPickerViewControllerMBS (subclass with didFinishPicking event)
Var filters() As PHPickerFilterMBS
filters.Add PHPickerFilterMBS.imagesFilter
filters.Add PHPickerFilterMBS.livePhotosFilter

Var config As New PHPickerConfigurationMBS
config.Filter = PHPickerFilterMBS.anyFilterMatchingSubfilters(filters)

Picker = New PHPickerViewControllerMBS(config)
Picker.Present
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Picking picture on macOS
- MBS Xojo Plugins, version 22.5pr1

146.39.2 Methods

146.39.3 anyFilterMatchingSubfilters(filters() as PHPickerFilterMBS) as PHPickerFilterMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: Creates a new filter by combining the filters in the array.
Notes: filters: The list of filters to combine into a new filter.

146.39.4 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: The private constructor.

146.39.5 copy as PHPickerFilterMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: Creates a copy of the filter object.

146.39.6 imagesFilter as PHPickerFilterMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: A filter that represents images, and includes Live Photos.
Notes: Use anyFilterMatchingSubfilters if you like to pick more than one type (image, live photos or photos)

146.39.7 livePhotosFilter as PHPickerFilterMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: A filter that represents Live Photos.

146.39.8 videosFilter as PHPickerFilterMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: A filter that represents video assets.

146.39.9 Properties

146.39.10 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.40 class PHPickerResultMBS

146.40.1 class PHPickerResultMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: Types that represent a selected asset from the user,Äôs photo library.
Notes: When you get result objects in a real application and you like to allow more than a few pictures, you may need to manage the jobs to download:

- Have a queue for the result objects to be downloaded.
- Check what types are available on each.
- Download what you need, e.g. HEIC or JPEG representation.
- Have a timer to start downloads and make sure you have only a limited number of parallel downloads like e.g. 4.
- Monitor which downloads failed and keep the NSErrorMBS for logging them.
- Show progress dialog for the download, e.g. with our ProgressHUDMBS class.

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Picking picture on macOS
- The Top 10 from the MBS Xojo Plugins in 2022
- News from the MBS Xojo Plugins Version 22.5
- MBS Xojo Plugins, version 22.5pr1

146.40.2 Methods

146.40.3 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: The private constructor.

146.40.4 Destructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: The destructor.

146.40.5 hasItemConformingToTypeIdentifier(typeIdentifier as string) as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: Returns a Boolean value indicating whether an item provider contains a data representation conforming to a specified uniform type identifier (UTI) and to specified open-in-place behavior.

146.40.6 loadFileRepresentationForTypeIdentifier(typeIdentifier as string, handler as LoadFileRepresentationCompletedMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: Asynchronously loads the requested type to a temporary file.
Notes: You can show a progress dialog and use progressCurrent and progressTotal values.
Calls delegate later when download is finished.

146.40.7 TypeIdentifiers as String()

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: Returns the array of type identifiers for the item provider, listed in the same order in which they were registered.

146.40.8 Properties

146.40.9 assetIdentifier as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: The selected asset,Äôs local identifier.
Notes: (Read only property)

146.40.10 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.40.11 progressCurrent as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: The number of bytes downloaded so far.
Notes: This allows you to periodically check how far a download is and show a progress dialog.
Only valid after calling loadFileRepresentationForTypeIdentifier method.
(Read only property)

146.40.12 progressTotal as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: The total size of a download.
Notes: This allows you to periodically check how far a download is and show a progress dialog.
Only valid after calling loadFileRepresentationForTypeIdentifier method.
(Read only property)

146.40.13 Delegates

146.40.14 LoadFileRepresentationCompletedMBS(File as FolderItem, error as NSErrorMBS, result as PHPickerResultMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: Desktop & iOS.

Function: The delegate called when loadFileRepresentationForTypeIdentifier is finished.
Notes: Called on main thread.

146.41 class PHPickerViewControllerMBS

146.41.1 class PHPickerViewControllerMBS

MBS iOS Plugin, Plugin Version: 22.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A view controller that provides the user interface for choosing assets from the photo library.
Notes: The PHPickerViewController class is an alternative to UIImagePickerController.
PHPickerViewController improves stability and reliability, and includes several benefits to developers and users, such as the following:

- Deferred image loading and recovery UI
- Reliable handling of large and complex assets, like RAW and panoramic images
- User-selectable assets that aren,Äôt available for UIImagePickerController
- Configuration of the picker to display only Live Photos
- Availability of PHLivePhotoMBS objects without library access
- Stricter validations against invalid inputs

You can present a picker object only once; you can,Äôt reuse it across sessions.

146.41.2 Methods

146.41.3 Constructor(configuration as PHPickerConfigurationMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Creates a new picker view controller with the configuration you specify.
Notes: configuration: The configuration with which to initialize the view controller.

146.41.4 Destructor

MBS iOS Plugin, Plugin Version: 22.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The destructor.

146.41.5 Dismiss

MBS iOS Plugin, Plugin Version: 22.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Dismisses the controller.

146.41.6 Present

MBS iOS Plugin, Plugin Version: 22.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Presents the controller.

146.41.7 Properties

146.41.8 configuration as PHPickerConfigurationMBS

MBS iOS Plugin, Plugin Version: 22.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The configuration you specify when creating the picker.
Notes: (Read only property)

146.41.9 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.41.10 popover as Variant

MBS iOS Plugin, Plugin Version: 23.2, Platform: macOS, Targets: Desktop only.

Function: The NSPopoverMBS object if used.
Notes: Allows access to the popover on macOS.
(Read only property)

146.41.11 PopOverHeight as Integer

MBS iOS Plugin, Plugin Version: 23.2, Platform: macOS, Targets: Desktop only.

Function: The desired height for the popover.
Notes: We use this size to initialize it. Default is 500.
(Read and Write property)

146.41.12 PopOverWidth as Integer

MBS iOS Plugin, Plugin Version: 23.2, Platform: macOS, Targets: Desktop only.

Function: The desired width for the popover.
Notes: We use this size to initialize it. Default is 600.
(Read and Write property)

146.41.13 View as NSViewMBS

MBS iOS Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The view of the picker.
Notes: (Read only property)

146.41.14 ViewController as Variant

MBS iOS Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The underlaying view controller.
Notes: Either a NSViewControllerMBS for macOS or an UIViewControllerMBS for iOS.

(Read only property)

146.41.15 Events

146.41.16 didFinishPicking(Result() as PHPickerResultMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Notifies the delegate that the user completed a selection or dismissed the picker using the cancel button.
Notes: picker: The currently presented picker view controller.
results: The results of the user,Äôs selections.

The system doesn,Äôt automatically dismiss the picker after calling this method, but the plugin does.

It may happen that the user manages to dismiss the dialog without this event running. Seems to be a bug in iOS. So you can catch the viewDidDisappear event and do any cleanup there, if the didFinishPicking event did not fire before.

146.41.17 popoverDidClose

MBS iOS Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop & iOS.

Function: The popover did close.

146.41.18 popoverDidShow

MBS iOS Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop & iOS.

Function: The popover did show.

146.41.19 popoverWillClose

MBS iOS Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop & iOS.

Function: The popover will close.

146.41.20 popoverWillShow

MBS iOS Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop & iOS.

Function: The popover will show.

146.41.21 viewDidAppear

MBS iOS Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The view did appear.

146.41.22 viewDidDisappear

MBS iOS Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The view did disappear.

146.41.23 viewWillAppear

MBS iOS Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The view will appear.

146.41.24 viewWillDisappear

MBS iOS Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The view will disappear.

146.42 class PHProjectChangeRequestMBS

146.42.1 class PHProjectChangeRequestMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: A request to change asset data in a Photos project extension.
Notes: Make a project change request to alter a project's title or metadata. Respond to project change requests by updating your user interface as assets are added, modified, or removed.

Available in macOS 10.13 or newer.
Subclass of the PHChangeRequestMBS class.

146.42.2 Methods

146.42.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.42.4 Constructor(project as PHProjectMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Creates a change request around the specified project.
Notes: project: The project being changed in the request.

146.42.5 Destructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The destructor.

146.42.6 removeAssets(assets() as PHAssetMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Removes the specified assets from the project.
Notes: assets: A collection of PHAssets to be removed from the project.

146.42.7 Properties

146.42.8 keyAsset as PHAssetMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Sets the key asset representing the project.
Notes: Setting a key asset has been deprecated in macOS 10.14. Use ProjectPreviewImage to provide a rendered preview image instead of designating a key asset.
(Read and Write property)

146.42.9 projectExtensionData as Memoryblock

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Compressed project-specific data to use in the change request.
Notes: The total size of stored data is limited to 1 MB; attempting to store more data will result in an error. Don't include rasterized images that can be locally cached. Limit stored data to compressed project-specific data.
(Read and Write property)

146.42.10 projectPreviewImage as NSImageMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The project preview in Photos.
Notes: When setting, please pass a rendered project preview with dimensions of 1024 x 1024.

PhotoKit requires that you set a project preview in the following situations:

- Whenever the project changes in a way that requires a new preview.
- During or after execution of the beginProjectWithExtensionContext protocol method.
- During or after execution of the resumeProjectWithExtensionContext protocol method.

(Read and Write property)

146.42.11 title as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The title of the change request.
Notes: (Read and Write property)

146.43 class PHProjectMBS

146.43.1 class PHProjectMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: A representation of a Photos app project extension.
Notes: This class represents the project when extended from macOS Photos. Projects can have the following types:

- Book
- Calendar
- Card
- Prints
- Slideshow
- Wall decor

Users create projects by selecting one or more assets, right-clicking the selection, and grouping the assets, much like an album collection. Your app treats the project as a separate entity, represented as a PHProject. Subclass of the PHAssetCollectionMBS class.

146.43.2 Methods

146.43.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.13 or newer.

146.43.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The constructor.

146.43.5 Properties

146.43.6 hasProjectPreview as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: A property that indicates whether a project preview was previously set.
Notes: To set the preview, use ProjectPreviewImage property.
(Read only property)

146.43.7 projectExtensionData as Memoryblock

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Data associated with the project extension.
Notes: (Read only property)

146.44 class PHVideoRequestOptionsMBS

146.44.1 class PHVideoRequestOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A set of options affecting the delivery of video asset data that you request from an image manager.
Example:

```
// get a video from the Photos library as AVAsset, downloading from iCloud if needed
// asset is a PHAssetMBS with a video, e.g. from PHAssetMBS.fetchAssetsWithMediaType
Var asset As PHAssetMBS // your asset
If asset = Nil Then Return

Var options As New PHVideoRequestOptionsMBS
options.DeliveryMode = PHVideoRequestOptionsMBS.DeliveryModeHighQualityFormat
options.NetworkAccessAllowed = True

Call PHImageManagerMBS.defaultManager.RequestAVAssetForVideo(asset, options, "", AddressOf VideoLoaded)

// a method in the window:
Sub VideoLoaded(asset As PHAssetMBS, options As PHVideoRequestOptionsMBS, AVAsset As Variant, AVAudioMix As Variant, info As Dictionary, tag As Variant)
If AVAsset IsA AVURLAssetMBS Then
System.DebugLog "Video file: " + AVURLAssetMBS(AVAsset).URL
End If
End Sub
```

Notes: Available on MacOS 10.15 or newer.

146.44.2 Methods

146.44.3 available as boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks whether class is available.
Notes: Should return true on MacOS 10.15 or newer.

146.44.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

146.44.5 Destructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

146.44.6 SetProgressHandler(ProgressHandler as ProgressHandlerMBS, tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the delegate that Photos calls periodically while downloading the video.
Notes: If you request a video whose data is not on the local device, and you have enabled downloading with the networkAccessAllowed property, Photos calls your delegate periodically to report progress and to allow you to cancel the download.

146.44.7 Properties

146.44.8 DeliveryMode as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A mode specifying the requested video quality and delivery priority.
Notes: Use this property to tell Photos to provide a video quickly (possibly sacrificing image quality) or to provide a high-quality video (possibly sacrificing speed). This option applies only when requesting the current version of the video (that is, only when the version property is VersionCurrent).
The default option is DeliveryModeAutomatic. See DeliveryMode.
(Read and Write property)

146.44.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

146.44.10 NetworkAccessAllowed as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that specifies whether Photos can download the requested video from iCloud.
Notes: If true, and the requested video is not stored on the local device, Photos downloads the video from iCloud. To be notified of the download,Äôs progress, use the progressHandler property to provide a delegate that Photos calls periodically while downloading the video. If false (the default), and the video is not on the local device, the PHImageResultIsInCloudKey value in the result handler,Äôs info dictionary indicates that the video is not available unless you enable network access.
(Read and Write property)

146.44.11 ProgressHandler as ProgressHandlerMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The delegate that Photos calls periodically while downloading the video.
Notes: If you request a video whose data is not on the local device, and you have enabled downloading with the networkAccessAllowed property, Photos calls your delegate periodically to report progress and to allow you to cancel the download.
(Read and Write property)

146.44.12 Version as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The version of the video to request.
Notes: If a video asset has been edited, use this property to request a video with or without adjustments. The default option is VersionCurrent. See Version constants.
(Read and Write property)

146.44.13 Constants

Delivery Modes

Constant	Value	Description
DeliveryModeAutomatic	0	Photos automatically determines which quality of video data to provide b on the request and current conditions.
DeliveryModeFastFormat	3	Photos provides whatever quality of video can be most quickly loaded.
DeliveryModeHighQualityFormat	1	Photos provides only the highest quality video available.
DeliveryModeMediumQualityFormat	2	Photos provides a video of moderate quality unless a higher quality versio locally cached.

Version Mode

Constant	Value	Description
VersionCurrent	0	Request the most recent version of the video asset, reflecting all edits. The resulting video is the rendered output from all previously made adjustments.
VersionOriginal	1	Request a version of the video asset without adjustments. The resulting video is the originally captured or imported version of the asset, regardless of any edits that have been made.

146.44.14 Delegates

146.44.15 ProgressHandlerMBS(progress as double, tag as Variant, error as NSErrorMBS, byref stop as Boolean, info as Dictionary)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The delegate that Photos calls while downloading asset data from iCloud.
Notes: If you request a video asset whose data is not on the local device, and you have enabled downloading with the networkAccessAllowed property, Photos calls your block periodically to report progress and allow canceling the download.

The method takes the following parameters:

progress: A floating-point value indicating the progress of the download. A value of 0.0 indicates the download has just started, and a value of 1.0 indicates the download is complete.
error: An NSErrorMBS object describing an error that occurred when attempting to download the video, or nil if no errors have occurred.
stop: A pointer to a Boolean value. To cancel the download, set stop to true inside the method.
info: A dictionary providing additional information about the status of the video request. See Image Result Info Keys for possible keys and values.

If the event is dispatched asynchronously to main thread, the stop property will not work.

Chapter 147

Pictures Import and Export

147.1 Globals

147.1.1 BitRotateMBS(Degree as Integer, InputData as Ptr, OutputData as Ptr, Width as Integer, Height as Integer, InputRowBytes as Integer = -1, OutputRowBytes as Integer = -1) as boolean

MBS Images Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rotates 1bit image in memory.
Example:

```
Var InputTIFF As TiffPictureMBS // your input file
Var OutputTIFF as TiffPictureMBS // your output file

Var inMB As MemoryBlock = InputTIFF.Scanlines(0, InputTIFF.Height)
Var outMB As New MemoryBlock(OutputTIFF.BytesPerRow * (OutputTIFF.Height + 8))

Const PlateRotation = 90

Var b As Boolean = BitRotateMBS(PlateRotation, inMB, outMB, InputTIFF.Width, InputTIFF.Height,
InputTIFF.BytesPerRow, OutputTIFF.BytesPerRow)

Break
```

Notes: Degree can be -360, -270, -180, -90, 0, 90, 180 or 270 to rotate counter clockwise.
InputData points to an 1bit image with given width and height. InputRowBytes if defined tells how many bytes per row are used in the input image. If <= 0, we calculate it. OutputRowBytes defines row bytes for output image, which is different for 90/270 rotation.
Returns true on success or false on failure.
The function is optimized for 180 degree to be quicker if image size is multiply of 8.

For 90 and 270 degree, there is an optimization if width and height are a multiply of 8.

147.1.2 BMPStringtoPictureMBS(data as string) as picture

MBS Picture Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a BMP picture from a string.
Example:

```
Var p as Picture = LogoMBS(500)
Var s as string = p.BMPDataMBS
Var q as Picture = BMPStringtoPictureMBS(s)
Window1.Backdrop = q
```

Notes: This function is endian safe and supports 1, 4, 8, 16, 24, 32 bit BMP images.
For 32bit images the alpha value is ignored.
Returns nil on any error.
Only uncompressed BMP files are supported.

- 21.5, page 74: Windows PDF, New MBS classes let you work with PDFS on Windows. by Stefanie Juchmes

147.1.3 Split1BitFileMBS(f as folderitem, fc as folderitem, fm as folderitem, fy as folderitem, fk as folderitem, width as Integer, height as Integer, CallbackTarget as object, CacheSizeRead as Integer, CacheSizeWrite as Integer) as Integer

MBS Images Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Splits a one bit CMYK file into different files.
Notes: Source file has 1 bit for each channel.
Error code is returned which is 0 for no error.
CacheSize can be set to a value greater than 0. And it may make the process faster or slower depending on what you do.

CallbackTarget can be nil or must be an object with a method with the following declaration: "Progress(RowIndex as Integer, RowCount as Integer)"

Errorcodes:

1	not used
2	Failed to open f
3	Failed to open fc
4	Failed to open fm
5	Failed to open fy
6	Failed to open fk
7	Width<1
8	Height<1
9	Allocating read buffer failed
10	Allocating write buffer failed for c
11	Allocating write buffer failed for m
12	Allocating write buffer failed for y
13	Allocating write buffer failed for k
14	Read failed
15	Write failed for c
16	Write failed for m
17	Write failed for y
18	Write failed for k

See also:

- 147.1.4 Split1BitFileMBS(f as folderitem, fc as folderitem, fm as folderitem, fy as folderitem, fk as

folderitem, width as Integer, height as Integer, CallbackTarget as object, CacheSizeRead as Integer, CacheSizeWrite as Integer, ReadLines as Integer, WriteLines as Integer) as Integer 20076

147.1.4 Split1BitFileMBS(f as folderitem, fc as folderitem, fm as folderitem, fy as folderitem, fk as folderitem, width as Integer, height as Integer, CallbackTarget as object, CacheSizeRead as Integer, CacheSizeWrite as Integer, ReadLines as Integer, WriteLines as Integer) as Integer

MBS Images Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Splits a one bit CMYK file into different files.
Notes: Source file has 1 bit for each channel.
Error code is returned which is 0 for no error.
CacheSize can be set to a value greater than 0. And it may make the process faster or slower depending on what you do.

CallbackTarget can be nil or must be an object with a method with the following declaration: "Progress(RowIndex as Integer, RowCount as Integer)"

ReadLines and WriteLines define how many rows to read in one I/O operation.

Errorcodes:

147.2 class PNGOptimizerMBS

147.2.1 class PNGOptimizerMBS

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: This class is a wrapper for the OptiPNG command line tool.
Example:

```
Var p as Picture = LogoMBS(500)

Var fi as FolderItem = SpecialFolder.Desktop.Child("test unoptimized.png")
if not fi.SaveAsPNGMBS(p,0) then
MessageBox "Failed to save PNG file."
```

1	not used
2	Failed to open f
3	Failed to open fc
4	Failed to open fm
5	Failed to open fy
6	Failed to open fk
7	Width<1
8	Height<1
9	Allocating read buffer failed
10	Allocating write buffer failed for c
11	Allocating write buffer failed for m
12	Allocating write buffer failed for y
13	Allocating write buffer failed for k
14	Read failed
15	Write failed for c
16	Write failed for m
17	Write failed for y
18	Write failed for k

```
Return
end if

Var fo as FolderItem = SpecialFolder.Desktop.Child("test optimized.png")
fo.Delete // delete if existed before

Var o as new PNGOptimizerMBS

o.YieldTicks=10 // give time for other threads
o.InputFile=fi
o.OutputFile=fo

if o.Optimize then
MessageBox "OK: Saved "+str(o.BytesSaved)
fo.Launch
else
MessageBox "failed"
end if
```

147.2.2 Methods

147.2.3 Optimize as boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The main optimization function.
Notes: Returns true on success and false on failure.

147.2.4 Properties

147.2.5 BytesSaved as Integer

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: After the optimization this property shows how many bytes were saved.
Notes: (Read and Write property)

147.2.6 Debug as Boolean

MBS Images Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables debug output.
Notes: (Read and Write property)

147.2.7 Fix as Boolean

MBS Images Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable error recovery.
Notes: (Read and Write property)

147.2.8 Force as Boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enforce writing of a new output file.
Notes: If the input image has a digital signature, the library will not optimize the file unless force=true.
(Read and Write property)

147.2.9 full as Boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to produce a full report on IDAT (might reduce speed).
Notes: (Read and Write property)

147.2.10 InputFile as FolderItem

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file to process.
Notes: (Read and Write property)

147.2.11 interlace as Integer

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The interlace type (0-1).
Notes: Set by default to -1 for undefined.
(Read and Write property)

147.2.12 KeepBackup as Boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to keep a backup of the modified files.
Notes: If the file exists and KeepBackup=false an error is reported. If you set KeepBackup=True the old file is renamed.
(Read and Write property)

147.2.13 NoBitDepthReduction as Boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to not do a bit depth reduction.
Notes: Reducing the bit depth of the image data can reduce the file size.
(Read and Write property)

147.2.14 NoColorTypeReduction as Boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to not do a color type reduction.
Notes: If your PNG file has only 256 colors in use, the optimizer can use a color palette to save space.
(Read and Write property)

147.2.15 NoIDATRecompression as Boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to not recompress the image data.
Notes: (Read and Write property)

147.2.16 NoPaletteReduction as Boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to not reduce the palette.
Notes: If not all colors are used, the palette can be reduced in its size.
(Read and Write property)

147.2.17 OptimizationLevel as Integer

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The optimization level.
Notes: A value between 0 and 7.
Default is 2.
(Read and Write property)

147.2.18 OutputFile as FolderItem

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The output file.
Notes: (Read and Write property)

147.2.19 Overwrite as Boolean

MBS Images Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Overwrite existing files.
Notes: (Read and Write property)

147.2.20 Preserve as Boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to preserve file attributes if possible.
Notes: (Read and Write property)

147.2.21 Quiet as Boolean

MBS Images Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Run in quiet mode.
Notes: (Read and Write property)

147.2.22 simulate as Boolean

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the optimization runs only in simulation mode.
Notes: No file is written in simulation mode.
(Read and Write property)

147.2.23 Snip as Boolean

MBS Images Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Cut one image out of multi-image or animation files.
Notes: (Read and Write property)

147.2.24 StripAll as Boolean

MBS Images Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Strip metadata objects .
Notes: (Read and Write property)

147.2.25 Verbose as Boolean

MBS Images Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Run in verbose mode / show copyright and version info.
Notes: (Read and Write property)

147.2.26 YieldTicks as Integer

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: How much time is given back to Xojo for other ticks.
Example:

```
Var p as new PNGOptimizerMBS
p.YieldTicks=6 // only use 1/10th of a second
```

Notes: If value is greater than zero, the application will yield to another RB thread after the given number of ticks have passed. 60 ticks are one second. Using a small value can slow down processing a lot while a big value keeps your application not responding to mouse clicks.
If you use this property with e.g. 6 as the value, you may also want to use this method in a thread so you can handle mouse events or let Xojo redraw a progressbar.

(Read and Write property)

147.2.27 Events

147.2.28 Log(message as string)

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event to output a message to the log file.
Notes: You may want to show that to your advantaged users.

147.2.29 Panic(message as string)

MBS Images Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Called if something really bad happend and the app needs to quit.

147.2.30 Progress(index as Integer, count as Integer)

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called for reporting ongoing process in the trials.
Notes: The library will try several PNG settings and report progress so you can update a progress bar.

147.2.31 ProgressBegin

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: This event is called before the library starts to optimize.
Notes: You may want to show a progress dialog here.

147.2.32 ProgressEnd

MBS Images Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: This event is called after the library finished.
Notes: You may want to hide your progress dialog here.

Chapter 148

PNG

148.1 Globals

148.1.1 PictureToPNGStringMBS(pic as picture, gamma as single = 0.0) as string

MBS Images Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves a picture to a PNG string.
Notes: If the picture has no mask, no alpha channel is written to the file.
Returns "" on any error.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma
See also:

- 148.1.2 PictureToPNGStringMBS(pic as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string 20085
- 148.1.3 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single = 0.0) as string 20086
- 148.1.4 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string 20087

148.1.2 PictureToPNGStringMBS(pic as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string

MBS Images Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves a palette based RGB picture as a PNG file.
Notes: If the picture has no mask, no alpha channel is written to the file.
Colors must be an array with 256 values defining the palette.

Returns true on success and false on failure.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma

If Interlace is true the Adam7 interlacing is used.
FilterType specifies the filter:

```
const PNG_NO_FILTERS      = 0
const PNG_FILTER_NONE     = 8
const PNG_FILTER_SUB      = 16
const PNG_FILTER_UP       = 32
const PNG_FILTER_AVG      = 64
const PNG_FILTER_PAETH    = 128
const PNG_FILTER_ALL      = 248
```

See also:

- 148.1.1 PictureToPNGStringMBS(pic as picture, gamma as single = 0.0) as string 20085
- 148.1.3 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single = 0.0) as string 20086
- 148.1.4 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string 20087

148.1.3 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single = 0.0) as string

MBS Images Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves a picture to a PNG string.
Example:

```
// save a picture with a mask as PNG data, e.g. to store it in a database
Var pic As New Picture(100, 100, 32)
pic.Graphics.DrawingColor = &cFF0000
pic.Graphics.FillOval(0, 0, 100, 100)
Var mask As New Picture(100, 100, 32)
```

```
mask.Graphics.DrawingColor = &cFFFFFF // white = transparent
mask.Graphics.FillRectangle(0, 0, 100, 100)
mask.Graphics.DrawingColor = &c000000 // black = opaque
mask.Graphics.FillOval(0, 0, 100, 100)

Var png As String = PictureToPNGStringMBS(pic, mask)
MessageBox png.Bytes.ToString + " bytes PNG"
```

Notes: Returns "" on any error.

It uses the mask passed. If nil, no alpha channel is written to the file.
The mask from the picture is ignored.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma
See also:

- 148.1.1 PictureToPNGStringMBS(pic as picture, gamma as single = 0.0) as string 20085
- 148.1.2 PictureToPNGStringMBS(pic as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string 20085
- 148.1.4 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string 20087

148.1.4 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string

MBS Images Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves a picture to a PNG string.
Notes: Returns "" on any error.

It uses the mask passed. If nil, no alpha channel is written to the file.
The mask from the picture is ignored.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma

If Interlace is true the Adam7 interlacing is used.

FilterType specifies the filter:

```
const PNG_NO_FILTERS      = 0
const PNG_FILTER_NONE     = 8
const PNG_FILTER_SUB      = 16
const PNG_FILTER_UP       = 32
const PNG_FILTER_AVG      = 64
const PNG_FILTER_PAETH    = 128
const PNG_FILTER_ALL      = 248
```

- Inside REAL Studio Web Edition

See also:

- 148.1.1 PictureToPNGStringMBS(pic as picture, gamma as single = 0.0) as string 20085
- 148.1.2 PictureToPNGStringMBS(pic as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string 20085
- 148.1.3 PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single = 0.0) as string 20086

148.1.5 PNGStringToPictureMBS(data as string, gamma as single = 0.0, AllowDamaged as boolean = false) as picture

MBS Images Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads PNG data from a string variable.
Example:

```
// read a PNG from memory, accepting slightly damaged files
Var data As String = BinaryStream.Open(SpecialFolder.Desktop.Child("image.png")).Read(100000000)
Var pic As Picture = PNGStringToPictureMBS(data, 0.0, True)
If pic <>Nil Then MessageBox pic.Width.ToString + " x " + pic.Height.ToString
```

Notes: If the picture has an alpah channel the returned picture will have a mask.

Returns picture on success and nil on failure.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)

negative value: do not correct gamma

AllowDamaged: Whether to allow damaged PNG files to return a part of the image as picture.
Blog Entries

- MBS Xojo Plugins, version 18.4pr1

148.1.6 PNGStringToPNGPictureMBS(data as string, gamma as single = 0.0, AllowDamaged as boolean = false) as PNGPictureMBS

MBS Images Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads PNG data from a string variable.
Example:

```
// read a PNG from memory and keep its mask separately
Var data As String = BinaryStream.Open(SpecialFolder.Desktop.Child("image.png")).Read(100000000)
Var png As PNGPictureMBS = PNGStringToPNGPictureMBS(data)
If png <>Nil Then
Var pic As Picture = png.Pict
Var mask As Picture = png.Mask // Nil if the PNG has no alpha channel
End If
```

Notes: Returns PNGPictureMBS object on success and nil on failure.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma

AllowDamaged: Whether to allow damaged PNG files to return a part of the image as picture.

148.2 class PNGpictureMBS

148.2.1 class PNGpictureMBS

MBS Images Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a PNG picture.
Notes: Based on LibPNG.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr11

- MBS Real Studio Plugins, version 12.5pr8
- MBS Real Studio Plugins, version 11.3pr1

148.2.2 Methods

148.2.3 CombinePictureWithMask as picture

MBS Images Plugin, Plugin Version: 4.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a new picture which is created using the picture and it's mask.
Example:

```
Var t as TiffPictureMBS
' ...
Canvas1.backdrop=t.CombinePictureWithMask
```

148.2.4 PNGLibVersion as string

MBS Images Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version of the PNG library compiled into the plugin.
Notes: Please ask if you need a newer version.

148.2.5 Properties

148.2.6 height as Integer

MBS Images Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the picture.
Notes: (Read and Write property)

148.2.7 mask as picture

MBS Images Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mask of the picture.
Notes: May be nil.
(Read and Write property)

148.2.8 pict as picture

MBS Images Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The picture data of the picture.
Notes: If this image is all black, you may use a different gamma setting.
(Read and Write property)

148.2.9 width as Integer

MBS Images Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the picture.
Notes: (Read and Write property)

148.2.10 Constants

Constants

Constant	Value	Description
kDefaultGamma	0	The default gamma constant. Pass this value to get the default gamma.
kDefaultNoGamma	-1	The no gamma constant. Pass this value to not do any gamma correction.

148.3 class PNGReaderMBS

148.3.1 class PNGReaderMBS

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for reading PNG files.
Example:

```
Var Current as PictureMBS // global
Var f as FolderItem

f=FolderItem.ShowOpenFileDialog(FileTypes.Png)

if f<>Nil then
Current=nil

Var p as new PNGReaderMBS

if p.OpenFile(f) then
if p.ApplyOptions(0) then

Current=new PictureMBS(p.Width,p.Height,PictureMBS.ImageFormatRGB)

Var i,c as Integer

c=p.Height-1
for i=0 to c
Current.RowInFormat(i, PictureMBS.ImageFormatRGBA)=p.ReadRow
next

end if
end if
end if
```

Notes: Use this class to read PNG files row by row as memoryblock.

Based on LibPNG.

148.3.2 Methods

148.3.3 ApplyOptions(gamma as double = 0.0, ScreenGamma as double = -1.0) as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies various options.
Notes: The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma

Added ScreenGamma parameter in plugin version 15.2. If you set both gamma and Screengamma to a value >0.0, the plugin will use those gamma values. If both are equal, no gamma correction is made.

16-bit images are always reduced to 8-bit images.

Returns true on success and false on failure. Calls ReadHeader method if needed.

148.3.4 CombinePictureWithMask as picture

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines the pict and the mask property to a picture with mask.

148.3.5 Open(file as folderitem, data as string) as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens either the data string or the file.
Notes: Returns true on success.

148.3.6 OpenData(data as string) as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a PNG file from the data string.
Notes: Returns true on success.

148.3.7 OpenFile(file as folderitem) as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a file.
Example:

```
Var p As New PNGReaderMBS
Var f As FolderItem = SpecialFolder.Desktop.Child("test.png")

If p.OpenFile(f) Then
If p.ApplyOptions Then
If p.ReadPicture Then
Window1.Backdrop = p.Pict
End If
end if
End If
```

Notes: Returns true on success.
See also:

- 148.3.8 OpenFile(Path as String) as boolean 20094

148.3.8 OpenFile(Path as String) as boolean

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a file.
Example:

```
Var p As New PNGReaderMBS
Var f As FolderItem = SpecialFolder.Desktop.Child("test.png")
Var path As String = f.NativePath

If p.OpenFile(path) Then
If p.ApplyOptions Then
If p.ReadPicture Then
Window1.Backdrop = p.Pict
End If
end if
End If
```

Notes: Returns true on success.
See also:

- 148.3.7 OpenFile(file as folderitem) as boolean 20094

148.3.9 OpenSpecialData(data as string) as boolean

MBS Images Plugin, Plugin Version: 10.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Same as OpenData but with special handling of the png data.
Example:

```
Var f as FolderItem = New FolderItem("mbs.png")
Var b as BinaryStream = f.OpenAsBinaryFile(false) // BinaryStream.Open(f) in newer RB versions
Var s as string = b.Read(B.Length)

Var p as new PNGReaderMBS
if p.OpenSpecialData(s) then
if p.ApplyOptions(0) then
if p.ReadPicture then
Backdrop = p.Pict
Title = "OK"
else
Title = "Failed to read picture."
end if
else
Title = "Failed to apply options."
end if
else
Title = "Failed to open picture."
end if
```

Notes: This function can be used to read PNG files made for the Apple iPhone. The PNG is converted

from the Apple format to the normal PNG format and passed to OpenData. In the SourceData property you can get the modified PNG data. Still this modified PNG data has the channels swapped, so you should read the image with the pict property.

On Mac OS X 10.8, the NSImage class also reads iOS optimized PNG files.

Deprecated as it does not read all files and we can't fix this old code. Please use a command line tool to convert instead.

148.3.10 PNGLibVersion as string

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version of the PNG library compiled into the plugin.

148.3.11 ReadEXIF(byref exif as string) as boolean

MBS Images Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the EXIF data block.
Notes: Returns true on success or false on failure.

148.3.12 ReadHeader as Boolean

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads header of PNG.
Notes: This reads header and fill properties Width, Height, ColorType, OriginalColorType, InterlaceType and BitDepth.
Returns true on success and false on failure.

148.3.13 ReadICCProfile(byref name as string, byref compression as Integer, byref profile as string) as boolean

MBS Images Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the ICC Profile from the PNG file.
Notes: Name is the profile name, compression the method used to compress the profile data and profile a string with the content of the profile as binary data.

Returns true on success.

You need to call ApplyOptions before reading the profile.

148.3.14 ReadPicture as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the picture into the pict and mask properties.
Notes: Returns true on success.

148.3.15 ReadRow as memoryblock

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the next row as a memoryblock.
Example:

```
Var fSource as FolderItem = SpecialFolder.Desktop.Child("test.png") // some png with alpha
Var oPNGInput as new PNGReaderMBS

If oPNGInput.OpenFile(fSource) Then
If oPNGInput.ApplyOptions(0) Then

Var imgSource as New PictureMBS(oPNGInput.Width, oPNGInput.Height, PictureMBS.ImageFormatRGBA)

' Read row by row the file and puts it in a PictureMBS instance

Var nMax as Integer = oPNGInput.Height - 1
For nInd as Integer = 0 To nMax
imgSource.RowInFormat(nInd, PictureMBS.ImageFormatRGBA, true) = oPNGInput.ReadRow()
Next

' show only alpha/mask channel
Backdrop=imgSource.AlphaChannel.CopyPicture

' show Picture without mask
Backdrop=imgSource.CopyPicture

' show picture with mask
Backdrop=imgSource.CopyPictureWithMask

End If
End If
```

Notes: Returns nil on any error.
Format is RGBA as in the example with 4 bytes per pixel.
See also:

- 148.3.16 ReadRow(mem as memoryblock) as boolean 20098

148.3.16 ReadRow(mem as memoryblock) as boolean

MBS Images Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the next row into the given memoryblock.
Notes: Returns false on any error and true on success.
Format is RGBA as in the example with 4 bytes per pixel.
Make sure the memoryblock is big enough. Else you risk a crash.

See also PNGReaderMBS.RowBytes.

ReadRow with reusing memoryblock is faster than allocating a new one for each row.
See also:

- 148.3.15 ReadRow as memoryblock 20097

148.3.17 ReadRowAlphaOnly(mem as memoryblock) as boolean

MBS Images Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the next row into the given memoryblock.
Notes: Returns false on any error and true on success.
Format is alpha channel as in the example with one byte per pixel.
Make sure the memoryblock has size from RowBytes property. Else you risk a crash.
The data in memoryblock is width bytes long, 1/4 of the size of the memoryblock.

See also PNGReaderMBS.RowBytes.

ReadRow with reusing memoryblock is faster than allocating a new one for each row.

148.3.18 ReadRowMaskOnly(mem as memoryblock) as boolean

MBS Images Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the next row into the given memoryblock.
Notes: Returns false on any error and true on success.
Format is mask (inverse alpha) as in the example with one byte per pixel.
Make sure the memoryblock has size from RowBytes property. Else you risk a crash.
The data in memoryblock is width bytes long, 1/4 of the size of the memoryblock.

See also PNGReaderMBS.RowBytes.
ReadRow with reusing memoryblock is faster than allocating a new one for each row.

148.3.19 ReadsRGBTag(byref file_srgb_intent as Integer) as boolean

MBS Images Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the sRGB tag.
Notes: Returns true if the value was read into the given variable.

148.3.20 RowBytes as Integer

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The length of each row in bytes.

148.3.21 Properties

148.3.22 AllowDamaged as Boolean

MBS Images Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to return picture for files with damaged content.
Notes: e.g. a half downloaded PNG file can still be processed and may give you a preview for the file.
(Read and Write property)

148.3.23 BitDepth as Integer

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The bit depth of the PNG file.
Notes: The original value from file headers, not updated by ApplyOptions, even if we convert e.g. 1 bit to gray for you.
(Read and Write property)

148.3.24 ChunkCacheMax as UInt32

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum cache size for caching chunks.
Notes: The PNG specification sets no limit on the number of ancillary chunks allowed in a PNG datastream. By default, libpng imposes a limit of a total of 1000 sPLT, tEXt, iTXt, zTXt, and unknown chunks to be stored.
You can change the limit on the total number of such hunks that will be stored, with this property, where &h7fffffff means unlimited.
(Read and Write property)

148.3.25 ChunkMallocMax as UInt64

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum allocation size for one chunk.
Example:

```
Var png as new PNGReaderMBS
png.chunkMallocMax=32 * 1024 * 1024
```

Notes: Libpng imposes a limit of 8 Megabytes (8,000,000 bytes) on the amount of memory that a compressed chunk other than IDAT can occupy, when decompressed.
You can query or change this limit with with this property.
Any chunks that would cause either of these limits to be exceeded will be ignored.
(Read and Write property)

148.3.26 ColorType as Integer

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color type of the PNG file.
Notes: The value is a combination of this constants:

```
PNG_COLOR_MASK_PALETTE   = 1
PNG_COLOR_MASK_COLOR     = 2
PNG_COLOR_MASK_ALPHA     = 4
```

The PNG library will convert on reading every row into 32bit RGBA, so don't worry about this.

The OriginalColorType property is the color type of the file. ColorType property reports what ApplyOptions changed it to, so you know what ReadRow will put in the MemoryBlock.

(Read and Write property)

148.3.27 CompressionBufferSize as UInt64

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The zlib compression buffer size.
Notes: You can change the zlib compression buffer size to be used while reading compressed data with this property where the default size is 8192 bytes. Note that the buffer size is changed immediately and the buffer is reallocated immediately, instead of setting a flag to be acted upon later.
(Read and Write property)

148.3.28 ExpandGrayToRGB as Boolean

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether grayscale images are expanded to RGB.
Notes: Set before ApplyOptions if you need this option.
Default is true.

Shall set transformations such that the grayscale image is converted to 24-bit RGB.

see png_set_gray_to_rgb function in libpng documentation.
(Read and Write property)

148.3.29 HasAlpha as Boolean

MBS Images Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this picture has an alpha channel.
Example:

```
var f as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var p As New PNGReaderMBS

If p.OpenFile(f) Then
If p.ApplyOptions(0) Then

MessageBox "Has alpha: " + p.HasAlpha.ToString

End If
```

end if

Notes: Set by ReadHeader.
(Read only property)

148.3.30 HasTransparency as Boolean

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether a transparency block is included for palette images (tRNS).
Notes: Set by ReadHeader or ApplyOptions.
(Read only property)

148.3.31 Height as Integer

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the picture in pixels.
Notes: (Read and Write property)

148.3.32 InterlaceType as Integer

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The interlace setting.
Notes: (Read and Write property)

148.3.33 Interlacing as Integer

MBS Images Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the png file is interlaced.
Notes: Value is 1 if not interlaced and 7 if interlaced.
(Read and Write property)

148.3.34 InvertAlpha as Boolean

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether alpha values should be inverted.
Notes: Set before ApplyOptions if you need this option.
Default is false.

see png_set_invert_alpha function in libpng documentation.
(Read and Write property)

148.3.35 Mask as Picture

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mask of the picture.
Notes: (Read and Write property)

148.3.36 OriginalColorType as Integer

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The original color type of the PNG file.
Notes: The value is a combination of this constants:

PNG_COLOR_MASK_PALETTE	= 1
PNG_COLOR_MASK_COLOR	= 2
PNG_COLOR_MASK_ALPHA	= 4

The PNG library will convert on reading every row into 32bit RGBA, so don't worry about this.

The OriginalColorType property is the color type of the file. ColorType property reports what ApplyOptions changed it to, so you know what ReadRow will put in the MemoryBlock.
(Read and Write property)

148.3.37 Pict as Picture

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The picture read.
Notes: (Read and Write property)

148.3.38 RGBToGray as Boolean

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to convert RGB to grayscale.
Example:

```
Var png as PNGReaderMBS

// ask for gray only
png.RGBToGray = True

// avoid extra filler bytes for missing alpha channel
png.UseFiller = false
```

Notes: Set before ApplyOptions if you need this option.
Default is false.

see png_set_rgb_to_gray function in libpng documentation.
(Read and Write property)

148.3.39 RGBToGrayErrorAction as Integer

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Error handling option for Reduce RGB to grayscale.
Notes: Can be 1 for none, 2 for warn or 3 for error.
Default is 1.
(Read and Write property)

148.3.40 RGBToGrayGreen as Double

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green coefficient to use for RGB to Gray conversion.
Notes: Default is -1 for default coefficients.
(Read and Write property)

148.3.41 RGBToGrayRed as Double

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green coefficient to use for RGB to Gray conversion.
Notes: Default is -1 for default coefficients.
(Read and Write property)

148.3.42 SourceData as String

MBS Images Plugin, Plugin Version: 10.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The source data used in Open functions.
Example:

```
Var p as PNGReaderMBS // your reader

// write data to file
Var fo as FolderItem = SpecialFolder.Desktop.Child("mbsout.png")
Var bo as BinaryStream = fo.CreateBinaryFile("") // BinaryStream.Create(fo,true) in newer RB Versions

bo.Write p.SourceData
```

Notes: If you used OpenSpecialData, the data here is the PNG without the Apple modifications, but still with swapped colors.
This property is set by the OpenSpecialData, Open and OpenData functions.
(Read and Write property)

148.3.43 SourceFile as FolderItem

MBS Images Plugin, Plugin Version: 10.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The folderitem passed to the Open functions.
Notes: This property is set by the Open and OpenFile functions.
(Read and Write property)

148.3.44 SourcePath as String

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The source file path.
Notes: (Read and Write property)

148.3.45 StripAlpha as Boolean

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to strip alpha.
Notes: Set before ApplyOptions if you need this option.
Default is false.

see png_set_strip_alpha function in libpng documentation.
(Read and Write property)

148.3.46 SwapRB as Boolean

MBS Images Plugin, Plugin Version: 10.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to swap red and blue channels.
Example:

```
Var p as new PNGReaderMBS
p.SwapRB = true
```

Notes: The PNG files for the iPhone have swapped channels so the iPhone does not need to swap them for display. One of the tricks Apple uses for making the iPhone faster.
This flag is set to true by OpenSpecialData.
(Read and Write property)

148.3.47 UseFiller as Boolean

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether filler byte is used for RGB.
Notes: Set by ApplyOptions if needed.
Defines whether RGB is extended to 4 bytes with an extra filler byte if needed.

see png_set_filler function in libpng documentation.
(Read and Write property)

148.3.48 UserHeightMaximum as UInt32

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height maximum.

Notes: The PNG specification allows the width and height of an image to be as large as 2^31-1 (0x7fffffff), or about 2.147 billion rows and columns.
For safety, libpng imposes a default limit of 1 million rows and columns.
Larger images will be rejected immediately with a png_error() call. If you wish to change these limits, you can use this property to set your own limits (libpng may reject some very wide images anyway because of potential buffer overflow conditions).
(Read and Write property)

148.3.49 UserWidthMaximum as UInt32

MBS Images Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width maximum.
Notes: The PNG specification allows the width and height of an image to be as large as 2^31-1 (0x7fffffff), or about 2.147 billion rows and columns.
For safety, libpng imposes a default limit of 1 million rows and columns.
Larger images will be rejected immediately with a png_error() call. If you wish to change these limits, you can use this property to set your own limits (libpng may reject some very wide images anyway because of potential buffer overflow conditions).
(Read and Write property)

148.3.50 Width as Integer

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the picture in pixels.
Notes: (Read and Write property)

148.3.51 Events

148.3.52 Error(msg as string)

MBS Images Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PNG library has an error message for you.
Notes: Processing will stop soon.

148.3.53 Warning(msg as string)

MBS Images Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PNG library has a warning for you.

148.4 class PNGWriterMBS

148.4.1 class PNGWriterMBS

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to write a PNG file.
Example:

```
Var Current as PictureMBS // your picture
Var f as FolderItem

f=FolderItem.ShowSaveFileDialog(FileTypes.Png,"test.png")

if f<>Nil then
const PNG_COLOR_MASK_PALETTE = 1
const PNG_COLOR_MASK_COLOR = 2
const PNG_COLOR_MASK_ALPHA = 4

Var p as new PNGWriterMBS

p.Width=Current.Width
p.Height=Current.Height
p.Type=PNG_COLOR_MASK_COLOR
p.bpc=3
p.Rowbytes=p.Width*p.bpc

if p.OpenWriteDestination(f) then
if p.SetHeader(false, -1) then
if p.SetGamma(0) then
if p.WriteInfo then
Var i,c as Integer

c=p.Height-1
for i=0 to c
p.WriteRow current.RowInFormat(i, Current.ImageFormatRGB)
next

if p.WriteEnd then
MessageBox "OK"
end if
end if
end if
end if
end if
end if
```

Notes: You can use this class to write PNG files by row.

Based on LibPNG.

148.4.2 Methods

148.4.3 CloseDestination

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes the file.

148.4.4 Finish as string

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finishes the PNG file and returns the PNG file content as string.
Notes: Returns "" on any error.

148.4.5 OpenWriteDestination(file as folderitem) as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens the file to write.
Example:

```
Var f As FolderItem = SpecialFolder.Desktop.Child("test.png")
Var p As New PNGWriterMBS
```

```
Var pic As Picture = LogoMBS(500)

If p.OpenWriteDestination(f) Then
If p.SetRGBPicture(pic) Then
If p.SetHeader(False, -1) Then
If p.SetGamma(0) Then
If p.WriteInfo Then
If p.WriteRows Then
If p.WriteEnd Then
MessageBox "OK"
End If
End If
End If
End If
End If
End If
End If
```

Notes: If you pass nil for the file, the data is collected in memory and you can get it on the end using the Finish method.
See also:

- 148.4.6 OpenWriteDestination(Path as String) as boolean 20111

148.4.6 OpenWriteDestination(Path as String) as boolean

MBS Images Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens the file to write.
Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("test.png")
Var path As String = file.NativePath

Var p As New PNGWriterMBS
Var pic As Picture = LogoMBS(500)

If p.OpenWriteDestination(path) Then
If p.SetRGBPicture(pic) Then
If p.SetHeader(False, -1) Then
If p.SetGamma(0) Then
If p.WriteInfo Then
If p.WriteRows Then
If p.WriteEnd Then
MessageBox "OK"
End If
End If
```

```
End If
End If
End If
End If
End If
```

Notes: If you pass "" for the file, the data is collected in memory and you can get it on the end using the Finish method.
See also:

- 148.4.5 OpenWriteDestination(file as folderitem) as boolean 20110

148.4.7 PNGLibVersion as string

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version of the PNG library compiled into the plugin.

148.4.8 SetAlphaData(alphas() as Integer, colors() as color) as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the alpha data and the color palette.
Notes: The array can have up to 256 colors.
The color and the alpha arrays must have the same size.
Returns true on success.

148.4.9 SetAlphas as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the alpha data to the file.
Notes: You must call SetAlphaData before.
Returns true on success.

148.4.10 SetEXIF(EXIFData as string) as boolean

MBS Images Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the EXIF data block.
Notes: Returns true on success or false on failure.

148.4.11 SetGamma(gamma as Double = 0.0) as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Defines the gamma value and other options for the PNG file.
Notes: Returns on success.

The gamma parameter defines what gamma correction is applied:
positive value: use the value as the gamma correction
zero: use default value (or value saved in file itself)
negative value: do not correct gamma

Default for Mac is 1.8 and for Windows 2.2.
If you use SRGB, the Gamma must be 2.2.

148.4.12 SetGrayPicture(pict as picture, mask as picture = nil) as boolean

MBS Images Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a picture into the internal buffers for writing a Grayscale image file.
Notes: This method sets width, height, type and bpc properties.
Returns true on success.

Mask can be nil.

148.4.13 SetHeader(Interlace as boolean = false, Filter as Integer = -1, Compression as Integer = -1) as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Defines the header options for the PNG file.
Notes: Interlace is true the Adam7 interlacing is used.
FilterType specifies the filter:

```
const PNG_NO_FILTERS      = 0
const PNG_FILTER_NONE     = 8
const PNG_FILTER_SUB      = 16
const PNG_FILTER_UP       = 32
const PNG_FILTER_AVG      = 64
const PNG_FILTER_PAETH    = 128
const PNG_FILTER_ALL      = 248
```

Compression can be between 0 (none) to 9 (max). Default is 6. Value -1 means the plugin will not change from default of PNG library. Normally you have no better compression for setting higher than 6, but only burn more CPU power.

148.4.14 SetICCProfile(name as string, CompressionType as Integer, Profile as string) as boolean

MBS Images Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a ICC Profile to the PNG.
Notes: Name is the profile name as an ASCII string.
CompressionType is always 0 (PNG_COMPRESSION_TYPE_BASE).

148.4.15 SetPalette as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the palette data.
Notes: Returns true on success.

148.4.16 SetPaletteData(colors() as color) as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color palette.
Notes: The array can have up to 256 colors.
Returns true on success.

148.4.17 SetPalettePicture(pict as picture) as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a picture into the internal buffers.
Notes: You need to define the color palette before calling this method.

This method sets width, height, type and bpc properties.
Returns true on success.

148.4.18 SetResolution(ResolutionHorizontal as Integer, ResolutionVertical as Integer, Unit as Integer) as boolean

MBS Images Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the resolution of the PNG.
Notes: Unit is ResolutionUnknown, ResolutionMeter or ResolutionDPI.
Internally the PNG saves only in dots per meter, so the plugin converts DPI to DPM for you.

148.4.19 SetRGBPicture(pict as picture, mask as picture = nil) as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a picture into the internal buffers.
Example:

```
// Write a RGBA PNG file
Var current as Picture = LogoMBS(500)

// create a mask
Var g as Graphics = current.Mask.Graphics
g.ForeColor = &cFFFFFF
g.FillRect 0,0,500,500
g.ForeColor = &c000000
g.FillOval 0,0,500,500

// show in window
Window1.Backdrop = current

// and write to file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.png")

Var p as new PNGWriterMBS

if p.OpenWriteDestination(f) then // open file
if p.SetRGBPicture(current, current.mask) then // set picture to write
if p.SetHeader(false, -1) then // setup file header
if p.SetGamma(0) then // and default gamma
if p.WriteInfo then // write file header
if p.WriteRows then // write pixels
if p.WriteEnd then // and write file end
p = nil // cleanup
f.Launch
end if
end if
end if
end if
```

```
end if
end if
end if
```

Notes: This method sets width, height, type and bpc properties.
Returns true on success.

Mask can be nil.

148.4.20 SetRows(rows() as memoryblock) as boolean

MBS Images Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses the given memoryblocks for row data.
Notes: The memory is not copied, so keep the array alive!
This method sets height. You need to set width, bpc, type and rowbytes.
Returns true on success.

148.4.21 SetsRGB(intent as Integer) as boolean

MBS Images Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the sRGB intent.
Notes: Possible values:

```
const PNG_sRGB_INTENT_PERCEPTUAL   = 0
const PNG_sRGB_INTENT_RELATIVE     = 1
const PNG_sRGB_INTENT_SATURATION   = 2
const PNG_sRGB_INTENT_ABSOLUTE     = 3
```

148.4.22 WriteEnd as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finishes the writing.
Notes: Returns true on success.

Do not call if you use WriteRows.

148.4.23 WriteInfo as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the PNG file header.
Notes: Returns true on success.

Do not call if you use WriteRows.

148.4.24 WriteRow(row as memoryblock)

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes one row of image data.
Notes: The data must be in the RGBA format with one byte per value.
(4 bytes per Pixel)

Returns true on success.

Do not call if you use WriteRows.

148.4.25 WriteRows as boolean

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the picture from memory to the file.
Example:

```
// Write a RGB PNG file
Var current as Picture = LogoMBS(500)
Var f as FolderItem = SpecialFolder.Desktop.Child("test.png")

Var p as new PNGWriterMBS

if p.OpenWriteDestination(f) then // open file
if p.SetRGBPicture(current) then // set picture to write
if p.SetHeader(false, -1) then // setup file header
if p.SetGamma(0) then // and default gamma
if p.WriteInfo then // write file header
if p.WriteRows then // write pixels
if p.WriteEnd then // and write file end
p = nil // cleanup
f.Launch
```

```
end if
end if
end if
end if
end if
end if
end if
```

Notes: If you call this method, you need to call SetRGBPicture or SetPalettePicture before and you can't call WriteInfo, WriteRow and WriteEnd.

148.4.26 Properties

148.4.27 bpc as Integer

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The bytes per pixel.
Notes: Should be 3 for RGB, 1 for palette pictures and 4 for RGB with Alpha.
(Read and Write property)

148.4.28 Height as Integer

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the picture to write.
Notes: (Read and Write property)

148.4.29 Rowbytes as Integer

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The bytes per row.
Notes: (Read and Write property)

148.4.30 Type as Integer

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color type.

Notes: The value is a combination of this constants:

PNG_COLOR_MASK_PALETTE	= 1
PNG_COLOR_MASK_COLOR	= 2
PNG_COLOR_MASK_ALPHA	= 4

(Read and Write property)

148.4.31 Width as Integer

MBS Images Plugin, Plugin Version: 9.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the picture to write.
Notes: (Read and Write property)

148.4.32 Events

148.4.33 Error(msg as string)

MBS Images Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PNG library has an error message for you.
Notes: Processing will stop soon.

148.4.34 Warning(msg as string)

MBS Images Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PNG library has a warning for you.

148.4.35 Constants

Constants

Constant	Value	Description
ResolutionDPI	2	One of the resolution unit type constants. The unit for points per inch.
ResolutionMeter	1	One of the resolution unit type constants. The unit for points per meter.
ResolutionUnknown	0	One of the resolution unit type constants.

Type Constants

Constant	Value	Description
TypeGray	0	Gray
TypeGrayA	4	Gray with Alpha
TypePalette	1	Palette
TypeRGB	2	RGB
TypeRGBA	6	RGB with Alpha.

Chapter 149

Power

149.1 class IOPMAssertionMBS

149.1.1 class IOPMAssertionMBS

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for PowerManagement assertions.
Example:

```
// prevent the Mac from going to sleep while a long task runs
// Assertion is a property of the window: Assertion As IOPMAssertionMBS
Assertion = IOPMAssertionMBS.CreateWithName(IOPMAssertionMBS.kIOPMAssertionTypePreventUserIdleSystemSleep, IOPMAssertionMBS.kIOPMAssertionLevelOn, "Exporting videos")

// ... do the long work ...

// when done, release the assertion to allow sleep again
Assertion = Nil
```

Notes: You use this class to block a Mac from sleeping display, disk or whole machine.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr9

149.1.2 Methods

149.1.3 AssertionsByProcess as Dictionary

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a dictionary listing all assertions, grouped by their owning process.
Notes: Notes: One process may have multiple assertions. Several processes may have asserted the same assertion to different levels.

On success, this returns a dictionary of assertions per process. At the top level, keys to the Dictionary are pids stored as Integer. The value associated with each pid is an array of active assertions. Each entry in the array is an assertion represented as a Dictionary. See the keys kIOPMAssertionTypeKey and kIOPMAssertionLevelKey.

149.1.4 AssertionsStatus as Dictionary

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a list of available assertions and their system-wide levels.
Notes: The system-wide level is the maximum of all individual assertions' levels.

On success, this returns a Dictionary of all assertions currently available.
The keys in the dictionary are the assertion types, and the value of each is a CFNumber that represents the aggregate level for that assertion.

149.1.5 Constructor(type as string, level as Integer, name as string)

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Calls internally CreateWithName function.

149.1.6 CreateWithDescription(AssertionType as string, Name as string, Details as string = "", HumanReadableReason as string = "", LocalizationBundlePath as string = "", Timeout as Double = 0, TimeoutAction as string = "") as IOPMAssertionMBS

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an IOPMAssertion.
Notes: This is the preferred API to call to create an assertion. It allows the caller to specify the Name, Details, and HumanReadableReason at creation time. There are other keys that can further describe an assertion, but most developers don't need to use them. Use SetProperty or CreateWithProperties if you need to specify properties that aren't available here.

AssertionType: An assertion type constant. Caller must specify this argument.
Name: A String value to correspond to key kIOPMAssertionNameKey. Caller must specify this argument.

Details: A String value to correspond to key kIOPMAssertionDetailsKey. Caller my pass "", but it helps power users and administrators identify the reasons for this assertion.
HumanReadableReason: A String value to correspond to key kIOPMAssertionHumanReadableReasonKey. Caller may pass "", but if it's specified OS X may display it to users to describe the active assertions on their system.
LocalizationBundlePath: A String value to correspond to key kIOPMAssertionLocalizationBundlePathKey. This bundle path should include a localization for the string HumanReadableReason. Caller may pass "", but this argument is required if caller specifies HumanReadableReason.
Timeout: Specifies a timeout for this assertion. Pass 0 for no timeout.
TimeoutAction: Specifies a timeout action. Caller my pass "". If a timeout is specified but a TimeoutAction is not, the default timeout action is kIOPMAssertionTimeoutActionTurnOff.

On success this function returns a new assertion.

149.1.7 CreateWithHandle(Handle as Integer) as IOPMAssertionMBS

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new object with retaining given handle.

149.1.8 CreateWithName(type as string, level as Integer, name as string) as IOPMAssertionMBS

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Dynamically requests a system behavior from the power management system.
Notes: Create is deprecated in favor of CreateWithProperties. Please use that version of this API instead.

No special privileges are necessary to make this call - any process may activate a power assertion. Caller must specify an AssertionName - "" is not a valid input.

Type	The String assertion type to request from the PM system.
Level	Pass kIOPMAssertionLevelOn or kIOPMAssertionLevelOff.
Name	A string that describes the name of the caller and the activity being handled by this assertion (e.g. "Mail Compacting Mailboxes"). Name may be no longer than 128 characters.

On success, returns an IOPMAssertionMBS object.

149.1.9 CreateWithProperties(AssertionProperties as Dictionary) as IOPMAssertionMBS

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an IOPMAssertion with more flexibility than CreateWithDescription.
Notes: AssertionProperties: Dictionary providing the properties of the assertion that need to be created. On successful return, returns the assertion.

Create a new PM assertion - the caller must specify the type of assertion, initial level, and its properties as IOPMAssertionDictionaryKeys keys in the AssertionProperties dictionary. The following keys are recommend and/or required to be specified in the AssertionProperties dictionary argument.

- Required kIOPMAssertionTypeKey define the assertion type.
- Required kIOPMAssertionValueKey define an inital value.
- Required kIOPMAssertionNameKey Caller must describe the name for the activity that requires the change in behavior provided by the assertion.
- Optional kIOPMAssertionDetailsKey Caller may describe context-specific data about the assertion.
- Optional kIOPMAssertionHumanReadableReasonKey Caller may describe the reason for creating the assertion in a localizable String. This should be a human readable phrase that describes the actions the calling process is taking while the assertion is held, like "Downloading TV episodes", or "Compiling Projects"
- Optional kIOPMAssertionLocalizationBundlePathKey Caller may provide its bundle's path, where OS X can localize for GUI display the String specified by kIOPMAssertionHumanReadableReasonKey.
- Optional kIOPMAssertionPlugInIDKey if the caller is a plugin with a different identity than the process it's loaded in.
- Optional kIOPMAssertionFrameworkIDKey if the caller is a framework acting on behalf of a process.
- Optional The caller may specify a timeout.

149.1.10 DeclareUserActivity(AssertionName as string, userType as Integer, byref AssertionID as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Declares that the user is active on the system.
Notes: This causes the display to power on and postpone display sleep up to the user's display sleep Energy Saver settings. If you prefer to hold the display awake for a longer period and you know how long you'd like to hold it, consider taking assertion kIOPMAssertionTypePreventUserIdleDisplaySleep using CreateWithDescription instead.

No special privileges are necessary to make this call - any process may call this API. Caller must specify an AssertionName.

AssertionName: A string that describes the name of the caller and the activity being handled by this assertion (e.g. "Mail Compacting Mailboxes"). Name may be no longer than 128 characters.
userType: This parameter specifies if the active user is located locally in front of the system or connected to the system over the network. Various components of the system are maintained at different power levels depending on user location.

On Success, unique id will be returned in this parameter. Caller may call this function again with the unique id retured previously to report continuous user activity. The unique id returned by this function may change on each call depending on how frequently this function call is repeated and the current display sleep timer value. If you make this call more than once, track the returned value for assertionID, and pass it in as an argument on each call.

Returns kIOReturnSuccess (0) on success, any other return indicates PM could not successfully activate the specified assertion.

149.1.11 Properties as Dictionary

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Copies details about an IOPMAssertion.
Notes: Returns a dictionary describing an IOPMAssertion's specifications and current state.

149.1.12 SetProperty(key as string, value as Variant) as boolean

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets a property in the assertion.
Example:

```
Var t as string = IOPMAssertionMBS.kIOPMAssertionTypePreventUserIdleDisplaySleep
Var l as Integer = IOPMAssertionMBS.kIOPMAssertionLevelOn
Var a as IOPMAssertionMBS = IOPMAssertionMBS.CreateWithName(t, l, "Working")
if a.SetProperty(IOPMAssertionMBS.kIOPMAssertionNameKey, "test") then
MessageBox a.name
end if
```

Notes: Only the process that created an assertion may change its properties.
key: The string key to modify.
Value: The property to set. It must be a number or string, as specified by the property key named in key.

Returns false on any error and true on success.

149.1.13 Properties

149.1.14 Details as String

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The details for this assertion.
Notes: You may provide extra, contextual information about an assertion for admins and for debugging in this key. Setting this key in an assertion dictionary is optional.

Please name your assertion something unique with kIOPMAssertionNameKey first.
If you have more data to describe this assertion, put it here as a String.

Example: OS X creates an assertion named com.apple.powermanagement.tty to prevent sleep for remote-logged in users. To identify the cause for these assertions, OS X sets kIOPMAssertionDetailsKey to the String device path of the active remote session(s), e.g. "/dev/ttys000" or "/dev/ttys004"

The String you associate with this key does not have to be localizable (OS X will not attempt to localize it.)
(Read and Write property)

149.1.15 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal handle to the assertion.
Notes: Zero is not a valid ID.
(Read only property)

149.1.16 HumanReadableReason as String

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Optional valie that provides a localizable string for OS X to display PM Assertions in the GUI.
Notes: The caller should specify this string in CreateWithProperties.
If present, OS X may display this string, localized to the user's language, to explain changes in system behavior caused by the assertion.

If set, the caller must also specify a bundle path for the key kIOPMAssertionLocalizationBundlePathKey.
The bundle at that path should contain localization info for the specified string.

(Read and Write property)

149.1.17 Level as Integer

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The assertion level.
Notes: (Read and Write property)

149.1.18 LocalizationBundlePath as String

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Refers to a string, identifying the path to the caller's bundle, which contains localization info.
Notes: (Read and Write property)

149.1.19 Name as String

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the assertion.
Example:

```
Var t as string = IOPMAssertionMBS.kIOPMAssertionTypePreventUserIdleDisplaySleep
Var l as Integer = IOPMAssertionMBS.kIOPMAssertionLevelOn
Var a as IOPMAssertionMBS = IOPMAssertionMBS.CreateWithName(t, l, "Working")
MessageBox a.Name
```

Notes: kIOPMAssertionNameKey describes the activity the assertion is protecting. The creator should specify a String value for this key in the dictionary passed to CreateWithProperties.

The assertion name is separate from the assertion type's behavior - specify a String like "Checking mail" or "Compiling" that describes the task that this assertion protects.

The String you associate with this key does not have to be localizable (OS X will not attempt to localize it.)
(Read and Write property)

149.1.20 RetainCount as Integer

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The retain count of the object.
Notes: (Read only property)

149.1.21 Timeout as Double

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Specifies an outer bound, in seconds, that this assertion should be asserted.
Notes: If your application hangs, or is unable to complete its assertion task in a reasonable amount of time, specifying a timeout allows PM to disable your assertion so the system can resume normal activity.
Once a timeout with the kIOPMAssertionTimeoutActionTurnOff assertion fires, the level will be set to kIOPMAssertionTimeoutActionTurnOff. The assertion may be re-armed by calling IOPMAssertionSetLevel.
(Read and Write property)

149.1.22 TimeoutAction as String

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Specifies the action to take upon timeout expiration.
Notes: Specifying the timeout action only has meaning if you also specify an kIOPMAssertionTimeoutKey. If the caller does not specify a timeout action, the default action is kIOPMAssertionTimeoutActionTurnOff.
(Read and Write property)

149.1.23 Type as String

MBS MacOSX Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The assertion type.
Notes: The value for this key will be a CFStringRef, with the value of the assertion type specified at creation time.
Note that OS X may substitute a support assertion type string if the caller specifies a deprecated assertion type; in that case the value for this key could differ from the caller-provided assertion type.
(Read and Write property)

149.1.24 Constants

Constants

Constant	Value	Description
kIOPMAssertionDetailsKey	"Details"	One of the keys for the properties You may provide extra, contextual and for debugging in this key. Se optional. Please name your assertion someth first. If you have more data to describe t Example: OS X creates an asserti to prevent sleep for remote-logged assertions, OS X sets kIOPMAsser the active remote session(s), e.g. " The String you associate with this will not attempt to localize it.) Describe your assertion as thoroug can you can set to add explanation * Optional kIOPMAssertionNameI * Optional kIOPMAssertionHuman * Optional kIOPMAssertionLocaliz
kIOPMAssertionFrameworkIDKey	"FrameworkBundleID"	One of the keys for the properties
kIOPMAssertionHumanReadableReasonKey	"HumanReadableReason"	One of the keys for the properties Optional key that provides a locali tions in the GUI. The caller should specify this strin If present, OS X may display this explain changes in system behavior If set, the caller must also specify a LocalizationBundlePathKey. The bundle at that path should con This key may be specified in the di This key may be present in the dic Describe your assertion as thoroug can you can set to add explanation * Required kIOPMAssertionNameI * Optional kIOPMAssertionDetails
kIOPMAssertionLevelKey	"AssertLevel"	One of the keys for the properties The Dictionary key for assertion le The value for this key will be an i or kIOPMAssertionLevelOn. The level reflects the assertion's l MAssertionSetLevel.
kIOPMAssertionLevelOff	0	Level for a disabled assertion, pass
kIOPMAssertionLevelOn	255	Level for an enabled assertion, pass
kIOPMAssertionLocalizationBundlePathKey	"BundlePath"	One of the keys for the properties Refers to a string, identifying the localization info.
kIOPMAssertionNameKey	"AssertName"	One of the keys for the properties The Dictionary key for assertion na creating an assertion. kIOPMAssertionNameKey describ The creator should specify a String to CreateWithProperties. The assertion name is separate fro String like "Checking mail" or "C assertion protects. The String you associate with this will not attempt to localize it.) Describe your assertion as thoroug can you can also set to add explan

User Activity Constants

Constant	Value	Description
kIOPMUserActiveLocal	0	User is local on the system
kIOPMUserActiveRemote	1	Remote User connected to the system.

149.2 class IOPMMBS

149.2.1 class IOPMMBS

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The Mac OS X class which can control the energy settings.
Example:

```
// This example needs a window with ListBox1.
Var p as new IOPMMBS

ListBox1.AddRow "EthernetWakeOnLANSettings: "+str(p.EthernetWakeOnLANSettings)
ListBox1.AddRow "GeneralAggressiveness: "+str(p.GeneralAggressiveness)
ListBox1.AddRow "MinutesToDim: "+str(p.MinutesToDim)
ListBox1.AddRow "MinutesToSleep: "+str(p.MinutesToSleep)
ListBox1.AddRow "MinutesToSpinDown: "+str(p.MinutesToSpinDown)
ListBox1.AddRow "MotionSensor: "+str(p.MotionSensor)
ListBox1.AddRow "PowerSource: "+str(p.PowerSource)
ListBox1.AddRow "SetProcessorSpeed: "+str(p.SetProcessorSpeed)
```

Notes: The functions and properties are not described from Apple.

149.2.2 Properties

149.2.3 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference for the power manager.
Notes: If this value is zero, the properties will not work.
(Read and Write property)

149.2.4 EthernetWakeOnLANSettings as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The setting for whether ethernet wake on LAN.
Notes: Value is 1 if you enable this option in the energy system control panel and 0 if you disable it.
(Read and Write computed property)

149.2.5 GeneralAggressiveness as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The general aggressiveness.
Notes: (Read and Write computed property)

149.2.6 MinutesToDim as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The minutes until the display is dimmed.
Example:

```
Var p as new IOPMMBS
p.MinutesToDim=10 // dim display in 10 minutes
```

Notes: This value is the same as in the energy system control panel.
(Read and Write computed property)

149.2.7 MinutesToSleep as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time in minutes until the Mac goes to sleep.
Example:

```
Var p as new IOPMMBS
p.MinutesToSleep=10 // sleep display in 10 minutes
```

Notes: (Read and Write computed property)

149.2.8 MinutesToSpinDown as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time in minutes until the hard discs spin down.
Notes: If you enable the spin down option in the energy system control panel, this value is 10 and if you disable it, it is 180.
(Read and Write computed property)

149.2.9 MotionSensor as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The setting for the motion sensor.
Notes: (Read and Write computed property)

149.2.10 PowerSource as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The power source settings.
Notes: Constants for this property:

const kIOPMInternalPower = 1
const kIOPMExternalPower = 2
(Read and Write computed property)

149.2.11 SetProcessorSpeed as Integer

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The setting for the processor speed.
Notes: (Read and Write computed property)

149.3 class IOPowerSourcesMBS

149.3.1 class IOPowerSourcesMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class to look on all the power sources on a Mac OS X based computer.
Example:

```
Var i as IOPowerSourcesMBS
Var j,n as Integer

i=new IOPowerSourcesMBS

n=i.Count-1
for j=0 to n
CFShowMBS i.Item(j) // Print battery info to console.
next
```

Notes: Requires Mac OS X.
Blog Entries

- MBS Xojo Plugins, version 17.3pr3
- MBS Xojo / Real Studio Plugins, version 16.4pr9

149.3.2 Methods

149.3.3 ExternalPowerAdapterDetails as CFDictionaryMBS

MBS MacCF Plugin, Plugin Version: 16.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a CFDictionary that describes the attached (AC) external power adapter (if any external power adapter is attached.
Example:

```
Var d as CFDictionaryMBS = IOPowerSourcesMBS.ExternalPowerAdapterDetails
Var dic as Dictionary = d.Dictionary

Var lines() as string
lines.Add "AdapterRevision: "+dic.Lookup("AdapterRevision", "")
lines.Add "AdapterID: "+dic.Lookup("AdapterID", "")
lines.Add "FamilyCode: "+dic.Lookup("FamilyCode", "")
lines.Add "SerialNumber: "+dic.Lookup("SerialNumber", "")
lines.Add "Watts: "+dic.Lookup("Watts", "")
```

MessageBox Join(lines, EndOfLine)

Notes: Returns a CFDictionary on success.
If no adapter is attached, or if there's an error, returns nil.

149.3.4 Item(index as Integer) as CFDictionaryMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Ask for the power source description with the given index.
Example:

```
Var i as new IOPowerSourcesMBS
i.Update
MessageBox i.Item(0).XML.Str // shows dictionary for first power source
```

Notes: Indes is from 0 to count-1.

149.3.5 Update

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries for new power sources and updates the item array.
Example:

```
Var i as new IOPowerSourcesMBS
i.Update
MessageBox str(i.Count)
```

149.3.6 Properties

149.3.7 Count as Integer

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The number of registered power sources.
Example:

```
Var i as new IOPowerSourcesMBS
i.Update
MessageBox str(i.Count)
```

Notes: (Read only property)

149.3.8 Events

149.3.9 Changed

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The state of one power source changed.
Notes: Whenever something changes around the power sources, you are notified with this event.

149.4 class SleepNotificationMBS

149.4.1 class SleepNotificationMBS

MBS MacOSX Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class to listen for sleep notifications on Mac OS X .
Example:

```
// save data when the Mac goes to sleep
// MySleepNotification is a subclass of SleepNotificationMBS with the Sleep event implemented.
// Sleeper is a property of the app: Sleeper As MySleepNotification
Sleeper = New MySleepNotification

// in MySleepNotification:
Function Sleep(message As Int64) As Boolean Handles Sleep
System.DebugLog "Sleep message " + Hex(message)
Return True // allow sleep
End Function
```

Notes: Uses IOKit.

Your application can use the sleep event to deny idle sleep, i.e. sleep after a period of inactivity. Applications should not deny idle sleep unless absolutely necessary.

The kIOMessage* constants in this class are declared in the Mac OS X headers, but they are not all used by the system.

In the plugins is the WakeNotifierMBS class and the SleepNotificationMBS class. WakeNotifierMBS uses the API coming from Mac OS and it can delay sleep. SleepNotificationMBS works on the lower Next APIs.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.1pr1

149.4.2 Properties

149.4.3 running as Boolean

MBS MacOSX Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether this notification class is working.
Notes: Value is true on MachO targets.
(Read and Write property)

149.4.4 Events

149.4.5 Sleep(message as int64) as boolean

MBS MacOSX Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: A message was received.
Notes: Use the constants to check what message you got.

Return true to deny or false to allow.

On the Can Messages the plugin informs the system about Deny or Allow, but on the Will messages, it will not answer if you return true, so the system will wait for an answer and delay sleep. There seems to be no way to delay more than 30 seconds when the user selects the sleep menu command.

The message parameter is an int64 in Plugin version 9.7 so the integer comparison to the constants works better.

149.4.6 Constants

Constants

Constant	Value	Description
kIOMessageCanSystemPowerOff	&he0000240	One of the message constants.
kIOMessageCanSystemSleep	&he0000270	One of the message constants. Idle sleep is about to kick in. Applications have a chance to prevent sleep by returning true in the sl Most applications should not prevent idle sleep. Power Management waits up to 30 seconds for you to either allow or sleep. If you don't acknowledge this power change by returning tru the system will wait 30 seconds then go to sleep.
kIOMessageSystemHasPoweredOn	&he0000300	One of the message constants.
kIOMessageSystemWillNotPowerOff	&he0000260	One of the message constants.
kIOMessageSystemWillNotSleep	&he0000290	One of the message constants.
kIOMessageSystemWillPowerOff	&he0000250	One of the message constants.
kIOMessageSystemWillPowerOn	&he0000320	One of the message constants.
kIOMessageSystemWillRestart	&he0000310	One of the message constants.
kIOMessageSystemWillSleep	&he0000280	One of the message constants.

149.5 class WakeNotifierMBS

149.5.1 class WakeNotifierMBS

MBS MacClassic Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Notification and statistics about sleeping off a Mac.
Example:

```
// get notified when the Mac goes to sleep and wakes up again
// MyWakeNotifier is a subclass of WakeNotifierMBS with the events implemented.
// Notifier is a property of the app: Notifier As MyWakeNotifier
Notifier = New MyWakeNotifier
Notifier.CallEvents = True

// in MyWakeNotifier:
Sub SleepDemand() Handles SleepDemand
System.DebugLog "Going to sleep, close network connections now."
End Sub

Sub WakeUp() Handles WakeUp
System.DebugLog "Woke up, slept " + SleepCount.ToString + " times so far."
End Sub
```

Notes: For Mac OS X 10.5.6 you see the SleepDemand and the WakeUp events when your Mac sleeps and wakes up.

In the plugins is the WakeNotifierMBS class and the SleepNotificationMBS class. WakeNotifierMBS uses the API coming from Mac OS and it can delay sleep. SleepNotificationMBS works on the lower Next APIs.

149.5.2 Properties

149.5.3 CallEvents as boolean

MBS MacClassic Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: whether or not to call the events of this class.
Notes: Default is false.
(Read and Write property)

149.5.4 DisableSleep as boolean

MBS MacClassic Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Disabled sleep if a sleep request comes?
Notes: Not used if you have code in the SleepRequest event handler.
(Read and Write property)

149.5.5 HadSleeped as boolean

MBS MacClassic Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sleeped since last reset?
Notes: You can set this value to false to reset it.
(Read and Write property)

149.5.6 LastSleepTime as Double

MBS MacClassic Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Last time in absolute seconds when falled asleep.
Notes: Changed type from integer to double in version 4.2.
Value is the same as in date.totalseconds.
(Read and Write property)

149.5.7 LastWakeTime as Double

MBS MacClassic Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Last time in absolute seconds when waken up.
Notes: Changed type from integer to double in version 4.2.
Value is the same as in date.totalseconds.
(Read and Write property)

149.5.8 SleepCount as Integer

MBS MacClassic Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Count of sleep demands.
Notes: (Read only property)

149.5.9 SleepEventCount as Integer

MBS MacClassic Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Counts how often the Power Manager calls the sleep notification function.
Notes: For debugging so you know that sleep requests are handled.
(Read and Write property)

149.5.10 Valid as boolean

MBS MacClassic Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns True if the sleep event handler could be installed.
Notes: False, if no Power Manager is installed.
(Read only property)

149.5.11 WakeCount as Integer

MBS MacClassic Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Count of waking up.
Notes: (Read only property)

149.5.12 Events

149.5.13 SleepDemand

MBS MacClassic Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Called just before falling asleep.

149.5.14 SleepRequest as boolean

MBS MacClassic Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Can be go sleeping?
Notes: Return true to deny sleeping.
Returning nothing or false will put the Mac to sleep.

149.5.15 SleepRevoke

MBS MacClassic Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Called when a sleep request was denied by an application or a device driver.

149.5.16 WakeUp

MBS MacClassic Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Called when the Mac wakes up.

149.6 class WindowsPowerStateMBS

149.6.1 class WindowsPowerStateMBS

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to watch for power changes on a computer using Microsoft Windows as operating system.
Example:

```
// get notified when Windows goes to sleep or the power source changes
// MyPowerState is a subclass of WindowsPowerStateMBS with the events implemented.
// Power is a property of the app: Power As MyPowerState
Power = New MyPowerState
Power.ListenForPowerSourceChanged

// in MyPowerState:
Sub Suspend() Handles Suspend
System.DebugLog "Going to sleep, save your data."
End Sub

Sub PowerSourceChanged(power As Integer) Handles PowerSourceChanged
System.DebugLog "Power source: " + power.ToString // 0 = battery, 1 = AC
End Sub
```

Notes: Not all Windows versions call the same/all events.
Your application needs to run the event loop, so events get delivered.

This function listens for WM_POWERBROADCAST sent to all applications.

see
https://msdn.microsoft.com/en-us/library/windows/desktop/aa373247(v=vs.85).aspx

You need to run ListenForSuspendResumeNotification to receive suspend/resume events.

See also WindowsPowerManagerMBS class.

149.6.2 Methods

149.6.3 ListenForBatteryCapacityChanged

MBS Win Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers for battery capacity change events.
Notes: Triggers BatteryCapacityChanged event later.

149.6.4 ListenForLidSwitchStateChanged

MBS Win Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers for lid switch state change events.
Notes: Triggers LidSwitchStateChanged event later.

149.6.5 ListenForPowerSourceChanged

MBS Win Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers for power source events.
Notes: Triggers PowerSourceChanged event later.

149.6.6 ListenForSuspendResumeNotification

MBS Win Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers for suspend and resume events.

149.6.7 Events

149.6.8 BatteryCapacityChanged(Percentage as Integer)

MBS Win Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The remaining battery capacity has changed.
Notes: The granularity varies from system to system but the finest granularity is 1 percent. The Percentage parameter that indicates the current battery capacity remaining as a percentage from 0 through 100.

149.6.9 BatteryLow

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The BatteryLow event is broadcast to notify applications that battery power is low.
Notes: Support for this event was removed in Windows Vista bei Microsoft.

149.6.10 LidSwitchStateChanged(LidState as Integer)

MBS Win Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The state of the lid has changed (open or closed).
Notes: The event won't be called until a lid device is found and its current state is known.

0 - The lid is closed.
1 - The lid is opened.

149.6.11 OEMEvent(eventcode as Integer)

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The OEMEvent event is broadcast when an APM BIOS signals an APM OEM event.
Notes: eventcode: A DWORD value that specifies the OEM-defined event code that was signaled by the system's APM BIOS. OEM event codes are in the range &h0200 - &h02FF.

Because not all APM BIOS implementations provide OEM event notifications, this event may never be broadcast on some computers.

Support for this event was removed in Windows Vista bei Microsoft.

149.6.12 PowerSettingChange(data as MemoryBlock)

MBS Win Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A power setting change event has been received.
Notes: This is the raw event with data.
We also call BatteryCapacityChanged, PowerSourceChanged and LidSwitchStateChanged events if their GUIDs are happening.

The data memoryblock contains POWERBROADCAST_SETTING data, where first 16 bytes are the GUID for the type of change. Then follows the 32-bit integer for data length and the data specific to the event.

see
https://learn.microsoft.com/en-us/windows/win32/api/winuser/ns-winuser-powerbroadcast_setting

149.6.13 PowerSourceChanged(power as Integer)

MBS Win Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The system power source has changed.
Notes: PowerSourceAC (0) - The computer is powered by an AC power source (or similar, such as a laptop powered by a 12V automotive adapter).
PowerSourceDC (1) - The computer is powered by an onboard battery power source.
PowerSourceUPS (2) - The computer is powered by a short-term power source such as a UPS device.

Only called if you called ListenForPowerSourceChanged once.

149.6.14 PowerStatusChange

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The PowerStatusChange event is broadcast when a change in the power status of the computer is detected, such as a switch from battery power to A/C.
Notes: The system also broadcasts this event when remaining battery power slips below the threshold specified by the user or if the battery power changes by a specified percentage.

149.6.15 QueryStandby(PromptUser as boolean) as boolean

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The QueryStandby event is broadcast to request permission to set the computer into standby mode.
Notes: An application that grants permission should carry out preparations for the suspension before returning.

PromptUser: If true, the application can prompt the user for directions on how to prepare for the suspension; otherwise, the application must prepare without user interaction.

Return true to deny the request, false to grant the request.

An application should process this event by first determining whether permission to go to standby mode can

be granted. It must not grant permission if doing so would cause a loss of data. The application can prompt the user for directions on how to prepare for suspension only if PromptUser is set.

The system allows approximately 20 seconds for an application to remove the message that is sending the QueryStandby event from the application's message queue. If an application does not remove the message from its queue in less then 20 seconds, the system will assume that the application is in a non-responsive state, and that the application agrees to the sleep request. Applications that do not process their message queues may have their operations interrupted. After it removes the message from the message queue, an application can take as much time as needed to perform any required operations before entering the sleep state. Any operations that could take longer then 20 seconds should be performed at this time, since the system allows only 20 seconds for operations to complete during standby processing.

149.6.16 QueryStandbyFailed

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The QueryStandbyFailed event is broadcast as a notification that permission to go to standby mode was denied.
Notes: This event is broadcast if any application or driver returned false to a previous QueryStandby event.

149.6.17 QuerySuspend(PromptUser as boolean) as boolean

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The QuerySuspend event is broadcast to request permission to suspend the computer.
Notes: An application that grants permission should carry out preparations for the suspension before returning.

PromptUser: If true, the application can prompt the user for directions on how to prepare for the suspension; otherwise, the application must prepare without user interaction.

Return true to deny the request, false to grant the request.

An application should process this event by first determining whether permission to suspend can be granted. It must not grant permission if doing so would cause a loss of data. The application can prompt the user for directions on how to prepare for suspension only if PromptUser is set.

The system allows approximately 20 seconds for an application to remove the message that is sending the QuerySuspend event from the application's message queue. If an application does not remove the message from its queue in less then 20 seconds, the system will assume that the application is in a non-responsive state, and that the application agrees to the sleep request. Applications that do not process their message queues may have their operations interrupted. After it removes the message from the message queue, an

application can take as much time as needed to perform any required operations before entering the sleep state. Any operations that could take longer then 20 seconds should be performed at this time, since the system allows only 20 seconds for operations to complete during Suspend processing.

Support for this event was removed in Windows Vista bei Microsoft.

149.6.18 QuerySuspendFailed

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The QuerySuspendFailed event is broadcast as a notification that permission to suspend the computer was denied.
Notes: This event is broadcast if any application or driver returned false to a previous QuerySuspend event.

Support for this event was removed in Windows Vista bei Microsoft.

149.6.19 ResumeAutomatic

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ResumeAutomatic event is broadcast when the computer wakes up automatically to handle an event.
Notes: An application will not generally respond unless it is handling the event, because the user is not present.

149.6.20 ResumeCritical

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ResumeCritical event is broadcast as a notification that the system has resumed operation.
Notes: This event can indicate that some or all applications did not receive a Suspend event. For example, this event can be broadcast after a critical suspension caused by a failing battery.

Support for this event was removed in Windows Vista bei Microsoft.

149.6.21 ResumeStandby

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ResumeStandby event is broadcast as a notification that the system has resumed operation after being put to standby.

149.6.22 ResumeSuspend

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ResumeSuspend event is broadcast as a notification that the system has resumed operation after being suspended.

149.6.23 Standby

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Standby event is broadcast immediately before the computer enters a standby state.
Notes: This event is typically broadcast when all applications and installable drivers have returned okay to a previous QueryStandby event.

149.6.24 Suspend

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Suspend event is broadcast immediately before the computer enters a suspended state.
Notes: This event is typically broadcast when all applications and installable drivers have returned okay to a previous QuerySuspend event.

149.6.25 Constants

Lid States

Constant	Value	Description
LidClosed	0	The lid is closed.
LidOpened	1	The lid is opened.

Power Source States

Constant	Value	Description
PowerSourceAC	0	The computer is powered by an AC power source (or similar, such as a laptop powered by a 12V automotive adapter).
PowerSourceDC	1	The computer is powered by an onboard battery power source.
PowerSourceUPS	2	The computer is powered by a short-term power source such as a UPS device.

Chapter 150

Printing iOS

150.1 class UIPrinterMBS

150.1.1 class UIPrinterMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A printer on the network.
Notes: You use a printer object to obtain information about a printer so that you can display that information in your app,Äôs interface. You do not use printer objects to communicate with the printer directly.

Most of the time, you use a UIPrinterPickerControllerMBS object to retrieve a printer object representing the printer selected by the user. If you already have a URL containing the address of a printer—perhaps one that was previously selected by the user—you can use that URL to create a printer object directly. When creating your own printer objects, you must connect to the printer using the contactPrinter method before retrieving any of the printer,Äôs attributes.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Xojo Developer Magazine

- 22.5, page 10: News
- 22.4, page 9: News

150.1.2 Methods

150.1.3 Constructor

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The private constructor.

150.1.4 contactPrinter

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Connects to the printer and gathers information about its capabilities.
Notes: Runs contactPrinterCompleted event later with result.

For printers you create yourself using the printerWithURL: method, you must call this method prior to accessing properties containing printer-related information. This method runs asynchronously, returning immediately while the system continues to try and gather information about the printer,Äôs name, location, capabilities, and so on. When the printer,Äôs availability is determined, the results are delivered to the event.

Calling this method can take a significantly long time (up to 30 seconds), so after calling this method you should continue with other tasks. Use your event to update your app as appropriate.

150.1.5 printerWithURL(URL as String) as UIPrinterMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Creates and returns a printer with the specified location.
Notes: url: A URL that identifies the location of the printer on your network.

Returns a printer object representing the specified printer or nil if there was a problem initializing the object.

Use this method to create printer objects for printers whose address you already know. The printer does not need to be online or available when you call this method. The URL you specify is stored in the returned object so that you can contact the printer later using the contactPrinter method.

150.1.6 Properties

150.1.7 displayLocation as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The human-readable text that describes the location of the printer.
Notes: Many printers can be configured with a location string to reflect the printer,Äôs physical location in an office. This property contains that location string or nil if no such string is available.

For printers you create yourself using the printerWithURL method, the value of this property is nil until you successfully connect to the printer using the contactPrinter method.
(Read only property)

150.1.8 displayName as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The human-readable printer name.
Notes: This property contains a printer name that is suitable for display in your app,Äôs user interface. For printers you create yourself using the printerWithURL method, the value of this property is nil until you successfully connect to the printer using the contactPrinter method.
(Read only property)

150.1.9 Handle as Integer

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

150.1.10 makeAndModel as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A string that contains the manufacturer,Äôs name and the model name of the printer.
Notes: The string in this property is provided by the printer and usually consists of the manufacturer,Äôs name, the model name of the printer, and the model number of the printer.

For printers you create yourself using the printerWithURL method, the value of this property is nil until you successfully connect to the printer using the contactPrinter method.

(Read only property)

150.1.11 supportedJobTypes as Integer

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The capabilities of the printer.
Notes: Job types indicate the types of operations you can perform with the printer. You might use this information when deciding whether or not to use a printer for a particular task. For example, a photo app might prevent a printer picker interface from displaying printers that do not support the UIPrinterJobTypePhoto job type.

For printers you create yourself using the printerWithURL method, the value of this property is JobTypeUnknown until you successfully connect to the printer using the contactPrinter method.
(Read only property)

150.1.12 supportsColor as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether the printer supports color printing.
Notes: The value of this property is true if the printer supports color printing or NO if it does not. For printers you create yourself using the printerWithURL method, the value of this property is false until you successfully connect to the printer using the contactPrinter method.
(Read only property)

150.1.13 supportsDuplex as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether the printer supports printing on both sides of a sheet of paper.
Notes: The value of this property is true if the printer supports double-sided printing or false if it does not. For printers you create yourself using the printerWithURL method, the value of this property is NO until you successfully connect to the printer using the contactPrinter method.
(Read only property)

150.1.14 URL as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The full address of the printer.
Notes: Use this property to retrieve the address of a printer on the network. You can also save the value in this property to disk and use it later to initialize a new printer object that points to the same printer.

e.g. "ipp://Laserdrucker.local.:631/ipp/print"
(Read only property)

150.1.15 Events

150.1.16 contactPrinterCompleted(available as Boolean)

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The event called from contactPrinter method.
Notes: available: True if the printer was available and its information was retrieved or false if the printer could not be found or was unavailable.

150.1.17 Constants

Job Types

Constant	Value	Description
JobTypeDocument	1	The printer supports standard document printing.
JobTypeEnvelope	2	The printer supports printing on envelopes.
JobTypeLabel	4	The printer supports printing on cut labels.
JobTypeLargeFormat	64	The printer supports printing larger than the ISO A3 size.
JobTypePhoto	8	The printer supports printing with photographic print quality.
JobTypePostcard	128	The printer supports printing on postcards.
JobTypeReceipt	16	The printer supports printing receipts on a continuous roll of paper.
JobTypeRoll	32	The printer supports printing documents or photos on a continuous roll of paper.
JobTypeUnknown	0	The printer support is unknown.

150.2 class UIPrinterPickerControllerMBS

150.2.1 class UIPrinterPickerControllerMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A view controller that displays the standard interface for selecting a printer.
Example:

```
Sub PickPrinter()
// your subclass to catch event
picker = New MyUIPrinterPickerControllerMBS
picker.Present
End Sub
```

Notes: You can use a printer picker controller to display a list of printers to the user prior to printing a document, photo, or other content. Printer pickers display all pickers normally but you can filter out printers by assigning an appropriate delegate object to the picker before displaying it.

- 22.4, page 9: News

150.2.2 Methods

150.2.3 Constructor(printer as UIPrinterMBS = nil)

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Creates and returns a printer picker with an initially selected printer object.
Notes: printer: A printer object to select initially. Specify nil if you do not want to display a selected printer initially.

After creating a printer picker controller, present the controller.

150.2.4 Destructor

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The destructor.

150.2.5 Dismiss

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Dismisses the picker.
Notes: This method dismisses a picker that you previously presented. When using this method to dismiss a picker, the picker does not call theWillDismiss or DidDismiss events.

User interactions with the picker can also dismiss the picker automatically. For example, if the user selects a printer or cancels the picker, the picker dismisses itself automatically. Use this method to dismiss a picker programmatically in response to other events in your app.

150.2.6 Present

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Presents the picker from a view controller of your app.
Example:

```
Sub PickPrinter()
picker = New MyUIPrinterPickerControllerMBS
picker.Present
End Sub
```

Notes: This method presents the picker from one of your app,Äôs view controllers and returns immediately.

After presenting the picker, the picker interface runs until the user or your app dismisses it. The picker interface provides ways for the user to cancel printing directly, all of which dismiss the picker. You can also dismiss the printer picker programmatically by calling the dismiss method.

150.2.7 Properties

150.2.8 Handle as Integer

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

150.2.9 isBeingPresented as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Whether the controller is currently presented.
Notes: (Read only property)

150.2.10 selectedPrinter as UIPrinterMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The selected printer.
Notes: The value of this property is set to the picker you specified at creation time initially. When the picker is dismissed, the value is updated to reflect the printer that the user selected, if any. If the user cancels the picker without selecting a printer, the value of this property does not change.
(Read only property)

150.2.11 Events

150.2.12 Completed(userDidSelect as Boolean, error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The event to execute when the picker is dismissed.
Example:

```
Class MyUIPrinterPickerControllerMBS Inherits UIPrinterPickerControllerMBS
Sub Completed(userDidSelect as Boolean, error as NSErrorMBS)
System.DebugLog CurrentMethodName+" "+userDidSelect.ToString

If error <>Nil Then
MessageBox error.LocalizedDescription
End If

If userDidSelect Then
Var p As UIPrinterMBS = Me.selectedPrinter

If p <>Nil Then

MainScreen.printer = p
```

```
MessageBox "You picked "+p.displayName+EndOfLine+p.printerID

End If
End If
End Sub
End Class
```

Notes: Use this block to receive information about the selected printer or information about any errors that occurred.

150.2.13 DidDismiss

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The printer picker was dismissed.
Notes: Use this method to perform any tasks associated with displaying the printer picker controller.

This method is called when the user dismisses the picker, either by selecting a printer or by canceling the picker interface. This method is not called when you dismiss the picker programmatically using the dismiss method.

150.2.14 DidPresent

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The printer picker was displayed and is now visible.
Notes: Use this method to perform any tasks associated with displaying the printer picker controller.

150.2.15 DidSelectPrinter

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A printer was selected.
Notes: Implement this event if you want to be notified of the selected printer. The selected printer can be either one that the user selected or the initially selected printer that you specified when creating your UIPrinterPickerControllerMBS object.

150.2.16 shouldShowPrinter(printer as UIPrinterMBS) as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Whether the specified printer should be included in the picker.
Notes: printer: The printer object to consider.

Return true if the printer should be displayed or false if it should not.

Implement this event if you want to filter the list of printers displayed by the printer picker interface. You might use this method to display only printers with specific capabilities. The printer picker interface calls this method once for each printer it is preparing to display, so your implementation should perform any required checks and return as quickly as possible. Do not perform any lengthy operations in this method.
If you do not implement this method, the picker interface displays all of the printers that it finds.

150.2.17 WillDismiss

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The printer picker is about to be dismissed.
Notes: Use this method to perform any tasks associated with displaying the printer picker controller.

This method is called when the user dismisses the picker, either by selecting a printer or by canceling the picker interface. This method is not called when you dismiss the picker programmatically using the dismiss method.

150.2.18 WillPresent

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The printer picker is about to be displayed.
Notes: Use this method to perform any tasks associated with displaying the printer picker controller.

150.3 class UIPrintInfoMBS

150.3.1 class UIPrintInfoMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The class for the print settings.
Example:

```
Var info As New UIPrintInfoMBS

info.outputType = info.OutputGrayscale
info.duplex = info.DuplexLongEdge
info.jobName = "testing"
```

Blog Entries

Xojo Developer Magazine

- 22.5, page 10: News
- 22.4, page 9: News

150.3.2 Methods

150.3.3 Constructor

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a print-information object initialized with default values.

150.3.4 copy as UIPrintInfoMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Creates a clone of the object.

150.3.5 printInfo as UIPrintInfoMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a print-information object initialized with default values.
Notes: An instance of UIPrintInfo or nil if the object could not be created.

150.3.6 printInfoWithDictionary(Dic as Dictionary) as UIPrintInfoMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a print-information object that is initialized with the data in the passed-in dictionary.
Notes: Dic: A dictionary that contains data to initialize the UIPrintInfo object with.

Returns an instance of UIPrintInfo or nil if the object could not be created.

You use the dictionary parameter to initialize a UIPrintInfoMBS object with stored print-job information. Some applications might archive a previous UIPrintInfoMBS object and use that for a future print job with this method.

You can later access the dictionary by calling the dictionaryRepresentation method on the UIPrintInfoMBS object.

150.3.7 Properties

150.3.8 dictionaryRepresentation as Dictionary

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A dictionary representation of a print-information object.
Example:

```
Var info As New UIPrintInfoMBS

info.outputType = info.OutputGrayscale
info.duplex = info.DuplexLongEdge
info.jobName = "testing"

Var dic As Dictionary = info.dictionaryRepresentation

Break
```

Notes: A dictionary representation of a UIPrintInfoMBS object that can be archived and used to create a

new UIPrintInfoMBS object. Returns nil if no dictionary can be created.
(Read only property)

150.3.9 duplex as Integer

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The duplex mode to use for the print job.
Example:

```
Var info As New UIPrintInfoMBS
info.duplex = info.DuplexLongEdge
```

Notes: Some printers can print either duplex (double-sided) or single-sided. If double-sided is selected, a printer can either print flipping the back page along the long edge of the paper or along the short edge. The default option for duplex-capable printers is based on document type: single-sided (none) for photos, double-sided and long edge for other documents. If a printer is capable of duplex printing, a switch in the printing options allows users to toggle between single-side and double-sided printing.
(Read and Write property)

150.3.10 Handle as Integer

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

150.3.11 jobName as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The name of the print job.
Notes: The name of the print job appears in the Print Center when the job is printing. An app should set this property to a name appropriate to the content that,Äôs printing. The default job name is the app name.
(Read and Write property)

150.3.12 outputType as Integer

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The kind of printable content.
Example:

```
Var info As New UIPrintInfoMBS
info.outputType = info.OutputGrayscale
```

Notes: The output type can be general, photo, or grayscale. An application can set this property to a value thats appropriate to the printable content. The default is OutputGeneral.

The output type controls the quality and default paper size used in printing. For example, if your application only prints black text, setting this property to OutputGrayscale can result in better performance in many cases.
(Read and Write property)

150.3.13 printerID as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: An identifier of the printer to use for the print job.
Notes: This property is set through user selection in the printing user interface. You may provide a printer ID as a hint (for example, the last printer used from a particular print job). The default value is "".

e.g. "Laserdrucker._ipp._tcp.local."
(Read and Write property)

150.3.14 Constants

Duplex

Constant	Value	Description
DuplexLongEdge	1	Duplex printing that flips the back page along the long edge of the paper.
DuplexNone	0	No double-sided (duplex) printing; single-sided printing only.
DuplexShortEdge	2	Duplex print that flips the back page along the short edge of the paper.

Output Types

Constant	Value	Description
OutputGeneral	0	Specifies that the printed content consists of mixed text, graphics, and images. The default paper is Letter, A4, or similar locale-specific designation. Output is normal quality, duplex.
OutputGrayscale	2	Specifies that the printed content is a grayscale image. Set the output type to this value when your printable content contains no color—for example, it,Äôs black text only. The default paper is Letter/A4. Output is high quality grayscale, duplex.
OutputPhoto	1	Specifies that the printed content consists of black-and-white or color images. The default paper is 4x6, A6, or similar locale-specific designation. Output is high quality, simplex.
OutputPhotoGrayscale	3	Specifies that the printed content is grayscale. Set the output type to this value when your printable content contains no color—for example, it,Äôs black text only. The default paper is Letter/A4. Output is grayscale quality, duplex. This content type can produce a performance improvement in some cases.

150.4 class UIPrintInteractionControllerMBS

150.4.1 class UIPrintInteractionControllerMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A user interface that manages the printing of documents, images, and other printable content in iOS.
Example:

```
Sub Pressed()
printController = New MyUIPrintInteractionControllerMBS

Var printinfo As New UIPrintInfoMBS
printinfo.outputType = printinfo.OutputGrayscale
printinfo.duplex = printinfo.DuplexLongEdge
printinfo.jobName = "testing"
printinfo.printerID = "Laserdrucker._ipp._tcp.local."

printController.showsNumberOfCopies = True
printController.printInfo = printinfo
printController.printingItem = LogoImageData

printController.Present
End Sub
```

Notes: UIPrintInteractionController is the central class for printing in iOS. The shared instance of it represents a print job. A print job includes the content to print and information and options related to its printing, such as output type, job name, paper size, and orientation.

If the showsPageRange property is true, the number of pages is more than 1, and you assign an object to any of these properties except for the printingItems property, the printing options include a control that allows users to select a page range.

When users tap a print button on the app,Äôs user interface, a controller object of the app should respond to the action message by obtaining the shared instance of UIPrintInteractionController and preparing it for the print job. When the app calls one of the present methods, UIPrintInteractionController displays a view containing printing options. This interface is simple, allowing users to select a printer, specify the number of copies and possibly a range of pages, and choose single-sided or double-sided printing (if the printer supports duplex printing). When users make their selections and tap Print, the print job begins.

150.4.2 Methods

150.4.3 canPrintData(data as MemoryBlock) as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a Boolean value that indicates whether UIKit can print the contents of a data object.
Example:

```
Var pic As Picture = LogoMBS(500)
Var data As MemoryBlock = pic.ToData(picture.Formats.JPEG)

If UIPrintInteractionControllerMBS.canPrintData(data) Then
MessageBox "Can print it"
Else
MessageBox "Can't print it"
End If
```

Notes: data: The memoryblock that contains PDF data or an image in a format supported by the Image I/O framework.

Returns true if UIKit can print the contents of the data object, otherwise false. The method returns false if data is PDF data that specifies that printing is not allowed.

You should call this method to test a data object prior to assigning it to printingItem or printingItems.

150.4.4 canPrintFile(File as FolderItem) as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a Boolean value that indicates whether UIKit can print the file that the specified URL references.
Example:

```
Var file As FolderItem = SpecialFolder.Resource("test.pdf")

If UIPrintInteractionControllerMBS.canPrintFile(file) Then
MessageBox "Can print it"
Else
```

```
MessageBox "Can't print it"
End If
```

Notes: url: An object representing a URL. Valid folderitem must use the file: or any scheme that can return an NSData object with a registered protocol. The file referenced by the URL must contain PDF data or an image in a format supported by the Image I/O framework. See View Programming Guide for iOS in View Programming Guide for iOS for a list of the supported image formats.

Return true if UIKit can print the contents of the referenced file, otherwise false. The method returns false if url references PDF data that specifies that printing is not allowed.

You should call this method to test the data referenced by a URL prior to assigning that URL to printingItem or printingItems.

150.4.5 canPrintURL(URL as string) as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a Boolean value that indicates whether UIKit can print the file that the specified URL references.
Notes: URL: An object representing a URL. Valid URLs must use the file: or any scheme that can return an NSData object with a registered protocol. The file referenced by the URL must contain PDF data or an image in a format supported by the Image I/O framework.

Returns ture if UIKit can print the contents of the referenced file, otherwise false. The method returns false if url references PDF data that specifies that printing is not allowed.

You should call this method to test the data referenced by a URL prior to assigning that URL to printingItem or printingItems.

150.4.6 Constructor

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The constructor.

150.4.7 Destructor

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The destructor.

150.4.8 Dismiss

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Dismisses the printing-options sheet or popover.
Notes: You should dismiss the printing options when they are presented in a sheet or animated from a rectangle and the user changes the orientation of the device. (This, of course, assumes your application responds to orientation changes.) You should then present the printing options again once the new orientation takes effect. You can observe the UIApplicationWillChangeStatusBarOrientationNotification notification to find out when the device orientation is about to change.

150.4.9 Present

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Presents the iPhone printing user interface in a sheet, optionally animating it to slide up from the bottom of the screen.
Notes: Calls Completed events later.

150.4.10 printableUTIs as String()

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a set of the Uniform Type Identifiers for the types of data that UIKit can print.
Notes: An array object that contains, as strings, the UTIs identifying data types that UIKit knows how to print natively.

150.4.11 printingItems as Variant()

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Queries the printing items.

150.4.12 printToPrinter(printer as UIPrinterMBS) as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Prints directly to the specified printer.
Notes: printer: The printer to use for printing. You can obtain a list of available printers using a UIPrinterPickerControllerMBS object.

Calls Completed event later.

Returns true if printing was successful or false if there was a problem.

This method starts the print job and displays the printing progress indicator to the user. This method associates the current printing information (available in the printInfo property) with the job but disables duplex printing. Upon completion of the print job, the print interaction controller executes the block in the completion parameter.

150.4.13 setPrintingItems(items() as Variant)

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Set the printing items.
Notes: You can pass an array of ready-to-print objects containing:

- NSURLMBS objects
- FolderItems
- MemoryBlocks
- Pictures
- NSImageMBS objects

Items are printed in array-index order. The array is released at the end of the print job. The default value is nil.

If you set this property, UIPrintInteractionController sets the printingItem, printPageRenderer, and printFormatter properties to nil. (Only one of these properties can be set for a print job.)

If this property is set, the printing options do not include the control for selecting a page range, even if the showsPageRange property is set to false. If you want page-range selection, you should use the printingItem property instead.

150.4.14 UIPrintErrorDomain as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The error domain used in the NSErrorMBS objects.

150.4.15 Properties

150.4.16 Handle as Integer

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

150.4.17 isBeingPresented as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Whether the controller is currently presented.
Notes: (Read only property)

150.4.18 printInfo as UIPrintInfoMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns an object that encapsulates information about the print job.
Notes: An instance of UIPrintInfo includes properties such as the print-job name, the printer identifier, the orientation of the printed content, the duplex mode, and the kind of content (general, photo, or grayscale). If you do not assign an instance of UIPrintInfo to this property, the UIKit printing system assumes defaults for many of these properties. Users can modify the selected printer and the duplex mode (if available on the printer). Once the printing options are presented, any changes to the UIPrintInfo object referenced by this property are ignored. The object is released when printing completes.
(Read and Write property)

150.4.19 printingAvailable as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether the device supports printing.
Notes: This value is true if the device supports printing, otherwise false. An application can show or hide

any print buttons based on this value.
(Read only property)

150.4.20 printingItem as Variant

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A single ready-to-print object.
Notes: You can assign:

- an NSURLMBS object
- a FolderItem
- a MemoryBlock
- a Picture
- a NSImageMBS object

The object must be an instance of (or convertible to) the NSURL, NSData, or UIImage class. An object of the first two types must reference or contain image data or PDF data. NSURL objects must use the file: or any scheme that can return an NSData object with a registered protocol. Image data (including that encapsulated by UIImage) must be in a format supported by the Image I/O framework;

The object is released at the end of the print job. The default value is nil.
If you set this property, UIPrintInteractionController sets the printingItems to nil. (You can only set one of these properties for a print job).

If this property is set and the showsPageRange property is set to truej—and the printing item is a PDF document of more than one page—the printing options include the control for selecting a page range.
(Read and Write property)

150.4.21 printPaper as UIPrintPaperMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: An object that represents the paper size and printing area for the print job.
Notes: UIPrintInteractionControllerMBS sets this property immediately after the user selects a printer and before it calls the WillStartJob event.
(Read only property)

150.4.22 showsNumberOfCopies as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A Boolean value that determines whether the printing options include the number of copies.
Notes: The default value is true.
(Read and Write property)

150.4.23 showsPaperOrientation as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether the printing options include the paper-orientation control.
Notes: The default value is true.
(Read and Write property)

150.4.24 showsPaperSelectionForLoadedPapers as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A Boolean value that determines whether the paper selection menu displays.
Notes: The default value of this property is false. Setting the value to true enables a paper selection menu on printers that support different types of paper and have more than one paper type loaded. On printers where only one paper type is available, no paper selection menu is displayed, regardless of the value of this property.
(Read and Write property)

150.4.25 Events

150.4.26 Completed(completed as Boolean, error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The print operation completed.
Example:

```
Class MyUIPrintInteractionControllerMBS Inherits UIPrintInteractionControllerMBS
Sub Completed(completed as Boolean, error as NSErrorMBS)
System.DebugLog CurrentMethodName+" "+completed.ToString

If error <>Nil Then
MessageBox error.LocalizedDescription
```

```
End If

Var printInfo As UIPrintInfoMBS = Self.printInfo

If printInfo <>Nil Then
System.DebugLog printInfo.printerID
End If
End Sub
End Class
```

Notes: When a print job concludes, you can reset any state set up for printing and do related housekeeping tasks. If the print job encountered an error, it is likely to be a programming error, so you might want to log the error for debugging purposes.

completed: A Boolean value that indicates whether the print job completed successfully.
error: An instance of the NSErrorMBS that contains information about the printing error. The printing domain is UIPrintErrorDomain. If the print job completes successfully, this parameter is nil.

150.4.27 DidDismissPrinterOptions

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The device is dismissing the printing-options user interface.
Notes: This message is sent both when the user taps Print on the printing-options view and when the user dismisses the view by tapping outside it.

150.4.28 DidFinishJob

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The print job has ended.
Notes: You can implement this method to do clean-up tasks related to the print job. This method is called after the last page of the print job is generated but before the Completed event is called.

150.4.29 DidPresentPrinterOptions

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The device has presented the printing-options user interface.

150.4.30 WillDismissPrinterOptions

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The device is about to dismiss the printing-options user interface.

150.4.31 WillPresentPrinterOptions

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The device is about to display the printing-options user interface.

150.4.32 WillStartJob

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The print job is about to start.
Notes: You can implement this method to do set-up tasks related to the print job. For example, an application that needs to do intensive rendering could implement this method to pause animations. This method is called before drawing begins but after the printing user interface is dismissed.

150.4.33 Constants

Print Errors

Constant	Value	Description
PrintingNotAvailableError	1	An image is in a format that UIKit doesn,Äôt recognize for printing.
PrintJobFailedError	4	An internal error occurred with the print job.
PrintNoContentError	2	UIKit hasn,Äôt assigned a print formatter, page renderer, or printing item to print.
PrintUnknownImageFormatError	3	Unknown image format.

150.5 class UIPrintPaperMBS

150.5.1 class UIPrintPaperMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The size of paper for a print job and the rectangular area that the content prints within.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 24.2
- MBS Xojo Plugins, version 24.2pr1

150.5.2 Methods

150.5.3 Constructor

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The private constructor.

150.5.4 Properties

150.5.5 Handle as Integer

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

150.5.6 paperHeight as Double

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The size of the sheet to use for printing.
Notes: The paper size is often associated with a standard designation, such as ,ÄúLetter,Äù and ,ÄúA4,Äù. For example, the paper size for a Letter sheet of paper is 612 points wide and 792 points high.
(Read only property)

150.5.7 paperWidth as Double

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The size of the sheet to use for printing.
Notes: The paper size is often associated with a standard designation, such as ,ÄúLetter,Äù and ,ÄúA4,Äù. For example, the paper size for a Letter sheet of paper is 612 points wide and 792 points high.
(Read only property)

150.5.8 printableRectHeight as Double

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The rectangle that represents the portion of the paper that can be imaged upon.
Notes: (Read only property)

150.5.9 printableRectLeft as Double

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The rectangle that represents the portion of the paper that can be imaged upon.
Notes: (Read only property)

150.5.10 printableRectTop as Double

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The rectangle that represents the portion of the paper that can be imaged upon.
Notes: (Read only property)

150.5.11 printableRectWidth as Double

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The rectangle that represents the portion of the paper that can be imaged upon.
Notes: (Read only property)

Chapter 151

Printing Mac

151.1 Globals

151.1.1 NewCPMPageFormatMBS as CPMPageFormatMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Creates a new page format object.
Notes: Returns nil on any error.

151.1.2 NewCPMPrintSessionMBS as CPMPrintSessionMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Creates a new print session object.
Example:

```
'get a print session

// print this PDF
Var pathPrinted as FolderItem=New FolderItem("test.pdf")

Var thePrintSession as CPMPrintSessionMBS = NewCPMPrintSessionMBS
if thePrintSession = nil then Return

'get default page format and print settings and attach it to the print settings
Var thePageFormat as CPMPageFormatMBS = NewCPMPageFormatMBS
Var thePrintSettings as CPMPrintSettingsMBS = NewCPMPrintSettingsMBS
thePrintSession.DefaultPageFormat thePageFormat
thePrintSession.DefaultPrintSettings thePrintSettings
```

```
'show the print dialog
if not thePrintSession.PrintDialog(thePrintSettings,thePageFormat) then return

'open the file which will be printed
Var thePdfDocument as CGPDFDocumentMBS = pathPrinted.OpenAsCGPDFDocumentMBS

' limit page counts to the one we have
Var LastPage as Integer = thePdfDocument.PageCount
if thePrintSettings.LastPage<lastpage then
lastpage=thePrintSettings.LastPage
end if

' you get better progress bar if you tell how many pages will come
thePrintSettings.LastPage=lastpage

'begin the printing
thePrintSession.BeginDocument(thePrintSettings, thePageFormat)

'loop over the number of copies
for currentCopy as Integer = 1 to thePrintSettings.Copies

'loop over the pages
for currentPage as Integer = thePrintSettings.FirstPage to LastPage

'prepage the page
Var PrintRect as CPMRectMBS =thePageFormat.AdjustedPageSize
Var CGRect as CGRectMBS =CGMakeRectMBS(PrintRect.left, PrintRect.top, PrintRect.Width, Print-
Rect.Height)
thePrintSession.BeginPage(thePageFormat, nil)
Var thePrintContext as CGContextMBS = thePrintSession.PageContext
if thePrintContext = Nil then return

'print the page
thePrintContext.DrawCGPDFDocument thePdfDocument, CGRect, currentPage

'end the page
thePrintContext = nil
thePrintSession.EndPage
next

next

'end the printing
thePrintSession.EndDocument
```

Notes: Returns nil on any error.

151.1.3 NewCPMPrintSettingsMBS as CPMPrintSettingsMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Creates a new print settings object.
Notes: Returns nil on any error.

151.2 class CPMLanguageInfoMBS

151.2.1 class CPMLanguageInfoMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a language info.
Notes: Only a data class.

151.2.2 Properties

151.2.3 Level as String

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The level string of the printer.
Notes: (Read and Write property)

151.2.4 Release as String

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The release string of the printer.
Notes: (Read and Write property)

151.2.5 Version as String

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The version string of the printer.
Notes: (Read and Write property)

151.3 class CPMPageFormatMBS

151.3.1 class CPMPageFormatMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a page format.
Example:

```
// show the paper size and orientation of the default page format
Var session As New CPMPrintSessionMBS
Var format As New CPMPageFormatMBS
session.DefaultPageFormat format

Var paper As CPMRectMBS = format.AdjustedPaperSize
Var landscape As Boolean = format.Orientation = CPMPageFormatMBS.kPMLandscape
MessageBox "Paper: " + Format(paper.Width, "0") + " x " + Format(paper.Height, "0") + " points" +
EndOfLine + _
"Landscape: " + landscape.ToString + EndOfLine + "Scale: " + format.Scale.ToString + "%"

// store it for later with format.CreateDataRepresentation
```

151.3.2 Methods

151.3.3 AdjustedPageSize as CPMRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The adjusted page size.
Notes: Lasterror is set.

151.3.4 AdjustedPaperSize as CPMRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The adjusted page size.
Notes: Lasterror is set.

151.3.5 Constructor

MBS MacCG Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new page format object.

151.3.6 CopySettings(Destination as CPMPageFormatMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Copies the settings to another pageformat object.

151.3.7 CreateDataRepresentation(Format as Integer = 0) as String

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Returns a data representation of a PMPageFormat object as a data string.
Example:

```
Var p as new CPMPageFormatMBS
p.orientation = p.kPMLandscape
Var d as string = p.CreateDataRepresentation
break // check in debugger
```

Notes: Use CreateWithDataRepresentation to create a CPMPageFormatMBS from a string created by this call.
Format can be kPMDataFormatXMLDefault, kPMDataFormatXMLMinimal or kPMDataFormatXMLCompressed.

151.3.8 CreateWithDataRepresentation(Data as String) as CPMPageFormatMBS

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Creates a PMPageFormat object from a data representation created with CreateDataRepresentation.
Example:

```
Var p as new CPMPageFormatMBS
p.orientation = p.kPMLandscape
Var d as string = p.CreateDataRepresentation

Var other as CPMPageFormatMBS = CPMPageFormatMBS.CreateWithDataRepresentation(d)
MessageBox str(other.Orientation)
```

Notes: Returns nil in case of error.

151.3.9 PrinterID as String

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Obtains the formatting printer for the pageformat.
Notes: Will either return the formatting printer for the pageformat or will return nil if the pageformat doesn't have that information.

151.3.10 UnadjustedPageSize as CPMRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The unadjusted page size.
Notes: Lasterror is set.

151.3.11 UnadjustedPaperSize as CPMRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The unadjusted page size.
Notes: Lasterror is set.

151.3.12 Properties

151.3.13 handle as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The handle for the page format.
Notes: It's a PMPageFormat which you find in CMTypes.h in the Toolbox.
(Read and Write property)

151.3.14 Lasterror as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The error code from the last command.
Notes: 0 if successful, -1 if function is not available or a required parameter was not set. Else a Mac OS error code.
(Read and Write property)

151.3.15 release as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: whether the destructor will release the handle.
Notes: (Read and Write property)

151.3.16 Orientation as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The page orientation.
Example:

```
Var p as new CPMPageFormatMBS
p.orientation = p.kPMLandscape
```

Notes: Lasterror is set.

Possible values:

kPMPortrait	1	
kPMLandscape	2	
kPMReversePortrait	3	will revert to kPortrait for current drivers
kPMReverseLandscape	4	will revert to kLandscape for current drivers

(Read and Write computed property)

151.3.17 Scale as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The page scaling.
Notes: Lasterror is set.
Value is 100 for 100%.
(Read and Write computed property)

151.3.18 Constants

Data Formats

Constant	Value	Description
kPMDataFormatXMLCompressed	2	kPMDataFormatXMLCompressed is only compatible and usable with Mac O X version 10.5 and later. Data in this format can be only be reconsistuted int the equivalent printing manager object with the appropriate PMXXXCreat WithDataRepresentation function. The data representation produced when u ing kPMDataFormatXMLCompressed is approximately 20 times smaller tha kPMDataFormatXMLDefault. This format is a good choice when executic on versions of Mac OS X prior to 10.5 is not necessary and the minimum dat size is important.
kPMDataFormatXMLDefault	0	Specifies a data format that is compatible with all Mac OS X versions. Dat in this format can be used with the PMUnflattenXXX routines present in a versions of Mac OS X prior to 10.5. However, this data representation is muc larger than the more modern data representations described below.
kPMDataFormatXMLMinimal	1	XMLMinimal is only compatible and usable with Mac OS X version 10.5 an later. Data in this format can be only be reconsistuted into the equivalent prin ing manager object with the appropriate CreateWithDataRepresentation fun tion. The data representation produced when using kPMDataFormatXMLMi imal is approximately 3-5 times smaller than kPMDataFormatXMLDefaul This format is a good choice when execution on versions of Mac OS X prior t 10.5 is not necessary and an uncompressed XML representation of the data needed.

Orientation Constants

Constant	Value	Description
kPMLandscape	2	Landscape
kPMPortrait	1	Portrait
kPMReverseLandscape	4	Reverse Landscape
kPMReversePortrait	3	Reverse Portrait

151.4 class CPMPrinterMBS

151.4.1 class CPMPrinterMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a printer.
Example:

```
// list the printers installed on this Mac
Var lines() As String
For Each printer As CPMPrinterMBS In CPMPrinterMBS.CreateLocalPrinterList
Var line As String = printer.Name + " (" + printer.MakeAndModelName + ")"
If printer.IsDefault Then line = line + " - default"
lines.Add line
Next

MessageBox String.FromArray(lines, EndOfLine)
```

Blog Entries

- MBS Real Studio Plugins, version 12.3pr5
- MonkeyBread Software Releases the MBS REALbasic plug-ins 9.2

151.4.2 Methods

151.4.3 Constructor(name as string)

MBS MacCG Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Initializes a new printer object given the printer name.
Notes: Raises exception if lookup fails.
This accepts both CUPS names and the Mac GUI names in printing control panel.

151.4.4 CreateFromPrinterID(PrinterID as String) as CPMPrinterMBS

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Create a PMPrinter instance from the supplied printerID.
Example:

```
Var p as CPMPrinterMBS = CPMPrinterMBS.CreateFromPrinterID("Brother_DCP_8085DN")
MessageBox p.name
```

151.4.5 CreateGenericPrinter as CPMPrinterMBS

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Creates a generic PMPrinter.

151.4.6 CreateLocalPrinterList as CPMPrinterMBS()

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Queries list of local printers.
Example:

```
Var a() as CPMPrinterMBS = CPMPrinterMBS.CreateLocalPrinterList
for each p as CPMPrinterMBS in a
MessageBox p.Name
next
```

151.4.7 DescriptionURL as string

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Returns the description URL for this printer.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MessageBox printer.DescriptionURL
```

Notes: Should be the path to a PPD file for a laser printer.
Lasterror is set.

151.4.8 DeviceURI as string

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Hand back the URI of the printer's device.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter
```

MessageBox printer.DeviceURI

Notes: On success returns a CFURLMBS object describing the printer's device.
Lasterror is set.

151.4.9 DriverCreator as String

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Returns a 4 letter code for the creator of the printer.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MessageBox "DriverCreator: "+str(printer.DriverCreator)
```

Notes: Lasterror is set.

151.4.10 DriverReleaseInfo as CPMVersionMBS

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Queries printer driver version.

151.4.11 HostName as string

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Hand back the host name of the print server hosting the printer's print queue.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MessageBox "HostName: "+str(printer.HostName)
```

Notes: Lasterror is set.

151.4.12 ID as string

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Returns the ID of the string.

151.4.13 IndexedPrinterResolution(index as Integer) as CPMResolutionMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Returns a printer resolution.
Notes: Lasterror is set.
Index is from 1 to ResolutionCount.

151.4.14 IsDefault as boolean

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Whether this printer is the default printer.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MessageBox "IsDefault: "+str(printer.IsDefault)
```

151.4.15 IsFavorite as boolean

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Return true if the printer is in the user's favorite printer list.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MessageBox "IsFavorite: "+str(printer.IsFavorite)
```

151.4.16 IsPostScriptCapable as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Can this printer do postscript?
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MessageBox "IsPostScriptCapable: "+str(printer.IsPostScriptCapable)
```

Notes: Lasterror is set.

151.4.17 IsPostScriptPrinter as boolean

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: If the result is true if the printer is a PostScript printer.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MessageBox "IsPostScriptPrinter: "+str(printer.IsPostScriptPrinter)
```

Notes: A PostScript printer is one whose driver takes PostScript directly.

151.4.18 IsRemote as boolean

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Hand back a boolean indicating whether the printer is hosted by remote print server.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MessageBox "IsRemote: "+str(printer.IsRemote)
```

Notes: If result is true, the print queue represents a printer hosted and managed by a remote print server.

If result is false, the print queue represents a directly connected printer, a network printer, or a remote printer that is locally managed. Consult the queue's device URI to determine the type of connection that is used to communicate with the printer.

Whether a printer is remote is derived from the CUPS printer-type attribute for the print queue.

151.4.19 LanguageInfo as CPMLanguageInfoMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Returns language information about the printer.
Notes: Lasterror is set.

151.4.20 Location as string

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Returns the location of the printer.

151.4.21 MakeAndModelName as string

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: A string with the name for the model and the maker.
Notes: Lasterror is set.
Returns "" on any error.

151.4.22 Name as string

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Returns the name of the string.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MessageBox printer.name
```

151.4.23 ResolutionCount as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Returns how much resolutions are supported by the printer.
Notes: Lasterror is set.

151.4.24 SetDefault

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Set the default printer for the current user.
Notes: It is not typical for an application to set the current default printer for the user; the printing system itself takes care of managing the default printer.
This function should be used only in rare circumstances.

Requires Mac OS X 10.5.

151.4.25 State as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Queries printer state.
Example:

```
Var p as CPMPrinterMBS = CPMPrinterMBS.CreateFromPrinterID("Brother_DCP_8085DN")
MessageBox str(p.State)
```

Notes: Can be kPMPrinterIdle, kPMPrinterProcessing or kPMPrinterStopped.

151.4.26 Properties

151.4.27 handle as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The handle for the printer.
Notes: It's a PMPrinter which you find in CMTypes.h in the Toolbox.
(Read and Write property)

151.4.28 Lasterror as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The error code from the last command.
Notes: 0 if successful, -1 if function is not available or a required parameter was not set. Else a Mac OS

error code.
(Read and Write property)

151.4.29 release as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: whether the destructor will release the handle.
Notes: (Read and Write property)

151.4.30 Constants

Printer States

Constant	Value	Description
kPMPrinterIdle	3	Printer is idle.
kPMPrinterProcessing	4	Printer is processing.
kPMPrinterStopped	5	Printer is stopped.

151.5 class CPMPrintSessionMBS

151.5.1 class CPMPrintSessionMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a print session.
Example:

```
// show the macOS print dialog and print one page with Core Graphics
Var session As New CPMPrintSessionMBS
Var settings As New CPMPrintSettingsMBS
Var format As New CPMPageFormatMBS
session.DefaultPrintSettings settings
session.DefaultPageFormat format

If Not session.PrintDialog(settings, format) Then Return // cancelled

session.BeginDocument(settings, format)
session.BeginPage(format, Nil)
Var g As CGContextMBS = session.PageContext
g.SetRGBFillColor(0, 0, 1)
g.FillRect CGRectMBS.Make(72, 72, 200, 100)
session.EndPage
session.EndDocument
```

Notes: Works only in Carbon Stuff and can only be used with CGContext which works only on Mac OS X.
Blog Entries

- MBS Real Studio Plugins, version 12.3pr5

151.5.2 Methods

151.5.3 BeginDocument(settings as CPMPrintSettingsMBS, pageformat as CPMPageFormatMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Begins a new document with the given settings.
Notes: Lasterror is set.

151.5.4 BeginDocumentNoDialog(settings as CPMPrintSettingsMBS, pageformat as CPMPageFormatMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Begins a new document with the given settings.
Notes: Doesn't use the print progress dialog.
Lasterror is set.

151.5.5 BeginPage(pageformat as CPMPageFormatMBS, rect as CPMRectMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Begins a new page.
Notes: Lasterror is set.

151.5.6 BeginPageNoDialog(pageformat as CPMPageFormatMBS, rect as CPMRectMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Begins a new page.
Notes: Doesn't use the print progress dialog.
Lasterror is set.

151.5.7 Constructor

MBS MacCG Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new print session object.

151.5.8 CreatePrinterList(list() as string)

MBS MacCG Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Creates a list of all printers.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS

Var list() as string
session.CreatePrinterList(list)
```

MessageBox join(list, EndOfLine)

Notes: List is an array of strings with the names of the printers.
Lasterror is set.
See also:

- 151.5.9 CreatePrinterList(list() as string, byref index as Integer, byref currentprinter as CPMPrinterMBS) 20198

151.5.9 CreatePrinterList(list() as string, byref index as Integer, byref currentprinter as CPMPrinterMBS)

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Creates a list of all printers.
Example:

Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS

Var list() as string
Var currentprinter as CPMPrinterMBS
Var index as Integer
session.CreatePrinterList(list, index, currentprinter)

MessageBox join(list, EndOfLine)

Notes: List is an array of strings with the names of the printers.
Index is the index of the current printer inside this list.
CurrentPrinter is the current printer selected.
Lasterror is set.
See also:

- 151.5.8 CreatePrinterList(list() as string) 20197

151.5.10 DefaultPageFormat(pageformat as CPMPageFormatMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Sets the page format object to the default settings.
Notes: Lasterror is set.

151.5.11 DefaultPrintSettings(printsettings as CPMPrintSettingsMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Sets the settings object to the default settings.
Notes: Lasterror is set.

151.5.12 EndDocument

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Ends the current document.
Notes: Lasterror is set.

151.5.13 EndDocumentNoDialog

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Ends the current document.
Notes: Doesn't use the print progress dialog.
Lasterror is set.

151.5.14 EndPage

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Ends the current page.
Notes: Lasterror is set.

151.5.15 EndPageNoDialog

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Ends the current page.
Notes: Doesn't use the print progress dialog.
Lasterror is set.

151.5.16 GetDestinationFormat(printsettings as CPMPrintSettingsMBS) as String

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Returns the destination format value.
Notes: Lasterror is set.

151.5.17 GetDestinationLocation(printsettings as CPMPrintSettingsMBS) as String

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Returns the destination location value.
Notes: Lasterror is set.

151.5.18 GetDestinationType(printsettings as CPMPrintSettingsMBS) as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Returns the destination type value.
Notes: Lasterror is set.

151.5.19 kPMDocumentFormatDefault as String

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the document format.

151.5.20 kPMDocumentFormatPDF as String

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the document format.

151.5.21 kPMDocumentFormatPostScript as string

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the document format.

151.5.22 kPMGraphicsContextCoreGraphics as string

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the graphics context.

151.5.23 kPMGraphicsContextDefault as string

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the graphics context.

151.5.24 PageContext as CGContextMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Creates a new CGContext object for the current page.
Notes: Lasterror is set.

151.5.25 PageSetupDialog(pageformat as CPMPageFormatMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Shows the page setup dialog.
Notes: Lasterror is set.

151.5.26 PrintDialog(settings as CPMPrintSettingsMBS, pageformat as CPMPageFormatMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Shows the print dialog.
Notes: Lasterror is set.

151.5.27 SetDestination(printsettings as CPMPrintSettingsMBS, desttype as Integer, destformat as String, desturl as String)

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Sets a new destination.
Notes: Some destinations so you may need to specify a format, else you can pass "" for the default format. Some destinations require a URL to a file.

Destination type codes:

kPMDestinationInvalid	0
kPMDestinationPrinter	1
kPMDestinationFile	2
kPMDestinationFax	3
kPMDestinationPreview	4

Destformat strings:

kPMDocumentFormatPDF	application/pdf
kPMDocumentFormatPICT	application/vnd.apple.printing-pict
kPMDocumentFormatPICTPS	application/vnd.apple.printing-pict-ps
kPMDocumentFormatPostScript	application/postscript

Lasterror is set.

151.5.28 UseSheets(docWindow as window)

MBS MacCG Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop only.

Function: Specifies that a printing dialog should be displayed as a sheet.
Notes: docWindow: The window to which the sheet dialog should be attached.
Lasterror is set. (-1 for the docWindow parameter being nil)

151.5.29 ValidatePageFormat(pageformat as CPMPageFormatMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Validates the page format.
Notes: Lasterror is set.

151.5.30 ValidatePrintSettings(printsettings as CPMPrintSettingsMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Validates the print settings.
Notes: Lasterror is set.

151.5.31 Properties

151.5.32 handle as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The handle for the print session.
Notes: It's a PMPrintSession which you find in CMTypes.h in the Toolbox.
(Read and Write property)

151.5.33 Lasterror as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The error code from the last command.
Notes: 0 if successful, -1 if function is not available or a required parameter was not set. Else a Mac OS error code.
(Read and Write property)

151.5.34 release as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: whether the destructor will release the handle.
Notes: (Read and Write property)

151.5.35 SheetTarget as Window

MBS MacCG Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop only.

Function: The window set by UseSheets.
Notes: This property is to reference the window used for the sheets so Xojo does not destroy the window too early.
(Read and Write property)

151.5.36 CurrentPrinter as CPMPrinterMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The current printer for this session.
Notes: Lasterror is set.
Setting this can only be done on Mac OS X.
(Read and Write computed property)

151.5.37 CurrentPrinterName as string

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The current printer for this session by name.
Notes: Lasterror is set.
(Read and Write computed property)

151.5.38 Events

151.5.39 SheetDone(WindowHandle as Integer, accepted as boolean)

MBS MacCG Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: This event is called for a finished print sheet.
Notes: Accepted is false if the cancel button was used. True if OK was clicked.

151.5.40 Constants

Destination Types

Constant	Value	Description
kPMDestinationFax	3	Fax
kPMDestinationFile	2	File
kPMDestinationInvalid	0	Invalid
kPMDestinationPreview	4	Preview
kPMDestinationPrinter	1	Printer
kPMDestinationProcessPDF	5	Process to PDF
kPMDestinationTypeDefault	1	Default is printer.

151.6 class CPMPrintSettingsMBS

151.6.1 class CPMPrintSettingsMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a print session.
Example:

```
// show the default print settings
Var session As New CPMPrintSessionMBS
Var settings As New CPMPrintSettingsMBS
session.DefaultPrintSettings settings

MessageBox "Printer: " + session.CurrentPrinterName + EndOfLine + _
"Copies: " + settings.Copies.ToString + EndOfLine + _
"Pages: " + settings.FirstPage.ToString + " to " + settings.LastPage.ToString + EndOfLine + _
"Duplex: " + settings.Duplex.ToString
```

151.6.2 Methods

151.6.3 Constructor

MBS MacCG Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new print settings object.

151.6.4 CopyPrintSettings(dest as CPMPrintSettingsMBS)

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Copes the settings to the other settings.

151.6.5 CreateDataRepresentation(Format as Integer = 0) as String

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Returns a data representation of a PMPageFormat object as a data string.
Example:

```
Var p as new CPMPrintSettingsMBS
p.Collate = true
p.Duplex = p.kPMDuplexTumble
```

```
Var data as string = p.CreateDataRepresentation
Break // check in debugger
```

151.6.6 CreateWithDataRepresentation(Data as String) as CPMPrintSettingsMBS

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Creates a PMPageFormat object from a data representation created with CreateDataRepresentation.

151.6.7 Dictionary as Dictionary

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Represent these print settings as a dictionary.

151.6.8 GetPageRange(byref minPage as UInt32, byref maxPage as UInt32)

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Queries the page range to print.
Notes: Obtains the valid range of pages that can be printed.
The default page range is 1 - (all pages). The page range is something that is set by the application. It is NOT the first and last page to print. It serves as limits for setting the first and last page.

151.6.9 Keys as String()

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Queries list of keys.
Example:

```
Var p as new CPMPrintSettingsMBS
p.Collate = true
p.Duplex = p.kPMDuplexTumble
Var keys() as string = p.keys
Break // check in debugger
```

151.6.10 SetPageRange(minPage as UInt32, maxPage as UInt32)

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Sets the page range to print.

151.6.11 Properties

151.6.12 handle as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The handle for the print settings.
Notes: It's a PMPrintSettings which you find in CMTypes.h in the Toolbox.
(Read and Write property)

151.6.13 Lasterror as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The error code from the last command.
Notes: 0 if successful, -1 if function is not available or a required parameter was not set. Else a Mac OS error code.
(Read and Write property)

151.6.14 release as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: whether the destructor will release the handle.
Notes: (Read and Write property)

151.6.15 Collate as boolean

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The collate setting.
Notes: (Read and Write computed property)

151.6.16 Copies as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The number of copies that the user requests to be printed.
Notes: Lasterror is set.
(Read and Write computed property)

151.6.17 Duplex as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The duplex setting.
Notes: (Read and Write computed property)

151.6.18 FirstPage as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The number of the first page to print.
Notes: Lasterror is set.
(Read and Write computed property)

151.6.19 JobName as String

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Specifies the name of a print job.
Notes: Lasterror is set.
(Read and Write computed property)

151.6.20 LastPage as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The number of the last page to print.
Example:

```
'get a print session

// print this PDF
Var pathPrinted as FolderItem=New FolderItem("test.pdf")
```

```
Var thePrintSession as CPMPrintSessionMBS = NewCPMPrintSessionMBS
if thePrintSession = nil then Return

'get default page format and print settings and attach it to the print settings
Var thePageFormat as CPMPageFormatMBS = NewCPMPageFormatMBS
Var thePrintSettings as CPMPrintSettingsMBS = NewCPMPrintSettingsMBS
thePrintSession.DefaultPageFormat thePageFormat
thePrintSession.DefaultPrintSettings thePrintSettings

'show the print dialog
if not thePrintSession.PrintDialog(thePrintSettings,thePageFormat) then return

'open the file which will be printed
Var thePdfDocument as CGPDFDocumentMBS = pathPrinted.OpenAsCGPDFDocumentMBS

' limit page counts to the one we have
Var LastPage as Integer = thePdfDocument.PageCount
if thePrintSettings.LastPage<lastpage then
lastpage=thePrintSettings.LastPage
end if

' you get better progress bar if you tell how many pages will come
thePrintSettings.LastPage=lastpage

'begin the printing
thePrintSession.BeginDocument(thePrintSettings, thePageFormat)

'loop over the number of copies
for currentCopy as Integer = 1 to thePrintSettings.Copies

'loop over the pages
for currentPage as Integer = thePrintSettings.FirstPage to LastPage

'prepage the page
Var PrintRect as CPMRectMBS =thePageFormat.AdjustedPageSize
Var CGRect as CGRectMBS =CGMakeRectMBS(PrintRect.left, PrintRect.top, PrintRect.Width, Print-
Rect.Height)
thePrintSession.BeginPage(thePageFormat, nil)
Var thePrintContext as CGContextMBS = thePrintSession.PageContext
if thePrintContext = Nil then return

'print the page
thePrintContext.DrawCGPDFDocument thePdfDocument, CGRect, currentPage

'end the page
thePrintContext = nil
thePrintSession.EndPage
```

```
next

next

'end the printing
thePrintSession.EndDocument
```

Notes: Lasterror is set.
(Read and Write computed property)

151.6.21 Value(key as String) as Variant

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The value in settings.
Example:

```
Var p as new CPMPrintSettingsMBS
p.Collate = true
Var value as Variant = p.value("com.apple.print.PrintSettings.PMCopyCollate")
Break // check in debugger
```

Notes: (Read and Write computed property)

151.6.22 Constants

Duplex Modes

Constant	Value	Description
kPMDuplexNone	1	Duplex off.
kPMDuplexNoTumble	2	Duplex with no tumble.
kPMDuplexTumble	3	Duplex with tumble.
kPMSimplexTumble	4	No duplex.

151.7 class CPMRectMBS

151.7.1 class CPMRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a rectangle.
Notes: Only a data class.

151.7.2 Properties

151.7.3 Bottom as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The bottom distance to the border.
Notes: (Read and Write property)

151.7.4 Height as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The height of the rectangle.
Notes: Setting the height changes the bottom property.
(Read and Write property)

151.7.5 Left as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The left distance to the border.
Notes: (Read and Write property)

151.7.6 Right as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The right distance to the border.
Notes: (Read and Write property)

151.7.7 Top as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The top distance to the border.
Notes: (Read and Write property)

151.7.8 Width as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The width of the rectangle.
Notes: Setting the height changes the right property.
(Read and Write property)

151.8 class CPMResolutionMBS

151.8.1 class CPMResolutionMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a resolution.
Notes: Only a data class.

151.8.2 Properties

151.8.3 Horizontal as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The horizontal resolution.
Notes: (Read and Write property)

151.8.4 Vertical as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The vertical resolution.
Notes: (Read and Write property)

151.9 class CPMVersionMBS

151.9.1 class CPMVersionMBS

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for version information.

151.9.2 Properties

151.9.3 CountryCode as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The country code.
Notes: (Read and Write property)

151.9.4 LongVersion as String

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The long version string.
Notes: (Read and Write property)

151.9.5 ShortVersion as String

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The short version string.
Notes: (Read and Write property)

151.9.6 VersionMajor as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The major version number.
Notes: (Read and Write property)

151.9.7 VersionMinor as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The minor version number.
Notes: (Read and Write property)

151.9.8 VersionRevision as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The reversion number.
Notes: (Read and Write property)

151.9.9 VersionStage as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The version stage.
Notes: (Read and Write property)

Chapter 152

Printing Windows

152.1 class WindowsAddPrintJobMBS

152.1.1 class WindowsAddPrintJobMBS

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to send raw data to a printer.
Example:

```
// Print Postscript directly to Postscript printer
const PrinterName = "Brother DCP-8085DN"

Var w as new WindowsAddPrintJobMBS

if not w.OpenPrinter(PrinterName) then
MessageBox "OpenPrinter failed. Is the printer name correct in the source code?"
Return
end if

const DocName = "My Document"

if not w.StartDocPrinter("My Document", w.kDataFormatRAW) then
MessageBox "StartDocPrinter failed."
Return
end if

MessageBox "Print Job ID: "+str(w.JobID)

call w.StartPagePrinter

Var PostScript as string = "%!PS"+EndOfLine.UNIX+".1 setgray"+EndOfLine.UNIX+"0 0 100 100 rect-
```

```
fill"+EndOfLine.UNIX+"showpage"+EndOfLine.UNIX

Var BytesSent as Integer = w.WritePrinter(PostScript)

MessageBox str(BytesSent)+" bytes of "+str(lenb(PostScript))+" bytes sent."

call w.EndPagePrinter
call w.EndDocPrinter

w = nil // close printer
```

Notes: Perfect for printing postscript data to a postscript printer.
You can use this class in several ways:

1. OpenPrinter, AddJob, WriteJob and ScheduleJob.
2. OpenPrinter, StartDocPrinter, StartPagePrinter, WritePrinter, EndPagePrinter, EndDocPrinter and ClosePrinter.
3. OpenPrinter, StartDocPrinter, WritePrinter, EndDocPrinter and ClosePrinter.

Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.2pr1
- More on printing on Windows
- MBS Plugins 10.3 Release Notes

152.1.2 Methods

152.1.3 AddJob as boolean

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new print job.
Notes: Returns true on success and false on failure.

152.1.4 ClosePrinter

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Closes printer connection.

152.1.5 EndDocPrinter as boolean

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The EndDocPrinter function ends a print job for the specified printer.
Notes: If the function succeeds, the return value is a true.

The EndDocPrinter function returns an error if the print job was not started by calling the StartDocPrinter function.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it may fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

152.1.6 EndPagePrinter as boolean

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The EndPagePrinter function notifies the print spooler that the application is at the end of a page in a print job.
Notes: If the function succeeds, the return value is a true.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error

message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

152.1.7 OpenPrinter(PrinterName as string) as boolean

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Opens the printer for printing.
Notes: Returns true on success and false on failure.
PrinterName can be "" for the default printer.

152.1.8 ScheduleJob as boolean

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Schedules the printing.
Notes: Returns true on success and false on failure.

152.1.9 StartDocPrinter(DocName as string, Datatype as string) as boolean

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The StartDocPrinter function notifies the print spooler that a document is to be spooled for printing.
Example:

```
// Print Postscript directly to Postscript printer
const PrinterName = "Brother DCP-8085DN"

Var w as new WindowsAddPrintJobMBS

if not w.OpenPrinter(PrinterName) then
MessageBox "OpenPrinter failed. Is the printer name correct in the source code?"
Return
end if

const DocName = "My Document"

if not w.StartDocPrinter("My Document", w.kDataFormatRAW) then
MessageBox "StartDocPrinter failed."
Return
end if
```

```
MessageBox "Print Job ID: "+str(w.JobID)

call w.StartPagePrinter

Var PostScript as string = "%!PS"+EndOfLine.UNIX+".1 setgray"+EndOfLine.UNIX+"0 0 100 100 rectfill"+EndOfLine.UNIX+"showpage"+EndOfLine.UNIX

Var BytesSent as Integer = w.WritePrinter(PostScript)

MessageBox str(BytesSent)+" bytes of "+str(lenb(PostScript))+" bytes sent."

call w.EndPagePrinter
call w.EndDocPrinter

w = nil // close printer
```

Notes: DocName: A string that specifies the name of the document.
OutputFile: Optional a path string or a folderitem that specifies the name of an output file. To print to a printer, set this to "" or nil or leave away.
Datatype: A string that identifies the type of data used to record the document.

If the function succeeds, the return value is true and the JobID property is set.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

- 152.1.11 StartDocPrinter(DocName as string, OutputFilePath as string, Datatype as string) as boolean 20223

152.1.10 StartDocPrinter(DocName as string, OutputFile as folderitem, Datatype as string) as boolean

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The StartDocPrinter function notifies the print spooler that a document is to be spooled for printing.
Example:

```
// Print Postscript directly to Postscript printer
const PrinterName = "Brother DCP-8085DN"

Var w as new WindowsAddPrintJobMBS

if not w.OpenPrinter(PrinterName) then
MessageBox "OpenPrinter failed. Is the printer name correct in the source code?"
Return
end if

const DocName = "My Document"

// output to a file
Var file as FolderItem = SpecialFolder.Desktop.Child("test.ps")

if not w.StartDocPrinter("My Document", file, w.kDataFormatRAW) then
MessageBox "StartDocPrinter failed."
Return
end if

MessageBox "Print Job ID: "+str(w.JobID)

call w.StartPagePrinter

Var PostScript as string = "%!PS"+EndOfLine.UNIX+".1 setgray"+EndOfLine.UNIX+"0 0 100 100 rect-
fill"+EndOfLine.UNIX+"showpage"+EndOfLine.UNIX

Var BytesSent as Integer = w.WritePrinter(PostScript)

MessageBox str(BytesSent)+" bytes of "+str(lenb(PostScript))+" bytes sent."

call w.EndPagePrinter
call w.EndDocPrinter

w = nil // close printer
```

Notes: DocName: A string that specifies the name of the document.
OutputFile: Optional a path string or a folderitem that specifies the name of an output file. To print to a printer, set this to "" or nil or leave away.

Datatype: A string that identifies the type of data used to record the document.

If the function succeeds, the return value is true and the JobID property is set.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

152.1.11 StartDocPrinter(DocName as string, OutputFilePath as string, Datatype as string) as boolean

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The StartDocPrinter function notifies the print spooler that a document is to be spooled for printing.
Example:

```
// Print Postscript directly to Postscript printer
const PrinterName = "Brother DCP-8085DN"

Var w as new WindowsAddPrintJobMBS

if not w.OpenPrinter(PrinterName) then
MessageBox "OpenPrinter failed. Is the printer name correct in the source code?"
Return
end if

const DocName = "My Document"
```

```
// output to a file
Var file as string = "C:\test.ps"

if not w.StartDocPrinter("My Document", file, w.kDataFormatRAW) then
MessageBox "StartDocPrinter failed."
Return
end if

MessageBox "Print Job ID: "+str(w.JobID)

call w.StartPagePrinter

Var PostScript as string = "%!PS"+EndOfLine.UNIX+".1 setgray"+EndOfLine.UNIX+"0 0 100 100 rectfill"+EndOfLine.UNIX+"showpage"+EndOfLine.UNIX

Var BytesSent as Integer = w.WritePrinter(PostScript)

MessageBox str(BytesSent)+" bytes of "+str(lenb(PostScript))+" bytes sent."

call w.EndPagePrinter
call w.EndDocPrinter

w = nil // close printer
```

Notes: DocName: A string that specifies the name of the document.
OutputFile: Optional a path string or a folderitem that specifies the name of an output file. To print to a printer, set this to "" or nil or leave away.
Datatype: A string that identifies the type of data used to record the document.

If the function succeeds, the return value is true and the JobID property is set.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.
See also:

- 152.1.9 StartDocPrinter(DocName as string, Datatype as string) as boolean 20220
- 152.1.10 StartDocPrinter(DocName as string, OutputFile as folderitem, Datatype as string) as boolean 20222

152.1.12 StartPagePrinter as boolean

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The StartPagePrinter function notifies the spooler that a page is about to be printed on the specified printer.
Notes: If the function succeeds, the return value is a true.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

152.1.13 WriteJob(data as string) as Integer

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds data to the spool file.
Notes: You need to pass raw data for the printer, e.g. postscript data.
Returns the number of bytes written.
So lenb(data) should be equal to the result.
Only available between a call to AddJob and ScheduleJob.

152.1.14 WritePrinter(data as string) as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WritePrinter function notifies the print spooler that data should be written to the specified printer.

Notes: data: The data that should be written to the printer.

If the function succeeds, the return value is a true.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a high-level document (such as an Adobe PDF or Microsoft Word file) or other printer data (such PCL, PS, or HPGL) is sent directly to a printer, the print settings defined in the document take precedent over Windows print settings.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

152.1.15 Properties

152.1.16 JobID as Integer

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The JobID of this print.
Notes: For information only.
Maybe be useful for the user to find this print job later.
(Read and Write property)

152.1.17 JobPath as String

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file name of the temporary file used.
Notes: Just for information and only available between a call to AddJob and ScheduleJob.
(Read and Write property)

152.1.18 lastError as Integer

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Zero for no error.
-1 if the plugin has a problem like invalid parameter or called on Mac/Linux.
others are Windows error codes.
(Read and Write property)

152.1.19 lastErrorMessage as String

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The localized text message for LastError property.
Notes: (Read and Write property)

152.1.20 PrinterHandle as Integer

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle to the printer.
Notes: (Read and Write property)

152.1.21 Constants

Constants

Constant	Value	Description
kDataFormatRAW	"RAW"	One of the data format constants. Use this constant if you send to both local and networked printers that us GDI-based printer drivers.
kDataFormatXPS_PASS	"XPS_PASS"	One of the data format constants. Use this constant to send printer control data directly to printers that us XPSDrv printer drivers.

152.2 class WindowsDeviceModeMBS

152.2.1 class WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for device modue information for a Windows printer.
Example:

```
Var d as new WindowsDeviceModeMBS
Var name as string = "My printer"

// here we define which values we want to change
d.Fields = d.DM_ORIENTATION
// and change value
d.Orientation = d.DMORIENT_PORTRAIT

Var w as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name)
if w.ChangePrinterSettings(d, 2) then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: Basicly this class wraps the Windows DEVMODE structure.

For more information on the DEVMODE structure, visit this website:
http://msdn.microsoft.com/en-us/library/dd183565(VS.85).aspx

152.2.2 Methods

152.2.3 ApplyToSetupString(SetupString as String) as string

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Applies current device mode to the given setup string.
Example:

```
Var p as new PrinterSetup

if p.PageSetupDialog then

Var w as WindowsDeviceModeMBS = WindowsDeviceModeMBS.FromSetupString(s)

w.Copies = 3
w.Fields = BitwiseOr(w.Fields, w.DM_COPIES)

Var s as string = w.SetupString
Var t as string = w.ApplyToSetupString(s)

Break // check

end if
```

Notes: The setup string contains a device mode and we replace the one from Xojo with our own. The other information is kept the same.

152.2.4 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new empty device mode.
Notes: Size is set for you to default name of the data structure.

152.2.5 FromRawData(data as memoryblock, Unicode as boolean = true) as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new WindowsDeviceModeMBS object with given data.
Notes: The data is expected to the in format of DEVMODEW structure with some extra data and the right values inside.
If Unicode is true, we use DEVMODEW and if Unicode is false, we use DEVMODEA structure.
See also:

- 152.2.6 FromRawData(data as string, Unicode as boolean = true) as WindowsDeviceModeMBS 20230

152.2.6 FromRawData(data as string, Unicode as boolean = true) as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new WindowsDeviceModeMBS object with given data.
Notes: The data is expected to the in format of DEVMODEW structure with some extra data and the right values inside.
If Unicode is true, we use DEVMODEW and if Unicode is false, we use DEVMODEA structure.
See also:

- 152.2.5 FromRawData(data as memoryblock, Unicode as boolean = true) as WindowsDeviceModeMBS 20230

152.2.7 FromSetupString(SetupString as String) as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 14.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Initialized DevMode object from setup string.
Example:

```
Var p as new PrinterSetup

// setup something
call p.PageSetupDialog

// now we have nice setupstring
Var ss as string = p.SetupString

// parse it in device mode
Var d as WindowsDeviceModeMBS = WindowsDeviceModeMBS.FromSetupString(ss)

// duplex is?
MessageBox "Duplex: "+str(d.Duplex)
```

```
// change printer
d.DeviceName = "Deskjet 2540 series#:2"

// enable duplex
d.Fields = BitwiseOr(d.Fields, d.DM_DUPLEX)
d.Duplex = d.DMDUP_HORIZONTAL

// now duplex is?
MessageBox "Duplex: "+str(d.Duplex)

// get back as setup string
Var da as string = d.SetupString

if da = "" then
MessageBox "failed to create setup string"
Return
end if

// assign back
p.SetupString = da

// take a look
call p.PageSetupDialog

// and print something
Var g as Graphics = OpenPrinter(p)

g.DrawString "Page 1", 20, 20
g.NextPage
g.DrawString "Page 2", 20, 20
```

Notes: You can pass string from PrinterSetup.SetupString.

Supports Xojo 2017r1 with 17.3 plugins.

152.2.8 RawData(Unicode as boolean = true) as memoryblock

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copies the raw data of the WindowsDeviceModeMBS class.
Notes: Returns nil on any error.
If Unicode is true, we use DEVMODEW and if Unicode is false, we use DEVMODEA structure.

152.2.9 SetupString(ActualHorizontalResolution as integer, ActualVerticalResolution as integer, MaxHorizontalResolution as integer, MaxVerticalResolution as integer, MarginLeft as integer = 2500, MarginRight as integer = 2500, MarginTop as integer = 2500, MarginBottom as integer = 2500, MinMarginLeft as integer = 0, MinMarginRight as integer = 0, MinMarginTop as integer = 0, MinMarginBottom as integer = 0, PageSetupFlags as integer = 8) as string

MBS Win Plugin, Plugin Version: 17.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a setup string from devmode.
Notes: This setupstring is empty on error.
If not empty, you can assign to PrinterSetup.SetupString.

Please pass reasonable flags.
Check existing SetupStrings from Xojo for possible values.
Resolution parameters can e.g. bei 72.

Supports Xojo 2017r1 with 17.3 plugins.
See also:

- 152.2.10 SetupString(Margin as Integer = 2500) as string 20232

152.2.10 SetupString(Margin as Integer = 2500) as string

MBS Win Plugin, Plugin Version: 14.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a setup string from devmode.
Example:

```
Var p as new PrinterSetup

// setup something
call p.PageSetupDialog

// now we have nice setupstring
Var ss as string = p.SetupString

// parse it in device mode
Var d as WindowsDeviceModeMBS = WindowsDeviceModeMBS.FromSetupString(ss)

// duplex is?
MessageBox "Duplex: "+str(d.Duplex)

// change printer
d.DeviceName = "Deskjet 2540 series#:2"
```

```
// enable duplex
d.Fields = BitwiseOr(d.Fields, d.DM_DUPLEX)
d.Duplex = d.DMDUP_HORIZONTAL

// now duplex is?
MessageBox "Duplex: "+str(d.Duplex)

// get back as setup string
Var da as string = d.SetupString

if da = "" then
MessageBox "failed to create setup string"
Return
end if

// assign back
p.SetupString = da

// take a look
call p.PageSetupDialog

// and print something
Var g as Graphics = OpenPrinter(p)

g.DrawString "Page 1", 20, 20
g.NextPage
g.DrawString "Page 2", 20, 20
```

Notes: This setupstring is empty on error.
If not empty, you can assign to PrinterSetup.SetupString.

Supports Xojo 2017r1 with 17.3 plugins.
See also:

- 152.2.9 SetupString(ActualHorizontalResolution as integer, ActualVerticalResolution as integer, MaxHorizontalResolution as integer, MaxVerticalResolution as integer, MarginLeft as integer = 2500, MarginRight as integer = 2500, MarginTop as integer = 2500, MarginBottom as integer = 2500, MinMarginLeft as integer = 0, MinMarginRight as integer = 0, MinMarginTop as integer = 0, MinMarginBottom as integer = 0, PageSetupFlags as integer = 8) as string 20232

152.2.11 Properties

152.2.12 Collate as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies whether collation should be used when printing multiple copies.
Notes: This member is ignored unless the printer driver indicates support for collation by setting the dmFields member to DM_COLLATE.
This member can be one of the following values:

Value	Meaning
DMCOLLATE_TRUE	Collate when printing multiple copies.
DMCOLLATE_FALSE	Do not collate when printing multiple copies.

(Read and Write property)

152.2.13 Color as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Switches between color and monochrome on color printers.
Notes: The following are the possible values:
DMCOLOR_COLOR
DMCOLOR_MONOCHROME
(Read and Write property)

152.2.14 Copies as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Selects the number of copies printed if the device supports multiple-page copies.
Example:

```
Var w as WindowsDeviceModeMBS // your device mode object

w.Copies = 3
w.Fields = BitwiseOr(w.Fields, w.DM_COPIES)
```

Notes: (Read and Write property)

152.2.15 Data as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The raw data pointer to the DEVMODEW structure.
Notes: (Read only property)

152.2.16 DefaultSource as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the paper source.
Notes: Use the DMBIN_* constants.
(Read and Write property)

152.2.17 DeviceName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the "friendly" name of the printer or display; for example, "PCL/HP LaserJet" in the case of PCL/HP LaserJet.
Notes: This string is unique among device drivers. Note that this name may be truncated to fit in the dmDeviceName field.
(Read and Write property)

152.2.18 DitherType as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies how dithering is to be done.
Notes: The member can be one of the following predefined values, or a driver-defined value greater than or equal to the value of DMDITHER_USER.

Value	Meaning
DMDITHER_NONE	No dithering.
DMDITHER_COARSE	Dithering with a coarse brush.
DMDITHER_FINE	Dithering with a fine brush.
DMDITHER_LINEART	Line art dithering, a special dithering method that produces well defined borders between black, white, and gray scaling. It is not suitable for images that include continuous graduations in intensity and hue, such as scanned photographs.
DMDITHER_GRAYSCALE	Device does gray scaling.

(Read and Write property)

152.2.19 DriverExtra as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Contains the number of bytes of private driver-data that follow this structure. If a device driver does not use device-specific information, set this member to zero.
Notes: (Read and Write property)

152.2.20 DriverVersion as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The driver version number assigned by the driver developer.
Notes: (Read and Write property)

152.2.21 Duplex as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Selects duplex or double-sided printing for printers capable of duplex printing.
Notes: Following are the possible values.

Value	Meaning
DMDUP_SIMPLEX	Normal (nonduplex) printing.
DMDUP_HORIZONTAL	Short-edge binding, that is, the long edge of the page is horizontal.
DMDUP_VERTICAL	Long-edge binding, that is, the long edge of the page is vertical.

(Read and Write property)

152.2.22 Fields as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies whether certain properties have been initialized.
Notes: If a property is initialized, its corresponding bit is set, otherwise the bit is clear. A driver supports only those properties that are appropriate for the printer or display technology.

Use the DM_* constants which match by name their property. So the DM_ORIENTATION bit value is related to the Orientation property.
(Read and Write property)

152.2.23 FormName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string array that specifies the name of the form to use; for example, "Letter" or "Legal".
Notes: A complete set of names can be retrieved by using the GetPrinterFormats function on the WindowsPrinterListMBS class.
(Read and Write property)

152.2.24 ICMIntent as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies which color matching method, or intent, should be used by default.
Notes: This member is primarily for non-ICM applications. ICM applications can establish intents by using the ICM functions. This member can be one of the following predefined values, or a driver defined value greater than or equal to the value of DMICM_USER.

Value	Meaning
DMICM_ABS_COLORIMETRIC	Color matching should optimize to match the exact color requested without white point mapping. This value is most appropriate for use with proofing.
DMICM_COLORIMETRIC	Color matching should optimize to match the exact color requested. This value is most appropriate for use with business logos or other images when an exact color match is desired.
DMICM_CONTRAST	Color matching should optimize for color contrast. This value is the most appropriate choice for scanned or photographic images when dithering is desired.
DMICM_SATURATE	Color matching should optimize for color saturation. This value is the most appropriate choice for business graphs when dithering is not desired.

(Read and Write property)

152.2.25 ICMMethod as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies how ICM is handled.
Notes: For a non-ICM application, this member determines if ICM is enabled or disabled. For ICM applications, the system examines this member to determine how to handle ICM support. This member can

be one of the following predefined values, or a driver-defined value greater than or equal to the value of DMICMMETHOD_USER.

Value	Meaning
DMICMMETHOD_NONE	Specifies that ICM is disabled.
DMICMMETHOD_SYSTEM	Specifies that ICM is handled by Windows.
DMICMMETHOD_DRIVER	Specifies that ICM is handled by the device driver.
DMICMMETHOD_DEVICE	Specifies that ICM is handled by the destination device.

The printer driver must provide a user interface for setting this member. Most printer drivers support only the DMICMMETHOD_SYSTEM or DMICMMETHOD_NONE value. Drivers for PostScript printers support all values.
(Read and Write property)

152.2.26 LogPixels as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of pixels per logical inch.
Notes: Printer drivers do not use this member.
(Read and Write property)

152.2.27 MediaType as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the type of media being printed on.
Notes: The member can be one of the following predefined values, or a driver-defined value greater than or equal to the value of DMMEDIA_USER.

Value	Meaning
DMMEDIA_STANDARD	Plain paper.
DMMEDIA_GLOSSY	Glossy paper.
DMMEDIA_TRANSPARENCY	Transparent film.

(Read and Write property)

152.2.28 Nup as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies where the NUP is done.
Notes: It can be one of the following.

Value	Meaning
DMNUP_SYSTEM	The print spooler does the NUP.
DMNUP_ONEUP	The application does the NUP.

(Read and Write property)

152.2.29 Orientation as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printer devices only, selects the orientation of the paper.
Example:

```
Var d as new WindowsDeviceModeMBS
Var name as string = "My printer"

// here we define which values we want to change
d.Fields = d.DM_ORIENTATION
// and change value
d.Orientation = d.DMORIENT_PORTRAIT

Var w as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name)
if w.ChangePrinterSettings(d, 2) then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: This member can be either DMORIENT_PORTRAIT (1) or DMORIENT_LANDSCAPE (2).
(Read and Write property)

152.2.30 PaperLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printer devices only, overrides the length of the paper specified by the PaperSize member, either for custom paper sizes or for devices such as dot-matrix printers that can print on a page of arbitrary length.
Notes: These values, along with all other values in this structure that specify a physical length, are in

tenths of a millimeter.
(Read and Write property)

152.2.31 PaperSize as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printer devices only, selects the size of the paper to print on.
Notes: This member can be set to zero if the length and width of the paper are both set by the PaperLength and PaperWidth members. Otherwise, the PaperSize member can be set to a device specific value greater than or equal to DMPAPER_USER or to one of the following predefined values with DMPAPER_* constants.
(Read and Write property)

152.2.32 PaperWidth as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printer devices only, overrides the width of the paper specified by the PaperSize member.
Notes: Unit is tenths of a millimeter.
(Read and Write property)

152.2.33 PrintQuality as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the printer resolution.
Notes: There are four predefined device-independent values:

DMRES_HIGH
DMRES_MEDIUM
DMRES_LOW
DMRES_DRAFT

If a positive value is specified, it specifies the number of dots per inch (DPI) and is therefore device dependent.
(Read and Write property)

152.2.34 Scale as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the factor by which the printed output is to be scaled.
Notes: The apparent page size is scaled from the physical page size by a factor of Scale /100. For example, a letter-sized page with a dmScale value of 50 would contain as much data as a page of 17- by 22-inches because the output text and graphics would be half their original height and width.
(Read and Write property)

152.2.35 Size as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the size, in bytes, of the DEVMODE structure, not including any private driver-specific data that might follow the structure's public members.
Notes: You don't need to set this field normally as the plugin does that for you.
(Read and Write property)

152.2.36 SpecVersion as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The version number of the initialization data specification on which the structure is based.
Notes: You don't need to set this field normally as the plugin does that for you.
(Read and Write property)

152.2.37 TTOption as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies how TrueType fonts should be printed.
Notes: This member can be one of the following values:

Value	Meaning
DMTT_BITMAP	Prints TrueType fonts as graphics. This is the default action for dot-matrix printers.
DMTT_DOWNLOAD	Downloads TrueType fonts as soft fonts. This is the default action for Hewlett-Packard printers that use Printer Control Language (PCL).
DMTT_DOWNLOAD_OUTLINE	Downloads TrueType fonts as outline soft fonts.
DMTT_SUBDEV	Substitutes device fonts for TrueType fonts. This is the default action for PostScript printers.

(Read and Write property)

152.2.38 YResolution as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the y-resolution, in dots per inch, of the printer.
Notes: If the printer initializes this member, the PrintQuality member specifies the x-resolution, in dots per inch, of the printer.
(Read and Write property)

152.2.39 Constants

Constants

Constant	Value	Description
DMBIN_AUTO	7	One of the source bin constants. Auto
DMBIN_CASSETTE	14	One of the source bin constants. Cassette
DMBIN_ENVELOPE	5	One of the source bin constants. Envelope
DMBIN_ENVMANUAL	6	One of the source bin constants. Envelope Manual.
DMBIN_FORMSOURCE	15	One of the source bin constants. Form Source.
DMBIN_LARGECAPACITY	11	One of the source bin constants. Large Capacity
DMBIN_LARGEFMT	10	One of the source bin constants. Large Format
DMBIN_LOWER	2	One of the source bin constants. Lower
DMBIN_MANUAL	4	One of the source bin constants. Manual
DMBIN_MIDDLE	3	One of the source bin constants. Middle
DMBIN_ONLYONE	1	One of the source bin constants. Only One.
DMBIN_SMALLFMT	9	One of the source bin constants. Small Format
DMBIN_TRACTOR	8	One of the source bin constants. Tractor
DMBIN_UPPER	1	One of the source bin constants. Upper
DMBIN_USER	256	One of the source bin constants. User
DMCOLLATE_FALSE	0	One of the collate mode constants. Do not collate when printing multiple copies
DMCOLLATE_TRUE	1	One of the collate mode constants. Collate when printing multiple copies.
DMCOLOR_COLOR	2	One of the color mode constants. Color
DMCOLOR_MONOCHROME	1	One of the color mode constants. Monochrome.
DMDITHER_COARSE	2	One of the dither constants. Dithering with a coarse brush.
DMDITHER_ERRORDIFFUSION	5	One of the dither constants.
DMDITHER_FINE	3	One of the dither constants. Dithering with a fine brush.
DMDITHER_GRAYSCALE	10	One of the dither constants. Device does gray scaling.
DMDITHER_LINEART	4	One of the dither constants. Line art dithering, a special dithering metho ders between black, white, and gray scalin that include continuous graduations in intens tographs.
DMDITHER_NONE	1	One of the dither constants. No dithering.
DMDITHER_RESERVED6	6	One of the dither constants.
DMDITHER_RESERVED7	7	One of the dither constants.
DMDITHER_RESERVED8	8	One of the dither constants.
DMDITHER_RESERVED9	9	One of the dither constants.
DMDITHER_USER	256	One of the dither constants.
DMDUP_HORIZONTAL	3	One of the duplex mode constants.

152.3 class WindowsGraphicsInfoMBS

152.3.1 class WindowsGraphicsInfoMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class gives information for Windows Device contexts.
Example:

```
Var g as Graphics = OpenPrinter
Var info as WindowsGraphicsInfoMBS = g.WindowsGraphicsInfoMBS

MessageBox _
"Printer physical page size: "+str(info.PhysicalWidth)+" "+str(info.PhysicalHeight)+_
EndOfLine+_
"Useable paper size: "+str(info.ResolutionX)+ " x "+str(info.ResolutionY)+_
EndOfLine+_
"Paper size: "+str(info.SizeX)+" x "+str(info.Sizey)+" mm"
```

Notes: Main use currently is to learn about native resolution of a printer graphics object.

152.3.2 Methods

152.3.3 Constructor

MBS Win Plugin, Plugin Version: 18.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Initializes properties for main screen.
See also:

- 152.3.4 Constructor(c as control) 20245
- 152.3.5 Constructor(c as DesktopControl) 20245
- 152.3.6 Constructor(g as graphics) 20245

- 152.3.7 Constructor(p as Picture) 20246
- 152.3.8 Constructor(w as DesktopWindow) 20246
- 152.3.9 Constructor(w as window) 20247

152.3.4 Constructor(c as control)

MBS Win Plugin, Plugin Version: 18.3, Platform: Windows, Targets: Desktop only.

Function: Initializes properties for this control object.
See also:

- 152.3.3 Constructor 20244
- 152.3.5 Constructor(c as DesktopControl) 20245
- 152.3.6 Constructor(g as graphics) 20245
- 152.3.7 Constructor(p as Picture) 20246
- 152.3.8 Constructor(w as DesktopWindow) 20246
- 152.3.9 Constructor(w as window) 20247

152.3.5 Constructor(c as DesktopControl)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Initializes properties for this control object.
See also:

- 152.3.3 Constructor 20244
- 152.3.4 Constructor(c as control) 20245

152.3.10 Properties

152.3.11 AspectX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Relative width of a device pixel used for line drawing.
Notes: (Read and Write property)

152.3.12 AspectXY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Diagonal width of the device pixel used for line drawing.
Notes: (Read and Write property)

152.3.13 AspectY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Relative height of a device pixel used for line drawing.
Notes: (Read and Write property)

152.3.14 BitsPerPixel as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of adjacent color bits for each pixel.
Example:

```
Var p as new Picture(200, 200, 32)
Var info as new WindowsGraphicsInfoMBS(p.Graphics)

MessageBox "Color Depth: "+str(info.BitsPerPixel)
```

Notes: As example gives a display device context, the bits per pixel is the screen depth.
(Read and Write property)

152.3.15 BrushesCount as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of device-specific brushes.
Notes: (Read and Write property)

152.3.16 ColorCount as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of entries in the device's color table, if the device has a color depth of no more than 8 bits per pixel.
Notes: For devices with greater color depths, 1 is returned.
(Read and Write property)

152.3.17 DesktopResolutionX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Horizontal width of entire desktop in pixels.
Example:

```
Var p as new Picture(200, 200, 32)
Var info as new WindowsGraphicsInfoMBS(p.Graphics)

MessageBox "Size of Windows Desktop: "+str(info.DesktopResolutionX)+ " x "+str(info.DesktopResolutionY)
```

Notes: (Read and Write property)

152.3.18 DesktopResolutionY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Vertical height of entire desktop in pixels.
Example:

```
Var p as new Picture(200, 200, 32)
Var info as new WindowsGraphicsInfoMBS(p.Graphics)

MessageBox "Size of Windows Desktop: "+str(info.DesktopResolutionX)+ " x "+str(info.DesktopResolutionY)
```

Notes: (Read and Write property)

152.3.19 DriverVersion as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device driver version.
Notes: (Read and Write property)

152.3.20 FontCount as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of device-specific fonts.
Notes: (Read and Write property)

152.3.21 LogPixelsX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of pixels per logical inch along the screen width.
Example:

```
Var g as Graphics = OpenPrinter
Var info as WindowsGraphicsInfoMBS = g.WindowsGraphicsInfoMBS
```

MessageBox "Printer resolution: "+str(info.LogPixelsX)+" x "+str(info.LogPixelsY)

Notes: In a system with multiple display monitors, this value is the same for all monitors.
(Read and Write property)

152.3.22 LogPixelsY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of pixels per logical inch along the screen height.
Example:

Var g as Graphics = OpenPrinter
Var info as WindowsGraphicsInfoMBS = g.WindowsGraphicsInfoMBS

MessageBox "Printer resolution: "+str(info.LogPixelsX)+" x "+str(info.LogPixelsY)

Notes: In a system with multiple display monitors, this value is the same for all monitors.
(Read and Write property)

152.3.23 MakersCount as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of markers the device has.
Notes: (Read and Write property)

152.3.24 PenCount as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of device-specific pens.
Notes: (Read and Write property)

152.3.25 PhysicalHeight as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printing devices: the height of the physical page, in device units.
Notes: For example, a printer set to print at 600 dpi on 8.5-by-11-inch paper has a physical height value of

6600 device units. Note that the physical page is almost always greater than the printable area of the page, and never smaller.
(Read and Write property)

152.3.26 PhysicalOffsetX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printing devices: the distance from the left edge of the physical page to the left edge of the printable area, in device units.
Notes: For example, a printer set to print at 600 dpi on 8.5-by-11-inch paper, that cannot print on the leftmost 0.25-inch of paper, has a horizontal physical offset of 150 device units.
(Read and Write property)

152.3.27 PhysicalOffsetY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printing devices: the distance from the top edge of the physical page to the top edge of the printable area, in device units.
Notes: For example, a printer set to print at 600 dpi on 8.5-by-11-inch paper, that cannot print on the topmost 0.5-inch of paper, has a vertical physical offset of 300 device units.
(Read and Write property)

152.3.28 PhysicalWidth as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printing devices: the width of the physical page, in device units.
Notes: For example, a printer set to print at 600 dpi on 8.5-x11-inch paper has a physical width value of 5100 device units. Note that the physical page is almost always greater than the printable area of the page, and never smaller.
(Read and Write property)

152.3.29 Planes as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of color planes.
Notes: (Read and Write property)

152.3.30 ResolutionX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Width, in pixels, of the screen; or for printers, the width, in pixels, of the printable area of the page.
Notes: (Read and Write property)

152.3.31 ResolutionY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Height, in raster lines, of the screen; or for printers, the height, in pixels, of the printable area of the page.
Notes: (Read and Write property)

152.3.32 ScalingFactorX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scaling factor for the x-axis of the printer.
Notes: (Read and Write property)

152.3.33 ScalingFactorY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scaling factor for the y-axis of the printer.
Notes: (Read and Write property)

152.3.34 SizeX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Width, in millimeters, of the physical screen.
Notes: (Read and Write property)

152.3.35 SizeY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Height, in millimeters, of the physical screen.
Notes: (Read and Write property)

152.3.36 Technology as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Device technology. It can be any one of the kTechnology* constants.
Notes: (Read and Write property)

152.3.37 VRefresh as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: For display devices: the current vertical refresh rate of the device, in cycles per second (Hz).
Notes: (Read and Write property)

152.3.38 Constants

Technology Constants

Constant	Value	Description
kTechnologyCharStream	4	Character stream
kTechnologyDisplayFile	6	Display file
kTechnologyMetaFile	5	Metafile
kTechnologyPlotter	0	Vector plotter
kTechnologyRasterCamera	3	Raster camera
kTechnologyRasterDisplay	1	Raster display
kTechnologyRasterPrinter	2	Raster printer

152.4 class WindowsPageFormatMBS

152.4.1 class WindowsPageFormatMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a page format.
Example:

```
// change the printer name to your printer's name
Var w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)
Var formats(-1) as WindowsPageFormatMBS = w.GetPrinterFormats

for each p as WindowsPageFormatMBS in formats
MessageBox p.Name
next
```

Notes: This class wraps the FORM_INFO_1 structure. You can find more information here:
http://msdn.microsoft.com/en-us/library/dd144836(v=VS.85).aspx
Blog Entries

- MBS Real Studio Plugins, version 12.1pr1

152.4.2 Properties

152.4.3 DisplayName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The form's display name in the language specified by LangId.
Notes: Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

152.4.4 Flags as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The flags for this page format.
Notes: The following values are defined.

(Read and Write property)

Value	Meaning
FORM_USER	If this bit flag is set, the form has been defined by the user. Forms with this flag set are defined in the registry.
FORM_BUILTIN	If this bit-flag is set, the form is part of the spooler. Form definitions with this flag set do not appear in the registry.
FORM_PRINTER	If this bit flag is set, the form is associated with a certain printer, and its definition appears in the registry.

152.4.5 ImageableAreaBottom as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The imageable area, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

152.4.6 ImageableAreaHeight as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The imageable area, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

152.4.7 ImageableAreaLeft as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The imageable area, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

152.4.8 ImageableAreaRight as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The imageable area, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

152.4.9 ImageableAreaTop as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The imageable area, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

152.4.10 ImageableAreaWidth as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The imageable area, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

152.4.11 Keyword as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A non-localizable string identifier of the form.
Notes: When passed to AddForm or SetForm, this gives the caller a means of identifying the form in all locales.
Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

152.4.12 LangId as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The language of the DisplayName.
Notes: Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

152.4.13 Mode as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The mode.
Notes: Value can be 1 (Windows 2000 and newer) or 2 (Windows Vista and newer).
(Read and Write property)

152.4.14 MuiDll as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Multilingual User Interface localized resource DLL that contains the localized display name.
Notes: Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

152.4.15 Name as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the form.
Notes: (Read and Write property)

152.4.16 ResourceId as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The resource ID of the form's display name in MuiDll.
Notes: Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

152.4.17 SizeHeight as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

152.4.18 SizeWidth as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

152.4.19 StringType as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies how a localized display name for the form is obtained at runtime.
Notes: The following values are defined. Only one can be set in any given call to AddForm or SetForm. Both STRING_MUIDLL and STRING_LANGPAIR can be set in the WindowsPageFormatMBS (s) returned by

GetForm or GetPrinterFormats.

Can be STRING_LANGPAIR, STRING_MUIDLL or STRING_NONE.
Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

152.4.20 Constants

Constants

Constant	Value	Description
FORM_BUILTIN	1	One of the flag constants. If this bit-flag is set, the form is part of the spooler. Form definitions with this flag set do not appear in the registry.
FORM_PRINTER	2	One of the flag constants. If this bit flag is set, the form is associated with a certain printer, and its definition appears in the registry.
FORM_USER	0	One of the flag constants. If this bit flag is set, the form has been defined by the user. Forms with this flag set are defined in the registry.

String Type Constants

Constant	Value	Description
STRING_LANGPAIR	4	The display name and language ID are provided directly by DisplayName and the language is specified by LangId.
STRING_MUIDLL	2	The display name is extracted from the Multilingual User Interface localized resources DLL specified in MuiDll. The ID is in the ResourceId member.
STRING_NONE	1	There is no localized display name.

152.5 class WindowsPageSetupDialogMBS

152.5.1 class WindowsPageSetupDialogMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The class to run the Windows Page Setup dialog.
Example:

```
// let the user choose paper and margins with the Windows page setup dialog
Var dialog As New WindowsPageSetupDialogMBS
dialog.Parent = Self

If dialog.PageSetupDialog Then
MessageBox "Paper: " + dialog.PaperSizeX.ToString + " x " + dialog.PaperSizeY.ToString + EndOfLine
+ _
"Margins: " + dialog.MarginLeft.ToString + ", " + dialog.MarginTop.ToString + ", " + dialog.Margin-
Right.ToString + ", " + dialog.MarginBottom.ToString
// keep dialog.DevMode for printing later
End If
```

152.5.2 Methods

152.5.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The constructor.

152.5.4 GetDevNames(byref DriverName as string, byref DeviceName as string, byref OutputName as string, byref flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Queries the strings that identify the driver, device, and output port names for a printer.
Notes: Returns true if values are available and false if not.

DriverName: The file name (without the extension) of the device driver. On input, this string is used to determine the printer to display initially in the dialog box.

OutputName: The device name for the physical output medium (output port).
Flags: Indicates whether the strings here identify the default printer. This string is used to verify that the default printer has not changed since the last print operation. If any of the strings do not match, a warning message is displayed informing the user that the document may need to be reformatted. On output, the Flags member is changed only if the Print Setup dialog box was displayed and the user chose the OK button. The DN_DEFAULTPRN flag is used if the default printer was selected. If a specific printer is selected, the flag is not used. All other flags in this member are reserved for internal use by the dialog box procedure for the Print property sheet or Print dialog box.

152.5.5 PageSetupDialog as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Creates a Page Setup dialog box that enables the user to specify the attributes of a printed page.
Notes: These attributes include the paper size and source, the page orientation (portrait or landscape), and the width of the page margins.

If the user clicks the OK button, the return value is true. The members of the object indicate the user's selections.
If the user cancels or closes the Page Setup dialog box or an error occurs, the return value is false. To get extended error information, use the lasterror property.

Starting with Windows Vista, the PageSetupDialog does not contain the Printer button. To switch printer selection other functions.

152.5.6 SetDevNames(DriverName as string, DeviceName as string, OutputName as string, flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Sets the strings that identify the driver, device, and output port names for a printer.
Notes: Returns true on success and false on failure.

DriverName: The file name (without the extension) of the device driver. On input, this string is used to determine the printer to display initially in the dialog box.
OutputName: The device name for the physical output medium (output port).
Flags: Indicates whether the strings here identify the default printer. This string is used to verify that the default printer has not changed since the last print operation. If any of the strings do not match, a warning message is displayed informing the user that the document may need to be reformatted. On output, the Flags member is changed only if the Print Setup dialog box was displayed and the user chose the OK button. The DN_DEFAULTPRN flag is used if the default printer was selected. If a specific printer is selected, the flag is not used. All other flags in this member are reserved for internal use by the dialog box procedure for the Print property sheet or Print dialog box.

152.5.7 Properties

152.5.8 DevMode as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The device mode object.
Notes: On input, if an object is specified, the values in the corresponding DEVMODE structure are used to initialize the controls in the dialog box. On output, the dialog box sets DevMode to a new object that contains values specifying the user's selections. If the user's selections are not available, the dialog box sets DevMode to nil.
(Read and Write property)

152.5.9 Flags as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: A set of bit flags that you can use to initialize the Page Setup dialog box.
Notes: When the dialog box returns, it sets these flags to indicate the user's input.
See the PSD_* constants for possible values.
(Read and Write property)

152.5.10 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The last error code.
Notes: (Read and Write property)

152.5.11 MarginBottom as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The widths of the bottom margin.
Notes: If you set the PSD_MARGINS flag, rtMargin specifies the initial margin values. When PageSetupDlg returns, rtMargin contains the margin widths selected by the user. The PSD_INHUNDREDTHSOFMILLIMETERS or PSD_INTHOUSANDTHSOFINCHES flag indicates the units of measurement.
(Read and Write property)

152.5.12 MarginLeft as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The widths of the left margin.
Notes: If you set the PSD_MARGINS flag, rtMargin specifies the initial margin values. When PageSetupDlg returns, rtMargin contains the margin widths selected by the user. The PSD_INHUNDREDTHSOFMILLIMETERS or PSD_INTHOUSANDTHSOFINCHES flag indicates the units of measurement.
(Read and Write property)

152.5.13 MarginRight as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The widths of the right margin.
Notes: If you set the PSD_MARGINS flag, rtMargin specifies the initial margin values. When PageSetupDlg returns, rtMargin contains the margin widths selected by the user. The PSD_INHUNDREDTHSOFMILLIMETERS or PSD_INTHOUSANDTHSOFINCHES flag indicates the units of measurement.
(Read and Write property)

152.5.14 MarginTop as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The widths of the top margin.
Notes: If you set the PSD_MARGINS flag, rtMargin specifies the initial margin values. When PageSetupDlg returns, rtMargin contains the margin widths selected by the user. The PSD_INHUNDREDTHSOFMILLIMETERS or PSD_INTHOUSANDTHSOFINCHES flag indicates the units of measurement.
(Read and Write property)

152.5.15 MinMarginBottom as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The minimum allowable widths for the bottom margin.
Notes: The system ignores this member if the PSD_MINMARGINS flag is not set. These values must be less than or equal to the values specified in the Margin* member. The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
(Read and Write property)

152.5.16 MinMarginLeft as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The minimum allowable widths for the left margin.
Notes: The system ignores this member if the PSD_MINMARGINS flag is not set. These values must be less than or equal to the values specified in the Margin* member. The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
(Read and Write property)

152.5.17 MinMarginRight as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The minimum allowable widths for the right margin.
Notes: The system ignores this member if the PSD_MINMARGINS flag is not set. These values must be less than or equal to the values specified in the Margin* member. The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
(Read and Write property)

152.5.18 MinMarginTop as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The minimum allowable widths for the top margin.
Notes: The system ignores this member if the PSD_MINMARGINS flag is not set. These values must be less than or equal to the values specified in the Margin* member. The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
(Read and Write property)

152.5.19 PaperSizeX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The dimensions of the paper selected by the user.
Notes: The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
(Read and Write property)

152.5.20 PaperSizeY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The dimensions of the paper selected by the user.
Notes: The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
(Read and Write property)

152.5.21 Parent as Variant

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The window that owns the dialog box.
Notes: This member can be any valid window, or it can be nil if the dialog box has no owner.
Can reference a Window or DesktopWindow object.
(Read and Write property)

152.5.22 Constants

Constants

Constant	Value	Description
DN_DEFAULTPRN	1	The flag for default printer on the SetDevNames/GetDevNames flag parameter.

Flags

Constant	Value	Description
PSD_DEFAULTMINMARGINS	&h00000000	Sets the minimum values that the user can specify for th be the minimum margins allowed by the printer. This is flag is ignored if the PSD_MARGINS and PSD_MINMAR specified.
PSD_DISABLEMARGINS	&h00000010	Disables the margin controls, preventing the user from sett
PSD_DISABLEORIENTATION	&h00000100	Disables the orientation controls, preventing the user fro orientation.
PSD_DISABLEPAPER	&h00000200	Disables the paper controls, preventing the user from settin such as the paper size and source.
PSD_DISABLEPRINTER	&h00000020	Obsolete. Windows XP/2000: Disables the Printer button, preven invoking a dialog box that contains additional printer setu
PSD_INHUNDREDTHSOFMILLIMETERS	&h00000008	Indicates that hundredths of millimeters are the unit of me gins and paper size. The values in the Margin, MinMarg members are in hundredths of millimeters. You can set to override the default unit of measurement for the user's function returns, the dialog box sets this flag to indicate th
PSD_INTHOUSANDTHSOFINCHES	&h00000004	Indicates that thousandths of inches are the unit of measu and paper size. The values in the Margin, MinMargin, and are in thousandths of inches. You can set this flag on in default unit of measurement for the user's locale. When th the dialog box sets this flag to indicate the units used.
PSD_MARGINS	&h00000002	Causes the system to use the values specified in the Marg initial widths for the left, top, right, and bottom margins. is not set, the system sets the initial widths to one inch for
PSD_MINMARGINS	&h00000001	Causes the system to use the values specified in the MinM the minimum allowable widths for the left, top, right, an The system prevents the user from entering a width that is ified minimum. If PSD_MINMARGINS is not specified, t minimum allowable widths to those allowed by the printer.
PSD_NONETWORKBUTTON	&h00200000	Hides and disables the Network button.
PSD_NOWARNING	&h00000080	Prevents the system from displaying a warning message whe printer.
PSD_RETURNDEFAULT	&h00000400	PageSetupDialog does not display the dialog box. Instea Names and DevMode members to objects that are initiali default printer. PageSetupDlg returns an error if either Dev is not nil.
PSD_SHOWHELP	&h00000800	Causes the dialog box to display the Help button. The hw must specify the window to receive the HELPMSGSTRING that the dialog box sends when the user clicks the Help bu

152.6 class WindowsPrintDialogMBS

152.6.1 class WindowsPrintDialogMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The class for showing the windows print dialog.
Example:

```
// show the Windows print dialog with a page range of 1 to 10
Var dialog As New WindowsPrintDialogMBS
dialog.Parent = Self
dialog.MinPage = 1
dialog.MaxPage = 10
dialog.FromPage = 1
dialog.ToPage = 10
dialog.Copies = 1

Call dialog.PrintDialogEx
If dialog.ResultAction = WindowsPrintDialogMBS.PD_RESULT_PRINT Then
Var driver, device, port As String
Var devFlags As Integer
Call dialog.GetDevNames(driver, device, port, devFlags)
MessageBox "Print " + dialog.Copies.ToString + " copies on " + device
End If
```

Blog Entries

- MBS Xojo Plugins, version 21.3pr2
- MBS Real Studio Plugins, version 12.1pr7

152.6.2 Methods

152.6.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The constructor.

152.6.4 GetDevNames(byref DriverName as string, byref DeviceName as string, byref OutputName as string, byref flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Queries the strings that identify the driver, device, and output port names for a printer.
Notes: Returns true if values are available and false if not.

DriverName: The file name (without the extension) of the device driver. On input, this string is used to determine the printer to display initially in the dialog box.
OutputName: The device name for the physical output medium (output port).
Flags: Indicates whether the strings here identify the default printer. This string is used to verify that the default printer has not changed since the last print operation. If any of the strings do not match, a warning message is displayed informing the user that the document may need to be reformatted. On output, the Flags member is changed only if the Print Setup dialog box was displayed and the user chose the OK button. The DN_DEFAULTPRN flag is used if the default printer was selected. If a specific printer is selected, the flag is not used. All other flags in this member are reserved for internal use by the dialog box procedure for the Print property sheet or Print dialog box.

152.6.5 getPageRange(index as Integer, byref fromPage as Integer, byref toPage as Integer)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Queries a page range entry.

152.6.6 PrintDialog as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Displays a Print Dialog Box or a Print Setup dialog box.
Notes: The Print dialog box enables the user to specify the properties of a particular print job.

If the user clicks the OK button, the return value is true. The members of the object indicate the user's selections.

If the user canceled or closed the Print or Printer Setup dialog box or an error occurred, the return value is zero. To get extended error information, use the lasterror property. If the user canceled or closed the dialog box, lasterror returns zero.

This is the older function. PrintDialogEx is the newer function.
see also

http://msdn.microsoft.com/en-us/library/windows/desktop/ms646940(v=vs.85).aspx

152.6.7 PrintDialogEx as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Displays a Print property sheet that enables the user to specify the properties of a particular print job.
Notes: Changed from Boolean to Integer in v21.3 to allow you to distinguish between different different results. Result is either 0 for OK or an COM error code.

A Print property sheet has a General page that contains controls similar to the Print dialog box. The property sheet can also have additional application-specific and driver-specific property pages as well as the General page.
If the function succeeds, the return value is S_OK (0) and the ResultAction member contains one of the following values.

Constant	Value	Description
PD_RESULT_APPLY	2	The user clicked the Apply button and later clicked the Cancel button. This indicates that the user wants to apply the changes made in the property sheet, but does not yet want to print. The WindowsPrintDialogMBS contains the information specified by the user at the time the Apply button was clicked.
PD_RESULT_CANCEL	0	The user clicked the Cancel button. The information in the WindowsPrintDialogMBS is unchanged.
PD_RESULT_PRINT	1	The user clicked the Print button. The WindowsPrintDialogMBS contains the information specified by the user.

Lasterror is set.
The values of DevMode and DevNames in WindowsPrintDialogMBS may change when they are passed into PrintDialog. This is because these members are filled on both input and output.
If PD_RETURNDC is set but PD_USEDEVMODECOPIESANDCOLLATE flag is not set, the PrintDialog functions return incorrect number of copies. To get the correct number of copies, ensure that the calling application always uses PD_USEDEVMODECOPIESANDCOLLATE with PD_RETURNDC.

http://msdn.microsoft.com/en-us/library/windows/desktop/ms646942(v=vs.85).aspx

152.6.8 SetDevNames(DriverName as string, DeviceName as string, OutputName as string, flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Sets the strings that identify the driver, device, and output port names for a printer.
Notes: Returns true on success and false on failure.

DriverName: The file name (without the extension) of the device driver. On input, this string is used to determine the printer to display initially in the dialog box.
OutputName: The device name for the physical output medium (output port).
Flags: Indicates whether the strings here identify the default printer. This string is used to verify that the default printer has not changed since the last print operation. If any of the strings do not match, a warning message is displayed informing the user that the document may need to be reformatted. On output, the Flags member is changed only if the Print Setup dialog box was displayed and the user chose the OK button. The DN_DEFAULTPRN flag is used if the default printer was selected. If a specific printer is selected, the flag is not used. All other flags in this member are reserved for internal use by the dialog box procedure for the Print property sheet or Print dialog box.

152.6.9 setPageRange(index as Integer, fromPage as Integer, toPage as Integer)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Sets a page range entry.
Notes: Index from 0 to 19.

152.6.10 Properties

152.6.11 Copies as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Contains the initial number of copies for the Copies edit control if DevMode is nil; otherwise, the Copies member of the DEVMODE contains the initial value.
Notes: When PrintDlgEx returns, nCopies contains the actual number of copies the application must print. This value depends on whether the application or the printer driver is responsible for printing multiple copies. If the PD_USEDEVMODECOPIESANDCOLLATE flag is set in the Flags member, nCopies is always 1 on return, and the printer driver is responsible for printing multiple copies. If the flag is not set, the application is responsible for printing the number of copies specified by nCopies. For more information, see the description of the PD_USEDEVMODECOPIESANDCOLLATE flag.
(Read and Write property)

152.6.12 DC as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The device context or an information context, depending on whether the Flags member specifies

the PD_RETURNDC or PC_RETURNIC flag.
Notes: If neither flag is specified, the value of this member is undefined. If both flags are specified, PD_RETURNDC has priority.
(Read and Write property)

152.6.13 DevMode as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The device mode object.
Notes: On input, if an object is specified, the values in the corresponding DEVMODE structure are used to initialize the controls in the dialog box. On output, the dialog box sets DevMode to a new object that contains values specifying the user's selections. If the user's selections are not available, the dialog box sets DevMode to nil.
(Read and Write property)

152.6.14 ExclusionFlags as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: A set of bit flags that can exclude items from the printer driver property pages in the Print property sheet.
Notes: This value is used only if the PD_EXCLUSIONFLAGS flag is set in the Flags member. Exclusion flags should be used only if the item to be excluded will be included on either the General page or on an application-defined page in the Print property sheet. This member can specify the following flag.
PD_EXCL_COPIESANDCOLLATE: Excludes the Copies and Collate controls from the printer driver property pages in a Print property sheet. This flag should always be set when the application uses the default Copies and Collate controls provided by the lower portion of the General page of the Print property sheet.
(Read and Write property)

152.6.15 Flags as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: A set of bit flags that you can use to initialize the Print property sheet.
Notes: When the PrintDialog function returns, it sets these flags to indicate the user's input. This member can be one or more of the following values.

To ensure that PrintDialog returns the correct values in the Copies and Collate members of the DeviceMode, set PD_RETURNDC = TRUE and PD_USEDEVMODECOPIESANDCOLLATE = TRUE. In so doing, the Copies member of the PRINTDLG structure is always 1 and PD_COLLATE is always false.

To ensure that PrintDialog returns the correct values in nCopies and PD_COLLATE, set PD_RETURNDC = TRUE and PD_USEDEVMODECOPIESANDCOLLATE = FALSE. In so doing, dmCopies is always 1 and dmCollate is always FALSE.
Starting with Windows Vista, when you call PrintDlg or PrintDlgEx with PD_RETURNDC set to TRUE and PD_USEDEVMODECOPIESANDCOLLATE set to FALSE, the PrintDlg or PrintDlgEx function sets the number of copies in the nCopies member of the PRINTDLG structure, and it sets the number of copies in the structure represented by the hDC member of the PRINTDLG structure.
When making calls to GDI, you must ignore the value of nCopies, consider the value as 1, and use the returned hDC to avoid printing duplicate copies.
(Read and Write property)

152.6.16 FromPage as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The initial value for the starting page edit control.
Notes: When PrintDialog returns, nFromPage is the starting page specified by the user. If the Pages radio button is selected when the user clicks the Okay button, PrintDialog sets the PD_PAGENUMS flag and does not return until the user enters a starting page value that is within the minimum to maximum page range.
If the input value for either FromPage or nToPage is outside the minimum/maximum range, PrintDlg returns an error only if the PD_PAGENUMS flag is specified; otherwise, it displays the dialog box but changes the out-of-range value to the minimum or maximum value.
This is only for PrintDialog, not for PrintDialogEx.
(Read and Write property)

152.6.17 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The last error code.
Notes: Typical errors:
E_OUTOFMEMORY = &h8007000E // Insufficient memory.
E_INVALIDARG = &h80070057 // One or more arguments are invalid.
E_POINTER = &h80000005 // Invalid pointer.
E_HANDLE = &h80000006 // Invalid handle.
E_FAIL = &h80000008 // Unspecified error.
(Read and Write property)

152.6.18 MaxPage as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The maximum value for the page ranges specified in the Pages edit control.
Notes: If the PD_NOPAGENUMS flag is specified, this value is not valid.
(Read and Write property)

152.6.19 MaxPageRanges as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The size, in array elements, of the PageRanges buffer.
Notes: This value indicates the maximum number of page ranges that can be stored in the array. If the PD_NOPAGENUMS flag is specified, this value is not valid. If the PD_NOPAGENUMS flag is not specified, this value must be greater than zero.
The plugin supports up to 20 page ranges.
(Read and Write property)

152.6.20 MinPage as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The minimum value for the page ranges specified in the Pages edit control.
Notes: If the PD_NOPAGENUMS flag is specified, this value is not valid.
(Read and Write property)

152.6.21 PageRanges as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: On input, set this member to the initial number of page ranges specified.
Notes: When the PrintDialog function returns, PageRanges indicates the number of user-specified page ranges. If the PD_NOPAGENUMS flag is specified, this value is not valid. Use getPageRange to query page ranges or setPageRange to set them.
(Read and Write property)

152.6.22 Parent as Variant

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The window that owns the dialog box.
Notes: The window that owns the property sheet. This member must be a valid window handle; it cannot be nil.
Can reference a Window or DesktopWindow object.
(Read and Write property)

152.6.23 ResultAction as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: If the PrintDlgEx function returns S_OK (0), ResultAction contains the outcome of the dialog.
Notes: If PrintDialog returns an error, this member should be ignored. The ResultAction member can be one of the following values:

PD_RESULT_APPLY	The user clicked the Apply button and later clicked the Cancel button. This indicates that the user wants to apply the changes made in the property sheet, but does not want to print yet. The PRINTDLGEX structure contains the information specified by the user at the time the Apply button was clicked.
PD_RESULT_CANCEL	The user clicked the Cancel button. The information in the PRINTDLGEX structure is unchanged.
PD_RESULT_PRINT	The user clicked the Print button. The PRINTDLGEX structure contains the information specified by the user.

(Read and Write property)

152.6.24 StartPanel as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The property page that is initially displayed.
Notes: To display the General page, specify START_PAGE_GENERAL. For consistency, it is recommended that the property sheet always be started on the General page.
The plugin sets START_PAGE_GENERAL for default value.
(Read and Write property)

152.6.25 ToPage as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The initial value for the ending page edit control.
Notes: When PrintDialog returns, ToPage is the ending page specified by the user. If the Pages radio

button is selected when the use clicks the Okay button, PrintDialog sets the PD_PAGENUMS flag and does not return until the user enters an ending page value that is within the minimum to maximum page range. This is only for PrintDialog, not for PrintDialogEx.
(Read and Write property)

152.6.26 Constants

Constants

Constant	Value	Description
START_PANEL_GENERAL	&hffffffff	Special value for StartPanel property to select general panel.

Flag Constants

Constant	Value	Description
PD_ALLPAGES	0	The default flag that indicates that the All radio button i This flag is used as a placeholder to indicate that the PD_SELECTION, and PD_CURRENTPAGE flags are n
PD_COLLATE	&h00000010	If this flag is set, the Collate check box is selected. If this flag is set when the PrintDlgEx function returns, t simulate collation of multiple copies. For more informatio of the PD_USEDEVMODECOPIESANDCOLLATE flag See PD_NOPAGENUMS.
PD_CURRENTPAGE	&h00400000	If this flag is set, the Current Page radio button is sele PD_PAGENUMS, PD_SELECTION, or PD_CURREN the All radio button is selected.
PD_DISABLEPRINTTOFILE	&h00080000	Disables the Print to File check box.
PD_EXCLUSIONFLAGS	&h01000000	Indicates that the ExclusionFlags member identifies items the printer driver property pages. If this flag is not set, items will be excluded by default fro property pages. The exclusions prevent the duplication General page, any application-specified pages, and the pri
PD_EXCL_COPIESANDCOLLATE	&h00008100	Excludes the Copies and Collate controls from the printer c in a Print property sheet. This flag should always be set w uses the default Copies and Collate controls provided by the General page of the Print property sheet.
PD_HIDEPRINTTOFILE	&h00100000	Hides the Print to File check box.
PD_NOCURRENTPAGE	&h00800000	Disables the Current Page radio button.
PD_NONETWORKBUTTON	&h00200000	Hides and disables the Network button.
PD_NOPAGENUMS	8	Disables the Pages radio button and the associated edit c Also, it causes the Collate check box to appear in the dia
PD_NOSELECTION	4	Disables the Selection radio button.
PD_NOWARNING	&h00000080	Prevents the warning message from being displayed when
PD_PAGENUMS	2	If this flag is set, the Pages radio button is selected. If n GENUMS, PD_SELECTION, or PD_CURRENTPAGE radio button is selected. If this flag is set when the Prin turns, the PageRanges member indicates the page ranges s
PD_PRINTSETUP	&h00000040	Causes the system to display the Print Setup dialog box r dialog box.
PD_PRINTTOFILE	&h00000020	If this flag is set, the Print to File check box is selected. If this flag is set when PrintDialog returns, the Output contains the string "FILE:". When you call the StartD the printing operation, specify this "FILE:" string in th member of the DOCINFO structure. Specifying this str subsystem to query the user for the name of the output fi StartDoc is available in our plugins through StartDocPri dPrintJobMBS class.
PD_RETURNDC	&h00000100	Causes PrintDialog to return a device context matching th made in the property sheet. The device context is returned in DC property.
PD_RETURNDEFAULT	&h00000400	If this flag is set, the PrintDialog function does not displa Instead, it sets the DevNames and DevMode members to system default printer. Both DevNames and DevMode PrintDialog returns an error.
PD_RETURNIC	&h00000200	Similar to the PD_RETURNDC flag, except this flag ret context rather than a device context. If neither PD_RETURNDC nor PD_RETURNIC is spe fined on output.
PD_SELECTION	1	If this flag is set, the Selection radio button is selected. If none of the PD_PAGENUMS, PD_SELECTION, or PD flags is set, the All radio button is selected.
PD_SHOWHELP	&h00000800	Causes the dialog box to display the Help button.
PD_USEDEVMODECOPIES	&h00040000	Same as PD_USEDEVMODECOPIESANDCOLLATE.

Result Constants

Constant	Value	Description
PD_RESULT_APPLY	2	The user clicked the Apply button and later clicked the Cancel button. This indicates that the user wants to apply the changes made in the property sheet, but does not yet want to print. The WindowsPrintDialogMBS contains the information specified by the user at the time the Apply button was clicked.
PD_RESULT_CANCEL	0	The user clicked the Cancel button. The information in the WindowsPrintDialogMBS is unchanged.
PD_RESULT_PRINT	1	The user clicked the Print button. The WindowsPrintDialogMBS contains the information specified by the user.

152.7 class WindowsPrinterInfoMBS

152.7.1 class WindowsPrinterInfoMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for details on printer information.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MessageBox p.PrinterName
next
```

Notes: This class wraps the PRINTER_INFO_2 structure on windows which you find documented here:
http://msdn.microsoft.com/en-us/library/dd162845(VS.85).aspx
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.2pr6
- MBS Real Studio Plugins, version 12.1pr6

152.7.2 Methods

152.7.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

152.7.4 LocalPrinters as WindowsPrinterInfoMBS()

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the printers as an array.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MessageBox p.PrinterName
```

next

Notes: On any error the array will be empty.

152.7.5 OpenPrinter(admin as boolean = false) as WindowsPrinterMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Opens the printer so you can operate on it.
Example:

```
Var name as string = WindowsPrinterMBS.GetDefaultPrinter
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name)
MessageBox p.PrinterName
```

Notes: Admin: whether you want to get permissions to administrate.
Returns nil on any error.

152.7.6 Printers(flags as Integer, Name as Variant = nil) as WindowsPrinterInfoMBS()

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Printers function enumerates available printers, print servers, domains, or print providers.
Notes: If you call this with flags = kPrinterFlagsLocal + kPrinterFlagsConnections and name = nil, you get same as LocalPrinters function.

see also
https://msdn.microsoft.com/en-us/library/windows/desktop/dd162692(v=vs.85).aspx

152.7.7 Properties

152.7.8 AttributeFlags as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the printer attributes.
Notes: This member can be one of the following values:

Renamed Attributes parameter to AttributeFlags in plugin version 8.2.

PRINTER_ATTRIBUTE_QUEUED	&h00000001	
PRINTER_ATTRIBUTE_DIRECT	&h00000002	
PRINTER_ATTRIBUTE_DEFAULT	&h00000004	(Windows 95)
PRINTER_ATTRIBUTE_SHARED	&h00000008	
PRINTER_ATTRIBUTE_NETWORK	&h00000010	
PRINTER_ATTRIBUTE_HIDDEN	&h00000020	
PRINTER_ATTRIBUTE_LOCAL	&h00000040	
PRINTER_ATTRIBUTE_ENABLE_DEVQ	&h00000080	
PRINTER_ATTRIBUTE_KEEPPRINTEDJOBS	&h00000100	
PRINTER_ATTRIBUTE_DO_COMPLETE_FIRST	&h00000200	
PRINTER_ATTRIBUTE_WORK_OFFLINE	&h00000400	(Windows 95)
PRINTER_ATTRIBUTE_ENABLE_BIDI	&h00000800	(Windows 95)
PRINTER_ATTRIBUTE_RAW_ONLY	&h00001000	
PRINTER_ATTRIBUTE_PUBLISHED	&h00002000	(Windows 2000) Indicates whether the printer is published in the directory service.

(Read and Write property)

152.7.9 AveragePPM as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the average number of pages per minute that have been printed on the printer.
Notes: (Read and Write property)

152.7.10 Comment as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that provides a brief description of the printer.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MessageBox p.PrinterName+": "+p.Comment
next
```

Notes: (Read and Write property)

152.7.11 CountJobs as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the number of print jobs that have been queued for the printer.
Notes: (Read and Write property)

152.7.12 Datatype as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the data type used to record the print job.
Notes: (Read and Write property)

152.7.13 DefaultPriority as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the default priority value assigned to each print job.
Notes: (Read and Write property)

152.7.14 DevMode as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WindowsDeviceModeMBS object that defines default printer data such as the paper orientation and the resolution.
Notes: (Read and Write property)

152.7.15 DriverName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the name of the printer driver.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MessageBox p.PrinterName+": "+p.DriverName
next
```

Notes: (Read and Write property)

152.7.16 Location as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the physical location of the printer.
Notes: for example, "Bldg. 38, Room 1164".
(Read and Write property)

152.7.17 Parameters as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the default print-processor parameters.
Notes: (Read and Write property)

152.7.18 PortName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that identifies the port(s) used to transmit data to the printer.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MessageBox p.PrinterName+": "+p.PortName
next
```

Notes: If a printer is connected to more than one port, the names of each port must be separated by commas (for example, "LPT1:,LPT2:,LPT3:").
(Read and Write property)

152.7.19 PrinterName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the name of the printer.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MessageBox p.PrinterName
```

next

Notes: (Read and Write property)

152.7.20 PrintProcessor as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the name of the print processor used by the printer.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MessageBox p.PrintProcessor
next
```

Notes: (Read and Write property)

152.7.21 Priority as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies a priority value that the spooler uses to route print jobs.
Notes: Possible values:

NO_PRIORITY	0
MAX_PRIORITY	99
MIN_PRIORITY	1
DEF_PRIORITY	1

(Read and Write property)

152.7.22 SeparatorPageFile as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the name of the file used to create the separator page.
Notes: This page is used to separate print jobs sent to the printer.

(Read and Write property)

152.7.23 ServerName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string identifying the server that controls the printer.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MessageBox p.PrinterName+": "+p.ServerName
next
```

Notes: If this string is "", the printer is controlled locally.
(Read and Write property)

152.7.24 ShareName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that identifies the sharepoint for the printer.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MessageBox p.PrinterName+": "+p.ShareName
next
```

Notes: This string is used only if the PRINTER_ATTRIBUTE_SHARED constant was set for the Attributes member.
(Read and Write property)

152.7.25 StartTime as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the earliest time at which the printer will print a job.
Notes: This value is expressed as minutes elapsed since 12:00 A.M. GMT (Greenwich Mean Time).
(Read and Write property)

152.7.26 Status as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the printer status.
Notes: This member can be one of the following values:

PRINTER_STATUS_PAUSED	&h00000001
PRINTER_STATUS_ERROR	&h00000002
PRINTER_STATUS_PENDING_DELETION	&h00000004
PRINTER_STATUS_PAPER_JAM	&h00000008
PRINTER_STATUS_PAPER_OUT	&h00000010
PRINTER_STATUS_MANUAL_FEED	&h00000020
PRINTER_STATUS_PAPER_PROBLEM	&h00000040
PRINTER_STATUS_OFFLINE	&h00000080
PRINTER_STATUS_IO_ACTIVE	&h00000100
PRINTER_STATUS_BUSY	&h00000200
PRINTER_STATUS_PRINTING	&h00000400
PRINTER_STATUS_OUTPUT_BIN_FULL	&h00000800
PRINTER_STATUS_NOT_AVAILABLE	&h00001000
PRINTER_STATUS_WAITING	&h00002000
PRINTER_STATUS_PROCESSING	&h00004000
PRINTER_STATUS_INITIALIZING	&h00008000
PRINTER_STATUS_WARMING_UP	&h00010000
PRINTER_STATUS_TONER_LOW	&h00020000
PRINTER_STATUS_NO_TONER	&h00040000
PRINTER_STATUS_PAGE_PUNT	&h00080000
PRINTER_STATUS_USER_INTERVENTION	&h00100000
PRINTER_STATUS_OUT_OF_MEMORY	&h00200000
PRINTER_STATUS_DOOR_OPEN	&h00400000
PRINTER_STATUS_SERVER_UNKNOWN	&h00800000
PRINTER_STATUS_POWER_SAVE	&h01000000

Windows 95: The PRINTER_STATUS_PAGE_PUNT value specifies that the page is being "punted" (that is, not printed) because it is too complex for the printer to print.
(Read and Write property)

152.7.27 UntilTime as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the latest time at which the printer will print a job.
Notes: This value is expressed as minutes elapsed since 12:00 A.M. GMT (Greenwich Mean Time).
Status
(Read and Write property)

152.7.28 Constants

Printer Enumeration Flags

Constant	Value	Description
kPrinterFlagsConnections	4	The function enumerates the list of printers to which the user has made previous connections.
kPrinterFlagsDefault	1	Default printer.
kPrinterFlagsLocal	2	If the kPrinterFlagsName flag is not also passed, the function ignores the Name parameter, and enumerates the locally installed printers. If kPrinterFlagsName is also passed, the function enumerates the local printers on Name.
kPrinterFlagsName	8	The function enumerates the printer identified by Name. This can be a server, a domain, or a print provider. If Name is nil, the function enumerates available print providers.
kPrinterFlagsNetwork	64	Network printers?
kPrinterFlagsRemote	16	Remote (non Local) printers?
kPrinterFlagsShared	32	The function enumerates printers that have the shared attribute. Cannot be used in isolation; use an OR operation to combine with another constants.

152.8 class WindowsPrinterJobMBS

152.8.1 class WindowsPrinterJobMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for Windows print job information.
Blog Entries

- MBS Real Studio Plugins, version 12.1pr4

152.8.2 Properties

152.8.3 Datatype as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The type of data used to record the print job.
Notes: (Read and Write property)

152.8.4 DevMode as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device-initialization and environment data for the printer driver.
Notes: (Read and Write property)

152.8.5 Document as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the user who owns the print job.
Notes: (Read and Write property)

152.8.6 DriverName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the printer driver that should be used to process the print job.
Notes: (Read and Write property)

152.8.7 JobID as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A job identifier value.
Notes: (Read and Write property)

152.8.8 MachineName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the machine that created the print job.
Notes: (Read and Write property)

152.8.9 NotifyName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the user who should be notified when the job has been printed or when an error occurs while printing the job.
Notes: (Read and Write property)

152.8.10 PagesPrinted as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of pages that have printed.
Notes: This value may be zero if the print job does not contain page delimiting information.
(Read and Write property)

152.8.11 Parameters as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Print-processor parameters.
Notes: (Read and Write property)

152.8.12 Position as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The job's position in the print queue.
Notes: (Read and Write property)

152.8.13 PrinterName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the printer for which the job is spooled.
Notes: (Read and Write property)

152.8.14 PrintProcessor as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the print processor that should be used to print the job.
Notes: (Read and Write property)

152.8.15 Priority as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The job priority.
Notes: This member can be one of the following values or in the range between 1 through 99 (kPriorityMin through kPriorityMax).
(Read and Write property)

152.8.16 Size as Int64

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size, in bytes, of the job.
Notes: (Read and Write property)

152.8.17 StartTime as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The earliest time that the job can be printed.
Notes: (Read and Write property)

152.8.18 Status as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The job status.
Notes: Check kJobStatus* constants for possible values.
(Read and Write property)

152.8.19 StatusString as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The status of the print job.
Notes: This member should be checked prior to Status and, if StatusString is "", the status is defined by the contents of the Status member.
(Read and Write property)

152.8.20 Submitted as Date

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The time when the job was submitted.
Notes: This time value is in Universal Time Coordinate (UTC) format.
(Read and Write property)

152.8.21 Time as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The total time, in milliseconds, that has elapsed since the job began printing.
Notes: (Read and Write property)

152.8.22 TotalPages as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of pages required for the job.
Notes: This value may be zero if the print job does not contain page delimiting information.
(Read and Write property)

152.8.23 UntilTime as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The latest time that the job can be printed.
Notes: (Read and Write property)

152.8.24 UserName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the user who owns the print job.
Notes: (Read and Write property)

152.8.25 Constants

Job Status Constants

Constant	Value	Description
kJobStatusBlockedDeviceQueue	&h200	The driver cannot print the job.
kJobStatusComplete	&h1000	The job is sent to the printer, but may not be printed yet. (Windows XP and later)
kJobStatusDeleted	&h100	Job has been deleted.
kJobStatusDeleting	4	Job is being deleted.
kJobStatusError	2	An error is associated with the job.
kJobStatusOffline	&h20	Printer is offline.
kJobStatusPaperOut	&h40	Printer is out of paper.
kJobStatusPaused	1	Job is paused.
kJobStatusPrinted	&h80	Job has printed.
kJobStatusPrinting	&h10	Job is printing.
kJobStatusRenderingLocally	&h4000	Rendering.
kJobStatusRestart	&h800	Job has been restarted.
kJobStatusRetained	&h2000	The job has been retained in the print queue following printing. (Windows XP and later)
kJobStatusSpooling	8	Job is spooling.
kJobStatusUserIntervention	&h400	Printer has an error that requires the user to do something.

Priority Constants

Constant	Value	Description
kPriorityDefault	1	Default priority.
kPriorityMax	99	Maximum priority.
kPriorityMin	1	Minimum priority.
kPriorityNo	0	No priority.

152.9 class WindowsPrinterMBS

152.9.1 class WindowsPrinterMBS

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for an open connection to a windows printer.
Example:

```
// list the jobs waiting in a printer queue on Windows
Var printer As WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter("Microsoft Print to PDF")
If printer = Nil Then
MessageBox "Printer not found."
Return
End If

Var lines() As String
For Each job As WindowsPrinterJobMBS In printer.AllJobs
lines.Add job.JobID.ToString + ": " + job.Document + " (" + job.TotalPages.ToString + " pages)"
Next

MessageBox printer.PrinterName + ": " + lines.Count.ToString + " jobs" + EndOfLine + String.FromArray(lines, EndOfLine)
```

Notes: Objects of this class can operate on printers.
Some operations need administrative permissions. If you don't have them, lasterror is set to 5.

152.9.2 Methods

152.9.3 AddForm(form as WindowsPageFormatMBS) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The AddForm function adds a form to the list of available forms that can be selected for the specified printer.
Example:

```
// query default printer
Var w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)

Var form as new WindowsPageFormatMBS

form.Mode = 1
form.Name = "MyTest"
form.DisplayName = "MyTest"
form.Flags = 0
form.SizeHeight = 100000
form.SizeWidth = 100000
form.ImageableAreaLeft = 0
form.ImageableAreaTop = 0
form.ImageableAreaRight = 100000
form.ImageableAreaBottom = 100000

if w.AddForm(form) then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: Form.Mode gives level of the data. Must be either 1 (old version) or 2 (newer version).

Form: The form details.

Returns true if the function succeeds and false if the function fails.

Note: This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

An application can determine which forms are available for a printer by calling the GetPrinterFormats function.
If form points to a Mode 2 form, then AddForm will fail if either a form with the specified name already exists or the Keyword value already exists.

152.9.4 AdvancedDocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, parent as DesktopWindow) as integer

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Displays a printer-configuration dialog box for the specified printer, allowing the user to configure that printer.
Notes: This function is a special case of the DocumentProperties function.

parent: The parent window of the printer-configuration dialog box.

OutputDevMode: The device mode structure that will contain the configuration data specified by the user.
InputDevMode: The device mode structure that contains the configuration data used to initialize the controls of the printer-configuration dialog box.

If the DocumentProperties function with these parameters is successful, the return value of AdvancedDocumentProperties is 1. Otherwise, the return value is zero.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

This function can only display the printer-configuration dialog box so a user can configure it. For more control, use DocumentProperties.
See also:

- 152.9.5 AdvancedDocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, parent as window = nil) as Integer 20293

152.9.5 AdvancedDocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, parent as window = nil) as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Displays a printer-configuration dialog box for the specified printer, allowing the user to configure that printer.
Notes: This function is a special case of the DocumentProperties function.

parent: The parent window of the printer-configuration dialog box.

OutputDevMode: The device mode structure that will contain the configuration data specified by the user.
InputDevMode: The device mode structure that contains the configuration data used to initialize the controls of the printer-configuration dialog box.

If the DocumentProperties function with these parameters is successful, the return value of AdvancedDocumentProperties is 1. Otherwise, the return value is zero.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

This function can only display the printer-configuration dialog box so a user can configure it. For more control, use DocumentProperties.
See also:

- 152.9.4 AdvancedDocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, parent as DesktopWindow) as integer 20293

152.9.6 AllJobs as WindowsPrinterJobMBS()

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all jobs for the printer.
Example:

```
Var w as new WindowsPrinterMBS( WindowsPrinterMBS.GetDefaultPrinter)
Var jobs() as WindowsPrinterJobMBS = w.AllJobs
MessageBox str(jobs.Count)+" jobs"
```

Notes: PrinterName property must be set, so the function knows which printer.

152.9.7 CanPrinterPassThroughPostScript as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this printer can pass through postscript data.
Notes: Returns true for Postscript printers and false for other printers.

For more information on this function, visit this website:
http://msdn.microsoft.com/en-us/library/dd162831(v=VS.85).aspx

152.9.8 ChangePrinterSettings(value as WindowsDeviceModeMBS, Mode as Integer=2) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Changes printer settings.
Notes: This function opens the printer, queries current settings using GetPrinter, applies all your changes, calls DocumentProperties to verify those settings are valid for the printer and uses SetPrinter to apply the changes.
To indicate which fiels in the WindowsDeviceModeMBS object are set by you, use the fields integer value with a combination of the DM_* constants.
Returns true on success and false on failure.

Mode can be 2 (general printer information), 8 (global settings) or 9 (user settings).

For more information on the GetPrinter function, check this website:
http://msdn.microsoft.com/en-us/library/dd144911(VS.85).aspx

For more information on the SetPrinter function, check this website:
http://msdn.microsoft.com/en-us/library/dd145082(VS.85).aspx

For more information on the DocumentProperties function, check this website:
http://msdn.microsoft.com/en-us/library/dd183576(VS.85).aspx

Even if you change printer settings, other parts of the application, e.g. Xojo framework may not care.

152.9.9 ConfigurePort(name as string = ””, parent as window = nil, PortName as string = ””) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Displays the port-configuration dialog box for a port on the specified server.
Notes: Name: The name of the server on which the specified port exists. If this parameter is ””, the port is local.
parent: The parent window of the port-configuration dialog box.
PortName: The name of the port to be configured.

Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a

thread that manages interaction with the user interface could make the application appear to be unresponsive.

Before calling the ConfigurePort function, an application should call the EnumPorts function to determine valid port names.
See also:

- 152.9.10 ConfigurePort(name as string, parent as DesktopWindow, PortName as string) as boolean 20296

152.9.10 ConfigurePort(name as string, parent as DesktopWindow, PortName as string) as boolean

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Displays the port-configuration dialog box for a port on the specified server.
Notes: Name: The name of the server on which the specified port exists. If this parameter is "", the port is local.
parent: The parent window of the port-configuration dialog box.
PortName: The name of the port to be configured.

Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

Before calling the ConfigurePort function, an application should call the EnumPorts function to determine valid port names.
See also:

- 152.9.9 ConfigurePort(name as string = "", parent as window = nil, PortName as string = "") as boolean 20295

152.9.11 ConnectToPrinterDialog(parent as DesktopWindow) as boolean

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Displays a dialog box that lets users browse and connect to printers on a network.
Notes: If the user selects a printer, the function attempts to create a connection to it; if a suitable driver is not installed on the server, the user is given the option of creating a printer locally.

parent: Specifies the parent window of the dialog box.

If the function succeeds and the user selects a printer, this object points to the new printer and return value is true.
If the function fails, or the user cancels the dialog box without selecting a printer, the return value is true.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

The ConnectToPrinterDialog function attempts to create a connection to the selected printer. However, if the server on which the printer resides does not have a suitable driver installed, the function offers the user the option of creating a printer locally.

An application should call DeletePrinter to delete a local printer. An application should call DeletePrinterConnection to delete a connection to a printer.
See also:

- 152.9.12 ConnectToPrinterDialog(parent as window = nil) as boolean 20297

152.9.12 ConnectToPrinterDialog(parent as window = nil) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Displays a dialog box that lets users browse and connect to printers on a network.
Notes: If the user selects a printer, the function attempts to create a connection to it; if a suitable driver is not installed on the server, the user is given the option of creating a printer locally.

parent: Specifies the parent window of the dialog box.

If the function succeeds and the user selects a printer, this object points to the new printer and return value is true.
If the function fails, or the user cancels the dialog box without selecting a printer, the return value is true.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

The ConnectToPrinterDialog function attempts to create a connection to the selected printer. However, if the server on which the printer resides does not have a suitable driver installed, the function offers the user the option of creating a printer locally.

An application should call DeletePrinter to delete a local printer. An application should call DeletePrinterConnection to delete a connection to a printer.
See also:

- 152.9.11 ConnectToPrinterDialog(parent as DesktopWindow) as boolean 20296

152.9.13 Constructor(PrinterName as string, admin as boolean = false)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Opens the printer so you can operate on it.
Notes: Admin: whether you want to get permissions to administrate.
Raises exception if printer can't be opened. Use OpenPrinter function to avoid exception.

152.9.14 DeleteForm(name as string) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The DeleteForm function removes a form name from the list of supported forms.
Notes: name: The form name to be removed.

Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

DeleteForm can only delete form names that were added by using the AddForm function.

152.9.15 DeleteJob(JobID as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Delete the print job.
Notes: Returns true on success and false on failure.

152.9.16 DeletePrinter as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes the specified printer object.
Notes: Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

If there are print jobs remaining to be processed for the specified printer, DeletePrinter marks the printer for pending deletion, and then deletes it when all the print jobs have been printed. No print jobs can be added to a printer that is marked for pending deletion.
A printer marked for pending deletion cannot be held, but its print jobs can be held, resumed, and restarted. If the printer is held and there are jobs for the printer, DeletePrinter fails with ERROR_ACCESS_DENIED.

Lasterror is set.

152.9.17 DeletePrinterConnection(name as string) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes a connection to a printer that was established by a call to AddPrinterConnection or ConnectToPrinterDialog.
Notes: name: The name of the printer connection to delete.
Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

The DeletePrinterConnection function does not delete any printer driver files that were copied to the server to which the printer is attached.

152.9.18 DocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, Prompt as boolean = false, parent as window = nil) as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The DocumentProperties function retrieves or modifies printer initialization information or displays a printer-configuration property sheet for the specified printer.

Example:

```
// get default printer
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(WindowsPrinterMBS.GetDefaultPrinter)

// ask for printer settings
Var s as new WindowsDeviceModeMBS
Var n as Integer = p.DocumentProperties(nil, s, true, Window1)
```

Notes: Printername property must be set.

parent: The parent window of the printer-configuration property sheet. Can be nil.
Prompt: Whether to show dialog.

OutputDevMode: Devmode variable that receives the printer configuration data specified by the user.
InputDevMode: Optional input data which the operating system uses to initialize the property sheet controls.
Prompt: Whether the function presents the printer driver's Print Setup property sheet and then changes the settings in the printer's DeviceMode data structure to those values specified by the user.

If you provide object for InputDevMode, the function will read settings from there. If you don't pass an object (nil) or you pass incomplete settings, default settings are used to complete.
If prompt is true, the dialog is shown and user can change settings.
On the end, the current new data is stored in OutputDevMode where you can find it.

If the function displays the property sheet, the return value is either IDOK (1) or IDCANCEL (2), depending on which button the user selects.
If the function does not display the property sheet and is successful, the return value is IDOK (1).
If the function fails, the return value is less than zero.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation-factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

152.9.19 DocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, Prompt as boolean, parent as DesktopWindow) as integer

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The DocumentProperties function retrieves or modifies printer initialization information or displays a printer-configuration property sheet for the specified printer.
Example:

```
// get default printer
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(WindowsPrinterMBS.GetDefaultPrinter)

// ask for printer settings
Var s as new WindowsDeviceModeMBS
Var n as Integer = p.DocumentProperties(nil, s, true, Window1)
```

Notes: Printername property must be set.

parent: The parent window of the printer-configuration property sheet. Can be nil.
Prompt: Whether to show dialog.

OutputDevMode: Devmode variable that receives the printer configuration data specified by the user.
InputDevMode: Optional input data which the operating system uses to initialize the property sheet controls.
Prompt: Whether the function presents the printer driver's Print Setup property sheet and then changes the settings in the printer's DeviceMode data structure to those values specified by the user.

If you provide object for InputDevMode, the function will read settings from there. If you don't pass an object (nil) or you pass incomplete settings, default settings are used to complete.
If prompt is true, the dialog is shown and user can change settings.
On the end, the current new data is stored in OutputDevMode where you can find it.

If the function displays the property sheet, the return value is either IDOK (1) or IDCANCEL (2), depending on which button the user selects.
If the function does not display the property sheet and is successful, the return value is IDOK (1).
If the function fails, the return value is less than zero.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation-factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

http://msdn.microsoft.com/en-us/library/windows/desktop/dd183576(v=vs.85).aspx
See also:

- 152.9.18 DocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, Prompt as boolean = false, parent as window = nil) as Integer 20299

152.9.20 GetDefaultPrinter as string

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetDefaultPrinter function retrieves the printer name of the default printer for the current user on the local computer.
Example:

```
MessageBox WindowsPrinterMBS.GetDefaultPrinter
```

Notes: For more details on the GetDefaultPrinter function, check this website:
http://msdn.microsoft.com/en-us/library/dd144876(VS.85).aspx

Returns an empty string on any error.

152.9.21 GetForm(name as string) as WindowsPageFormatMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetForm function retrieves information about a specified form.
Example:

```
// query default printer
Var w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)

// get a page format
Var f as WindowsPageFormatMBS = w.GetForm("Letter")

// and show details
MessageBox f.DisplayName+" "+str(F.SizeWidth/10000,"0.0")+" x "+str(f.SizeHeight/10000,"0.0")
```

Notes: name: The string that specifies the name of the form. To get the names of the forms supported by the printer, call the GetPrinterFormats function.

On failure returns nil, on success the form details.

This is a blocking or synchronous function and might not return immediately. How quickly this function

returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

If the caller is remote, and the Form Mode is 2, the StringType value of the returned WindowsPageFormatMBS will always be STRING_LANGPAIR.

152.9.22 GetJob(JobID as Integer) as WindowsPrinterJobMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Query job with given ID from printer.
Notes: Returns nil on any error.
PrinterName property must be set, so the function knows which printer.

152.9.23 GetPrinterFormats as WindowsPageFormatMBS()

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the page formats supported by this printer.
Notes: On failure the array is empty.

This function uses the EnumForms for which you can find more information on this website:
http://msdn.microsoft.com/en-us/library/dd162624(v=VS.85).aspx

152.9.24 GetPrinterSettings(Mode as Integer=2) as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries printer settings.
Example:

```
Var w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)
Var dm as WindowsDeviceModeMBS = w.GetPrinterSettings
```

Notes: Mode can be 2 (general printer information), 8 (global settings) or 9 (user settings).

For more information on the GetPrinter function, check this website:
http://msdn.microsoft.com/en-us/library/dd144911(VS.85).aspx

152.9.25 GetPrinterTechnology as string

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the printer technology.
Example:

```
Var w as new WindowsPrinterMBS("my printer")
MessageBox w.GetPrinterTechnology
```

Notes: Opens the printer, queries the print technology and returns that string.
For postscript printers the string should contain the word "postscript".
Returns an empty string on any error.

For details on this function, check the following website:
http://msdn.microsoft.com/en-us/library/dd144931(VS.85).aspx

152.9.26 OpenPrinter(PrinterName as string, admin as boolean = false) as WindowsPrinterMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Opens the printer so you can operate on it.
Notes: Admin: whether you want to get permissions to administrate.
Returns nil on any error.

152.9.27 PauseJob(JobID as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Pause the print job.
Notes: Returns true on success and false on failure.

152.9.28 PausePrinter as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Pauses the printer.
Example:

```
Var name as string = WindowsPrinterMBS.GetDefaultPrinter
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name, true)
```

```
if p.PausePrinter then
MessageBox "OK"
else
MessageBox "Failed: "+p.LasterrorMessage+" "+str(p.Lasterror)
end if
```

Notes: Requires application to be run by administrator and printer opened with admin option. Else you get error 5.
Returns true on success and false on failure.

152.9.29 PrinterProperties(parent as DesktopWindow) as boolean

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The PrinterProperties function displays a printer-properties property sheet for the specified printer.
Example:

```
// get default printer
Var w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)

// open properties dialog
if w.PrinterProperties(Window1) then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: Returns true on success (dialog shows) or false on error.
Parent is the parent window for the new dialog. Can be nil.
See also:

- 152.9.30 PrinterProperties(parent as window = nil) as boolean 20305

152.9.30 PrinterProperties(parent as window = nil) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The PrinterProperties function displays a printer-properties property sheet for the specified printer.
Example:

```
// get default printer
Var w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)
```

```
// open properties dialog
if w.PrinterProperties(Window1) then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: Returns true on success (dialog shows) or false on error.
Parent is the parent window for the new dialog. Can be nil.
See also:

- 152.9.29 PrinterProperties(parent as DesktopWindow) as boolean 20305

152.9.31 PurgePrinter as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Purges the printer.
Example:

```
Var name as string = WindowsPrinterMBS.GetDefaultPrinter
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name, true)

if p.PurgePrinter then
MessageBox "OK"
else
MessageBox "Failed: "+p.LasterrorMessage+" "+str(p.Lasterror)
end if
```

Notes: Requires application to be run by administrator and printer opened with admin option. Else you get error 5.
Returns true on success and false on failure.

152.9.32 ResumeJob(JobID as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Resume a paused print job.
Notes: Returns true on success and false on failure.

152.9.33 ResumePrinter as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Resumes the printer.
Example:

```
Var name as string = WindowsPrinterMBS.GetDefaultPrinter
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name, true)

if p.ResumePrinter then
MessageBox "OK"
else
MessageBox "Failed: "+p.LasterrorMessage+" "+str(p.Lasterror)
end if
```

Notes: Requires application to be run by administrator and printer opened with admin option. Else you get error 5.
Returns true on success and false on failure.

152.9.34 SetDefaultPrinter(PrinterName as string) as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Changes the default printer to the given one.
Example:

```
call WindowsPrinterMBS.SetDefaultPrinter("My Printer")
```

Notes: Returns a Windows error code. (0 for success)

For details on the Windows SetDefaultPrinter method, check here:
http://msdn.microsoft.com/en-us/library/dd162971(VS.85).aspx

152.9.35 SetForm(name as string, form as WindowsPageFormatMBS) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The SetForm function sets the form information for the specified printer.
Notes: name: The string that specifies the form name for which the form information is set.
Form: The form data. Mode property must be either 1 (older format) or 2 (newer format).

Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver im-

plementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

SetForm can be called multiple times for an existing WindowsPageFormatMBS, each call adding additional pairs of DisplayName and LangId values. All languages versions of the form will get the Size and ImageableArea values of the WindowsPageFormatMBS in the most recent call to SetForm.
If the caller is remote and the form's Mode is 2, the StringType value of the WindowsPageFormatMBS cannot be STRING_MUIDLL.

152.9.36 SetJob(JobID as Integer, job as WindowsPrinterJobMBS) as boolean

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets job parameters.
Example:

```
Var w as new WindowsPrinterMBS( WindowsPrinterMBS.GetDefaultPrinter, true)
Var jobs() as WindowsPrinterJobMBS = w.AllJobs
MessageBox str(jobs.Count)+" jobs"

// pick first
Var j as WindowsPrinterJobMBS = jobs(0)
j.Document = "Hello World"

// write back values
call w.SetJob(j.JobID, j)

// error?
if w.Lasterror<>0 then
MessageBox w.LasterrorMessage
end if
```

Notes: see also
http://msdn.microsoft.com/en-us/library/windows/desktop/dd162978(v=vs.85).aspx

152.9.37 SetPrinterSettings(value as WindowsDeviceModeMBS, Mode as Integer=2) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets printer settings.
Example:

```
// switch default printer to A5 landscape paper
```

```
Var name as string = WindowsPrinterMBS.GetDefaultPrinter
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name, false)
Var d as WindowsDeviceModeMBS = p.GetPrinterSettings(9)

if d = nil then
MessageBox p.LasterrorMessage
else
d.PaperSize = d.DMPAPER_A5
d.Fields = BitwiseOr(d.Fields, d.DM_PAPERSIZE)
d.Orientation = d.DMORIENT_LANDSCAPE
d.Fields = BitwiseOr(d.Fields, d.DM_ORIENTATION)

if p.SetPrinterSettings(d, 9) then
MessageBox "OK"
else
MessageBox "Failed: "+p.LasterrorMessage
end if
end if
```

Notes: Mode can be 2 (general printer information), 8 (global settings) or 9 (user settings).

For more information on the GetPrinter function, check this website:
http://msdn.microsoft.com/en-us/library/dd145082(v=vs.85).aspx

152.9.38 Properties

152.9.39 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal handle to the printer.
Notes: (Read and Write property)

152.9.40 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last windows error code.
Notes: (Read and Write property)

152.9.41 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The text message for the last error code.
Notes: (Read and Write property)

152.9.42 PrinterName as String

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the open printer in this object.
Example:

```
Var name as string = WindowsPrinterMBS.GetDefaultPrinter
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name)
MessageBox p.PrinterName
```

Notes: (Read and Write property)

Chapter 153

Process

153.1 class Application

153.1.1 class Application

Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Extends the Application class inside Xojo.

153.1.2 Methods

153.1.3 ApplicationCreatorCodeMBS as string

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns the Creator Code of the application.
Example:

MessageBox "Hi. This application has the creator code "+app.ApplicationCreatorCodeMBS

Notes: Only useful on Mac OS.
If you run your app inside the Xojo IDE it will return "RBv2" which is Xojo's Creator code sind Xojo 2.0.
Blog Entries

- MBS Xojo Plugins, version 19.4pr1

153.1.4 ApplicationFileMBS as folderitem

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use ExecutableFile instead.
Function: Gives a folderitem to the applications file.
Example:

MessageBox "Hi. The file of this application is named "+app.ApplicationFileMBS.name

Notes: Inside Xojo points to the Xojo application.

This item may go in the future. Please use app.executablefile in new Xojo versions.
Blog Entries

- MBS Plugins updated for Xojo 2019r2
- MBS Xojo Plugins, version 19.4pr1

Xojo Developer Magazine

- 3.1, page 42: Register Document File Types, Fill and Query the Registry by Christian Schmitz

153.1.5 ApplicationNameMBS as string

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns the name of the application.
Example:

MessageBox "Hi. This application is named "+app.ApplicationNameMBS

Notes: This may not be the exact same name than the filename.

153.1.6 ArgumentsMBS as String()

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries arguments of process.
Notes: Returns nil in case of any error (low memory).
First entry in result is path to current app.
Other entries are parameters, without any quotes.

153.1.7 BundleFolderMBS as folderitem

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns a folderitem to the bundle's mail folder.

153.1.8 BundleLocalizedStringMBS(key as string) as string

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns the localized string for the given key from the default table.
Notes: A short version for BundleLocalizedString which uses the default table.
See also:

- 153.1.9 BundleLocalizedStringMBS(key as string,fromtable as string) as string 20313

153.1.9 BundleLocalizedStringMBS(key as string,fromtable as string) as string

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns the localized string for the given key and table.
Example:

```
// You may make yourself a function to look up for the key and return
// This function was not tested in a real application. May contain a bug.

function Localize(key as string, default as string) as string
Var s as string

s=app.BundleLocalizedStringMBS(key)
if s="" then
s=default // For Mac OS Classic and Windows
elseif s=key then // returns key for not localized items
MessageBox "For developer: the key """+key+""" was not localized for any language."
end if

return s
end sub

// use like this
FileOpen.text=Localize("FileOpenLabel", "Open...")
```

Notes: The table parameter is optional to specify which ".strings"-file to use.
without table or table="" the "Localizable.strings" file is used by Mac OS X.

Returns "" (empty string) on Mac OS Classic or Windows.
See also:

- 153.1.8 BundleLocalizedStringMBS(key as string) as string 20313

153.1.10 BundleResourceFolderItemLocalizedMBS(ResourceName as string, ResourceType as string, SubDirectory as string) as folderitem

MBS Util Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop only.

Function: Searches inside the application bundle for a file.
Example:

```
Var f as FolderItem
f=app.BundleResourceFolderItemLocalizedMBS("logo","jpg","")
MessageBox f.NativePath
```

Notes: ResourceName is the filename of the resource file.
ResourceType is the file extension.
SubDirectory is the name of the directory.
This function will take care for localization folders.

153.1.11 BundleResourceFolderMBS as folderitem

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns a folderitem to the resource file inside the bundle.
Example:

```
Var f As FolderItem = App.BundleResourceFolderMBS

If f = Nil Then
MessageBox "Failed?"
Else
MessageBox f.NativePath
End If
```

153.1.12 HideMeMBS as boolean

MBS Util Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop only.

Function: Hides the current application.
Notes: Returns true if the current application was hidden.

153.1.13 HideOthersMBS as boolean

MBS Util Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop only.

Function: Hides all applications except the current one.
Notes: Returns true if the other applications were hidden.

153.1.14 LaunchTimeMBS as Double

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns the ticks value at launch time.
Example:

```
Var d as date

d=new date
d.totalSeconds=d.totalSeconds-(ticks-app.launchTimeMBS)/60

MessageBox d.longdate+" "+d.longtime
```

Notes: This value must be converted to the secondsvalue like in the example.
-1 on Windows.
For Mac OS X see the DarwinResourceUsageMBS class.

153.1.15 MainBundleMBS as CFBundleMBS

MBS MacCF Plugin, Platform: macOS, Targets: Desktop only.

Function: If your application is a bundle, this function returns your own bundle.
Notes: Returns nil on any error.

Works for Console, Desktop and Web projects. Version 19.4 declares this method for ConsoleApplication and Application class.

153.1.16 NSApplicationMBS as NSApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns the shared NSApplication object.
Notes: This method gives easy access to the NSApplicationMBS class.

The plugin makes sure that there is only one application object by returning the same object each time. Works for Console, Desktop and Web projects. Version 19.4 declares this method for ConsoleApplication and Application class.

153.1.17 OverlayApplicationDockTileImageMBS(pic as CGImageMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop only.

Function: Adds a picture on top of the application dock title.
Example:

```
static n as Integer // global property
Var p as picture
Var m as picture
Var g as graphics
Var s as string
Var w,h,x as Integer

n=n+1 // add one
s=str(n)
m=New Picture(128,128,32)
p=New Picture(128,128,32)

g=p.graphics
g.textsize=24
w=g.stringwidth(s)
h=g.stringheight(s,0)
x=125-w-10
g.foreColor=rgb(255,0,0)
g.fillRoundRect x,10,10+w,10+h,20,20
g.foreColor=rgb(0,0,0)
g.drawstring s,x+5,15+g.textascent

g=m.graphics
g.foreColor=rgb(0,0,0)
g.fillRoundRect x,10,10+w,10+h,20,20

if app.OverlayApplicationDockTileImageMBS(CGCreateImageMBS(p,m)) then
end if
```

Notes: Changed in MBS Plugin 2.7 to use CGImages directly.
Added support for 64-bit in plugin version 16.0.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.5pr2

153.1.18 ProcessTimeMBS as Double

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns the current CPU time for the process.
Example:

```
MessageBox "I got "+format(app.ProcessTimeMBS/100,"0.00")+" seconds CPU time till now."
```

Notes: On Mac OS X, the OS counts how much CPU time in given to the current process.
Returns -1 in case of an error.

You can do this function yourself if you like:

```
Var s as SoftDeclareMBS

s=new SoftDeclareMBS

if s.LoadLibrary("System.Framework") then
if s.LoadFunction("clock") then
if s.Call(0,nil) then
MessageBox "clock: "+str(s.Result)+chr(13)+"app.ProcessTime: "+str(app.ProcessTime)
end if
end if
end if
```

You may need to add Error Checking code.

153.1.19 RestoreApplicationDockTileImageMBS as boolean

MBS MacCG Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop only.

Function: Restores the application dock tile image.
Example:

```
if app.RestoreApplicationDockTileImageMBS then
// ok
end if
```

Notes: Added support for 64-bit in plugin version 16.0.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.5pr2

153.1.20 SetApplicationDockTileImageMBS(pic as CGImageMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop only.

Function: Sets the application dock tile image.
Example:

```
Var p as CGImageMBS = CGImageMBS.CreateImage(LogoMBS(500))

if app.SetApplicationDockTileImageMBS(p) then
// ok
end if
```

Notes: Changed in MBS Plugin 2.7 to use CGImages directly.
Added support for 64-bit in plugin version 16.0.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.5pr2

153.1.21 Properties

153.1.22 FrontmostMBS as boolean

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns true if the application is frontmost.
Example:

```
app.frontmostmbs=True 'bring app to front
```

Notes: This property is for read and write. Writing to it brings the app to front.
Setting this property to false does nothing.

If you need to make some other application frontmost, you can use app.HideMeMBS or use the ProcessMBS class.

Implemented for Windows in version 19.2. When querying, we check if the front window belongs to our application. When setting the plugin builds a list of all FileMaker windows. Than we activate the top most of them and move all other windows in z order behind.
(Read and Write computed property)

153.2 class AutoMutexMBS

153.2.1 class AutoMutexMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class to auto unlock a mutex.
Notes: Auto unlocks in the mutex in the destructor if needed.
Blog Entries

- News from the MBS Xojo Plugins in version 26.3
- MonkeyBread Software Releases the MBS Xojo Plugins in version 26.3
- AutoMutexMBS: Automatic Mutex Management in MBS Plugins 26.3
- MBS Xojo Plugins, version 26.3pr1

153.2.2 Methods

153.2.3 Unlock

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Manually unlocks the mutex.
Notes: Only performs unlock when locked property is true.

153.2.4 Properties

153.2.5 Locked as Boolean

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the mutex is locked by this object.
Notes: This becomes false if you call Unlock.
(Read and Write property)

153.2.6 Mutex as MutexMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parent mutex.
Notes: (Read and Write property)

153.3 module CallDelegateCrashSafeMBS

153.3.1 module CallDelegateCrashSafeMBS

MBS Util Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The module to call a delegate and catch a crash.
Example:

```
Try

System.DebugLog "Try the call..."

CallDelegateCrashSafeMBS AddressOf TestMethod

System.DebugLog "Call succeeded!"

Catch c As DelegateCrashExceptionMBS

System.DebugLog "Caught exception!"
System.DebugLog c.Message

End Try
```

Notes: We can catch the following conditions:

- Invalid pointer access
- Invalid instruction
- Floating point exception
- Wrong system call
- Broken pipe
- Bus error

We may crash ourselves on stack corruption and we print the stack trace to stderr for macOS and Linux for debugging.

If a crash is caught, there may be memory leaked as objects allocated in the called method are not freed. The call function can not be used recursively and only on one thread at the time.

153.3.2 Methods

153.3.3 CallDelegateCrashSafeMBS(m as DelegateCrashSafeMBS)

MBS Util Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Calls a method that may crash.
Example:

```
Try

System.DebugLog "Try the call..."

CallDelegateCrashSafeMBS AddressOf TestMethod

System.DebugLog "Call succeeded!"

Catch c As DelegateCrashExceptionMBS

System.DebugLog "Caught exception!"
System.DebugLog c.Message

End Try
```

Notes: Raises DelegateCrashExceptionMBS if a crash happens.

The call function can not be used recursively and only on one thread at the time.

153.3.4 PrintBacktraceMBS

MBS Util Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Prints the stack trace.
Notes: Utility function to help debugging.

153.3.5 Properties

153.3.6 CallCounter as Integer

MBS Util Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of calls made.
Notes: (Read only property)

153.3.7 CrashCounter as Integer

MBS Util Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of crashes caught.
Notes: (Read only property)

153.3.8 Delegates

153.3.9 DelegateCrashSafeMBS()

MBS Util Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The delegate definition for a simple method to call.
Blog Entries

- Stacktraces for Windows

Xojo Developer Magazine

- 21.1, page 9: News

153.4 module CallDelegatesMBS

153.4.1 module CallDelegatesMBS

MBS Util Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The module for the call delegate methods.
Example:

```
// run a method on the main thread, e.g. to update the GUI from a preemptive thread
CallDelegatesMBS.CallDelegateOnMainThreadMBS AddressOf UpdateStatus

// a method in the window:
Sub UpdateStatus()
Self.Title = "Done at " + DateTime.Now.SQLDateTime
End Sub
```

Notes: Only supported on Xojo 2013r1 and newer.
Blog Entries

- MBS Xojo Plugins, version 23.6pr1
- New in MBS Xojo Plugins in version 23.1
- MonkeyBread Software Releases the MBS Xojo Plugins in version 23.1

- MonkeyBread Software Releases the MBS Xojo / Real Studio plug-ins in version 14.0

153.4.2 Methods

153.4.3 CallDelegateOnMainThreadMBS(m as __delegateMBS)

MBS Util Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a delegate on the main thread.
Example:

```
CallDelegateOnMainThreadMBS AddressOf testString, "Hello"
CallDelegateOnMainThreadMBS AddressOf testNumbers, 5, 6
CallDelegateOnMainThreadMBS AddressOf TestNoParameters
CallDelegateOnMainThreadMBS AddressOf Test, "4th call", 4
```

Notes: We call the delegate on the main thread later with passing a parameter
Our plugin supports various combinations of up to 2 parameters of type string, variant, boolean, double, integer and object.
If you need more, please contact us.

Only supported on Xojo 2013r1 and newer.

If the method you call has optional parameters, you must pass all values or Xojo will throw a compile error.

153.4.4 CallDelegateOnPreemptiveThreadMBS(m as _delegateMBS) as Boolean

MBS Util Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Calls a delegate on a preemptive thread.
Notes: Experimental function to play with preemptive-threads in Xojo apps.

Some rules:

- No objects, no strings, no arrays
- Use Ptr, not Memoryblocks
- Crashes in debugger, so only use in built app
- Use #Pragma BackgroundTasks False
- Use #Pragma BreakOnExceptions False
- Use #Pragma StackOverflowChecking False
- Use #Pragma NilObjectChecking False
- No exceptions
- Delegate must be stored in global variable to avoid it getting freed early.
- You can pass up to one ptr as data parameter.
- Declares may work, but should be pre-used to make sure they don't raise an exception and are loaded.

uses thread pool on iOS, macOS and Windows. Otherwise regular threads.
See also:

- 153.4.5 CallDelegateOnPreemptiveThreadMBS(m as _delegatePtrMBS, data as Ptr) as Boolean 20324

153.4.5 CallDelegateOnPreemptiveThreadMBS(m as _delegatePtrMBS, data as Ptr) as Boolean

MBS Util Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a delegate on a preemptive thread and passes a ptr.
Notes: Experimental function to play with preemptive-threads in Xojo apps.

Some rules:

- No objects, no strings, no arrays
- Use Ptr, not Memoryblocks
- Crashes in debugger, so only use in built app
- Use #Pragma BackgroundTasks False
- Use #Pragma BreakOnExceptions False
- Use #Pragma StackOverflowChecking False
- Use #Pragma NilObjectChecking False
- No exceptions
- Delegate must be stored in global variable to avoid it getting freed early.
- You can pass up to one ptr as data parameter.
- Declares may work, but should be pre-used to make sure they don't raise an exception and are loaded.

uses thread pool on iOS, macOS and Windows. Otherwise regular threads.
See also:

- 153.4.4 CallDelegateOnPreemptiveThreadMBS(m as _delegateMBS) as Boolean 20324

153.5 Globals

153.5.1 CallMethodLaterMBS(target as object, name as string, afterDelay as Double) as boolean

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a method on the target object on the main thread after the given delay in seconds.
Example:

```
if CallMethodLaterMBS(Window1, "Test", 5.0) then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: The method must be declared on the given class for the target object with no parameters and no return values.

The method will be called later (Asyncronously) on the main thread. Useful for performing non thread safe stuff like GUI functions on the main thread after the given delay in seconds.

Returns true on success and false on failure.
The time given is just a roughly suggestions. Actual time on the method call depends on how busy your application is.
See also:

- 153.5.2 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant) as boolean 20326
- 153.5.3 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant, value2 as Variant) as boolean 20327
- 153.5.4 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant, value2 as Variant, value3 as Variant) as boolean 20328

153.5.2 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant) as boolean

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a method on the target object on the main thread after the given delay in seconds.
Example:

```
if CallMethodLaterMBS(Window1, "Test", 4.0, "Hello") then
MessageBox "OK"
```

```
else
MessageBox "Failed"
end if
```

Notes: The method must be declared on the given class for the target object with one variant parameter and no return values.

The method will be called later (Asyncronously) on the main thread after the given delay in seconds. Useful for performing non thread safe stuff like GUI functions on the main thread.

Returns true on success and false on failure.
The time given is just a roughly suggestions. Actual time on the method call depends on how busy your application is.
See also:

- 153.5.1 CallMethodLaterMBS(target as object, name as string, afterDelay as Double) as boolean 20326
- 153.5.3 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant, value2 as Variant) as boolean 20327
- 153.5.4 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant, value2 as Variant, value3 as Variant) as boolean 20328

153.5.3 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant, value2 as Variant) as boolean

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a method on the target object on the main thread after the given delay in seconds.
Example:

```
if CallMethodLaterMBS(Window1, "Test", 3.0, "Hello", "World") then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: The method must be declared on the given class for the target object with two variant parameters and no return values.

The method will be called later (Asyncronously) on the main thread. Useful for performing non thread safe stuff like GUI functions on the main thread after the given delay in seconds.

Returns true on success and false on failure.
The time given is just a roughly suggestions. Actual time on the method call depends on how busy your

application is.
See also:

- 153.5.2 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant) as boolean 20326
- 153.5.4 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant, value2 as Variant, value3 as Variant) as boolean 20328

153.5.4 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant, value2 as Variant, value3 as Variant) as boolean

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a method on the target object on the main thread after the given delay in seconds.
Example:

```
if CallMethodLaterMBS(Window1, "Test", 3.0, "Hello", "World", 5) then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: The method must be declared on the given class for the target object with three variant parameters and no return values.

The method will be called later (Asyncronously) on the main thread. Useful for performing non thread safe stuff like GUI functions on the main thread after the given delay in seconds.

Returns true on success and false on failure.
The time given is just a roughly suggestions. Actual time on the method call depends on how busy your application is.

- 153.5.6 CallMethodMBS(target as object, name as string, value1 as Variant) as boolean 20329
- 153.5.8 CallMethodMBS(target as object, name as string, value1 as Variant, value2 as Variant, value3 as Variant) as boolean 20330

153.5.8 CallMethodMBS(target as object, name as string, value1 as Variant, value2 as Variant, value3 as Variant) as boolean

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a method on the target object.
Example:

```
if CallMethodMBS(Window1, "Test", "Hello", "World", 5) then
MessageBox "OK"
```

```
else
MessageBox "Failed"
end if
```

Notes: The method must be declared on the given class for the target object with three variant parameters and no return values.

Returns true on success and false on failure.

153.5.9 CallMethodOnMainThreadMBS(target as object, name as string) as boolean

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a method on the target object on the main thread.
Example:

```
if CallMethodOnMainThreadMBS(Window1, "Test") then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: The method must be declared on the given class for the target object with no parameters and no return values.

The method will be called later (Asyncronously) on the main thread. Useful for performing non thread safe stuff like GUI functions on the main thread.

Returns true on success and false on failure.
Deprecated, please use CallDelegatesMBS.CallDelegateOnMainThreadMBS instead.

153.5.10 CallMethodOnMainThreadMBS(target as object, name as string, value1 as Variant) as boolean

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a method on the target object on the main thread.
Example:

```
if CallMethodOnMainThreadMBS(Window1, "Test", "Hello") then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: The method must be declared on the given class for the target object with one variant parameter and no return values.

The method will be called later (Asyncronously) on the main thread. Useful for performing non thread safe stuff like GUI functions on the main thread.

Returns true on success and false on failure.

153.5.13 GetDarwinVMStatisticsMBS as DarwinVMStatisticsMBS

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: Returns information about the current memory status on Mac OS X.
Example:

```
Var d as DarwinVMStatisticsMBS

d=GetDarwinVMStatisticsMBS

if d=nil then
MessageBox "No Darwin running :-("
quit
else
Var lines(-1) as string

lines.Add format(d.pageins,"0")+" pageins"
lines.Add format(d.pageouts,"0")+" pageouts"
lines.Add format(d.pagesize,"0")+" pagesize"
lines.Add format(d.freepages,"0")+" freepages"
```

```
lines.Add format(d.activepages,"0")+" activepages"
lines.Add format(d.inactivepages,"0")+" inactivepages"
lines.Add format(d.wiredpages,"0")+" wiredpages"
lines.Add format(d.zerofillpages,"0")+" zerofillpages"
lines.Add format(d.reactivations,"0")+" reactivations"
lines.Add format(d.faults,"0")+" faults"
lines.Add format(d.cowfaults,"0")+" cowfaults"
lines.Add format(d.lookups,"0")+" lookups"
lines.Add format(d.hits,"0")+" hits"

MessageBox Join(lines,EndOfLine)
end if
```

153.5.14 GetDarwinResourceUsageMBS as DarwinResourceUsageMBS

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Get information about resource utilization.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.IntegralMaxResidentSetSize)
```

Notes: Returns nil on any error.
For more information type "man getrusage" in the Mac OS X Terminal.

153.5.15 SetThreadNameMBS(name as string)

MBS Util Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the name of current thread.
Example:

```
SetThreadNameMBS "SQL Query Thread"
```

Notes: This is useful to see thread name in crash reports or sample reports.
Blog Entries

- MBS Xojo plug-ins in version 16.0
- Thread Names
- MBS Xojo / Real Studio Plugins, version 15.5pr2

153.5.16 CountProcessesMBS as Integer

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Counts how many processes are running.
Example:

```
// show how many processes are running
MessageBox CountProcessesMBS.ToString + " processes are running."
```

Notes: Short for this function:

```
function CountProcesses as Integer
Var n as Integer
Var p as ProcessMBS

p=new ProcessMBS
p.getfirstProcess
n=1
while p.getnextProcess
n=n+1
wend

return n
end if
```

153.5.17 GetWindowsVMStatisticsMBS as WindowsVMStatisticsMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns information about the current memory status on Windows.
Example:

```
Var w as WindowsVMStatisticsMBS

w=GetWindowsVMStatisticsMBS
if w<>nil then

list.AddRow format(w.pagesize,"0")
list.AddRow format(w.memoryLoad,"0")
list.AddRow format(w.availablePageFileMemory,"0")
list.AddRow format(w.availablePhysicalMemory,"0")
list.AddRow format(w.availableVirtualMemory,"0")
list.AddRow format(w.totalPageFileMemory,"0")
list.AddRow format(w.totalPhysicalMemory,"0")
list.AddRow format(w.totalVirtualMemory,"0")
```

```
else

MessageBox "No Windows memory statistics..."
quit
end if
```

Notes: See also WindowsProcessStatisticsMBS for the application.

153.6 class ConsoleApplication

153.6.1 class ConsoleApplication

Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Console only.

Function: Extends the ConsoleApplication class inside Xojo.

153.6.2 Methods

153.6.3 ArgumentsMBS as String()

MBS Util Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Console only.

Function: Queries arguments of process.
Notes: Returns nil in case of any error (low memory).
First entry in result is path to current app.
Other entries are parameters, without any quotes.

Works for Console, Desktop and Web projects. Version 19.4 declares this method for ConsoleApplication and Application class.

153.6.4 LaunchTimeMBS as double

MBS Util Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Console only.

Function: Returns the ticks value at launch time.
Example:

```
Var d as date

d=new date
```

d.totalSeconds=d.totalSeconds-(ticks-app.launchTimeMBS)/60

MessageBox d.longdate+" "+d.longtime

Notes: This value must be converted to the secondsvalue like in the example.
-1 on Windows.
For Mac OS X see the DarwinResourceUsageMBS class.

Works for Console, Desktop and Web projects. Version 19.4 declares this method for ConsoleApplication and Application class.

153.6.5 MainBundleMBS as CFBundleMBS

MBS MacCF Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Console only.

Function: If your application is a bundle, this function returns your own bundle.
Notes: Returns nil on any error.
For console application, returns the bundle referencing the console app file.

Works for Console, Desktop and Web projects. Version 19.4 declares this method for ConsoleApplication and Application class.

153.6.6 NSApplicationMBS as NSApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Console only.

Function: Returns the shared NSApplication object.
Notes: This method gives easy access to the NSApplicationMBS class.

The plugin makes sure that there is only one application object by returning the same object each time.
Works for Console, Desktop and Web projects. Version 19.4 declares this method for ConsoleApplication and Application class.

153.6.7 ProcessTimeMBS as double

MBS Util Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Console only.

Function: Returns the current CPU time for the process.
Example:

MessageBox "I got "+format(app.ProcessTimeMBS/100,"0.00")+" seconds CPU time till now."

Notes: On Mac OS X, the OS counts how much CPU time in given to the current process.
On Mac OS 9 you can get this information for any process using the ProcessMBS class.
Returns -1 in case of an error.

You can do this function yourself if you like:

```
Var s as SoftDeclareMBS

s=new SoftDeclareMBS

if s.LoadLibrary("System.Framework") then
if s.LoadFunction("clock") then
if s.Call(0,nil) then
MessageBox "clock: "+str(s.Result)+chr(13)+"app.ProcessTime: "+str(app.ProcessTime)
end if
end if
end if
```

You may need to add Error Checking code.

Works for Console, Desktop and Web projects. Version 19.4 declares this method for ConsoleApplication and Application class.

153.7 class DarwinGroupListMBS

153.7.1 class DarwinGroupListMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The list of Groups on a Mac OS X system.
Example:

```
Var l as new DarwinGroupListMBS
MessageBox str(l.Count)+" groups"
```

153.7.2 Methods

153.7.3 CurrentEffectiveUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The effective user ID of the calling process.
Example:

```
Var l as new DarwinGroupListMBS
MessageBox str(l.CurrentEffectiveUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

153.7.4 CurrentGroupID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real group ID of the calling process.
Example:

```
Var l as new DarwinGroupListMBS
MessageBox "CurrentGroupID: "+str(l.CurrentGroupID)
```

Notes: The real group ID is specified at login time.

153.7.5 CurrentUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real user ID of the calling process.
Example:

```
Var l as new DarwinGroupListMBS
MessageBox "CurrentUserID: "+str(l.CurrentUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

153.7.6 Group(index as Integer) as DarwinGroupMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Returns the Group with the given index.
Example:

```
Var l as new DarwinGroupListMBS
Var c as Integer = l.Count-1
Var names(-1) as string
for i as Integer = 0 to c
Var g as DarwinGroupMBS = l.Group(i)
names.Add g.Name
next
MessageBox Join(names,EndOfLine)
```

153.7.7 Properties

153.7.8 Count as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The number of Groups on this Mac OS X system.
Example:

```
Var l as new DarwinGroupListMBS
MessageBox str(l.Count)+" groups"
```

Notes: (Read only property)

153.8 class DarwinGroupMBS

153.8.1 class DarwinGroupMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: A class with information about a Group on Mac OS X.
Example:

```
Var g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID
MessageBox g.Name
```

Blog Entries

- MBS Xojo Plugins, version 19.4pr1

153.8.2 Methods

153.8.3 CurrentEffectiveUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The effective user ID of the calling process.
Example:

```
Var g as new DarwinGroupMBS
MessageBox "CurrentEffectiveUserID: "+str(G.CurrentEffectiveUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

153.8.4 CurrentGroupID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real group ID of the calling process.
Example:

```
Var g as new DarwinGroupMBS
MessageBox "CurrentGroupID: "+str(G.CurrentGroupID)
```

Notes: The real group ID is specified at login time.

153.8.5 CurrentUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real user ID of the calling process.
Example:

```
Var g as new DarwinGroupMBS
MessageBox "CurrentUserID: "+str(G.CurrentUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

153.8.6 LoadGroupByID(Groupid as Integer)

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Fills the properties of this class with the values for the Group with the given ID.
Example:

```
Var g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID
MessageBox g.Name
```

153.8.7 LoadGroupByName(name as string)

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Fills the properties of this class with the values for the given Group.
Example:

```
Var g as new DarwinGroupMBS
g.LoadGroupByName "staff"
MessageBox g.Name
```

153.8.8 UserName(index as Integer) as string

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The Group ID of this Group.
Example:

```
Var g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID

Var c as Integer = g.UserCount-1
for i as Integer = 0 to c
MessageBox g.UserName(i)
next
```

153.8.9 Properties

153.8.10 GroupID as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The group ID of the Group.
Example:

```
Var g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID
MessageBox "GroupID: "+str(G.GroupID)
```

Notes: (Read only property)

153.8.11 Name as string

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The name of the Group.
Example:

```
Var g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID
MessageBox "Name: "+g.Name
```

Notes: (Read only property)

153.8.12 Password as string

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The password for this group.
Notes: (Read only property)

153.8.13 Ready as Boolean

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: whether the values in this class were filled correctly.
Notes: (Read only property)

153.8.14 UserCount as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The number of users in this group.
Example:

```
Var g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID
MessageBox "UserCount: "+str(G.UserCount)
```

Notes: (Read only property)

153.9 class DarwinHostVMStatisticsMBS

153.9.1 class DarwinHostVMStatisticsMBS

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Queries memory host statistics for macOS and iOS.
Example:

```
Var d As New DarwinHostVMStatisticsMBS

Var FreeMB As Integer = d.FreeCount * d.Pagesize / 1024 / 1024
Var ActiveMB As Integer = d.ActiveCount * d.Pagesize / 1024 / 1024
Var InactiveMB As Integer = d.InactiveCount * d.Pagesize / 1024 / 1024
Var WiredMB As Integer = d.WireCount * d.Pagesize / 1024 / 1024
Var CompressedMB As Integer = d.CompressorPageCount * d.Pagesize / 1024 / 1024

Var Sum As Integer = FreeMB + ActiveMB + WiredMB + InactiveMB + CompressedMB

MessageBox _
"Free: " + FreeMB.ToString+EndOfLine+_
"Active: " + ActiveMB.ToString+EndOfLine+_
"Inactive: " + InactiveMB.ToString+EndOfLine+_
"Wired: " + WiredMB.ToString+EndOfLine+_
"Compressed: " + CompressedMB.ToString+EndOfLine+_
"Total: "+Sum.ToString
```

- MonkeyBread Software Releases the MBS Xojo Plugins in version 24.3
- MBS Xojo Plugins, version 24.3pr2

153.9.2 Methods

153.9.3 Constructor

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: The constructor.
Notes: Fills in the values or raises an exception.

153.9.4 Properties

153.9.5 ActiveCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages active
Notes: (Read only property)

153.9.6 Compressions as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages compressed
Notes: (Read only property)

153.9.7 CompressorPageCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages used by the compressed pager to hold all the compressed data
Notes: (Read only property)

153.9.8 CopyOnWriteFaults as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of copy-on-writes.
Notes: If you allocate memory, e.g. for a memoryblock, you get zero fill pages. Which means you get virtual memory, not physical. As soon as you touch a zero fill memory page, it triggers a copy on write to make a private copy for you.
(Read only property)

153.9.9 Decompressions as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages decompressed
Notes: (Read only property)

153.9.10 ExternalPageCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages that are file-backed (non-swap)
Notes: For example application code is paged in.
(Read only property)

153.9.11 Faults as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of faults
Notes: (Read only property)

153.9.12 FreeCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages free.
Example:

```
Var d As New DarwinHostVMStatisticsMBS

MessageBox str(d.FreeCount * d.Pagesize, "0")+" bytes free"
```

Notes: (Read only property)

153.9.13 Hits as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: object cache hits
Notes: (Read only property)

153.9.14 InactiveCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages inactive.
Notes: (Read only property)

153.9.15 InternalPageCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages that are anonymous.
Notes: (Read only property)

153.9.16 Lookups as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: object cache lookups
Notes: (Read only property)

153.9.17 PageIns as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pageins
Notes: (Read only property)

153.9.18 PageOuts as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pageouts
Notes: (Read only property)

153.9.19 Pagesize as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: The size of a page in bytes.
Notes: Page size is different for Intel vs. Apple Silicon.
(Read only property)

153.9.20 PurgeableCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages purgeable.
Notes: (Read only property)

153.9.21 Purges as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages purged.
Notes: (Read only property)

153.9.22 Reactivations as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages reactivated
Notes: (Read only property)

153.9.23 SpeculativeCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages speculative read.
Notes: Speculative pages are already accounted for in FreeCount, so SpeculativeCount is the number of "free" pages that are used to hold data that was read speculatively from disk but haven't actually been used by anyone so far.
(Read only property)

153.9.24 SwapIns as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages swapped in (via compression segments)
Notes: (Read only property)

153.9.25 SwapOuts as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages swapped out (via compression segments)
Notes: (Read only property)

153.9.26 ThrottledCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages throttled
Notes: (Read only property)

153.9.27 TotalUncompressedPagesInCompressor as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages (uncompressed) held within the compressor.
Notes: (Read only property)

153.9.28 WireCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages wired down.
Notes: (Read only property)

153.9.29 ZeroFillCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of zero fill pages
Notes: (Read only property)

153.10 class DarwinResourceUsageMBS

153.10.1 class DarwinResourceUsageMBS

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: A class for information about resource utilization.
Example:

Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.IntegralMaxResidentSetSize)

Notes: For more information type "man getrusage" in the Mac OS X Terminal.

153.10.3 BlockInputOperations as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of block input operations.
Example:

Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.BlockInputOperations)

Notes: (Read only property)

153.10.4 BlockOutputOperations as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of block output operations.
Example:

Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.BlockOutputOperations)

Notes: (Read only property)

153.10.5 IntegralMaxResidentSetSize as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Integral max resident set size.
Example:

```
Var u as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
Var t as new DarwinTaskInfoMBS

MessageBox "Application Resident Size: "+str(t.ResidentSize)+EndOfLine+_
"Application Virtual Size: "+str(t.VirtualSize)+EndOfLine+_
"Application Integral Max Resident Size: "+str(u.IntegralMaxResidentSetSize)
```

Notes: Maximum memory usage of this app.
(Read only property)

153.10.6 IntegralSharedTextMemorySize as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Integral shared text memory size.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.IntegralSharedTextMemorySize)
```

Notes: (Read only property)

153.10.7 IntegralUnsharedDataSize as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Integral unshared data size.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.IntegralUnsharedDataSize)
```

Notes: (Read only property)

153.10.8 IntegralUnsharedStackSize as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Integral unshared stack size.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.IntegralUnsharedStackSize)
```

Notes: (Read only property)

153.10.9 InvoluntaryContextSwitches as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of involuntary context switches.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.InvoluntaryContextSwitches)
```

Notes: (Read only property)

153.10.10 MessagesReceived as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of messages received.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.MessagesReceived)
```

Notes: (Read only property)

153.10.11 MessagesSent as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of messages sent.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.MessagesSent)
```

Notes: (Read only property)

153.10.12 PageFaults as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of page faults.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.PageFaults)
```

Notes: (Read only property)

153.10.13 PageReclaims as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of page reclaims.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.PageReclaims)
```

Notes: (Read only property)

153.10.14 SignalsReceived as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of signals received.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.SignalsReceived)
```

Notes: (Read only property)

153.10.15 Swaps as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of swaps.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.Swaps)
```

Notes: (Read only property)

153.10.16 SystemTimeUsed as Double

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Seconds of system time used.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.SystemTimeUsed)
```

Notes: (Read only property)

153.10.17 UserTimeUsed as Double

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Seconds of user time used.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.UserTimeUsed)
```

Notes: (Read only property)

153.10.18 VoluntaryContextSwitches as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of voluntary context switches.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MessageBox str(d.VoluntaryContextSwitches)
```

Notes: (Read only property)

153.11 class DarwinTaskInfoMBS

153.11.1 class DarwinTaskInfoMBS

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: A class for your applications memory/resource usage.
Example:

```
Var u as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
Var t as new DarwinTaskInfoMBS

MessageBox "Application Resident Size: "+str(t.ResidentSize)+EndOfLine+_
"Application Virtual Size: "+str(t.VirtualSize)+EndOfLine+_
"Application Integral Max Resident Size: "+str(u.IntegralMaxResidentSetSize)
```

Xojo Developer Magazine

- 3.6, page 6: News

153.11.2 Methods

153.11.3 Update as boolean

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Updates the values and returns true on success.
Example:

```
Var d as new DarwinTaskInfoMBS
MessageBox str(d.UserTime)
call d.Update
MessageBox str(d.UserTime)
```

Notes: The constructor updates the values on creation of the object.

153.11.4 Properties

153.11.5 ContextSwitches as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of context switches.
Example:

```
Var d as new DarwinTaskInfoMBS
MessageBox str(d.ContextSwitches)
```

Notes: (Read and Write property)

153.11.6 COWFaults as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of copy-on-write faults.
Example:

```
Var d as new DarwinTaskInfoMBS
MessageBox str(d.COWFaults)
```

Notes: (Read and Write property)

153.11.7 Faults as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of page faults.
Example:

```
Var d as new DarwinTaskInfoMBS
MessageBox str(d.Faults)
```

Notes: (Read and Write property)

153.11.8 MessagesReceived as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of messages received.
Example:

```
Var d as new DarwinTaskInfoMBS
MessageBox str(d.MessagesReceived)
```

Notes: (Read and Write property)

153.11.9 MessagesSent as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of messages sent.
Example:

```
Var d as new DarwinTaskInfoMBS
MessageBox str(d.MessagesSent)
```

Notes: (Read and Write property)

153.11.10 PageIns as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of actual pageins.
Example:

```
Var d as new DarwinTaskInfoMBS
MessageBox str(d.PageIns)
```

Notes: (Read and Write property)

153.11.11 ResidentSize as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of resident pages.
Example:

```
Var d as DarwinTaskInfoMBS

d=new DarwinTaskInfoMBS
MessageBox "This application uses "+Format(d.ResidentSize,"0")+" Bytes of physical memory."
```

Notes: (Read and Write property)

153.11.12 SuspendCount as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Suspend count for task.
Example:

```
Var d as new DarwinTaskInfoMBS
MessageBox str(d.SuspendCount)
```

Notes: (Read and Write property)

153.11.13 SystemCallsMach as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of mach system calls.
Example:

```
Var d as DarwinTaskInfoMBS

d=new DarwinTaskInfoMBS

MessageBox "This application has done so far "+Format(d.SystemCallsMach,"0")+" system calls using the Mach Interface."
```

Notes: (Read and Write property)

153.11.14 SystemCallsUnix as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of unix system calls.
Example:

```
Var d as DarwinTaskInfoMBS

d=new DarwinTaskInfoMBS

MessageBox "This application has done so far "+Format(d.SystemCallsUnix,"0")+" system calls using the Unix Interface."
```

Notes: (Read and Write property)

153.11.15 SystemTime as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Total system run time.
Example:

```
Var d as DarwinTaskInfoMBS

d=new DarwinTaskInfoMBS

MessageBox "This application has used so far "+Format(d.SystemTime,"0")+" seconds of CPU time."
```

Notes: (Read and Write property)

153.11.16 UserTime as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Total user run time.
Example:

```
Var d as DarwinTaskInfoMBS

d=new DarwinTaskInfoMBS

MessageBox "This application has used so far "+Format(d.UserTime,"0")+" seconds of CPU time."
```

Notes: (Read and Write property)

153.11.17 VirtualSize as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of virtual pages.
Example:

```
Var d as DarwinTaskInfoMBS

d=new DarwinTaskInfoMBS
MessageBox "This application uses "+Format(d.VirtualSize,"0")+" Bytes of the 4 GB address space."
```

Notes: (Read and Write property)

153.12 class DarwinUserListMBS

153.12.1 class DarwinUserListMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The list of users on a Mac OS X system.
Example:

```
// find the short user name
Var d as DarwinUserListMBS
Var u as string
Var p as DarwinUserMBS
Var uid,i,c as Integer

// requires MachO target
declare function getuid lib "System" () as Integer

uid=getuid

d=new DarwinUserListMBS

c=d.Count-1
for I=0 to c
p=d.User(i)
if p.UserID=uid then
MessageBox p.Name
end if
next
```

153.12.2 Methods

153.12.3 CurrentEffectiveUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The effective user ID of the calling process.
Example:

```
Var l as new DarwinUserListMBS
MessageBox "CurrentEffectiveUserID: "+str(l.CurrentEffectiveUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

153.12.4 CurrentGroupID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real group ID of the calling process.
Example:

```
Var l as new DarwinUserListMBS
MessageBox "CurrentGroupID: "+str(l.CurrentGroupID)
```

Notes: The real group ID is specified at login time.

153.12.5 CurrentUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real user ID of the calling process.
Example:

```
Var l as new DarwinUserListMBS
MessageBox "CurrentUserID: "+str(l.CurrentUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

153.12.6 User(index as Integer) as DarwinUserMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Returns the user with the given index.
Example:

```
// find short user name
Var d as DarwinUserListMBS
Var u as string
Var p as DarwinUserMBS
Var uid,i,c as Integer

u=SystemInformationMBS.Username
d=new DarwinUserListMBS

c=d.Count-1
for I=0 to c
p=d.User(i)
```

```
if p.LongName=u then
MessageBox p.Name
end if
next
```

153.12.7 Properties

153.12.8 Count as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The number of users on this Mac OS X system.
Example:

```
Var l as new DarwinUserListMBS
MessageBox "Number of users: "+str(l.Count)
```

Notes: (Read only property)

153.13 class DarwinUserMBS

153.13.1 class DarwinUserMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: A class with information about a user on Mac OS X.
Example:

```
Var l as new DarwinUserMBS
l.LoadUserByID l.CurrentUserID
MessageBox l.Name+": "+l.LongName
```

153.13.2 Methods

153.13.3 CurrentEffectiveUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The effective user ID of the calling process.
Example:

```
Var l as new DarwinUserMBS
MessageBox str(l.CurrentEffectiveUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

153.13.4 CurrentGroupID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real group ID of the calling process.
Example:

```
Var l as new DarwinUserMBS
MessageBox str(l.CurrentGroupID)
```

Notes: The real group ID is specified at login time.

153.13.5 CurrentUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real user ID of the calling process.
Example:

```
Var l as new DarwinUserMBS
MessageBox str(l.CurrentUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

153.13.6 LoadUserByID(userid as Integer)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Fills the properties of this class with the values for the user with the given ID.
Example:

```
Var l as new DarwinUserMBS

l.LoadUserByID l.CurrentUserID

MessageBox l.Name
```

153.13.7 LoadUserByName(name as string)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Fills the properties of this class with the values for the given user.
Example:

```
Var l as new DarwinUserMBS

l.LoadUserByName "cs"

MessageBox l.LongName
```

153.13.8 Properties

153.13.9 AccountExpireTime as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The time when the account will expire.
Notes: (Read only property)

153.13.10 GroupID as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The group ID of the user.
Example:

```
Var l as new DarwinUserMBS
l.LoadUserByID l.CurrentUserID
MessageBox str(l.GroupID)
```

Notes: (Read only property)

153.13.11 HomePath as string

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The home path of the user.
Example:

```
Var l as new DarwinUserMBS

l.LoadUserByName "cs"

MessageBox l.HomePath
```

Notes: (Read only property)

153.13.12 LastPasswordChangeTime as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The last time when the user changed the password.

Notes: (Read only property)

153.13.13 LongName as string

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The long name of the user.
Example:

```
Var l as new DarwinUserMBS

l.LoadUserByName "cs"

MessageBox l.LongName
```

Notes: (Read only property)

153.13.14 Name as string

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The short name of the user.
Example:

```
Var l as new DarwinUserListMBS

Var c as Integer = l.Count-1
for i as Integer = 0 to c
Var u as DarwinUserMBS = l.User(i)
if u.UserID = l.CurrentUserID then
MessageBox "our user name: "+u.Name
end if
next
```

Notes: (Read only property)

153.13.15 Ready as Boolean

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: whether the values in this class were filled correctly.
Notes: (Read only property)

153.13.16 Shell as string

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The path to the default shell for this user.
Example:

```
Var l as new DarwinUserMBS

l.LoadUserByID l.CurrentUserID

MessageBox l.Shell
```

Notes: (Read only property)

153.13.17 UserID as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The user ID of this user.
Example:

```
Var l as new DarwinUserMBS

l.LoadUserByID l.CurrentUserID

MessageBox str(l.UserID)
```

Notes: (Read only property)

153.14 class DarwinVMStatisticsMBS

153.14.1 class DarwinVMStatisticsMBS

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: Holds information about the current Mac OS X memory status.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.pageins)+" page ins"
```

Notes: See newer class DarwinHostVMStatisticsMBS.

153.14.2 Properties

153.14.3 ActivePages as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The total number of pages currently in use and pageable.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.ActivePages)
```

Notes: (Read only property)

153.14.4 CowFaults as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The number of faults that caused a page to be copied (generally caused by copy-on-write faults).
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.CowFaults)
```

Notes: (Read only property)

153.14.5 CPUTicksIdle as Integer

MBS MacCF Plugin, Plugin Version: 2.7, Platform: macOS, Targets: All.

Function: The number of time slices used by the Idle process.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.CPUTicksIdle)
```

Notes: Calculate deltas like in the example to see usage of CPU time.
(Read only property)

153.14.6 CPUTicksNice as Integer

MBS MacCF Plugin, Plugin Version: 2.7, Platform: macOS, Targets: All.

Function: The number of time slices used by the task switcher process.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.CPUTicksNice)
```

Notes: Calculate deltas like in the example to see usage of CPU time.
(Read only property)

153.14.7 CPUTicksSystem as Integer

MBS MacCF Plugin, Plugin Version: 2.7, Platform: macOS, Targets: All.

Function: The number of time slices used by the system processes.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.CPUTicksSystem)
```

Notes: Calculate deltas like in the example to see usage of CPU time.
(Read only property)

153.14.8 CPUTicksUser as Integer

MBS MacCF Plugin, Plugin Version: 2.7, Platform: macOS, Targets: All.

Function: The number of time slices used by the user application processes.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.CPUTicksUser)
```

Notes: Calculate deltas like in the example to see usage of CPU time.
(Read only property)

153.14.9 Faults as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The number of times the "vm_fault" routine has been called.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.Faults)
```

Notes: (Read only property)

153.14.10 FreePages as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The total number of free pages in the system.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.FreePages)
```

Notes: (Read only property)

153.14.11 Hits as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The hit count.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.Hits)
```

Notes: (Read only property)

153.14.12 InactivePages as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The total number of pages on the inactive list.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.InactivePages)
```

Notes: (Read only property)

153.14.13 Lookups as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The count of lookups.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.Lookups)
```

Notes: (Read only property)

153.14.14 PageIns as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The number of requests for pages from a pager (such as the inode pager).
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.pageins)
```

Notes: (Read only property)

153.14.15 PageOuts as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The number of pages that have been paged out.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.PageOuts)
```

Notes: (Read only property)

153.14.16 Pagesize as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The size of one memory page in memory.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.Pagesize)
```

Notes: On PowerPC CPUs, it should be 4096 Bytes.
(Read only property)

153.14.17 Reactivations as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: the total number of pages that have been moved from the inactive list to the active list (reactivated).
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.Reactivations)
```

Notes: (Read only property)

153.14.18 WiredPages as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The total number of pages wired down. That is, pages that cannot be paged out.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.WiredPages)
```

Notes: (Read only property)

153.14.19 ZeroFillPages as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The total number of pages that have been zero-filled on demand.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MessageBox str(d.ZeroFillPages)
```

Notes: (Read only property)

153.15 class DelegateCrashExceptionMBS

153.15.1 class DelegateCrashExceptionMBS

MBS Util Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The exception raised when a delegate call crashes.
Notes: Raised in CallDelegateCrashSafeMBS function.
Message defines what caused the crash and ErrorNumber is the signal number (platform dependent!).

Message contains the reason, e.g.

- Delegate crashed with invalid pointer access.
- Delegate crashed with illegal instruction.
- Delegate crashed with floating point error.
- Delegate crashed with wrong system call.
- Delegate crashed with broken pipe.
- Delegate crashed with memory bus error.

Subclass of the RuntimeException class.

153.16 class DesktopApplication

153.16.1 class DesktopApplication

Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Extends the Application class inside Xojo.

153.16.2 Methods

153.16.3 ApplicationNameMBS as string

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the name of the application.
Example:

MessageBox "Hi. This application is named "+app.ApplicationNameMBS

Notes: This may not be the exact same name than the filename.

153.16.4 ArgumentsMBS as String()

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries arguments of process.
Notes: Returns nil in case of any error (low memory).
First entry in result is path to current app.
Other entries are parameters, without any quotes.

153.16.5 BundleFolderMBS as folderitem

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a folderitem to the bundle's mail folder.
Blog Entries

- MBS Real Studio Plugins, version 13.0pr9

153.16.6 BundleLocalizedStringMBS(key as string) as string

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the localized string for the given key from the default table.
Notes: A short version for BundleLocalizedString which uses the default table.
See also:

- 153.16.7 BundleLocalizedStringMBS(key as string,fromtable as string) as string 20379

153.16.7 BundleLocalizedStringMBS(key as string,fromtable as string) as string

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the localized string for the given key and table.
Example:

```
// You may make yourself a function to look up for the key and return
// This function was not tested in a real application. May contain a bug.

function Localize(key as string, default as string) as string
Var s as string

s=app.BundleLocalizedStringMBS(key)
if s="" then
s=default // For Mac OS Classic and Windows
elseif s=key then // returns key for not localized items
MessageBox "For developer: the key """+key+""" was not localized for any language."
end if

return s
end sub

// use like this
FileOpen.text=Localize("FileOpenLabel", "Open...")
```

Notes: The table parameter is optional to specify which ".strings"-file to use.
without table or table="" the "Localizable.strings" file is used by Mac OS X.

Returns "" (empty string) on Mac OS Classic or Windows.
See also:

• 153.16.6 BundleLocalizedStringMBS(key as string) as string 20379

153.16.8 BundleResourceFolderItemLocalizedMBS(ResourceName as string, ResourceType as string, SubDirectory as string) as folderitem

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Searches inside the application bundle for a file.
Example:

```
Var f as FolderItem
f=app.BundleResourceFolderItemLocalizedMBS("logo","jpg","")
MessageBox f.NativePath
```

Notes: ResourceName is the filename of the resource file.
ResourceType is the file extension.
SubDirectory is the name of the directory.
This function will take care for localization folders.

153.16.9 BundleResourceFolderMBS as folderitem

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a folderitem to the resource file inside the bundle.
Example:

```
Var f As FolderItem = App.BundleResourceFolderMBS

If f = Nil Then
MessageBox "Failed?"
Else
MessageBox f.NativePath
End If
```

Blog Entries

- MBS Xojo Plugins, version 21.4pr2
- MBS Real Studio Plugins, version 13.0pr9

153.16.10 HideMeMBS as boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Hides the current application.
Notes: Returns true if the current application was hidden.

153.16.11 HideOthersMBS as boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Hides all applications except the current one.
Notes: Returns true if the other applications were hidden.

153.16.12 LaunchTimeMBS as double

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the ticks value at launch time.
Example:

```
Var d as date

d=new date
d.totalSeconds=d.totalSeconds-(ticks-app.launchTimeMBS)/60

MessageBox d.longdate+" "+d.longtime
```

Notes: This value must be converted to the secondsvalue like in the example.
-1 on Windows.
For Mac OS X see the DarwinResourceUsageMBS class.

153.16.13 MainBundleMBS as CFBundleMBS

MBS MacCF Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: If your application is a bundle, this function returns your own bundle.
Notes: Returns nil on any error.

Works for Console, Desktop and Web projects.

153.16.14 NSApplicationMBS as NSApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the shared NSApplication object.
Notes: This method gives easy access to the NSApplicationMBS class.

The plugin makes sure that there is only one application object by returning the same object each time.
Works for Console, Desktop and Web projects.

153.16.15 ProcessTimeMBS as double

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the current CPU time for the process.
Example:

```
MessageBox "I got "+format(app.ProcessTimeMBS/100,"0.00")+" seconds CPU time till now."
```

Notes: On Mac OS X, the OS counts how much CPU time in given to the current process.
Returns -1 in case of an error.

153.16.16 Properties

153.16.17 FrontmostMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns true if the application is frontmost.
Example:

```
app.frontmostmbs=True 'bring app to front
```

Notes: This property is for read and write. Writing to it brings the app to front.
Setting this property to false does nothing.

If you need to make some other application frontmost, you can use app.HideMeMBS or use the ProcessMBS class.

Implemented for Windows, too. When querying, we check if the front window belongs to our application. When setting the plugin builds a list of all FileMaker windows. Than we activate the top most of them and move all other windows in z order behind.
(Read and Write computed property)

153.17 class EnvironmentMBS

153.17.1 class EnvironmentMBS

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Allows you to access system wide environment properties.
Blog Entries

- MBS Real Studio Plugins, version 12.1pr3

153.17.2 Methods

153.17.3 Add(name as string,value as string) as boolean

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Add a property to the list.
Example:

```
Var e as EnvironmentMBS

e=new EnvironmentMBS
if e.add("authorname","Christian") then
MessageBox "ok"
else
MessageBox "fail"
end if
```

Notes: Setting this value to some new value will currently only change this value for your application and all child applications.

153.17.4 Get(name as string) as string

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Returns the value for a named property.
Example:

```
Var e as EnvironmentMBS

e=new EnvironmentMBS
MessageBox e.get("windir") // normally c:\windows
```

153.17.5 Lines as string()

MBS Util Plugin, Plugin Version: 12.1, Platform: Windows, Targets: All.

Function: Returns array of definition lines of environment variables.
Example:

```
Var e as new EnvironmentMBS
MessageBox join(e.lines, endofline)
```

Notes: Returned strings are in format "name=value".

153.17.6 Name(Index as Integer) as string

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Returns the name of the environment propertie number n.

153.17.7 Names as string()

MBS Util Plugin, Plugin Version: 12.1, Platform: Windows, Targets: All.

Function: Returns array of names of environment variables.
Example:

```
Var e as new EnvironmentMBS
MessageBox join(e.lines, endofline)
```

153.17.8 Update

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Updates the object to the current environment properties.
Notes: This method is called by the constructor and the methods which change the environment properties.

153.17.9 Properties

153.17.10 Count as Integer

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Returns the number of environment properties.
Example:

```
Var e as EnvironmentMBS

e=new EnvironmentMBS
MessageBox str(e.count)
```

Notes: (Read only property)

153.17.11 Value(Index as Integer) as string

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Returns the value of the environment propertie number n.
Notes: Setting this value to some new value will currently only change this value for your application and all child applications.
(Read and Write computed property)

153.18 class MutexMBS

153.18.1 class MutexMBS

MBS Util Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a mutex.
Notes: A mutex is not locked by default.

See also AtomicIntegerMBS class.

153.18.2 Methods

153.18.3 AutoLock as AutoMutexMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Auto locks the mutex and returns an AutoMutexMBS object to unlock later.
Example:

```
Public Sub test(m as MutexMBS)
// lock count is zero
Var l1 As Integer = m.LockCount

// locks it
Var a As AutoMutexMBS = m.AutoLock

// lock count is 1
Var l2 As Integer = m.LockCount

Break // unlocks when method ends
```

```
End Sub
```

Notes: Keep the AutoMutexMBS object in a local variable. When the method ends and the variable is freed, the mutex is unlocked automatically.

153.18.4 Lock

MBS Util Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Locks the mutex.
Example:

```
Var m as new MutexMBS

m.Lock
MessageBox "Got mutex."

m.Unlock
MessageBox "Released mutex."
```

Notes: The function returns as soon as it has access to the mutex.

Always use Lock and Unlock in a pair.

153.18.5 TryAutoLock as AutoMutexMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Auto locks the mutex if possible and returns an AutoMutexMBS object to unlock later.
Notes: Returns AutoMutexMBS object if we got a lock and nil if not.

Keep the AutoMutexMBS object in a local variable. When the method ends and the variable is freed, the mutex is unlocked automatically.

153.18.6 TryLock as boolean

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Locks the mutex if possible.
Example:

```
Var m as new MutexMBS

if m.TryLock then
MessageBox "Got mutex."

m.Unlock
else
MessageBox "Failed to get mutex."
end if
```

Notes: Returns true if we got a lock and false if not.
Always use Lock and Unlock in a pair.

153.18.7 Unlock

MBS Util Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unlocks the mutex.
Example:

```
Var m as new MutexMBS

m.Lock
MessageBox "Got mutex."

m.Unlock
MessageBox "Released mutex."
```

Notes: Always use Lock and Unlock in a pair.

153.18.8 Properties

153.18.9 Handle as Integer

MBS Util Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal used reference to the native mutex object.
Example:

```
Var m as new MutexMBS
MessageBox "Handle: "+hex(m.Handle)
```

Notes: Windows Mutex or PThread Mutex.

(Read and Write property)

153.18.10 LockCount as Integer

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The lock count.
Example:

```
// make a new mutex
Var m As New MutexMBS

// check lock count ->0
Var l1 As Integer = m.LockCount

// we lock the mutex
m.Lock

// check lock count ->1
Var l2 As Integer = m.LockCount

// we unlock the mutex
m.Unlock

// check lock count ->0
Var l3 As Integer = m.LockCount

Break
```

Notes: For debugging to inspect whether mutex is locked.
(Read only property)

153.18.11 Tag as Variant

MBS Util Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: An object reference for your use.
Notes: Just for convenience.
This property was added so you can use this property for a reference so you won't need to subclass this class and add custom properties.
(Read and Write property)

153.19 class NamedMutexMBS

153.19.1 class NamedMutexMBS

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a named mutex.
Example:

```
// allow only one running instance of the app
// Mutex is a property of the app: Mutex As NamedMutexMBS
Mutex = New NamedMutexMBS("com.example.myapp.single")
If Not Mutex.TryLock Then
MessageBox "The app is already running."
Quit
End If

// keep the mutex locked while the app runs, it is released when the app quits
```

Notes: Using a mutex on Windows and a semaphore on MacOS and Linux.

Raises UnsupportedOperationException exceptions if something fails.
See also MutexMBS class.
Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 20.2
- MBS Xojo Plugins, version 20.2pr2

153.19.2 Methods

153.19.3 Constructor(Name as string)

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create a new mutex.
Notes: Name should be a simple text, but unique, so we recommend reverse domain notation.
The name should not contain a slash.
If mutex exists already, we open it. The mutex lives until the last application closed it.

If name matches the name of an existing event, semaphore, waitable timer, job, or file-mapping object, the function fails.

Raises an UnsupportedOperationException on failure.

You can open the same mutex twice and get different Xojo objects from the plugin for both.

153.19.4 Lock

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Locks the mutex.
Notes: Blocks until mutex is locked.
Please call Unlock later to unlock.

To avoid you looking up the app, we limit locking to one minute. After that you get a timeout error.

153.19.5 TryLock as boolean

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tries to lock the mutex.
Notes: Returns true if locked or false if the lock can't be set.
If false is returned another app may have a lock currently.
Please call Unlock later to unlock if you get back true.

153.19.6 Unlock

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unlocks the mutex.

153.19.7 Properties

153.19.8 Handle as Integer

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

153.19.9 Locked as Boolean

MBS Util Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the mutex was locked here.
Notes: We keep track whether you call Lock/TryLock here vs. Unlock function.
(Read only property)

153.19.10 Name as String

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the mutex.
Notes: (Read only property)

153.19.11 Tag as Variant

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag value.
Notes: You can use it as you like to store whatever value is needed.
(Read and Write property)

153.20 class NSProcessInfoActivityMBS

153.20.1 class NSProcessInfoActivityMBS

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The class for an activity.
Example:

```
Var Activity as NSProcessInfoActivityMBS // property in your window, control, thread, app
Var AllowAppNap as boolean // allow or not?

Var ProcessInfo as NSProcessInfoMBS = NSProcessInfoMBS.processInfo
if AllowAppNap then
Activity = nil
else
// disable sleep to let us make something...
Activity = ProcessInfo.beginActivity(NSProcessInfoMBS.NSActivityBackground, "Backup running")
end if
```

Notes: For Windows, please check WindowsThreadExecutionStateMBS to prevent system sleep.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

153.20.2 Methods

153.20.3 Constructor

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Private constructor.

153.20.4 Destructor

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The destructor.
Notes: If you missed to call endActivity, the destructor will do it.

153.20.5 Properties

153.20.6 Handle as Integer

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

153.20.7 Options as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The options used to create activity.
Notes: (Read and Write property)

153.20.8 Reason as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The reason used to create the activity.
Notes: (Read and Write property)

153.21 class NSProcessInfoMBS

153.21.1 class NSProcessInfoMBS

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: The NSProcessInfo class provides methods to access information about the current process.
Example:

```
// show information about the system and the current process
Var info As NSProcessInfoMBS = NSProcessInfoMBS.processInfo

MessageBox "OS: " + info.operatingSystemVersionString + EndOfLine + _
"Process ID: " + info.processIdentifier.ToString + EndOfLine + _
"Processors: " + info.activeProcessorCount.ToString + EndOfLine + _
"Memory: " + Format(info.physicalMemory / 1024 / 1024 / 1024, "0.0") + " GB" + EndOfLine + _
"Low power mode: " + info.isLowPowerModeEnabled.ToString
```

Notes: Each process has a single, shared NSProcessInfo object, known as process information agent.

The process information agent can return such information as the arguments, environment variables, host name, or process name. The processInfo class method returns the shared agent for the current process—that is, the process whose object sent the message. For example, the following line returns the NSProcessInfo object, which then provides the name of the current process:

```
Var processInfo as new NSProcessInfoMBS
Var processName as string = processInfo.processName
```

The NSProcessInfo class also includes the operatingSystem method, which returns an enum constant identifying the operating system on which the process is executing.

NSProcessInfo objects attempt to interpret environment variables and command-line arguments in the user's default C string encoding if they cannot be converted to Unicode as UTF-8 strings. If neither conversion works, these values are ignored by the NSProcessInfo object.

For Windows, please check WindowsThreadExecutionStateMBS to prevent system sleep.

Xojo Developer Magazine

- 19.5, page 9: News

153.21.2 Methods

153.21.3 argument(index as Integer) as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns the command-line argument for the process with the given index.
Example:

```
Var p as new NSProcessInfoMBS

Var i,c as Integer

c=p.argumentCount-1
for i=0 to c
MessageBox p.argument(i)
next
```

153.21.4 arguments as string()

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns the command-line arguments for the process.
Notes: Returns array of strings with the process's command-line arguments.

153.21.5 beginActivity(options as Integer, reason as string) as NSProcessInfoActivityMBS

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Begin an activity using the given options and reason.
Example:

```
Var Activity as NSProcessInfoActivityMBS // property in your window, control, thread, app
Var AllowAppNap as boolean // allow or not?

Var ProcessInfo as NSProcessInfoMBS = NSProcessInfoMBS.processInfo
if AllowAppNap then
Activity = nil
else
// disable sleep to let us make something...
Activity = ProcessInfo.beginActivity(NSProcessInfoMBS.NSActivityBackground, "Backup running")
end if
```

Notes: options: Options for the activity. See constants for possible values.
reason: A string used in debugging to indicate the reason the activity began.

Returns an object token representing the activity.

Indicate completion of the activity by calling endActivity passing the returned object as the argument.
Available in OS X v10.9 and later.

For Windows, please check WindowsThreadExecutionStateMBS to prevent system sleep.

153.21.6 Constructor

MBS MacBase Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: The constructor.

153.21.7 disableAutomaticTermination(Reason as string)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Decrement the counter tracking the number of automatic quit opt-out requests.
Notes: When this counter is greater than zero, the app will be considered 'active' and ineligible for automatic termination.
An example of using this would be disabling autoquitting when the user of an instant messaging application signs on, due to it requiring a background connection to be maintained even if the app is otherwise inactive.
Each pair of calls should have a matching "reason" argument, which can be used to easily track why an application is or is not automatically terminable.
A given reason can be used more than once at the same time (for example: two files are transferring over

the network, each one disables automatic termination with the reason ”file transfer in progress”)

153.21.8 disableSuddenTermination

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Disables the application for quickly klling using sudden termination.
Notes: This method increments the sudden termination counter. When the termination counter reaches 0 the application allows sudden termination.

By default the sudden termination counter is set to 1. This can be overriden in your application Info.plist. See ”Sudden Termination” for more information and debugging suggestions.

Available in Mac OS X v10.6 and later.

153.21.9 enableAutomaticTermination(Reason as string)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Increment the counter tracking the number of automatic quit opt-out requests.
Notes: When this counter is greater than zero, the app will be considered 'active' and ineligible for automatic termination.
An example of using this would be disabling autoquitting when the user of an instant messaging application signs on, due to it requiring a background connection to be maintained even if the app is otherwise inactive.
Each pair of calls should have a matching ”reason” argument, which can be used to easily track why an application is or is not automatically terminable.
A given reason can be used more than once at the same time (for example: two files are transferring over the network, each one disables automatic termination with the reason ”file transfer in progress”)

153.21.10 enableSuddenTermination

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Enables the application for quick killing using sudden termination.
Notes: This method decrements the sudden termination counter. When the termination counter reaches 0 the application allows sudden termination.

By default the sudden termination counter is set to 1. This can be overriden in your application Info.plist. See ”Sudden Termination” for more information and debugging suggestions.

Available in Mac OS X v10.6 and later.

153.21.11 endActivity(activity as NSProcessInfoActivityMBS)

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Ends the given activity.
Notes: activity: An activity object returned by beginActivity.
Available in OS X v10.9 and later.

153.21.12 NSActivityLatencyCritical as UInt64

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: One of the activity option constants.
Notes: Flag to indicate the activity requires the highest amount of timer and I/O precision available.
Important: Very few applications should need to use this constant.
Available in OS X v10.9 and later.
Value is &hFF00000000.

153.21.13 NSProcessInfoPowerStateDidChangeNotification as String

MBS MacBase Plugin, Plugin Version: 24.1, Platform: macOS, Targets: All.

Function: The name of the notification that is posted when the power state of a device changes.
Notes: After your observer receives this notification, query the lowPowerModeEnabled property to determine the current power state of the device. If Low Power Mode is active, take appropriate steps to reduce activity in your app. Otherwise, your app can resume normal operations.
The notification object is an NSProcessInfo instance.

153.21.14 NSProcessInfoThermalStateDidChangeNotification as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The notification name to use with NSNotificationObserverMBS.
Notes: This notification is posted once the thermal state of the system has changed. Once the notification is posted, use the thermalState property to retrieve the current thermal state of the system.

You can use this opportunity to take corrective action in your application to help cool the system down. Work that could be done in the background or at opportunistic times should be using the Quality of Service

levels in NSOperation or the NSBackgroundActivityScheduler API.

This notification is posted on the global dispatch queue. Register for it using the default notification center. The object associated with the notification is NSProcessInfoMBS.processInfo.

153.21.15 operationSystemVersion(byref Major as Integer, byref Minor as Integer, byref Patch as Integer)

MBS MacBase Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Queries operating system version.
Notes: One call to get all three parts.

153.21.16 processInfo as NSProcessInfoMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns the process information agent for the process.

153.21.17 Properties

153.21.18 activeProcessorCount as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Provides the number of active processing cores available on the computer.
Example:

```
Var p as new NSProcessInfoMBS

MessageBox str(p.activeProcessorCount)
```

Notes: Available in Mac OS X v10.5 and later.
(Read only property)

153.21.19 argumentsCount as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: The number of the command-line arguments.
Example:

```
Var p as new NSProcessInfoMBS

Var i,c as Integer

c=p.argumentCount-1
for i=0 to c
MessageBox p.argument(i)
next
```

Notes: (Read only property)

153.21.20 automaticTerminationSupportEnabled as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Marks the calling app as supporting automatic termination.
Notes: Without calling this or setting the equivalent Info.plist key (NSSupportsAutomaticTermination), the above methods (disableAutomaticTermination/enableAutomaticTermination) have no effect, although the counter tracking automatic termination opt-outs is still kept up to date to ensure correctness if this is called later. Currently, passing false has no effect.
This should be called during applicationDidFinishLaunching or earlier.
(Read and Write property)

153.21.21 environment as dictionary

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns the variable names and their values in the environment from which the process was launched.
Example:

```
Var p as new NSProcessInfoMBS
Var d as Dictionary = p.environment
MessageBox str(d.Count)
```

Notes: (Read only property)

153.21.22 globallyUniqueString as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns a global unique identifier for the process.
Example:

```
Var p as new NSProcessInfoMBS

MessageBox p.globallyUniqueString // shows for example "072EC09A-4825-11DD-BDC0-001D4F46F5E0-18405-00000CA853EB5B46"
```

Notes: Returns the Global ID for the process. The ID includes the host name, process ID, and a time stamp, which ensures that the ID is unique for the network.

This method generates a new string each time it is invoked, so it also uses a counter to guarantee that strings created from the same process are unique.
(Read only property)

153.21.23 Handle as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: The internal reference to the NSProcessInfo object.
Notes: (Read and Write property)

153.21.24 hostName as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns the name of the host computer.
Example:

```
Var p as new NSProcessInfoMBS

MessageBox p.hostName // for example "iMac.local"
```

Notes: (Read only property)

153.21.25 isiOSAppOnMac as Boolean

MBS MacBase Plugin, Plugin Version: 21.0, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the process is an iPhone or iPad app running on a Mac.
Notes: The value of this property is true only when the process is an iOS app running on a Mac. The value of the property is false for all other apps on the Mac, including Mac apps built using Mac Catalyst. The property is also false for processes running on platforms other than macOS.
(Read only property)

153.21.26 isiOSAppOnVision as Boolean

MBS MacBase Plugin, Plugin Version: 26.0, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the process is an iPhone or iPad app running on visionOS.
Notes: The value of this property is true only when the process is an iOS app running on a visionOS device. The value of the property is false for all other apps on visionOS. The property is also false for processes running on platforms other than visonOS.

Can only return true on macOS 26.1 or newer.
(Read only property)

153.21.27 isLowPowerModeEnabled as Boolean

MBS MacBase Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: All.

Function: Retrieve the current setting of the system for the low power mode setting.
Notes: On systems where the low power mode is unknown or unsupported, the value returned from the lowPowerModeEnabled property is always false.
Returns true if low power mode is enabled for macOS 12 or iOS 9 and newer.
(Read only property)

153.21.28 operatingSystem as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns a constant to indicate the operating system on which the process is executing.
Example:

```
Var p as new NSProcessInfoMBS

MessageBox str(p.operatingSystem) // shows 5 = NSMACHOperatingSystem
```

Notes: Operating system identifier. See "Constants" for a list of possible values. In Mac OS X, it's NSMACHOperatingSystem.

(Read only property)

153.21.29 operatingSystemName as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns a string containing the name of the operating system on which the process is executing.
Example:

```
Var p as new NSProcessInfoMBS

MessageBox p.operatingSystemName // shows "NSMACHOperatingSystem"
```

Notes: Operating system name. In Mac OS X, it's "NSMACHOperatingSystem"
(Read only property)

153.21.30 operatingSystemVersionString as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns a string containing the version of the operating system on which the process is executing.
Example:

```
Var p as new NSProcessInfoMBS

MessageBox p.operatingSystemVersionString // "Version 10.5.4 (Build 9E17)"
```

Notes: Returns the Operating system version. This string is human readable, localized, and is appropriate for displaying to the user. This string is not appropriate for parsing.
(Read only property)

153.21.31 operationSystemVersionMajor as Integer

MBS MacBase Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Queries major OS version.
Notes: (Read only property)

153.21.32 operationSystemVersionMinor as Integer

MBS MacBase Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Queries minor OS version.
Notes: (Read only property)

153.21.33 operationSystemVersionPatch as Integer

MBS MacBase Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Queries OS version patch level.
Notes: (Read only property)

153.21.34 physicalMemory as UInt64

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Provides the amount of physical memory on the computer.
Example:

```
Var p as new NSProcessInfoMBS

MessageBox str(p.physicalMemory)
```

Notes: Available in Mac OS X v10.5 and later.
(Read only property)

153.21.35 processIdentifier as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns the identifier of the process.
Example:

```
Var p as new NSProcessInfoMBS

MessageBox str(p.processIdentifier)
```

Notes: (Read only property)

153.21.36 processName as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: The name of the process.
Example:

```
Var p as new NSProcessInfoMBS

MessageBox p.processName
```

Notes: The process name is used to register application defaults and is used in error messages. It does not uniquely identify the process.

You can assign a new value, but:
User defaults and other aspects of the environment might depend on the process name, so be very careful if you change it. Setting the process name in this manner is not thread safe.
(Read and Write property)

153.21.37 processorCount as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Provides the number of processing cores available on the computer.
Example:

```
Var p as new NSProcessInfoMBS

MessageBox str(p.processorCount)
```

Notes: Available in Mac OS X v10.5 and later.
(Read only property)

153.21.38 systemUptime as Double

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the how long it has been since the computer has been restarted.
Notes: Returns an NSTimeInterval indicating how long system the computer has been restarted.
Available in Mac OS X v10.6 and later.
(Read only property)

153.21.39 thermalState as Integer

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Retrieve the current thermal state of the system.
Example:

```
Var n as NSProcessInfoMBS = NSProcessInfoMBS.processInfo

Select case n.thermalState
case n.NSProcessInfoThermalStateNominal
MessageBox "Thermal State: Nominal"
case n.NSProcessInfoThermalStateFair
MessageBox "Thermal State: Fair"
case n.NSProcessInfoThermalStateSerious
MessageBox "Thermal State: Serious"
case n.NSProcessInfoThermalStateCritical
MessageBox "Thermal State: Critical"
else
MessageBox "Thermal State: Unknown"
end Select
```

Notes: On systems where thermal state is unknown or unsupported, the value returned from the thermalState property is always NSProcessInfoThermalStateNominal.

Available in Mac OS X 10.10.3 and newer.
Returns -1 if function is called on older Mac OS X versions, Linux or Windows.
(Read only property)

153.21.40 Constants

Constants

Constant	Value	Description
NSHPUXOperatingSystem	4	One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem. Indicates the HP UX operating system.
NSMACHOperatingSystem	5	One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem. Indicates the Mac OS X operating system.
NSOSF1OperatingSystem	7	One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem. Indicates the OSF/1 operating system.
NSSolarisOperatingSystem	3	One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem. Indicates the Solaris operating system.
NSSunOSOperatingSystem	6	One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem. Indicates the Sun OS operating system.
NSWindows95OperatingSystem	2	One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem. Indicates the Windows 95 operating system.
NSWindowsNTOperatingSystem	1	One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem. Indicates the Windows NT operating system.

Activity Options

Constant	Value	Description
NSActivityAutomaticTerminationDisabled	&h8000	Flag to prevent automatic termination. Available in OS X v10.9 and later.
NSActivityBackground	&h000000FF	Flag to indicate the app has initiated some kind of v result of user request. Available in OS X v10.9 and later.
NSActivityIdleDisplaySleepDisabled	&h10000000000	Flag to require the screen to stay powered on. Available in OS X v10.9 and later.
NSActivityIdleSystemSleepDisabled	&h100000	Flag to prevent idle sleep. This is included in NSActivityUserInitiatedAllowing Available in OS X v10.9 and later.
NSActivitySuddenTerminationDisabled	&h4000	Flag to prevent sudden termination. This is included in NSActivityUserInitiatedAllowing Available in OS X v10.9 and later.
NSActivityUserInitiated	&h00FFFFFF	Flag to indicate the app is performing a user-reques Available in OS X v10.9 and later.
NSActivityUserInitiatedAllowingIdleSystemSleep	&h00EFFFFF	Flag to indicate the app is performing a user-requ system can sleep on idle. Available in OS X v10.9 and later.

Thermal State Constants

Constant	Value	Description
NSProcessInfoThermalStateCritical	3	System performance is significantly impacted and the Mac needs to cool do Recommendation: reduce application's usage of CPU, GPU, and I/O to minimum level needed to respond to user actions. Consider stopping us camera and other peripherals if your application is using them.
NSProcessInfoThermalStateFair	1	The system has reached a state where fans may become audible.
NSProcessInfoThermalStateNominal	0	No corrective action is needed.
NSProcessInfoThermalStateSerious	2	Fans are running at maximum speed, system performance maybe impac Recommendation: reduce application's usage of CPU, GPU and I/O, if po ble. Switch to lower quality visual effects, reduce frame rates.

153.22 class NSRunningApplicationMBS

153.22.1 class NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: NSRunningApplication is a class to manipulate and provide information for a single instance of an application.
Example:

Var n as new NSRunningApplicationMBS

MessageBox n.localizedName

Notes: Only user applications are tracked; this does not provide information about every process on the system.
Some properties of an application are fixed, such as the bundle identifier. Other properties may vary over time, such as whether the app is hidden. Properties that vary can be observed with key-value observing, in which case the description comment for the method notes this capability.
Properties that vary over time are inherently race-prone. For example, a hidden app may unhide itself at any time. To ameliorate this, properties persist until the next turn of the main run loop in a common mode. For example, if you repeatedly poll an unhidden app for its hidden property without allowing the run loop to run, it will continue to return false, even if the app hides, until the next turn of the run loop.
NSRunningApplication is thread safe, in that its properties are returned atomically. However, it is still subject to the main run loop policy described above. If you access an instance of NSRunningApplication from a background thread, be aware that its time-varying properties may change from under you as the main run loop runs (or not).
An NSRunningApplication instance remains valid after the application exits. However, most properties lose their significance, and some properties may not be available on a terminated application.

Requires Mac OS X 10.6.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.3pr5
- MBS Real Studio Plugins, version 11.3pr9

153.22.2 Methods

153.22.3 activateWithOptions(options as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to activate the application using the specified options.
Notes: options: The options to use when activating the application. See "NSApplicationActivationOptions"

for the possible values.

Returns true if the application was activated successfully, otherwise false.

This method will return false if the application has quit, or is not a type of application than can be activated.

Available in Mac OS X v10.6 and later.

153.22.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.
Example:

```
Var n as new NSRunningApplicationMBS

MessageBox n.localizedName
```

Notes: Initializes the object with the current application.
Available in Mac OS X v10.6 and later.

153.22.5 currentApplication as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSRunningApplication representing this application.
Example:

```
Var n as NSRunningApplicationMBS = NSRunningApplicationMBS.currentApplication

MessageBox n.localizedName
```

Notes: Available in Mac OS X v10.6 and later.

153.22.6 forceTerminate as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to force the receiver to quit.
Notes: Returns true if the application successfully terminated, otherwise false.

This method will return false if the application is no longer running when the forceTerminate message is sent to the receiver.

This method may return before the receiver exits; you should observe the terminated property to determine when the application terminates.

Available in Mac OS X v10.6 and later.

153.22.7 hide as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to hide or the application.
Example:

```
Var n as NSRunningApplicationMBS = NSRunningApplicationMBS.currentApplication

MessageBox str(n.hide) // hide me
```

Notes: The property of this value will be false if the application has already quit, or if of a type that is unable to be hidden.
Available in Mac OS X v10.6 and later.

153.22.8 runningApplications as NSRunningApplicationMBS()

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of NSRunningApplication representing the running applications.
Example:

```
Var n(-1) as NSRunningApplicationMBS = NSRunningApplicationMBS.runningApplications
Var s(-1) as string

for each r as NSRunningApplicationMBS in n
s.Add r.localizedName
next

MessageBox Join(s,EndOfLine)
```

Notes: Returns an array of NSRunningApplication instances.

The order of the array is unspecified, but it is stable, meaning that the relative order of particular applications will not change across multiple calls to runningApplications. See NSRunningApplication Class Reference for more information on NSRunningApplication.
Similar to the NSRunningApplication classes's properties, this property will only change when the main run loop is run in a common mode. Instead of polling, use key-value observing to be notified of changes to this array property.
This property is thread safe, in that it may be called from background threads and the result is returned atomically.

This list is not updated in a tight loop. For receiving updates, you need to have the runloop run (e.g. check regularly in a timer).

153.22.9 runningApplicationsWithBundleIdentifier(bundleID as string) as NSRunningApplicationMBS()

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of currently running applications with the specified bundle identifier.
Example:

```
Var n(-1) as NSRunningApplicationMBS = NSRunningApplicationMBS.runningApplicationsWithBundleIdentifier("com.apple.iTunes")

if n.LastIndex>=0 then
MessageBox n(0).localizedName
else
MessageBox "iTunes is not running?"
end if
```

Notes: An array of NSRunningApplications, or an empty array if no applications match the bundle identifier.
Available in Mac OS X v10.6 and later.

153.22.10 runningApplicationWithProcessIdentifier(pid as Integer) as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the running application with the given process identifier, or nil if no application has that pid.
Example:

```
Var n as NSRunningApplicationMBS
Var pid as Integer
```

```
while n=nil
pid=pid+1
n=NSRunningApplicationMBS.runningApplicationWithProcessIdentifier(pid)
wend

MessageBox n.localizedName+" has PID "+str(pid)
```

Notes: pid: The process identifier.

Returns an instance of NSRunningApplication for the specified pid, or nil if the application has no process identifier.

Applications that do not have PIDs cannot be returned from this method.
Available in Mac OS X v10.6 and later.

153.22.11 terminate as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to quit the receiver normally.
Notes: Returns true if the application successfully terminated, otherwise false.

This method will return false if the application is no longer running when the terminate message is sent to the receiver.
This method may return before the receiver exits; you should observe the terminated property to determine when the application terminates.

Available in Mac OS X v10.6 and later.

153.22.12 unhide as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to unhide or the application.
Notes: Returns true if the application was successfully shown, otherwise false.

The property of this value will be false if the application has already quit, or if of a type that is unable to be hidden.

Available in Mac OS X v10.6 and later.

153.22.13 Properties

153.22.14 activationPolicy as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the activation policy of the application. (read-only)
Notes: The value returned by this property is usually fixed, but it may change through a call to activateWithOptions.
Available in Mac OS X v10.6 and later.
(Read only property)

153.22.15 active as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the application is currently frontmost. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MessageBox str(n.active)
```

Notes: Available in Mac OS X v10.6 and later.
(Read only property)

153.22.16 bundleIdentifier as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the CFBundleIdentifier of the application. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MessageBox n.bundleIdentifier
```

Notes: The value of this property will be nil if the application does not have an Info.plist.
(Read only property)

153.22.17 bundleURL as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the URL to the application's bundle. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MessageBox n.bundleURL
```

Notes: Available in Mac OS X v10.6 and later.
(Read only property)

153.22.18 executableArchitecture as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the URL to the application's executable. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MessageBox str(n.executableArchitecture) // shows 7
```

Notes: Available in Mac OS X v10.6 and later.
(Read only property)

153.22.19 executableURL as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the URL to the application's executable. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MessageBox n.executableURL
```

Notes: Available in Mac OS X v10.6 and later.
(Read only property)

153.22.20 finishedLaunching as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the receiver's process has finished launching, (read-only)
Notes: The value of this property corresponds to the running application having received an NSApplicationDidFinishLaunchingNotification notification internally. Some applications do not post this notification (applications that do not rely on NSApplication) and so are never reported as finished launching.
Available in Mac OS X v10.6 and later.
(Read only property)

153.22.21 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference to the NSRunningApplication object.
Notes: (Read and Write property)

153.22.22 hidden as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the application is currently hidden. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MessageBox str(n.hidden)
```

Notes: Available in Mac OS X v10.6 and later.
(Read only property)

153.22.23 icon as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the icon for the receiver's application. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

Var i as NSImageMBS = n.icon
```

```
// without this call the size is 32x32 Pixel
i.setSize 512,512

Backdrop = i.CopyPictureWithMask
```

Notes: Available in Mac OS X v10.6 and later.
(Read only property)

153.22.24 launchDate as date

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the date when the application was launched. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MessageBox n.launchDate.ShortTime
```

Notes: This property is not available for all applications. Specifically, it is not available for applications that were launched not launched by LaunchServices.
Available in Mac OS X v10.6 and later.
(Read only property)

153.22.25 launchDateTime as DateTime

MBS MacCocoa Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the date when the application was launched. (read-only)
Notes: This property is not available for all applications. Specifically, it is not available for applications that were launched not launched by LaunchServices.
Available in Mac OS X v10.6 and later.
(Read only property)

153.22.26 localizedName as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the localized name of the application. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS
```

```
MessageBox n.localizedName
```

Notes: The value of this property is dependent on the current localization of the application and is suitable for presentation to the user.
Available in Mac OS X v10.6 and later.
(Read only property)

153.22.27 ownsMenuBar as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether the application owns the current menu bar.
Example:

```
// put in a timer...
Var r as NSRunningApplicationMBS = NSRunningApplicationMBS.currentApplication
Window1.Title = str(r.ownsMenuBar)
```

Notes: Available in Mac OS X v10.7 and later.
(Read only property)

153.22.28 processIdentifier as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the process identifier (pid) of the application. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MessageBox str(n.processIdentifier)
```

Notes: Not all applications have a pid. Applications without a return a value of -1.
Do not rely on this for comparing processes, instead compare NSRunningApplication instances using isEqual:.
Available in Mac OS X v10.6 and later.
(Read only property)

153.22.29 terminated as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates that the receiver's application has terminated. (read-only)
Notes: The value of terminated is true if the receiver's application has terminated, otherwise false.
This property is observable using key-value observing.
Available in Mac OS X v10.6 and later.
(Read only property)

153.22.30 Constants

Constants

Constant	Value	Description
NSApplicationActivateAllWindows	1	One of the flag constants for activateWithOptions. By default, activation brings only the main and key windows forwar specify NSApplicationActivateAllWindows, all of the application's wi brought forward. Available in Mac OS X v10.6 and later.
NSApplicationActivateIgnoringOtherApps	2	One of the flag constants for activateWithOptions. By default, activation deactivates the calling app (assuming it was ac then the new app is activated only if there is no currently active ap This prevents the new app from stealing focus from the user, if the a to activate and the user has switched to a different app in the interim. if you specify NSApplicationActivateIgnoringOtherApps, the applica tivated regardless of the currently active app, potentially stealing fo the user. You should rarely pass this flag because stealing key focus a very bad user experience. Available in Mac OS X v10.6 and later.
NSApplicationActivationPolicyAccessory	1	One of the constants used for following activation policies. The application does not appear in the Dock and does not have a m but it may be activated programmatically or by clicking on one of its This corresponds to value of the LSUIElement key in the application's being 1. Available in Mac OS X v10.6 and later.
NSApplicationActivationPolicyProhibited	2	One of the constants used for following activation policies. The application does not appear in the Dock and may not create or be activated. This corresponds to the value of the LSBackgroun in the application's Info.plist being 1. This is also the default for u executables that do not have Info.plists. Available in Mac OS X v10.6 and later.
NSApplicationActivationPolicyRegular	0	One of the constants used for following activation policies. The application is an ordinary app that appears in the Dock and m user interface. This is the default for bundled apps, unless overrido Info.plist. Available in Mac OS X v10.6 and later.

153.23 class NSXPCConnectionMBS

153.23.1 class NSXPCConnectionMBS

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The NSXPCConnection class provides a bi-directional communication channel between two processes.
Notes: This class is the primary means of creating and configuring the communication mechanism between two processes. Each process has one instance of this class to represent the endpoint in the communication channel.

Requires a setup with info.plist entries, correct permissions and code signing.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr1

153.23.2 Methods

153.23.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.

153.23.4 CallMethod(name as string, tag as Variant, params() as Variant)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Calls method and passes parameters.
Notes: Returns array of variant.

153.23.5 Close

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Closes the connection.

153.23.6 Constructor(endpoint as NSXPCListenerEndpointMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Initializes an NSXPCConnection object to connect to an NSXPCListener object in another process, identified by an NSXPCListenerEndpoint object.
Notes: endpoint: The desired listener endpoint for the service.
Available in OS X v10.8 and later.
See also:

- 153.23.7 Constructor(MachOServiceName as string, flags as Integer) 20422
- 153.23.8 Constructor(ServiceName as string) 20422

153.23.7 Constructor(MachOServiceName as string, flags as Integer)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes an NSXPCConnection object to connect to a LaunchAgent or LaunchDaemon with a name advertised in a launchd.plist.
Notes: For example, if an agent is managed with launchd and has a launchd.plist in textasciitilde /Library/LaunchAgents, this method would create a connection to that agent. The agent should use NSXPCListener to wait for new connections.

If the connection is being made to a process that is running in a privileged Mach bootstrap context (for example, a daemon started by a launchd property list in /Library/LaunchDaemons), then pass the NSXPC-ConnectionPrivileged option.

Available in OS X v10.8 and later.

- 153.23.6 Constructor(endpoint as NSXPCListenerEndpointMBS) 20421
- 153.23.8 Constructor(ServiceName as string) 20422

153.23.8 Constructor(ServiceName as string)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Initializes an NSXPCConnection object to connect to an NSXPCListener object in an XPC service, identified by a service name.
Notes: XPC services are helper processes that are usually part of your application bundle. The service should use NSXPCListener to wait for new connections.
Available in OS X v10.8 and later.
See also:

- 153.23.6 Constructor(endpoint as NSXPCListenerEndpointMBS) 20421
- 153.23.7 Constructor(MachOServiceName as string, flags as Integer) 20422

153.23.9 Destructor

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The destructor.

153.23.10 invalidate

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Invalidates the connection.
Notes: When you call this method, all outstanding reply blocks, error handling blocks, and invalidation blocks are called on the message handling queue. The connection must be invalidated before it is deallocated. After a connection is invalidated, no more messages may be sent or received.

153.23.11 resume

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Starts or resumes handling of messages on a connection.
Notes: All connections start suspended. You must resume them before they start processing received messages or sending messages through the remoteObjectProxy object.
Available in OS X v10.8 and later.

153.23.12 suspend

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Suspends the connection.
Notes: Suspends and resumes must be balanced before the connection may be invalidated.
Available in OS X v10.8 and later.

153.23.13 Properties

153.23.14 auditSessionIdentifier as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The BSM audit session identifier for the connecting process.
Notes: This attribute may be used by the listener delegate to accept or reject connections.

(Read only property)

153.23.15 effectiveGroupIdentifier as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The effective group ID (EGID) of the connecting process.
Notes: This attribute may be used by the listener delegate to accept or reject connections.
(Read only property)

153.23.16 effectiveUserIdentifier as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The effective user ID (EUID) of the connecting process.
Notes: This attribute may be used by the listener delegate to accept or reject connections.
(Read only property)

153.23.17 endpoint as NSXPCListenerEndpointMBS

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: If the connection was created with an NSXPCListenerEndpoint object, returns the endpoint object used.
Notes: (Read only property)

153.23.18 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

153.23.19 processIdentifier as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The process ID (PID) of the connecting process.
Notes: This attribute may be used by the listener delegate to accept or reject connections.
Available in OS X v10.8 and later.

(Read only property)

153.23.20 serviceName as String

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The name of the XPC service that this connection was configured to connect to.
Notes: (Read only property)

153.23.21 Events

153.23.22 CallMethodReturned(name as string, tag as Variant, Parameters() as Variant, Results() as Variant)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The event called when method returns.

153.23.23 ErrorHandler(error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The error event for errors happening when calling method.

153.23.24 InterruptionHandler

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The event is called if the remote process exits or crashes.
Notes: It may be possible to re-establish the connection by simply sending another message. The handler is invoked on the same queue as reply messages and other handlers, and it is always executed after any other messages or reply block handlers (except for the invalidation handler).

153.23.25 InvalidationHandler

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: This event is invoked on the same queue as reply messages and other handlers, and is always executed last (after the interruption handler, if required).

Notes: You may not send messages over the connection from within an invalidation handler block.

153.23.26 Constants

Constants

Constant	Value	Description
NSXPCConnectionPrivileged	1	One of the options that you can pass to a connection. Use this option if connecting to a service in the privileged Mach bootstrap (for example, a daemon with a launchd.plist in /Library/LaunchDaemons). Available in OS X v10.8 and later.

153.24 class NSXPCListenerEndpointMBS

153.24.1 class NSXPCListenerEndpointMBS

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Class that "names" a specific NSXPCListener object.
Notes: An instance may be retrieved from an NSXPCListener and sent over existing NSXPCConnections. A process may then use it to create a new NSXPCConnection to the original NSXPCListener.

This pattern is useful if you have a service which multiplexes work to other services. The service can act as an intermediate helper. The requesting application does not need to know specifically which service it is connecting to, just that it implements a known NSXPCInterface.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

153.24.2 Methods

153.24.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.

153.24.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The private constructor.

153.24.5 Properties

153.24.6 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

153.25 class NSXPCListenerMBS

153.25.1 class NSXPCListenerMBS

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The NSXPCListener class and its delegate are responsible for waiting for new incoming connections, configuring them, and accepting or rejecting them.
Notes: Each XPC service, launchd agent, or launchd daemon typically has at least one NSXPCListener object that listens for connections to a specified service name.
When the listener receives a new connection request, it creates a new NSXPCConnection object, then asks the delegate to inspect, configure, and resume the connection object by calling the delegate's shouldAcceptNewConnection event.

- MBS Xojo / Real Studio Plugins, version 14.2pr1

153.25.2 Methods

153.25.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.

153.25.4 Close

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Closes listener.

153.25.5 Constructor(Anonymous as boolean = false)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new listener connection.
Notes: If Anonymous is true: Initializes with a new anonymous listener connection.
If false: Initializes with the singleton listener used to listen for incoming connections in an XPC service.

see also:
https://developer.apple.com/library/mac/documentation/Foundation/Reference/NSXPCListener_reference/translated_content/NSXPCListener.html
See also:

- 153.25.6 Constructor(Name as string) 20429

153.25.6 Constructor(Name as string)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a listener in a LaunchAgent or LaunchDaemon which has a name advertised in a launchd.plist file.
Notes: For example, you might use this in an agent launched by launchd with a launchd.plist contained in textasciitilde /Library/LaunchAgents, or a daemon launched by launchd with a launchd.plist contained in /Library/LaunchDaemons.

Available in OS X v10.8 and later.
See also:

- 153.25.5 Constructor(Anonymous as boolean = false) 20428

153.25.7 Destructor

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The destructor.

153.25.8 invalidate

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Invalidates the listener.
Notes: After calling this method, no more connections are created. Once a listener is invalidated it may not be resumed or suspended.
Available in OS X v10.8 and later.

153.25.9 resume

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Starts processing of incoming requests.
Notes: All listeners start suspended and must be resumed before they begin processing incoming requests.

If called on the serviceListener object, this method never returns. Therefore, you should call it as the last step inside the XPC service's main function after setting up any desired initial state and configuring the

listener itself.

If called on any other NSXPCListener, the connection is resumed, and the method returns immediately.
Available in OS X v10.8 and later.

153.25.10 suspend

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Suspends the listener.
Notes: Suspends and resumes must be balanced before the listener may be invalidated.
Available in OS X v10.8 and later.

153.25.11 Properties

153.25.12 endpoint as NSXPCListenerEndpointMBS

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns an endpoint object that may be sent over an existing connection.
Notes: The receiver of the endpoint can use this object to create a new connection to this NSXPCListener object. The resulting NSXPCListenerEndpoint object uniquely names this listener object across connections.
(Read only property)

153.25.13 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

153.25.14 Events

153.25.15 CallMethod(Name as string, Parameters() as Variant) as Variant()

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Called on the listener side when a method was called on the connection.
Notes: Return array of variant for the results.

153.25.16 shouldAcceptNewConnection(newConnection as NSXPCConnectionMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Accepts or rejects a new connection to the listener.
Notes: To accept the connection, first configure the connection if desired, then call resume on the new connection, then return true.
To reject the connect, return a value of false. This causes the connection object to be invalidated.
In this method, you can also set up properties on the connection object, such as its exported object and interfaces. Be sure to call resume when you are finished configuring the connection object and are ready for it to receive messages.

153.26 class ProcessMBS

153.26.1 class ProcessMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Adds the class ProcessMBS to Xojo to get details about all running applications.
Example:

```
// Shows how to use the processInformationCFDictionary function to
// decide on Mac OS X whether an application is a background only one.

Var myProcess as ProcessMBS
Var myCFDictionary as CFDictionaryMBS
Var myCFBoolean as CFBooleanMBS
Var myCFObject as CFObjectMBS

myProcess=new ProcessMBS
myProcess.GetCurrentProcess
myCFDictionary = CFDictionaryMBS(myProcess.processInformationCFDictionary)
myCFObject = myCFDictionary.Value(newcfstringmbs("LSBackgroundOnly"))
myCFBoolean=CFBooleanMBS(myCFObject)

if myCFBoolean.Value then
MessageBox "is background"
else
MessageBox "is not background"
end if
```

Notes: Requires Windows 95 or Windows 2000 to run on Windows.

To find all windows on Windows, use the WindowsListMBS class.
To find all windows on Mac OS X, use the CGSWindowListMBS class.

For newer code on Mac, please check NSRunningApplicationMBS class.
See also WindowsProcessDiagnosticInfoMBS class for Windows.

153.26.2 Methods

153.26.3 Bundle as folderitem

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bundle path.
Notes: Maybe nil if not available.
Returns on Mac OS X the path to the main bundle of the process.

153.26.4 BundleID as string

MBS Util Plugin, Plugin Version: 7.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bundle identifier.
Notes: Maybe "" if not available.
Returns on Mac OS X the identifier to the main bundle of the process.

153.26.5 CurrentProcessID as Integer

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the process ID of the application.
Example:

MessageBox str(ProcessMBS.CurrentProcessID)

153.26.6 GetCurrentProcess

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Load the current Process' information into the class.
Notes: This should always be your Xojo application.

153.26.7 GetfirstProcess

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Load the first Process into the class.
Example:

```
Var p as ProcessMBS
p=new ProcessMBS
p.GetfirstProcess ' get first
do
MessageBox p.name
loop until not p.GetNextProcess ' get next till no more
```

153.26.8 GetFrontProcess

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Load the frontmost Process' information into the class.

153.26.9 GetNextProcess as boolean

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Load the next Process into the class.
Example:

```
Var p as ProcessMBS
p=new ProcessMBS
p.GetfirstProcess ' get first
do
MessageBox p.name
loop until not p.GetNextProcess ' get next till no more
```

Notes: Returns true if successful.

153.26.10 GetProcess(serial as memoryblock)

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Load the process information for the process with the given serial.

153.26.11 KillProcess as Integer

MBS Util Plugin, Plugin Version: 2.7, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Kills a Process on Mac OS X or Windows.
Example:

```
Var p as ProcessMBS
p=new ProcessMBS
p.getcurrentprocess
MessageBox str(p.killprocess)
```

Notes: Returns -1 if function is not available. Else returns a Mac OS error code where 0 equals "no error".

Sets the lasterror property.

Lasterror codes on Windows:
0 - failed
1 - normal exit
2 - forced exit

If you kill the main process of a task, this can kill the sub processes, too.
See also:

- 153.26.12 KillProcess(ProcessID as Integer, timeout as Integer) as Integer 20435
- 153.26.13 KillProcess(timeoutms as Integer) as Integer 20436

153.26.12 KillProcess(ProcessID as Integer, timeout as Integer) as Integer

MBS Util Plugin, Plugin Version: 10.3, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Kills a Process on Mac OS X or Windows.
Example:

```
const pid = 12345 // put the PID here
call ProcessMBS.KillProcess pid, 100
```

Notes: Returns -1 if function is not available. Else returns a Mac OS error code where 0 equals "no error".

Returns on Windows:
0 - failed
1 - normal exit
2 - forced exit

The timeout is in milliseconds.
If you kill the main process of a task, this can kill the sub processes, too.
See also:

- 153.26.11 KillProcess as Integer 20435
- 153.26.13 KillProcess(timeoutms as Integer) as Integer 20436

153.26.13 KillProcess(timeoutms as Integer) as Integer

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Kills a Process on Mac OS X or Windows.
Example:

```
Var p as ProcessMBS
p=new ProcessMBS
p.getcurrentprocess
MessageBox str(p.killprocess)
```

Notes: Returns -1 if function is not available. Else returns a Mac OS error code where 0 equals "no error".

Sets the lasterror property.

Lasterror codes on Windows:
0 - failed
1 - normal exit
2 - forced exit

The timeout is in milliseconds. If you don't specify a timeout, 1000 ms are used.
If you kill the main process of a task, this can kill the sub processes, too.
See also:

- 153.26.11 KillProcess as Integer 20435
- 153.26.12 KillProcess(ProcessID as Integer, timeout as Integer) as Integer 20435

153.26.14 MacProcessSerial as memoryblock

MBS Util Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the serial number for this process as a memoryblock with binary content.
Notes: On Mac OS every process as its own unique ID. (If you launch one application two times, they may have everything equal except the process serial.)

The serial itself is a 8byte long memoryblock (two integer).

Returns nil on any error.

153.26.15 ProcessInformationCFDictionary as object

MBS Util Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a CFDictionaryMBS object with the properties of the process.
Example:

```
Var p as ProcessMBS
Var d as CFDictionaryMBS

p=new ProcessMBS

p.GetCurrentProcess

d=CFDictionaryMBS(p.ProcessInformationCFDictionary)

if d=nil then
MessageBox "This example works only on Mac OS X 10.2!"
else
// use information in dictionary
end if
```

Notes: Only available on Mac OS X 10.2 or newer.
(And in Mac OS X 10.2 is a bug which may lead into a crash by using this function. Fixed in Mac OS X 10.3)
The function returns a CFDictionaryMBS, but to avoid plugin dependencies, the function is declared as Object, so RB 4.5 don't crash when an application uses the process plugin and dosn't use the CF Plugin.

Result:
An immutable CFDictionary containing these keys and their values. Keys marked with an '*' are optional. Over time more keys may be added.

153.26.16 QuitProcess as Integer

MBS Util Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Quits a Process on Mac OS.
Example:

Key Name	Type
"PSN"	CFNumber, kCFNumberLongLongType
"Flavor"	CFNumber, kCFNumberSInt32
"Attributes"	CFNumber, kCFNumberSInt32
"ParentPSN"	CFNumber, kCFNumberLongLong
"FileType"	CFString, file type
"FileCreator"	CFString, file creator
"pid"	CFNumber, kCFNumberLongType
"LSBackgroundOnly"	CFBoolean
"LSUIElement"	CFBoolean
"IsHiddenAttr"	CFBoolean
"IsCheckedInAttr"	CFBoolean
"RequiresClassic"	CFBoolean
"RequiresCarbon"	CFBoolean
"LSUserQuitOnly"	CFBoolean
"LSUIPresentationMode"	CFNumber, kCFNumberShortType
"BundlePath"	CFString
kIOBundleExecutableKey	CFString
kIOBundleNameKey	CFString
kIOBundleIdentifierKey	CFString

```
Var p as ProcessMBS
p=new ProcessMBS
p.getcurrentprocess
MessageBox str(p.QuitProcess)
```

Notes: Returns -1 if function is not available. Else returns a Mac OS error code where 0 equals "no error". Sets the lasterror property.

153.26.17 SameAs(other as ProcessMBS) as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if two ProcessMBS objects have the same Process.

153.26.18 SetFrontProcessWithOptions(options as Integer)

MBS Util Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Moves the current process to the front.
Example:

```
Var p as ProcessMBS
```

```
// move my front window to the front
p=new ProcessMBS
p.GetCurrentProcess
p.SetFrontProcessWithOptions 1
```

Notes: If you pass 0 in the options parameter, the process is activated and all process windows are brought forward.

If you pass kSetFrontProcessFrontWindowOnly (value 1), the process is activated and the frontmost non-floating window is brought forward. (Mac OS X only)

153.26.19 SetServiceMode(ismode as boolean) as boolean

MBS Util Plugin, Plugin Version: 2.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: If an application is a service, it is not listed inside the Windows force quit window.
Notes: Works only on Windows 95, 98 and ME.

153.26.20 TransformProcessType(mode as Integer) as Integer

MBS Util Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Changes the 'type' of the process specified in the psn parameter.
Notes: Given a psn for an application, this call transforms that application into the given type. Foreground applications have a menu bar and appear in the Dock. Background applications do not appear in the Dock, do not have a menu bar (and should not have windows or other user interface). UIElement applications do not have a menu bar, do not appear in the dock, but may in limited circumstances present windows and user interface. If a foreground application is frontmost when transformed into a background application, it is first hidden and another application is made frontmost. A UIElement or background-only application which is transformed into a foreground application is not brought to the front (use SetFrontProcess() after the transform if this is required) nor will it be shown if it is hidden (even if hidden automatically by being transformed into a background-only application), so the caller should use ShowHideProcess() to show the application after it is transformed into a foreground application. Applications can only transform themselves; this call cannot change the type of another application.

Returns error code (0 for success).

153.26.21 TransformToForegroundApplication as Integer

MBS Util Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Transforms a background application to a foreground application.
Notes: Returns a Mac OS error code. Returns -1 if the function is not available. You need to select a process first with Get*Process functions.
Requires Mac OS X 10.3.

You can use this call to transform a background-only application into a foreground application. A foreground application appears in the Dock (and in the Force Quit dialog) and contains a menu bar. This function does not cause the application to be brought to the front; you must set FrontProcess=true to do so.

While available starting in 10.3 "Panther," calling TransformProcessType on a UIElement application in 10.3 or 10.4 will return paramErr (-50), rendering it only usable on a full BackgroundOnly? application. Leopard supports foregrounding both UIElement and BackgroundOnly? applications.

153.26.22 Update

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Updates the classes information.
Notes: Use it if you want the current CPUTime value after some time.

153.26.23 WinFullProcessImagePath as string

MBS Util Plugin, Plugin Version: 9.6, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the full name of the executable image for the specified process.
Notes: Returns empty string on any error like missing permissions.
The path is in the device style "Device\Harddisk0\Partition1\WINNT\System32\test.exe".

Requires Windows Vista or Windows Server 2008 or newer.

153.26.24 WinGetPriorityClass(ProcessID as Integer) as Integer

MBS Util Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the priority class for the specified process.
Notes: You can pass ProcessID -1 to get the current process.
This value, together with the priority value of each thread of the process, determines each thread's base priority level.

If the function succeeds, the return value is the priority class of the specified process.

The process's priority class is one of the following values:

Name	Value	Description
ABOVE_NORMAL_PRIORITY_CLASS	&h00008000	Process that has priority above NORMAL_PRIORITY_CLASS but below HIGH_PRIORITY_CLASS.
BELOW_NORMAL_PRIORITY_CLASS	&h00004000	Process that has priority above IDLE_PRIORITY_CLASS but below NORMAL_PRIORITY_CLASS.
HIGH_PRIORITY_CLASS	&h00000080	Process that performs time-critical tasks that must be executed immediately for it to run correctly. The threads of a high-priority class process preempt the threads of normal or idle priority class processes. An example is the Task List, which must respond quickly when called by the user, regardless of the load on the operating system. Use extreme care when using the high-priority class, because a high-priority class CPU-bound application can use nearly all available cycles.
IDLE_PRIORITY_CLASS	&h00000040	Process whose threads run only when the system is idle and are preempted by the threads of any process running in a higher priority class. An example is a screen saver. The idle priority class is inherited by child processes.
NORMAL_PRIORITY_CLASS	&h00000020	Process with no special scheduling needs.
REALTIME_PRIORITY_CLASS	&h00000100	Process that has the highest possible priority. The threads of a real-time priority class process preempt the threads of all other processes, including operating system processes performing important tasks. For example, a real-time process that executes for more than a very brief interval can cause disk caches not to flush or cause the mouse to be unresponsive.

Every thread has a base priority level determined by the thread's priority value and the priority class of its process. The operating system uses the base priority level of all executable threads to determine which thread gets the next slice of CPU time. Threads are scheduled in a round-robin fashion at each priority level, and only when there are no executable threads at a higher level will scheduling of threads at a lower level take place.
For a table that shows the base priority levels for each combination of priority class and thread priority value, see Scheduling Priorities.
Priority class is maintained by the executive, so all processes have a priority class that can be queried.

For Mac and Linux, please use Priority.

153.26.25 WinModulePath as string

MBS Util Plugin, Plugin Version: 9.6, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the path the first code file in this process.
Notes: Returns empty string on any error like missing permissions.
The path is in the typical style "C:\path\name.exe".

153.26.26 WinProcessImagePath as string

MBS Util Plugin, Plugin Version: 9.6, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the name of the executable file for the specified process.

Notes: Returns empty string on any error like missing permissions.
The path is in the device style "Device\Harddisk0\Partition1\WINNT\System32\test.exe".

Requires Windows XP or Windows Server 2003 or newer.

153.26.27 WinSetPriorityClass(ProcessID as Integer, PriorityClass as Integer) as Integer

MBS Util Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the priority class for the specified process.
Notes: You can pass ProcessID -1 to get the current process.
This value together with the priority value of each thread of the process determines each thread's base priority level.

The process's priority class is one of the following values:

Name	Value	Description
ABOVE_NORMAL_PRIORITY_CLASS	&h00008000	Process that has priority above NORMAL_PRIORITY_CLASS but below HIGH_PRIORITY_CLASS.
BELOW_NORMAL_PRIORITY_CLASS	&h00004000	Process that has priority above IDLE_PRIORITY_CLASS but below NORMAL_PRIORITY_CLASS.
HIGH_PRIORITY_CLASS	&h00000080	Process that performs time-critical tasks that must be executed immediately for it to run correctly. The threads of a high-priority class process preempt the threads of normal or idle priority class processes. An example is the Task List, which must respond quickly when called by the user, regardless of the load on the operating system. Use extreme care when using the high-priority class, because a high-priority class CPU-bound application can use nearly all available cycles.
IDLE_PRIORITY_CLASS	&h00000040	Process whose threads run only when the system is idle and are preempted by the threads of any process running in a higher priority class. An example is a screen saver. The idle priority class is inherited by child processes.
NORMAL_PRIORITY_CLASS	&h00000020	Process with no special scheduling needs.
REALTIME_PRIORITY_CLASS	&h00000100	Process that has the highest possible priority. The threads of a real-time priority class process preempt the threads of all other processes, including operating system processes performing important tasks. For example, a real-time process that executes for more than a very brief interval can cause disk caches not to flush or cause the mouse to be unresponsive.

Every thread has a base priority level determined by the thread's priority value and the priority class of its process. The operating system uses the base priority level of all executable threads to determine which thread gets the next slice of CPU time. Threads are scheduled in a round-robin fashion at each priority level, and only when there are no executable threads at a higher level will scheduling of threads at a lower level take place.
For a table that shows the base priority levels for each combination of priority class and thread priority value, see Scheduling Priorities.
Priority class is maintained by the executive, so all processes have a priority class that can be queried.

Every thread has a base priority level determined by the thread's priority value and the priority class of its process. The system uses the base priority level of all executable threads to determine which thread gets the next slice of CPU time. The SetThreadPriority function enables setting the base priority level of a thread relative to the priority class of its process. For more information, see Scheduling Priorities.
The *_PRIORITY_CLASS values affect the CPU scheduling priority of the process. For processes that perform background work such as file I/O, network I/O, or data processing, it is not sufficient to adjust the CPU scheduling priority; even an idle CPU priority process can easily interfere with system responsiveness when it uses the disk and memory. Processes that perform background work should use the PROCESS_MODE_BACKGROUND_BEGIN and PROCESS_MODE_BACKGROUND_END values to adjust their resource scheduling priorities; processes that interact with the user should not use PROCESS_MODE_BACKGROUND_BEGIN.
If a process is in background processing mode, the new threads it creates will also be in background processing mode. When a thread is in background processing mode, it should minimize sharing resources such as critical sections, heaps, and handles with other threads in the process, otherwise priority inversions can occur. If there are threads executing at high priority, a thread in background processing mode may not be scheduled promptly, but it will never be starved.
Each thread can enter background processing mode independently using SetThreadPriority. Do not call SetPriorityClass to enter background processing mode after a thread in the process has called SetThreadPriority to enter background processing mode. After a process ends background processing mode, it resets all threads in the process; however, it is not possible for the process to know which threads were already in background processing mode.

On any error the value is zero.
For Mac and Linux, please use Priority.

153.26.28 Properties

153.26.29 CPUTime as Integer

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of the ticks this Process did get to calculate.
Notes: Unit is 1/60 of a second.
On Mac OS X this value is not available and normally 0.
(Read only property)

153.26.30 CurrentProcess as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if the application is in the current Process.
Notes: This should always be true because you are running Xojo as the current ProcessMBS while you ask for this.
(Read only property)

153.26.31 flags as Integer

MBS Util Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The flags for this process on Mac OS.
Example:

```
// This example needs a window with ListBox1.
Sub Open()
// List all visible processes

Var s as string
Var p as ProcessMBS
Var d As CFDictionaryMBS
Var LSBackgroundOnly, LSUIElement As CFStringMBS
Var b As CFBooleanMBS
Var obj As CFObjectMBS
Var visible as Boolean

const modeOnlyBackground=&h00000400

LSUIElement=NewCFStringMBS("LSUIElement")
LSBackgroundOnly = NewCFStringMBS("LSBackgroundOnly")

p = new ProcessMBS
p.getfirstProcess

do
visible=True

// Mac OS X
d = CFDictionaryMBS(p.ProcessInformationCFDictionary)

if d <>nil Then
obj = d.Value(LSBackgroundOnly)
if obj isa CFBooleanMBS then
b=CFBooleanMBS(obj)

if b.value Then
visible=false
end
end if

obj= d.Value(LSUIElement)
if obj isa CFBooleanMBS then
b=CFBooleanMBS(obj)
```

```
if b.value Then
visible=false
end
end if
end if

// Mac OS 9

if BitwiseAnd(p.Flags,modeOnlyBackground)<>0 then
visible=False
end if

if visible then
ListBox1.AddRow p.Name
end if

loop until not p.GetNextProcess
End Sub
```

Notes: Returns 0 on any error.

Process mode flags. These flags indicate whether the process is an application or desk accessory. For applications, this field also returns information specified in the application's 'SIZE' resource. This information is returned as flags. You can refer to these flags by using these constants:

modeDeskAccessory	&h00020000
modeMultiLaunch	&h00010000
modeNeedSuspendResume	&h00004000
modeCanBackground	&h00001000
modeDoesActivateOnFGSwitch	&h00000800
modeOnlyBackground	&h00000400
modeGetFrontClicks	&h00000200
modeGetAppDiedMsg	&h00000100
mode32BitCompatible	&h00000080
modeHighLevelEventAware	&h00000040
modeLocalAndRemoteHLEvents	&h00000020
modeStationeryAware	&h00000010
modeUseTextEditServices	&h00000008

(Read only property)

153.26.32 FrontProcess as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if the application is in the front of all others.
Example:

```
Var p as new ProcessMBS
p.GetCurrentProcess
p.FrontProcess=true 'bring app to front
```

Notes: This property is for read and write. Writing to it brings the Process to front.
(Read and Write property)

153.26.33 lasterror as Integer

MBS Util Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: As this property is introduced with MBS Plugin 3.1, only a few functions set it.
0 means no error, -1 means not available and anything else is a Mac OS error code.
(Read and Write property)

153.26.34 LaunchProcess as ProcessMBS

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the application which launched the current one.
Notes: For some applications like the "loginwindow" it is nil, because there was no app to launch it other than the system itself.
(Read only property)

153.26.35 MacCreator as string

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the Mac Creator code for the application.
Notes: (Read only property)

153.26.36 MacType as string

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the Mac Type code for the application.
Notes: Possible values:

"APPL"	normal application
"appe"	background application (Classic)
"APPC"	Control panel application (Classic)
"APPD"	Desktop Accessory (Classic)
"FNDR"	Finder

others may be possible.
(Read only property)

153.26.37 MemoryFree as Integer

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the size of the free space in the Process' memory partition.
Notes: On Mac OS X normally 0.
(Read only property)

153.26.38 MemorySize as Integer

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns size of the Process' memory partition.
Notes: On Mac OS X normally 0.
(Read only property)

153.26.39 Name as string

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Returns the name of this application.
Notes: Added Windows support in MBS Plugin 2.7 for this property.
(Read only property)

153.26.40 Path as folderitem

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the path of the Process' executable file.
Notes: Maybe nil if not available.
Use this folderitem to get an icon for the Process.
(and this icon may be nil!)
(Read only property)

153.26.41 ProcessID as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Returns the PID of the process for use in unix command line tools.
Example:

```
Function LoginWindowPID() as Integer
// returns Process ID of Loginwindow on Mac OS X.
// or 0 on error

Var p as ProcessMBS

p=new ProcessMBS
p.GetFirstProcess

do
if p.Name="loginwindow" then
Return p.ProcessID
end if
loop until not p.GetNextProcess
End Function
```

Notes: Works only on Mac OS X.
See the "CPU Focus" application for an example.

Note that this call does not make sense for Classic applications, since they all share a single UNIX process ID.
(Read only property)

153.26.42 Visible as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if the application is visible.
Example:

```
// hide iTunes

Var p as new ProcessMBS

p.GetFirstProcess
do
if p.BundleID="com.apple.iTunes" then
p.Visible=false
exit
end if
loop until not p.GetNextProcess
```

Notes: Works only on Mac OS X.
Returns false if not supported.

Sets the lasterror property.
(Read and Write property)

153.26.43 Priority as Integer

MBS Util Plugin, Plugin Version: 10.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The priority of the process.
Example:

```
Var p as new ProcessMBS

p.GetCurrentProcess

MessageBox str(p.priority) // shows 0

p.priority = 5

MessageBox str(p.priority) // shows 5
```

Notes: 20 (least) to -20 (max). Setting the value may be limited due to permissions.
(Read and Write computed property)
See also:

- 153.26.44 Priority(ProcessID as Integer) as Integer 20450

153.26.44 Priority(ProcessID as Integer) as Integer

MBS Util Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Sets or gets priority for a process on Mac and Linux.
Notes: Value is in the range -20 to 20. The default priority is 0; lower priorities cause more favorable scheduling.
For Windows, please use WinSetPriorityClass and WinGetPriorityClass.
(Read and Write computed property)
See also:

- 153.26.43 Priority as Integer 20449

153.26.45 Constants

Process Transformation Types

Constant	Value	Description
kProcessTransformToBackgroundApplication	2	Turn application in a background application. functional in Mac OS X 10.7 and later
kProcessTransformToForegroundApplication	1	Turn application in a foreground application.
kProcessTransformToUIElementApplication	4	Turn application in a user interface element application. functional in Mac OS X 10.7 and later

153.27 class WindowsProcessMemoryInfoMBS

153.27.1 class WindowsProcessMemoryInfoMBS

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to get information about the memory usage of a process on Windows.
Example:

```
// show the memory usage of the own process on Windows
Var info As New WindowsProcessMemoryInfoMBS // current process
MessageBox "Working set: " + Format(info.WorkingSetSize / 1024 / 1024, "0.0") + " MB" + EndOfLine
+ _
"Peak working set: " + Format(info.PeakWorkingSetSize / 1024 / 1024, "0.0") + " MB" + EndOfLine + _
"Page file usage: " + Format(info.PagefileUsage / 1024 / 1024, "0.0") + " MB" + EndOfLine + _
"Page faults: " + info.PageFaultCount.ToString
```

Notes: See also WindowsProcessMemoryUsageReportMBS and WindowsProcessStatisticsMBS classes.
Blog Entries

- MBS Xojo Plugins, version 17.1pr2

153.27.2 Methods

153.27.3 Constructor

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor which fills the values into the properties.
Example:

```
Var w as new WindowsProcessMemoryInfoMBS
MessageBox "This application uses currently "+str(w.WorkingSetSize)+" Bytes of memory."
```

Notes: Queries the current process memory information.
See also:

- 153.27.4 Constructor(ProcessID as Integer) 20451

153.27.4 Constructor(ProcessID as Integer)

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor which fills the values into the properties.
Notes: Queries the process memory information of the process with the given ID.
See also:

- 153.27.3 Constructor 20451

153.27.5 Properties

153.27.6 PageFaultCount as Integer

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of page faults.
Notes: (Read only property)

153.27.7 PagefileUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current space allocated for the pagefile, in bytes. Those pages may or may not be in memory.
Notes: (Read only property)

153.27.8 PeakPagefileUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak space allocated for the pagefile, in bytes.
Notes: (Read only property)

153.27.9 PeakWorkingSetSize as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak working set size, in bytes.
Notes: (Read only property)

153.27.10 ProcessID as Integer

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The process ID of the process queried.
Notes: Value is 0 if the query failed.
(Read only property)

153.27.11 QuotaNonPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak nonpaged pool usage, in bytes.
Notes: (Read only property)

153.27.12 QuotaPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current paged pool usage, in bytes.
Notes: (Read only property)

153.27.13 QuotaPeakNonPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current nonpaged pool usage, in bytes.
Notes: (Read only property)

153.27.14 QuotaPeakPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak paged pool usage, in bytes.
Notes: (Read only property)

153.27.15 WorkingSetSize as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current working set size, in bytes.
Notes: This is the memory your application uses.
(Read only property)

153.28 class WindowsProcessStatisticsMBS

153.28.1 class WindowsProcessStatisticsMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to get information about process statistics on Windows.
Example:

```
Var c as new WindowsProcessStatisticsMBS
MessageBox str(C.PeakWorkingSetSize)
```

Notes: See also WindowsVMStatisticsMBS for the system memory usage.

See also WindowsProcessMemoryInfoMBS and WindowsProcessMemoryUsageReportMBS classes.

153.28.2 Methods

153.28.3 Constructor(ProcessID as Integer = -1, Mode as Integer = 255)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new object for given process and with given mode.
Example:

```
Var pid as Integer = -1
Var c as new WindowsProcessStatisticsMBS(pid, WindowsProcessStatisticsMBS.ModeMemoryCounters)
MessageBox str(C.PeakWorkingSetSize)
```

Notes: If ProcessID is -1, the current process is queried.
Mode can be a combination of the Mode* constants you want to query. The Mode property will later contain the Mode* constants combination of the values which are valid.

153.28.4 Properties

153.28.5 CreationTime as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A file time that receives the creation time of the process.
Notes: Property is valid if Mode contains ModeTimes.
(Read only property)

153.28.6 CycleTime as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The sum of the cycle time of all threads of the specified process.
Notes: Property is valid if Mode contains ModeTimes.
This value can only be queried on Windows Vista or newer.
(Read only property)

153.28.7 ExitTime as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A file time that receives the exit time of the process. If the process has not exited, the content of this structure is undefined.
Notes: Property is valid if Mode contains ModeTimes.
(Read only property)

153.28.8 HandleCount as Integer

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of handles in use by the process.
Example:

```
Var w as new WindowsProcessStatisticsMBS
Var n1 as Integer = w.HandleCount

Var x as new Window1 // make a new window

w = new WindowsProcessStatisticsMBS
Var n2 as Integer = w.HandleCount
```

MessageBox str(n2)+" handles in used, "+str(n2-n1)+" used by second window"

Notes: Value is -1 on an error.
(Read only property)

153.28.9 KernelTime as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A file time structure that receives the amount of time that the process has executed in kernel mode.
Notes: The time that each of the threads of the process has executed in kernel mode is determined, and then all of those times are summed together to obtain this value.
Property is valid if Mode contains ModeTimes.
(Read only property)

153.28.10 Mode as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Which values have been queried.
Notes: This value is a combination of the Mode* constants.
(Read only property)

153.28.11 OtherOperationCount as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of I/O operations performed, other than read and write operations.
Notes: Property is valid if Mode contains ModeIOCounters.
(Read only property)

153.28.12 OtherTransferCount as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of bytes transferred during operations other than read and write operations.
Notes: Property is valid if Mode contains ModeIOCounters.
(Read only property)

153.28.13 PageFaultCount as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of page faults.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

153.28.14 PagefileUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current space allocated for the pagefile, in bytes. Those pages may or may not be in memory.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

153.28.15 PeakPagefileUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak space allocated for the pagefile, in bytes.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

153.28.16 PeakWorkingSetSize as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak working set size, in bytes.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

153.28.17 ProcessID as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The process ID of the process queried.
Notes: (Read only property)

153.28.18 QuotaNonPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak nonpaged pool usage, in bytes.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

153.28.19 QuotaPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current paged pool usage, in bytes.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

153.28.20 QuotaPeakNonPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current nonpaged pool usage, in bytes.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

153.28.21 QuotaPeakPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak paged pool usage, in bytes.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

153.28.22 ReadOperationCount as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of read operations performed.
Notes: Property is valid if Mode contains ModeIOCounters.
(Read only property)

153.28.23 ReadTransferCount as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of bytes read.
Notes: Property is valid if Mode contains ModeIOCounters.
(Read only property)

153.28.24 TotalIdleTime as UInt64

MBS Win Plugin, Plugin Version: 11.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The amount of time that the system has been idle.
Notes: (Read only property)

153.28.25 TotalKernelTime as UInt64

MBS Win Plugin, Plugin Version: 11.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The amount of time that the system has spent executing in Kernel mode (including all threads in all processes, on all processors).
Notes: This time value also includes the amount of time the system has been idle. So you may want to subtract idle time to get real kernel time.
(Read only property)

153.28.26 TotalUserTime as UInt64

MBS Win Plugin, Plugin Version: 11.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The amount of time that the system has spent executing in User mode (including all threads in all processes, on all processors).
Notes: If you need to know what is the percentage of the CPU time spent for user applications, you need to read this value two times and calculate the delta.
(Read only property)

153.28.27 UserTime as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A file time structure that receives the amount of time that the process has executed in user mode.
Notes: The time that each of the threads of the process has executed in user mode is determined, and then

all of those times are summed together to obtain this value.
Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

153.28.28 WorkingSetSize as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current working set size, in bytes.
Notes: This is the memory your application uses.
Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

153.28.29 WriteOperationCount as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of write operations performed.
Notes: Property is valid if Mode contains ModeIOCounters.
(Read only property)

153.28.30 WriteTransferCount as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of bytes written.
Notes: Property is valid if Mode contains ModeIOCounters.
(Read only property)

153.28.31 Constants

Constants

Constant	Value	Description
ModeHandles	32	One of the mode constants. Whether to query the handle count.

Mode Constants

Constant	Value	Description
ModeCycleTime	8	Whether to query the cycle time.
ModeIOCounters	2	Whether to query the IOCounters.
ModeMemoryCounters	1	Whether to query the memory counters.
ModeTimes	4	Whether to query the time values.
ModeTotalTime	16	Whether to query the total CPU time values. Requires Windows XP with SP1.

153.29 class WindowsVMStatisticsMBS

153.29.1 class WindowsVMStatisticsMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Holds information about the current Windows memory status.
Example:

```
// show memory usage on Windows
Var vm As New WindowsVMStatisticsMBS
MessageBox "Memory load: " + vm.Memoryload.ToString + "%" + EndOfLine + _
"Physical: " + Format(vm.AvailablePhysicalMemory / 1024 / 1024, "0") + " of " + Format(vm.TotalPhysicalMemory / 1024 / 1024, "0") + " MB free" + EndOfLine + _
"Page file: " + Format(vm.AvailablePageFileMemory / 1024 / 1024, "0") + " of " + Format(vm.TotalPageFileMemory / 1024 / 1024, "0") + " MB free"
```

Notes: See also WindowsProcessStatisticsMBS, WindowsProcessMemoryInfoMBS, WindowsProcessMemoryUsageReportMBS and WindowsSystemMemoryUsageReportMBS classes.

153.29.2 Methods

153.29.3 Constructor

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new statistics object with current values.
Example:

```
// show values in a listbox:
Var w as new WindowsVMStatisticsMBS

list.AddRow "Pagesize: "+format(w.Pagesize,"0")
list.AddRow "MemoryLoad: "+format(w.MemoryLoad,"0")
list.AddRow "AvailablePageFileMemory: "+format(w.AvailablePageFileMemory,"0")
list.AddRow "AvailablePhysicalMemory: "+format(w.AvailablePhysicalMemory,"0")
list.AddRow "AvailableVirtualMemory: "+format(w.AvailableVirtualMemory,"0")
list.AddRow "TotalPageFileMemory: "+format(w.TotalPageFileMemory,"0")
list.AddRow "TotalPhysicalMemory: "+format(w.TotalPhysicalMemory,"0")
list.AddRow "TotalVirtualMemory: "+format(w.TotalVirtualMemory,"0")
```

153.29.4 Properties

153.29.5 AllocationGranularity as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The granularity for the starting address at which virtual memory can be allocated.
Notes: Typically 64 KB.
(Read only property)

153.29.6 AvailablePageFileMemory as Int64

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the number of bytes available in the paging file.
Notes: (Read only property)

153.29.7 AvailablePhysicalMemory as Int64

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the number of bytes of physical memory available.
Notes: (Read only property)

153.29.8 AvailableVirtualMemory as Int64

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the number of bytes of unreserved and uncommitted memory in the user mode portion of the virtual address space of the calling process.
Notes: (Read only property)

153.29.9 Memoryload as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies a number between 0 and 100 that gives a general idea of current memory utilization, in which 0 indicates no memory use and 100 indicates full memory use.
Notes: (Read only property)

153.29.10 Pagesize as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size of one memory page in memory.
Notes: On Intel 80386 or newer CPUs, it should be 4096 Bytes.
(Read only property)

153.29.11 TotalPageFileMemory as Int64

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the total number of bytes that can be stored in the paging file. Note that this number does not represent the actual physical size of the paging file on disk.
Notes: (Read only property)

153.29.12 TotalPhysicalMemory as Int64

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the total number of bytes of physical memory.
Notes: (Read only property)

153.29.13 TotalVirtualMemory as Int64

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the total number of bytes that can be described in the user mode portion of the virtual address space of the calling process.
Notes: Value is 0 on any error.
(Read only property)

Chapter 154

ProgressView

154.1 class ProgressBackgroundViewMBS

154.1.1 class ProgressBackgroundViewMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The class for a background view.

154.1.2 Methods

154.1.3 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The constructor.

154.1.4 Properties

154.1.5 BlurEffectStyle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The blur effect style, when using BackgroundStyleBlur.
Notes: Defaults to UIBlurEffectStyleLight.
(Read and Write property)

154.1.6 Color as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The background color or the blur tint color.
Notes: Defaults to nil on iOS 13 and later and [UIColor colorWithWhite:0.8f alpha:0.6f] on older systems.
This uses NSColorMBS to wrap the UIColor.
(Read and Write property)

154.1.7 ColorValue as Color

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The background color or the blur tint color.
Example:

```
// set background color for this HUD
Var p as ProgressHUDMBS // your instance
p.backgroundView.ColorValue = &c00FF00
```

Notes: Defaults to nil on iOS 13 and later and [UIColor colorWithWhite:0.8f alpha:0.6f] on older systems.
This is the color as a Xojo color value.
(Read and Write property)

154.1.8 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

154.1.9 Style as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The background style.
Notes: Defaults to BackgroundStyleBlur.
(Read and Write property)

154.1.10 Constants

Styles

Constant	Value	Description
BackgroundStyleBlur	1	UIVisualEffectView or UIToolbar.layer background view.
BackgroundStyleSolidColor	0	Solid color background

154.2 class ProgressBarProgressViewMBS

154.2.1 class ProgressBarProgressViewMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A flat bar progress view.

154.2.2 Methods

154.2.3 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The constructor.

154.2.4 Properties

154.2.5 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

154.2.6 LineColor as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Bar border line color.
Notes: Defaults to white [UIColor whiteColor] .
This uses NSColorMBS to wrap the UIColor.
(Read and Write property)

154.2.7 LineColorValue as Color

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Bar border line color.
Notes: Defaults to white.

This is the color as a Xojo color value.
(Read and Write property)

154.2.8 Progress as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The Progress (0.0 to 1.0).
Notes: (Read and Write property)

154.2.9 ProgressColor as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Bar progress color.
Notes: Defaults to white [UIColor whiteColor] .
This uses NSColorMBS to wrap the UIColor.
(Read and Write property)

154.2.10 ProgressColorValue as Color

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Bar progress color.
Notes: Defaults to white.
This is the color as a Xojo color value.
(Read and Write property)

154.2.11 ProgressRemainingColor as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Bar background color.
Notes: Defaults to clear [UIColor clearColor] .
This uses NSColorMBS to wrap the UIColor.
(Read and Write property)

154.2.12 ProgressRemainingColorValue as Color

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Bar background color.
Notes: Defaults to clear [UIColor clearColor] .
This is the color as a Xojo color value.
(Read and Write property)

154.3 class ProgressHUDMBS

154.3.1 class ProgressHUDMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Displays a simple HUD window containing a progress indicator and two optional labels for short messages.
Example:

```
// show a progress HUD on an iOS screen while working
// HUD is a property of the screen: HUD As ProgressHUDMBS
HUD = New ProgressHUDMBS(Self)
HUD.Mode = ProgressHUDMBS.ModeDeterminate
HUD.LabelText = "Importing..."
HUD.show

// update while working, e.g. from a timer
HUD.Progress = 0.5

// when done
HUD.hide
```

Notes: This is a simple drop-in class for displaying a progress HUD view similar to Apple's private UIProgressHUD class.
The MBProgressHUD window spans over the entire space given to it by the constructor and catches all user input on this region, thereby preventing the user operations on components below the view.

To still allow touches to pass through the HUD, you can set hud.userInteractionEnabled = false.
MBProgressHUD is a UI class and should therefore only be accessed on the main thread.

Xojo Developer Magazine

- 21.1, page 34: News from MBS Xojo Plugins, What's up with MonkeyBread Software by Stefanie Juchmes

154.3.2 Methods

154.3.3 Constructor(Control as MobileControl)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Creates a HUD on top of the control.
See also:

- 154.3.4 Constructor(Screen as MobileScreen) 20472
- 154.3.5 Constructor(ViewHandle as Integer) 20472

154.3.4 Constructor(Screen as MobileScreen)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Creates a HUD on top of the screen.
See also:

- 154.3.3 Constructor(Control as MobileControl) 20472
- 154.3.5 Constructor(ViewHandle as Integer) 20472

154.3.5 Constructor(ViewHandle as Integer)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Creates a HUD on top of the given view handle.
See also:

- 154.3.3 Constructor(Control as MobileControl) 20472
- 154.3.4 Constructor(Screen as MobileScreen) 20472

154.3.6 Destructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The destructor.

154.3.7 hide(animated as boolean = true)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Hides the HUD.
Notes: This still calls the hudWasHidden event. This is the counterpart of the show method. Use it to hide the HUD when your task completes.

animated: If set to true the HUD will disappear using the current animationType. If set to false the HUD will not use animations while disappearing.

You may want to set RemoveFromSuperViewOnHide to false in case you like to show it again later.
See also:

- 154.3.8 hide(animated as boolean, afterDelay as Double) 20473

154.3.8 hide(animated as boolean, afterDelay as Double)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Hides the HUD after a delay.
Notes: This still calls the hudWasHidden event. This is the counterpart of the show method. Use it to hide the HUD when your task completes.

animated: If set to true the HUD will disappear using the current animationType. If set to false the HUD will not use animations while disappearing.
delay: Delay in seconds until the HUD is hidden.
See also:

- 154.3.7 hide(animated as boolean = true) 20472

154.3.9 show(animated as boolean = true)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Displays the HUD.
Notes: You need to make sure that the main thread completes its run loop soon after this method call so that the user interface can be updated. Call this method when your task is already set up to be executed in a new thread (e.g., when using something like a thread or timer).

Animated: If set to true the HUD will appear using the current animationType. If set to false the HUD will not use animations while appearing.

154.3.10 Properties

154.3.11 AnimationType as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The animation type that should be used when the HUD is shown and hidden.
Notes: (Read and Write property)

154.3.12 backgroundView as ProgressBackgroundViewMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: View covering the entire HUD area, placed behind bezelView.
Example:

```
// set background color for this HUD
Var p as ProgressHUDMBS // your instance
p.backgroundView.ColorValue = &c00FF00
```

Notes: (Read only property)

154.3.13 bezelView as ProgressBackgroundViewMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The view containing the labels and indicator (or customView).
Notes: (Read only property)

154.3.14 ButtonTitle as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The title of the button.
Notes: (Read and Write property)

154.3.15 ButtonView as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A button that is placed below the labels.
Notes: Value is NSViewMBS object.
(Read only property)

154.3.16 ContentColor as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A color that gets forwarded to all labels and supported indicators.
Notes: Also sets the tintColor
for custom views on iOS 7+. Set to nil to manage color individually.
Defaults to semi-translucent black on iOS 7 and later and white on earlier iOS versions.
This uses NSColorMBS to wrap the UIColor.
(Read and Write property)

154.3.17 ContentColorValue as Color

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A color that gets forwarded to all labels and supported indicators.
Example:

```
Var p as ProgressHUDMBS // your view

// change color to red
p.ContentColorValue = &cFF0000
```

Notes: Also sets the tintColor
for custom views on iOS 7+. Set to nil to manage color individually.
Defaults to semi-translucent black on iOS 7 and later and white on earlier iOS versions.
This is the color as a Xojo color value.
(Read and Write property)

154.3.18 defaultMotionEffectsEnabled as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: When enabled, the bezel center gets slightly affected by the device accelerometer data.
Notes: Defaults to false.

This can cause main thread checker assertions on certain devices. https://github.com/jdg/MBProgressHUD/issues/552

(Read and Write property)

154.3.19 DetailsLabelText as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The text for the details label.
Notes: The details text can span multiple lines.
(Read and Write property)

154.3.20 DetailsLabelView as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A label that holds an optional details message displayed below the labelText message.
Notes: The details text can span multiple lines.
Value is NSViewMBS object.
(Read only property)

154.3.21 graceTime as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function:

Grace period is the time (in seconds) that the invoked method may be run without showing the HUD.
Notes:

If the task finishes before the grace time runs out, the HUD will not be shown at all.
This may be used to prevent HUD display for very short tasks.
Defaults to 0 (no grace time).

The graceTime needs to be set before the hud is shown.
(Read and Write property)

154.3.22 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.

Notes: (Read and Write property)

154.3.23 Indicator as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The indicator control in use.
Notes: Either ProgressBarProgressViewMBS or ProgressRoundProgressViewMBS object.
(Read only property)

154.3.24 LabelText as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The label text.
Notes: The HUD is automatically resized to fit the entire text.
(Read and Write property)

154.3.25 LabelView as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A label that holds an optional short message to be displayed below the activity indicator. #
Notes: The HUD is automatically resized to fit the entire text.
Value is NSViewMBS object.
(Read only property)

154.3.26 margin as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The amount of space between the HUD edge and the HUD elements (labels, indicators or custom views).
Notes: This also represents the minimum bezel distance to the edge of the HUD view.
Defaults to 20.
(Read and Write property)

154.3.27 MinHeight as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The minimum size of the HUD bezel.
Notes: Defaults to zero (no minimum size).
(Read and Write property)

154.3.28 minShowTime as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The minimum time (in seconds) that the HUD is shown.
Notes: This avoids the problem of the HUD being shown and than instantly hidden.
Defaults to 0 (no minimum show time).
(Read and Write property)

154.3.29 MinWidth as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The minimum size of the HUD bezel.
Notes: Defaults to zero (no minimum size).
(Read and Write property)

154.3.30 Mode as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: MBProgressHUD operation mode.
Notes: The default is ModeIndeterminate.
(Read and Write property)

154.3.31 offsetX as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The bezel offset relative to the center of the view.
Notes: You can use MBProgressMaxOffset and -MBProgressMaxOffset to move the HUD all the way to the screen edge in each direction.
E.g., CGPointMake(0, MBProgressMaxOffset) would position the HUD centered on the bottom edge.

(Read and Write property)

154.3.32 offsetY as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The bezel offset relative to the center of the view.
Notes: You can use MBProgressMaxOffset and -MBProgressMaxOffset to move the HUD all the way to the screen edge in each direction.
E.g., CGPointMake(0, MBProgressMaxOffset) would position the HUD centered on the bottom edge.
(Read and Write property)

154.3.33 Progress as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The progress of the progress indicator, from 0.0 to 1.0.
Notes: Defaults to 0.0.
(Read and Write property)

154.3.34 RemoveFromSuperViewOnHide as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Removes the HUD from its parent view when hidden.
Notes: Defaults to false.
(Read and Write property)

154.3.35 Square as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Force the HUD dimensions to be equal if possible.
Notes: (Read and Write property)

154.3.36 userInteractionEnabled as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A Boolean value that determines whether user events are ignored and removed from the event queue.
Notes: When set to false, touch, press, keyboard, and focus events intended for the view are ignored and removed from the event queue. When set to YES, events are delivered to the view normally. The default value of this property is true.

During an animation, user interactions are temporarily disabled for all views involved in the animation, regardless of the value in this property. You can disable this behavior by specifying the UIViewAnimationOptionAllowUserInteraction option when configuring the animation.
(Read and Write property)

154.3.37 View as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The view as NSViewMBS object.
Notes: Value is NSViewMBS object.
(Read only property)

154.3.38 Events

154.3.39 buttonAction

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Called when user taps the button.

154.3.40 hudWasHidden

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Called after the HUD was fully hidden from the screen.

154.3.41 Constants

Constants

Constant	Value	Description
MaxOffset	1000000.0	The max offset constant to move to the other border.

Animations

Constant	Value	Description
AnimationFade	0	Opacity animation
AnimationZoom	1	Opacity + scale animation (zoom in when appearing zoom out when disappearing)
AnimationZoomIn	3	Opacity + scale animation (zoom in style)
AnimationZoomOut	2	Opacity + scale animation (zoom out style)

Modes

Constant	Value	Description
ModeAnnularDeterminate	3	Ring-shaped progress view.
ModeCustomView	4	Shows a custom view.
ModeDeterminate	1	A round, pie-chart like, progress view.
ModeDeterminateHorizontalBar	2	Horizontal progress bar.
ModeIndeterminate	0	A round progress indicator.
ModeText	5	Shows only labels.

154.4 class ProgressRoundProgressViewMBS

154.4.1 class ProgressRoundProgressViewMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A progress view for showing definite progress by filling up a circle (pie chart).

154.4.2 Methods

154.4.3 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The constructor.

154.4.4 Properties

154.4.5 Annular as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Display mode.
Notes: False = round or True = annular. Defaults to round.
(Read and Write property)

154.4.6 backgroundTintColor as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Indicator background (non-progress) color.
Notes: Only applicable on iOS versions older than iOS 7.
Defaults to translucent white (alpha 0.1).
This uses NSColorMBS to wrap the UIColor.
(Read and Write property)

154.4.7 backgroundTintColorValue as Color

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Indicator background (non-progress) color.
Notes: Only applicable on iOS versions older than iOS 7.
Defaults to translucent white (alpha 0.1).
This is the color as a Xojo color value.
(Read and Write property)

154.4.8 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

154.4.9 Progress as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The Progress (0.0 to 1.0).
Notes: (Read and Write property)

154.4.10 progressTintColor as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Indicator progress color.
Notes: Defaults to white [UIColor whiteColor] .
This uses NSColorMBS to wrap the UIColor.
(Read and Write property)

154.4.11 progressTintColorValue as Color

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Indicator progress color.
Notes: Defaults to white.
This is the color as a Xojo color value.
(Read and Write property)

Chapter 155

Python

155.1 class PythonExceptionMBS

155.1.1 class PythonExceptionMBS

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: An exception to report problems in Python code.
Notes: See message property for details.
Subclass of the RuntimeException class.

155.2 class PythonMBS

155.2.1 class PythonMBS

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The class to use Python code in Xojo applications.
Example:

```
Var p As New PythonMBS

Var r As Variant = p.Evaluate("1+2")
Print "Result: "+r

Break
```

Notes: MBS Plugin does some exception handling for you as well as type conversion.
We convert variants to/from python as much as possible, including arrays and dictionaries.

Xojo Developer Magazine

- 23.6, page 10: News

155.2.2 Methods

155.2.3 AddCustomFunction(FunctionName as String)

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Adds a custom function to Python.
Example:

```
Var p As New MyPythonMBS

p.AddCustomFunction "Test"
p.AddCustomFunction "UserName"
p.AddCustomFunction "Sum"

Var r1 As Variant = p.Evaluate("Test('test')")
Var r2 As Variant = p.Evaluate("UserName()")
Var r3 As Variant = p.Evaluate("Sum(2,3,6)")

Break
```

Notes: You can define multiple functions all with different names.
Function names are case sensitive.
See also:

- 155.2.4 AddCustomFunction(FunctionName as String, theDelegate as CustomFunctionCalledMBS) 20487

155.2.4 AddCustomFunction(FunctionName as String, theDelegate as CustomFunctionCalledMBS)

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Adds a custom function to call the delegate instead of the event.
See also:

- 155.2.3 AddCustomFunction(FunctionName as String) 20486

155.2.5 AddSysPath(Path as String)

MBS Python Plugin, Plugin Version: 25.1, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Adds a file path to the system path list.
Notes: This allows you to add the path to the current virtual environment.

155.2.6 Clear

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Clears the variables in the Python environment.
Example:

```
Var p As New PythonMBS

p.Value("Hello") = 123.0
p.Clear

Var check As Boolean = p.HasValue("Hello")

Break
```

155.2.7 Constructor

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The constructor.

155.2.8 DeleteValue(Key as String)

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Deletes a variable in the Python environment.
Example:

```
Var p As New PythonMBS

p.Value("Hello") = 123.0
p.DeleteValue "Hello"

Var check As Boolean = p.HasValue("Hello")

Break
```

155.2.9 Evaluate(Expression as String) as Variant

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Evaluates an expression in Python.
Example:

```
Var p As New PythonMBS

Var r As Variant = p.Evaluate("1+2")
Print "Result: "+r

Break
```

Notes: Pass an expression to evaluate with Python.
Returns the result of the expression.

May raise a PythonExceptionMBS exception.

155.2.10 HasValue(Key as String) as Boolean

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Checks whether a variable is set for the Python environment.
Example:

```
Var p As New PythonMBS

p.Value("Hello") = 123.0
Var hasIt As Boolean = p.HasValue("Hello")
Var hasNothing As Boolean = p.HasValue("other")

Break
```

Notes: Returns true if variable is set.

155.2.11 Keys as Variant()

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Queries the list of names for values.

Example:

```
Var p As New MyPythonMBS

p.AddCustomFunction "Test"
p.Value("Other") = 123

For Each key As Variant In p.keys
Print "key: "+key
Next

Break
```

Notes: This includes the registered custom functions.

155.2.12 Load(File as FolderItem) as Boolean

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Loads the Python library.
Notes: You may need to check what version you have as the paths usually contain version numbers.
See also:

- 155.2.13 Load(Path as String) as Boolean 20490

155.2.13 Load(Path as String) as Boolean

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Loads the Python library.
Example:

```
const path = "/opt/homebrew/Cellar/python@3.12/3.12.3/Frameworks/Python.framework"

Var loaded As Boolean = PythonMBS.Load(path)

Print "Error: "+PythonMBS.LibraryError
Print "Version: "+PythonMBS.LibraryVersion
```

Notes: You may need to check what version you have as the paths usually contain version numbers.

e.g.

MacOS:	/opt/homebrew/Cellar/python@3.12/3.12.3/Frameworks/Python.framework
Windows:	C:\Users\cs\AppData\Local\Programs\Python\Python312\python312.dll
Linux:	libpython3.11.so

See also:

- 155.2.12 Load(File as FolderItem) as Boolean 20490

155.2.14 Run(Script as String) as Variant

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Runs a Python script.
Example:

```
Var p As New MyPythonMBS

// calls print event
Call p.run("print('Hello')")
```

Notes: Pass the script text to run.
Returns the result of the script.

155.2.15 RunFile(File as FolderItem) as Variant

MBS Python Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Runs a Python script file.
Example:

```
Var p As New PythonMBS

// connect print event, so we can catch output of print() commands
AddHandler p.Print, AddressOf Print

var f as FolderItem = SpecialFolder.Desktop.Child("test.py")
call p.RunFile(f)
```

Notes: Returns the result of the script.

155.2.16 Properties

155.2.17 ExecPrefix as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return the exec-prefix for installed platform-dependent files.
Notes: This is derived through a number of complicated rules from the program name set with Py_SetProgramName() and some environment variables; for example, if the program name is '/usr/local/bin/python', the exec-prefix is '/usr/local'.
The value is available to Python code as sys.exec_prefix. It is only useful on Unix.

Background: The exec-prefix differs from the prefix when platform dependent files (such as executables and shared libraries) are installed in a different directory tree. In a typical installation, platform dependent files may be installed in the /usr/local/plat subtree while platform independent may be installed in /usr/local.

Generally speaking, a platform is a combination of hardware and software families, e.g. Sparc machines running the Solaris 2.x operating system are considered the same platform, but Intel machines running Solaris 2.x are another platform, and Intel machines running Linux are yet another platform. Different major revisions of the same operating system generally also form different platforms. Non-Unix operating systems are a different story; the installation strategies on those systems are so different that the prefix and exec-prefix are meaningless, and set to the empty string. Note that compiled Python bytecode files are platform independent (but not independent from the Python version by which they were compiled!).

System administrators will know how to configure the mount or automount programs to share /usr/local between platforms while having /usr/local/plat be a different filesystem for each platform.
(Read only property)

155.2.18 Handle as Integer

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

155.2.19 LibraryBuildInfo as String

MBS Python Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return information about the sequence number and build date and time of the current Python

interpreter instance.
Example:

MessageBox PythonMBS.LibraryBuildInfo

Notes: The value is available to Python code as part of the variable sys.version.

e.g. returns "main, Dec 3 2024, 17:59:52"
(Read only property)

155.2.20 LibraryCompiler as String

MBS Python Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return an indication of the compiler used to build the current Python version, in square brackets.
Example:

MessageBox PythonMBS.LibraryCompiler

Notes: The value is available to Python code as part of the variable sys.version.

e.g. returns [Clang 16.0.0 (clang-1600.0.26.4)]
(Read only property)

155.2.21 LibraryCopyright as String

MBS Python Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return the official copyright string for the current Python version.
Example:

MessageBox PythonMBS.LibraryCopyright

Notes: The value is available to Python code as sys.copyright.
(Read only property)

155.2.22 LibraryError as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The error message from Load methods in case of the error.
Notes: (Read only property)

155.2.23 LibraryPlatform as String

MBS Python Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return the platform identifier for the current platform.
Example:

MessageBox PythonMBS.LibraryPlatform

Notes: On Unix, this is formed from the ‚Äúofficial‚Äù name of the operating system, converted to lower case, followed by the major revision number; e.g., for Solaris 2.x, which is also known as SunOS 5.x, the value is 'sunos5'. On macOS, it is 'darwin'. On Windows, it is 'win'.
The value is available to Python code as sys.platform.

Value is e.g. "darwin" on macOS.
(Read only property)

155.2.24 LibraryVersion as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Queries the version text of the Python library.
Notes: Returns e.g. "3.12.3 (main, Apr 9 2024, 08:09:14) [Clang 15.0.0 (clang-1500.3.9.4)] "
(Read only property)

155.2.25 Loaded as Boolean

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Queries whether Python libraries have been loaded.
Notes: Returns true if loaded or false if not.

(Read only property)

155.2.26 MonotonicTime as Int64

MBS Python Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Read the monotonic clock.
Example:

MessageBox PythonMBS.MonotonicTime.ToString

Notes: e.g. 1221942957636375
(Read only property)

155.2.27 Path as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return the default module search path.
Notes: This is computed from the program name (set by assigning ProgramName) and some environment variables. The returned string consists of a series of directory names separated by a platform dependent delimiter character. The delimiter character is ':' on Unix and macOS, ';' on Windows.
The list sys.path is initialized with this value on interpreter startup; it can be (and usually is) modified later to change the search path for loading modules.

e.g.
/opt/homebrew/Cellar/python@3.12/3.12.3/Frameworks/Python.framework/Versions/3.12/lib/python312.zip:/opt/homebrew/Cellar/python@3.12/3.12.3/Frameworks/Python.framework/Versions/3.12/lib/python3.12:/opt/homebrew/Cellar/python@3.12/3.12.3/Frameworks/Python.framework/Versions/3.12/lib/python3.12/lib-dynload
(Read only property)

155.2.28 Prefix as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return the prefix for installed platform-independent files.
Notes: This is derived through a number of complicated rules from the program name set with Py_SetProgramName() and some environment variables; for example, if the program name is '/usr/local/bin/python', the prefix is '/usr/local'.

The value is available to Python code as sys.prefix. It is only useful on Unix.
(Read only property)

155.2.29 ProgramFullPath as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return the full program name of the Python executable
Notes: This is computed as a side-effect of deriving the default module search path from the program name (set by assignment to ProgramName).
The value is available to Python code as sys.executable.
This is usually the path to your Xojo application.
(Read only property)

155.2.30 ProgramName as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The program name.
Notes: Can be set before initializing Python, otherwise the default will be "python".
(Read and Write property)

155.2.31 PythonHome as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The default "home" path.
Notes: The value is set by a previous with setting PythonHome property, or the value is the value of the PYTHONHOME environment variable if it is set.
(Read and Write property)

155.2.32 RecursionLimit as Integer

MBS Python Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The recursion limit.
Notes: Default is 1000.

(Read and Write property)

155.2.33 Time as Int64

MBS Python Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Read the ‚Äúwall clock‚Äù time.
Example:

MessageBox PythonMBS.Time.ToString

Notes: Return the time in seconds since the epoch as a floating-point number. The handling of leap seconds is platform dependent. On Windows and most Unix systems, the leap seconds are not counted towards the time in seconds since the epoch. This is commonly referred to as Unix time.

e.g. 1743330201673808000
(Read only property)

155.2.34 ValueCount as Integer

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Queries number of variables.
Example:

```
Var p As New PythonMBS

Print "ValueCount: " + p.ValueCount.ToString

p.Value("Hello") = 123.0

Print "ValueCount: " + p.ValueCount.ToString

p.DeleteValue "Hello"

Print "ValueCount: " + p.ValueCount.ToString
```

Notes: See Keys method to get list of names.
(Read only property)

155.2.35 Value(Key as String) as Variant

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Get or set a local variable in Python.
Example:

```
Var p As New MyPythonMBS

p.Value("Hello") = 123.0
Var d As Double = p.Value("Hello")

break
```

Notes: Data types are converted as far as possible.
(Read and Write computed property)

155.2.36 Events

155.2.37 Flush

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The flush event sent when print is done.

155.2.38 FunctionCall(FunctionName as String, Args() as Variant) as Variant

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The event raised if a custom function is called.
Example:

```
Function FunctionCall(FunctionName as String, Args() as Variant) Handles FunctionCall as Variant
Print CurrentMethodName

Select Case FunctionName
Case "Test"
Return Args(0)
case "UserName"
Return SystemInformationMBS.UserName
Case "Sum"
Var d As Double = 0
```

```
For Each v As Double In args
d = d + v
Next

Return d
End Select

Exception r As RuntimeException
Return Introspection.GetType(r).name+": "+r.message

End Function
```

Notes: Please use try/catch to catch any exceptions in your functions.
Check with the name which function is called.
Function names are case sensitive.

155.2.39 Input(Args() as Variant) as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The input event.
Notes: Called when the input function is called in Python.
Please return whatever text to pass back to the Python script.

155.2.40 Print(text as String)

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The event called when print function is used in Python.
Example:

```
Sub Print(text as String) Handles Print
Print CurrentMethodName
Print "received: " + Text
End Sub
```

155.2.41 Delegates

155.2.42 CustomFunctionCalledMBS(Args() as Variant) as Variant

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The delegate for custom functions.

Chapter 156

Quartz Composer

156.1 control DesktopQCViewControlMBS

156.1.1 control DesktopQCViewControlMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The control to host a QCView properly.
Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo / Real Studio Plugins, version 15.1pr2

156.1.2 Properties

156.1.3 View as QCViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The QCView in use by this control.
Notes: Please use this property to access the actual view and make your settings and load the data to render.
(Read only property)

156.1.4 Events

156.1.5 BoundsChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

156.1.6 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

156.1.7 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

156.1.8 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

156.1.9 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

156.1.10 DidStartRendering

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Rendering did start notification.

156.1.11 DidStopRendering

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Rendering did stop notification.

156.1.12 FocusLost

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

156.1.13 FocusReceived

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

156.1.14 FrameChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

156.1.15 MenuBarSelected

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

156.1.16 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

156.1.17 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

156.1.18 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

156.1.19 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

156.1.20 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

156.1.21 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

156.2 class QCCompositionMBS

156.2.1 class QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The composition class.
Notes: The QCComposition class represents a Quartz Composer composition that either:

- comes from the system-wide composition repository (/Library/Compositions and textasciitilde /Library/Compositions) where it can be accessed by any application through the methods of the QCCompositionRepository class
- is created from an arbitrary source (typically a file on disk) using one of its methods

This class cannot be subclassed.

A QCComposition object has the following information associated with it and that you can obtain by using the appropriate method of the QCComposition class:

- Attributes include the name and description of the composition, copyright information, and whether or not its provided by OS X (built-in).
- The protocols that the composition conforms to. A composition protocol defines a set of required and optional input parameters and output results.

Many methods of the QCRenderer, QCCompositionLayer, and QCView classes take a QCComposition object as a parameter.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.1pr2

156.2.2 Methods

156.2.3 compositionWithData(data as MemoryBlock) as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a composition object initialized with the contents of a Quartz Composer composition file.
Example:

```
Var data as MemoryBlock // composition file content in MemoryBlock variable
Var q as QCCompositionMBS = QCCompositionMBS.compositionWithData(data)
```

Notes: data: The contents of a file created with the Quartz Composer developer tool.

Returns a Quartz Composer composition object or nil if there is an error.
See also:

- 156.2.4 compositionWithData(data as string) as QCCompositionMBS 20507

156.2.4 compositionWithData(data as string) as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a composition object initialized with the contents of a Quartz Composer composition file.
Example:

```
Var data as string // composition file content in string variable
Var q as QCCompositionMBS = QCCompositionMBS.compositionWithData(data)
```

Notes: data: The contents of a file created with the Quartz Composer developer tool.

Returns a Quartz Composer composition object or nil if there is an error.
See also:

- 156.2.3 compositionWithData(data as MemoryBlock) as QCCompositionMBS 20506

156.2.5 compositionWithFile(file as folderitem) as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a composition object initialized with a Quartz Composer composition file.
Example:

```
Var file as folderitem // your folderitem
Var q as QCCompositionMBS = QCCompositionMBS.compositionWithFile(file)
```

Notes: file: A path to a file created with the Quartz Composer developer tool (.qtz extension).

Returns a Quartz Composer composition object or nil if there is an error.
See also:

- 156.2.6 compositionWithFile(path as string) as QCCompositionMBS 20508

156.2.6 compositionWithFile(path as string) as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a composition object initialized with a Quartz Composer composition file.
Example:

```
Var path as string = "/System/Library/Compositions/Rollercoaster.qtz" // your path
Var q as QCCompositionMBS = QCCompositionMBS.compositionWithFile(path)
```

Notes: file: A path to a file created with the Quartz Composer developer tool (.qtz extension).

Returns a Quartz Composer composition object or nil if there is an error.
See also:

- 156.2.5 compositionWithFile(file as folderitem) as QCCompositionMBS 20507

156.2.7 Constructor

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

156.2.8 copy as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of the composition.

156.2.9 getAttributes as dictionary

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the attributes of the composition.

156.2.10 inputKeys as string()

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array listing the keys that identify the input ports of the root patch of the composition.

156.2.11 outputKeys as string()

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array listing the keys that identify the output ports of the root patch of the composition.

156.2.12 protocols as string()

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the list of protocols to which the composition conforms.

156.2.13 QCCompositionAttributeBuiltInKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard attribute names.
Example:

```
Var c as QCCompositionMBS = QCCompositionMBS.compositionWithFile("/System/Library/Compositions/Rollercoaster.qtz")
Var d as Dictionary = c.getattributes
Var b as Boolean = d.Value(c.QCCompositionAttributeBuiltInKey)
MessageBox str(b)
```

Notes: The key for the composition origin. The associated value is a Boolean value.
True indicates the composition is built-in (provided by OS X).

156.2.14 QCCompositionAttributeCategoryKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard attribute names.
Example:

```
Var c as QCCompositionMBS = QCCompositionMBS.compositionWithFile("/System/Library/Compositions/Rollercoaster.qtz")
Var d as Dictionary = c.getattributes
Var b as string = d.Lookup(c.QCCompositionAttributeCategoryKey, "?")
MessageBox b
```

Notes: The composition category. The associated value is a category constant. See Categories.

156.2.15 QCCompositionAttributeCopyrightKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard attribute names.
Example:

```
Var c as QCCompositionMBS = QCCompositionMBS.compositionWithFile("/System/Library/Compositions/Rollercoaster.qtz")
Var d as Dictionary = c.getattributes
Var b as string = d.Value(c.QCCompositionAttributeCopyrightKey)
MessageBox b
```

Notes: The key for composition copyright information.
The associated value is a string.

156.2.16 QCCompositionAttributeDescriptionKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard attribute names.
Notes: The key for the composition description.
The associated value is a string.

156.2.17 QCCompositionAttributeHasConsumersKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard attribute names.
Notes: The key for a composition that has consumer patches. The associated value is a Boolean value. True indicates that the composition has consumers.

156.2.18 QCCompositionAttributeIsTimeDependentKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard attribute names.
Notes: The key for the composition time dependency. The associated value is a Boolean value. True indicates that the composition is time dependent.

156.2.19 QCCompositionAttributeNameKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard attribute names.
Example:

```
Var c as QCCompositionMBS = QCCompositionMBS.compositionWithFile("/System/Library/Compositions/Rollercoaster.qtz")
Var d as Dictionary = c.getattributes
MessageBox d.Value(c.QCCompositionAttributeNameKey)
```

Notes: The key for the composition name.
The associated value is a string.

156.2.20 QCCompositionCategoryDistortion as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the category names.
Notes: A composition that produces a distortion effect.

156.2.21 QCCompositionCategoryStylize as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the category names.
Notes: A composition that produces a stylize effect.

156.2.22 QCCompositionCategoryUtility as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the category names.
Notes: A utility composition.

156.2.23 QCCompositionInputAudioPeakKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A number input port whose key is inputAudioPeak. The value must be in the [0,1] range as a mono signal with no decay applied.

156.2.24 QCCompositionInputAudioSpectrumKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A structure input port whose key is inputAudioSpectrum. The structure must contain 16 values in the [0,1] range representing 16 spectrum bands of the mono signal from low to high frequencies with no decay applied.

156.2.25 QCCompositionInputDestinationImageKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: An image input port whose key is inputDestinationImage.

156.2.26 QCCompositionInputImageKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: An image input port whose key is inputImage.

156.2.27 QCCompositionInputPaceKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A number input port whose key is inputPace. The value must be in the [0,1] range.

156.2.28 QCCompositionInputPreviewModeKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A Boolean input port whose key is inputPreviewMode. When the value of this input port is set to TRUE, the composition that provides this port must be able to run in a low-quality mode that produces a preview of the composition.

156.2.29 QCCompositionInputPrimaryColorKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A color input port whose key is inputPrimaryColor.

156.2.30 QCCompositionInputScreenImageKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: An image input port whose key is inputScreenImage.

156.2.31 QCCompositionInputSecondaryColorKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A color input port whose key is inputSecondaryColor.

156.2.32 QCCompositionInputSourceImageKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: An image input port whose key is inputSourceImage.

156.2.33 QCCompositionInputTrackInfoKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A structure input port whose key is inputTrackInfo. The structure contains optional entries, such as "name", "artist", "album", "duration", "artwork", and so on.

156.2.34 QCCompositionInputTrackPositionKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A number input port whose key is inputTrackPosition. The value must be expressed in seconds.

156.2.35 QCCompositionInputTrackSignalKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A Boolean input port whose key is inputTrackSignal.

156.2.36 QCCompositionInputXKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A number input port whose key is inputX. The value must be normalized to the image width with the origin on the left.

156.2.37 QCCompositionInputYKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A number input port whose key is inputY. The value must be normalized to the image height with the origin at the bottom.

156.2.38 QCCompositionOutputImageKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard output key names.
Notes: An image output port whose key is outputImage.

156.2.39 QCCompositionOutputWebPageURLKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard output key names.
Notes: A string output port whose key is outputWebPageURL.

156.2.40 QCCompositionProtocolGraphicAnimation as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard protocol names.
Notes: A composition that renders a generic graphical animation. It has the option to use QCCompositionInputPrimaryColorKey for the primary color of the animation, QCCompositionInputSecondaryColorKey for the secondary color of the animation, QCCompositionInputPaceKey for the global pace of the animation, and QCCompositionInputPreviewModeKey to indicate if the animation should run in lower-quality for preview purposes.

Available in OS X v10.5 and later.

156.2.41 QCCompositionProtocolGraphicTransition as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard protocol names.
Notes: A composition that performs a transition between two images, using a transition time in range of 0 to 1. A conforming composition must use the input keys QCCompositionInputSourceImageKey for the starting image and QCCompositionInputDestinationImageKey for the image to transition to. The composition can optionally use QCCompositionInputPreviewModeKey to indicate if the animation should run in lower-quality for preview purposes.

156.2.42 QCCompositionProtocolImageFilter as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard protocol names.
Notes: A composition that applies an effect to a source image. A conforming composition must use the input key QCCompositionInputImageKey for the source image and QCCompositionOutputImageKey for the output image. The composition can optionally use QCCompositionInputXKey to specify the X position of the center point of the effect, QCCompositionInputYKey to specify the Y position of the center point of the

effect, andQCCompositionInputPreviewModeKey to indicate if the animation should run in lower-quality for preview purposes.

156.2.43 QCCompositionProtocolMusicVisualizer as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard protocol names.
Notes: A composition that acts as a visualizer for music. A conforming composition must use the input key QCCompositionInputAudioPeakKey for the instantaneous audio peak and the QCCompositionInputAudioSpectrumKey for the instantaneous audio spectrum. It can optionally use the QCCompositionInputTrackInfoKey to indicate it receives information about the current track and the QCCompositionInputTrackSignalKey to indicate the start of a new track.

Available in OS X v10.5 and later.

156.2.44 QCCompositionProtocolScreenSaver as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard protocol names.
Notes: A composition that can be used as a screen saver. The composition has the option to use QCCompositionInputScreenImageKey for a screenshot image of the screen that the screen saver runs on, QCCompositionInputPreviewModeKey to indicate if the animation should run in lower-quality for preview purposes, and QCCompositionOutputWebPageURLKey for a URL to open in the default web browser when screen saver exits (only allowed if screen saver password is disabled).

Available in OS X v10.5 and later.

156.2.45 Properties

156.2.46 Description as String

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The description for the composition.
Notes: (Read only property)

156.2.47 Handle as Integer

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

156.2.48 identifier as String

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The identifier for the composition.
Example:

```
Var r as QCCompositionRepositoryMBS = QCCompositionRepositoryMBS.sharedCompositionRepository
Var a() As QCCompositionMBS = r.allCompositions
MessageBox a(0).identifier
```

Notes: The unique identifier for the composition if it comes from the composition repository; "" otherwise. (Read only property)

156.2.49 Name as String

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name for the composition.
Example:

```
Var c as QCCompositionMBS = QCCompositionMBS.compositionWithFile("/System/Library/Compositions/Rollercoaster.qtz")
MessageBox c.name
```

Notes: (Read only property)

156.3 class QCCompositionRepositoryMBS

156.3.1 class QCCompositionRepositoryMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The system-wide Quartz Composer composition repository.
Example:

```
Var r as QCCompositionRepositoryMBS = QCCompositionRepositoryMBS.sharedCompositionRepository
Var a() As QCCompositionMBS = r.allCompositions
MessageBox str(a.Count)+" compositions installed"
```

Notes: The QCCompositionRepository class represents a system-wide centralized repository of built-in and installed Quartz Composer compositions (/Library/Compositions and
textasciitilde /Library/Compositions). The QCCompositionRepository class cannot be subclassed.

Compositions in the repository are represented by the QCComposition class. You can use the methods of the QCCompositionRepository class to fetch all compositions or only those that meet specific criteria.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

156.3.2 Methods

156.3.3 allCompositions as QCCompositionMBS()

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array that contains all compositions currently in the composition repository.
Example:

```
Var r as QCCompositionRepositoryMBS = QCCompositionRepositoryMBS.sharedCompositionRepository
Var a() As QCCompositionMBS = r.allCompositions
MessageBox str(a.Count)+" compositions installed"
```

156.3.4 Compositions(protocols() as String = nil, attributes as Dictionary = nil) as QCCompositionMBS()

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of compositions that match a set of criteria.
Example:

```
Var r as QCCompositionRepositoryMBS = QCCompositionRepositoryMBS.sharedCompositionRepository
Var a() As QCCompositionMBS = r.Compositions( array( QCCompositionMBS.QCCompositionProtocolImageFilter))
MessageBox str(a.Count)+" compositions found"
```

Notes: protocols: The protocols that you want compositions to conform to. Pass nil if you don,Äôt want to filter based on the protocol. You can pass any of these protocols: QCCompositionProtocolAnimation, QCCompositionProtocolImageProducer, QCCompositionProtocolImageFilter, QCCompositionProtocolImageCompositor, QCCompositionProtocolImageTransition, and QCCompositionProtocolScreenSaverRSS.
attributes: A dictionary that contains the attributes, and their associated values, that you want compositions to match. Pass nil if you don,Äôt want to filter based on the attributes. For example, you can pass any of these attributes: QCCompositionAttributeNameKey, QCCompositionAttributeDescriptionKey, QCCompositionAttributeCopyrightKey, QCCompositionAttributeBuiltInKey, and QCCompositionAttributeTimeDependentKey.

Returns an array of QCComposition objects that meet the supplied criteria.

156.3.5 compositionWithIdentifier(identifier as string) as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the composition that corresponds to the identifier.
Example:

```
Var r as QCCompositionRepositoryMBS = QCCompositionRepositoryMBS.sharedCompositionRepository
Var c as QCCompositionMBS = r.compositionWithIdentifier("/swing")
MessageBox c.Name
```

Notes: identifier: A string that uniquely identifies the composition to retrieve.

Returns the composition identified by the provided string, or nil if there is no composition with that identifier in the composition repository.

156.3.6 Constructor

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

156.3.7 loadPlugIn(file as folderitem) as Boolean

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to load a Quartz Composer plug-in from a .plugin bundle at the specified path and returns true on success.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.plugin")
Var r as Boolean = QCCompositionRepositoryMBS.loadPlugIn(f)

if r then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: This method will do nothing if the plug-in was already loaded.
See also:

- 156.3.8 loadPlugIn(path as string) as Boolean 20520

156.3.8 loadPlugIn(path as string) as Boolean

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to load a Quartz Composer plug-in from a .plugin bundle at the specified path and returns true on success.
Notes: This method will do nothing if the plug-in was already loaded.
See also:

- 156.3.7 loadPlugIn(file as folderitem) as Boolean 20520

156.3.9 QCCompositionRepositoryDidUpdateNotification as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The new of the notification which is posted whenever the list of compositions in the composition repository is updated.

156.3.10 sharedCompositionRepository as QCCompositionRepositoryMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the shared instance of the composition repository.

156.3.11 Properties

156.3.12 Handle as Integer

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

156.4 control QCViewControlMBS

156.4.1 control QCViewControlMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The control to host a QCView properly.
Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo / Real Studio Plugins, version 15.1pr2

156.4.2 Properties

156.4.3 View as QCViewMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The QCView in use by this control.
Notes: Please use this property to access the actual view and make your settings and load the data to render.
(Read only property)

156.4.4 Events

156.4.5 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

156.4.6 Close

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

156.4.7 Closing

Plugin Version: 15.1, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

156.4.8 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

156.4.9 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

156.4.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

156.4.11 DidStartRendering

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Rendering did start notification.

156.4.12 DidStopRendering

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Rendering did stop notification.

156.4.13 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

156.4.14 FocusLost

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

156.4.15 FocusReceived

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

156.4.16 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

156.4.17 GotFocus

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

156.4.18 LostFocus

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

156.4.19 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

156.4.20 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.

Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

156.4.21 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

156.4.22 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

156.4.23 Open

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

156.4.24 Opening

Plugin Version: 15.1, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

156.4.25 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

156.4.26 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

156.5 class QCViewMBS

156.5.1 class QCViewMBS

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: The QCView class is a custom NSView class that loads, plays, and controls Quartz Composer compositions.
Notes: It is an autonomous view that is driven by an internal timer running on the main thread.

The view can be set to render a composition automatically when it is placed onscreen. The view stops rendering when it is placed offscreen. When not rendering, the view is filled with the current erase color. The rendered composition automatically synchronizes to the vertical retrace of the monitor.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

156.5.2 Methods

156.5.3 Constructor

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new Quartz composer view with size 100/100 and position 0/0
Example:

```
Var t as new QCViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 156.5.4 Constructor(Handle as Integer) 20529
- 156.5.5 Constructor(left as Double, top as Double, width as Double, height as Double) 20529

156.5.4 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given QCView handle.
Example:

```
Var t as new QCViewMBS(0, 0, 100, 100)
Var v as new QCViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a QCView and the plugin retains this handle.
See also:

- 156.5.3 Constructor 20528
- 156.5.5 Constructor(left as Double, top as Double, width as Double, height as Double) 20529

156.5.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new Quartz composer view with the given size and position.
Example:

```
Var x as new QCViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 156.5.3 Constructor 20528
- 156.5.4 Constructor(Handle as Integer) 20529

156.5.6 erase

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Clears the view using the current erase color.

156.5.7 getAttributes as dictionary

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns the attributes of the composition associated with the renderer.
Notes: Returns a dictionary that contains the attributes that describe the composition, including the input and output ports of the root patch.

The dictionary can define any of the attributes that are specified by the composition attribute keys. See QCCompositionAttributeNameKey, QCCompositionAttributeDescriptionKey, and QCCompositionAttributeCopyrightKey.

The dictionary can also contain dictionaries that correspond to the keys that identify the input and output ports of the root patch of the composition. See QCPortAttributeTypeKey, QCPortAttributeNameKey, QCPortAttributeMinimumValueKey, QCPortAttributeMaximumValueKey, and QCPortAttributeMenuItemsKey.

Available in Mac OS X v10.4 and later.

156.5.8 inputKeys as string()

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns an array that contains the keys that identify the input ports of the root patch of the composition.

156.5.9 loadComposition(composition as QCCompositionMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Loads a QCComposition object into the view.
Notes: Returns true if successful; otherwise false.
If unsuccessful, any composition that's already loaded in the view remains loaded.

156.5.10 loadCompositionFromData(data as MemoryBlock) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Loads the composition from memoryblock.
Notes: If unsuccessful, returns false; any composition that's already loaded in the view remains loaded.
Available in Mac OS X v10.4 and later.
See also:

- 156.5.11 loadCompositionFromData(data as string) as boolean

156.5.11 loadCompositionFromData(data as string) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Loads the composition from data string.
Notes: If unsuccessful, returns false; any composition that's already loaded in the view remains loaded.
Available in Mac OS X v10.4 and later.
See also:

- 156.5.10 loadCompositionFromData(data as MemoryBlock) as boolean 20530

156.5.12 loadCompositionFromFile(file as folderitem) as boolean

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Loads the composition file located at the specified path.
Notes: file: A folderitem that specifies the location of a Quartz Composer composition file.

If unsuccessful, returns false; any composition that's already loaded in the view remains loaded.

Available in Mac OS X v10.4 and later.
See also:

- 156.5.13 loadCompositionFromFile(filepath as string) as boolean 20531

156.5.13 loadCompositionFromFile(filepath as string) as boolean

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Loads the composition file located at the specified path.
Notes: filepath: A string that specifies the location of a Quartz Composer composition file.

If unsuccessful, returns false; any composition that's already loaded in the view remains loaded.

Available in Mac OS X v10.4 and later.
See also:

- 156.5.12 loadCompositionFromFile(file as folderitem) as boolean 20531

156.5.14 outputKeys as string()

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns an array that contains the keys that identify the output ports of the root patch of the composition.

156.5.15 pauseRendering

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Pauses rendering in the view.
Notes: You can nest calls to this method.
Available in Mac OS X v10.5 and later.

156.5.16 resumeRendering

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Resumes rendering a paused composition.
Notes: You can nest calls to this method.
Available in Mac OS X v10.5 and later.

156.5.17 setValueForInputKey(value as Variant, key as string) as boolean

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Sets the value for an input port of a composition.
Notes: value: The value to set for the input port. The input port must be at the root patch of the composition. The data type of the value argument must match the input port.
key: The key associated with the input port of the composition. This method throws an exception if key is invalid.

Returns false if it cannot set the value.
Available in Mac OS X v10.4 and later.

156.5.18 startRendering as boolean

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Starts rendering the composition that is in the view.
Notes: Returns false if the composition fails to start rendering; true otherwise.
Available in Mac OS X v10.4 and later.

156.5.19 stopRendering

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Stops rendering the composition that is in the view.
Notes: Available in Mac OS X v10.4 and later.

156.5.20 unloadComposition

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Unloads the composition from the view.
Notes: If necessary, this method calls stopRendering prior to unloading the composition.
Available in Mac OS X v10.5 and later.

156.5.21 valueForInputKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns the value for an input port of a composition.
Notes: key: The key associated with an input port for the root patch of a composition. This method throws an exception if key is invalid.

Returns the value. The data type of returned value depends on the type of the input port.
Available in Mac OS X v10.4 and later.

156.5.22 valueForOutputKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns the value for an output port of a composition.
Notes: key
The key associated with an output port for the root patch of a composition. This method throws an exception if key is invalid.

Returns the value as Xojo variant. The data type of returned value depends on the type of the output port.

156.5.23 Properties

156.5.24 autostartsRendering as boolean

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Whether the composition that is in the view starts rendering automatically when the view is put on the screen.
Notes: Available in Mac OS X v10.4 and later.
(Read and Write property)

156.5.25 eraseColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: The color used to erase the view.
Notes: Available in Mac OS X v10.4 and later.
(Read and Write property)

156.5.26 eventForwardingMask as Integer

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: The mask used to filter which types of events are forwarded from the view to the composition during rendering.
Notes: mask: An event filtering mask. The mask can be a combination of any of the mask constants listed in Table below (defined in NSEventMBS) or the constant NSAnyEventMask.

(Read and Write property)

156.5.27 isPausedRendering as boolean

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns whether or not the rendering in the view is paused.
Notes: True if the rendering is paused; otherwise false.
Available in Mac OS X v10.5 and later.
(Read only property)

Constant	Description
NSLeftMouseDownMask	The user pressed the left button.
NSLeftMouseDraggedMask	The user moved the mouse with the left button down.
NSLeftMouseUpMask	The user released the left button.
NSRightMouseDownMask	The user pressed the right button.
NSRightMouseDraggedMask	The user moved the mouse with the right button down.
NSRightMouseUpMask	The user released the right button.
NSOtherMouseDownMask	The user pressed the middle button, or some button other than the left or right button.
NSOtherMouseDraggedMask	The user moved the mouse with the middle button down, or some button other than the left or right button.
NSOtherMouseUpMask	The user released the middle button, or some button other than the left or right button.
NSMouseMovedMask	The user moved the mouse without holding down a mouse button.
NSScrollWheelMask	The user moved the mouse scroll wheel.
NSKeyDownMask	The user generated a character or characters by pressing a key.
NSKeyUpMask	The user released a key.
NSFlagsChangedMask	The user pressed or released a modifier key, or toggled the Caps Lock key.

156.5.28 isRendering as boolean

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Checks whether a composition is rendering in the view.
Notes: Returns true if a composition is rendering in the view; false otherwise.
Available in Mac OS X v10.5 and later.
(Read only property)

156.5.29 loadedComposition as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Returns the composition loaded in the view.
Notes: (Read only property)

156.5.30 maxRenderingFrameRate as Double

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: The maximum rendering frame rate.
Notes: Pass 0.0 to specify that there is no limit.
Available in Mac OS X v10.4 and later.
(Read and Write property)

156.5.31 snapshotImage as NSImageMBS

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns an NSImage object of the current image in the view.
Notes: Available in Mac OS X v10.5 and later.
(Read only property)

Chapter 157

QuickLook

157.1 control DesktopQLPreviewViewControlMBS

157.1.1 control DesktopQLPreviewViewControlMBS

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a QLPreviewViewMBS.
Blog Entries

- News from the MBS Xojo Plugins Version 23.3
- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo / Real Studio Plugins, version 15.0pr8

157.1.2 Properties

157.1.3 View as QLPreviewViewMBS

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view this control shows.
Notes: (Read only property)

157.1.4 Events

157.1.5 BoundsChanged

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

157.1.6 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

157.1.7 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

157.1.8 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

157.1.9 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

157.1.10 FocusLost

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

157.1.11 FocusReceived

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

157.1.12 FrameChanged

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

157.1.13 MenuBarSelected

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

157.1.14 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

157.1.15 MouseDrag(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

157.1.16 MouseUp(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

157.1.17 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

157.1.18 ScaleFactorChanged(NewFactor as Double)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

157.1.19 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

157.2 class QLPreviewControllerMBS

157.2.1 class QLPreviewControllerMBS

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: A specialized view controller for previewing an item.
Notes: A QLPreviewController can display previews for many common file types, including the following:

- iWork documents
- Microsoft Office documents
- Rich text format, or RTF, documents
- PDF files
- Images
- Text files with a uniform type identifier that conforms to the public.text type. To learn more, see Uniform type identifiers.
- Comma-separated values, or CSV, files
- 3D models in the USDZ format with both standalone and AR views for viewing the model

The list of supported common file types may change between operating system releases. In addition, you can enable previews for your own file types by implementing your own preview extension.

With editing mode, you get the PDF markup editor right into your Xojo application.

See QLPreviewViewControlMBS for desktop macOS projects.
See WinPreviewControlMBS control for Windows targets.

157.2.2 Methods

157.2.3 AddItem(item as FolderItem)

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Adds an item to the list of items to show.
Notes: Please call reloadData if you modify the list of items.
See also:

- 157.2.4 AddItem(item as FolderItem, title as String) 20543

157.2.4 AddItem(item as FolderItem, title as String)

MBS iOS Plugin, Plugin Version: 25.5, Platform: iOS, Targets: iOS only.

Function: Adds an item to the list of items to show.
Notes: This method allows you to add an optional title for the item, which is different to the file name.

Please call reloadData if you modify the list of items.
See also:

- 157.2.3 AddItem(item as FolderItem) 20543

157.2.5 AddItems(items() as FolderItem)

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Add multiple years.
Notes: Please call reloadData if you modify the list of items.

157.2.6 canPreviewItem(file as FolderItem) as Boolean

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Returns a Boolean value that indicates whether the preview controller can display an item.
Notes: If the system can,Äôt display an item, but you still attempt to display it, a Quick Look preview controller displays a generic error. Always check whether you can display an item before choosing to do so.

157.2.7 ClearItems

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Remove all items.

157.2.8 Constructor

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The constructor.

157.2.9 Destructor

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The destructor.

157.2.10 Dismiss

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Dismisses the controller.

157.2.11 Items as FolderItem()

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Queries list of items to show.

157.2.12 Present

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Presents the controller.

157.2.13 refreshCurrentPreviewItem

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Asks the Quick Look preview controller to recompute the display of the current preview item.
Notes: Quick Look recomputes the display regardless of whether the current preview item changes.

157.2.14 reloadData

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Asks the preview controller to reload its data from its data source.
Notes: Quick Look recomputes the displayed data only if the current preview item changes.

157.2.15 SetItems(items() as FolderItem)

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Replaces the list of items.
Notes: Please call reloadData if you modify the list of items.

157.2.16 Properties

157.2.17 currentPreviewItem as FolderItem

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The item displaying in the Quick Look preview controller.
Notes: If the preview controller isn,Äôt displaying an item, this property,Äôs value is nil.
(Read only property)

157.2.18 currentPreviewItemIndex as Integer

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The index within the preview item navigation list of the item displaying in the Quick Look preview controller.
Notes: You can change which item the preview controller displays, among those in a navigation list, by setting this property,Äôs value. If the preview controller isn,Äôt displaying an item, this property,Äôs value is -1.

(Read and Write property)

157.2.19 Handle as Integer

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

157.2.20 Events

157.2.21 DidDismiss

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Tells you that the preview was closed.

157.2.22 didSaveEditedCopyOfPreviewItem(Item as FolderItem, modifiedContentsFile as FolderItem)

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Tells you that the preview item,Äôs edited content was successfully saved to a copy at the given URL.
Notes: The platform invokes this callback with an edited copy of the preview item at modifiedContentsFile. It invokes the callback in the following scenarios:

- The editing mode of the previewItem is EditingModeCreateCopy.
- The editing mode of the previewItem is EditingModeUpdateContents and the system can,Äôt overwrite its previewItemURL. In this case, modifiedContentsURL points to a temporary file on disk containing the edited copy.
- The editing mode of the preview item is EditingModeUpdateContents and its content type doesn,Äôt match the content type of the edited version. This mismatch means that the file type of the file at modifiedContentsURL may be different from the file type of the preview item.

The platform may invoke the callback multiple times consecutively with the successive edited versions of the preview item. It typically invokes the callback once for each time the user saves their edits.

157.2.23 didUpdateContentsOfPreviewItem(Item as FolderItem)

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Tells you that the content of a preview was updated successfully.
Notes: The platform invokes this callback after the preview controller successfully overwrites the file at the previewItem location with an updated file.

The platform may invoke the callback multiple times consecutively with the successive edited versions of the preview item. It typically invokes the callback once for each time the user saves their edits.

157.2.24 editingModeForPreviewItem(Item as FolderItem) as Integer

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Returns a value that indicates how the preview controller handles edits to the content of the previewed file.
Notes: Return a value that indicates whether the previewed content is editable and how Quick Look saves the edits. If you return EditingModeUpdateContents or EditingModeCreateCopy to allow edits to a preview, make sure to implement the appropriate callbacks.

The platform invokes this callback when the preview controller loads its data. The system calls it for each preview item that it passes to the data source of the preview controller.
By default, a preview controller doesn,Äôt allow edits to a preview. However, you can implement this method to allow the user to edit the previewed document, and specify the behavior for saving changes. The supported set of edits may change over time, but currently includes adding markup to images or PDFs, as well as simple edits to video files.
If you want to update the underlying file in place, return EditingModeUpdateContents, and implement both the didUpdateContentsOfPreviewItem and didSaveEditedCopyOfPreviewItem delegate methods. The Quick Look feature calls didUpdateContentsOfPreviewItem first and updates the preview item,Äôs content. If it can,Äôt update the item directly, it invokes didSaveEditedCopyOfPreviewItem and creates a copy of the preview item,Äôs content that contains the edits.
If you prefer to always save edits to a copy of the preview item,Äôs content, return EditingModeCreateCopy and implement didSaveEditedCopyOfPreviewItem.

157.2.25 shouldOpenURL(URL as String, Item as FolderItem) as Boolean

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Whether the preview controller should open a URL.
Notes: The system invokes this method when the user taps a URL link in a preview. If you return true, the Quick Look preview controller invokes the openURL method on the UIApplication object, sending it the value of the url parameter. If you return false, the system doesn,Äôt invoke the openURL method and you

can do something yourself.

If you don,Äôt implement this method, it defaults to returning true.

157.2.26 WillDismiss

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Tells you that the preview is about to close.

157.2.27 Constants

Editing Modes

Constant	Value	Description
EditingModeCreateCopy	2	Represents the mode to create a copy of the file and perform the edits on the copy.
EditingModeDisabled	0	Represents the mode to disable edit mode for the file.
EditingModeUpdateContents	1	Represents the mode to update the file directly without creating a copy.

157.3 class QLPreviewPanelMBS

157.3.1 class QLPreviewPanelMBS

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The QLPreviewPanel class implements the Preview Panel - a user interface object that displays the preview of a list of items.
Example:

```
// show the Quick Look panel for two files
// MyPreviewPanel is a subclass of QLPreviewPanelMBS with the events implemented.
// Panel is a property of the window: Panel As MyPreviewPanel
Panel = New MyPreviewPanel
Panel.makeKeyAndOrderFront

// in MyPreviewPanel:
Function numberOfPreviewItems() As Integer Handles numberOfPreviewItems
Return 2
End Function

Function previewItemAtIndex(index As Integer) As FolderItem Handles previewItemAtIndex
If index = 0 Then
Return SpecialFolder.Desktop.Child("test.pdf")
Else
Return SpecialFolder.Desktop.Child("photo.jpg")
End If
End Function
```

Notes: Every application only has on instance of QLPreviewPanel.

Use QLPreviewControllerMBS to do similar on iOS or WinPreviewControlMBS for previews on Windows.
Subclass of the NSPanelMBS class.

Xojo Developer Magazine

- 24.4, page 10: News

157.3.2 Methods

157.3.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether this panel is available.
Notes: Returns true on Snow Leopard.

157.3.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new panel.

157.3.5 currentPreviewItem as folderitem

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The currently previewed item in the preview panel or nil if there is none.

157.3.6 enterFullScreenMode(screen as NSScreenMBS)

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Enters full screen mode.
Notes: If panel is not on-screen, the panel will go directly to full screen mode.

157.3.7 exitFullScreenMode

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Exits full screen mode.

157.3.8 refreshCurrentPreviewItem

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Asks the Preview Panel to recompute the preview of the currently previewed item.

157.3.9 reloadData

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Asks the Preview Panel to reload its data from its data source.
Notes: This method does not refresh the visible item if it has not changed.

157.3.10 updateController

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Asks the Preview Panel to update its current controller.
Notes: The Preview Panel automatically updates its controller (by searching the responder chain) whenever the main or key window changes. Invoke updateController if the responder chain changes without explicit notice.

157.3.11 Properties

157.3.12 currentPreviewItemIndex as Integer

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The index of the currently previewed item in the preview panel or NSNotFound (-1) if there is none.
Notes: (Read and Write property)

157.3.13 inFullScreenMode as boolean

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: True if the panel is currently open and in full screen mode.
Notes: (Read only property)

157.3.14 PreviewView as QLPreviewViewMBS

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Returns the preview view in the panel.
Notes: (Read only property)

157.3.15 Events

157.3.16 beginPreviewPanel

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: The event called when the panel begins.

157.3.17 didLoadPreviewItem(file as folderitem)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This event is called after an item has been loaded.

157.3.18 endPreviewPanel

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: The event called when the panel ends.

157.3.19 handleEvent(e as NSEventMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Invoked by the preview panel when it receives an event it doesn't handle.
Example:

```
Function handleEvent(e as NSEventMBS) Handles handleEvent as boolean
if e.type = NSEventMBS.NSKeyDown then

if e.keyCode = 125 then
System.DebugLog "cursor down pressed"
elseif e.keyCode = 126 then
System.DebugLog "cursor up pressed"
end if
```

```
else

if e.keyCode = 125 then
System.DebugLog "cursor down released"
elseif e.keyCode = 126 then
System.DebugLog "cursor up released"
end if

end if

Return false
End Function
```

Notes: Returns true if you did not handle this event.

157.3.20 numberOfPreviewItems as Integer

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The event called to ask you for the number of items that the preview panel should preview.

157.3.21 previewItemAtIndex(index as Integer) as folderitem

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The event is called to ask you for the item with the given index.

157.3.22 sourceFrameOnScreenForPreviewItem(file as folderitem) as NSRectMBS

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Invoked when the preview panel opens or closes to provide a zoom effect.
Notes: Return a zero rect if there is no origin point, this will produce a fade of the panel. The coordinates are screen based.

157.3.23 transitionImageForPreviewItem(file as folderitem, byref contentRect as NSRectMBS) as NSImageMBS

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Called to ask you for the transition image for a given preview item.
Notes: Invoked when the preview panel opens or closes to provide a smooth transition when zooming.

contentRect: The rect within the image that actually represents the content of the document. For example, for icons the actual rect is generally smaller than the icon itself.

Return an image the panel will crossfade with when opening or closing. You can specify the actual "document" content rect in the image in contentRect.

157.3.24 willLoadPreviewItem(file as folderitem)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This event is called before an item is loaded.

157.4 control QLPreviewViewControlMBS

157.4.1 control QLPreviewViewControlMBS

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a QuickLook preview view.
Notes: See QLPreviewViewMBS class.

See QLPreviewControllerMBS for iOS projects.
See WinPreviewControlMBS control for Windows targets.

157.4.2 Properties

157.4.3 View as QLPreviewViewMBS

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The view this control shows.
Notes: (Read only property)

157.4.4 Events

157.4.5 BoundsChanged

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

157.4.6 Close

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

157.4.7 Closing

Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

157.4.8 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

157.4.9 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

157.4.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

157.4.11 EnableMenuItems

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

157.4.12 FocusLost

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

157.4.13 FocusReceived

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

157.4.14 FrameChanged

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

157.4.15 GotFocus

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

157.4.16 LostFocus

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

157.4.17 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

157.4.18 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

157.4.19 MouseDrag(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

157.4.20 MouseUp(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

157.4.21 Open

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

157.4.22 Opening

Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

157.4.23 ScaleFactorChanged(NewFactor as Double)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

157.4.24 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

157.5 class QLPreviewViewMBS

157.5.1 class QLPreviewViewMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The class for using a preview view from QuickLook in Xojo.
Example:

```
// show a Quick Look preview of a file inside the window
// Preview is a property of the window: Preview As QLPreviewViewMBS
Preview = New QLPreviewViewMBS(20, 20, 400, 300)
Preview.previewItem = SpecialFolder.Desktop.Child("test.pdf")
Preview.shouldCloseWithWindow = True
Self.NSWindowMBS.contentView.addSubview Preview
```

Notes: If you want to show previews of files in your application, use this view. For example if you not just want to show previews of pictures, but also from Movies, PDF, Office and iWork files.
Requires Mac OS X 10.6 or newer.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.

Use QLPreviewViewControlMBS to have this view as a control.
See WinPreviewControlMBS for something similar on Windows.
Subclass of the NSViewMBS class.
Blog Entries

- MBS Real Studio Plugins, version 11.2pr8

157.5.2 Methods

157.5.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.6 or newer.

157.5.4 close

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Closes the receiver, releasing the current preview item.

Notes: Once the receiver has closed, it will no longer accept preview items.

The application is required to call close when the receiver is no longer needed if shouldCloseWithWindow is false.
The close method will be called automatically when the window closes if shouldCloseWithWindow is true.

157.5.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new quicklook preview view with size 100/100 and position 0/0
Example:

```
Var t as new QLPreviewViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 157.5.6 Constructor(Handle as Integer) 20562
- 157.5.7 Constructor(left as Double, top as Double, width as Double, height as Double) 20563
- 157.5.8 Constructor(left as Double, top as Double, width as Double, height as Double, style as Integer) 20563

157.5.6 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given QLPreviewView handle.
Example:

```
Var t as new QLPreviewViewMBS(0, 0, 100, 100)
Var v as new QLPreviewViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a QLPreviewView and the plugin retains this handle.
See also:

- 157.5.5 Constructor 20562
- 157.5.7 Constructor(left as Double, top as Double, width as Double, height as Double) 20563
- 157.5.8 Constructor(left as Double, top as Double, width as Double, height as Double, style as Integer) 20563

157.5.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new QuickLook preview view with the given size and position.
Example:

```
Var x as new QLPreviewViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 157.5.5 Constructor 20562
- 157.5.6 Constructor(Handle as Integer) 20562
- 157.5.8 Constructor(left as Double, top as Double, width as Double, height as Double, style as Integer) 20563

157.5.8 Constructor(left as Double, top as Double, width as Double, height as Double, style as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new QuickLook preview view with the given size and position.
Example:

```
Var view as new QLPreviewViewMBS(0, 0, 200, 200, QLPreviewViewMBS.StyleCompact)
```

Notes: On success the handle property is not zero.

On Mac OS X 10.7 or later we use the new style parameter to create a Preview view with the given style.
See also:

- 157.5.5 Constructor 20562
- 157.5.6 Constructor(Handle as Integer) 20562
- 157.5.7 Constructor(left as Double, top as Double, width as Double, height as Double) 20563

157.5.9 refreshPreviewItem

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Asks the Preview view to recompute the preview of the currently previewed item.

157.5.10 Properties

157.5.11 autostarts as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Whether playback of audio/video files automatically starts.
Notes: (Read and Write computed property)

157.5.12 previewItem as folderitem

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The current visible item in the view.
Notes: (Read and Write computed property)

157.5.13 shouldCloseWithWindow as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Set whether the receiver closes when its window closes.
Notes: See close method.
(Read and Write computed property)

157.5.14 Constants

Preview View Styles

Constant	Value	Description
StyleCompact	1	Use in inspectors.
StyleNormal	0	Use in full previews.

157.6 class QLThumbnailGenerationRequestMBS

157.6.1 class QLThumbnailGenerationRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: A request to generate a thumbnail for a file.
Example:

var request as New QLThumbnailGenerationRequestMBS(file, 512, 512, QLThumbnailGenerationRequestMBS.RequestRepresentationTypeIcon)
request.iconMode = True

Blog Entries

- News from the MBS Xojo Plugins Version 24.2
- MBS Xojo Plugins, version 24.2pr4

157.6.2 Methods

157.6.3 Constructor(File as FolderItem, width as Integer = 512, height as Integer = 512, scale as double = 2.0, representationTypes as Integer = &hFF)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: Creates a new request for a thumbnail with the specified parameters for a file.
Notes: File: The file for which you want to create a thumbnail.
width and height: The desired size of the thumbnails.
scale: The scale of the thumbnails. This parameter usually represents the scale of the current screen. However, you can pass a screen scale to the initializer that isn,Äôt the current device,Äôs screen scale. For example, you can create thumbnails for different scales and upload them to a server in order to download them later on devices with a different screen scale.
representationTypes: The different thumbnail types. For a list of all possible thumbnail representation types, see constants.

157.6.4 Properties

157.6.5 contentType as String

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The content type of the source file.
Notes: The content type of the file being thumbnailed is used to determine the provider of the thumbnail

and the icon styles applied if iconMode is requested. By default the content type is derived from the file extension. Setting this property will override the derived content type. This is useful for files that don,Äôt have meaningful extensions but for which you may already know the content type.
(Read and Write property)

157.6.6 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

157.6.7 height as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The desired size of the thumbnails that should be generated.
Notes: (Read only property)

157.6.8 iconMode as Boolean

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: Whether to add icon art.
Notes: If set to true, this will generate something appropriate for display as a file icon, meaning that the thumbnail might be embedded in a frame, show a curled corner, draw a background and/or a drop shadow, as appropriate for the platform. If set to NO, this will generate a raw undecorated thumbnail. Defaults to false.
(Read and Write property)

157.6.9 minimumDimension as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The minimum dimenstion.
Notes: Defaults to 0. If set, the thumbnail will have a width and height greater or equal to minimumDimension * scale. If set and it is not possible to generate thumbnails of minimumDimension for any of the requested types, no thumbnail will be provided.
(Read and Write property)

157.6.10 representationTypes as Integer

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The desired successive representations of the thumbnail that should be generated when possible.
Notes: (Read only property)

157.6.11 scale as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The desired scale of the thumbnails that should be generated.
Notes: This will usually be the scale of the screen.
You can for instance pass a scale different from the one of the screen if you would like to save generated thumbnails to a server to later download them on devices with a different screen scale.
(Read only property)

157.6.12 width as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The desired size of the thumbnails that should be generated.
Notes: (Read only property)

157.6.13 Constants

Representation Types

Constant	Value	Description
RequestRepresentationTypeAll	&hFF	The thumbnail type to generate all possible thumbnail repr
RequestRepresentationTypeIcon	1	A file icon representation of a file.
RequestRepresentationTypeLowQualityThumbnail	2	A faster to generate version of the thumbnail that may s speed.
RequestRepresentationTypeThumbnail	4	A thumbnail representation of a file.

157.7 class QLThumbnailGeneratorMBS

157.7.1 class QLThumbnailGeneratorMBS

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: An object that generates thumbnail images based on provided requirements.
Example:

```
// create a thumbnail of a document as the Finder shows it
// MyThumbnailGenerator is a subclass of QLThumbnailGeneratorMBS with the generateBestRepresentationForRequestCompleted event implemented.
// Generator is a property of the window: Generator As MyThumbnailGenerator
Generator = New MyThumbnailGenerator
Var request As New QLThumbnailGenerationRequestMBS(SpecialFolder.Desktop.Child("test.pdf"), 256, 256)
Generator.generateBestRepresentationForRequest request

// in MyThumbnailGenerator:
Sub generateBestRepresentationForRequestCompleted(request As QLThumbnailGenerationRequestMBS, thumbnail As QLThumbnailRepresentationMBS, error As NSErrorMBS) Handles generateBestRepresentationForRequestCompleted
If thumbnail <>Nil Then
Var pic As Picture = thumbnail.Picture
// show pic in a Canvas or ImageViewer
System.DebugLog "Thumbnail " + pic.Width.ToString + " x " + pic.Height.ToString
ElseIf error <>Nil Then
System.DebugLog error.localizedDescription
End If
End Sub
```

157.7.2 Methods

157.7.3 cancelRequest(request as QLThumbnailGenerationRequestMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: Cancels the generation of a thumbnail for a given request.

157.7.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The constructor.

157.7.5 generateBestRepresentationForRequest(request as QLThumbnailGenerationRequestMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: Generates the best possible thumbnail representation for a file and calls a handler upon completion.
Notes: request: The request that contains information about the thumbnail that you want to create.

Calls generateBestRepresentationForRequestCompleted event later.

157.7.6 generateRepresentationsForRequest(request as QLThumbnailGenerationRequestMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: Generates various thumbnail representations for a file and calls the update handler for each thumbnail representation.
Notes: request: The request that contains information about the thumbnail that you want to create.

Calls generateRepresentationsForRequestUpdated event later.

157.7.7 saveBestRepresentationForRequest(request as QLThumbnailGenerationRequestMBS, file as FolderItem, contentType as String)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: Saves the best representation of thumbnail for a specific request to the specified URL.
Notes: request: The request that you used to generate a thumbnail.
fileURL: The destination to which you save the generated thumbnail.
contentType: The content type of the thumbnail image that you want to save. Use a type that is supported by CGImageDestinationRef, such as kUTTypePNG or kUTTypeJPEG.

157.7.8 sharedGenerator as QLThumbnailGeneratorMBS

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The singleton thumbnail generator instance.

157.7.9 Properties

157.7.10 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

157.7.11 Events

157.7.12 generateBestRepresentationForRequestCompleted(request as QLThumbnailGenerationRequestMBS, thumbnail as QLThumbnailRepresentationMBS, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The completion event to call when the thumbnail generation completes.
Notes: It is always called when QLThumbnailGenerator finishes the generation of a requested thumbnail.

thumbnail: The most representative version of the requested thumbnail or nil if QLThumbnailGeneratorMBS was unable to generate a thumbnail.
error: An error object that indicates why the thumbnail generation failed, or nil if the thumbnail generation succeeded.

157.7.13 generateRepresentationsForRequestUpdated(request as QLThumbnailGenerationRequestMBS, thumbnail as QLThumbnailRepresentationMBS, type as Integer, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The handler to call successively for each requested representation of a thumbnail.
Notes: QuickLookThumbnailing calls the updateHandler in order of lower quality to higher quality thumbnail types. If a better quality thumbnail becomes available before a lower quality one, the framework may skip the call to the updateHandler for the lower quality thumbnail.

You can rely on QuickLookThumbnailing to call the updateHandler at least once by the time it finishes the creation of thumbnails with either the best requested thumbnail, or an error object.

The handler takes the following parameters:
thumbnail: A thumbnail that is successfully generated or nil if QLThumbnailGenerator is unable to generate a thumbnail.
type: The type of the generated thumbnail representation.
error: An error object that indicates why the thumbnail generation failed, or nil if the thumbnail generation succeeded.

157.7.14 saveBestRepresentationForRequestCompleted(request as QLThumbnailGenerationRequestMBS, error as NSErrorMBS, file as FolderItem)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The handler to call when saving the thumbnail to disk.
Notes: error: An error object that indicates why saving a thumbnail image failed, or nil if saving the thumbnail succeeded.

157.8 class QLThumbnailRepresentationMBS

157.8.1 class QLThumbnailRepresentationMBS

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: Information about the thumbnail that the thumbnail generator returns.
Notes: QuickLook Thumbnailing is a non-UI framework, so your app doesn,Äôt have to link to either UIKit or AppKit. Quicklook Thumbnailing generates a thumbnail as a Core Graphics image object and makes the thumbnail available as the CGImage property.
If an app links to AppKit or UIKit, the thumbnail is available through the NSImage or UIImage properties.
For more information on the different types of thumbnails that QLThumbnailGenerator can create, see type constants.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

157.8.2 Methods

157.8.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

157.8.4 Properties

157.8.5 CGImage as Variant

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: A thumbnail in the form of a Core Graphics image object.
Notes: Value is a CGImageMBS object.
(Read only property)

157.8.6 contentRectHeight as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The rectangle within the thumbnail image of the document that represents its contents.
Notes: (Read only property)

157.8.7 contentRectLeft as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The rectangle within the thumbnail image of the document that represents its contents.
Notes: (Read only property)

157.8.8 contentRectTop as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The rectangle within the thumbnail image of the document that represents its contents.
Notes: (Read only property)

157.8.9 contentRectWidth as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The rectangle within the thumbnail image of the document that represents its contents.
Notes: (Read only property)

157.8.10 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

157.8.11 NSImage as NSImageMBS

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: A thumbnail in the form of an image object.
Notes: Contains NSImage on macOS and UIImage on iOS.
(Read only property)

157.8.12 Picture as Picture

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The image as a Xojo picture.
Notes: (Read only property)

157.8.13 Type as Integer

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The type of thumbnail.
Notes: (Read only property)

157.8.14 Constants

Types

Constant	Value	Description
TypeIcon	0	A file icon representation of an image.
TypeLowQualityThumbnail	1	A cached thumbnail representation of an image.
TypeThumbnail	2	A thumbnail representation of an image.

Chapter 158

QuickTime

158.1 class QTAudioChannelDescriptionMBS

158.1.1 class QTAudioChannelDescriptionMBS

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: The description for an audio channel.
Blog Entries

- MBS Xojo Plugins, version 25.6pr2
- MBS Real Studio Plugins, version 11.3pr8

158.1.2 Properties

158.1.3 ChannelFlags as UInt32

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: Flags that control the interpretation of Coordinates.
Notes: (Read and Write property)

158.1.4 ChannelLabel as UInt32

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: The AudioChannelLabel that describes the channel.
Notes: (Read and Write property)

158.1.5 Coordinates(index as Integer) as Double

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: An ordered triple that specifies a precise speaker location.
Notes: Index from 0 to 2.
(Read and Write computed property)

158.1.6 Constants

Coordinates array Indexes

Constant	Value	Description
kAudioChannelCoordinates_Azimuth	0	For spherical coordinates, 0 is front center, positive is right, negative This is measured in degrees.
kAudioChannelCoordinates_BackFront	1	For rectangulare coordinates, negative is back and positive is front.
kAudioChannelCoordinates_Distance	2	For spherical coordinates, the units are described by flags.
kAudioChannelCoordinates_DownUp	2	For rectangulare coordinates, negative is below ground level, 0 is groun and positive is above ground level.
kAudioChannelCoordinates_Elevation	1	For spherical coordinates, +90 is zenith, 0 is horizontal, -90 is nadir. measured in degrees.
kAudioChannelCoordinates_LeftRight	0	For rectangulare coordinates, negative is left and positive is right.

Channel Coordinate Flags

Constant	Value	Description
kAudioChannelFlags_AllOff	0	All flags off.
kAudioChannelFlags_Meters	4	Set to indicate the units are in meters, clear to indicate the uni to the unit cube or unit sphere.
kAudioChannelFlags_RectangularCoordinates	1	The channel is specified by the cartesioan coordinates of the spe This flag is mutally exclusive with kAudioChannelFlags_Spherica
kAudioChannelFlags_SphericalCoordinates	2	The channel is specified by the spherical coordinates of the spe This flag is mutally exclusive with kAudioChannelFlags_Recta nates.

Channel Label Constants

Constant	Value	Description
kAudioChannelLabel_Ambisonic_W	200	
kAudioChannelLabel_Ambisonic_X	201	
kAudioChannelLabel_Ambisonic_Y	202	
kAudioChannelLabel_Ambisonic_Z	203	
kAudioChannelLabel_Center	3	
kAudioChannelLabel_CenterSurround	9	WAVE: "Back Center" or plain "Rear Surround"
kAudioChannelLabel_CenterSurroundDirect	44	back center, non diffuse
kAudioChannelLabel_ClickTrack	304	
kAudioChannelLabel_DialogCentricMix	43	
kAudioChannelLabel_Discrete	400	
kAudioChannelLabel_Discrete_0	&h10000

158.2 class QTAudioChannelLayoutMBS

158.2.1 class QTAudioChannelLayoutMBS

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: The class is used to specify channel layouts in files and hardware.
Notes: This class does not use QuickTime functions as it only wraps data structures. And it can be used with Mac App Store and AVFoundation.

Some channel abbreviations used for the constants:

- L - left
- R - right
- C - center
- Ls - left surround
- Rs - right surround
- Cs - center surround
- Rls - rear left surround
- Rrs - rear right surround
- Lw - left wide
- Rw - right wide
- Lsd - left surround direct
- Rsd - right surround direct
- Lc - left center
- Rc - right center
- Ts - top surround
- Vhl - vertical height left
- Vhc - vertical height center
- Vhr - vertical height right
- Lt - left matrix total. for matrix encoded stereo.
- Rt - right matrix total. for matrix encoded stereo.

158.2.2 Methods

158.2.3 GetNumberOfChannels(layoutTag as UInt32) as UInt32

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: Function to get the number of channels out of an AudioChannelLayoutTag.
Notes: The low 16 bits of an AudioChannelLayoutTag gives the number of channels except for kAudioChannelLayoutTag_UseChannelDescriptions and kAudioChannelLayoutTag_UseChannelBitmap.

158.2.4 Memory as Memoryblock

MBS Main Plugin, Plugin Version: 13.0, Platforms: macOS, Windows, Targets: All.

Function: Returns the audio channel layout as memoryblock, so you can pass it for declares.

158.2.5 Properties

158.2.6 ChannelBitmap as UInt32

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: If ChannelLayoutTag is set to kAudioChannelLayoutTag_UseChannelBitmap, this field is the channel usage bitmap.
Notes: (Read and Write property)

158.2.7 ChannelLayoutTag as UInt32

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: The AudioChannelLayoutTag that indicates the layout.
Notes: (Read and Write property)

158.2.8 NumberChannelDescriptions as UInt32

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: The number of items in the ChannelDescriptions array.
Notes: (Read and Write property)

158.2.9 ChannelDescriptions(index as Integer) as QTAudioChannelDescriptionMBS

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: An array of AudioChannelDescriptions that describe the layout.
Notes: Index from 0 to NumberChannelDescriptions-1.
(Read and Write computed property)

158.2.10 Constants

Channel Bitmap Constants

Constant	Value	Description
kAudioChannelBit_Center	4	
kAudioChannelBit_CenterSurround	256	WAVE: "Back Center"
kAudioChannelBit_Left	1	
kAudioChannelBit_LeftCenter	64	
kAudioChannelBit_LeftSurround	16	WAVE: "Back Left"
kAudioChannelBit_LeftSurroundDirect	512	WAVE: "Side Left"
kAudioChannelBit_LFEScreen	8	
kAudioChannelBit_Right	2	
kAudioChannelBit_RightCenter	128	
kAudioChannelBit_RightSurround	32	WAVE: "Back Right"
kAudioChannelBit_RightSurroundDirect	1024	WAVE: "Side Right"
kAudioChannelBit_TopBackCenter	65536	
kAudioChannelBit_TopBackLeft	32768	
kAudioChannelBit_TopBackRight	131072	
kAudioChannelBit_TopCenterSurround	2048	
kAudioChannelBit_VerticalHeightCenter	8192	WAVE: "Top Front Center"
kAudioChannelBit_VerticalHeightLeft	4096	WAVE: "Top Front Left"
kAudioChannelBit_VerticalHeightRight	16384	WAVE: "Top Front Right"

158.3 class QTSoundStreamMBS

158.3.1 class QTSoundStreamMBS

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: A class for the QTSoundOutput component which outputs sound using a given AudioUnit.
Notes: Not supported for 64 bit targets.
Blog Entries

- MBS Real Studio Plugins, version 11.4pr2

158.3.2 Methods

158.3.3 AttachToAudioUnitComponent(componenthandle as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Attaches the Sound Output component to a given Audio Unit component.
Notes: Returns the error code. (0 for success)
You may call AudioUnitInitialize and AudioOutputUnitStart after this to start the output unit.
See also:

- 158.3.4 AttachToAudioUnitComponent(componenthandle as Integer, element as Integer) as Integer 20585

158.3.4 AttachToAudioUnitComponent(componenthandle as Integer, element as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Attaches the Sound Output component to a given Audio Unit component.
Notes: Returns the error code. (0 for success)
You may call AudioUnitInitialize and AudioOutputUnitStart after this to start the output unit.
See also:

- 158.3.3 AttachToAudioUnitComponent(componenthandle as Integer) as Integer 20585

158.3.5 AudioOutputUnitStart(componenthandle as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Starts the output unit.
Notes: Returns a Mac OS errro code (0 for success).

158.3.6 AudioUnitInitialize(componenthandle as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Initializes the output unit.
Notes: Returns a Mac OS errro code (0 for success).

158.3.7 closeComponent

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Closes the Sound Output component.

158.3.8 InitComponent

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Initializes the sound output component.
Notes: Allocates memory for example.

158.3.9 OpenComponent

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Opens the SoundOutput component.

158.3.10 OpenDefaultAudioUnitOutputComponent as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Opens the default audio unit component and returns the handle.
Notes: Returns 0 on any error.
The component is only available on Mac OS X, so this function will return 0 on all other platforms.

158.3.11 Properties

158.3.12 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: The component handle.
Notes: (Read and Write property)

158.3.13 IsOpen as Boolean

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Whether the sound output component has been opened yet.
Notes: Returns false on any error.
(Read only property)

158.3.14 IsStreamActive as Boolean

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: True in case the stream is active.
Notes: Returns false on any error.
(Read only property)

158.3.15 PostsStatusNotifications as Boolean

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Whether status notificiations should be posted.
Notes: (Read and Write property)

158.3.16 Release as Boolean

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Whether the constructor should release the handle.
Notes: (Read and Write property)

158.3.17 SoundOutputComponentHandle as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: The handle of the used component instance.
Notes: (Read only property)

Chapter 159

RabbitMQ

159.1 class RabbitMQBasicPropertiesMBS

159.1.1 class RabbitMQBasicPropertiesMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The basic properties class.
Example:

```
// publish a JSON message with properties for a request/reply pattern
// r is a connected RabbitMQConnectionMBS with an open channel 1, see there
Var r As RabbitMQConnectionMBS // your connection
If r = Nil Then Return

Var props As New RabbitMQBasicPropertiesMBS
props.ContentType = "application/json"
props.DeliveryMode = RabbitMQBasicPropertiesMBS.kDeliveryPersistent
props.CorrelationId = "request-42" // to match the answer
props.ReplyTo = "answers" // queue for the answer
props.Expiration = "60000" // milliseconds

Call r.BasicPublish(1, "", "requests", False, False, props, " { ""action"":""ping"" } ")
```

159.1.2 Methods

159.1.3 Constructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

159.1.4 Destructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

159.1.5 Properties

159.1.6 AppId as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The app-id.
Notes: (Read and Write property)

159.1.7 ClusterId as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The cluster ID.
Notes: (Read and Write property)

159.1.8 ContentEncoding as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The content-encoding.
Notes: (Read and Write property)

159.1.9 ContentType as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The content-type.
Notes: (Read and Write property)

159.1.10 CorrelationId as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The correlation-id.
Notes: (Read and Write property)

159.1.11 DeliveryMode as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The delivery-mode.
Notes: (Read and Write property)

159.1.12 Expiration as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The expiration.
Notes: (Read and Write property)

159.1.13 Flags as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Bit-mask of set fields.
Notes: (Read and Write property)

159.1.14 HasAppId as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagAppId.
Notes: (Read and Write property)

159.1.15 HasClusterId as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagClusterId.
Notes: (Read and Write property)

159.1.16 HasContentEncoding as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagContentEncoding.
Notes: (Read and Write property)

159.1.17 HasContentType as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagContentType.
Notes: (Read and Write property)

159.1.18 HasCorrelationId as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagCorrelationId.
Notes: (Read and Write property)

159.1.19 HasDeliveryMode as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagDeliveryMode.
Notes: (Read and Write property)

159.1.20 HasExpiration as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagExpiration.
Notes: (Read and Write property)

159.1.21 HasHeaders as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagHeaders.
Notes: (Read and Write property)

159.1.22 HasMessageId as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagMessageId.
Notes: (Read and Write property)

159.1.23 HasPriority as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagPriority.
Notes: (Read and Write property)

159.1.24 HasReplyTo as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagReplyTo.
Notes: (Read and Write property)

159.1.25 HasTimestamp as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagTimestamp.
Notes: (Read and Write property)

159.1.26 HasType as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagType.
Notes: (Read and Write property)

159.1.27 HasUserId as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagUserId.
Notes: (Read and Write property)

159.1.28 Headers as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Dictionary with headers.
Notes: (Read and Write property)

159.1.29 MessageId as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The message ID.
Notes: (Read and Write property)

159.1.30 Priority as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The priority.
Notes: (Read and Write property)

159.1.31 ReplyTo as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The reply to field.
Notes: (Read and Write property)

159.1.32 Timestamp as UInt64

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The timestamp.
Notes: (Read and Write property)

159.1.33 Type as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The type field.
Notes: (Read and Write property)

159.1.34 UserId as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The user id.
Notes: (Read and Write property)

159.1.35 Constants

Delivery modes

Constant	Value	Description
kDeliveryNonPersistent	1	Non-persistent message.
kDeliveryPersistent	2	Persistent message

Field flags

Constant	Value	Description
kFlagAppId	8	AppID field is set.
kFlagClusterId	4	ClusterId field is set.
kFlagContentEncoding	16384	ContentEncoding field is set.
kFlagContentType	32768	ContentType field is set.
kFlagCorrelationId	1024	CorrelationId field is set.
kFlagDeliveryMode	4096	DeliveryMode field is set.
kFlagExpiration	256	Expiration field is set.
kFlagHeaders	8192	Headers field is set.
kFlagMessageId	128	MessageId field is set.
kFlagPriority	2048	Priority field is set.
kFlagReplyTo	512	ReplyTo field is set.
kFlagTimestamp	64	Timestamp field is set.
kFlagType	32	Type field is set.
kFlagUserId	16	UserId field is set.

159.2 class RabbitMQConnectionInfoMBS

159.2.1 class RabbitMQConnectionInfoMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class ot parse an URL.
Example:

```
// split an AMQP URL into its parts
Var info As New RabbitMQConnectionInfoMBS("amqps://user:secret@rabbit.example.com:5671/production")
MessageBox "Host: " + info.Host + EndOfLine + _
"Port: " + info.Port.ToString + EndOfLine + _
"User: " + info.User + EndOfLine + _
"Virtual host: " + info.VHost + EndOfLine + _
"SSL: " + info.SSL.ToString
```

159.2.2 Methods

159.2.3 Constructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
Notes: Sets default values for properties.

The default values are:

- user: "guest"
- password: "guest"
- host: "localhost"
- vhost: "/"
- port: 5672

See also:

- 159.2.4 Constructor(URL as String) 20598

159.2.4 Constructor(URL as String)

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parse a connection URL.
Notes: An amqp connection url takes the form:

amqp:// [$ USERNAME [:$ PASSWORD] @] $ HOST [:$ PORT] / [$ VHOST]

Examples:
amqp://guest:guest@localhost:5672//
amqp://guest:guest@localhost/myvhost

Any missing parts of the URL will be set to the defaults specified in other Constructor. For amqps: URLs the default port will be set to 5671 instead of 5672 for non-SSL URLs.

We raise UnsupportedOperationException if parsing failes.
See also:

- 159.2.3 Constructor 20597

159.2.5 Destructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

159.2.6 Properties

159.2.7 Host as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The hostname of the broker.
Notes: (Read only property)

159.2.8 Password as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The password to authenticate with the broker.
Notes: default on most brokers is 'guest'

(Read only property)

159.2.9 Port as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The port that the broker is listening on.
Notes: default on most brokers is 5672.
(Read only property)

159.2.10 SSL as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to use SSL.
Notes: (Read only property)

159.2.11 User as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The username to authenticate with the broker.
Notes: default on most broker is 'guest'
(Read only property)

159.2.12 VHost as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The virtual host on the broker to connect to.
Notes: a good default is "/"
(Read only property)

159.3 class RabbitMQConnectionMBS

159.3.1 class RabbitMQConnectionMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a RabbitMQ connection to a server.
Example:

```
// connect to a RabbitMQ server, declare a queue and publish a message
Var r As New RabbitMQConnectionMBS
If Not r.NewTCPSocket Then Return
Call r.OpenSocket("localhost", 5672)

Call r.LoginPlain("/", 0, 131072, 0, "guest", "guest")

Const channel = 1
Call r.ChannelOpen(channel)
Call r.QueueDeclare(channel, "hello", False, False, False, True, Nil)

Var props As New RabbitMQBasicPropertiesMBS
props.ContentType = "text/plain"
props.DeliveryMode = 2 // persistent

Call r.BasicPublish(channel, "", "hello", False, False, props, "Hello World!")

Call r.ChannelClose(channel)
Call r.ConnectionClose
```

Notes: Our plugin converts from dictionary/array/variant to/from the encoded representation used in MQ automatically.

- Bringing RabbitMQ to Xojo

159.3.2 Methods

159.3.3 BasicAck(channel as Integer, deliveryTag as UInt64, multiple as Boolean = false) as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Acknowledges a message.
Notes: Does a basic.ack on a received message.

channel: the channel identifier
deliveryTag: the delivery tag of the message to be ack'd.
multiple: if true, ack all messages up to this delivery tag, if false ack only this delivery tag.

Returns error code, 0 on success, 0 >on failing to send the ack to the broker. this will not indicate failure if something goes wrong on the broker.

159.3.4 BasicCancel(channel as Integer, consumerTag as String) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Cancels a channel.

159.3.5 BasicConsume(channel as Integer, queue as String, consumerTag as String, noLocal as Boolean, noAck as Boolean, exclusive as Boolean, arguments as Dictionary) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Basic consume.

159.3.6 BasicGet(channel as Integer, queue as String, noAck as Boolean) as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do a basic.get.
Notes: Synchronously polls the broker for a message in a queue, and retrieves the message if a message is in the queue.

channel: the channel identifier to use
queue: the queue name to retrieve from
noAck: if true the message is automatically ack'ed if false BasicAck() should be called once the message retrieved has been processed

Returns RabbitMQRPCReplyMBS object indicating success or failure

159.3.7 BasicNAck(channel as Integer, deliveryTag as UInt64, multiple as Boolean = false, requeue as Boolean = false) as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do a basic.nack.
Notes: Actively reject a message, this has the same effect as BasicReject() however, BasicNAck() can negatively acknowledge multiple messages with one call much like BasicAck() can acknowledge mutliple messages with
one call.

channel: the channel identifier
deliveryTag the delivery tag of the message to reject
multiple: if set to 1 negatively acknowledge all unacknowledged messages on this channel.
requeue: indicate to the broker whether it should requeue the message or dead-letter it.

Returns error code, kStatusOK on success, an status constant value otherwise.

159.3.8 BasicPublish(channel as Integer, exchange as String, routingKey as String, mandatory as Boolean, immediate as Boolean, properties as RabbitMQBasicPropertiesMBS, body as String) as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Publish a message to the broker.
Notes: Publish a message on an exchange with a routing key.

Note that at the AMQ protocol level basic.publish is an async method:
this means error conditions that occur on the broker (such as publishing to
a non-existent exchange) will not be reflected in the return value of this
function.

channel: the channel identifier
exchange: the exchange on the broker to publish to
routingKey: the routing key to use when publishing the message mandatory indicate to the broker that the message MUST be routed to a queue. If the broker cannot do this it should respond with a basic.return method.
immediate: indicate to the broker that the message MUST be delivered to a consumer immediately. If the broker cannot do this it should respond with a basic.return method.
properties: the properties associated with the message
body: the message body

kStatusOK on success, other kStatus values on failure. Note that basic.publish is an async method, the

return value from this function only indicates that the message data was successfully transmitted to the broker. It does not indicate failures that occur on the broker, such as publishing to a non-existent exchange.

Possible error values:

- kStatusTimerFailure: system timer facility returned an error the message was not sent.
- kStatusHeartbeatTimeout: connection timed out waiting for a heartbeat from the broker. The message was not sent.
- kStatusNoMemory: memory allocation failed. The message was not sent.
- kStatusTableTooBig: a table in the properties was too large to fit in a single frame. Message was not sent.
- kStatusConnectionClosed: the connection was closed
- kStatusSSLError: a SSL error occurred.
- kStatusTCPError: a TCP error occurred. errno or WSAGetLastError() may provide more information.

159.3.9 BasicQOS(channel as Integer, prefetchSize as Integer, prefetchCount as Integer, isGlobal as boolean) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Basic QOS.

159.3.10 BasicRecover(channel as Integer, requeue as Boolean) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Recover a channel.

159.3.11 BasicReject(channel as Integer, deliveryTag as UInt64, requeue as Boolean = false) as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do a basic.reject.
Notes: Actively reject a message that has been delivered

channel: the channel identifier
deliveryTag the delivery tag of the message to reject

requeue: indicate to the broker whether it should requeue the message or just discard it.

Returns error code, 0 on success, 0 >on failing to send the reject method to the broker.
This will not indicate failure if something goes wrong on the broker.

159.3.12 ChannelClose(Channel as Integer, Code as Integer = 200) as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Closes an channel.
Notes: channel: the channel identifier
code: the reason for closing the channel, kReplySuccess is a good default.

Returns RabbitMQRPCReplyMBS object indicating success or failure

159.3.13 ChannelFlow(channel as Integer, active as Boolean) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Channel Flow control.

159.3.14 ChannelOpen(Channel as Integer) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Opens a channel.

159.3.15 ConfirmSelect(channel as Integer) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Confirm select.

159.3.16 ConnectionClose(Code as Integer = 200) as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Closes a connection.

159.3.17 ConstantIsHardError(constantNumber as Integer) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks to see if a constant is a hard error.
Notes: A hard error occurs when something severe enough happens that the connection must be closed.

Returns true if its a hard error, false otherwise.

159.3.18 ConstantName(constantNumber as Integer) as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get constant name string from constant.

159.3.19 Constructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
Notes: Allocate and initialize a new connection object.

159.3.20 ConsumeMessage(byref envelope as RabbitMQEnvelopeMBS, timeoutValue as double = 30, flags as Integer = 0) as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Wait for and consume a message.
Notes: Waits for a basic.deliver method on any channel, upon receipt of basic.deliver it reads that message, and returns. If any other method is received before basic.deliver, this function will return an RabbitMQRPCReplyMBS with ReplyType = ResponseTypeLibraryException, and Reply.LibraryError = kStatusUnexpectedState. The caller should then call WaitFrame() to read this frame and take appropriate action.

This function should be used after starting a consumer with the BasicConsume() function

Envelope receives new object.

Timeout is in seconds.
flags: pass in 0. Currently unused.

Returns RabbitMQRPCReplyMBS, which may contain error information.
Type of the object is RabbitMQRPCReplyMBS.ResponseTypeNormal on success.

159.3.21 Destructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.
Notes: Closes the entire connection.

Implicitly closes all channels and informs the broker the connection
is being closed, after receiving acknowledgment from the broker it closes
the socket.

159.3.22 ErrorString(ErrorCode as Integer) as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the error string for the given error code.
Notes: Get an error string associated with an error code.

159.3.23 ExchangeBind(channel as Integer, destination as String, source as String, routingKey as String, arguments as Dictionary) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Binds an exchange.

159.3.24 ExchangeDeclare(channel as Integer, exchange as String, type as String, passive as Boolean, durable as Boolean, autoDelete as Boolean, internal as Boolean, arguments as Dictionary) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Declare an exchange.

159.3.25 ExchangeDelete(channel as Integer, exchange as String) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Deletes an exchange.

159.3.26 ExchangeUnbind(channel as Integer, destination as String, source as String, routingKey as String, arguments as Dictionary) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Unbinds an exchange.

159.3.27 LoginExternal(vhost as String, channelMax as Integer, frameMax as Integer, heartbeat as Integer, Identity as String, properties as Dictionary = nil) as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Login with external SASL.
Notes: Login to the broker passing an optional properties table.

vhost: the virtual host to connect to on the broker. The default on most brokers is "/".
channelMax: the limit for the number of channels for the connection.
0 means no limit, and is a good default (kDefaultMaxChannels) Note that the maximum number of channels the protocol supports is 65535 (2^16, with the 0-channel reserved). The server can set a lower channelMax and then the client will use the lowest of the two.
frameMax: the maximum size of an AMQP frame ont he wire to request of the broker for this connection. 4096 is the minimum size, 2^31-1 is the maximum, a good default is 131072 (128KB), or kDefaultFrameSize.
heartbeat: the number of seconds between heartbeat frame to request of the broker. A value of 0 disables heartbeats. Note rabbitmq-c only has partial support for hearts, as of v0.4.0 heartbeats are only serviced during BasicPublish(), and SimpleWaitFrame() properties a table of properties to send the broker.
sasl_method the SASL method to authenticate with the properties.

Returns error code indicating success or failure via RabbitMQRPCReplyMBS object.

- Reply.Type = kResponseNormal. Login completed successfully
- Reply.Type = kResponseLibraryException. In most cases errors from the broker when logging in will be represented by the broker closing the socket. In this case r.libraryError will be set to kStatusConnectionClosed. This error can represent a number of error conditions including: invalid vhost, authentication failure.

- Reply.Type = kResponseServerException. The broker returned an exception:
- If Reply.MethodId = kChannelCloseMethod a channel exception occurred, check decoded properties to see details of the exception. The client should SendMethod() a kChannelCloseOkMethod. The channel must be re-opened before it can be used again. Any resources associated with the channel (auto-delete exchanges, auto-delete queues, consumers) are invalid and must be recreated before attempting to use them again.
- If Reply.MethodId = kConnectionCloseMethod a connection exception occurred, check decoded properties to see details of the exception. The client SendMethod() a kConnectionCloseOkMethod and disconnect from the broker.

159.3.28 LoginPlain(vhost as String, channelMax as Integer, frameMax as Integer, heartbeat as Integer, Username as String, Password as String, properties as Dictionary = nil) as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Login with plain SASL.
Notes: Login to the broker passing an optional properties table.

vhost: the virtual host to connect to on the broker. The default on most brokers is "/".
channelMax: the limit for the number of channels for the connection.
0 means no limit, and is a good default (kDefaultMaxChannels) Note that the maximum number of channels the protocol supports is 65535 (2^16, with the 0-channel reserved). The server can set a lower channelMax and then the client will use the lowest of the two.
frameMax: the maximum size of an AMQP frame ont he wire to request of the broker for this connection. 4096 is the minimum size, 2^31-1 is the maximum, a good default is 131072 (128KB), or kDefaultFrameSize.
heartbeat: the number of seconds between heartbeat frame to request of the broker. A value of 0 disables heartbeats. Note rabbitmq-c only has partial support for hearts, as of v0.4.0 heartbeats are only serviced during BasicPublish(), and SimpleWaitFrame() properties a table of properties to send the broker.
sasl_method the SASL method to authenticate with the properties.

Returns error code indicating success or failure via RabbitMQRPCReplyMBS object.

- Reply.Type = kResponseNormal. Login completed successfully
- Reply.Type = kResponseLibraryException. In most cases errors from the broker when logging in will be represented by the broker closing the socket. In this case r.libraryError will be set to kStatusConnectionClosed. This error can represent a number of error conditions including: invalid vhost, authentication failure.
- Reply.Type = kResponseServerException. The broker returned an exception:
- If Reply.MethodId = kChannelCloseMethod a channel exception occurred, check decoded properties to see details of the exception. The client should SendMethod() a kChannelCloseOkMethod. The channel

must be re-opened before it can be used again. Any resources associated with the channel (auto-delete exchanges, auto-delete queues, consumers) are invalid and must be recreated before attempting to use them again.

- If Reply.MethodId = kConnectionCloseMethod a connection exception occurred, check decoded properties to see details of the exception. The client SendMethod() a kConnectionCloseOkMethod and disconnect from the broker.

159.3.29 MaybeReleaseBuffers

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Release connection owned memory.
Notes: Release memory owned by the connection object related to any channel, allowing reuse by the library. Use of any memory returned by the library before this function is called with result in undefined behavior.

Internally rabbitmq-c tries to reuse memory when possible. As a result its possible calling this function may not have a noticeable effect on memory usage.

159.3.30 MaybeReleaseBuffersOnChannel(channel as Integer)

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Release connection owned memory related to a channel.
Notes: Release memory owned by the amqp_connection_state_t object related to the specified channel, allowing reuse by the library. Use of any memory returned the library for a specific channel will result in undefined behavior.

Internally rabbitmq-c tries to reuse memory when possible. As a result its possible calling this function may not have a noticeable effect on memory usage.

159.3.31 MethodHasContent(constantNumber as Integer) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks whether such a method has content.
Notes: Returns true if content is expected.

159.3.32 MethodName(constantNumber as Integer) as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get method name string from method number.
Notes: Returns method name string.

159.3.33 NewTCPSocket(UseSSL as boolean = false) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates new socket.
Notes: Optional uses OpenSSL to create a SSL socket if UseSSL is passed with value true.
Returns true on success.

159.3.34 OpenSocket(Host as String, Port as Integer, TimeOut as Double = 10) as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Open a socket connection.
Notes: This function opens a socket connection returned created with NewTCPSocket(). This function should be called after setting socket options.
Returns error code.

host: Connect to this host.
port: Connect on this remote port.
timeout: Max allowed time to spent on opening.

159.3.35 QueueBind(channel as Integer, queue as String, exchange as String, routingKey as String, arguments as Dictionary) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Binds an exchange.

159.3.36 QueueDeclare(channel as Integer, queue as String, passive as Boolean, durable as Boolean, exclusive as Boolean, autoDelete as Boolean, arguments as Dictionary) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Declare a queue.

159.3.37 QueueDelete(channel as Integer, queue as String, ifUnused as Boolean, ifEmpty as Boolean) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Delete a queue.

159.3.38 QueuePurge(channel as Integer, queue as String) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Purge a queue.

159.3.39 QueueUnbind(channel as Integer, queue as String, exchange as String, routingKey as String, arguments as Dictionary) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Unbind a queue.

159.3.40 ReadMessage(channel as Integer, byref message as RabbitMQMessageMBS, flags as Integer = 0) as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reads the next message on a channel
Notes: Reads a complete message (header + body) on a specified channel. This function is intended to be used with amqp_basic_get() or when an AMQP_BASIC_DELIVERY_METHOD method is received.

channel: the channel on which to read the message from
message: The parameter receiving the message.

flags: currently unused.

Returns RabbitMQRPCReplyMBS, which may contain error information.
Type of the object is RabbitMQRPCReplyMBS.ResponseTypeNormal on success.

159.3.41 SendHeader as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Send initial AMQP header to the broker.
Notes: This is a low level function intended for those who want to interact with the broker at a very low level. Use of this function without understanding what it does will result in AMQP protocol errors.

This function sends the AMQP protocol header to the broker.

Returns error code, kStatusOK on success, a negative value on failure. Possible error codes:

- kStatusConnectionClosed: the connection to the broker was closed.
- kStatusSocketError: a socket error occurred. It is likely the underlying socket has been closed. errno or WSAGetLastError() may provide further information.
- kStatusSSLError: a SSL error occurred. The connection to the broker was closed.

159.3.42 SetCACert(File as FolderItem) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets CACert file with root certificates.
Notes: Returns true on success and false on failure.
See also:

- 159.3.43 SetCACert(Path as String) as Boolean 20612

159.3.43 SetCACert(Path as String) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets CACert file with root certificates.
Notes: Returns true on success and false on failure.
See also:

- 159.3.42 SetCACert(File as FolderItem) as Boolean 20612

159.3.44 SetKey(CertFile as FolderItem, KeyFile as FolderItem) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets SSL key with certificate file path and key file path.
Notes: Returns true on success and false on failure.
See also:

- 159.3.45 SetKey(CertPath as String, KeyPath as String) as Boolean 20613

159.3.45 SetKey(CertPath as String, KeyPath as String) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets SSL key with certificate file path and key file path.
Notes: Returns true on success and false on failure.
See also:

- 159.3.44 SetKey(CertFile as FolderItem, KeyFile as FolderItem) as Boolean 20613

159.3.46 SetKeyData(CertFile as FolderItem, KeyData as String) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets SSL key with certificate file and key data as PEM.
Notes: Returns true on success and false on failure.
See also:

- 159.3.47 SetKeyData(CertPath as String, KeyData as String) as Boolean 20613

159.3.47 SetKeyData(CertPath as String, KeyData as String) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets SSL key with certificate file and key data as PEM.
Notes: Returns true on success and false on failure.
See also:

- 159.3.46 SetKeyData(CertFile as FolderItem, KeyData as String) as Boolean 20613

159.3.48 SimpleWaitFrame(byref Frame as RabbitMQFrameMBS, timeoutValue as double = 30) as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Read a single frame with a timeout.
Notes: Waits for the next frame to be read from the broker, up to a timespan specified by tv. The function will return kStatusTimeout if the timeout is reached. The tv value is not modified by the function.

The library may buffer frames. When an connection object has frames buffered calling SimpleWaitFrame_noblock() will return an frame without entering a blocking read(). You can test to see if an connection object has frames buffered by calling the FramesEnqueued() function.

The library has a socket read buffer. When there is data in an connection read buffer, SimpleWaitFrame() may return an frame without entering a blocking read(). You can test to see if an connection object has data in its read buffer by calling the DataInBuffer() function.

This function does not return heartbeat frames. When enabled, heartbeating is handed internally internally by the library.

Frame: receives decoded frame the frame
timeoutValue: the maximum time to wait for a frame to be read in seconds. Setting to 0 will do a non-blocking read.

Returns kStatusOK on success. An kStatus value is returned otherwise. Possible errors include:

- kStatusTimeout the timeout was reached while waiting for a frame from the broker.
- kStatusInvalidParameter the tv parameter contains an invalid value.
- kStatusNoMemory failure in allocating memory. The library is likely in an indeterminate state making recovery unlikely. Client should note the error and terminate the application
- kStatusBadAMQPData bad AMQP data was received. The connection should be shutdown immediately
- kStatusUnknownMethod: an unknown method was received from the broker. This is likely a protocol error and the connection should be shutdown immediately
- kStatusUnknownClass: a properties frame with an unknown class was received from the broker. This is likely a protocol error and the connection should be shutdown immediately
- kStatusHeartbeatTimeout: timed out while waiting for heartbeat from the broker. The connection has been closed.
- kStatusTimerFailure: system timer indicated failure.
- kStatusSocketError: a socket error occurred. The connection has been closed
- kStatusSSLError: a SSL socket error occurred. The connection has been closed.

159.3.49 TXCommit(channel as Integer) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Commit.

159.3.50 TXRollback(channel as Integer) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Rollback.

159.3.51 TXSelect(channel as Integer) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Select.

159.3.52 Properties

159.3.53 ClientProperties as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the client properties table
Notes: Get the properties that were passed to the broker on connection.
(Read only property)

159.3.54 DataInBuffer as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Check to see if there is data left in the receive buffer.
Notes: Can be used to see if there is data still in the buffer, if so calling SimpleWaitFrame will not immediately enter a blocking read.

Returns true if there is data in the receive buffer, false otherwise.
(Read only property)

159.3.55 FramesEnqueued as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks to see if there are any incoming frames ready to be read.
Notes: Checks to see if there are any frame objects buffered by the connection object. Having one or more frames buffered means that SimpleWaitFrame() will return a frame without potentially blocking on a read() call.

Returns true if there are frames enqueued, false otherwise.
(Read only property)

159.3.56 Handle as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

159.3.57 HandshakeTimeout as Double

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get or set the login handshake timeout.
Notes: Login performs the login handshake with the broker. This function sets the timeout associated with completing this operation from the client side.

The timeout must be set before Login is called to change from the default timeout.

Note that the RabbitMQ broker has a configurable timeout for completing the login handshake, the default is 10 seconds. rabbitmq-c has a default of 12 seconds.
(Read and Write property)

159.3.58 Heartbeat as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the number of seconds between heartbeats of the connection.
Notes: The number of seconds between heartbeats is set when connection negotiation takes place in Login.

Returns the number of seconds between heartbeats.

(Read only property)

159.3.59 MaximumChannel as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the maximum number of channels the connection can handle.
Notes: The maximum number of channels is set when connection negotiation takes place in Login.

Returns the maximum number of channels. 0 if there is no limit.
(Read only property)

159.3.60 MaximumFrameSize as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the maximum size of an frame the connection can handle.
Notes: The maximum size of an frame is set when connection negotiation takes place in Login.

Return the maximum size in bytes of an frame.
(Read only property)

159.3.61 RPCReply as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the last global RPCReply
Notes: The API methods corresponding to most synchronous AMQP methods return a pointer to the decoded method result. Upon error, they return nil, and we need some way of discovering what, if anything, went wrong. RPCReply() returns the most recent RabbitMQRPCReplyMBS instance corresponding to such an API operation for the given connection.

Only use it for operations that do not themselves return RabbitMQRPCReplyMBS; operations that do return RabbitMQRPCReplyMBS generally do NOT update this per-connection-global RabbitMQRPCReplyMBS instance.

Returns the most recent RabbitMQRPCReplyMBS object:

- Reply.Type = kResponseNormal. Login completed successfully

- Reply.Type = kResponseLibraryException. In most cases errors from the broker when logging in will be represented by the broker closing the socket. In this case r.libraryError will be set to kStatusConnectionClosed. This error can represent a number of error conditions including: invalid vhost, authentication failure.

- Reply.Type = kResponseServerException. The broker returned an exception:

- If Reply.MethodId = kChannelCloseMethod a channel exception occurred, check decoded properties to see details of the exception. The client should SendMethod() a kChannelCloseOkMethod. The channel must be re-opened before it can be used again. Any resources associated with the channel (auto-delete exchanges, auto-delete queues, consumers) are invalid and must be recreated before attempting to use them again.

- If Reply.MethodId = kConnectionCloseMethod a connection exception occurred, check decoded properties to see details of the exception. The client SendMethod() a kConnectionCloseOkMethod and disconnect from the broker.

(Read only property)

159.3.62 RPCTimeout as Double

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The RPC timeout.
Notes: Get or set the RPC timeout.

Sets the timeout for any RPC-style AMQP command (e.g., QueueDeclare).
This timeout may be changed at any time by calling this function with a new
timeout. The timeout applies individually to each RPC that is made.

The default value is 0, or an infinite timeout.

When an RPC times out, the function will return an error kStatusTimeout,
and the connection will be closed.

RPC-timeouts are an advanced feature intended to be used to detect
dead connections quickly when the rabbitmq-c implementation of heartbeats
does not work. Do not use RPC timeouts unless you understand the implications
of doing so.
(Read and Write property)

159.3.63 ServerProperties as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the broker properties table.
Notes: Returns a dictionary containing the properties advertised by the broker on connection.
(Read only property)

159.3.64 SocketFileDescriptor as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the socket descriptor in use by a socket object.
Notes: Retrieve the underlying socket descriptor. This function can be used to perform low-level socket operations that aren't supported by the socket interface. Use with caution!
(Read only property)

159.3.65 SSLCACertPath as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The CA certificate file path.
Notes: cacert Path to the CA cert file in PEM format.
(Read only property)

159.3.66 SSLCertPath as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The certificate file path.
Notes: Cert file in PEM format.
(Read only property)

159.3.67 SSLKeyData as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The client key.
Notes: A buffer containing client key in PEM format.
(Read only property)

159.3.68 SSLKeyPath as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The file path to the SSL key.
Notes: (Read only property)

159.3.69 SSLMaxVersion as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Maximum allowed SSL version.
Notes: Defaults to latest TLS version.
(Read and Write property)

159.3.70 SSLMinVersion as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Minimum allowed SSL version.
Notes: Defaults to TLS v1.0.
(Read and Write property)

159.3.71 SSLVerifyHostname as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enable or disable hostname verification.
Notes: Hostname verification checks the broker cert for a CN or SAN that matches the hostname that OpenSocket() is presented.
Peer verification is controlled by SSLVerifyPeer property.
(Read and Write property)

159.3.72 SSLVerifyPeer as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enable or disable peer verification.
Notes: Peer verification validates the certificate chain that is sent by the broker.
Hostname validation is controlled by SSLVerifyHostname.
(Read and Write property)

159.3.73 Version as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries version number of the library.
Notes: Returns the rabbitmq-c version as a string.
(Read only property)

159.3.74 VersionNumber as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries version number of the library.
Notes: Returns the rabbitmq-c version as a packed integer.

first byte is major, second byte minor, third byte patch level and last release counter.
Value = ((((Major * 256) + Minor) * 256 + Patch) * 256 + Release)
(Read only property)

159.3.75 Constants

Constants

Constant	Value	Description
kDefaultFrameSize	131072	Default frame size (128Kb)
kDefaultHeartbeat	0	Default heartbeat interval (0, heartbeat disabled)
kDefaultVHost	"/"	Default RabbitMQ vhost: "/".
kMaxChannels	2047	Default maximum number of channels (2047, RabbitMQ default limit of 2048, minus 1 for channel 0). RabbitMQ set a default limit of 2048 channels per connection in v3.7.5 to prevent broken clients from leaking too many channels.
kProtocolPort	5672	Default AMQP Port.
kProtocolVersionMajor	0	AMQP protocol version major
kProtocolVersionMinor	9	AMQP protocol version minor.
kProtocolVersionRevision	1	AMQP protocol version revision.

Status constants.

Constant	Value	Description
kStatusBadAmqpData	-2	Incorrect or corrupt data was received from the broker. This is a protocol
kStatusBadUrl	-8	malformed AMQP URL
kStatusBrokerUnsupportedSaslMethod	-19	Broker does not support the requested SASL mechanism.
kStatusConnectionClosed	-7	The connection to the broker has been closed.
kStatusHeartbeatTimeout	-15	Timed out waiting for heartbeat.
kStatusHostnameResolutionFailed	-5	Unable to resolve the hostname.
kStatusIncompatibleAmqpVersion	-6	The broker advertised an incompaible AMQP version.
kStatusInvalidParameter	-10	An invalid parameter was passed into the function.
kStatusNoMemory	-1	Memory allocation failed.
kStatusOk	0	Operation successful.
kStatusSocketClosed	-17	Underlying socket is closed.
kStatusSocketError	-9	A socket error occurred.
kStatusSocketInuse	-18	Underlying socket is already open.
kStatusSslConnectionFailed	-515	SSL handshake failed.
kStatusSslError	-512	A generic SSL error occurred.
kStatusSslHostnameVerifyFailed	-513	SSL validation of hostname against peer certificate failed.
kStatusSslPeerVerifyFailed	-514	SSL validation of peer certificate failed.
kStatusTableTooBig	-11	The dictionary object cannot be serialized because the output buffer small.
kStatusTcpError	-256	A generic TCP error occurred.
kStatusTcpSocketlibInitError	-257	An error occurred trying to initialize the socket library
kStatusTimeout	-13	Operation timed out.
kStatusTimerFailure	-14	The underlying system timer facility failed.
kStatusUnexpectedState	-16	Unexpected protocol state
kStatusUnknownClass	-3	An unknown AMQP class was received. This is a protocol error.
kStatusUnknownMethod	-4	An unknown AMQP method was received. This is a protocol error.
kStatusUnsupported	-20	Parameter is unsupported in this version.
kStatusWrongMethod	-12	The wrong method was received.

TLS Version

Constant	Value	Description
kTLSv10	1	TLS v1.0
kTLSv11	2	TLS v1.1
kTLSv12	3	TLS v1.2
kTLSv13	4	TLS v1.3
kTLSvLatest	65535	Latest TLS version available.

159.4 class RabbitMQEnvelopeMBS

159.4.1 class RabbitMQEnvelopeMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Envelope object.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Frame Types

Constant	Value	Description
kFrameBody	3	The BodyFragment and BodyFragmentSize properties are set.
kFrameEnd	206	Frame end type.
kFrameHeader	2	ClassID, BodySize, PropertiesDecoded, Raw and RawSize properties are set.
kFrameHeartbeat	8	Heartbeat frame type.
kFrameMethod	1	The MethodDecoded and MethodID properties are set.

159.6 class RabbitMQMessageMBS

159.6.1 class RabbitMQMessageMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a message.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- News from the MBS Xojo Plugins Version 21.2
- Bringing RabbitMQ to Xojo

159.6.2 Methods

159.6.3 Constructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private construtor.

159.6.4 Properties

159.6.5 Body as MemoryBlock

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The message body.
Notes: (Read only property)

159.6.6 Properties as RabbitMQBasicPropertiesMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The message properties.
Notes: (Read only property)

159.7 class RabbitMQRPCReplyMBS

159.7.1 class RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reply from a RPC method on the broker.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- News from the MBS Xojo Plugins Version 21.2
- Bringing RabbitMQ to Xojo

159.7.2 Methods

159.7.3 Constructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

159.7.4 Destructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

159.7.5 Properties

159.7.6 LibraryError as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The library error code.
Notes: in case of ResponseTypeLibraryException this field will be set to an error code.
An error string can be retrieved using ErrorString().
(Read only property)

159.7.7 MethodDecoded as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The decoded data for the method.
Notes: MBS Plugin has code to translate over 60 types of method structures into Xojo dictionary.
(Read only property)

159.7.8 MethodId as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The method ID.
Notes: (Read only property)

159.7.9 Type as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The response type.
Notes: See ResponseTypeLibraryException, ResponseTypeServerException, ResponseTypeNone and ResponseTypeNormal.
(Read only property)

159.7.10 Constants

Error Codes

Constant	Value	Description
kAccessRefused	403	
kChannelError	504	
kCommandInvalid	503	
kConnectionForced	320	
kContentTooLarge	311	
kFrameError	501	
kInternalError	541	
kInvalidPath	402	
kNoConsumers	313	
kNoRoute	312	
kNotAllowed	530	
kNotFound	404	
kNotImplemented	540	
kPreconditionFailed	406	
kReplySuccess	200	Success
kResourceError	506	
kResourceLocked	405	
kSyntaxError	502	
kUnexpectedFrame	505	

Response Types

Constant	Value	Description
ResponseTypeLibraryException	2	The library encountered an error, check the LibraryError field.
ResponseTypeNone	0	Invalid state.
ResponseTypeNormal	1	The RPC completed successfully.
ResponseTypeServerException	3	The broker returned an exception, check the reply field.

Chapter 160

RAMStream

160.1 class RAMStreamMBS

160.1.1 class RAMStreamMBS

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allows you to use a memory bases stream.
Example:

```
// write binary values into a memory stream and read them back
Var stream As RAMStreamMBS = CreateRamStreamMBS
stream.LittleEndian = True
stream.WriteLong 12345
stream.WriteShort 42
stream.Write "Hello"

stream.Position = 0
Var a As Integer = stream.ReadLong
Var b As Integer = stream.ReadShort
Var s As String = stream.Read(5)
MessageBox a.ToString + ", " + b.ToString + ", " + s + " (" + stream.Length.ToString + " bytes)"
```

Notes: If you need to concat lot's of streams, just make a RAMstream and write to it.

In the example folder is a project called "test ramstream speed" which tests the speed on concating 10000 strings which each 1000 bytes in length.

On my G4 Dual 1000 Mhz, I get this result:
String only: 22063 ticks

RAMStream: 18 ticks
Blog Entries

- MBS Real Studio Plugins, version 12.5pr2

160.1.2 Methods

160.1.3 close

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

160.1.4 Constructor(InitialSize as Integer=0)

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new RAMStream.
Example:

```
Var r as RAMStreamMBS
r=new RAMStreamMBS(1000000)
r.write "Hello"
```

Notes: To avoid memory fragmentation the memory grows in 32 KByte chunks.

The parameter you give is the size for the first allocation. So if you only need 2 KByte, you just pass 2048. If you don't know the size, you can pass 0 or a negative number to get the default initial size which is 32 KByte.

You can change the GrowSize property to use a different growing size.
Performance is better if resizing the memory buffer is minimized.

The stream can grow to around 2 GB.
On low memory, the initial resize will fail and length will be 0.

160.1.5 Look(count as Integer) as string

MBS Util Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads bytes, but does not move the current position.
Example:

```
Var r as RamStreamMBS // your stream
Var s as string
s=r.look(100)
```

Notes: Like the lookahead property in a socket.

160.1.6 LookBlock(count as Integer) as memoryblock

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads bytes into a memoryblock, but leaves the current position untouched.
Example:

```
Var b as RAMStreamMBS
Var s as memoryblock
'...
s=b.LookBlock(5)
```

160.1.7 LookByte as Integer

MBS Util Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a byte, but leaves the current position untouched.

160.1.8 LookLong as Integer

MBS Util Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads an integer, but leaves the current position untouched.

160.1.9 LookShort as Integer

MBS Util Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a short, but leaves the current position untouched.

160.1.10 Read(count as Integer) as string

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads bytes into a string.
Example:

```
Var b as RAMStreamMBS
Var s as string
'...
s=b.read(5)
```

160.1.11 ReadBlock(count as Integer) as memoryblock

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads bytes into a memoryblock.
Example:

```
Var b as RAMStreamMBS
Var s as memoryblock
'...
s=b.ReadBlock(5)
```

160.1.12 Readbyte as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads an 8bit Byte from the stream.
Example:

```
Var b as RAMStreamMBS
Var i as Integer
'...
i=B.readbyte
```

160.1.13 ReadLong as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a signed 32bit Integer from the stream.
Example:

```
Var b as RAMStreamMBS
Var i as Integer
```

```
'...
i=B.readlong
```

Notes: This function is affected by the LittleEndian Setting.

160.1.14 ReadShort as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a signed 16bit Integer from the stream.
Example:

```
Var b as RAMStreamMBS
Var i as Integer
'...
i=B.readshort
```

Notes: This function is affected by the LittleEndian Setting.

160.1.15 Write(data as string)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes bytes from a string to file.

160.1.16 WriteBlock(data as memoryblock,count as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes count bytes from a memoryblock to file.
Example:

```
Var b as RAMStreamMBS
Var m as memoryblock
'...
b.writeblock m,m.size
```

160.1.17 WriteByte(data as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a byte to file.

160.1.18 WriteLong(data as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes an 32bit integer to file.
Notes: This method is affected by the LittleEndian Setting.

160.1.19 WriteShort(data as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes an 16bit integer to file.
Notes: This method is affected by the LittleEndian Setting.

160.1.20 Properties

160.1.21 EOF as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if you are at the end of the stream.
Notes: (Read only property)

160.1.22 GrowSize as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size in bytes used to grow the ramstream backbuffer.
Notes: Default is 32 Kilobytes.
If the value is bigger than zero, it will be used as the allocation increase. Else the default value is used.
(Read and Write property)

160.1.23 Length as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current length of the stream.
Notes: You can truncate the stream by setting this property.

(Read and Write property)

160.1.24 LittleEndian as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decides whether to convert integers read or wrote to the file.
Notes: See Xojos binarystream for more details.
For native platform you may set "littleendian=targetwin32".
(Read and Write property)

160.1.25 MemoryUsed as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: How much memory is currently used for this Stream.
Notes: (Read and Write property)

160.1.26 Position as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns current position.
Notes: You can set the current file stream position using this property.
(Read and Write property)

160.2 Globals

160.2.1 CreateRamStreamMBS(InitialSize as Integer = 0) as RamStreamMBS

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new RAMStream.
Example:

```
Var r as RAMStreamMBS
r=CreateRamStreamMBS(1000000)
r.write "Hello"
```

Notes: To avoid memory fragmentation the memory grows in 32 KByte chunks.

The parameter you give is the size for the first allocation. So if you only need 2 KByte, you just pass 2048. If you don't know the size, you can pass 0 or a negative number to get the default initial size which is 32 KByte.

You can change the GrowSize property to use a different growing size.
Performance is better if resizing the memory buffer is minimized.

The stream can grow to around 2 GB.
Returns nil on low memory.

Chapter 161

RaspberryPiCamera

161.1 class RaspberryPiCameraFormatDescriptionMBS

161.1.1 class RaspberryPiCameraFormatDescriptionMBS

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class for a format description.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

161.1.2 Methods

161.1.3 Constructor

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The private constructor.

161.1.4 Properties

161.1.5 Description as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The format description.
Notes: (Read only property)

161.1.6 Flags as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The flags.
Notes: Currently can be 1 for compressed and 2 for emulated.
(Read only property)

161.1.7 Index as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Format number.
Notes: (Read only property)

161.1.8 Pixelformat as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The pixel format.
Notes: (Read only property)

161.1.9 PixelformatString as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The pixel format as text.
Notes: (Read only property)

161.1.10 Type as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The buffer type.
Notes: Usually 1 for video capture.
(Read only property)

161.2 class RaspberryPiCameraFormatMBS

161.2.1 class RaspberryPiCameraFormatMBS

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class for format settings.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

161.2.2 Methods

161.2.3 Constructor

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The private constructor.

161.2.4 Properties

161.2.5 BytesPerRow as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The number of bytes per row.
Notes: For padding, zero if unused.
(Read and Write property)

161.2.6 ColorSpace as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The colorspace.
Example:

```
// ITU-R 601 – broadcast NTSC/PAL
const V4L2_COLORSPACE_SMPTE170M = 1

// 1125-Line (US) HDTV
const V4L2_COLORSPACE_SMPTE240M = 2

// HD and modern captures.
```

```
const V4L2_COLORSPACE_REC709 = 3

// broken BT878 extents (601, luma range 16-253 instead of 16-235)
const V4L2_COLORSPACE_BT878 = 4

// These should be useful. Assume 601 extents.
const V4L2_COLORSPACE_470_SYSTEM_M = 5
const V4L2_COLORSPACE_470_SYSTEM_BG = 6

// I know there will be cameras that send this. So, this is
// unspecified chromaticities and full 0-255 on each of the
// Y'CbCr components
const V4L2_COLORSPACE_JPEG = 7

// For RGB colourspaces, this is probably a good start.
const V4L2_COLORSPACE_SRGB = 8
```

Notes: Normally zero for default.
(Read and Write property)

161.2.7 Field as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The field.
Example:

```
const V4L2_FIELD_ANY = 0
// driver can choose from none, top, bottom, interlaced
// depending on whatever it thinks is approximate ...
const V4L2_FIELD_NONE = 1
// this device has no fields ...
const V4L2_FIELD_TOP = 2
// top field only
const V4L2_FIELD_BOTTOM = 3
// bottom field only
const V4L2_FIELD_INTERLACED = 4
// both fields interlaced
const V4L2_FIELD_SEQ_TB = 5
// both fields sequential into one
// buffer, top-bottom order
const V4L2_FIELD_SEQ_BT = 6
// same as above + bottom-top order
const V4L2_FIELD_ALTERNATE = 7
// both fields alternating into separate buffers
const V4L2_FIELD_INTERLACED_TB = 8
```

```
// both fields interlaced, top field
// first and the top field is transmitted first
const V4L2_FIELD_INTERLACED_BT = 9
// both fields interlaced, top field
// first and the bottom field is transmitted first
```

Notes: (Read and Write property)

161.2.8 Height as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The height of image in pixels.
Notes: (Read and Write property)

161.2.9 Pixelformat as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The pixel format.
Notes: (Read and Write property)

161.2.10 PixelformatString as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The pixel format as text.
Notes: (Read only property)

161.2.11 SizeImage as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The size of image.
Notes: (Read and Write property)

161.2.12 Type as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The type of data stream.
Notes: With plugin we always use 1 for video capture (V4L2_BUF_TYPE_VIDEO_CAPTURE).
(Read and Write property)

161.2.13 Width as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The width of image in pixels.
Notes: (Read and Write property)

161.3 class RaspberryPiCameraMBS

161.3.1 class RaspberryPiCameraMBS

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class to get pictures from Raspberry Pi camera and similar Linux cameras.

161.3.2 Methods

161.3.3 AvailableFormats as RaspberryPiCameraFormatDescriptionMBS()

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries available formats.
Notes: Lasterror and ErrorMessage are set.
Can return nil in case of error.

161.3.4 Capture(WithPicture as boolean = true) as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Captures a new picture.
Notes: If WithPicture is true and pixel format is compatible (RGB 24 or 32bit), we set the picture property.
If capturing JPEG, we copy the JPEG data into the JPEG property.

Returns true on success.
Lasterror and ErrorMessage are set.

161.3.5 Close

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Closes camera device.
Notes: Lasterror and ErrorMessage are set.

161.3.6 Constructor

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The constructor.

161.3.7 CurrentFormat as RaspberryPiCameraFormatMBS

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries current format.
Notes: Returns nil in case of error.
Lasterror and ErrorMessage are set.

161.3.8 InitBuffer as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes buffer.
Notes: This is done automatically if you capture.

Returns true on success.
Lasterror and ErrorMessage are set.

161.3.9 Open(Device as string = "/dev/video0") as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Opens the camera device.
Notes: You need

- a Raspberry Pi computer

- to attach the camera module
- to enable the video camera
- run a command: sudo modprobe bcm2835-v4l2
- to check if you see /dev/video0 in file system.

Returns true on success.
Lasterror and ErrorMessage are set.

161.3.10 SetCurrentFormat(format as RaspberryPiCameraFormatMBS) as boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sets current format.
Notes: This allows to use any format, even if we can't transform it to picture for you.

Returns true on success.
Lasterror and ErrorMessage are set.

161.3.11 SetJPEGSize(Width as Integer, Height as Integer) as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sets size and format to capture.
Notes: Sets JPEG format with given size.

Returns true on success.
Lasterror and ErrorMessage are set.

161.3.12 SetSize(Width as Integer, Height as Integer) as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sets size and format to capture.
Notes: Sets to capture RGB picture with given size.

Returns true on success.
Lasterror and ErrorMessage are set.

161.3.13 Properties

161.3.14 AutoExposureBias as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
e.g. 12.
(Read and Write property)

161.3.15 AutoFocusRange as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kAutoFocusRange* constants
(Read and Write property)

161.3.16 AutoFocusStart as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.17 AutoFocusStatus as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kAutoFocusStatus* constants
(Read and Write property)

161.3.18 AutoFocusStop as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.

(Read and Write property)

161.3.19 AutoNPresetWhiteBalance as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kWhiteBalance* constants.
e.g. value is 1 for kWhiteBalanceAuto.
(Read and Write property)

161.3.20 Buffer as Ptr

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The pointer to the buffer.
Notes: For the case you want to convert yourself pixel values to a picture.
(Read only property)

161.3.21 BufferLength as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The length of the buffer.
Notes: (Read only property)

161.3.22 BusInfo as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The device bus info.
Notes: e.g. "PCI:test"
(Read only property)

161.3.23 BytesPerRow as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The bytes per row for current image.
Notes: (Read only property)

161.3.24 CanCapture as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Whether the device can capture video.
Notes: This is queried by checking if bitwiseAnd(capabilities,1) = 1.
(Read only property)

161.3.25 Capabilities as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Device capabilities bitmap.
Notes: (Read only property)

161.3.26 Card as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The name of the card.
Notes: e.g. "Hauppauge WinTV"
(Read only property)

161.3.27 Driver as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The name of the driver.
Notes: e.g. "bttv"
(Read only property)

161.3.28 ErrorMessage as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The error message for lasterror property.
Notes: (Read only property)

161.3.29 ExposureAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
e.g. 1000
(Read and Write property)

161.3.30 ExposureAuto as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kExposure* constants.
Value is e.g. 0 for kExposureAuto.
(Read and Write property)

161.3.31 ExposureAutoPriority as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.32 ExposureMetering as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kExposureMetering* constants
(Read and Write property)

161.3.33 FocusAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
May not work if you don't have a controllable focus on the camera.

(Read and Write property)

161.3.34 FocusAuto as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
May not work if you don't have a controllable focus on the camera.
(Read and Write property)

161.3.35 FocusRelative as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
May not work if you don't have a controllable focus on the camera.
(Read and Write property)

161.3.36 Handle as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal file handle.
Notes: (Read only property)

161.3.37 Height as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The height in pixel used for capture.
Notes: (Read only property)

161.3.38 ImageStabilization as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.

(Read and Write property)

161.3.39 IrisAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
May not work if you don't have a controllable iris on the camera.
(Read and Write property)

161.3.40 IrisRelative as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
May not work if you don't have a controllable iris on the camera.
(Read and Write property)

161.3.41 IsoSensitivity as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.42 IsoSensitivityAuto as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kISOSensitivity* constants.
Usually set to kISOSensitivityAuto for auto mode (1).
(Read and Write property)

161.3.43 JPEG as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The last JPEG image data block.
Notes: (Read only property)

161.3.44 LastError as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read only property)

161.3.45 Lock3A as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kLock* constants.
(Read and Write property)

161.3.46 Opened as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Whether device is opened.
Notes: (Read only property)

161.3.47 PanAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.48 PanRelative as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.49 PanReset as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.50 PanSpeed as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.51 Picture as Picture

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The last captured picture.
Notes: (Read only property)

161.3.52 PixelFormat as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The pixel format.
Notes: (Read only property)

161.3.53 PixelformatString as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The pixel format as text.
Notes: (Read only property)

161.3.54 Privacy as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.55 Recording as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Whether we are recording currently.
Notes: (Read only property)

161.3.56 SceneMode as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kSceneMode* constants
(Read and Write property)

161.3.57 TiltAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.58 TiltRelative as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.59 TiltReset as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.60 TiltSpeed as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.61 Version as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The version of the driver.
Notes: (Read only property)

161.3.62 WideDynamicRange as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.63 Width as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The width in pixel used for capture.
Notes: (Read only property)

161.3.64 ZoomAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.65 ZoomContinuous as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.66 ZoomRelative as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

161.3.67 Constants

AutoFocusRange Values

Constant	Value	Description
kAutoFocusRangeAuto	0	
kAutoFocusRangeInfinity	3	
kAutoFocusRangeMacro	2	
kAutoFocusRangeNormal	1	

AutoFocusStatus Values

Constant	Value	Description
kAutoFocusStatusBusy	1	
kAutoFocusStatusFailed	4	
kAutoFocusStatusIdle	0	
kAutoFocusStatusReached	2	

ExposureAuto Values

Constant	Value	Description
kExposureAperturePriority	3	
kExposureAuto	0	
kExposureManual	1	
kExposureShutterPriority	2	

ExposureMetering Values

Constant	Value	Description
kExposureMeteringAverage	0	
kExposureMeteringCenterWeighted	1	
kExposureMeteringMatrix	3	
kExposureMeteringSpot	2	

IsoSensitivityAuto Values

Constant	Value	Description
kISOSensitivityAuto	1	
kISOSensitivityManual	0	

Lock3A Values

Constant	Value	Description
kLockExposure	1	
kLockFocus	4	
kLockWhiteBalance	2	

ScreenMode Values

Constant	Value	Description
kSceneModeBacklight	1	
kSceneModeBeachSnow	2	
kSceneModeCandleLight	3	
kSceneModeDawnDusk	4	
kSceneModeFallColors	5	
kSceneModeFireworks	6	
kSceneModeLandscape	7	
kSceneModeNight	8	
kSceneModeNone	0	
kSceneModePartyIndoor	9	
kSceneModePortrait	10	
kSceneModeSports	11	
kSceneModeSunset	12	
kSceneModeText	13	

AutoNPresetWhiteBalance Values

Constant	Value	Description
kWhiteBalanceAuto	1	
kWhiteBalanceCloudy	8	
kWhiteBalanceDaylight	6	
kWhiteBalanceFlash	7	
kWhiteBalanceFluorescent	3	
kWhiteBalanceFluorescentH	4	
kWhiteBalanceHorizon	5	
kWhiteBalanceIncandescent	2	
kWhiteBalanceManual	0	
kWhiteBalanceShade	9	

Chapter 162

Registration

162.1 module MBS

162.1.1 module MBS

MBS Main Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The module with version details.
Example:

```
// show the version of the MBS plugins the app was built with
MessageBox "MBS Plugins " + MBS.Version + " for " + MBS.Target
```

Notes: Those constants can be used in #if conditions.

162.1.2 Methods

162.1.3 Target as string

MBS Main Plugin, Plugin Version: 12.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the target where the plugin was compiled for.
Example:

```
MessageBox mbs.Target
```

Notes: Can be Win32, Linux, Carbon, Carbon-PPC or Cocoa.

162.1.4 Constants

Constants

Constant	Value	Description
BuildNumber	21554	The build num The constant v

HasImageMagickPlugin	false	Whether the Ir True if the Mai

162.2 Globals

162.2.1 LogoMBS(size as Integer = 0, WithAlphaChannel as boolean = false) as Picture

MBS Main Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the MBS logo picture.
Example:

Window1.Backdrop = LogoMBS(500)

Notes: Best size is 500 pixel.
This function exists to provide a sample picture for examples.
If WithAlphaChannel is true and alpha channel pictures are supported, the plugin returns a picture with alpha channel. (Cocoa, Windows or Linux target on Xojo 2011r4).

Due to a bug in console runtime from Real Software this function can only produce useful pictures with 500 pixel size in console or web applications.

162.2.2 MBSPluginCompileDate as string

MBS Main Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compilation date of the plugins.
Example:

MessageBox MBSPluginCompileDate

Notes: e.g. "Aug 27 2006"
Actually the compilation date of the Version Plugin part which defines this function.

162.2.3 MBSPluginCompileTime as string

MBS Main Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compilation Time of the plugins.
Example:

MessageBox MBSPluginCompileTime

Notes: e.g. "19:40:16"
Actually the compilation date of the Version Plugin part which defines this function.

162.2.4 MBSPluginVersion as string

MBS Main Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a version string from the plugin.
Example:

MessageBox "Build with Xojo "+RBVersionString+" and "+MBSPluginVersion

Notes: You can show that in your about box so your users can tell you which plugin they use.

162.2.5 RegisterMBSPlugin(name as string, product as string, enddate as Integer, serial as string) as boolean

MBS Main Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The function to register the plugins.
Example:

```
const name = "Joe Smith"
const serialnumber = "123456"
const enddate = 200710

if not RegisterMBSPlugin(name, "MBS Complete", enddate, serialnumber) then
MessageBox "something wrong with the serial number of the plugins!"
end if
```

Notes: Returns true if name and serial number is accepted.

While you are running your project in Xojo (or Xojo) you don't need to register, but if you compile for any target, you should or nice popup windows will show that the app is not registered.

Register in an application subclass to make registering as early as possible.

In case you get this message: "RegisterMBSPlugin()', giving the message "This
item conflicts with another item of the same name" you have something else in your plugins folder, e.g. a html file.

Possible reasons for this failing:
- The calculations you make on the strings or serial number do not create the same value on every machine (Intel vs. PPC, e.g. endian problems)
- You use MBS functions before calling registration function (e.g. you register in window.open event and use the plugin for a control.)
- You mix different plugin versions in your Xojo folder.

This function works only for 2015 and newer serial numbers.

162.2.6 SetRegistrationMessageMBS(ID as Integer, message as string)

MBS Main Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Defines what messages to show.
Example:

```
SetRegistrationMessageMBS(0, "This application is broken. Please reinstall!")
```

Notes: ID currently can only be 0 and is reserved for future flags.

Currently this changes the message which is shown if plugins of different versions are found.
This typically happens if installers mix old and new libraries in an app and the user should be asked to reinstall the application.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr9

162.3 class RegistrationEngineMBS

162.3.1 class RegistrationEngineMBS

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: An engine to add serial number generation to your application.
Example:

```
Var r as new RegistrationEngineMBS

r.Field(0)="Hello World"
r.Field(1)="MyProduct 2008"

MessageBox r.Calc // shows: ICYR-RES4-UXQ1
```

Notes: If you want to add serial numbers to your application, you can use this class to write yourself a serial number generator application.
You can later in your application use this class to verify the serial number.

You may want to design your application that the serial number is written to your preferences file so you can verify it every time your application is launched. But if you do this, also save some computer related value there so you can avoid people cloning the system. For example the MAC ID, the user name, the systemfolder creation date. This way you detect whenever a preferences file is copied to another machine.

For generate and later verify serial numbers the setup of the class must match. So carefully check how your serial number should look like. A format like "MA-1234-5678-9012-V1" can be good. Use a prefix and suffix so make serial numbers from different products and different major versions look different. 12 letters are normally enough for a serial number. Especially if you use alpha numeric characters. You can of course change the alphabet string and use lower case letters.

162.3.2 Methods

162.3.3 Calc as string

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the serial number.

162.3.4 Verify(s as string) as boolean

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Verifies the serial number.
Example:

```
Var r As New RegistrationEngineMBS

r.Field(0)="Hello World"
r.Field(1)="MyProduct 2008"

Var key As String = r.Calc

If r.Verify(key) Then
MessageBox "OK"
Else
MessageBox "Failed"
End If
```

Notes: If you only use upper case letter for your serial numbers, use a function like uppercase before calling verify. This way you avoid that a serial number "abc" is invalid because it is not "ABC".
Returns true on success and false on failure.

162.3.5 Properties

162.3.6 Alphabet as String

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The characters to use for serial numbers.
Example:

```
Var r as new RegistrationEngineMBS

r.Field(0)="Hello World"
r.Field(1)="MyProduct 2008"

r.Alphabet="ABC123"
MessageBox r.Calc // shows: A1AC-2312-12CC

r.Alphabet="0123456789"
MessageBox r.Calc // shows: 4308-2905-4013
```

Notes: Must have at least two characters.
Characters must be unique.
Default is "0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZ".
(Read and Write property)

162.3.7 BlockLength as Integer

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Length of the blocks in the serial number.
Example:

```
Var r as new RegistrationEngineMBS

r.Field(0)="Hello World"
r.Field(1)="MyProduct 2008"

r.NumberLength=10
r.BlockLength=5
MessageBox r.Calc // shows: ICYRR-ES4UX

r.NumberLength=16
r.BlockLength=4
MessageBox r.Calc // shows: ICYR-RES4-UXQ1
```

Notes: If this value is 0, no delimeters are used.

(Read and Write property)

162.3.8 Delimiter as String

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The delimiter string to use for separating blocks in the serial number.
Notes: Default is "-".
(Read and Write property)

162.3.9 Mode as Integer

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mode of operation.
Notes: Currently always 0.
Set to 1 to use 128bit instead of 64bit number.
(Read and Write property)

162.3.10 NumberLength as Integer

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum length of the number.
Example:

```
Var r as new RegistrationEngineMBS

r.Field(0)="Hello World"
r.Field(1)="MyProduct 2008"

r.NumberLength=10
r.BlockLength=5
MessageBox r.Calc // shows: ICYRR-ES4UX

r.NumberLength=16
r.BlockLength=4
MessageBox r.Calc // shows: ICYR-RES4-UXQ1
```

Notes: (Read and Write property)

162.3.11 Platform as Integer

MBS Util Plugin, Plugin Version: 9.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Which platform to use for platform specific keys.
Notes: Value is set in the constructor to current platform, but you can change it if you want to run the key generator on a different platform.

Values are:

1 Mac
2 Windows
3 Linux

All other values behave like PlatformSpecificKeys is false.
This value is only used if PlatformSpecificKeys is true.
(Read and Write property)

162.3.12 PlatformSpecificKeys as Boolean

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether you want platform specific keys.
Notes: Set to false if you want to have Windows, Mac OS X and Linux all use the same serial numbers.
Set to true if you want to different serial numbers depending on the platform.

Default is false.
(Read and Write property)

162.3.13 Prefix as String

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The prefix for the serial number string.
Notes: (Read and Write property)

162.3.14 Seed as Integer

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: A seed value you can set to get your serial number more unique.
Notes: (Read and Write property)

162.3.15 Suffix as String

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The suffix for the serial number string.
Example:

```
Var r as new RegistrationEngineMBS

r.Field(0)="Hello World"
r.Field(1)="Xojo"
r.suffix="-RB600CPFUSA-MAC"

r.BlockLength=8
r.NumberLength=32

MessageBox r.Calc
// shows: EV6GG9P2-DI533EV6-GG9P2DI5-33EV6GG9-RB600CPFUSA-MAC
// looks like a Xojo serial number ;-)
```

Notes: (Read and Write property)

162.3.16 Field(index as Integer) as string

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The data fields you can use for personalized serial numbers.
Notes: Fill this fields with all the values you want to use for personalized serial numbers. You should use the name of the user, maybe the postal address. You can use hardware values like the MAC address or software values like the system folder creation date.
Also you may have serial numbers different between version 1.x and 2.x of your application. So you pass version information like "1" or "2". Do not pass values like "1.2.3" as this serial number won't work on "1.2.4".

Index is from 0 to 7.
(Read and Write computed property)

Chapter 163

Regular Expressions

163.1 class PCRE2CodeInfoMBS

163.1.1 class PCRE2CodeInfoMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for inspecting callouts.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// pattern with callout
compiler.Pattern = "A(?C3)B"

Var code As PCRE2CodeMBS = Compiler.Compile
Var codeInfo() As PCRE2CodeInfoMBS = code.Infos

break // look into debugger
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

163.1.2 Methods

163.1.3 Constructor

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

163.1.4 Properties

163.1.5 CalloutNumber as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Number for numbered callouts.
Notes: (Read only property)

163.1.6 CalloutString as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The callout string.
Notes: (Read only property)

163.1.7 CalloutStringLength as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Length of callout string.
Notes: (Read only property)

163.1.8 CalloutStringOffset as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Offset to string within pattern.
Notes: (Read only property)

163.1.9 NextItemLength as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Length of next item in pattern.
Notes: (Read only property)

163.1.10 PatternPosition as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Offset to next item in pattern.
Notes: (Read only property)

163.2 class PCRE2CodeMBS

163.2.1 class PCRE2CodeMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a compiled pattern.
Example:

```
Var Compiler As New PCRE2CompilerMBS
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile

MessageBox Str(code.CaptureCount) // shows 2
```

Notes: Please use this class as a chance to compile once and then reuse the compiled pattern several times to search various strings.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Xojo Developer Magazine

- 21.1, page 27: News from MBS Xojo Plugins, What's up with MonkeyBread Software by Stefanie Juchmes
- 20.6, pages 70 to 71: Regular Expressions with Xojo, The MBS Plugins has its own RegEx library by Stefanie Juchmes

163.2.2 Methods

163.2.3 Constructor

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

163.2.4 Copy(withTables as boolean = false) as PCRE2CodeMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Makes a copy of the memory used for a compiled pattern, excluding any memory used by the JIT compiler.
Notes: Without a subsequent call to JITCompile(), the copy can be used only for non-JIT matching. The pointer to the character tables is copied, not the tables themselves (unless withTables is true).

163.2.5 Infos as PCRE2CodeInfoMBS()

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enumerate callouts in a compiled pattern.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// pattern with callout
compiler.Pattern = "A(?C3)B"

Var code As PCRE2CodeMBS = Compiler.Compile
Var codeInfo() As PCRE2CodeInfoMBS = code.Infos

break // look into debugger
```

Notes: Useful to debug the pattern.

163.2.6 JITCompile(Flags as Integer = 1)

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Requests JIT compilation.
Notes: If the just-in-time compiler is available, further processes a compiled pattern into machine code that executes much faster than the Match() interpretive matching function.

163.2.7 Match(Text as String, matchData as PCRE2MatchDataMBS, StartOffsetCharacters as Integer = 0, MatchContext as PCRE2MatchContextMBS = nil) as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Matches a compiled regular expression against a given subject string, using a matching algorithm that is similar to Perl's.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile

// prepare reusable match object
Var Match As New PCRE2MatchDataMBS(code)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var n As Integer = code.Match(Text, match)

// get result found
Var TotalSubString As String = match.SubString(0)
Var SubString1 As String = match.SubString(1)
Var SubString2 As String = match.SubString(2)

break // see debugger
```

Notes: It returns offsets to what it has matched and to captured substrings via the matchData object. The return from Match() is one more than the highest numbered capturing pair that has been set (for example, 1 if there are no captures), zero if the vector of offsets is too small.
Raises exception in case of error.

A match context is needed only if you want to:

- Set up a callout function
- Set a matching offset limit
- Change the heap memory limit
- Change the backtracking match limit
- Change the backtracking depth limit

- Set custom memory management specifically for the match

StartOffsetCharacters is optional to start at a specific character in the text.
See also:

- 163.2.8 Match(Text as String, StartOffsetCharacters as Integer = 0, MatchContext as PCRE2MatchContextMBS = nil) as PCRE2MatchDataMBS 20683

163.2.8 Match(Text as String, StartOffsetCharacters as Integer = 0, MatchContext as PCRE2MatchContextMBS = nil) as PCRE2MatchDataMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience variant of Match function.
Example:

```
// Compile a pattern
Var Compiler As New PCRE2CompilerMBS
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"
Var code As PCRE2CodeMBS = Compiler.Compile

// now run a match
Var Match1 As PCRE2MatchDataMBS = code.Match("abc") // ->nil as not found
Var Match2 As PCRE2MatchDataMBS = code.Match("T√§st 1234,Ç¨ Case")

MessageBox match2.SubString(0)
```

Notes: Performs match and returns the new PCRE2MatchDataMBS object.
Returns nil in case nothing is found.
See also:

- 163.2.7 Match(Text as String, matchData as PCRE2MatchDataMBS, StartOffsetCharacters as Integer = 0, MatchContext as PCRE2MatchContextMBS = nil) as Integer 20682

163.2.9 MatchAll(Text as String, StartOffsetCharacters as Integer = 0, MatchContext as PCRE2MatchContextMBS = nil) as PCRE2MatchDataMBS()

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Matches pattern several times in the text.
Example:

```
// Compile a pattern
Var Compiler As New PCRE2CompilerMBS
compiler.Pattern = "(\d)"
Var code As PCRE2CodeMBS = Compiler.Compile
```

```
// now run a match
Var Matches() As PCRE2MatchDataMBS = code.MatchAll("T√§st 1234,Ç¨ Case")

Var SubString0 As String = matches(0).SubString(0)
Var SubString1 As String = matches(1).SubString(0)
Var SubString2 As String = matches(2).SubString(0)
Var SubString3 As String = matches(3).SubString(0)

// see 4 results in debugger
Break
```

Notes: This does a loop to go over text from start to end to match the pattern as often as it fits.
We try to avoid endless loops.

Returns an array with PCRE2MatchDataMBS objects, one for each match.

163.2.10 Matches(Text as String, StartOffsetCharacters as Integer = 0, MatchContext as PCRE2MatchContextMBS = nil) as PCRE2IteratorMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Runs match with an iterator.
Example:

```
Var rx As New PCRE2CompilerMBS
rx.CaseLess = True
rx.DotAll = False
rx.Ungreedy = False
rx.NewLine = rx.kNewLineAnyCRLF
rx.Multiline = True
rx.Pattern = kMarkerPattern

Var code As PCRE2CodeMBS = rx.Compile
Var foundCount as integer

for each MatchData as PCRE2MatchDataMBS in code.Matches(TestString, 0)
foundCount = foundCount + 1
next
```

Notes: Returns the iterator, so you can use it with for each loop.
May raie an error if something goes wrong.

163.2.11 Names as String()

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries name table.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// find numbers
compiler.Pattern = "(?<AA>\d+)"

Var code As PCRE2CodeMBS = Compiler.Compile
Var names() As String = code.Names

Break // see debugger
```

163.2.12 SerializeDecode(Data as String) as PCRE2CodeMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Decodes a serialized set of compiled patterns back into a list of individual patterns.
Example:

```
// Compile a pattern
Var Compiler As New PCRE2CompilerMBS
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"
Var code1 As PCRE2CodeMBS = Compiler.Compile

// store somewhere compiled
Var data As String = code1.SerializeEncode

// later rebuild it
Var code2 As PCRE2CodeMBS = PCRE2CodeMBS.SerializeDecode(data)

// prepare reusable match object
Var Match As New PCRE2MatchDataMBS(code2)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var Found As Integer = code2.Match(Text, match)

MessageBox match.SubString(0)
```

Notes: This is possible only on a host that is running the same version of PCRE2, with the same code unit width, and the host must also have the same endianness, pointer width and size_t type.

163.2.13 SerializeEncode as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Encodes a compiled pattern into a byte stream that can be saved on disc or elsewhere.
Example:

```
// Compile a pattern
Var Compiler As New PCRE2CompilerMBS
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"
Var code1 As PCRE2CodeMBS = Compiler.Compile

// store somewhere compiled
Var data As String = code1.SerializeEncode

// later rebuild it
Var code2 As PCRE2CodeMBS = PCRE2CodeMBS.SerializeDecode(data)

// prepare reusable match object
Var Match As New PCRE2MatchDataMBS(code2)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var Found As Integer = code2.Match(Text, match)

MessageBox match.SubString(0)
```

Notes: Note that this is not an abstract format like Java or .NET. Conversion of the byte stream back into usable compiled patterns can only happen on a host that is running the same version of PCRE2, with the same code unit width, and the host must also have the same endianness, pointer width and size_t type.

163.2.14 Substitute(Text as String, Replacement as String, matchData as PCRE2MatchDataMBS = nil, StartOffsetCharacters as Integer = 0, MatchContext as PCRE2MatchContextMBS = nil) as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Matches a compiled regular expression against a given subject string, using a matching algorithm that is similar to Perl's.
Example:

```
// Compile a pattern
Var Compiler As New PCRE2CompilerMBS
compiler.Pattern = "(\d)"
Var code As PCRE2CodeMBS = Compiler.Compile
```

```
// replace all
code.SubstituteGlobal = True

// we replace all and duplicate all digits here:
Var newText As String = code.Substitute("T√§st 1234,Ç¨ Case", "$ 1$ 1")

Break // see result in debugger
```

Notes: It then makes a copy of the subject, substituting a replacement string for what was matched.

Text: The subject string
Replacement: the replacement string
matchData: The match data block, or is nil if you don't need the result.
StartOffsetCharacters: Offset in the subject at which to start matching.
MatchContext: A match context, or nil.

A match data block is needed only if you want to inspect the data from the final match that is returned in that block or if SubstituteMatched is set. A match context is needed only if you want to:

- Set up a callout function
- Set a matching offset limit
- Change the backtracking match limit
- Change the backtracking depth limit
- Set custom memory management in the match context

Raises exception in case of error.

The options are controlled via properties:

163.2.15 SubstringNumberFromName(Name as String) as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Finds the number of a named substring capturing parenthesis in a compiled pattern, provided that it is a unique name.
Notes: If the string is not found, you receive a negative value.
For other errors, we raise an exception.

Anchored	Match only at the first position
EndAnchored	Pattern can match only at end of subject
NotBOL	Subject string is not the beginning of a line
NotEOL	Subject string is not the end of a line
NotEmpty	An empty string is not a valid match
NotEmptyAtStart	An empty string at the start of the subject is not a valid match
NoJit	Do not use JIT matching
NoUTFCheck	Do not check the subject for UTF validity (only relevant if UTF was set at compile time)
PartialHard	Return PCRE2_ERROR_PARTIAL (-2) for a partial match even if there is a full match
PartialSoft	Return PCRE2_ERROR_PARTIAL (-2) for a partial match if no full matches are found.

163.2.16 Properties

163.2.17 AllOptions as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Final options after compiling.
Notes: (Read only property)

163.2.18 Anchored as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Match only at the first position.
Notes: (Read and Write property)

163.2.19 ArgOptions as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Options passed to Compile.
Notes: Should be same as Options value in PCRE2CompilerMBS.
(Read only property)

163.2.20 BackRefMax as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Number of highest backreference.
Notes: (Read only property)

163.2.21 BSR as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: What \R matches.
Notes: kBSRUnicode: Unicode line endings
kBSRanyCRLF: CR, LF, or CRLF only
(Read only property)

163.2.22 CaptureCount as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Number of capturing subpatterns.
Example:

```
Var Compiler As New PCRE2CompilerMBS
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile

MessageBox Str(code.CaptureCount) // shows 2
```

Notes: (Read only property)

163.2.23 DepthLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Backtracking depth limit if set.
Notes: (Read only property)

163.2.24 EndAnchored as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Pattern can match only at end of subject.
Notes: (Read and Write property)

163.2.25 ExtraOptions as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Extra options that were passed in the compile context.
Notes: (Read only property)

163.2.26 FirstCodeType as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Type of start-of-match information.
Notes: Value can be:
0 nothing set
1 first code unit is set
2 start of string or after newline
(Read only property)

163.2.27 FirstCodeUnit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: First code unit when type is 1.
Notes: (Read only property)

163.2.28 FrameSize as UInt64

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Size of backtracking frame.
Notes: (Read only property)

163.2.29 HasBackslashC as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return true if pattern contains \C.
Notes: (Read only property)

163.2.30 HasCRorLF as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return true if explicit CR or LF matches exist in the pattern.
Notes: (Read only property)

163.2.31 HeapLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Heap memory limit if set.
Notes: (Read only property)

163.2.32 JChanged as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return true if (?J) or (?-J) was used.
Notes: (Read only property)

163.2.33 JITSize as UInt64

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Size of JIT compiled code, or 0.
Notes: (Read only property)

163.2.34 LastCodeType as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Type of must-be-present information.
Notes: Value can be:
0 nothing set
1 code unit is set
(Read only property)

163.2.35 LastCodeUnit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Last code unit when type is 1.
Notes: (Read only property)

163.2.36 MatchEmpty as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Value is true if the pattern can match an empty string, false otherwise.
Notes: (Read only property)

163.2.37 MatchLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Match limit if set.
Notes: (Read only property)

163.2.38 MaxLookBehind as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Length (in characters) of the longest lookbehind assertion.
Notes: (Read only property)

163.2.39 MinLength as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Lower bound length of matching strings.
Notes: (Read only property)

163.2.40 NameCount as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Number of named subpatterns.
Notes: (Read only property)

163.2.41 NameEntrySize as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Size of name table entries.
Notes: (Read only property)

163.2.42 NewLine as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Code for the newline sequence.
Notes: See kNewLine* constants.
(Read only property)

163.2.43 NoJit as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do not use JIT matching.
Notes: (Read and Write property)

163.2.44 NotBOL as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Subject is not the beginning of a line.
Notes: (Read and Write property)

163.2.45 NotEmpty as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An empty string is not a valid match.
Notes: (Read and Write property)

163.2.46 NotEmptyAtStart as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An empty string at the start of the subject is not a valid match.
Notes: (Read and Write property)

163.2.47 NotEOL as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Subject is not the end of a line.
Notes: (Read and Write property)

163.2.48 NoUTFCheck as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do not check the subject or replacement for UTF validity (only relevant if UTF was set at compile time)
Notes: (Read and Write property)

163.2.49 Options as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The option flags.
Notes: You usually set the boolean properties to turn flags here on/off.
(Read and Write property)

163.2.50 PartialHard as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return -2 from Match() for a partial match even if there is a full match.
Notes: (Read and Write property)

163.2.51 PartialSoft as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return -2 from Match() for a partial match if no full matches are found.
Notes: (Read and Write property)

163.2.52 Size as UInt64

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Size of compiled pattern.
Notes: (Read only property)

163.2.53 SubstituteExtended as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do extended replacement processing.
Notes: (Read and Write property)

163.2.54 SubstituteGlobal as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Replace all occurrences in the subject.
Notes: (Read and Write property)

163.2.55 SubstituteLiteral as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The replacement string is literal.
Notes: (Read and Write property)

163.2.56 SubstituteMatched as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Use pre-existing match data for 1st match.
Notes: (Read and Write property)

163.2.57 SubstituteOverflowLength as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: If overflow, compute needed length.
Notes: (Read and Write property)

163.2.58 SubstituteReplacementOnly as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return only replacement string(s).
Notes: (Read and Write property)

163.2.59 SubstituteUnknownUnset as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Treat unknown group as unset.
Notes: (Read and Write property)

163.2.60 SubstituteUnsetEmpty as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Simple unset insert = empty string.
Notes: (Read and Write property)

163.2.61 Constants

Constants

Constant	Value	Description
kJITComplete	1	One of the flags for JIT compilation. Compile code for full matching.
kJITPartialHard	4	One of the flags for JIT compilation. Compile code for hard partial matching.
kJITPartialSoft	2	One of the flags for JIT compilation. Compile code for soft partial matching.

163.3 class PCRE2CompilerMBS

163.3.1 class PCRE2CompilerMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for compiling regular expression patterns into code.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile

// prepare reusable match object
Var Match As New PCRE2MatchDataMBS(code)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var n As Integer = code.Match(Text, match)

// get result found
Var TotalSubString As String = match.SubString(0)
Var SubString1 As String = match.SubString(1)
Var SubString2 As String = match.SubString(2)

break // see debugger
```

163.3.2 Methods

163.3.3 Compile as PCRE2CodeMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compiles a regular expression pattern into an internal form.
Notes: Please set pattern property before calling this.
Returns the code object or raises an exception.

163.3.4 Constructor

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

163.3.5 Copy as PCRE2CompilerMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a copy of the object.

163.3.6 SetOptimize(Flag as Integer)

MBS RegEx Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: PCRE2 can apply various performance optimizations during compilation, in order to make matching faster.
Notes: For example, the compiler might convert some regex constructs into an equivalent construct which pcre2_match() can execute faster. By default, all available optimizations are enabled. However, in rare cases, one might wish to disable specific optimizations. For example, if it is known that some optimizations cannot benefit a certain regex, it might be desirable to disable them, in order to speed up compilation.

The permitted values of directive are as follows:

kOptimizationFull:

Enable all optional performance optimizations. This is the default value.

kOptimizationNone:

Disable all optional performance optimizations.

kOptimizationAutoPossess and kOptimizationAutoPossessOff:

Enable/disable "auto-possessification" of variable quantifiers such as * and +. This optimization, for example, turns a+b into a++b in order to avoid backtracks into a+ that can never be successful. However, if callouts are in use, auto-possessification means that some callouts are never taken. You can disable this optimization if you want the matching functions to do a full, unoptimized search and run all the callouts.

kOptimizationDotstarAnchor and kOptimizationDotstarAnchorOff:

Enable/disable an optimization that is applied when .* is the first significant item in a top-level branch of a pattern, and all the other branches also start with .* or with \A or \G or ^. Such a pattern is automatically anchored if PCRE2_DOTALL is set for all the .* items and PCRE2_MULTILINE is not set for any ^items. Otherwise, the fact that any match must start either at the start of the subject or following a newline is remembered. Like other optimizations, this can cause callouts to be skipped.
Dotstar anchor optimization is automatically disabled for .* if it is inside an atomic group or a capture group that is the subject of a backreference, or if the pattern contains (*PRUNE) or (*SKIP).

kOptimizationStartOptimize and kOptimizationStartOptimizeOff:

Enable/disable optimizations which cause matching functions to scan the subject string for specific code unit values before attempting a match. For example, if it is known that an unanchored match must start with a specific value, the matching code searches the subject for that value, and fails immediately if it cannot find it, without actually running the main matching function. This means that a special item such as (*COMMIT) at the start of a pattern is not considered until after a suitable starting point for the match has been found. Also, when callouts or (*MARK) items are in use, these "start-up" optimizations can cause them to be skipped if the pattern is never actually used. The start-up optimizations are in effect a pre-scan of the subject that takes place before the pattern is run.
Disabling start-up optimizations ensures that in cases where the result is "no match", the callouts do occur, and that items such as (*COMMIT) and (*MARK) are considered at every possible starting position in the subject string.

Disabling start-up optimizations may change the outcome of a matching operation. Consider the pattern

(*COMMIT)ABC

When this is compiled, PCRE2 records the fact that a match must start with the character "A". Suppose the subject string is "DEFABC". The start-up optimization scans along the subject, finds "A" and runs the first match attempt from there. The (*COMMIT) item means that the pattern must match the current starting position, which in this case, it does. However, if the same match is run without start-up optimizations, the initial scan along the subject string does not happen. The first match attempt is run starting from "D" and when this fails, (*COMMIT) prevents any further matches being tried, so the overall result is "no match". Another start-up optimization makes use of a minimum length for a matching subject, which is recorded when possible. Consider the pattern

(*MARK:1)B(*MARK:2)(X | Y)

The minimum length for a match is two characters. If the subject is "XXBB", the "starting character" optimization skips "XX", then tries to match "BB", which is long enough. In the process, (*MARK:2) is encountered and remembered. When the match attempt fails, the next "B" is found, but there is only one character left, so there are no more attempts, and "no match" is returned with the "last mark seen" set to "2". Without start-up optimizations, however, matches are tried at every possible starting position, including at the end of the subject, where (*MARK:1) is encountered, but there is no "B", so the "last mark seen" that is returned is "1". In this case, the optimizations do not affect the overall match result, which is still "no match", but they do affect the auxiliary information that is returned.

163.3.7 Properties

163.3.8 AllocationBytes as Int64

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries size of all memory allocations summed up.
Notes: Only valid if MonitorAllocations is true.
(Read only property)

163.3.9 AllocationCount as Int64

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries number of allocations done.
Notes: Only valid if MonitorAllocations is true.
(Read only property)

163.3.10 AllowEmptyClass as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Allow empty classes.
Notes: Default is false.
(Read and Write property)

163.3.11 AllowLookaroundBSK as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Allow \K in lookarounds PCRE2_EXTRA_ALLOW_SURROGATE_ESCAPES Allow \x { df800 } to \x { dfff } in UTF-8 and UTF-32 modes.
Notes: Default is false.
(Read and Write property)

163.3.12 AllowSurrogateEscapes as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Disables check for surrogates to allow them.
Notes: Default is false.
(Read and Write property)

163.3.13 AltBsux as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Alternative handling of \u, \U, and \x
Notes: Default is false.
(Read and Write property)

163.3.14 AltCircumflex as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Alternative handling of ^in multiline mode.
Notes: Default is false.
(Read and Write property)

163.3.15 AltExtendedClass as Boolean

MBS RegEx Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Alternative extended character class syntax.
Notes: Default is false.
(Read and Write property)

163.3.16 AltVerbNames as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Process backslashes in verb names.
Notes: Default is false.
(Read and Write property)

163.3.17 Anchored as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Force pattern anchoring.
Notes: Default is false.
(Read and Write property)

163.3.18 AutoCallout as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compile automatic callouts.
Notes: Default is false.
(Read and Write property)

163.3.19 BadEscapeIsLiteral as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Treat all invalid escapes as a literal following character.
Notes: Default is false.
(Read and Write property)

163.3.20 BSR as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the convention for processing \R within a compile context.
Notes: Can be kBSRUnicode or kBSRanyCRLF.
Default value is 1 for kBSRUnicode.
(Read and Write property)

163.3.21 Caseless as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do caseless matching.
Notes: Set to true for caseless matching or false for case sensitive.
Default value is true.
(Read and Write property)

163.3.22 CaselessRestrict as Boolean

MBS RegEx Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Disable mixed ASCII/non-ASCII case folding.
Notes: Default is false.
(Read and Write property)

163.3.23 CompiledWidths as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Which of 8/16/32 support was compiled.
Notes: (Read only property)

163.3.24 DefaultBSR as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Indicates what \R matches by default.
Notes: Either kBSRUnicode or kBSRanyCRLF.
Default value is 1.
(Read only property)

163.3.25 DefaultDepthLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Default backtracking depth limit.
Notes: Default value is 10000000.
(Read only property)

163.3.26 DefaultHeapLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Default heap memory limit.
Notes: Default value is 20000000.
(Read only property)

163.3.27 DefaultMatchLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Default internal resource limit.
Notes: Default value is 10000000.
(Read only property)

163.3.28 DefaultNewLine as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Code for the default newline sequence.
Notes: See kNewLine* constants.

Default value is 4.
(Read only property)

163.3.29 DefaultParensLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Default parentheses nesting limit.
Notes: Default value is 250.

(Read only property)

163.3.30 DollarEndonly as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: $ not to match newline at end.
Notes: Default value is false.
(Read and Write property)

163.3.31 DotAll as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether . matches anything including NL
Notes: Default value is false.
(Read and Write property)

163.3.32 DupNames as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Allow duplicate names for subpatterns.
Notes: Default value is false.
(Read and Write property)

163.3.33 EffectiveLinksize as Integer

MBS RegEx Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: How many bytes are used for link size.
Notes: (Read only property)

163.3.34 EndAnchored as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Pattern can match only at end of subject.
Notes: Default value is false.

(Read and Write property)

163.3.35 ErrorOffset as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The error offset from Compile failure.
Notes: The error offsets in characters.
(Read and Write property)

163.3.36 EscapedCRIsLF as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Interpret \r as \n.
Notes: Default value is false.
(Read and Write property)

163.3.37 Extended as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Ignore white space and # comments.
Notes: Default value is false.
(Read and Write property)

163.3.38 ExtendedAltBSUX as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Extended alternate \u, \U, and \x handling.
Notes: Default value is false.
(Read and Write property)

163.3.39 ExtendedMore as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: If set, the same applies, but in addition unescaped space and horizontal tab characters are ignored inside a character class.

Notes: Default value is false.
(Read and Write property)

163.3.40 ExtraOptions as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The extra option flags.
Notes: You usually set the boolean properties to turn flags here on/off.
Default is zero.
(Read and Write property)

163.3.41 Firstline as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Force matching to be before newline.
Notes: Force matching to be before newline.
Default value is false.
(Read and Write property)

163.3.42 Greedy as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Don't invert greediness of quantifiers.
Notes: Default value is true.
(Read and Write property)

163.3.43 HasJIT as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Availability of just-in-time compiler support.
Notes: Default value is true.
(Read only property)

163.3.44 HasUnicode as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Availability of Unicode support.
Notes: Default value is true.
(Read only property)

163.3.45 JITTarget as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Information (a string) about the target architecture for the JIT compiler
Notes: (Read only property)

163.3.46 LinkSize as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Configured internal link size (2, 3, 4)
Notes: (Read only property)

163.3.47 Literal as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Pattern characters are all literal.
Notes: Default value is false.
(Read and Write property)

163.3.48 MatchInvalidUTF as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enable support for matching invalid UTF.
Notes: Default value is false.
(Read and Write property)

163.3.49 MatchLine as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Pattern matches whole lines.
Notes: Default value is false.
(Read and Write property)

163.3.50 MatchUnsetBackref as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Match unset backreferences.
Notes: Default value is false.
(Read and Write property)

163.3.51 MatchWord as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Pattern matches "words".
Notes: Default value is false.
(Read and Write property)

163.3.52 MaxPatternLength as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The maximum text length (in code units) of the pattern that can be compiled.
Example:

```
Var Compiler As New PCRE2CompilerMBS

compiler.MaxPatternLength = 10
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

// raises exception as pattern is too long
Var code As PCRE2CodeMBS = Compiler.Compile
```

Notes: The default value is -1 for unlimited.
(Read and Write property)

163.3.53 MonitorAllocations as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to monitor allocations.
Example:

```
PCRE2CompilerMBS.MonitorAllocations = True

Var a1 As Int64 = PCRE2CompilerMBS.AllocationCount
Var b1 As Int64 = PCRE2CompilerMBS.AllocationBytes

Var Compiler As New PCRE2CompilerMBS

Var a2 As Int64 = PCRE2CompilerMBS.AllocationCount
Var b2 As Int64 = PCRE2CompilerMBS.AllocationBytes

// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile
Var a3 As Int64 = PCRE2CompilerMBS.AllocationCount
Var b3 As Int64 = PCRE2CompilerMBS.AllocationBytes

// prepare reusable match object
Var Match As New PCRE2MatchDataMBS(code)

Var a4 As Int64 = PCRE2CompilerMBS.AllocationCount
Var b4 As Int64 = PCRE2CompilerMBS.AllocationBytes

match = Nil

Var a5 As Int64 = PCRE2CompilerMBS.AllocationCount
Var b5 As Int64 = PCRE2CompilerMBS.AllocationBytes

code = Nil

Var a6 As Int64 = PCRE2CompilerMBS.AllocationCount
Var b6 As Int64 = PCRE2CompilerMBS.AllocationBytes

compiler = Nil

Var a7 As Int64 = PCRE2CompilerMBS.AllocationCount
Var b7 As Int64 = PCRE2CompilerMBS.AllocationBytes
// should be both zero on the end

Break // see debugger
```

Notes: Please turn on if you look for memory leaks with PCRE2.
Otherwise keep off for higher performance.

Set to true, then do a few things, cleanup and check if AllocationBytes is combing back to zero.

Default value is false.
(Read and Write property)

163.3.54 Multiline as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: ^and $ match newlines within data.
Notes: Default value is false.
(Read and Write property)

163.3.55 NeverBackslashC as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether or not \C is disabled.
Notes: (Read only property)
See also:

- 163.3.56 NeverBackslashC as Boolean 20712

163.3.56 NeverBackslashC as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Lock out the use of \C in patterns.
Notes: (Read and Write property)
See also:

- 163.3.55 NeverBackslashC as Boolean 20712

163.3.57 NeverCallout as Boolean

MBS RegEx Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Disallow callouts in pattern.
Notes: Default is false.

(Read and Write property)

163.3.58 NeverUCP as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Lock out PCRE2_UCP, e.g. via (*UCP).
Notes: Default value is false.
(Read and Write property)

163.3.59 NeverUTF as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Lock out PCRE2_UTF, e.g. via (*UTF).
Notes: Default value is false.
(Read and Write property)

163.3.60 NewLine as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the newline convention within a compile context.
Notes: See kNewLine* constants.
Default value is 4 for kNewLineAny.
(Read and Write property)

163.3.61 NoAutoCapture as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Disable numbered capturing parentheses (named ones available).
Notes: Default value is false.
(Read and Write property)

163.3.62 NoAutoPossess as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Disable auto-possessification.
Notes: Default value is false.
(Read and Write property)

163.3.63 NoDotStarAnchor as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Disable automatic anchoring for .*
Notes: Default value is false.
(Read and Write property)

163.3.64 NoStartOptimize as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Disable match-time start optimizations.
Notes: Default value is false.
(Read and Write property)

163.3.65 NoUTFCheck as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do not check the pattern for UTF validity (only relevant if UTF is set)
Notes: Default value is true.
(Read and Write property)

163.3.66 Options as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The option flags.
Notes: You usually set the boolean properties to turn flags here on/off.
Default value is 1074397192.
(Read and Write property)

163.3.67 ParensNestLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Default parentheses nesting limit.
Notes: Default value is 250.
(Read and Write property)

163.3.68 Pattern as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The search pattern.
Notes: (Read and Write property)

163.3.69 PCRE2Version as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The PCRE2 version.
Notes: (Read only property)

163.3.70 TurkishCasing as Boolean

MBS RegEx Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Use Turkish I case folding.
Notes: Default is false.
(Read and Write property)

163.3.71 UCP as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Use Unicode properties for \d, \w, etc.
Notes: Default value is true.
(Read and Write property)

163.3.72 Ungreedy as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Invert greediness of quantifiers.
Notes: Default value is false.
(Read and Write property)

163.3.73 UnicodeVersion as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The Unicode version.
Notes: (Read only property)

163.3.74 UseOffsetLimit as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enable offset limit for unanchored matching.
Notes: Default value is false.
(Read and Write property)

163.3.75 UTF as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Treat pattern and subjects as UTF strings.
Notes: Default value is true.
(Read and Write property)

163.3.76 Constants

Constants

Constant	Value	Description
kOptimizationAutoPossess	64	Enable/disable "auto-possessification" of variable quantifiers such as * and +. This optimization, for example, turns a+b into a++b in order to avoid backtracks into a+ that can never be successful. However, if callouts are in use, auto-possessification means that some callouts are never taken. You can disable this optimization if you want the matching functions to do a full, unoptimized search and run all the callouts.

BSR

Constant	Value	Description
kBSRanyCRLF	2	CR, LF, or CRLF only
kBSRUnicode	1	Unicode line endings

New Line Character

Constant	Value	Description
kNewLineAny	4	Any Unicode newline sequence.
kNewLineAnyCRLF	5	CR, LF or CRLF.
kNewLineCR	1	Carriage return only
kNewLineCRLF	3	CR followed by LF only
kNewLineLF	2	Linefeed only
kNewLineNul	6	The NUL character (binary zero)

Optimization Flags

Constant	Value	Description
kOptimizationAutoPossessOff	65	Enable/disable "auto-possessification" of variable quantifiers such as * and +. This optimization, for example, turns a+b into a++b in order to avoid backtracks into a+ that can never be successful. However, if callouts are in use, auto-possessification means that some callouts are never taken. You can disable this optimization if you want the matching functions to do a full, unoptimized search and run all the callouts.
kOptimizationDotstarAnchor	66	Enable/disable an optimization that is applied when .* is the first significant item in a top-level branch of a pattern, and all the other branches also start with .* or with \A or \G or ^. Such a pattern is automatically anchored if PCRE2_DOTALL is set for all the .* items and PCRE2_MULTILINE is not set for any ^items. Otherwise, the fact that any match must start either at the start of the subject or following a newline is remembered. Like other optimizations, this can cause callouts to be skipped. Dotstar anchor optimization is automatically disabled for .* if it is inside an atomic group or a capture group that is the subject of a backreference, or if the pattern contains (*PRUNE) or (*SKIP).
kOptimizationDotstarAnchorOff	67	Enable/disable an optimization that is applied when .* is the first significant item in a top-level branch of a pattern, and all the other branches also start with .* or with \A or \G or ^. Such a pattern is automatically anchored if PCRE2_DOTALL is set for all the .* items and PCRE2_MULTILINE is not set for any ^items. Otherwise, the fact that any match must start either at the start of the subject or following a newline is remembered. Like other optimizations, this can cause callouts to be skipped. Dotstar anchor optimization is automatically disabled for .* if it is inside an atomic group or a capture group that is the subject of a backreference, or if the pattern contains (*PRUNE) or (*SKIP).
kOptimizationFull	1	Enable all optional performance optimizations. This is the default value.
kOptimizationNone	0	Disable all optional performance optimizations.
kOptimizationStartOptimize	68	Enable/disable optimizations which cause matching functions to scan the subject string for specific code unit values before attempting a match. For example, if it is known that an unanchored match must start with a specific value, the matching code searches the subject for that value, and fails immediately if it cannot find it, without actually running the main matching function. This means that a special item such as (*COMMIT) at the start of a pattern is not considered until after a suitable starting point for the match has been found. Also, when callouts or (*MARK) items are in use, these "start-up" optimizations can cause them to be skipped if the pattern is never actually used. The start-up optimizations are in effect a pre-scan of the subject that takes place before the pattern is run. Disabling start-up optimizations ensures that in cases where the result is "no match", the callouts do occur, and that items such as (*COMMIT) and (*MARK) are considered at every possible starting position in the subject string.
kOptimizationStartOptimizeOff	69	Enable/disable optimizations which cause matching functions to scan the subject string for specific code unit values before attempting a match. For example, if it is known that an unanchored match must start with a specific value, the matching code searches the subject for that value, and fails immediately if it cannot find it, without actually running the main matching function. This means that a special item such as (*COMMIT) at the start of a pattern is not considered until after a suitable starting point for the match has been found. Also, when callouts or (*MARK) items are in use, these "start-up" optimizations can cause them to be skipped if the pattern is never actually used. The start-up optimizations are in effect a pre-scan of the subject that takes place before the pattern is run. Disabling start-up optimizations ensures that in cases where the result is "no match", the callouts do occur, and that items such as (*COMMIT) and (*MARK) are considered at every possible starting position in the subject string.

163.4 class PCRE2ExceptionMBS

163.4.1 class PCRE2ExceptionMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for an error in PCRE2.
Notes: We usually set error message and number.
Check also ErrorOffset in PCRE2CompilerMBS class.
Subclass of the RuntimeException class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

163.4.2 Methods

163.4.3 Constructor

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

163.5 class PCRE2IteratorMBS

163.5.1 class PCRE2IteratorMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Our iterator class to match text.
Notes: Implements Iterable and Iterator interfaces.

This class is hidden for auto complete as you don't need to use it manually. Please use it using for each loops.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Interfaces: Iterator, Iterable

163.5.2 Methods

163.5.3 Constructor

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

163.5.4 Iterator as Iterator

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the iterator.
Notes: Part of the iterable interface.
Returns self.

163.5.5 MoveNext as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to next position.
Notes: Returns true if we found something or false if we finished or didn't found anything.

163.5.6 Value as Variant

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries current match.
Notes: Returns PCRE2MatchDataMBS object for the match.

To increase performance, the object is cached and reused.
So if you like to keep it, please call Copy method to clone it.

163.6 class PCRE2MatchContextMBS

163.6.1 class PCRE2MatchContextMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a match context.
Example:

```
// we limit offset here
Var context As New PCRE2MatchContextMBS
context.DepthLimit = 100
context.OffsetLimit = 3 // cause error later. 10 works

Var Compiler As New PCRE2CompilerMBS

// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"
compiler.UseOffsetLimit = True

Var code As PCRE2CodeMBS = Compiler.Compile

// prepare reusable match object
Var Match As New PCRE2MatchDataMBS(code)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var n As Integer = code.Match(Text, match, 0, context)

// show matched text
MessageBox match.SubString(0)

// The offset_limit parameter limits how far an unanchored search can advance in the subject string. The default value is PCRE2_UNSET. The Match() functions return -1 if a match with a starting point before or at the given offset is not found. The Substitute() function makes no more substitutions.
// For example, if the pattern /abc/ is matched against "123abc" with an offset limit less than 3, the result is -1. A match can never be found if the startoffset argument of Match() or Substitute() is greater than the offset limit set in the match context.
```

Notes: A match context is needed only if you want to:

- Set up a callout function
- Set a matching offset limit
- Change the heap memory limit
- Change the backtracking match limit

- Change the backtracking depth limit
- Set custom memory management specifically for the match

Xojo Developer Magazine

- 21.1, page 28: News from MBS Xojo Plugins, What's up with MonkeyBread Software by Stefanie Juchmes

163.6.2 Methods

163.6.3 Constructor

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a match context.

163.6.4 Copy as PCRE2MatchContextMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a copy of the match context.

163.6.5 SetStackSize(StartSize as UInt32, MaxSize as UInt32)

MBS RegEx Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates and sets a stack for use by the code compiled by the JIT compiler.
Example:

```
Var matchContext as PCRE2MatchContextMBS
```

```
matchContext = New PCRE2MatchContextMBS
matchContext.SetStackSize 1024*1024, 8*1024*1024
matchContext.HeapLimit = 1024 * 1024 * 16

// later pass to Match() functions
```

Notes: The two arguments are a starting size for the stack, and a maximum size to which it is allowed to grow.
A maximum stack size of 512KiB to 1MiB should be more than enough for any pattern.

If not set, an internal 32KiB block on the machine stack is used.

163.6.6 Properties

163.6.7 DepthLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the backtracking depth limit field in a match context.
Notes: Default is 4294967295 for no limit.
(Read and Write property)

163.6.8 HeapLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the backtracking heap limit field in a match context.
Notes: Default is 0 for no limit.
(Read and Write property)

163.6.9 MatchLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the match limit field in a match context.
Notes: Default is 0 for no limit.
(Read and Write property)

163.6.10 OffsetLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the offset limit field in a match context.
Notes: Default is 0 for no limit.
(Read and Write property)

163.7 class PCRE2MatchDataMBS

163.7.1 class PCRE2MatchDataMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a match.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile

// prepare reusable match object
Var Match As New PCRE2MatchDataMBS(code)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var n As Integer = code.Match(Text, match)

// show matched text
MessageBox match.SubString(0)
```

Notes: The class allows you to reuse the object to hold result of a match, so only create it once and then use it with multiple strings to match.

- 20.6, page 70: Regular Expressions with Xojo, The MBS Plugins has its own RegEx library by Stefanie Juchmes

163.7.2 Methods

163.7.3 Constructor(code as PCRE2CodeMBS)

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new match data block for holding the result of a match.
Notes: The first argument points to a compiled pattern. The number of capturing parentheses within the pattern is used to compute the number of pairs of offsets that are required in the match data block. These form the "output vector" (ovector) within the match data block, and are used to identify the matched string and any captured substrings when matching with Match().

Use this to allocate a match data object for a specific code object.
See also:

- 163.7.4 Constructor(size as Integer) 20727

163.7.4 Constructor(size as Integer)

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new match data block, which is used for holding the result of a match.
Notes: The first argument specifies the number of pairs of offsets that are required. These form the "output vector" (ovector) within the match data block, and are used to identify the matched string and any captured substrings when matching with Match(). There is always one pair of offsets; if size is zero, it is treated as one.

Use this to allocate a match data object with a bigger size to use it with various pattern.
See also:

- 163.7.3 Constructor(code as PCRE2CodeMBS) 20727

163.7.5 OffsetVector(index as Integer) as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the offset in the text for the match.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"
```

```
Var code As PCRE2CodeMBS = Compiler.Compile

// prepare reusable match object
Var Match As New PCRE2MatchDataMBS(code)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var n As Integer = code.Match(Text, match)

// get result found
Var OVector0 As Integer = match.OffsetVector(2)
Var OVector1 As Integer = match.OffsetVector(3)
Var Len As Integer = OVector1 - OVector0
Var pos As Integer = OVector0
Var OwnSubString As String = Text.Middle(pos, Len)

Break
```

Notes: Values in number of characters and zero based, so maybe use Middle() function on strings.
Range is 0 to OffsetVectorCount*2-1.

OffsetVector(0) and OffsetVector(1) is the total match found.
OffsetVector(2) and OffsetVector(3) is the first captured sub string.
OffsetVector(4) and OffsetVector(5) is the second captured sub string.
...
OffsetVector(OffsetVectorCount*2-2) and OffsetVector(OffsetVectorCount*2-1) is the last captured sub string.

163.7.6 OffsetVectors as Integer()

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries array of vector values.
Notes: All the values in an array for faster access.

163.7.7 SubString(Index as Integer) as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries substring by index.
Example:

```
Var Compiler As New PCRE2CompilerMBS
```

```
// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile

// prepare reusable match object
Var Match As New PCRE2MatchDataMBS(code)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var n As Integer = code.Match(Text, match)

// get result found
Var TotalSubString As String = match.SubString(0)
Var SubString1 As String = match.SubString(1)
Var SubString2 As String = match.SubString(2)

break // see debugger
```

See also:

- 163.7.8 SubString(Name as String) as String 20729

163.7.8 SubString(Name as String) as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries substring by name.
See also:

- 163.7.7 SubString(Index as Integer) as String 20728

163.7.9 SubStrings as String()

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: A convenience function for extracting all the captured substrings after a pattern match.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile
```

```
// prepare reusable match object
Var Match As New PCRE2MatchDataMBS(code)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var n As Integer = code.Match(Text, match)

// show matched text
Var subStrings() As String = match.SubStrings
Break
```

163.7.10 Properties

163.7.11 DataSize as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the size, in bytes, of the match data block that is its argument.
Notes: (Read only property)

163.7.12 HeapframesSize as Integer

MBS RegEx Plugin, Plugin Version: 26.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This function returns the size, in bytes, of the heapframes data block that is owned by this object.
Notes: (Read only property)

163.7.13 Mark as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the last (*MARK), (*PRUNE), or (*THEN) name that was encountered during the matching process.
Notes: The name is within the compiled pattern.
(Read only property)

163.7.14 OffsetVectorCount as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the number of pairs of offsets in the ovector that forms part of the given match data block.
Notes: (Read only property)

163.7.15 StartPosition as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the position of the character at which the successful match started.
Notes: For a non-partial match, this can be different to the value of CharactersOffsetVector(0) if the pattern contains the \K escape sequence. After a partial match, however, this value is always the same as CharactersOffsetVector(0) because \K does not affect the result of a partial match.
(Read only property)

163.7.16 Text as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The text used to match against.
Notes: (Read and Write property)

163.8 class RegExMBS

163.8.1 class RegExMBS

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for fast Regular Expression Search in a perl compatible way.
Example:

```
Var r as new RegExMBS
Var searchString as string = ".o"

if r.Compile(searchString) then

Var s as string="Hello World"

Var start as Integer = 0
while r.Execute(s,start)>0

Var p as Integer = r.OffsetCharacters(0)
Var l as Integer = r.OffsetCharacters(1)-r.OffsetCharacters(0)

MessageBox "Found "+searchString+" on position "+str(p)+" with length "+str(l)+" in """+s+"""

start = r.Offset(1)
wend

else
MessageBox "failed to compile"
end if
```

Notes: uses the PCRE library. You may check the PCRE documentation.

The RegExMBS class has different defaults as the built in RegEx class in Xojo.

You may want to set options like this:

RB: CaseSensitive = false
MBS: CompileOptionCaseLess = true

RB: DotMatchAll = false
MBS: CompileOptionDotAll = false

RB: Greedy = true
MBS: CompileOptionUngreedy = false

RB: LineEndType = 0
MBS: CompileOptionNewLineAnyCRLF = true and ExecuteOptionNewLineAnyCRLF = true

RB: MatchEmpty = true
MBS: ExecuteOptionNotEmpty = false

and you want to set CompileOptionMultiline to true for multi line match.

163.8.2 Methods

163.8.3 Compile(pattern as string) as boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compiles a pattern.
Example:

```
Var r as new RegExMBS
Var searchString as string = ".o"

if r.Compile(searchString) then
MessageBox "OK"
else
MessageBox "failed to compile"
end if
```

Notes: Some predefined patterns like \b do not support Unicode well, so you may work around that by using your own pattern.

Returns true on success and false on failure.
ErrorMessage, Lasterror, ErrorOffset and Handle are set.

The following table lists the error codes than may be returned by Compile(), along with the error messages that may be returned by both compiling functions.

163.8.4 CompileMemory(pattern as memoryblock, ByteOffset as Integer) as boolean

MBS RegEx Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compiles a pattern.
Notes: Same as Compile, but the text is stored in a memoryblock and must be a 0 terminated C string. Be careful to use valid UTF8 input and provide offset in byte units and not in characters.

163.8.5 ConfigBSR as boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an integer whose value indicates what character sequences the \R escape sequence matches by default.
Notes: A value of 0 means that \R matches any Unicode line ending sequence; a value of 1 means that \R matches only CR, LF, or CRLF. The default can be overridden when a pattern is compiled or matched.

163.8.6 ConfigLinkSize as Integer

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an integer that contains the number of bytes used for internal linkage in compiled regular

expressions.
Notes: The value is 2, 3, or 4. Larger values allow larger regular expressions to be compiled, at the expense of slower matching. The default value of 2 is sufficient for all but the most massive patterns, since it allows the compiled pattern to be up to 64K in size.

163.8.7 ConfigMallocThreshold as Integer

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The output is an integer that contains the threshold above which the POSIX interface uses malloc() for output vectors.

163.8.8 ConfigMatchLimit as Integer

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an integer that gives the default limit for the number of internal matching function calls in a Execute execution.

163.8.9 ConfigMatchLimitRecursion as Integer

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an integer that gives the default limit for the depth of recursion when calling the internal matching function in a Execute() execution.

163.8.10 ConfigNewLine as Integer

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: What newline character is used as default.
Notes: The output is an integer whose value specifies the default character sequence that is recognized as meaning "newline". The four values that are supported are: 10 for LF, 13 for CR, 3338 for CRLF, -2 for ANYCRLF, and -1 for ANY. Though they are derived from ASCII, the same values are returned in EBCDIC environments. The default should normally correspond to the standard sequence for your operating system.

163.8.11 ConfigStackRecurse as boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an integer that is set to one if internal recursion when running Execute() is implemented by recursive function calls that use the stack to remember their state.
Notes: This is the usual way that PCRE is compiled. The output is zero if PCRE was compiled to use blocks of data on the heap instead of recursive function calls. In this case, malloc and free are called to manage memory blocks on the heap, thus avoiding the use of the stack.

163.8.12 ConfigUnicodeProperties as boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if unicode properties are available.
Notes: Should be true for the plugin.

163.8.13 ConfigUTF8 as boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether UTF8 is supported.
Notes: If this ever is false, please complain. This plugin is designed to work only on UTF8 strings for best performance.

163.8.14 Constructor(VecSize as Integer = 0)

MBS RegEx Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: You pass here the internal vector size which limits how many substrings you can find.
For 20 substrings, you need to pass (20+1)*3 for vector size.

163.8.15 Escape(text as string) as string

MBS RegEx Plugin, Plugin Version: 7.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Escapes the string.
Example:

```
Var r as new RegExMBS

Var s as string = "Hello [ ] "
Var e as string = r.Escape(s)
MessageBox e // shows Hello \[ \]
```

```
Var d as string = r.Unescape(e)
MessageBox d // shows original string
```

Notes: The string is converted to UTF8 and all the RegEx special characters are escaped.
Returns "" on low memory.

163.8.16 Execute(start as Integer = 0) as Integer

MBS RegEx Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a search with the compiled pattern again.
Notes: You can use this variant of execute to continue a search in the same string/memoryblock at a new starting offset.
See also:

- 163.8.17 Execute(text as string, start as Integer = 0) as Integer 20737

163.8.17 Execute(text as string, start as Integer = 0) as Integer

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a search with the compiled pattern.
Example:

```
Var r as RegExMbs
Var s as string
Var c as Integer

s="123 ABC 456"

r=new RegExMBS
if r.Compile(" \D+ ") then
c=r.Execute(s,0)
MessageBox str(c)+" "+str(r.Offset(0))+" "+str(r.Offset(1))
// shows: 1 3 8
// 1 for number of results
// 3 for 3 bytes before the matched pattern
// 8 for the 8 bytes before the end of the matched pattern
end if
```

Notes: Returns the number of found offsets.
text must be in UTF-8 text encoding.
Start must be 0 for the first character and the byte offset for other chacters. Do not pass values from OffsetCharacters here!

Return values from Execute:
If Execute() fails, it returns a negative number. The following are defined in the header file:

See also:

- 163.8.16 Execute(start as Integer = 0) as Integer 20737

163.8.18 ExecuteMemory(text as memoryblock, ByteOffset as Integer = 0, ByteLength as Integer = 0) as Integer

MBS RegEx Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a search with the compiled pattern.
Notes: Same as Execute, but the text is stored in a memoryblock.
Be careful to use valid UTF8 input and provide offset and length in byte units and not in characters.
If ByteLength is zero, we take the length of the memoryblock.

163.8.19 ExecuteMemoryMT(text as memoryblock, ByteOffset as Integer = 0, ByteLength as Integer = 0) as Integer

MBS RegEx Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a search with the compiled pattern.
Notes: Same as ExecuteMemory, but more thread friendly.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

163.8.20 ExecuteMT(start as Integer = 0) as Integer

MBS RegEx Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a search with the compiled pattern.
Notes: Same as Execute, but more thread friendly.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 163.8.21 ExecuteMT(text as string, start as Integer = 0) as Integer 20739

163.8.21 ExecuteMT(text as string, start as Integer = 0) as Integer

MBS RegEx Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a search with the compiled pattern.
Notes: Same as Execute, but more thread friendly.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 163.8.20 ExecuteMT(start as Integer = 0) as Integer 20738

163.8.22 InfoNameEntry(Index as Integer) as string

MBS RegEx Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a name entry in the list of captures.
Notes: Only valid after pattern was compiled.

163.8.23 IsASCIIText(text as string) as boolean

MBS RegEx Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether text in string is only ASCII.
Example:

```
Var s As String = "Hello World"

If RegExMBS.IsASCIIText(s) Then
MessageBox "Only 7 bit ASCII"
Else
MessageBox "Not ASCII. Some 8 bit encoding like ANSI or UTF-8."
End If
```

Notes: Does checks bytes of text, so doesn't look on encoding property.

163.8.24 Match(text as string) as boolean

MBS RegEx Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if current search pattern matches against given text.
Example:

```
Var r as new RegExMBS

if r.Compile("e.l") then

if r.Match("Hello") then
MessageBox "match"
end if

if r.Match("Helro") then
MessageBox "wrong match"
end if
end if
```

Notes: Returns true if text matches.

Does not set properties like Execute, so subString() won't work.
See also:

- 163.8.25 Match(text() as string, inverse as boolean = false) as string() 20740
- 163.8.26 Match(text() as Variant, inverse as boolean = false) as string() 20741

163.8.25 Match(text() as string, inverse as boolean = false) as string()

MBS RegEx Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if current search pattern matches against given text array.
Example:

```
Var r as new RegExMBS

r.CompileOptionCaseLess = true

if r.Compile("e.l") then

Var t() as string = array("Hello", "World", "Xojo", "test")

Var match1() as string = r.Match(t)
Var match2() as string = r.Match(t, true)

MessageBox "Matching: "+Join(match1, ", ")+EndOfLine+"Other: "+Join(match2, ", ")
end if
```

Notes: Returns the list of matching values.
If inverse is set to true, it returns the list of non matching values.
See also:

- 163.8.24 Match(text as string) as boolean 20739
- 163.8.26 Match(text() as Variant, inverse as boolean = false) as string() 20741

163.8.26 Match(text() as Variant, inverse as boolean = false) as string()

MBS RegEx Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if current search pattern matches against given variant array.
Example:

```
Var r as new RegExMBS

r.CompileOptionCaseLess = true

if r.Compile("e.l") then

Var dic as new Dictionary
dic.Value("Hello") = 1
dic.Value("World") = 2
dic.Value("Xojo") = 3
dic.Value("Test") = 4

Var match1() as string = r.Match(dic.keys)
Var match2() as string = r.Match(dic.keys, true)

MessageBox "Matching: "+Join(match1, ", ")+EndOfLine+"Other: "+Join(match2, ", ")
end if
```

Notes: The variant array should have entries which convert well to string.
Returns the list of matching values.
If inverse is set to true, it returns the list of non matching values.
See also:

- 163.8.24 Match(text as string) as boolean 20739
- 163.8.25 Match(text() as string, inverse as boolean = false) as string() 20740

163.8.27 Offset(index as Integer) as Integer

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the offset in the offset list with given index in bytes.
Example:

```
Var r as RegExMbs
Var s as string
```

```
Var c as Integer

s="123 √§√√º ABC 456"

r=new RegExMBS
if r.Compile(".√.") then
c=r.Execute(s,0)
MessageBox str(c)+" "+str(r.Offset(0))+" "+str(r.Offset(1))
// shows: 1 4 10
// 1 for ubound of the offset array
// 4 for 4 bytes before the matched pattern
// 10 for the 10 bytes before the end of the matched pattern
end if

r=new RegExMBS
if r.Compile(".\xF6.") then // finds √ using Unicode codepoint
c=r.Execute(s,0)
MessageBox str(c)+" "+str(r.Offset(0))+" "+str(r.Offset(1))
// shows: 1 4 10
// 1 for ubound of the offset array
// 4 for 4 bytes before the matched pattern
// 10 for the 10 bytes before the end of the matched pattern
end if
```

Notes: If you found a pattern in a string you get here:

Invalid indexes return 0.
Count is the number of entries here.

163.8.28 OffsetCharacters(index as Integer) as Integer

MBS RegEx Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the offset in the offset list with given index in characters.
Example:

```
Var r as new RegExMBS
Var searchString as string = ".o"

if r.Compile(searchString) then

Var s as string="√§√√º Hello World"

if r.Execute(s,0)>0 then
Var lines(-1) as string
```

```
lines.Add str(R.Count)+" offset found."
lines.Add "In Bytes:"
lines.Add " Start of matched patern: "+str(R.Offset(0))
lines.Add " End of matched patern: "+str(R.Offset(1))
lines.Add " Length of matched patern: "+str(R.Offset(1)-r.Offset(0))

lines.Add "In Characters:"
lines.Add " Start of matched patern: "+str(R.OffsetCharacters(0))
lines.Add " End of matched patern: "+str(R.OffsetCharacters(1))
lines.Add " Length of matched patern: "+str(R.OffsetCharacters(1)-r.OffsetCharacters(0))

MessageBox Join(lines,EndOfLine)
end if

else
MessageBox "failed to compile"
end if
```

Notes: This function is identical to Offset(), but returns characters instead of bytes.
Works only with valid UTF-8 strings as input.
Value is calculated on each function call based on Offset(index) and current text.

If you found a pattern in a string you get here:

Invalid indexes return 0.
Count is the number of entries here.

Please note that if you just need offsets for calling Mid() function, you can get better performance by using just Offset and MidB function. Than neither Mid and OffsetCharacters need to calculate the character offset.

163.8.29 Replace(NewText as string) as string

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces the text on the current found position and returns the complete new text.
Notes: You need to call Execute before.
Lasterror is set.
NewText must have UTF-8 text encoding.

\0 references the whole found pattern, \1 to \15 the subexpressions.
\t is replaced with chr(9), \r and \n with chr(13) and \\with \.

163.8.30 ReplaceAll(Target as string, NewText as string = "") as string

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches the target string for current pattern and replaces all occurrences with the new text.
Notes: You need to call Compile before to initialize the pattern and you should call Study before to optimize the pattern.
Lasterror is set.
Target and NewText must have UTF-8 text encoding.

\0 references the whole found pattern, \1 to \15 the subexpressions.
\t is replaced with chr(9), \r and \n with chr(13) and \\with \.

163.8.31 ReplaceSelection(NewText as string) as string

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces the text on the current found position and returns new text for that selection.
Notes: This method is for text editors where you will store result in editfield.seltext to replace the current selection.
Lasterror is set.
You need to call Execute before.
NewText must have UTF-8 text encoding.

\0 references the whole found pattern, \1 to \15 the subexpressions.
\t is replaced with chr(9), \r and \n with chr(13) and \\with \.

163.8.32 StringNumber(name as string) as Integer

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This convenience function finds the number of a named substring capturing parenthesis in a compiled pattern.
Notes: name: Name whose number is required
The yield of the function is the number of the parenthesis if the name is found, or PCRE_ERROR_NOSUBSTRING otherwise.

163.8.33 Study as boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: After you compiled a pattern study can optimize it.

Notes: Only useful if you use Execute several times.
In that case you call one time Compile, one time Study and several times Execute.
Errormessage is set.

163.8.34 Substring(index as Integer) as string

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the subexpression found with the given index.
Notes: Returns "" on any error.
Lasterror is set.
See also:

- 163.8.35 Substring(name as string) as string 20745

163.8.35 Substring(name as string) as string

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the subexpression found with the given name.
Notes: Returns "" on any error.
Lasterror is set.
See also:

- 163.8.34 Substring(index as Integer) as string 20745

163.8.36 Unescape(text as string) as string

MBS RegEx Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unescapes the string.
Example:

```
Var r as new RegExMBS

Var s as string = "Hello [ ] "
Var e as string = r.Escape(s)
MessageBox e // shows Hello \[ \]

Var d as string = r.Unescape(e)
MessageBox d // shows original string
```

Notes: The string is converted to UTF8 and all the RegEx special characters are escaped.
Returns "" on low memory.

163.8.37 Version as string

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version of the PCRE library as an ASCII string.

163.8.38 Properties

163.8.39 CompileOptionAnchored as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Force pattern anchoring
Notes: (Read and Write property)

163.8.40 CompileOptionAutoCallOut as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Compile automatic callouts
Notes: (Read and Write property)

163.8.41 CompileOptionBSRAnyCRLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option and CompileOptionBSRUnicode (which are mutually exclusive) control what the \R escape sequence matches.
Notes: The choice is either to match only CR, LF, or CRLF, or to match any Unicode newline sequence. The default is specified when PCRE is built. It can be overridden from within the pattern, or by setting an option when a compiled pattern is matched.
(Read and Write property)

163.8.42 CompileOptionBSRUnicode as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option and CompileOptionBSRAnyCRLF (which are mutually exclusive) control what the \R escape sequence matches.
Example:

```
Var rg As new RegExMBS
rg.CompileOptionUngreedy = false
rg.CompileOptionBSRUnicode = true

Var ts as string = "one" + EndOfLine.UNIX + "test" + chr(&h2028) + "more"

// replace all end lines with #
if rg.Compile("\R+") then

ts = rg.ReplaceAll(ts,"#")

end if

MessageBox ts
```

Notes: The choice is either to match only CR, LF, or CRLF, or to match any Unicode newline sequence. The default is specified when PCRE is built. It can be overridden from within the pattern, or by setting an option when a compiled pattern is matched.
(Read and Write property)

163.8.43 CompileOptionCaseLess as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Do caseless matching
Example:

```
Var r as new RegExMBS
Var searchString as string = "hello"

r.CompileOptionCaseLess=True

if r.Compile(searchString) then

Var s as string="√§√√º Hello World"

if r.Execute(s,0)>0 then
MessageBox "Found: "+mid(s, r.OffsetCharacters(0)+1, r.OffsetCharacters(1)-r.OffsetCharacters(0))
else
MessageBox "nothing found"
end if

else
MessageBox "failed to compile"
end if
```

Notes: (Read and Write property)

163.8.44 CompileOptionDollarEndOnly as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: $ not to match newline at end
Notes: (Read and Write property)

163.8.45 CompileOptionDotAll as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: . matches anything including endofline
Example:

```
Var r as new RegExMBS
Var searchString as string = "<.+>"

r.CompileOptionDotAll = false // finds only if true

if r.Compile(searchString) then

Var s as string="<Step enable=""True""+EndOfLine.unix+"id=""93"" name=""Beep""/>"

if r.Execute(s,0)>0 then
MessageBox "Found: "+mid(s, r.OffsetCharacters(0)+1, r.OffsetCharacters(1)-r.OffsetCharacters(0))
else
MessageBox "nothing found"
end if

else
MessageBox "failed to compile"
end if
```

Notes: (Read and Write property)

163.8.46 CompileOptionDuplicateNames as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: If this bit is set, names used to identify capturing subpatterns need not be unique.
Notes: This can be helpful for certain types of pattern when it is known that only one instance of the

named subpattern can ever be matched. There are more details of named subpatterns below; see also the pcrepattern documentation.
(Read and Write property)

163.8.47 CompileOptionExtended as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Ignore whitespace and # comments
Notes: (Read and Write property)

163.8.48 CompileOptionFirstLine as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Force matching to be before newline
Notes: (Read and Write property)

163.8.49 CompileOptionJavaScriptCompat as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: If this option is set, PCRE's behaviour is changed in some ways so that it is compatible with JavaScript rather than Perl.
Notes: The changes are as follows:

(1) A lone closing square bracket in a pattern causes a compile-time error, because this is illegal in JavaScript (by default it is treated as a data character). Thus, the pattern AB] CD becomes illegal when this option is set.

(2) At run time, a back reference to an unset subpattern group matches an empty string (by default this causes the current matching alternative to fail). A pattern such as (\1)(a) succeeds when this option is set (assuming it can find an "a" in the subject), whereas it fails by default, for Perl compatibility.
(Read and Write property)

163.8.50 CompileOptionMultiline as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: ^and $ match newlines within data
Example:

```
Var r as RegExMBS
Var n,i,c as Integer
Var s as string

s=ReplaceLineEndings(EditField1.text,EndOfLine.UNIX)

r=new RegExMBS

'r.CompileOptionFirstLine=True
r.CompileOptionMultiline=True

if r.Compile("^....$ ") then
n=0
do
c=r.Execute(s,n)

if c>0 then
MessageBox r.Substring(0)
n=r.Offset(1)
end if

loop until c=0
end if
```

Notes: (Read and Write property)

163.8.51 CompileOptionNewLineAny as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: Setting CompileOptionNewLineCR or CompileOptionNewLineLF specifies that a newline is indicated by a single character (CR or LF, respectively). Setting CompileOptionNewLineCRLF specifies that a newline is indicated by the two-character CRLF sequence. Setting CompileOptionNewLineAnyCRLF specifies that any of the three preceding sequences should be recognized. Setting CompileOptionNewLineAny specifies that any Unicode newline sequence should be recognized. The Unicode newline sequences are the three just mentioned, plus the single characters VT (vertical tab, U+000B), FF (formfeed, U+000C), NEL (next line, U+0085), LS (line separator, U+2028), and PS (paragraph separator, U+2029). The last two are recognized only in UTF-8 mode.
The newline setting in the options word uses three bits that are treated as a number, giving eight possibilities. Currently only six are used (default plus the five values above). This means that if you set more than one newline option, the combination may or may not be sensible. For example, CompileOptionNewLineCR with CompileOptionNewLineLF is equivalent to CompileOptionNewLineCRLF, but other combinations may

yield unused numbers and cause an error.

The only time that a line break in a pattern is specially recognized when compiling is when PCRE_EXTENDED is set. CR and LF are whitespace characters, and so are ignored in this mode. Also, an unescaped # outside a character class indicates a comment that lasts until after the next line break sequence. In other circumstances, line break sequences in patterns are treated as literal data.
(Read and Write property)

163.8.52 CompileOptionNewLineAnyCRLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See CompileOptionNewLineAny for more details.
(Read and Write property)

163.8.53 CompileOptionNewLineCR as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See CompileOptionNewLineAny for more details.
(Read and Write property)

163.8.54 CompileOptionNewLineCRLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See CompileOptionNewLineAny for more details.
(Read and Write property)

163.8.55 CompileOptionNewLineLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See CompileOptionNewLineAny for more details.
(Read and Write property)

163.8.56 CompileOptionNoAutoCapture as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Disable numbered capturing parentheses (named ones available)
Notes: (Read and Write property)

163.8.57 CompileOptionNoStartOptimize as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This is an option that acts at matching time; that is, it is really an option for Execute.
Notes: If it is set at compile time, it is remembered with the compiled pattern and assumed at matching time.
(Read and Write property)

163.8.58 CompileOptionNoUTF8Check as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Do not check the pattern for UTF-8 validity.
Notes: (Read and Write property)

163.8.59 CompileOptions as Integer

MBS RegEx Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal value of all the compile options.
Notes: You can get and set the bits using the CompileOption* Boolean properties.
(Read and Write property)

163.8.60 CompileOptionUngreedy as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Invert greediness of quantifiers.
Notes: Basicly this is about whether to find the next matching item or the last matching item in the whole string.
Matching the next item is always much faster.
(Read and Write property)

163.8.61 CompileOptionUnicodeCodePoints as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to support unicode code points for character classes.
Notes: This option changes the way PCRE processes \B, \b, \D, \d, \S, \s, \W, \w, and some of the POSIX character classes. By default, only ASCII characters are recognized, but if PCRE_UCP is set, Unicode properties are used instead to classify characters. More details are given in the section on generic character types in the pcrepattern page. If you set PCRE_UCP, matching one of the items it affects takes much longer. The option is available only if PCRE has been compiled with Unicode property support.
(Read and Write property)

163.8.62 CompileOptionUTF8 as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Run in UTF-8 mode.
Notes: (Read and Write property)

163.8.63 Count as Integer

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of offsets found.
Example:

```
Var r as new RegExMBS
Var searchString as string = ".o"

if r.Compile(searchString) then

Var s as string="√§√√º Hello World"

if r.Execute(s,0)>0 then
Var lines(-1) as string

lines.Add str(R.Count)+" offset found."
lines.Add "In Bytes:"
lines.Add " Start of matched patern: "+str(R.Offset(0))
lines.Add " End of matched patern: "+str(R.Offset(1))
lines.Add " Length of matched patern: "+str(R.Offset(1)-r.Offset(0))

lines.Add "In Characters:"
lines.Add " Start of matched patern: "+str(R.OffsetCharacters(0))
lines.Add " End of matched patern: "+str(R.OffsetCharacters(1))
```

```
lines.Add " Length of matched patern: "+str(R.OffsetCharacters(1)-r.OffsetCharacters(0))

MessageBox Join(lines,EndOfLine)
end if

else
MessageBox "failed to compile"
end if
```

Notes: (Read only property)

163.8.64 ErrorMessage as String

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last message reported.
Notes: Set by Study and Compile.
(Read only property)

163.8.65 ErrorOffset as Integer

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error offset from the compile function.
Notes: (Read only property)

163.8.66 ExecuteOptionAnchored as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Execute: Match only at the first position
Notes: (Read and Write property)

163.8.67 ExecuteOptionBSRAnyCRLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option and ExecuteOptionBSRUnicode (which are mutually exclusive) control what the \R escape sequence matches.
Notes: The choice is either to match only CR, LF, or CRLF, or to match any Unicode newline sequence. The default is specified when PCRE is built. It can be overridden from within the pattern, or by setting an

option when a compiled pattern is matched.
(Read and Write property)

163.8.68 ExecuteOptionBSRUnicode as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option and ExecuteOptionBSRAnyCRLF (which are mutually exclusive) control what the \R escape sequence matches.
Example:

```
Var rg As new RegExMBS
rg.CompileOptionUngreedy = false
rg.ExecuteOptionBSRUnicode = true

Var ts as string = "one" + EndOfLine.UNIX + "test" + chr(&h2028) + "more"

// replace all end lines with #
if rg.Compile("\R+") then

ts = rg.ReplaceAll(ts,"#")

end if

MessageBox ts
```

Notes: The choice is either to match only CR, LF, or CRLF, or to match any Unicode newline sequence. The default is specified when PCRE is built. It can be overridden from within the pattern, or by setting an option when a compiled pattern is matched.
(Read and Write property)

163.8.69 ExecuteOptionNewLineAny as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: Setting ExecuteOptionNewLineCR or ExecuteOptionNewLineLF specifies that a newline is indicated by a single character (CR or LF, respectively). Setting ExecuteOptionNewLineCRLF specifies that a newline is indicated by the two-character CRLF sequence. Setting ExecuteOptionNewLineAnyCRLF specifies that any of the three preceding sequences should be recognized. Setting ExecuteOptionNewLineAny specifies that any Unicode newline sequence should be recognized. The Unicode newline sequences are the three just mentioned, plus the single characters VT (vertical tab, U+000B), FF (formfeed, U+000C), NEL (next line, U+0085), LS (line separator, U+2028), and PS (paragraph separator, U+2029). The last two are recognized only in UTF-8 mode.

The newline setting in the options word uses three bits that are treated as a number, giving eight possibilities. Currently only six are used (default plus the five values above). This means that if you set more than one newline option, the combination may or may not be sensible. For example, ExecuteOptionNewLineCR with ExecuteOptionNewLineLF is equivalent to ExecuteOptionNewLineCRLF, but other combinations may yield unused numbers and cause an error.

The only time that a line break in a pattern is specially recognized when compiling is when PCRE_EXTENDED is set. CR and LF are whitespace characters, and so are ignored in this mode. Also, an unescaped # outside a character class indicates a comment that lasts until after the next line break sequence. In other circumstances, line break sequences in patterns are treated as literal data.
(Read and Write property)

163.8.70 ExecuteOptionNewLineAnyCRLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See ExecuteOptionNewLineAny for more details.
(Read and Write property)

163.8.71 ExecuteOptionNewLineCR as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See ExecuteOptionNewLineAny for more details.
(Read and Write property)

163.8.72 ExecuteOptionNewLineCRLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See ExecuteOptionNewLineAny for more details.
(Read and Write property)

163.8.73 ExecuteOptionNewLineLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See ExecuteOptionNewLineAny for more details.
(Read and Write property)

163.8.74 ExecuteOptionNoStartOptimize as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: There are a number of optimizations that Execute uses at the start of a match, in order to speed up the process.
Notes: For example, if it is known that an unanchored match must start with a specific character, it searches the subject for that character, and fails immediately if it cannot find it, without actually running the main matching function. This means that a special item such as (*COMMIT) at the start of a pattern is not considered until after a suitable starting point for the match has been found. When callouts or (*MARK) items are in use, these "start-up" optimizations can cause them to be skipped if the pattern is never actually used. The start-up optimizations are in effect a pre-scan of the subject that takes place before the pattern is run.
The ExecuteOptionNoStartOptimize option disables the start-up optimizations, possibly causing performance to suffer, but ensuring that in cases where the result is "no match", the callouts do occur, and that items such as (*COMMIT) and (*MARK) are considered at every possible starting position in the subject string. If ExecuteOptionNoStartOptimize is set at compile time, it cannot be unset at matching time.

Setting ExecuteOptionNoStartOptimize can change the outcome of a matching operation. Consider the pattern

(*COMMIT)ABC
When this is compiled, PCRE records the fact that a match must start with the character "A". Suppose the subject string is "DEFABC". The start-up optimization scans along the subject, finds "A" and runs the first match attempt from there. The (*COMMIT) item means that the pattern must match the current starting position, which in this case, it does. However, if the same match is run with ExecuteOptionNoStartOptimize set, the initial scan along the subject string does not happen. The first match attempt is run starting from "D" and when this fails, (*COMMIT) prevents any further matches being tried, so the overall result is "no match". If the pattern is studied, more start-up optimizations may be used. For example, a minimum length for the subject may be recorded. Consider the pattern
(*MARK:A)(X | Y)
The minimum length for a match is one character. If the subject is "ABC", there will be attempts to match "ABC", "BC", "C", and then finally an empty string. If the pattern is studied, the final attempt does not take place, because PCRE knows that the subject is too short, and so the (*MARK) is never encountered. In this case, studying the pattern does not affect the overall match result, which is still "no match", but it does affect the auxiliary information that is returned.
(Read and Write property)

163.8.75 ExecuteOptionNotBOL as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Execute: Subject is not the beginning of a line
Notes: (Read and Write property)

163.8.76 ExecuteOptionNotEmpty as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Execute: An empty string is not a valid match
Notes: (Read and Write property)

163.8.77 ExecuteOptionNotEmptyAtStart as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the options.
Notes: This is like ExecuteOptionNotEmpty, except that an empty string match that is not at the start of the subject is permitted. If the pattern is anchored, such a match can occur only if the pattern contains \K. Perl has no direct equivalent of ExecuteOptionNotEmpty or ExecuteOptionNotEmptyAtStart, but it does make a special case of a pattern match of the empty string within its split() function, and when using the /g modifier. It is possible to emulate Perl's behaviour after matching a null string by first trying the match again at the same offset with ExecuteOptionNotEmptyAtStart and ExecuteOptionAnchored, and then if that fails, by advancing the starting offset (see below) and trying an ordinary match again. There is some code that demonstrates how to do this in the pcredemo sample program. In the most general case, you have to check to see if the newline convention recognizes CRLF as a newline, and if so, and the current character is CR followed by LF, advance the starting offset by two characters instead of one.
(Read and Write property)

163.8.78 ExecuteOptionNotEOL as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Execute: Subject is not the end of a line
Notes: (Read and Write property)

163.8.79 ExecuteOptionNoUTF8Check as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Execute: Do not check the subject for UTF-8 validity
Notes: (Read and Write property)

163.8.80 ExecuteOptionPartial as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Execute: Return PCRE_ERROR_PARTIAL for a partial match
Notes: (Read and Write property)

163.8.81 ExecuteOptionPartialHard as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option (and ExecuteOptionPartial) turn on the partial matching feature.
Notes: A partial match occurs if the end of the subject string is reached successfully, but there are not enough subject characters to complete the match. If this happens when ExecuteOptionPartial (but not ExecuteOptionPartialHard) is set, matching continues by testing any remaining alternatives. Only if no complete match can be found is ErrorPartial returned instead of PCRE_ERROR_NOMATCH. In other words, ExecuteOptionPartial says that the caller is prepared to handle a partial match, but only if no complete match can be found.
If ExecuteOptionPartialHard is set, it overrides ExecuteOptionPartial. In this case, if a partial match is found, Execute() immediately returns ErrorPartial, without considering any other alternatives. In other words, when ExecuteOptionPartialHard is set, a partial match is considered to be more important that an alternative complete match.

In both cases, the portion of the string that was inspected when the partial match was found is set as the first matching string. There is a more detailed discussion of partial and multi-segment matching, with examples, in the pcrepartial documentation.
(Read and Write property)

163.8.82 ExecuteOptions as Integer

MBS RegEx Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal value of all the execute options.
Notes: You can get and set the bits using the CompileOption* Boolean properties.
(Read and Write property)

163.8.83 Handle as Integer

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle to the pattern data structure.
Notes: (Read only property)

163.8.84 InfoCaptureCount as Integer

MBS RegEx Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of captures defined in the pattern.
Notes: Only valid after pattern was compiled.
(Read only property)

163.8.85 InfoNameCount as Integer

MBS RegEx Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of names defined in the pattern.
Notes: Only valid after pattern was compiled.
(Read only property)

163.8.86 InfoSize as Integer

MBS RegEx Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the size of the compiled pattern.
Notes: Only valid after pattern was compiled.
(Read only property)

163.8.87 InfoStudySize as Integer

MBS RegEx Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the study details size.
Notes: Only valid after calling Study.
(Read only property)

163.8.88 Lasterror as Integer

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code reported.
Notes: 0 is no error and -1 is some parameter error.
See Error* constants for other values.
(Read only property)

163.8.89 MatchLimit as Integer

MBS RegEx Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The match limit.
Notes: You can set it to a limit value. If set to zero, the plugin will use the default.

The default value for the limit can be set when PCRE is built; the default default is 10 million, which handles all but the most extreme cases. You can override the default by setting this property.
(Read and Write property)

163.8.90 MatchLimitRecursion as Integer

MBS RegEx Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The limit for recursion.
Notes: The MatchLimitRecursion field is similar to MatchLimit, but instead of limiting the total number of times that match() is called, it limits the depth of recursion. The recursion depth is a smaller number than the total number of calls, because not all calls to match() are recursive. This limit is of use only if it is set smaller than MatchLimit.

Limiting the recursion depth limits the amount of stack that can be used.

The default value for MatchLimitRecursion can be set when PCRE is built; the default default is the same value as the default for MatchLimit. You can override the default by setting this property. If value is zero, the plugin uses the default.
(Read and Write property)

163.8.91 Text as String

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The text used for the last successful compile call.
Notes: (Read only property)

163.8.92 TextMemory as Memoryblock

MBS RegEx Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The text used for the last successful compiletext call.
Notes: (Read only property)

163.8.93 VectorSize as Integer

MBS RegEx Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal vector size.
Notes: (Read only property)

163.8.94 Constants

Error Constants

Constant	Value	Description
ErrorBadCount	-15	This error is given if the value of the ovecsize argument is negative.
ErrorBadMagic	-4	PCRE stores a 4-byte "magic number" at the start of the compiled code, to catch the case when it is passed a junk pointer and to detect when a pattern that was compiled in an environment of one endianness is run in an environment with the other endianness. This is the error that PCRE gives when the magic number is not present.
ErrorBadNewLine	-23	An invalid combination of Newline options was given.
ErrorBadOffset	-24	The value of startoffset was negative or greater than the length of the subject, that is, the value in length.
ErrorBadOption	-3	An unrecognized bit was set in the options argument.
ErrorBadPartial	-13	This code is no longer in use. It was formerly returned when the PCRE_PARTIAL option was used with a compiled pattern containing items that were not supported for partial matching. From release 8.00 onwards, there are no restrictions on partial matching.
ErrorBadUTF8	-10	A string that contains an invalid UTF-8 byte sequence was passed as a subject. However, if PCRE_PARTIAL_HARD is set and the problem is a truncated UTF-8 character at the end of the subject, ErrorShortUTF8 is used instead.
ErrorBadUTF8Offset	-11	The UTF-8 byte sequence that was passed as a subject was valid, but the value of startoffset did not point to the beginning of a UTF-8 character or the end of the subject.
ErrorCallOut	-9	
ErrorDFARecurse	-20	
ErrorDFAUCond	-17	
ErrorDFAUItem	-16	
ErrorDFAUMLimit	-18	
ErrorDFAWSSize	-19	
ErrorInternal	-14	An unexpected internal error has occurred. This error could be caused by a bug in PCRE or by overwriting of the compiled pattern.
ErrorMatchLimit	-8	The backtracking limit, as specified by the match_limit field in a pcre_extra structure (or defaulted) was reached.
ErrorNoMatch	-1	The subject string did not match the pattern.
ErrorNoSubstring	-7	This error is used by the substring functions.
ErrorNull	-2	Either code or subject was passed as "", or ovector was "" and ovecsize was not zero.
ErrorNullWSLimit	-22	
ErrorPartial	-12	The subject string did not match, but it did match partially.
ErrorPlugin	-99	Generic error for something wrong with the plugin state. Like no current regex object internally or wrong function parameters.
ErrorRecursionLimit	-21	The internal recursion limit, as specified by the match_limit_recursion field in a pcre_extra structure (or defaulted) was reached. See the description above.
ErrorShortUTF8	-25	The subject string ended with an incomplete (truncated) UTF-8 character, and the PCRE_PARTIAL_HARD option was set. Without this option, ErrorBadUTF8 is returned in this situation.
ErrorUnknownNode	-6	
ErrorUnknownOpcode	-5	While running the pattern match, an unknown item was encountered in the compiled pattern. This error could be caused by a bug in PCRE or by overwriting of the compiled pattern.

0 no error
1 \at end of pattern
2 \c at end of pattern
3 unrecognized character follows \
4 numbers out of order in { } quantifier
5 number too big in { } quantifier
6 missing terminating] for character class
7 invalid escape sequence in character class
8 range out of order in character class
9 nothing to repeat
10 operand of unlimited repeat could match the empty string
11 internal error: unexpected repeat
12 unrecognized character after (?
13 POSIX named classes are supported only within a class
14 missing)
15 reference to non-existent subpattern
16 erroffset passed as NULL
17 unknown option bit(s) set
18 missing) after comment
19 parentheses nested too deeply
20 regular expression too large
21 failed to get memory
22 unmatched parentheses
23 internal error: code overflow
24 unrecognized character after (?<
25 lookbehind assertion is not fixed length
26 malformed number after (?(
27 conditional group contains more than two branches
28 assertion expected after (?(
29 (?R or (?digits must be followed by)
30 unknown POSIX class name
31 POSIX collating elements are not supported
32 this version of PCRE is not compiled with PCRE_UTF8 support
33 spare error
34 character value in \x { ... } sequence is too large
35 invalid condition (?(0)
36 \C not allowed in lookbehind assertion
37 PCRE does not support \L, \l, \N, \U, or \u
38 number after (?C is >255
39 closing) for (?C expected
40 recursive call could loop indefinitely
41 unrecognized character after (?P
42 syntax error after (?P
43 two named groups have the same name
44 invalid UTF-8 string
45 support for \P, \p, and \X has not been compiled
46 malformed \P or \p sequence
47 unknown property name after \P or \p

PCRE_ERROR_NOMATCH	-1	The subject string did not match the pattern.
PCRE_ERROR_NULL	-2	Either code or subject was passed as ””.
PCRE_ERROR_BADOPTION	-3	An unrecognized bit was set in the options argument.
PCRE_ERROR_BADMAGIC	-4	PCRE stores a 4-byte ”magic number” at the start of the compiled code, to catch the case when it is passed a junk pointer and to detect when a pattern that was compiled in an environment of one endianness is run in an environment with the other endianness. This is the error that PCRE gives when the magic number is not present.
PCRE_ERROR_UNKNOWN_NODE	-5	While running the pattern match, an unknown item was encountered in the compiled pattern. This error could be caused by a bug in PCRE or by overwriting of the compiled pattern.
PCRE_ERROR_NOMEMORY	-6	If a pattern contains back references, but the ovector that is passed to Execute() is not big enough to remember the referenced substrings, PCRE gets a block of memory at the start of matching to use for this purpose. If the call via pcre_malloc() fails, this error is given. The memory is automatically freed at the end of matching.
PCRE_ERROR_MATCHLIMIT	-8	The backtracking limit, as specified by the match_limit field in a pcre_extra structure (or defaulted) was reached.
PCRE_ERROR_RECURSIONLIMIT	-21	The internal recursion limit, as specified by the match_limit_recursion field in a pcre_extra structure (or defaulted) was reached.
PCRE_ERROR_CALLOUT	-9	This error is never generated by Execute() itself. It is provided for use by callout functions that want to yield a distinctive error code. See the pcrecallout documentation for details.
PCRE_ERROR_BADUTF8	-10	A string that contains an invalid UTF-8 byte sequence was passed as a subject.
PCRE_ERROR_BADUTF8_OFFSET	-11	The UTF-8 byte sequence that was passed as a subject was valid, but the value of startoffset did not point to the beginning of a UTF-8 character.
PCRE_ERROR_PARTIAL	-12	The subject string did not match, but it did match partially. See the pcrepartial documentation for details of partial matching.
PCRE_ERROR_BADPARTIAL	-13	The PCRE_PARTIAL option was used with a compiled pattern containing items that are not supported for partial matching. See the pcrepartial documentation for details of partial matching.
PCRE_ERROR_INTERNAL	-14	An unexpected internal error has occurred. This error could be caused by a bug in PCRE or by overwriting of the compiled pattern.
PCRE_ERROR_BADCOUNT	-15	This error is given if the value of the ovecsize argument is negative.

index	offset
0	start of matched pattern
1	end of matched pattern
2	start of subexpression 1
3	end of subexpression 1
2*n	start of subexpression n
2*n+1	end of subexpression n

index	offset
0	start of matched pattern
1	end of matched pattern
2	start of subexpression 1
3	end of subexpression 1
2*n	start of subexpression n
2*n+1	end of subexpression n

Chapter 164

Remote Control

164.1 class GammaFadeMBS

164.1.1 class GammaFadeMBS

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: A class to perform gamma fades on Mac OS X and Windows.
Example:

```
// fade the screen to black and back, e.g. while switching screen resolution
Var fade As New GammaFadeMBS
If Not fade.Available Then Return

fade.FadeColor = &c000000
If fade.GammaFadeOut(1.0) Then
// ... change something while the screen is dark ...
Call fade.GammaFadeIn(1.0)
End If
```

Notes: On Mac OS X a system API is used. On Windows the GammaMBS class is used internally.

- MonkeyBread Software Releases the MBS REALbasic plug-ins 8.4

164.1.2 Methods

164.1.3 Constructor

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Initializes the gamma fade class and queries the current gamma values.
Notes: On Windows a window is needed to get the exclusive access to the gamma controls.

The Available property is set to true if the constructor was successful.
See also:

- 164.1.4 Constructor(mainwindow as DesktopWindow) 20768
- 164.1.5 Constructor(mainwindow as window) 20768

164.1.4 Constructor(mainwindow as DesktopWindow)

MBS ComputerControl Plugin, Plugin Version: 22.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Initializes the gamma fade class and queries the current gamma values.
Notes: On Windows a window is needed to get the exclusive access to the gamma controls.

The Available property is set to true if the constructor was successful.
See also:

- 164.1.3 Constructor 20768
- 164.1.5 Constructor(mainwindow as window) 20768

164.1.5 Constructor(mainwindow as window)

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop only.

Function: Initializes the gamma fade class and queries the current gamma values.
Notes: On Windows a window is needed to get the exclusive access to the gamma controls.

The Available property is set to true if the constructor was successful.
See also:

- 164.1.3 Constructor 20768
- 164.1.4 Constructor(mainwindow as DesktopWindow) 20768

164.1.6 GammaFadeIn(seconds as Double) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Fades back to the normal screen.
Notes: Seconds is the duration of the fade in seconds. Typical 0.3 seconds.
Returns true on success and false on failure.

164.1.7 GammaFadeOut(seconds as Double) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Fades to a solid color.
Notes: Seconds is the duration of the fade in seconds. Typical 0.5 seconds.
Returns true on success and false on failure.

164.1.8 Properties

164.1.9 Available as Boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Whether the constructor was successful.
Notes: True if the initialization code worked.

On Mac OS X the constructor fails to get access if there is another gamma fade running.
On Windows the access to the gamma controls can fail if you don't provide a window, the hardware can't do gamma fades (e.g. running in VMWare) or DirectX is not available.
(Read and Write property)

164.1.10 FadeColor as Color

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The color to use for the fade.
Example:

```
Var g as new GammaFadeMBS
g.FadeColor=&c0000FF // blue
```

Notes: Default is black.
(Read and Write property)

164.2 class GammaMBS

164.2.1 class GammaMBS

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: A class to change the gamma settings of the display.
Example:

```
// make the display darker for a moment by changing the gamma, e.g. for a fade effect
Var g As New GammaMBS(Self)
If Not g.Available Then Return

Call g.SetGamma(0.5) // half brightness
// restore it later with g.SetGamma(1.0)
MessageBox "Gamma table has " + g.Size.ToString + " entries, red at middle: " + Format(g.Red(g.Size
\2), "0.000")
```

Notes: You can use that class to change the gamma table. For example to invert the screen or increase/decrease one of the colors.

Works on Mac OS X and Windows.

164.2.2 Methods

164.2.3 Constructor(mainwindow as DesktopWindow, displayIndex as integer = 0)

MBS ComputerControl Plugin, Plugin Version: 22.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Initializes the gamma class and queries the current gamma values.
Notes: On Windows a window is needed to get the exclusive access to the gamma controls.

The Available property is set to true if the constructor was successful.
Added displayIndex parameter in plugin version 14.1 to specify on Mac which display to handle.

If you like to pass nil for the window, please pass a variable, so Xojo knows which constructor to use and you avoid a compiler error.
See also:

- 164.2.4 Constructor(mainwindow as window = nil, displayIndex as Integer = 0) 20772

164.2.4 Constructor(mainwindow as window = nil, displayIndex as Integer = 0)

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop only.

Function: Initializes the gamma class and queries the current gamma values.
Notes: On Windows a window is needed to get the exclusive access to the gamma controls.

The Available property is set to true if the constructor was successful.
Added displayIndex parameter in plugin version 14.1 to specify on Mac which display to handle.

If you like to pass nil for the window, please pass a variable, so Xojo knows which constructor to use and you avoid a compiler error.
See also:

- 164.2.3 Constructor(mainwindow as DesktopWindow, displayIndex as integer = 0) 20771

164.2.5 SetGamma(gammaScale as Double = 1.0) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Sets the gamma values.
Notes: The current table assigned to the main screen.
All values are multiplied with gammaScale

164.2.6 Properties

164.2.7 Available as Boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Whether the constructor was successful.
Notes: True if the initialization code worked.

On Mac OS X the constructor fails to get access if it does not find a display with gamma controls.

On Windows the access to the gamma controls can fail if you don't provide a window, the hardware can't do gamma fades (e.g. running in VMWare) or DirectX is not available.
(Read and Write property)

164.2.8 Lasterror as Integer

MBS ComputerControl Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

164.2.9 Size as Integer

MBS ComputerControl Plugin, Plugin Version: 14.1, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The number of entries in the gamma table.
Notes: Should be 256 for Windows.
And 256 or 1024 for Mac.
(Read only property)

164.2.10 Blue(Index as Integer) as Double

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The blue value with the given index.
Notes: Index is from 0 to 255 and value from 0.0 to 1.0.
(Read and Write computed property)

164.2.11 Green(Index as Integer) as Double

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The green value with the given index.
Notes: Index is from 0 to 255 and value from 0.0 to 1.0.
(Read and Write computed property)

164.2.12 Red(Index as Integer) as Double

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The red value with the given index.
Notes: Index is from 0 to 255 and value from 0.0 to 1.0.
(Read and Write computed property)

164.3 class KeyCodesMBS

164.3.1 class KeyCodesMBS

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop only.

Function: A class for translating between key codes and ASCII characters.
Notes: This class is outdated, please use RemoteControlMBS module.

The list of key codes on a Mac is the same as the one used in the RB documentation for the sprite surface. Some special keys:

Modifier keys	
kVirtualCapsLockKey	&h039
kVirtualShiftKey	&h038
kVirtualControlKey	&h03B
kVirtualOptionKey	&h03A
kVirtualCommandKey	&h037
Editing/utility keys	
kVirtualHelpKey	&h072
kVirtualDeleteKey	&h033
kVirtualTabKey	&h030
kVirtualEnterKey	&h04C
kVirtualReturnKey	&h024
kVirtualEscapeKey	&h035
kVirtualForwardDeleteKey	&h075
Navigation keys	
kVirtualHomeKey	&h073
kVirtualEndKey	&h002
kVirtualPageUpKey	&h074
kVirtualPageDownKey	&h079
kVirtualLeftArrowKey	&h07B
kVirtualRightArrowKey	&h07C
kVirtualUpArrowKey	&h07E
kVirtualDownArrowKey	&h07D

Key codes for Windows:

Blog Entries

- MBS Real Studio Plugins, version 12.0pr6
- MBS Real Studio Plugins, version 11.3pr14

164.3.2 Methods

164.3.3 AsciiToKeyCode(ascii as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns the keycode which is needed to be pressed to create this ASCII character.
Notes: You get the main key, not any modifier which may also be pressed.

164.3.4 KeyCodeToAscii(keycode as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns the ASCII code which matches the key code.
Example:

```
Var k as KeyCodesMBS

k=new KeyCodesMBS

// makes a big A on a german keyboard:
MessageBox chr(k.KeyCodeToAsciiWithSecondKeyCode(0+512))
```

Notes: Note on a Mac:
Bit 0 to 6 are the keycode, bit 7 is 1 if key goes up and 0 if key goes down.
Bit 8 to 15 are modifier keys:

Constants for the modifier keys:

Not available in 64-bit.
See MacTextForKeyCode method in RemoteControlMBS module.

164.3.5 KeyCodeToAsciiWithSecondKeyCode(keycode as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 3.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns the ASCII code which matches the key code with the current state.
Example:

```
Var k as KeyCodesMBS

k=new KeyCodesMBS

MessageBox str(k.KeyCodeToAscii(&h0A))
```

```
MessageBox chr(k.KeyCodeToAsciiWithSecondKeyCode(0))

// gives √¢ on a German Keyboard
```

Notes: On the first call of KeyCodeToAscii you get the ASCII char, but if you call KeyCodeToAsciiWithSecondKeyCode and the state property is not changed, you can get what the user gets if he presses several keys.
KeyCodeToAscii resets state to 0 before calling.
On Windows, KeyCodeToAscii and KeyCodeToAsciiWithSecondKeyCode are equal.

Note on a Mac:
Bit 0 to 6 are the keycode, bit 7 is 1 if key goes up and 0 if key goes down.
Bit 8 to 15 are modifier keys:

Constants for the modifier keys:

Not available in 64-bit.

164.3.6 TestForAsciiKeyDown(ascii as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns true if the key with the given ascii code is pressed.

164.3.7 TestForKeyDown(keycode as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns true if the key with the given key code is pressed.
Example:

```
Var k As New KeyCodesMBS

Const VK_SHIFT = &h10 // for Windows
If k.TestForKeyDown(VK_SHIFT) Then
MessageBox "shift"
Else
MessageBox "no shift"
End If
```

164.3.8 Update

MBS ComputerControl Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Updates the layout so it is the current one.

164.3.9 Properties

164.3.10 LastError as Integer

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop only.

Function: The last error code.
Notes: The last function was successful if lasterror is 0.
If the last function was not available on this machine, the value is set to -1.
Other values are Mac OS error codes.
(Read and Write property)

164.3.11 Name as String

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop only.

Function: The name for the current keyboard layout.
Notes: On Mac OS 9 e.g. "Deutsch".
On Mac OS X e.g. "German".
On Windows 98 e.g. "00020407".
(Read only property)

164.3.12 State as Integer

MBS ComputerControl Plugin, Plugin Version: 3.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The last state.
Notes: The function KeyCodeToAscii stores a code here which the function KeyCodeToAsciiWithSecondKeyCode will use on further calls.
(Read and Write property)

VK_LBUTTON	&h01
VK_RBUTTON	&h02

164.4 class PresskeyMBS

164.4.1 class PresskeyMBS

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use RemoteControlMBS instead. **Function:** This class allows you to simulate keyboard activity.
Example:

```
// simulate pressing Command-C (Ctrl-C on Windows) to copy in the frontmost app
Var key As New PresskeyMBS
key.VirtualCode = 8 // C on macOS, use 67 (VK_C) on Windows
#If TargetMacOS Then
key.Command = True
#Else
key.Control = True
#EndIf
key.press
```

Notes: This class is deprecated, please use RemoteControlMBS module.
Blog Entries

- MBS Real Studio Plugins, version 12.0pr6

164.4.2 Methods

164.4.3 clear

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Resets this object.

164.4.4 mouseclick(down as boolean)

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Clicks the mouse button.
Notes: Clicks the mouse at current position.
Left button is used.
If you forget the mouseup you may loose control about a Mac with Mac OS X, but if you have enabled external terminal login you can login via SSH and quit Xojo from outside.

The Mac version sets the lasterror property.

See also:

- 164.4.5 MouseClick(down as boolean, rightdown as boolean) 20782

164.4.5 MouseClick(down as boolean, rightdown as boolean)

MBS ComputerControl Plugin, Plugin Version: 8.1, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Clicks the mouse with the given buttons.
Notes: Same as MouseClick, but with an additional rightdown parameter.
See also:

- 164.4.4 mouseclick(down as boolean) 20781

164.4.6 MouseMove(globalx as Integer,globaly as Integer)

MBS ComputerControl Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Moves the mouse.
Example:

```
Var x,y as Integer
Var p as PresskeyMBS
p=new PresskeyMBS
x=system.mousex
y=system.mousey+10 // move ten pixels down
p.mousemove x,y
```

Notes: Moves the mouse on screen.
The destination must be specified in global screen coordinates.
Requires Mac OS 8.5 or newer for Mac OS Classic.

164.4.7 MouseMoveClick(globalx as Integer,globaly as Integer,down as boolean)

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Moves the mouse.
Notes: Moves the mouse on screen and clicks.
The destination must be specified in global screen coordinates.
Requires Mac OS 8.5 or newer for Mac OS Classic.

The Mac version sets the lasterror property.

Mac OS X only:
Based on the values entered, the appropriate mouse-down, mouse-up, mouse-move, or mouse-drag events are generated, by comparing the new state with the current state.
See also:

- 164.4.8 MouseMoveClick(globalx as Integer,globaly as Integer,down as boolean, rightdown as boolean) 20783

164.4.8 MouseMoveClick(globalx as Integer,globaly as Integer,down as boolean, rightdown as boolean)

MBS ComputerControl Plugin, Plugin Version: 8.1, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Moves the mouse cursor and clicks the mouse with the given buttons.
Notes: Same as MouseMoveClick, but with an additional rightdown parameter.
See also:

- 164.4.7 MouseMoveClick(globalx as Integer,globaly as Integer,down as boolean) 20782

164.4.9 press

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Presses a key.
Example:

```
' example for Mac OS X:
Var p as PresskeyMBS

p=new PresskeyMBS
p.shift=true
p.charcode=asc("H")
p.keycode=4
p.press 'press H
p.shift=false
p.charcode=asc("e")
p.keycode=14
p.press 'press e
p.charcode=asc("l")
p.keycode=37
p.press 'press l
p.press 'press l
p.charcode=asc("o")
```

```
p.keycode=31
p.press 'press o

' example for Windows:

editfield1.setfocus 'so we get something in it!

p=new PresskeyMBS
p.shift=true
p.charcode=asc("H")
p.virtualCode=-1 'automatically try to get this code
p.press 'press H
p.shift=false
p.virtualCode=-1 'after a call you find the virtualCode there
p.charcode=asc("e")
p.press 'press e
p.virtualCode=-1
p.charcode=asc("l")
p.press 'press l
p.press 'press l
p.virtualCode=-1
p.charcode=asc("o")
p.press 'press o
```

Notes: Simulates a keypress and handles the Settings for Shift, Control, Command and Option key.
Command shows no reaction in my tests for Mac OS Classic
On Windows, if you set virtualcode=-1 this method will set it to the code matching the charcode property.

The Mac version sets the lasterror property.

164.4.10 pressraw(down as boolean)

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Presses a key.
Example:

```
' Works perfectly on Mac OS X but Shift can't be done Raw on Mac OS 9:
Var p as PresskeyMBS

p=new PresskeyMBS

p.charcode=0
p.keycode=&h38
p.pressraw true 'shift down
```

```
p.charcode=asc("H")
p.keycode=4
p.pressraw true 'press H
p.pressraw false

p.charcode=0
p.keycode=&h38
p.pressraw false 'shift up

p.charcode=asc("e")
p.keycode=14
p.pressraw true 'press e
p.pressraw false
p.charcode=asc("l")
p.keycode=37
p.pressraw true 'press l
p.pressraw false
p.pressraw true 'press l
p.pressraw false
p.charcode=asc("o")
p.keycode=31
p.pressraw true 'press o
p.pressraw false
```

Notes: Simulates a keypress and doesn't handle the Settings for Shift, Control, Command and Option key. On Windows, if you set virtualcode=-1 this method will set it to the code matching the charcode property.

The Mac version sets the lasterror property.

164.4.11 Properties

164.4.12 Charcode as Integer

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The character you want to press.
Example:

```
Var p as PresskeyMBS

p=new PresskeyMBS
p.charcode=8
p.keycode=&h33
p.press // press backspace on Mac OS
```

Notes: On Mac OS Classic the final printed charcode inside an editfield is the one you pass.
(Read and Write property)

164.4.13 Command as boolean

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Tells the Press method to press down command key before and release it after it simulates the key press.
Example:

```
Var p as new PresskeyMBS
p.command=True
```

Notes: It looks like the command key is not working for Mac OS Classic.
On Windows the control key is pressed if control or command properties are true.
(Read and Write property)

164.4.14 Control as boolean

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Tells the Press method to press down control key before and release it after it simulates the key press.
Example:

```
Var p as new PresskeyMBS
p.Control=True
```

Notes: On Windows the control key is pressed if control or command properties are true.
(Read and Write property)

164.4.15 Keycode as Integer

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: For Mac OS the number of the key on the keyboard which is pressed.
Example:

```
Var p as PresskeyMBS
p=new PresskeyMBS
```

```
p.keycode=2
p.charcode=asc("d")
p.press 'shows a "d" on Mac OS
```

Notes: You find this codes in that nice tables for the codes of the Spritesurface in the Xojo books.
(Read and Write property)

164.4.16 Lasterror as Integer

MBS ComputerControl Plugin, Plugin Version: 3.3, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Not all functions of this class fill this property!
(Read and Write property)

164.4.17 Option as boolean

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Tells the Press method to press down option key before and release it after it simulates the key press.
Example:

```
Var p as PresskeyMBS
p.option=True
```

Notes: (Read and Write property)

164.4.18 Shift as boolean

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Tells the Press method to press down shift before and release it after it simulates the key press.
Example:

```
Var p as PresskeyMBS

p=new PresskeyMBS
p.shift=true
p.charcode=asc("1")
p.keycode=18
p.press 'press !
```

Notes: (Read and Write property)

164.4.19 VirtualCode as Integer

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The virtual keycode to press.
Example:

```
Var p as PresskeyMBS
p=new PresskeyMBS
p.charcode=asc("m")
p.virtualcode=-1
p.press ' makes a "m" on Windows.
```

Notes: If you don't know this code, just pass -1 and this value will be filled automatically using the charcode property.
After you call press or pressraw you'll find the matching virtualcode in this property.
(Read and Write property)

164.5 module RemoteControlMBS

164.5.1 module RemoteControlMBS

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This module collects methods for simulating user input with mouse and keyboard.
Example:

```
// move the mouse to a screen position and click there
If RemoteControlMBS.MoveMouse(400, 300) Then
Call RemoteControlMBS.MouseClick(400, 300, True) // mouse down
Call RemoteControlMBS.MouseClick(400, 300, False) // mouse up
End If
```

Notes: You can use this class for GUI scripting.
Requires libXtst.so.6 on Linux to be installed.

- 22.1, page 9: News

164.5.2 Methods

164.5.3 LinuxConvertCase(keysymbol as Integer, byref lowerSymbol as Integer, byref upperSymbol as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Converts the case of the given keysymbol.
Notes: In lowerSymbol you will receive the key symbol for a lower case key and in upperSymbol the uppercase keys.

So passing in the key symbol of "a" or "A" will both return "a" and "A".

164.5.4 LinuxKeyCodeToKeySymbol(keycode as Integer, index as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns from the keyboard mapping tables the key symbol for the given key code.
Notes: Index is the offset in the tables. 0 for the first key symbol and 1 for the second. If the user presses shift the keyboard driver uses index=1 to access the capital letters.

164.5.5 LinuxKeyNameToKeySymbol(keyname as string) as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Searches the key mapping list for the key symbol for a given name.
Notes: Returns 0 on failure.

164.5.6 LinuxKeySymbolToKeyCode(keysymbol as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Searches the hardware dependent key code for the given key symbol.
Notes: Returns 0 on any error.

164.5.7 LinuxKeySymbolToKeyName(keysymbol as Integer) as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns the name of the key symbol.
Notes: Can return "" on an invalide keysymbol value.

164.5.8 LinuxMouseClick(ButtonID as Integer, ButtonDown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simulates a mouse click with the given button.
Notes: ButtonID=1 is the left mouse button.
Returns true on success.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.

164.5.9 LinuxMousePositionX as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

164.5.10 LinuxMousePositionY as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

164.5.11 LinuxMoveMouse(x as Integer, y as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Moves the mouse to the given position.
Notes: Returns true on success.

164.5.12 LinuxPressControlKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Presses the ctrl key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

164.5.13 LinuxPressKey(Keycode as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Presses the key with the given keycode.
Notes: Performs a key down and a key up event.
Returns true on success.
See also:

- 164.5.14 LinuxPressKey(Keycode as Integer, ButtonDown as boolean) as boolean 20792

164.5.14 LinuxPressKey(Keycode as Integer, ButtonDown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Performs a key event.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.
See also:

- 164.5.13 LinuxPressKey(Keycode as Integer) as boolean 20792

164.5.15 LinuxPressOptionKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Presses the alt key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

164.5.16 LinuxPressShiftKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Presses the shift key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

164.5.17 LinuxSupported as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Whether the functions are available for simulation of keyboard and mouse events.
Notes: Returns true if the Xtest extension is installed.

164.5.18 MacCurrentProcessID as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the process ID of your application.
Notes: Returns 0 on any error.

164.5.19 MacCurrentProcessName as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the name of the current process.
Example:

MessageBox RemoteControlMBS.MacCurrentProcessName

Notes: This is the name of your application.

164.5.20 MacDescriptionForKeyCode(keycode as Integer) as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Translates a keycode to a string for displaying.
Notes: Keycodes which match a special key like "Return", "F1" or "Backspace" are returned as descriptive strings.

164.5.21 MacDisplayNameForKeyCode(keycode as Integer) as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Translates a keycode to a string for displaying.
Notes: Same as MacTextForKeyCode(keycode, 4)

164.5.22 MacForegroundProcessID as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the process ID of the application in the foreground.
Notes: Returns 0 on any error.

164.5.23 MacFrontProcessName as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the front process.
Example:

```
RemoteControlMBS.MacFrontProcessName="iChat" // move iChat to front
```

Notes: (Read and Write computed property)

164.5.24 MacKeyboardLocalizedName as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The localized name of the current keyboard layout.
Notes: Returns "" on any error.

164.5.25 MacKeyboardName as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the current keyboard layout.
Notes: Returns "" on any error.

Added 64-bit support for version 17.0.

164.5.26 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Clicks the mouse buttons on the given position.
Example:

```
// doing a context menu click with control key:

Var x,y as Integer
x=System.MouseX
y=System.MouseY

call RemoteControlMBS.PressControlKey true
call RemoteControlMBS.MacMouseClick x, y, true, true
call RemoteControlMBS.MacMouseClick x, y, true, false
call RemoteControlMBS.PressControlKey false
```

Notes: Returns true on success.
If updateMouseCursorPosition is true the mouse position is updated on screen.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.
See also:

- 164.5.27 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean) as boolean 20795
- 164.5.28 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean, MouseButton3 as boolean) as boolean 20796

164.5.27 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Clicks the mouse buttons on the given position.
Example:

```
// do a right click:

Var x,y as Integer
x=System.MouseX
y=System.MouseY
```

call RemoteControlMBS.MacMouseClick x, y, true, false, true
call RemoteControlMBS.MacMouseClick x, y, true, false, false

Notes: Returns true on success.
If updateMouseCursorPosition is true the mouse position is updated on screen.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.
See also:

- 164.5.26 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean) as boolean 20795
- 164.5.28 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean, MouseButton3 as boolean) as boolean 20796

164.5.28 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean, MouseButton3 as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Clicks the mouse buttons on the given position.
Notes: Returns true on success.
If updateMouseCursorPosition is true the mouse position is updated on screen.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.
See also:

- 164.5.26 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean) as boolean 20795
- 164.5.27 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean) as boolean 20795

164.5.29 MacMousePositionX as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

164.5.30 MacMousePositionY as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

164.5.31 MacMouseWheel(wheel1 as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Performs a wheel event.
Example:

call RemoteControlMBS.MacMouseWheel 1

Notes: Returns true on success.
A typical value for the wheel changes are in range from -10 to 10.
See also:

- 164.5.32 MacMouseWheel(wheel1 as Integer, wheel2 as Integer) as boolean 20797

164.5.32 MacMouseWheel(wheel1 as Integer, wheel2 as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Performs a wheel event.
Example:

call RemoteControlMBS.MacMouseWheel 10,5

Notes: Returns true on success.
A typical value for the wheel changes are in range from -10 to 10.
See also:

- 164.5.31 MacMouseWheel(wheel1 as Integer) as boolean 20797

164.5.33 MacMoveMouse(x as Double, y as Double) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Moves the mouse to the given position.
Example:

call RemoteControlMBS.MacMoveMouse(100,100)

Notes: Returns true on success.
On Mac does not generate mouse events.

164.5.34 MacPressCommandKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Presses the command key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

164.5.35 MacPressControlKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Presses the ctrl key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

164.5.36 MacPressKey(keychar as Integer, virtualkey as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Presses the given key.
Notes: keychar is the ASCII code of the key you press and virtualkey is the key code.
Returns true on success.
Peforms a key down and a key up event.
See also:

- 164.5.37 MacPressKey(keychar as Integer, virtualkey as Integer, keydown as boolean) as boolean 20798

164.5.37 MacPressKey(keychar as Integer, virtualkey as Integer, keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Presses the given key.
Notes: keychar is the ASCII code of the key you press and virtualkey is the key code.
Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.
See also:

- 164.5.36 MacPressKey(keychar as Integer, virtualkey as Integer) as boolean 20798

164.5.38 MacPressOptionKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Presses the option key. (labeled with alt)
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

164.5.39 MacPressShiftKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Presses the shift key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

164.5.40 MacProcessCount as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Counts the high level processes.
Example:

MessageBox str(remoteControlMBS.macprocessCount)

164.5.41 MacProcessName(index as Integer) as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the process with the given index.
Example:

```
Var i,c as Integer

// search iChat and make it visible
c=remoteControlMBS.macprocesscount
for i=0 to c-1
if remoteControlMBS.macprocessname(i)="iChat" then
remoteControlMBS.macprocessVisible(i)=true
end if
next
```

Notes: Index is from 0 to MacProcessCount-1.

164.5.42 MacProcessVisible(index as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether a process is visible or not.
Example:

```
Var i,c as Integer

// search Safari and make it invisible
c=remoteControlMBS.macprocesscount
for i=0 to c-1
if remoteControlMBS.macprocessname(i)="Safari" then
remoteControlMBS.macprocessVisible(i)=false
end if
next
```

Notes: Index is from 0 to MacProcessCount-1.
(Read and Write computed property)

164.5.43 MacTextForKeyCode(keycode as Integer, KeyAction as Integer, ModifierState as Integer) as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Translates a keycode to a string.
Example:

```
// try some keycodes like e, E, ,Ç¨ or √©
Var key as string = "@"

const kCommandKey = 1
const kShift = 2
const kCapsLock = 4
const kOption = 8
const kControl = 16

// with no modifiers
for i as Integer = 0 to 127

Var s as string = RemoteControlMBS.MacTextForKeyCode(i, 3, 0)

if StrComp(key, s, 0) = 0 then
MessageBox "Found with keycode "+str(i)
Return
end if

next

// with shift
for i as Integer = 0 to 127

Var s as string = RemoteControlMBS.MacTextForKeyCode(i, 3, kShift)

if StrComp(key, s, 0) = 0 then
MessageBox "Found with keycode "+str(i)+" with Shift"
Return
end if

next

// with option
for i as Integer = 0 to 127

Var s as string = RemoteControlMBS.MacTextForKeyCode(i, 3, kOption)

if StrComp(key, s, 0) = 0 then
MessageBox "Found with keycode "+str(i)+" with Option"
Return
end if

next
```

Notes: Works only with Unicode keyboard layouts which need Mac OS X 10.5.

Modifier values:

Command Key	1
Shift	2
CapsLock	4
Option	8
Control	16

Possible constants for the Key Action:

kUCKeyActionDown	0	The user is pressing the key.
kUCKeyActionUp	1	The user is releasing the key.
kUCKeyActionAutoKey	2	The user has the key in an "auto-key" pressed state that is, the user is holding down the key for an extended period of time and is thereby generating multiple key strokes from the single key.
kUCKeyActionDisplay	3	The user is requesting information for key display, as in the Key Caps application.

164.5.44 MouseClick(x as Integer, y as Integer, down as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Performs a mouse click.
Notes: The mouse cursor is moved to the given position and the first mouse button is pressed.
Returns true on success.

164.5.45 MousePositionX as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

164.5.46 MousePositionY as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

164.5.47 MoveMouse(x as Integer, y as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Moves the mouse to the given location.
Notes: Returns true on success.
On Mac does not generate mouse events.

164.5.48 PressControlKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Presses the ctrl key.
Notes: Returns true on success.

164.5.49 PressOptionKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Presses the option key.
Notes: Returns true on success.

164.5.50 PressShiftKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Presses the shift key.
Notes: Returns true on success.

164.5.51 WinBringProcessToTop(ProcessID as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Brings all windows of process to the front.
Notes: Returns true if function found at least one window.

164.5.52 WinBringWindowToTop(WindowHandle as Integer, SetFocus as boolean = true) as boolean

MBS ComputerControl Plugin, Plugin Version: 13.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Brings a given window to front.
Example:

```
Var h as Integer = RemoteControlMBS.WinFindWindow("", "Calculator")
call RemoteControlMBS.WinBringWindowToTop h
```

Notes: Pass any window handle, including windows from other applications.
If SetFocus is true, we also set the focus.
Returns true on success.

164.5.53 WinCurrentProcessID as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the process ID of your application.
Notes: Returns 0 on any error.

164.5.54 WinFindWindow(ClassName as string, WindowName as string) as Integer

MBS ComputerControl Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Finds a window based on the classname and/or the window name.
Example:

```
Var h as Integer = RemoteControlMBS.WinFindWindow("SciCalc","")
MessageBox hex(h)
```

Notes: One of the names can be an empty string so only the other name is used. Normally you should prefer the class name as it is not localized. The WindowsListMBS class can help you finding the class name of a window.
Returns 0 on any error.

164.5.55 WinForegroundProcessID as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the process ID of the application which owns the foreground window.
Notes: Returns 0 on any error.

164.5.56 WinFrontWindowTitle as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The title of the window which has the focus.
Example:

title=remoteControlMBS.winfrontWindowTitle

Notes: May return "" on any error.

164.5.57 WinIsCapsLock as boolean

MBS ComputerControl Plugin, Plugin Version: 23.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether caps lock is set.
Example:

```
// check state in a timer
if RemoteControlMBS.WinKeyIsCapsLock then
title = "caps lock on"
else
Title = "caps lock off"
end if
```

Notes: User may press the caps lock key to toggle between on and off.

164.5.58 WinIsNumLock as boolean

MBS ComputerControl Plugin, Plugin Version: 23.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether caps lock is set.
Example:

```
// check state in a timer
if RemoteControlMBS.WinIsNumLock then
title = "num lock on"
else
Title = "num lock off"
end if
```

Notes: User may press the num lock key to toggle between on and off.

164.5.59 WinIsScrollLock as boolean

MBS ComputerControl Plugin, Plugin Version: 23.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether scroll lock is set.
Example:

```
// check state in a timer
if RemoteControlMBS.WinIsScrollLock then
title = "scroll lock on"
else
Title = "scroll lock off"
end if
```

Notes: User may press the scroll lock key to toggle between on and off.
For macOS and Parallels, this key is F14 on the Mac keyboard.

164.5.60 WinIsWindowMinimized(WindowHandle as Integer) as Boolean

MBS ComputerControl Plugin, Plugin Version: 15.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Checks whether the specified window is minimized.
Notes: Returns true if minimized.
Use RemoteControlMBS.WinFindWindow if you need to find a window handle.

164.5.61 WinIsWindowVisible(WindowHandle as Integer) as Boolean

MBS ComputerControl Plugin, Plugin Version: 15.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Checks the visibility state of the specified window.
Notes: Returns true if visible or false if not.
Use RemoteControlMBS.WinFindWindow if you need to find a window handle.

164.5.62 WinKeyboardName as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the current Windows keyboard layout.

164.5.63 WinKeyIsDown(virtualkey as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Tests whether a given key is currently pressed.

164.5.64 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use WinMouseClick with integer parameters instead. **Function:** Peforms a mouse click on the given position.
Notes: If AbsolutePosition is false the given coordinates are relative to the current position.
Returns true on success.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.
See also:

- 164.5.65 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean) as boolean 20808
- 164.5.66 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean, MouseButton3 as boolean) as boolean 20808
- 164.5.67 WinMouseClick(x as integer, y as integer, AbsolutePosition as boolean, MouseButton1 as Integer, MouseButton2 as Integer, MouseButton3 as Integer) as boolean 20809

164.5.65 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use WinMouseClick with integer parameters instead. **Function:** Peforms a mouse click on the given position.
Notes: If AbsolutePosition is false the given coordinates are relative to the current position.
Returns true on success.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.

Deprecated. Please use the version taking integers, so you can click only one button without others.
See also:

- 164.5.64 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean) as boolean 20807
- 164.5.66 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean, MouseButton3 as boolean) as boolean 20808
- 164.5.67 WinMouseClick(x as integer, y as integer, AbsolutePosition as boolean, MouseButton1 as Integer, MouseButton2 as Integer, MouseButton3 as Integer) as boolean 20809

164.5.66 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean, MouseButton3 as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use WinMouseClick with integer parameters instead. **Function:** Peforms a mouse click on the given position.
Notes: If AbsolutePosition is false the given coordinates are relative to the current position.
Returns true on success.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.

Deprecated. Please use the version taking integers, so you can click only one button without others.
See also:

- 164.5.64 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean) as boolean 20807

- 164.5.65 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean) as boolean 20808
- 164.5.67 WinMouseClick(x as integer, y as integer, AbsolutePosition as boolean, MouseButton1 as Integer, MouseButton2 as Integer, MouseButton3 as Integer) as boolean 20809

164.5.67 WinMouseClick(x as integer, y as integer, AbsolutePosition as boolean, MouseButton1 as Integer, MouseButton2 as Integer, MouseButton3 as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Peforms a mouse click on the given position.
Example:

```
Const x = 100
Const y = 100

// press right mouse button

Var success1 As Boolean = RemoteControlMBS.WinMouseClick(x, y, True, -1, 1, -1)

// and up
Var success2 As Boolean = RemoteControlMBS.WinMouseClick(x, y, True, -1, 0, -1)
```

Notes: If AbsolutePosition is false the given coordinates are relative to the current position.
Returns true on success.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.
Pass 1 to click mouse button down, 0 to release it or -1 to not touch the button.
See also:

- 164.5.64 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean) as boolean 20807
- 164.5.65 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean) as boolean 20808
- 164.5.66 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean, MouseButton3 as boolean) as boolean 20808

164.5.68 WinMousePositionX as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

164.5.69 WinMousePositionY as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

164.5.70 WinMoveMouse(x as Integer, y as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Moves the mouse cursor to the given position.
Notes: Returns true on success.
Internally the coordinates are converted to normalized absolute coordinates which can lead to have the mouse one pixel off the requested position due to rounding.

164.5.71 WinPressControlKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Presses the ctrl key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

164.5.72 WinPressKey(ScanCode as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a key event with the given data.
Notes: This methods creates a keydown and a keyup event.
Returns true on success.
See also:

- 164.5.73 WinPressKey(ScanCode as Integer, keydown as boolean) as boolean 20811
- 164.5.74 WinPressKey(virtualkey as Integer, ScanCode as Integer) as boolean 20811

- 164.5.75 WinPressKey(virtualkey as Integer, ScanCode as Integer, keydown as boolean) as boolean 20811

164.5.73 WinPressKey(ScanCode as Integer, keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a key event with the given data.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.
See also:

- 164.5.72 WinPressKey(ScanCode as Integer) as boolean 20810
- 164.5.74 WinPressKey(virtualkey as Integer, ScanCode as Integer) as boolean 20811
- 164.5.75 WinPressKey(virtualkey as Integer, ScanCode as Integer, keydown as boolean) as boolean 20811

164.5.74 WinPressKey(virtualkey as Integer, ScanCode as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a key event with the given data.
Notes: This methods creates a keydown and a keyup event.
Returns true on success.
See also:

- 164.5.72 WinPressKey(ScanCode as Integer) as boolean 20810
- 164.5.73 WinPressKey(ScanCode as Integer, keydown as boolean) as boolean 20811
- 164.5.75 WinPressKey(virtualkey as Integer, ScanCode as Integer, keydown as boolean) as boolean 20811

164.5.75 WinPressKey(virtualkey as Integer, ScanCode as Integer, keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a key event with the given data.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.
See also:

- 164.5.72 WinPressKey(ScanCode as Integer) as boolean 20810
- 164.5.73 WinPressKey(ScanCode as Integer, keydown as boolean) as boolean 20811
- 164.5.74 WinPressKey(virtualkey as Integer, ScanCode as Integer) as boolean 20811

164.5.76 WinPressOptionKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Presses the alt key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

164.5.77 WinPressShiftKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Presses the shift key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

164.5.78 WinScanCodeToVirtualKeyCode(ScanCode as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Searches the virtual key code for the given scancode.
Notes: Each key has a hardware dependent scan code. For each scancode you can get the virtual key code which is hardware independent.

Returns 0 on failure.

164.5.79 WinSendMessage(Win as DesktopWindow, Msg as integer, lParam as integer, WParam as integer) as integer

MBS ComputerControl Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Sends a Windows message to a given window.
Notes: The result depends on the message command.
See also:

- 164.5.80 WinSendMessage(Win as window, Msg as Integer, lParam as Integer, WParam as Integer) as Integer 20813
- 164.5.81 WinSendMessage(WindowHandle as Integer, Msg as Integer, lParam as Integer, WParam as Integer) as Integer 20813

164.5.80 WinSendMessage(Win as window, Msg as Integer, lParam as Integer, WParam as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop only.

Function: Sends a Windows message to a given window.
Example:

```
const WM_CLOSE = &h0010

call RemoteControlMBS.WinSendMessage(Window1, WM_CLOSE, 0, 0)
```

Notes: The result depends on the message command.
See also:

- 164.5.79 WinSendMessage(Win as DesktopWindow, Msg as integer, lParam as integer, WParam as integer) as integer 20813
- 164.5.81 WinSendMessage(WindowHandle as Integer, Msg as Integer, lParam as Integer, WParam as Integer) as Integer 20813

164.5.81 WinSendMessage(WindowHandle as Integer, Msg as Integer, lParam as Integer, WParam as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sends a Windows message to a given window.
Example:

```
const WM_CLOSE = &h0010
Var h as Integer = RemoteControlMBS.WinFindWindow("SciCalc","")
```

```
call RemoteControlMBS.WinSendMessage(h, WM_CLOSE, 0, 0) // Closes Calc
```

Notes: The result depends on the message command.
See also:

- 164.5.79 WinSendMessage(Win as DesktopWindow, Msg as integer, lParam as integer, WParam as integer) as integer 20813
- 164.5.80 WinSendMessage(Win as window, Msg as Integer, lParam as Integer, WParam as Integer) as Integer 20813

164.5.82 WinShowWindow(WindowHandle as Integer, CmdShow as Integer) as Boolean

MBS ComputerControl Plugin, Plugin Version: 15.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Shows or hides a window.
Notes: CmdShow can be:

0	Hide
1	Show normal
2	Show minimized
3	Maximize
4	Show without activating
5	Show
6	Minimize
7	Show minimized without activating
8	Show normal without activating
9	Restore
10	Show default
11	Force minimized

Use RemoteControlMBS.WinFindWindow if you need to find a window handle.

164.5.83 WinVirtualKeyCodeToCharCode(VirtualKeyCode as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the char code for a virtual key code.
Notes: Returns 0 on failure.

164.5.84 WinVirtualKeyCodeToScanCode(VirtualKeyCode as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Finds the scan code to match the given virtual key code.
Notes: Returns 0 on failure.

164.5.85 WinVirtualKeyForASCII(Character as Integer, byref VirtualKeyCode as Integer, Byref ShiftKey as boolean, byref ControlKey as Boolean, byref AltKey as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns for a given character which combination of key code and modifiers created the character.
Notes: For Character, you should use asc(string), but you may need to convert the string to Windows ANSI text encoding.

Returns 0 on failure.

Chapter 165

Resolution

165.1 class DisplayMBS

165.1.1 class DisplayMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Defines a class for accessing the displays of the screen.
Example:

```
// list all displays with position, size, color depth and refresh rate
Var lines() As String
For i As Integer = 0 To DisplayCountMBS - 1
Var d As DisplayMBS = GetDisplayMBS(i)
lines.Add "Display " + i.ToString + ": " + d.Width.ToString + " x " + d.Height.ToString + " at " +
d.Left.ToString + "/" + d.Top.ToString + _
", " + d.Depth.ToString + " bit, " + d.hz.ToString + " Hz"
Next
MessageBox String.FromArray(lines, EndOfLine)
```

165.1.2 Methods

165.1.3 CanDepth(depth as Integer) As Boolean

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns true if the monitor supports the given color depth at the current ResolutionMBS.
Notes: none.

165.1.4 FadeGamma(intensity as Integer, col As Color)

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets the gamma of the DisplayMBS
Notes: Intensity has to be between 0 and 1000. 1000 is normal, when it is 0, the whole DisplayMBS is in the color GammaColor.
Direct color display modes do not use color lookup tables and are usually 16, 24, or 32 bit. Not all direct color video boards support loadable gamma ramps.

See the NativeGamma documentation for more details on Windows Gamma details.

165.1.5 FadeGammaTo(intensity as Integer, col As Color, ticks as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Fades the intensity and color of the gamma slowly in the given number of milliseconds.
Notes: Intensity has to be between 0 and 1000. 1000 is normal, when it is 0, the whole display is in the color GammaColor.
Direct color display modes do not use color lookup tables and are usually 16, 24, or 32 bit. Not all direct color video boards support loadable gamma ramps.
See the NativeGamma documentation for more details on Windows Gamma details.

165.1.6 GetBestResolution(width as Integer, height as Integer, depth as Integer, safe As Boolean) As ResolutionMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Searches for the best matching resolution.
Notes: Returns the best resolution which size is not smaller that the dimensions given, which has the given depth and, if safe is true, which is safe. If safe is not true, be sure that the frequency works, if you want to switch to it (for example by asking the user).
On Mac OS X till now no resolution can be called safe.
See also:

- 165.1.7 GetBestResolution(width as Integer, height as Integer, safe As Boolean) As ResolutionMBS 20819

165.1.7 GetBestResolution(width as Integer, height as Integer, safe As Boolean) As ResolutionMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Searches for the best matching resolution.
Notes: Returns the best resolution which size is not smaller that the dimensions given, which has the highest depth and, if safe is true, which is safe. If safe is not true, be sure that the frequency works, if you want to switch to it (for example by asking the user).
On Mac OS X till now no resolution can be called safe.
See also:

- 165.1.6 GetBestResolution(width as Integer, height as Integer, depth as Integer, safe As Boolean) As ResolutionMBS 20819

165.1.8 GetCurrentResolution As ResolutionMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns the current resolution.
Notes: Returns the resolution the display is currently set to. This is useful if you want to switch back to the old resolution after you switched to another resolution.

165.1.9 GetLargestResolution(depth as Integer, safe As Boolean) As ResolutionMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Searches for the largest resolution with the given depth.
Notes: The same as GetBestResolution(width, height, depth, safe), the only difference is that it does not

search for the smallest resolution but for the biggest one.
On Mac OS X till now no resolution can be called safe.
See also:

- 165.1.10 GetLargestResolution(safe As Boolean) As ResolutionMBS 20820

165.1.10 GetLargestResolution(safe As Boolean) As ResolutionMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Searches for the largest resolution.
Notes: If safe is true, this method returns only safe resolutions.
On Mac OS X till now no resolution can be called safe.
See also:

- 165.1.9 GetLargestResolution(depth as Integer, safe As Boolean) As ResolutionMBS 20819

165.1.11 GetResolution(num as Integer) As ResolutionMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns a resolution.
Notes: Num has to be between 0 and ResolutionCount(safe)-1.

165.1.12 ResolutionCount(depth as Integer, safe As Boolean) as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns the number of resolutions for a given depth.
Notes: This method returns the number of resolutions that have the given depth and, if safe is true, which are safe.
On Mac OS X till now no ResolutionMBS can be called safe.
See also:

- 165.1.13 ResolutionCount(safe As Boolean) as Integer 20820

165.1.13 ResolutionCount(safe As Boolean) as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns the number of resolutions.
Notes: This method returns the total number of resolutions this monitor supports and, if safe is true, which are safe. Safe resolutions are resolutions which will always work.

On Mac OS X till now no ResolutionMBS can be called safe.
See also:

- 165.1.12 ResolutionCount(depth as Integer, safe As Boolean) as Integer 20820

165.1.14 SetDepth(depth as Integer) As Boolean

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Switches the color depth to the depth given. Returns true if attempt was successful.
Notes: none.

165.1.15 SwitchTo(width as Integer, height as Integer, depth as Integer, safe As Boolean) As Boolean

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Switches to the given ResolutionMBS if possible.
Notes: This method tries to switch directly to the best ResolutionMBS which size is bigger or the same as the given dimensions and which depth is the same as the given parameter. It returnes true if it was successful. Try this function first with safe set to true. If that fails, try again with false, but after that show a dialog asking the user if that ResolutionMBS is okay. If the user presses escape or clicks cancel, you should immediatly switch back to the old ResolutionMBS.
On Mac OS X till now no ResolutionMBS can be called safe.

165.1.16 Update

MBS Util Plugin, Plugin Version: 3.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Updates the properties in this class.
Notes: Call it whenever you detect a screen resolution change to update the content of this class.
In general you should not keep DisplayMBS classes around too long because the display described may go away (one a Powerbook the external display).

165.1.17 Properties

165.1.18 Depth as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Depth of the DisplayMBS.
Notes: Can be 8, 16 or 32. Other screen depths are not well supported.

(Read only property)

165.1.19 displaynum as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: DisplayNum is the number of the DisplayMBS
Notes: The number is always between 0 and DisplayCount-1, where 0 is the main monitor.
(Read only property)

165.1.20 GammaColor as color

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: The color for fading the DisplayMBS.
Notes: This property is read-only. To change it, use the methods of the DisplayMBS class and the Switch method of the ResolutionMBS class.
There is no fading for Windows.
(Read only property)

165.1.21 GammaIntensity as Integer

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: GammaIntensity is the intensity of the monitor.
Notes: 1000 is normal, if it is 0, the whole DisplayMBS is in the color GammaColor.
This property is read-only. To change it, use the methods of the DisplayMBS class and the Switch method of the ResolutionMBS class.
There is no fading for Windows.
(Read only property)

165.1.22 Height as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Height of the monitor.
Notes: (Read only property)

165.1.23 hz as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: frequency in Hz of that DisplayMBS
Example:

```
Var d as DisplayMBS

d=GetDisplayMBS(0)

MessageBox str(d.Hz)
```

Notes: On Windows:
Sometimes Hz is 0, this is when Windows itself does not know the frequency (at least it is so in my emulation, Virtual PC 3.0 with Win95).
The value should never be greater as the real frequency, so you can just ignore this.
(Read only property)

165.1.24 Left as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: The relative left offset to the other monitors.
Notes: Should be 0 for the main monitor.
(Read only property)

165.1.25 Top as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: The relative top offset to the other monitors.
Notes: Should be 0 for the main monitor.
(Read only property)

165.1.26 Width as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Width of this screen.
Notes: (Read only property)

165.1.27 NativeGamma as memoryblock

MBS Util Plugin, Plugin Version: 3.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: The native gamma values.
Example:

```
Var d as DisplayMBS // your display
d.nativegamma=newmemoryblock(3072) // all black
```

Notes: 3072 bytes big is this array a 256 RGB values saved in 3 single properties.

Some notes for SetDeviceGammaRamp, which is the Windows function used by the plugin:

SetDeviceGammaRamp doesn't allow all gamma ramps. It checks the gamma ramp; if it is too complex, such as the red flash when the player is shot in Quake, it rejects it.
SetDeviceGammaRamp will not currently make use of a gamma calibrator. This may change in future versions of Image Color Management (ICM), but for Windows 2000, only the DirectDraw API supports the gamma calibrators.
The existing gamma entry points is already used by GetDeviceGammaRamp and SetDeviceGammaRamp. Therefore, the display driver doesn't need to do anything special to support this new interface, as long as it already supports the Win32 Get/SetDeviceGammaRamp functions.
In addition to getting and setting gamma ramps, the new DirectDraw interface allows the new gamma ramp to be calibrated—if a gamma calibrator is installed. The mechanism that DirectDraw uses to register and communicate with the gamma calibrator is an interim mechanism that will be changed in future releases.
DirectDraw looks for an installed software calibrator and passes the gamma value to the software calibrator; the software calibrator in turn adjusts the gamma ramp according to the measured response of the monitor. The calibrator passes the gamma ramp back to DirectDraw, which passes it to the SetDeviceGammaRamp device driver interface (DDI). The result is that the game looks as intended.
For DirectDraw to use the gamma calibrator, the calibrator must register itself with DirectDraw using a registry key; DirectDraw will call it if the application wants the gamma ramp to be calibrated.
In the future, both the method by which DirectDraw communicates with the gamma calibrator, through the DDI, and the method gamma calibrators use to register themselves in the registry will change. But every part of the DirectDraw API is permanent.
ICM is the color management system in Windows; all system-level color management should be handled by ICM. For this reason, downloadable gamma ramp support will be rolled into ICM in the future, making current solutions for gamma calibrators obsolete. Until such time, we have provided a method by which applications can take advantage of the installed base of software calibrators and graphics adapters that support downloadable gamma ramps.
(Read and Write computed property)

165.2 Globals

165.2.1 DisplayCountMBS as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: DisplayCount returns the number of displays connected.
Example:

```
MessageBox "You have "+str(DisplayCountMBS)+" screens."
```

165.2.2 GetDisplayMBS(num as Integer) As DisplayMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns an object of class DisplayMBS for the given DisplayMBS.
Example:

```
Var d as DisplayMBS

d=GetDisplayMBS(0)
MessageBox str(d.width)+" x "+str(d.height)+" @ "+str(pow(2,d.depth))+" colors"
```

Notes: num must be: 0 <= num <displaycount

165.2.3 ResolutionLibraryPresentMBS as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns true if the DisplayManager library file was found.
Example:

```
if not ResolutionLibraryPresentMBS then
MessageBox "I'm missing the shared library 'DisplayManager'."
end if
```

Notes: This library should be present on all Mac OS Classic versions. (It is in the system suitcase.)
Returns always true on Windows.
Blog Entries

- MBS Xojo Plugins, version 20.6pr4

165.2.4 UpdateDisplayCountMBS

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Rebuilds the display list.
Notes: If new displays are attached or removed, this method needs to be called.

165.3 class ResolutionMBS

165.3.1 class ResolutionMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Defines a class for accessing the resolutions a screen.
Blog Entries

- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr4

165.3.2 Methods

165.3.3 Switch As Boolean

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: This function switches the DisplayMBS to the ResolutionMBS and returns true if the attempt was successful.
Notes: If IsSafe is false, show a dialog after the switch asking the user if that ResolutionMBS is okay. If the user presses escape or clicks cancel, you should immediatly switch back to the old ResolutionMBS. Especially on VGA-Monitors not all listed frequencies work.
On Mac OS X till now no ResolutionMBS can be called safe.

165.3.4 Properties

165.3.5 Depth as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Depth of the ResolutionMBS.
Notes: Can be 8, 16 or 32. Other screen depths are not well supported.
(Read only property)

165.3.6 displaynum as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: DisplayNum is the number of the DisplayMBS
Notes: The number is always between 0 and DisplayCount-1, where 0 is the main monitor.
(Read only property)

165.3.7 Height as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Height of the ResolutionMBS.
Notes: (Read only property)

165.3.8 hz as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: frequency in Hz of that ResolutionMBS
Notes: Sometimes Hz is 0, this is when Windows itself does not know the frequency (at least it is so in my emulation, Virtual PC 3.0 with Win95).
(Read only property)

165.3.9 issafe as boolean

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Is it a safe ResolutionMBS?
Notes: On Mac OS X till now no ResolutionMBS can be called safe.
(Read only property)

165.3.10 Left as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: The relative left offset to that ResolutionMBS.
Notes: Should be 0 for the main monitor.
(Read only property)

165.3.11 ResolutionNum as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: DisplayNum is the number of the DisplayMBS.
Notes: ResolutionNum is the number of the DisplayMBS which always is between 0 and GetDisplayMBS(DisplayNum).ResolutionCount(false)-1.

On Windows: dis.GetCurrentResolution.resolutionNum is sometimes also -1.
(Read only property)

165.3.12 Top as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: The relative top offset to the other monitors.
Notes: Should be 0 for the main monitor.
(Read only property)

165.3.13 Width as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Width of this ResolutionMBS.
Notes: (Read only property)

Chapter 166

RFC

166.1 class RFCClassDescriptionMBS

166.1.1 class RFCClassDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a class description.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

166.1.2 Methods

166.1.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

166.1.4 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

166.1.5 Properties

166.1.6 AttributesCount as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries attribute count for class.
Notes: (Read only property)

166.1.7 Connection as RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The connection owning this object.
Notes: (Read only property)

166.1.8 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

166.1.9 ImplementedInterfacesCount as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of implemented interfaces.
Notes: (Read only property)

166.1.10 Name as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the class.
Notes: (Read only property)

166.1.11 Parent as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: (Read only property)

166.1.12 ParentClassesCount as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of parent classes.
Notes: (Read only property)

166.2 class RFCConnectionAttributesMBS

166.2.1 class RFCConnectionAttributesMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for information about the partner system on the other side of this RFC connection.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

166.2.2 Methods

166.2.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

166.2.4 Properties

166.2.5 client as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Client ("Mandant")
Notes: (Read only property)

166.2.6 codepage as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Own code page.
Notes: (Read only property)

166.2.7 Connection as RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The connection used to get this information.
Notes: (Read only property)

166.2.8 cpicConvId as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: CPI-C Conversation ID.
Notes: (Read only property)

166.2.9 dest as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: RFC destination.
Notes: (Read only property)

166.2.10 host as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Own host name.
Notes: (Read only property)

166.2.11 isoLanguage as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: 2-byte ISO-Language
Notes: (Read only property)

166.2.12 kernelRel as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner kernel release.
Notes: (Read only property)

166.2.13 language as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Language.
Notes: (Read only property)

166.2.14 Parent as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object for this object.
Notes: (Read only property)

166.2.15 partnerBytesPerChar as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of bytes per character in the backend's current codepage.
Notes: Note this is different from the semantics of the PCS parameter.
(Read only property)

166.2.16 partnerCodepage as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner code page.
Notes: (Read only property)

166.2.17 partnerHost as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner host name.
Notes: (Read only property)

166.2.18 partnerIP as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner IP.
Notes: (Read only property)

166.2.19 partnerIPv6 as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner IPv6.
Notes: (Read only property)

166.2.20 partnerRel as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner system release.
Notes: (Read only property)

166.2.21 partnerSystemCodepage as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner system code page.
Notes: (Read only property)

166.2.22 partnerType as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner type.
Notes: 2/3/E/R: R/2,R/3,Ext,Reg.Ext
(Read only property)

166.2.23 progName as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Name of the calling APAB program (report, module pool)
Notes: (Read only property)

166.2.24 rel as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: My system release.
Notes: (Read only property)

166.2.25 rfcRole as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The RFC role.
Notes: C/S: RFC Client / RFC Server.
(Read only property)

166.2.26 sysId as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: R/3 system ID.
Notes: (Read only property)

166.2.27 sysNumber as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: R/3 system number.
Notes: (Read only property)

166.2.28 trace as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Trace level (0-3)
Notes: (Read only property)

166.2.29 type as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type.
Notes: 2/3/E/R: R/2,R/3,Ext,Reg.Ext
(Read only property)

166.2.30 user as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: User name.
Notes: (Read only property)

166.3 class RFCConnectionMBS

166.3.1 class RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for RFC connection to a SAP system.
Example:

```
// connect code from a sample project:

Var loginParams As New Dictionary
if app.LogOnData.SARouterString.IsEmpty then // LogOn with server (IP-Address)
loginParams.Value("ashost") = app.LogOnData.Anwendungsserver
else // LogOn with Servername and Router-String
loginParams.Value("ashost") = app.LogOnData.SARouterString+"/H/"+app.LogOnData.Anwendungsserver
end if
loginParams.Value("sysnr") = app.LogOnData.InstanzNr.ToText
loginParams.Value("client") = app.LogOnData.Mandant
loginParams.Value("user") = app.LogOnData.SAPBenutzer
loginParams.Value("passwd") = app.LogOnData.SAPPasswort
loginParams.Value("lang") = app.LogOnData.Sprache

app.ConnectionToSAP = New RFCConnectionMBS(loginParams)
```

- Connect Xojo to SAP via RFC

166.3.2 Methods

166.3.3 CachedClassDescription(repositoryID as String, Name as String) as RFCClassDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks for a cached class description.
Notes: This API should be used with care and is only for special scenarios, for example: 1. You know for sure, that a class description has already been cached via ClassDescription(), and don't want to open an extra rfcHandle that will never be used. In this case simply use the SAP System ID as the repositoryID. 2. You have created a hard-coded repository via RfcAddClassDesc(), which contains classes that do not exist in the backend's DDIC.

If repositoryID is "", the "default repository" is used.

repositoryID: System ID of R/3 System, for which this class description has been cached, or "" in case you want to look for it in the default repository.
Name: Name of the class.

166.3.4 CachedFunctionDescription(repositoryID as String, Name as String) as RFCFunctionDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks for a cached function description.
Notes: This API should be used with care and is only for special scenarios, for example: 1. You know for sure, that a function description has already been cached via FunctionDescription(), and don't want to open an extra rfcHandle that will never be used. In this case simply use the SAP System ID as the repositoryID. 2. You have created a hard-coded repository via AddFunctionDesc(), which contains function modules that do not exist in the backend's DDIC.

If repositoryID is "", the "default repository" is used.

166.3.5 CachedTypeDescription(repositoryID as String, Name as String) as RFCTypeDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks for a cached structure/table description.
Notes: Similar to TypeDescription(), but it only looks into the cache. Again it should almost never be necessary to get a metadata description of a single structure.

repositoryID: System ID of R/3 System, for which this type description has been cached, or "" in case you want to look for it in the default repository.
Name: Name of the DDIC structure/table.

166.3.6 Cancel

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Cancels the RFC call which is currently being called over the given RFC connection and closes the connection.
Notes: Can be used only on an RFC client connection and needs to be called from a different thread than the one currently executing the RFC call.

166.3.7 ClassDescription(Name as String) as RFCClassDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the class description that is valid for the system to which connection points to.
Notes: If the class description is already in the repository cache for that system ID, it will be returned immediately (from the cache), otherwise it will be looked up in the system's DDIC using the rfcHandle. The result from the DDIC lookup will then be placed into the cache for later use.

The RFC Runtime maintains a cache for every R/3 System ID, as the meta data could be different from R/3 release to R/3 release. This is the main API that should be used.

Name: Name of the class to look up.

166.3.8 ClearRepository(repositoryID as String)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes all metadata from the repository cache of the specified R/3 System.
Notes: If repositoryID is "", the "default repository" is cleared.

166.3.9 Constructor(LoginParams as Dictionary)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens an RFC client connection for invoking ABAP function modules in an R/3 backend.
Example:

```
Var loginParams As New Dictionary
loginParams.Value("ashost") = "hostname"
loginParams.Value("sysnr") = "05"
loginParams.Value("client") = "800"
loginParams.Value("user") = "user"
loginParams.Value("passwd") = "****"
loginParams.Value("lang") = "EN"

Var connection As New RFCConnectionMBS(loginParams)
```

Notes: Opens a client connection to an SAP System. The connectionParams may contain the following name-value pairs:

client, user, passwd, lang, trace and additionally one of

1. Direct application server logon: ashost, sysnr.
2. Logon with load balancing: mshost, msserv, sysid, group.
msserv is needed only, if the service of the message server is not defined as sapms<SYSID>in /etc/services.

When logging on with SNC, user&passwd are to be replaced by

snc_qop, snc_myname, snc_partnername and optionally snc_lib.
(If snc_lib is not specified, the underlying SNC layer uses the "global" GSS library defined via environment variable SNC_LIB or SNC_LIB_64.)

When logging on with SSO Ticket, you can use mysapsso2 instead of user&passwd. The old SSO format (mysapsso) is no longer supported.

Alternatively the connection parameters can be defined in the config file sapnwrfc.ini. In this case you just pass the parameter dest=... and all parameters that are missing in the sapnwrfc.ini entry into RfcOpenConnection().

For a complete list of logon parameters to be used in connectionParams as well as in the sapnwrfc.ini file, see the sample sapnwrfc.ini file in the SDK's demo folder.

If the logon was ok, constructor returns with a new object, otherwise an exception is raised.

166.3.10 CreateFunction(Name as String) as RFCFunctionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data container that can be used to execute function calls in the backend via Invoke.
Notes: The importing parameters can be set using the Value() properties. After the RfcInvoke call returned successfully, the exporting parameters can be read from this data container via the Value() properties.

166.3.11 CreateTransaction(TransactionID as String, QueueName as String) as RFCTransactionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a container for executing a (multi-step) transactional call.
Notes: TransactionID: trasanction ID used to identify the transaction;
queueName: queue name associated with the transaction. If it is "" or empty, the transaction is for tRfc

166.3.12 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: Closes an RFC connection.

166.3.13 FunctionDescription(Name as String) as RFCFunctionDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the function description that is valid for the system to which connection points to.
Example:

Var fd As RFCFunctionDescriptionMBS = connection.FunctionDescription("BAPI_COMPANY_GETDETAIL")

Notes: If the function description is already in the repository cache for that system ID, it will be returned immediately (from the cache), otherwise it will be looked up in the system's DDIC using the connection. The result from the DDIC lookup will then be placed in the cache. The RFC Runtime maintains a cache for every SAP System ID, as the meta data may be different depending on the SAP release. This is the main API that should be used.

166.3.14 isConnected as Boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if we are connected.
Notes: Same as Ping, but returns boolean and does not raise exception.

166.3.15 Ping

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Ping the remote communication partner through the passed connection handle.
Notes: Sends a ping to the backend in order to check, whether the connection is still alive. Can be used on both, client connections as well as server connections.

166.3.16 ResetServerContext

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resets the SAP server context ("user context / ABAP session context") associated with the given client connection, but does not close the connection.

166.3.17 TransactionID as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves a unique 24-digit transaction ID from the backend.

166.3.18 TypeDescription(Name as String) as RFCTypeDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the structure description that is valid for the system to which connection points to.
Notes: If the structure description is already in the repository cache for that system ID, it will be returned immediately (from the cache), otherwise it will be looked up in the system's DDIC using the rfcHandle. The result from the DDIC lookup will then be placed into the cache for later use.

The RFC Runtime maintains a cache for every R/3 System ID, as the meta data could be different from R/3 release to R/3 release.

Note
Normally it should not be necessary to lookup separate structure descriptions. They are already looked up as part of the function module, in which they are used.

Name: Name of a DDIC structure or table.

166.3.19 Properties

166.3.20 ConnectionAttributes as RFCConnectionAttributesMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns details about the current client or server connection.
Notes: (Read only property)

166.3.21 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

166.4 class RFCContainerMBS

166.4.1 class RFCContainerMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a container in a RFC connection.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

166.4.2 Methods

166.4.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

166.4.4 DescribeType as RFCTypeDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the metadata description of the given structure or table.

166.4.5 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

166.4.6 StringLength(Index as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries string length for field by index.
See also:

- 166.4.7 StringLength(Name as String) as Integer 20846

166.4.7 StringLength(Name as String) as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries string length for field by name.
See also:

- 166.4.6 StringLength(Index as Integer) as Integer 20845

166.4.8 Value(Index as Integer) as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convenience method to get value as variant.
Notes: When reading, we lookup data type for the property referred by index and return a matching value via variant.

Char, String, Num, Date, Time, BCD, DecF16 and DecF34 are returned as text.
Float is returned as double value.
Long, Second, Minute and Int8 is returned as Int64.
DTDay, DTWeek, DTMonth, TSecond, TMinute, CDeay, Int1, Int2 and Int values are retuned as Integer.
Table is returned as RFCTableMBS object.
Structure is returned as RFCStructureMBS object.
Byte data is returned as MemoryBlock.

For Null, ABAPObject, XMLData, BOX types we return nil.
See also:

- 166.4.9 Value(Name as String) as Variant 20846

166.4.9 Value(Name as String) as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convenience method to get value as variant.
Notes: When reading, we lookup data type for the property referred by name and return a matching value via variant.

Char, String, Num, Date, Time, BCD, DecF16 and DecF34 are returned as text.
Float is returned as double value.
Long, Second, Minute and Int8 is returned as Int64.
DTDay, DTWeek, DTMonth, TSecond, TMinute, CDeay, Int1, Int2 and Int values are retuned as Integer.
Table is returned as RFCTableMBS object.
Structure is returned as RFCStructureMBS object.

Byte data is returned as MemoryBlock.

For Null, ABAPObject, XMLData, BOX types we return nil.
See also:

- 166.4.8 Value(Index as Integer) as Variant 20846

166.4.10 Properties

166.4.11 Connection as RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The connection this object belongs to.
Notes: (Read only property)

166.4.12 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

166.4.13 Parent as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object for this container.
Notes: (Read only property)

166.4.14 Values as Dictionary

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convenience property to see all values in debugger.
Notes: (Read only property)

166.4.15 BytesValue(Index as Integer) as Memoryblock

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set BYTE value with MemoryBlock by index.
Notes: When you get or set, we copy the data.
(Read and Write computed property)
See also:

- 166.4.16 BytesValue(Name as String) as Memoryblock 20848

166.4.16 BytesValue(Name as String) as Memoryblock

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set BYTE value with MemoryBlock by name.
Notes: When you get or set, we copy the data.
(Read and Write computed property)
See also:

- 166.4.15 BytesValue(Index as Integer) as Memoryblock 20847

166.4.17 CharsValue(Index as Integer, Size as Integer) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set chars value by name.
Notes: This is for fixed size char values, so you pass in size.
Please use StringValue() to benefit from plugin querying size for you of existing value.
(Read and Write computed property)
See also:

- 166.4.18 CharsValue(Name as String, Size as Integer) as String 20848

166.4.18 CharsValue(Name as String, Size as Integer) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set chars value by index.
Notes: This is for fixed size char values, so you pass in size.
Please use StringValue() to benefit from plugin querying size for you of existing value.
(Read and Write computed property)
See also:

- 166.4.17 CharsValue(Index as Integer, Size as Integer) as String 20848

166.4.19 DateValue(Index as Integer) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set date value by index.
Notes: Format is always 8 character string with format YYYYMMDD.
(Read and Write computed property)
See also:

- 166.4.20 DateValue(Name as String) as String 20849

166.4.20 DateValue(Name as String) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set date value by name.
Notes: Format is always 8 character string with format YYYYMMDD.
(Read and Write computed property)
See also:

- 166.4.19 DateValue(Index as Integer) as String 20848

166.4.21 FloatValue(Index as Integer) as Double

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set float value by index.
Notes: (Read and Write computed property)
See also:

- 166.4.22 FloatValue(Name as String) as Double 20849

166.4.22 FloatValue(Name as String) as Double

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set float value by name.
Notes: (Read and Write computed property)
See also:

- 166.4.21 FloatValue(Index as Integer) as Double 20849

166.4.23 Int16Value(Index as Integer) as Int16

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set UInt16 value by index.
Notes: (Read and Write computed property)
See also:

- 166.4.24 Int16Value(Name as String) as Int16 20850

166.4.24 Int16Value(Name as String) as Int16

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set UInt16 value by name.
Notes: (Read and Write computed property)
See also:

- 166.4.23 Int16Value(Index as Integer) as Int16 20849

166.4.25 Int32Value(Index as Integer) as Int32

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set UInt32 value by index.
Notes: (Read and Write computed property)
See also:

- 166.4.26 Int32Value(Name as String) as Int32 20850

166.4.26 Int32Value(Name as String) as Int32

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set UInt32 value by name.
Notes: (Read and Write computed property)
See also:

- 166.4.25 Int32Value(Index as Integer) as Int32 20850

166.4.27 Int64Value(Index as Integer) as Int64

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set Int64 value by index.
Notes: (Read and Write computed property)
See also:

- 166.4.28 Int64Value(Name as String) as Int64 20851

166.4.28 Int64Value(Name as String) as Int64

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set Int64 value by name.
Notes: (Read and Write computed property)
See also:

- 166.4.27 Int64Value(Index as Integer) as Int64 20850

166.4.29 NumberValue(Index as Integer, Size as Integer) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set numeric value by index.
Notes: The value of the specified field as num-char array (digits only).
Please pass length. If you don't know, please try StringValue/StringLength.
(Read and Write computed property)
See also:

- 166.4.30 NumberValue(Name as String, Size as Integer) as String 20851

166.4.30 NumberValue(Name as String, Size as Integer) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set numeric value by name.
Notes: The value of the specified field as num-char array (digits only).
Please pass length. If you don't know, please try StringValue/StringLength.
(Read and Write computed property)
See also:

- 166.4.29 NumberValue(Index as Integer, Size as Integer) as String 20851

166.4.31 StringValue(Index as Integer) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set string value by index.
Notes: (Read and Write computed property)
See also:

- 166.4.32 StringValue(Name as String) as String 20852

166.4.32 StringValue(Name as String) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set string value by name.
Example:

```
Var fd As RFCFunctionDescriptionMBS = connection.FunctionDescription("BAPI_COMPANY_GETDETAIL")
Var f As RFCFunctionMBS = fd.CreateFunction

f.StringValue("COMPANYID") = "000007"
f.Invoke

Var s As RFCStructureMBS = f.StructureValue("RETURN")
Var t As String = s.StringValue("MESSAGE")

MessageBox t
```

Notes: (Read and Write computed property)
See also:

- 166.4.31 StringValue(Index as Integer) as String 20851

166.4.33 StructureValue(Index as Integer) as RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set structure value with RFCStructureMBS object by index.
Notes: (Read and Write computed property)
See also:

- 166.4.34 StructureValue(Name as String) as RFCStructureMBS 20852

166.4.34 StructureValue(Name as String) as RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set structure value with RFCStructureMBS object by name.
Notes: (Read and Write computed property)
See also:

- 166.4.33 StructureValue(Index as Integer) as RFCStructureMBS 20852

166.4.35 TableValue(Index as Integer) as RFCTableMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set table value with RFCTableMBS object by index.
Notes: (Read and Write computed property)
See also:

- 166.4.36 TableValue(Name as String) as RFCTableMBS 20853

166.4.36 TableValue(Name as String) as RFCTableMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set table value with RFCTableMBS object by name.
Notes: (Read and Write computed property)
See also:

- 166.4.35 TableValue(Index as Integer) as RFCTableMBS 20853

166.4.37 TimeValue(Index as Integer) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set time value by index.
Notes: Format is always 6 character string with format HHMMSS.
(Read and Write computed property)
See also:

- 166.4.38 TimeValue(Name as String) as String 20853

166.4.38 TimeValue(Name as String) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set time value by name.
Notes: Format is always 6 character string with format HHMMSS.
(Read and Write computed property)
See also:

- 166.4.37 TimeValue(Index as Integer) as String 20853

166.4.39 UInt8Value(Index as Integer) as UInt8

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set UInt8 value by index.
Notes: (Read and Write computed property)
See also:

- 166.4.40 UInt8Value(Name as String) as UInt8 20854

166.4.40 UInt8Value(Name as String) as UInt8

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set UInt8 value by name.
Notes: (Read and Write computed property)
See also:

- 166.4.39 UInt8Value(Index as Integer) as UInt8 20853

166.5 class RFCErrorExceptionMBS

166.5.1 class RFCErrorExceptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception class to report any error.
Notes: Subclass of the RuntimeException class.

166.6 class RFCExceptionDescriptionMBS

166.6.1 class RFCExceptionDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an exception description.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

166.6.2 Methods

166.6.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

166.6.4 Properties

166.6.5 Key as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Exception key
Notes: (Read only property)

166.6.6 Message as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Error message (exception text as defined in SE37)
Notes: (Read only property)

166.7 class RFCFieldDescriptionMBS

166.7.1 class RFCFieldDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a field description.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

166.7.2 Methods

166.7.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

166.7.4 Properties

166.7.5 Connection as RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The connection for this field.
Notes: (Read only property)

166.7.6 decimals as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: If the field is of type "packed number" (BCD), this member gives the number of decimals.
Notes: (Read only property)

166.7.7 Name as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Field name.
Notes: (Read only property)

166.7.8 nucLength as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Field length in bytes in a 1-byte-per-SAP_CHAR system.
Notes: (Read only property)

166.7.9 nucOffset as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Field offset in bytes in a 1-byte-per-SAP_CHAR system.
Notes: (Read only property)

166.7.10 Parent as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: (Read only property)

166.7.11 Type as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Field data type.
Notes: (Read only property)

166.7.12 TypeDescription as RFCTypeDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the type description for this field.
Notes: (Read only property)

166.7.13 TypeString as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type as string.
Notes: Convenience property so you can see type in debugger.
(Read only property)

166.7.14 ucLength as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Field length in bytes in a 2-byte-per-SAP_CHAR system.
Notes: (Read only property)

166.7.15 ucOffset as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Field offset in bytes in a 2-byte-per-SAP_CHAR system.
Notes: (Read only property)

166.8 class RFCFunctionDescriptionMBS

166.8.1 class RFCFunctionDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a function description.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

166.8.2 Methods

166.8.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

166.8.4 CreateFunction as RFCFunctionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data container that can be used to execute function calls in the backend via Invoke.
Notes: The importing parameters can be set using the Value() properties. After the RfcInvoke call returned successfully, the exporting parameters can be read from this data container via the Value() properties.

166.8.5 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

166.8.6 ExceptionDescription(Index as Integer) as RFCExceptionDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception description by index.
See also:

- 166.8.7 ExceptionDescription(Name as String) as RFCExceptionDescriptionMBS

166.8.7 ExceptionDescription(Name as String) as RFCExceptionDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception description by name.
See also:

- 166.8.6 ExceptionDescription(Index as Integer) as RFCExceptionDescriptionMBS 20860

166.8.8 ExceptionDescriptions as RFCExceptionDescriptionMBS()

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all exception descriptions.

166.8.9 ParameterDescription(Index as Integer) as RFCParameterDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries parameter description by index.
See also:

- 166.8.10 ParameterDescription(Name as String) as RFCParameterDescriptionMBS 20861

166.8.10 ParameterDescription(Name as String) as RFCParameterDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries parameter description by name.
See also:

- 166.8.9 ParameterDescription(Index as Integer) as RFCParameterDescriptionMBS 20861

166.8.11 ParameterDescriptions as RFCParameterDescriptionMBS()

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all parameter description as array.

166.8.12 Properties

166.8.13 Connection as RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent connection.
Notes: (Read only property)

166.8.14 ExceptionCount as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of exceptions.
Notes: (Read only property)

166.8.15 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

166.8.16 Name as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the function.
Notes: (Read only property)

166.8.17 ParameterCount as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of parameters for this function.
Notes: (Read only property)

166.8.18 Parent as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: (Read only property)

166.9 class RFCFunctionMBS

166.9.1 class RFCFunctionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a function in a RFC connection.
Notes: Please use values to set parameters and then call invoke.
Subclass of the RFCContainerMBS class.

166.9.2 Methods

166.9.3 Constructor(typeDescription as RFCFunctionDescriptionMBS)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data container that can be used to execute function calls in the backend via Invoke.
Notes: The importing parameters can be set using the Value() properties. After the RfcInvoke call returned successfully, the exporting parameters can be read from this data container via the Value() properties.

166.9.4 DescribeFunction as RFCFunctionDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the function description that is valid for the system to which connection points to.
Notes: If the function description is already in the repository cache for that system ID, it will be returned immediately (from the cache), otherwise it will be looked up in the system's DDIC using the connection. The result from the DDIC lookup will then be placed in the cache. The RFC Runtime maintains a cache for every SAP System ID, as the meta data may be different depending on the SAP release. This is the main API that should be used.

166.9.5 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

166.9.6 Invoke

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes a function module in the backend system so far.
Example:

```
Var fd As RFCFunctionDescriptionMBS = connection.FunctionDescription("BAPI_COMPANY_GETDETAIL")
Var f As RFCFunctionMBS = fd.CreateFunction

f.StringValue("COMPANYID") = "000007"
f.Invoke

Var s As RFCStructureMBS = f.StructureValue("RETURN")
Var t As String = s.StringValue("MESSAGE")

MessageBox t
```

166.9.7 Properties

166.9.8 ParameterActive(Name as String) as Boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether a parameter is active.
Notes: This is particularly useful for BAPIs which have many large tables, in which you are not interested. Deactivate those and leave only those tables active, in which you are interested. This reduces network traffic and memory consumption in your application considerably.

This functionality can be used for input and output parameters. If the parameter is an input, no data for that parameter will be sent to the backend. If it's an output, the backend will be informed not to return data for that parameter.
(Read and Write computed property)

166.10 module RFCModuleMBS

166.10.1 module RFCModuleMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The module for globals in RFC API.
Example:

```
// load the SAP NetWeaver RFC library and show its version
If Not RFCModuleMBS.LoadLibrary(SpecialFolder.Resources.Child("libsapnwrfc.dylib")) Then
MessageBox "Can't load the SAP NW RFC SDK."
Return
End If
RFCModuleMBS.TraceDir = SpecialFolder.Temporary.NativePath
MessageBox "RFC library " + RFCModuleMBS.Version
```

Notes: You can use this module and related classes to connect Xojo to SAP applications and databases.
We support MacOS, Windows and Linux.

You need to get a SAP login (maybe become SAP developer) and download
SAP NetWeaver RFC SDK 7.50.
You need SAP license for user and maybe a developer license yourself.

Please read SAP documentation for various RFC functions to get more details.
MBS Plugin manages memory for you, does reference counting and makes API easier to use for Xojo developers.

- Connect Xojo to SAP via RFC

166.10.2 Methods

166.10.3 LoadLibrary(file as folderitem) as boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the sapnwrfc library.
Example:

```
#If TargetWin32
Const path = "sapnwrfc.dll"
#Else
Var path As FolderItem = New FolderItem("libsapnwrfc.dylib")
Var LibPath As String = path.parent.NativePath
```

```
Call RFCModuleMBS.SetCurrentWorkingDirectory(libPath)
#EndIf

If RFCModuleMBS.LoadLibrary(path) Then
MessageBox "Library loaded."
Else
MessageBox "Failed to load library"+EndOfLine+EndOfLine+RFCModuleMBS.LibraryLoadErrorMessage
quit
End If
```

Notes: Pass path to sapnwrfc.dll on Windows or libsapnwrfc.dylib on MacOS or libsapnwrfc.so on Linux. If file is installed in system path, you may just pass file name.

Returns true on success or false on failure.
The LibraryLoadErrorMessage function returns error message on failure.
See also:

- 166.10.4 LoadLibrary(path as string) as boolean 20867

166.10.4 LoadLibrary(path as string) as boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the sapnwrfc library.
Notes: Pass path to sapnwrfc.dll on Windows or libsapnwrfc.dylib on MacOS or libsapnwrfc.so on Linux. If file is installed in system path, you may just pass file name.

Returns true on success or false on failure.
The LibraryLoadErrorMessage function returns error message on failure.
See also:

- 166.10.3 LoadLibrary(file as folderitem) as boolean 20866

166.10.5 LocalTransactionID as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves a unique 24-digit transaction ID.
Notes: The API will attempt to generate a TID locally using the operating system's UUID.

166.10.6 ReloadIniFile

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the contents of the sapnwrfc.ini file into memory.
Notes: Searches the directory given by IniPath (or the current working directory) for the file sapnwrfc.ini and loads its contents into memory.

166.10.7 SetCurrentWorkingDirectory(path as folderitem) as boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the current working directory.
Example:

```
Var path As FolderItem = New FolderItem("libsapnwrfc.dylib")
Var LibPath As String = path.parent.NativePath

Call RFCModuleMBS.SetCurrentWorkingDirectory(libPath)
```

Notes: This is often useful to make sure the DLLs in that folder are found.
See also:

- 166.10.8 SetCurrentWorkingDirectory(path as String) as boolean 20868

166.10.8 SetCurrentWorkingDirectory(path as String) as boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the current working directory.
Notes: This is often useful to make sure the DLLs in that folder are found.
See also:

- 166.10.7 SetCurrentWorkingDirectory(path as folderitem) as boolean 20868

166.10.9 Properties

166.10.10 IniPath as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The directory in which to search for the sapnwrfc.ini file.
Notes: By default the sapnwrfc library searches for the sapnwrfc.ini in the current working directory of the process. If you want to keep it in a different directory, use this function to tell the sapnwrfc library about the new path.

Note
After you have changed the directory, the NW RFC lib automatically loads the contents of the new sapn-

wrfc.ini file from that directory.

Pass the full (absolute) path of the directory, in which the sapnwrfc library should look for the sapnwrfc.ini file. A path relative to the current working directory of the process also works.
(Read and Write property)

166.10.11 LibraryLoadError as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The load error code.
Notes: (Read only property)

166.10.12 LibraryLoadErrorMessage as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The load error message.
Notes: (Read only property)

166.10.13 Loaded as Boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the library is loaded.
Notes: Returns true if the library contains the required functions.
(Read only property)

166.10.14 MajorVersion as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get information about currently loaded sapnwrfc library.
Notes: Major version, e.g. 7500.
(Read only property)

166.10.15 MinorVersion as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get information about currently loaded sapnwrfc library.
Notes: Minor version.
(Read only property)

166.10.16 PatchLevel as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get information about currently loaded sapnwrfc library.
Notes: Patch level of the version.
(Read only property)

166.10.17 TraceDir as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the directory where the NW RFC lib should write trace files.
Notes: This function has the same effect as the sapnwrfc.ini parameter RFC_TRACE_DIR. See the documentation of that parameter in the sample ini file contained in the /demo directory of the NW RFC SDK.

Note
This API call affects only new trace files that will be opened after the call. The directory of already existing trace files is not changed in order to prevent confusion and garbage data...

Pass the new directory. Can be an absolute or relative path name. The directory needs to exist prior to calling this API. The NW RFC lib will not attempt to create non-existing directories.
(Read and Write property)

166.10.18 TraceEncoding as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the character encoding to be used in trace files.
Notes: This function has the same effect as the sapnwrfc.ini parameter RFC_TRACE_ENCODING. See the documentation of that parameter in the sample ini file contained in the /demo directory of the NW RFC SDK.

Note
This API call affects only new trace files that will be opened after the call. The character encoding of already existing trace files is not changed in order to prevent confusion and garbage data...

Pass the new encoding. Possible values are "UTF-16", "UTF-8" and "DEFAULT". On Windows UTF-16 is recommended for faster performance. "DEFAULT" corresponds to the operating system's default character encoding, which is CP1252 or ISO-8859-1 on most Windows systems and UTF-8 on most Linux systems.
(Read and Write property)

166.10.19 TraceType as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the way the NW RFC lib writes trace files.
Notes: This function has the same effect as the sapnwrfc.ini parameter RFC_TRACE_TYPE. See the documentation of that parameter in the sample ini file contained in the /demo directory of the NW RFC SDK.

Note
This API call closes currently open trace files and then changes to "one file per process" or one "file per thread". If the NW RFC lib is already using the given trace type, it does nothing.

Must be either "PROCESS" or "THREAD".
(Read and Write property)

166.10.20 Version as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get information about currently loaded sapnwrfc library.
Notes: Version as text to show to user.
(Read only property)

166.10.21 Constants

Errors

Constant	Value	Description
kErrorAbapClassException	27	The called function module raised a class based exception
kErrorAbapException	5	The called function module raised an Exception (RAISE or MESSAGE . RAISING)
kErrorAbapMessage	4	The called function module raised an E-, A- or X-Message
kErrorAbapRuntimeFailure	3	SAP system runtime error (SYSTEM_FAILURE): Shortdump on the backen side
kErrorAuthorizationFailure	29	Authorization check error
kErrorBufferTooSmall	23	The given buffer was to small to hold the entire parameter. Data has bee truncated.
kErrorCanceled	7	No longer used
kErrorClosed	6	Connection closed by the other side
kErrorCodepageConversionFailure	21	Codepage conversion error
kErrorCommunicationFailure	1	Error in Network & Communication layer
kErrorConversionFailure	22	Error while converting a parameter to the correct data type
kErrorExecuted	16	Inbound tRFC Call already executed (needs to be returned fro RFC_ON_CHECK_TRANSACTION in case the TID is already known an successfully processed before.)
kErrorExternalFailure	15	Error in external custom code. (E.g. in the function handlers or tRFC ha dlers.) Results in SYSTEM_FAILURE
kErrorIllegalState	19	The operation is not supported on that handle at the current point of tim (e.g. trying a callback on a server handle, while not in a call)
kErrorInvalidHandle	13	An invalid handle was passed to an API call
kErrorInvalidParameter	20	An invalid parameter was passed to an API call, (e.g. invalid name, type c length)
kErrorInvalidProtocol	11	The received data has an unsupported format
kErrorLogonFailure	2	Unable to logon to SAP system. Invalid password, user locked, etc.
kErrorMemoryInsufficient	9	Memory insufficient
kErrorNotFound	17	Function or structure definition not found (Metadata API)
kErrorNotSupported	18	The operation is not supported on that handle
kErrorOk	0	Everything O.K. Used by every function. (no exception)
kErrorRetry	14	ListenAndDispatch did not receive an RFC request during the timeout perio
kErrorSerializationFailure	12	A problem while serializing or deserializing RFM parameters
kErrorStartSapguiFailure	26	Failed to start and attach SAPGUI to the RFC connection.
kErrorTableMoveBof	24	Trying to move the current position before the first row of the table.
kErrorTableMoveEof	25	Trying to move the current position after the last row of the table.
kErrorTimeout	8	Time out
kErrorUnknownError	28	”Something” went wrong, but I don’t know what...
kErrorVersionMismatch	10	Version mismatch

166.11 class RFCParameterDescriptionMBS

166.11.1 class RFCParameterDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a parameter description.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

166.11.2 Methods

166.11.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor

166.11.4 Properties

166.11.5 Connection as RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent connection.
Notes: (Read only property)

166.11.6 decimals as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gives the number of decimals in case of a packed number (BCD)
Notes: (Read only property)

166.11.7 defaultValue as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default value as defined in SE37.
Notes: (Read only property)

166.11.8 Direction as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies whether the parameter is an input, output or bi-directional parameter.
Notes: (Read only property)

166.11.9 isOptional as Boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies whether this parameter is defined as optional in SE37.
Notes: True is optional, false non-optional.
(Read only property)

166.11.10 Name as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parameter name.
Notes: (Read only property)

166.11.11 nucLength as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parameter length in bytes in a 1-byte-per-SAP_CHAR system.
Notes: (Read only property)

166.11.12 parameterText as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Description text of the parameter as defined in SE37.
Notes: (Read only property)

166.11.13 Parent as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: (Read only property)

166.11.14 Type as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parameter data type.
Notes: (Read only property)

166.11.15 TypeDescription as RFCTypeDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The structure definition in case this parameter is a structure or table.
Notes: May be nil for other parameter types.
(Read only property)

166.11.16 TypeString as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type as string.
Notes: Convenience property so you can see type in debugger.
(Read only property)

166.11.17 ucLength as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parameter length in bytes in a 2-byte-per-SAP_CHAR system.
Notes: (Read only property)

166.11.18 Constants

Direction Modes

Constant	Value	Description
kDirectionChanging	3	Import and export parameter. This corresponds to ABAP CHANGING parameter.
kDirectionExport	2	Export parameter. This corresponds to ABAP EXPORTING parameter.
kDirectionImport	1	Import parameter. This corresponds to ABAP IMPORTING parameter.
kDirectionTable	7	Table parameter. This corresponds to ABAP TABLES parameter.

166.12 class RFCStructureMBS

166.12.1 class RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a structure in a RFC connection.
Notes: Subclass of the RFCContainerMBS class.

166.12.2 Methods

166.12.3 Clone as RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the given structure and returns the handle to the new object.

166.12.4 Constructor(typeDescription as RFCTypeDescriptionMBS)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an internal structure data object and returns the handle to the structure object.

166.12.5 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

166.13 class RFCTableMBS

166.13.1 class RFCTableMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a table in a RFC connection.
Notes: Subclass of the RFCContainerMBS class.

166.13.2 Methods

166.13.3 AppendNewRow as RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new row and appends it at the end of the table.

166.13.4 AppendNewRows(numRows as Integer)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends a set of new empty rows at the end of the table and moves the table cursor to the first new row.

166.13.5 AppendRow(row as RFCStructureMBS)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends the given structure at the end of the table.

166.13.6 Clone as RFCTableMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the given table and returns the handle to the new table.

166.13.7 Constructor(TypeDescription as RFCTypeDescriptionMBS)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a internal table object and returns the handle to the table.

166.13.8 CurrentRow as RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the structure handle to the current row.

166.13.9 DeleteAllRows

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes all rows from the table.

166.13.10 DeleteCurrentRow

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes the current row from the table.

166.13.11 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

166.13.12 InsertNewRow as RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new row and inserts it at the current position of the table cursor.

166.13.13 InsertRow(row as RFCStructureMBS)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts the given structure at the current position of the table cursor.

166.13.14 MoveTo(row as Integer)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the cursor from the current position to the position specified by the index.

166.13.15 MoveToFirstRow

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the current position to the first row of the table.

166.13.16 MoveToLastRow

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the current position to the last row of the table.

166.13.17 MoveToNextRow

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the cursor from the current position to the next row.

166.13.18 MoveToPreviousRow

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the cursor from the current position to the previours row.

166.13.19 ReserveCapacity(numRows as Integer)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reserves memory without changing the size of a table so that new rows can be appended without new memory allocation.

166.13.20 Properties

166.13.21 RowCount as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the number of the rows contained in the table.
Notes: (Read only property)

166.13.22 RowType as RFCTypeDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the type descriptor of the table rows.
Notes: (Read only property)

166.14 class RFCTransactionMBS

166.14.1 class RFCTransactionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a transaction.

166.14.2 Methods

166.14.3 ConfirmTransaction

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: After SubmitTransaction has finally succeeded, ConfirmTransaction cleans up the transaction handling table in the backend.
Notes: Caution:
After this call the backend is no longer protected against this TID. So another SubmitTransaction would result in a duplicate.

166.14.4 Constructor(connection as RFCConnectionMBS, TransactionID as String, QueueName as String)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a container for executing a (multi-step) transactional call.
Notes: TransactionID: trasanction ID used to identify the transaction;
queueName: queue name associated with the transaction. If it is "" or empty, the transaction is for tRfc

166.14.5 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

166.14.6 InvokeInTransaction(funcHandle as RFCFunctionMBS)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Puts a tRfc or qRfc call into the given transaction.
Notes: Can be used multiple times within one transaction handle.

funcHandle: function handle that identifies the Rfc function;

166.14.7 SubmitTransaction

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes all function modules in the backend system, that have accumulated in the transaction so far.
Notes: This step can be repeated until it finally succeeds (RFC_OK). The transaction handling in the backend system protects against duplicates.

166.14.8 Properties

166.14.9 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

166.14.10 TransactionID as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves a unique 24-digit transaction ID from the SAP backend system.
Notes: (Read only property)

166.15 class RFCTypeDescriptionMBS

166.15.1 class RFCTypeDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a type definition.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

166.15.2 Methods

166.15.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

166.15.4 CreateStructure as RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an internal structure data object and returns the handle to the structure object.

166.15.5 CreateTable as RFCTableMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a internal table object and returns the handle to the table.

166.15.6 FieldDescription(Index as Integer) as RFCFieldDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the field description of the structure's indexth field.
See also:

- 166.15.7 FieldDescription(Name as String) as RFCFieldDescriptionMBS

166.15.7 FieldDescription(Name as String) as RFCFieldDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the field description of a field given by name.
See also:

- 166.15.6 FieldDescription(Index as Integer) as RFCFieldDescriptionMBS 20884

166.15.8 FieldDescriptions as RFCFieldDescriptionMBS()

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads all the field descriptions.

166.15.9 Properties

166.15.10 Connection as RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The connection owning this object.
Notes: (Read only property)

166.15.11 FieldCount as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of fields for this type.
Notes: (Read only property)

166.15.12 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

166.15.13 Name as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the type.
Notes: (Read only property)

166.15.14 Parent as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: (Read only property)

Chapter 167

SATSolver

167.1 class LGLAbortedExceptionMBS

167.1.1 class LGLAbortedExceptionMBS

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The exception used to report fatal errors in SAT Solver.
Notes: Subclass of the RuntimeException class.
Blog Entries

- MBS Xojo Plugins, version 21.3pr6

167.2 class LGLMBS

167.2.1 class LGLMBS

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for the SAT Solver from lingeling.
Example:

```
// solve (a or b) and (not a or b) and (not b or c) with the SAT solver
// variables are numbered from 1, negative numbers are negated, 0 ends a clause
Var solver As New LGLMBS
Const a = 1
Const b = 2
Const c = 3

solver.Add a
solver.Add b
solver.Add 0

solver.Add -a
solver.Add b
solver.Add 0

solver.Add -b
solver.Add c
solver.Add 0

If solver.Sat = LGLMBS.LGL_SATISFIABLE Then
// Deref returns a positive value for true and a negative value for false
MessageBox "a=" + solver.Deref(a).ToString + " b=" + solver.Deref(b).ToString + " c=" + solver.Deref(c).ToString
Else
MessageBox "Not satisfiable."
End If
```

Notes: Based on lingeling project here:
https://github.com/arminbiere/lingeling
and
http://fmv.jku.at/lingeling/

167.2.2 Methods

167.2.3 Add(lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a value.

167.2.4 Assume(lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assume single units.

167.2.5 CAssume(lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assume clause (at most one)

167.2.6 Clone as LGLMBS

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones the object.
Notes: Both 'Cloning' and 'Forking' can be used to implement 'Push & Pop', but the asymmetric forking is more similar to the classical way of implementing it, needs less resources since for instance eliminated variables do not occupy any memory in the children, but requires lifting back satisfying assignments explicitly (through the whole parent chain). If these full satisfying assignments are really needed actually cloning

could be more space efficient too. Assume you want to split the solver into two instances, one with a literal set to false, the other one to true. Then cloning allows you to produce two independent branches, while for forking you need three, since the root / top solver still has to be kept for lifting back a potential assignment.

167.2.7 Constructor

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: Creates new empty object.

167.2.8 DefaultOption(Name as String) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries default value for an option.

167.2.9 Deref(lit as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries value.
Notes: neg=false, pos=true
Returns -1 if lit is bigger then MaxVar.

167.2.10 Failed(lit as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks failed flag for given item.
Notes: neg=false, pos=true
for assumptions.

167.2.11 Fixate

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add assumptions as units

167.2.12 Fixed(lit as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks fixed flag.
Notes: neg=false, pos=true
Toplevel

167.2.13 FlushCache

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flush all learned clauses.

167.2.14 FlushTimers

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flush timers.

167.2.15 Fork as LGLMBS

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Forks the object.
Notes: 'Forking' copies only irredundant clauses and also uses internal variable indices of the parent as external variable indices. Thus 'parent' and the forked off 'child' do neither exactly work the same way, nor do they use from the API point of view the same set of variables. They are satisfiability equivalent. If the child becomes unsatisfiable the parent can be assumed to be unsatisfiable too and thus 'join' would just add the empty clause to the parent. If the child produces a satisfying assignment, this assignment is turned into an assignment of the parent by 'join'. Parents can be forked multiple times. A child has exactly one parent. Parents and children can be released independently. Between 'Fork' and 'Join' no other operations but further 'Fork' are allowed. The effect ot multiple 'Join' with the same parent is unclear at this point. The same memory manager is use for the child and the parent. Options, prefix, output file and the callbacks for 'getime' and 'Abort' are copied too (if set).

Both 'Cloning' and 'Forking' can be used to implement 'Push & Pop', but the asymmetric forking is more similar to the classical way of implementing it, needs less resources since for instance eliminated variables do not occupy any memory in the children, but requires lifting back satisfying assignments explicitly (through the whole parent chain). If these full satisfying assignments are really needed actually cloning could be more space efficient too. Assume you want to split the solver into two instances, one with a literal set to false, the other one to true. Then cloning allows you to produce two independent branches, while for forking you

need three, since the root / top solver still has to be kept for lifting back a potential assignment.

167.2.16 Freeze(lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Freezes the given item.

167.2.17 Frozen(lit as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries frozen state.

167.2.18 GetOptionMinMax(Name as String, byref min as Integer, byref max as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current value, minimum and maximum values.

167.2.19 HasOption(Name as String) as Boolean

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if the given option is set.

167.2.20 IncVar as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Increases variables by one.

167.2.21 Join(Child as LGLMBS) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Joins back forked child.

167.2.22 LibVersion as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries library version.
Example:

Print "LGL "+LGLMBS.LibVersion

167.2.23 Lookahead as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a good look ahead literal or zero if all potential literals have been eliminated or have been used as blocking literals in blocked clause elimination.
Notes: Zero is also returned if the formula is already inconsistent. The lookahead literal is made usable again, for instance if it was not frozen during a previous SAT call and thus implicitly became melted. Therefore it can be added in a unit clause.

167.2.24 Melt(lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Melts a literal.

167.2.25 MeltAll

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Melt all literals.

167.2.26 ParseFile(File as FolderItem, force as boolean = false) as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file.
Notes: Returns empty text on success or error message from parser.
See also:

- 167.2.27 ParseFile(File as FolderItem, force as boolean, byref LineNo as Integer, byref Max as Integer) as String 20894

167.2.27 ParseFile(File as FolderItem, force as boolean, byref LineNo as Integer, byref Max as Integer) as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file.
Notes: Returns empty text on success or error message from parser.
See also:

- 167.2.26 ParseFile(File as FolderItem, force as boolean = false) as String 20893

167.2.28 ParseFileMT(File as FolderItem, force as boolean = false) as String

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file.
Notes: Returns empty text on success or error message from parser.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 167.2.29 ParseFileMT(File as FolderItem, force as boolean, byref LineNo as Integer, byref Max as Integer) as String 20894

167.2.29 ParseFileMT(File as FolderItem, force as boolean, byref LineNo as Integer, byref Max as Integer) as String

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file.
Notes: Returns empty text on success or error message from parser.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 167.2.28 ParseFileMT(File as FolderItem, force as boolean = false) as String 20894

167.2.30 ParsePath(Path as String, force as boolean = false) as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given by path.
Notes: Returns empty text on success or error message from parser.

On MacOS and Linux, if file has the following extensions, the file will be decompressed with command line tool and then parsed:

.gz	gzip
.xz	xz
.bz2	bzip2
.zip	unzip
.7z	7x

See also:

- 167.2.31 ParsePath(Path as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String 20895

167.2.31 ParsePath(Path as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given by path.
Notes: Returns empty text on success or error message from parser.

On MacOS and Linux, if file has the following extensions, the file will be decompressed with command line tool and then parsed:

.gz	gzip
.xz	xz
.bz2	bzip2
.zip	unzip
.7z	7x

See also:

- 167.2.30 ParsePath(Path as String, force as boolean = false) as String 20895

167.2.32 ParsePathMT(Path as String, force as boolean = false) as String

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given by path.
Notes: Returns empty text on success or error message from parser.

On MacOS and Linux, if file has the following extensions, the file will be decompressed with command line tool and then parsed:

.gz	gzip
.xz	xz
.bz2	bzip2
.zip	unzip
.7z	7x

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 167.2.33 ParsePathMT(Path as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String 20896

167.2.33 ParsePathMT(Path as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given by path.
Notes: Returns empty text on success or error message from parser.

On MacOS and Linux, if file has the following extensions, the file will be decompressed with command line tool and then parsed:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

.gz	gzip
.xz	xz
.bz2	bzip2
.zip	unzip
.7z	7x

- 167.2.32 ParsePathMT(Path as String, force as boolean = false) as String 20896

167.2.34 ParseString(Data as String, force as boolean = false) as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given it as text.
Notes: Returns empty text on success or error message from parser.
Please pass text with data separated with unix line endings (endofline.unix), so you may need to use ReplaceLineEndings function.
See also:

- 167.2.35 ParseString(Data as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String 20897

167.2.35 ParseString(Data as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given it as text.
Notes: Returns empty text on success or error message from parser.
Please pass text with data separated with unix line endings (endofline.unix), so you may need to use ReplaceLineEndings function.
See also:

- 167.2.34 ParseString(Data as String, force as boolean = false) as String 20897

167.2.36 ParseStringMT(Data as String, force as boolean = false) as String

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given it as text.
Notes: Returns empty text on success or error message from parser.
Please pass text with data separated with unix line endings (endofline.unix), so you may need to use ReplaceLineEndings function.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 167.2.37 ParseStringMT(Data as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String 20898

167.2.37 ParseStringMT(Data as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given it as text.
Notes: Returns empty text on success or error message from parser.
Please pass text with data separated with unix line endings (endofline.unix), so you may need to use ReplaceLineEndings function.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 167.2.36 ParseStringMT(Data as String, force as boolean = false) as String 20897

167.2.38 Print(File as FolderItem = nil)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Print system to file or stdout.
Notes: Pass nil to use stdout.
Remaining in DIMACS format

167.2.39 PrintAll(File as FolderItem = nil)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prints all values.
Notes: Including units & equivs.
Pass nil to use stdout.

167.2.40 PrintBanner(Name as String, Prefix as String, File as FolderItem = nil)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prints banner including version of library.
Notes: Pass nil to use stdout.

see lglbnr function.

167.2.41 PrintOptions(prefix as string, IgnoreSome as boolean)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Print all options to stdout.

167.2.42 PrintPCS(mixed as boolean)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prints PCS file.

167.2.43 PrintRangeOptions

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Print range options to stdout.

167.2.44 PrintSizes

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prints data structure sizes.

167.2.45 PrintStats

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prints statistics to stdout.

167.2.46 PrintUsage

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Print usage "-h".

167.2.47 ReadOptionFile(File as FolderItem) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the option file.

167.2.48 Reconstk(byref Start as Ptr, byref Top as Ptr)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set Start and Top to the 'start' and 'top' of the reconstruction stack, which is used in BCE, BVE and CCE for reconstructing a solution after eliminating variables or clauses.
Notes: These pointers are only valid until the next Sat or Simp call.

167.2.49 ReduceCache

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reset cache size.

167.2.50 Representative(lit as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return representative from equivalence class if literal is not top-level assigned nor eliminated.

167.2.51 ResetPhase(lit as integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set default phase of a literal.
Notes: Stop forcing phase in decisions.

167.2.52 Reusable(lit as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if item can be reused.
Notes: If a literal was not frozen at the last call to Sat (or Simp) it becomes 'unusable' after the next call even though it might not have been used as blocking literal etc.

167.2.53 Reuse(lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reuses an item.
Notes: If a literal was not frozen at the last call to Sat (or Simp) it becomes 'unusable' after the next call even though it might not have been used as blocking literal etc.

167.2.54 Sat as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the system.
Notes: May output messages to stdout.

167.2.55 SatMT as Integer

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the system.
Notes: May output messages to stdout.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

167.2.56 SetAPITraceFile(File as FolderItem)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a text file and let the library output to this file.
Notes: Logs API calls to the library.

167.2.57 SetID(tid as Integer, tids as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set individual ids for logging and statistics.

167.2.58 SetImportant(lit as integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prefer decisions on 'important' variables.

167.2.59 SetOutputFile(File as FolderItem)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an output file and let the library output to this file.
Notes: Sets output file for report.

167.2.60 SetPhase(lit as integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set default phase of a literal.
Notes: Any decision on this literal will always try this phase. Note, that this function does not have any effect on eliminated variables. Further equivalent variables share the same forced phase and thus if they are set to different default phases, only the last set operation will be kept.

167.2.61 SetPhases

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the phases.
Notes: Assume the solver is in the SATISFIABLE state (after Sat or Simp), then calling SetPhases will copy the current assignment as default phases.

167.2.62 SetTraceFile(File as FolderItem)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a text file and let the library output to this file.
Notes: Set trace output file.
Logs trace calls to the library.

167.2.63 Simp(iterations as integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the system.
Notes: Iterations must be >= 0.

167.2.64 TraverseAllClauses

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loops over all clauses and calls TraverseAllClauses event for each.
Notes: Internally calls TraverseUnits, TraverseEquivalences and TraverseRemainingClauses.
See also:

- 167.2.90 TraverseAllClauses(Lit as Integer) 20908

167.2.65 TraverseEquivalences

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loops over equivalences and calls TraverseEquivalences event for each.
See also:

- 167.2.91 TraverseEquivalences(Lit as Integer, Representation as Integer) 20908

167.2.66 TraverseRemainingClauses

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loops over remaining clauses and calls TraverseRemainingClauses event for each.
See also:

- 167.2.92 TraverseRemainingClauses(Lit as Integer) 20908

167.2.67 TraverseUnits

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loops over units and calls TraverseUnits event for each.
See also:

- 167.2.93 TraverseUnits(Unit as Integer) 20908

167.2.68 Unclone(Child as LGLMBS) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unclones the object.

167.2.69 Usable(lit as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether an item is usable.
Notes: If a literal was not frozen at the last call to Sat (or Simp) it becomes 'unusable' after the next call even though it might not have been used as blocking literal etc.

167.2.70 Properties

167.2.71 Aborted as Boolean

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The aborted status.
Notes: We set this to true when the processing is aborted due to an error.
See AbortMessage property for the message.
(Read and Write property)
See also:

- 167.2.89 Aborted 20908

167.2.72 AbortMessage as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The abort reason message.
Notes: (Read only property)

167.2.73 Bytes as Int64

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current size in bytes.
Notes: (Read only property)

167.2.74 Changed as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Model changed.
Notes: (Read only property)

167.2.75 Confs as Int64

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of conflicts.
Notes: (Read only property)

167.2.76 Decs as Int64

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of decisions.
Notes: (Read only property)

167.2.77 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

167.2.78 Inconsistent as Boolean

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Contains empty clause?
Notes: (Read only property)

167.2.79 MaxMegaBytes as Double

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum memory usage in megabytes.
Notes: (Read only property)

167.2.80 MaxVar as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries maximum index of variables.
Notes: (Read only property)

167.2.81 MegaBytes as Double

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current size in memory as megabytes.
Notes: (Read only property)

167.2.82 Options as Dictionary

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all options with values.
Notes: (Read only property)

167.2.83 Prefix as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The prefix for messages.
Notes: (Read and Write property)

167.2.84 ProcessTime as Double

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries CPU usage time used.
Notes: Value is -1 on Windows as we don't have the unix functions there.
(Read only property)

167.2.85 Props as Int64

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of propagations.
Notes: (Read only property)

167.2.86 Seconds as Double

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns time needed.
Notes: (Read only property)

167.2.87 Option(Name as String) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries or sets option value.
Notes: (Read and Write computed property)

167.2.88 Events

167.2.89 Aborted

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called when processing is aborted due to an error.
Notes: Errors are printed to stdout.
See AbortMessage property for the message.
See also:

- 167.2.71 Aborted as Boolean 20904

167.2.90 TraverseAllClauses(Lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called for TraverseAllClauses method.
See also:

- 167.2.64 TraverseAllClauses 20903

167.2.91 TraverseEquivalences(Lit as Integer, Representation as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called for TraverseEquivalences method.
See also:

- 167.2.65 TraverseEquivalences 20903

167.2.92 TraverseRemainingClauses(Lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called for TraverseRemainingClauses method.
See also:

- 167.2.66 TraverseRemainingClauses 20903

167.2.93 TraverseUnits(Unit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called for TraverseUnits method.
See also:

- 167.2.67 TraverseUnits 20904

167.2.94 Constants

SAT Results

Constant	Value	Description
LGL_SATISFIABLE	10	The system is satisfiable.
LGL_UNKNOWN	0	It is not known whether it is satisfiable.
LGL_UNSATISFIABLE	20	The system is not satisfiable.

Chapter 168

Saxon

168.1 class DocumentBuilderMBS

168.1.1 class DocumentBuilderMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for building documents.
Example:

```
// parse an XML file with Saxon and list the child elements of the root
// The Saxon library must be loaded first with SaxonMBS.LoadLibrary.
Var processor As New SaxonProcessorMBS
Var builder As DocumentBuilderMBS = processor.NewDocumentBuilder
builder.LineNumbering = True

Var doc As XdmNodeMBS = builder.parseXmlFromFile(SpecialFolder.Desktop.Child("data.xml"))
If doc = Nil Then Return
For Each root As XdmNodeMBS In doc.Children
For Each child As XdmNodeMBS In root.Children
If child.NodeKind = XdmNodeMBS.KindElement Then System.DebugLog child.NodeName
Next
Next
```

Notes: A document builder holds properties controlling how a Saxon document treeshould be built, and provides methods to invoke the tree construction.

This class has no public constructor. To construct a DocumentBuilder,use the factory method SaxonProcessor.newDocumentBuilder().

All documents used in a single Saxon query, transformation, or validationepisode must be built with the same Configuration. However, there is no requirement that they should use the same DocumentBuilder.

Sharing of a DocumentBuilder across multiple threads is not recommended. However, in the current implementation sharing aDocumentBuilder (once initialized) will only cause problems if aSchemaValidator is used.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

168.1.2 Methods

168.1.3 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

168.1.4 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

168.1.5 parseXmlFromFile(File as FolderItem) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses an XML document from a file.
Notes: Build a document from a supplied XML file.

Returns an XdmNode. This will be the document node at the root of the tree of the resulting in-memory document.

If any failure occurs retrieving or parsing the document the exception methods will provide more information.

168.1.6 parseXmlFromPath(Path as String) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses an XML document from a file.

Notes: Build a document from a supplied XML file.

Returns an XdmNode. This will be the document node at the root of the tree of the resulting in-memory document.

If any failure occurs retrieving or parsing the document the exception methods will provide more information.

168.1.7 parseXmlFromString(content as String, encoding as String = "") as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses an XML document from a string.
Notes: Load an XML document, to create a tree representation of the document in memory.

content: the XML document as a serialized string @param encoding of the source string argument. If not specified then platform default encoding is used.

Returns an XdmNode. This will be the document node at the root of the tree of the resulting in-memory document.

If any failure occurs retrieving or parsing the document the exception methods will provide more information.

168.1.8 parseXmlFromUri(source as String) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses an XML document from an URI.
Notes: Build a document from a supplied URI source.

Returns an XdmNode. This will be the document node at the root of the tree of the resulting in-memory document.

If any failure occurs retrieving or parsing the document the exception methods will provide more information.

168.1.9 Properties

168.1.10 BaseURI as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The base URI of a document loaded using this DocumentBuilder.
Notes: This is used for resolving any relative URIs appearing within the document, for example in references to DTDs and external entities.

This information is required when the document is loaded from a source that does not provide an intrinsic URI, notably when loading from a Stream or a DOMSource. The value is ignored when loading from a source that does have an intrinsic base URI.

Value is the base URI of documents loaded using this DocumentBuilder. This must be an absolute URI.
(Read and Write property)

168.1.11 DTDValidation as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set whether DTD validation should be applied to documents loaded using this DocumentBuilder.
Example:

```
Var s As New SaxonProcessorMBS
Var d As DocumentBuilderMBS = s.NewDocumentBuilder

d.DTDValidation = True
```

Notes: By default, no DTD validation takes place.

Set to true if DTD validation is to be applied to the document.
(Read and Write property)

168.1.12 Handle as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

168.1.13 LineNumbering as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to keep ine numbers
Example:

```
Var s As New SaxonProcessorMBS
Var d As DocumentBuilderMBS = s.NewDocumentBuilder

d.LineNumbering = True
```

Notes: Get or set whether line and column numbering and is to be enabled for documents constructed using this DocumentBuilder. This has the effect that the line and column number in the original source document is maintained in the constructed tree, for each element node (and only for elements). The line and column number in question are generally the position at which the closing ">" of the element start tag appears.
By default, line and column numbers are not maintained.

Errors relating to document parsing and validation will generally contain line numbers whether or not this option is set, because such errors are detected during document construction.

Line numbering is not available for all kinds of source: for example, it is not available when loading from an existing DOM Document.
(Read and Write property)

168.1.14 SchemaValidator as SchemaValidatorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The SchemaValidator used to validate documents loaded using this DocumentBuilder.
Notes: This determines whether schema validation is applied to an input document and whether type annotations in a supplied document are retained. If no schemaValidator is supplied, then schema validation does not take place.
This option requires the schema-aware version of the Saxon product (Saxon-EE).

Since a SchemaValidator is serially reusable but not thread-safe, using this method is not appropriate when the DocumentBuilder is shared between threads.
(Read and Write property)

168.2 class SaxonExceptionMBS

168.2.1 class SaxonExceptionMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception for errors in Saxon.
Notes: Subclass of the RuntimeException class.
Blog Entries

- Validate electronic invoices with Saxon in Xojo

168.3 module SaxonMBS

168.3.1 module SaxonMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The module for globals.
Example:

```
// run a XPath 3.1 query on some XML with Saxon
If Not SaxonMBS.LoadLibrary(SpecialFolder.Resources.Child("libsaxon-hec.dylib")) Then
MessageBox SaxonMBS.LoadErrorString
Return
End If
Var xml As String = "<shop><item price=""5""/><item price=""12""/><item price=""3""/></shop>"
MessageBox "Total: " + SaxonMBS.XPathQuery(xml, "sum(//item/@price)") // 20
```

Notes: Requires an additional Saxon license from Monkeybread Software to use in Xojo.

168.3.2 Methods

168.3.3 ClearLicense

MBS XML Plugin, Plugin Version: 25.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the license.

168.3.4 LoadLibrary(file as folderitem) as boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the library.
Notes: You point to the right file:

File name	Platform
libsaxon-pec-12.5.0.so	Linux
libsaxon-pec-12.5.0.dylib	macOS
libsaxon-pec-12.5.0.dll	Windows

Sets the LoadErrorString and LoadError properties.
See also:

- 168.3.5 LoadLibrary(path as string) as boolean 20918

168.3.5 LoadLibrary(path as string) as boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the library.
Example:

```
Var path As String = "/Users/cs/saxon/Libs/libsaxon-pec-12.5.0.dylib"
Var b As Boolean = SaxonMBS.LoadLibrary(path)

If b Then
// okay
Else
Print SaxonMBS.LoadErrorString
End If
```

Notes: You point to the right file:

File name	Platform
libsaxon-pec-12.5.0.so	Linux
libsaxon-pec-12.5.0.dylib	macOS
libsaxon-pec-12.5.0.dll	Windows

Sets the LoadErrorString and LoadError properties.
See also:

- 168.3.4 LoadLibrary(file as folderitem) as boolean 20917

168.3.6 SetLicenseCode(Name as String, Product as String, enddate as integer, value as integer)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Not yet used.

168.3.7 Validate(xml as String, schema as String, Lax as boolean = false, Parameters as Dictionary = nil, Properties as Dictionary = nil) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validates XML given a schema.
Notes: This is a convenience function. You can do the same with more options using SchemaValidatorMBS class.

If Parameters is not nil, we use the values in the dictionary to set parameters. Same for properties dictionary.

168.3.8 XPathQuery(xml as String, query as String, Parameters as Dictionary = nil, Properties as Dictionary = nil) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs a XPath query.
Notes: This is a convenience function. You can do the same with more options using XPathProcessorMBS class.

If Parameters is not nil, we use the values in the dictionary to set parameters. Same for properties dictionary.

168.3.9 XQuery(xml as String, query as String, Parameters as Dictionary = nil, Properties as Dictionary = nil) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs a XML Query.
Notes: This is a convenience function. You can do the same with more options using XQueryProcessorMBS class.

If Parameters is not nil, we use the values in the dictionary to set parameters. Same for properties dictionary.

168.3.10 XSLT(xml as String, stylesheet as String, Parameters as Dictionary = nil, Properties as Dictionary = nil) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs a XML stylesheet transformation.
Notes: This is a convenience function. You can do the same with more options using Xslt30ProcessorMBS class.

If Parameters is not nil, we use the values in the dictionary to set parameters. Same for properties dictionary.

168.3.11 Properties

168.3.12 BaseURI as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the base URI for queries.
Notes: (Read and Write property)

168.3.13 CWD as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the current working directory.
Notes: The path must end with a slash (or a backslash on Windows).
(Read and Write property)

168.3.14 Debug as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables debug output for Saxon.
Notes: (Read and Write property)

168.3.15 IsLoaded as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the library has been loaded.
Notes: Returns true if loaded or false if not yet loaded.
(Read only property)

168.3.16 LanguageVersion as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The language version to use for queries.
Example:

SaxonMBS.LanguageVersion = "3.1"

Notes: e.g. set to "3.1".
(Read and Write property)

168.3.17 License as String

MBS XML Plugin, Plugin Version: 25.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries which license is set.
Notes: Returns "Saxon-EE", "Saxon-PE" or empty text.
(Read only property)

168.3.18 LoadError as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error code for the library loading.
Notes: Zero on success.
(Read only property)

168.3.19 LoadErrorString as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error message for loading the library.
Notes: (Read only property)

168.3.20 ValidationReport as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The validation report from Validate() function as XML.
Notes: (Read and Write property)

168.3.21 Version as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the version of the Saxon library.
Notes: Returns version or empty text.
(Read only property)

168.3.22 XSDVersion as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The XSD version to use.
Notes: (Read and Write property)

168.3.23 XslMessages as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the XLS Messages from last XSLT call.
Notes: (Read only property)

168.4 class SaxonProcessorMBS

168.4.1 class SaxonProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The SaxonProcessor class acts as a factory for generating XQuery, XPath, Schema and XSLT compilers.
Example:

Var Processor As New SaxonProcessorMBS
MessageBox Processor.Version

Notes: The SaxonProcessor class not only generates XQuery, XPath, Schema and XSLT Processors, but is used to create Xdm objects from primitive types.

Lot of functions take file paths as string. That can be an absolute file path for the operating system (e.g. FolderItem.NativePath), a simple file name in the current working directory or a relative file specification, e.g. "../data/test.xml".
Blog Entries

- MBS Xojo Plugins, version 26.3pr1
- News from the MBS Xojo Plugins in Version 25.1

168.4.2 Methods

168.4.3 clarkNameToEQName(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert clark name string to EQName notation.
Notes: The expanded name, as a string using the notation defined by the EQName production in XPath 3.0. If the name is in a namespace, the resulting string takes the form Q { uri } local. Otherwise, the value is the local part of the name.

Name: The URI in Clark notation: { uri } local if the name is in a namespace, or simply local if not.

Returns the expanded name, as a string using the notation defined by the EQName production in XPath 3.0.

168.4.4 clearConfigurationProperties

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear configuration properties specific to the processor in use.

168.4.5 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A default constructor.
Notes: Create Saxon Processor.
See also:

- 168.4.6 Constructor(other as SaxonProcessorMBS) 20924

168.4.6 Constructor(other as SaxonProcessorMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 168.4.5 Constructor 20924

168.4.7 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

168.4.8 EQNameToClarkName(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert EQName string to clark name notation.
Notes: name: The URI in EQName notation: Q { uri } local if the name is in a namespace. For a name in no namespace, either of the forms Q { } local or simply local are accepted.

Returns the URI in the clark notation.

168.4.9 makeArray(input() as Variant) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array from variants.
Example:

```
Var Processor As New SaxonProcessorMBS
Var values() As Variant
values.add 123
values.add "Hello"
values.add True
values.add Array(1,2,3)
Var a As XdmArrayMBS = Processor.makeArray(values)
Var t As String = a.toString
Break // shows [ 123,"Hello",true(), [ 1,2,3 ] ]
```

Notes: Uses makeValue internally to convert variant values to XdmValue.

168.4.10 makeArrayValues(input() as XdmValueMBS) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are of type XdmValue.
Example:

```
Var Processor As New SaxonProcessorMBS
Var v() As XdmValueMBS
v.Add Processor.makeInt32Value(123)
v.Add Processor.makeDoubleValue(123)
v.Add Processor.makeStringValue("Hello")
Var a As XdmValueMBS = Processor.makeArrayValues(v)
// shows [ 123,1.23e2,"Hello" ]
MessageBox a.toString
```

Notes: input: the input array of XdmValue pointers

Returns an XdmArray whose members are XdmValue values corresponding one-to-one with the input.

168.4.11 makeAtomicValue(type as String, value as String) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: ate an Xdm Atomic value from string representation.
Example:

```
Var Processor As New SaxonProcessorMBS
```

```
Var v As Variant = 1234.56
Var a As XdmAtomicValueMBS = Processor.makeAtomicValue(v)
MessageBox a.toString
```

Notes: type: Local name of a type in the XML Schema namespace.
value: The value given in a string form.

In the case of a QName the value supplied must be in clark notation. { uri } local

Returns XdmValueMBS object.
See also:

- 168.4.12 makeAtomicValue(value as Variant) as XdmAtomicValueMBS 20926

168.4.12 makeAtomicValue(value as Variant) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an atomic value.
Example:

```
Var Processor As New SaxonProcessorMBS
Var v As Variant = "Hello"
Var a As XdmAtomicValueMBS = Processor.makeAtomicValue(v)
Var t As String = a.toString
Break // shows Hello
```

Notes: Converts values to Atomic value. Supports string, text, date/datetime, UInt32, UInt64, Int64, Int32, Integer, Color, Boolean, Single and Double.
See also:

- 168.4.11 makeAtomicValue(type as String, value as String) as XdmAtomicValueMBS 20925

168.4.13 makeBooleanArray(input() as Boolean) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:boolean values.
Example:

```
Var Processor As New SaxonProcessorMBS
Var values() As Boolean = array(true, false, true)
Var a As XdmArrayMBS = Processor.makeBooleanArray(values)
Var t As String = a.toString
```

```
Break // shows [ true(),false(),true() ]
```

Notes: input: the input array of boolean values

Returns an XdmArrayMBS whose members are xs:boolean values corresponding one-to-one with the input.

168.4.14 makeBooleanValue(value as Boolean) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Factory method to make a boolean value.
Example:

```
Var Processor As New SaxonProcessorMBS
Var a As XdmAtomicValueMBS = Processor.makeBooleanValue(True)
Var t As String = a.toString
Break // shows true
```

Notes: Makes a XdmAtomicValue representing a boolean Value.

168.4.15 makeDoubleArray(input() as Double) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:float values.
Example:

```
Var Processor As New SaxonProcessorMBS
Var v() As Double
v.Add 0.1
v.Add 2.2
v.Add 99
Var a As XdmValueMBS = Processor.makeDoubleArray(v)
// shows [ 1.0e-1,2.2e0,9.9e1 ]
MessageBox a.toString
```

Notes: input: the input array of single values.

Returns an XdmArray whose members are xs:float values corresponding one-to-one with the input.

168.4.16 makeDoubleValue(value as Double) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Factory method to create a double.
Example:

```
Var Processor As New SaxonProcessorMBS
Var a As XdmAtomicValueMBS = Processor.makeDoubleValue(123)
MessageBox a.toString
```

Notes: Make an XdmAtomicValue from a primitive double value

168.4.17 makeInt16Array(input() as Int16) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:short values
Example:

```
Var Processor As New SaxonProcessorMBS
Var v() As Int16
v.Add 1
v.Add 2
v.Add -3
Var a As XdmValueMBS = Processor.makeInt16Array(v)
MessageBox a.toString // shows [ 1,2,-3 ]
```

Notes: input: the input array of short values

Returns an XdmArray whose members are xs:boolean values corresponding one-to-one with the input.

168.4.18 makeInt32Array(input() as Int32) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:int values.
Example:

```
Var Processor As New SaxonProcessorMBS
Var v() As Int32
v.Add 1
v.Add 2
v.Add 3
```

```
Var a As XdmValueMBS = Processor.makeInt32Array(v)
MessageBox a.toString // shows [ 1,2,3 ]
```

Notes: input: the input array of int values.

Returns an XdmArray whose members are xs:int values corresponding one-to-one with the input.

168.4.19 makeInt32Value(value as Int32) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Factory method to make an integer.
Example:

```
Var Processor As New SaxonProcessorMBS
Var s As Int32 = 123
Var a As XdmAtomicValueMBS = Processor.makeInt32Value(s)
Var t As String = a.toString
Break // shows 123
```

168.4.20 makeInt64Array(input() as Int64) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:long values
Example:

```
Var Processor As New SaxonProcessorMBS
Var v() As Int64 = Array(1,2,3,4)
Var a As XdmValueMBS = Processor.makeInt64Array(v)
MessageBox a.toString // shows [ 1,2,3,4 ]
```

Notes: input: the input array of long values

Returns an XdmArray whose members are xs:long values corresponding one-to-one with the input.

168.4.21 makeInt64Value(value as Int64) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Ractory method to make a Int64 value.

Example:

```
Var Processor As New SaxonProcessorMBS
Var s As XdmAtomicValueMBS = Processor.makeInt64Value(123)
Var t As String = s.StringValue
Var v As Variant = s.Value
Var i As Int64 = s.LongValue
Break
```

Notes: makes either an Int64Value or a BigIntegerValue depending on the value supplied.

168.4.22 makeIntegerArray(input() as Integer) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:long or xs:int values
Example:

```
Var Processor As New SaxonProcessorMBS
Var v() As Integer = Array(1,2,3,4)
Var a As XdmValueMBS = Processor.makeIntegerArray(v)
MessageBox a.toString // shows [ 1,2,3,4 ]
```

Notes: input: the input array of integer values

Either uses makeInt64Array or makeInt32Array internally depending on whether this is 32-bit or 64-bit application.

168.4.23 makeIntegerValue(value as Integer) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Makes an integer value.
Example:

```
Var Processor As New SaxonProcessorMBS
Var s As Int32 = 123
Var a As XdmAtomicValueMBS = Processor.makeIntegerValue(s)
Var t As String = a.toString
Break // shows 123
```

Notes: Internally uses makeInt32Value or makeInt64Value depending on whether the application is 32-bit or 64-bit.

168.4.24 makeMap(dataMap as Dictionary) as XdmMapMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmMap whose argument is a map from the dictionary.
Example:

```
Var Processor As New SaxonProcessorMBS
Var map As New Dictionary
map.Value("test") = Processor.makeStringValue("Hello")
map.Value("other") = "World"
map.Value(Processor.makeIntegerValue(123)) = True
Var m As XdmMapMBS = Processor.makeMap(map)
Var s As String = m.toString
Break // map { "other":"World","test":"Hello",123:true() }
```

Notes: dataMap: is dictionary, which consists of keys as XdmAtomicValueMBS and value is XdmValueMBS.

Returns an XdmMap whose members are key, value pair given as (XdmAtomicValue, XdmValue)

For your convenience we convert various data types to XdmAtomicValueMBS automatically using makeAtomicValue method.

Also for your convenience any value in the dictionary not being a XdmValueMBS is converted to XdmValueMBS using makeValue() function.

168.4.25 makeMap2(dataMap as Dictionary) as XdmMapMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmMap whose argument is a map from the standard template library.
Example:

```
Var Processor As New SaxonProcessorMBS
Var map As New Dictionary
map.Value("test") = Processor.makeStringValue("Hello")
map.Value("other") = Processor.makeIntegerValue(123)
Var m As XdmMapMBS = SaxonProcessorMBS.makeMap2(map)
Var s As String = m.toString
Break // map { "other":123,"test":"Hello" }
```

Notes: dataMap: is dictionary, which consists of keys as string and value is XdmValueMBS.
Keys are converted to XdmAtomicValue objects

Returns an XdmMap whose members are key, value pair given as (XdmAtomicValue, XdmValue)

168.4.26 makeObjectArray(input() as Object) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array from an array of objects.
Example:

```
Var Processor As New SaxonProcessorMBS
Var values() As Object
values.add Processor.makeValue(123)
values.add Processor.makeValue("Hello")
values.add Processor.makeValue(True)
values.add Processor.makeValue(Array(1,2,3))
Var a As XdmArrayMBS = Processor.makeObjectArray(values)
var t as string = a.toString
Break // shows [ 123,"Hello",true(), [ 1,2,3 ] ]
```

Notes: Uses makeValue internally to convert variant values to XdmValue.

168.4.27 makeQNameValue(value as String) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an QName Xdm value from string representation in clark notation
Example:

```
Var Processor As New SaxonProcessorMBS
Var a As XdmAtomicValueMBS = Processor.makeQNameValue("Hello")
Var s As String = a.toString
Break // s is Hello
```

Notes: value: The value given in a string form in clark notation. { uri } local

Returns XdmAtomicValueMBS object.

168.4.28 makeSingleArray(input() as Single) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:double values.
Example:

```
Var Processor As New SaxonProcessorMBS
Var v() As Single
v.Add 0.1
v.Add 2.2
v.Add 99
Var a As XdmValueMBS = Processor.makeSingleArray(v)
// shows [ xs:float("0.1"),xs:float("2.2"),xs:float("99") ]
MessageBox a.toString
Break
```

Notes: input: the input array of double values.

Returns an XdmArray whose members are xs:double values corresponding one-to-one with the input.

168.4.29 makeSingleValue(value as Single) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Factory method to make a float value.
Example:

```
Var Processor As New SaxonProcessorMBS
Var s As Single = 123.45
Var a As XdmAtomicValueMBS = Processor.makeSingleValue(s)
Var t As String = a.toString
Break // shows 123.45
```

Notes: Make an XdmAtomicValue from a primitive float value.

168.4.30 makeStringArray(input() as String) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:string values
Example:

```
Var Processor As New SaxonProcessorMBS
```

```
Var v() As String
v.Add "Hello"
v.add "World"
Var a As XdmValueMBS = Processor.makeStringArray(v)
// shows [ "Hello","World" ]
MessageBox a.toString
Break
```

Notes: input: the input array of string values

Returns an XdmArray whose members are xs:string values corresponding one-to-one with the input.

168.4.31 makeStringValue(value as String, encoding as String = "") as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Factory method to create string.
Example:

```
Var Processor As New SaxonProcessorMBS
Var s As XdmAtomicValueMBS = Processor.makeStringValue("Hello")
Var t As String = s.StringValue
Break
```

Notes: Unlike the constructor, this avoids creating a new StringValue in the case of a zero-length string (and potentially other strings, in future)

value: the String value.
encoding: the encoding of the string. If not specified then the platform default encoding is used.

168.4.32 makeValue(value as Variant) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a value.
Example:

```
Var Processor As New SaxonProcessorMBS

Var v As Variant = 123.45
Var a As XdmValueMBS = Processor.makeValue(v)
Var t As String = a.toString
```

Break

Notes: Converts values to XdmValueMBS internally:

- nil value
- Array of String
- Array of Boolean
- Array of Int32, Int64 or Integer
- Array of Single/Double
- Array of Object/Variant
- String, OSType, Date, DateTime, Text
- Int32
- Int64, UInt32, Color
- Single
- Double, Currency, UInt64
- Boolean
- Object: Dictionary or XdmValueMBS

Raises exception for unsupported types. We could add more types if needed.

168.4.33 NewDocumentBuilder as DocumentBuilderMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a DocumentBuilder.
Notes: A DocumentBuilder is used to load source XML documents.

168.4.34 NewSchemaValidator as SchemaValidatorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a SchemaValidator which can be used to validate instance documents against the schema held by this SchemaManager.
Notes: Returns nil, if license doesn't allow the validator.

168.4.35 NewXPathProcessor as XPathProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an XPathProcessor.
Notes: An XPathProcessor is used to compile XPath expressions.

168.4.36 NewXQueryProcessor as XQueryProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an XQueryProcessor.
Notes: An XQueryProcessor is used to compile XQuery queries.

168.4.37 NewXslt30Processor as Xslt30ProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an Xslt30Processor.
Notes: An Xslt30Processor is used to compile XSLT30 stylesheets.

168.4.38 parseJsonFromFile(File as FolderItem) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse a source JSON file and return it as an XdmValue.
Example:

```
Const Path = "/Users/cs/test.json"
Var n As XdmValueMBS = s.parseJsonFromFile(Path)
Var x As String = n.toString

Break
```

Notes: File: The full path to the file.

Returns an XdmValueMBS.

Throws a SaxonExceptionMBS if there ia a failure in the parsing of the XML file.

168.4.39 parseJsonFromPath(Path as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse a source JSON file and return it as an XdmValue.
Example:

```
Const Path = "/Users/cs/test.json"
Var n As XdmValueMBS = s.parseJsonFromFile(Path)
Var x As String = n.toString

Break
```

Notes: Path: the filename of the JSON. This is a full path filename or a URI.

Returns an XdmValueMBS.

Throws a SaxonExceptionMBS if there ia a failure in the parsing of the XML file.

168.4.40 parseJsonFromString(content as String, encoding as String = "") as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse a lexical representation of the JSON and return it as an XdmValue.
Example:

```
Var Processor As New SaxonProcessorMBS
Var n As XdmValueMBS = Processor.parseJsonFromString(" [ 1,2,3 ] ")
Var s As String = n.toString
Break
// shows [ 1.0e0,2.0e0,3.0e0 ]
```

Notes: source: the JSON as a lexical string
encoding: the encoding of the source argument. Argument can be omitted and "" accepted to use the default platform encoding.

Returns an XdmValueMBS.

Raises SaxonExceptionMBS if there is a failure in the parsing of the JSON.

168.4.41 parseXmlFromFile(File as FolderItem, validator as SchemaValidatorMBS = nil) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse a source document file and return it as an XdmNode.
Notes: source: the filename of the source document
validator: can be used to supply a SchemaValidator to validate the document. Default is nil.

Returns an XdmNodeMBS

Throws a SaxonExceptionMBS if there ia a failure in the parsing of the XML file.

168.4.42 parseXmlFromPath(Path as String, validator as SchemaValidatorMBS = nil) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse a source document file and return it as an XdmNode.
Example:

```
Var s As New SaxonProcessorMBS

Const XMLPath = "/Users/cs/test.xml"
Var n As XdmNodeMBS = s.parseXmlFromPath(XMLPath)
Var x As String = n.toString

Break
```

Notes: source: the filename of the source document
validator: can be used to supply a SchemaValidator to validate the document. Default is nil.

Returns an XdmNodeMBS

Throws a SaxonExceptionMBS if there ia a failure in the parsing of the XML file.

168.4.43 parseXmlFromString(content as String, encoding as String = "", validator as SchemaValidatorMBS = nil) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse a lexical representation of the source document and return it as an XdmNodeMBS.

Notes: source: the source document as a lexical string
encoding: the encoding used to decode the source string. If not specified then platform default encoding is used.
validator: can be used to supply a SchemaValidator to validate the document. Default is nil.

Returns an XdmNodeMBS

Throws a SaxonExceptionMBS if there is a failure in the parsing of the XML document

168.4.44 parseXmlFromUri(URI as String, validator as SchemaValidatorMBS = nil) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse a source document available by URI and return it as an XdmNode.
Notes: source: the URI of the source document
validator: can be used to supply a SchemaValidator to validate the document. Default is nil.

Returns an XdmNodeMBS.

Raises SaxonExceptionMBS if there ia failure in the parsing of the XML file

168.4.45 setCatalog(catalogFile as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set catalog to be used in Saxon.
Notes: catalogFile: file name to the catalog

168.4.46 setCatalogFiles(catalogFiles() as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The catalog files to be used in Saxon.
Notes: catalogFiles: the catalog file names array to the catalog

168.4.47 StringValue(item as XdmItemMBS) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the string representation of the XdmValue.

168.4.48 SystemFunction(name as String, arity as Integer) as XdmFunctionItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get a system function.
Example:

```
Var processor As New SaxonProcessorMBS
Var func As XdmFunctionItemMBS = processor.SystemFunction(" { http://www.w3.org/2005/xpath-functions
} parse-json", 1)
Break
```

Notes: This can be any function defined in XPath 3.1 functions and operators, including functions in the math, map, and array namespaces. It can also be a Saxon extension function, provided a licensed Processor is used.

processor: The Saxon Processor object required to get the system function.
name: the name of the function
arity: the number of arguments in the function

Returns the requested function, or null if there is no such function. Note that some functions (those with particular context dependencies) may be unsuitable for dynamic calling.

168.4.49 Properties

168.4.50 ConfigurationProperties as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all configuration properties.
Notes: (Read only property)

168.4.51 CWD as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current working directory.
Notes: The path must end with a slash (or a backslash on Windows).
(Read and Write property)

168.4.52 isLicensed as Boolean

MBS XML Plugin, Plugin Version: 25.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether as license was set.
Notes: (Read only property)

168.4.53 isSchemaAwareProcessor as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Test whether this processor is schema-aware.
Notes: True if this this processor is licensed for schema processing, false otherwise.
(Read only property)

168.4.54 ResourcesDirectory as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The saxon resources directory.
Notes: (Read and Write property)

168.4.55 Version as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the version of Saxonica library.
Example:

```
Var s As New SaxonProcessorMBS
MessageBox s.Version
```

Notes: e.g. "SaxonC-HE 12.5 from Saxonica"
(Read only property)

168.4.56 ConfigurationProperty(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A configuration property specific to the processor in use.
Notes: Properties specified here are common across all the processors.
Example 'l': enable line number has the value 'on' or 'off'
(Read and Write computed property)

168.5 class SchemaValidatorMBS

168.5.1 class SchemaValidatorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A SchemaValidator represents a factory for validating instance documents against a schema.
Example:

```
Var processor As New SaxonProcessorMBS
Var validator As SchemaValidatorMBS = processor.NewSchemaValidator

// parse XML
Var InputXML As String = _
"<?xml version=""1.0"" encoding=""UTF-8""?>" + EndOfLine + _
"<request>" + EndOfLine + _
" <a/>" + EndOfLine + _
" <!–comment–>" + EndOfLine + _
"</request>"

Var SchemaXML As String = _
"<?xml version=""1.0"" encoding=""UTF-8""?>" + EndOfLine + _
"<xs:schema xmlns:xs=""http://www.w3.org/2001/XMLSchema"" elementFormDefault=""qualified"" at-
tributeFormDefault=""unqualified"">" + EndOfLine + _
" <xs:element name=""request"">" + EndOfLine + _
" <xs:complexType>" + EndOfLine + _
" <xs:sequence>" + EndOfLine + _
" <xs:element name=""a"" type=""xs:string""/>" + EndOfLine + _
" <xs:element name=""b"" type=""xs:string""/>" + EndOfLine + _
" </xs:sequence>" + EndOfLine + _
" <xs:assert test=""count(child::node()) = 3""/>" + EndOfLine + _
" </xs:complexType>" + EndOfLine + _
" </xs:element>" + EndOfLine + _
"</xs:schema>"

Var Input As XdmNodeMBS = processor.parseXmlFromString(InputXML)

validator.PropertyValue("report-node") = "true"
validator.registerSchemaFromString SchemaXML
validator.SourceNode = input

Var ErrorMessage As String
Try
validator.validate
MessageBox "OK"
Catch s As SaxonExceptionMBS

MessageBox s.Message
```

```
Var report As XdmNodeMBS = validator.ValidationReport
Var reportXML As String = report.toString
Var reportText As String = report.StringValue

Break
End Try
```

- Validate electronic invoices with Saxon in Xojo

168.5.2 Methods

168.5.3 AddParameters(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameters given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys to XdmAtomicValue and values XdmValue objects internally and set parameters.

168.5.4 AddProperties(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets properties given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys and values to string and set properties.

168.5.5 clearParameters

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear parameter values set.

168.5.6 clearProperties

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears all properties.

168.5.7 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor.
See also:

- 168.5.8 Constructor(other as SchemaValidatorMBS) 20945
- 168.5.9 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 20945

168.5.8 Constructor(other as SchemaValidatorMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 168.5.7 Constructor 20945
- 168.5.9 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 20945

168.5.9 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A constructor with a SaxonProcessor.
Notes: The supplied processor should have license flag set to true for the Schema Validator to operate.

SaxonProcessor: the SaxonProcessor
cwd: set the current working directory
See also:

- 168.5.7 Constructor 20945
- 168.5.8 Constructor(other as SchemaValidatorMBS) 20945

168.5.10 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

168.5.11 exportSchema(File as FolderItem)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Export a precompiled Schema Component Model containing all the components (except built-in components) that have been loaded by using the register methods.
See also:

- 168.5.12 exportSchema(Path as String) 20946

168.5.12 exportSchema(Path as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Export a precompiled Schema Component Model containing all the components (except built-in components) that have been loaded by using the register methods.
Notes: Path: The file name where the exported schema will be stored
See also:

- 168.5.11 exportSchema(File as FolderItem) 20946

168.5.13 registerSchemaFromFile(File as FolderItem)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Register the schema from file name.
Notes: The schema components derived from this schema document are added to the cache of schema components maintained by this SchemaManager.

Raises exception if parsing schema fails.

168.5.14 registerSchemaFromNode(node as XdmNodeMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Register the schema supplied as an XDM Node Object.
Notes: node: The schema document supplied as an XdmNode object

Raises exception if parsing schema fails.

168.5.15 registerSchemaFromPath(Path as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Register the schema from file name.
Notes: The schema components derived from this schema document are added to the cache of schema components maintained by this SchemaManager.

Path: File name of the schema relative to the cwd or full path if cwd is "". The document may be either a schema document in source XSD format, or a compiled schema in Saxon-defined SCM format (as produced using the method exportSchema)

Raises exception if parsing schema fails.

168.5.16 registerSchemaFromString(schemaStr as String, systemID as String = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Register the schema supplied as a string.
Example:

```
Var processor As New SaxonProcessorMBS
Var validator As SchemaValidatorMBS = processor.NewSchemaValidator

Var SchemaXML As String = _
"<?xml version=""1.0"" encoding=""UTF-8""?>" + EndOfLine + _
"<xs:schema xmlns:xs=""http://www.w3.org/2001/XMLSchema"" elementFormDefault=""qualified"" at-
tributeFormDefault=""unqualified"">" + EndOfLine + _
" <xs:element name=""request"">" + EndOfLine + _
" <xs:complexType>" + EndOfLine + _
" <xs:sequence>" + EndOfLine + _
" <xs:element name=""a"" type=""xs:string""/>" + EndOfLine + _
" <xs:element name=""b"" type=""xs:string""/>" + EndOfLine + _
" </xs:sequence>" + EndOfLine + _
" <xs:assert test=""count(child::node()) = 3""/>" + EndOfLine + _
" </xs:complexType>" + EndOfLine + _
" </xs:element>" + EndOfLine + _
"</xs:schema>"

validator.registerSchemaFromString SchemaXML
```

Notes: schemaStr: The schema document supplied as a string.
systemID: The system ID of the document supplied as a string.

Raises exception if parsing schema fails.

168.5.17 removeParameter(name as String) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove a parameter (name, value) pair.
Notes: Please pass the name of the parameter.
Returns outcome of the removal, true if found.

168.5.18 validate

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validate an instance document by a registered schema.
Notes: Source must be provided with SourceNode property or other way.
See also:

- 168.5.19 validate(sourceFile as FolderItem) 20948
- 168.5.20 validate(sourcePath as String) 20948

168.5.19 validate(sourceFile as FolderItem)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validate an instance document by a registered schema.
Notes: sourceFile: Name of the file to be validated.
Allows nil when source document is supplied with other method.
See also:

- 168.5.18 validate 20948
- 168.5.20 validate(sourcePath as String) 20948

168.5.20 validate(sourcePath as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validate an instance document by a registered schema.
Notes: sourcePath: Name of the file to be validated.
Allows "" when source document is supplied with other method.
See also:

- 168.5.18 validate 20948
- 168.5.19 validate(sourceFile as FolderItem) 20948

168.5.21 validateToNode(sourceFile as String = "") as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validate an instance document supplied as a Source object.
Notes: sourceFile: The name of the file to be validated. Default is "".

Returns the validated document returned to the calling program as XdmNodeMBS.

168.5.22 ValidationReport as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the Validation report.
Example:

```
Var processor As New SaxonProcessorMBS
Var validator As SchemaValidatorMBS = processor.NewSchemaValidator

// enable reporting of errors.
validator.PropertyValue("report-node") = "true"

// validate something here

Var report As XdmNodeMBS = validator.ValidationReport
Var reportXML As String = report.toString
Var reportText As String = report.StringValue
break // see in debugger
```

Notes: The validation-report option must have been set to true in the properties to use this feature.

Returns nil if validation reporting feature has not been enabled.

168.5.23 Properties

168.5.24 CWD as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Current working Directory.
Notes: Set the current working directory for the Schema Validator.

The path must end with a slash (or a backslash on Windows).
(Read and Write property)

168.5.25 Handle as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

168.5.26 hasLicense as Boolean

MBS XML Plugin, Plugin Version: 25.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether as license was set.
Notes: (Read only property)

168.5.27 Lax as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The validation mode may be either strict or lax.
Notes: The default is strict; this method may be called to indicate that lax validation is required. With strict validation, validation fails if no element declaration can be located for the outermost element. With lax validation, the absence of an element declaration results in the content being considered valid.

Value is true if validation is to be lax, false if it is to be strict.
(Read and Write property)

168.5.28 OutputFile as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the output file that will be used by the validator.
Notes: (Read and Write property)

168.5.29 Parameters as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all parameters.
Notes: Great for viewing them in the debugger.
(Read only property)

168.5.30 Properties as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all properties.
Notes: Great for viewing them in the debugger.
(Read only property)

168.5.31 SourceNode as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The source node for validation.
Notes: The source document supplied as an XdmNode, which will be used to validate against the schema using the validate methods.
The deletion of allocated memory associated with the source node is the document is the responsbility of the caller.
(Read and Write property)

168.5.32 ParameterValue(name as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set a parameter.
Notes: Name: The name of the parameter, as a string.
For namespaced parameter use the JAXP solution i.e. " { uri } name" value of the query parameter.
Assign "" to clear a previously set value.

Some of the properties on this class may just internally set/get a parameter.
(Read and Write computed property)

168.5.33 PropertyValue(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property specific to the processor in use.
Example:

```
var s as SchemaValidatorMBS // your validator

// enable reporting of errors.
s.PropertyValue("report-node") = "true"
```

Notes: Some of the properties on this class may just internally set/get a property.
(Read and Write computed property)

168.6 class XdmArrayMBS

168.6.1 class XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: An array in the XDM data model. An array is a list of zero or more members, each of which is an arbitrary XDM value.
Example:

```
Var processor As New SaxonProcessorMBS

Var values() As Integer = Array(1,2,3)
Var a As XdmArrayMBS = processor.makeArray(values)
MessageBox a.toString // shows [ 1,2,3 ]
```

Notes: The array itself is an XDM item.

An XdmArray is immutable. And an XdmArray is also a function with one argument, the index.
Subclass of the XdmFunctionItemMBS class.

168.6.2 Methods

168.6.3 addMember(value as XdmValueMBS) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Append a new member to an array.
Notes: value: the new member Returns a new array, one item longer than the original.

If the value is lazily evaluated, and evaluation fails then return null.

168.6.4 concat(values as XdmArrayMBS) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Concatenate another array.
Example:

```
Var processor As New SaxonProcessorMBS

Var values() As Integer = Array(1,2,3)
Var a As XdmArrayMBS = processor.makeArray(values)
```

```
Var b As XdmArrayMBS = processor.makeArray(values)
Var c As XdmArrayMBS = a.concat(b)

Break // check in debugger
```

Notes: value: the other array

Returns a new array, containing the members of this array followed by the members of the other array.

168.6.5 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.
Notes: Create an empty XdmArray
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.
See also:

- 168.6.6 Constructor(other as XdmArrayMBS) 20954

168.6.6 Constructor(other as XdmArrayMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 168.6.5 Constructor 20954

168.6.7 PutValue(Index as Integer, value as XdmValueMBS) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a new array in which one member is replaced with a new value.
Notes: n the position of the member that is to be replaced, counting the first member in the array as member zero
value: is the new member for the new array Returns a new array, the same length as the original, with one member replaced by a new value.

If n is less than zero or greater than or equal to the number of members in the array then return nil.

168.6.8 Value(Index as Integer) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the n'th member in the array, counting from zero.
Example:

```
Var processor As New SaxonProcessorMBS

Var values() As Integer = Array(1,2,3)
Var a As XdmArrayMBS = processor.makeArray(values)
// pick second element
Var v As XdmValueMBS = a.Value(1)
// unpack the item to look into the atomic value inside:
Var h As XdmAtomicValueMBS = XdmAtomicValueMBS(v.Head)
// and get our integer
Var n As Integer = h.LongValue

Break
```

Notes: n the member that is required, counting the first member in the array as member zero

Returns the n'th member in the sequence making up the array, counting from zero

Raises OutOfBoundsException if index is out of bounds.

168.6.9 values as XdmValueMBS()

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the members of the array in the form of an array.

168.6.10 Properties

168.6.11 Length as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the number of members in the array.
Example:

```
Var s As New SaxonProcessorMBS

Var values() As Integer = Array(1,2,3)
```

```
Var a As XdmArrayMBS = s.makeArray(values)
Var Length As Integer = a.Length

Break
```

Notes: Returns the number of members in the array.
(Note that the size() method returns 1 (one), because an XDM array is an item.)
(Read only property)

168.7 class XdmAtomicValueMBS

168.7.1 class XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class XdmAtomicValue represents an item in an XPath sequence that is an atomic value.
Example:

```
// get typed values from an XPath result
Var proc As New SaxonProcessorMBS
Var xpath As XPathProcessorMBS = proc.NewXPathProcessor

Var item As XdmItemMBS = xpath.evaluateSingle("3 * 1.5")
If item IsA XdmAtomicValueMBS Then
Var v As XdmAtomicValueMBS = XdmAtomicValueMBS(item)
MessageBox "Type: " + v.PrimitiveTypeName + EndOfLine + "Double: " + v.DoubleValue.ToString
End If
```

Notes: The value may belong to any of the 19 primitive types defined in XML Schema, or to a type derived from these primitive types, or the XPath type xs:untypedAtomic. The type may be either a built-in type or a user-defined type.
An XdmAtomicValue is immutable.
Subclass of the XdmItemMBS class.

168.7.2 Methods

168.7.3 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A default Constructor.
Notes: Create a empty atomic value.
See also:

- 168.7.4 Constructor(other as XdmAtomicValueMBS) 20957

168.7.4 Constructor(other as XdmAtomicValueMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 168.7.3 Constructor 20957

168.7.5 Properties

168.7.6 BooleanValue as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the value converted to a boolean using the XPath casting rules
Example:

```
Var Processor As New SaxonProcessorMBS

Var a As XdmAtomicValueMBS = Processor.makeBooleanValue(True)
Var d As Boolean = a.BooleanValue
Var t As Variant = a.Value

Break
```

Notes: Returns the result of converting to a boolean (Note: this is not the same as the effective boolean value).
false if the value cannot be cast to a boolean.
(Read only property)

168.7.7 DoubleValue as Double

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the value converted to a double using the XPath casting rules.
Example:

```
Var Processor As New SaxonProcessorMBS

Var a As XdmAtomicValueMBS = Processor.makeSingleValue(12.34)
Var d as Double = a.DoubleValue
Var t As Variant = a.Value

Break
```

Notes: If the value is a string, the XSD 1.1 rules are used, which means that the string "+INF" is recognised.

Returns the result of converting to a double.
zero if the value cannot be cast to a double.
(Read only property)

168.7.8 HashCode as Int32

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get a hashcode that reflects the rules for equality matching.
Example:

```
Var Processor As New SaxonProcessorMBS
Var a As XdmAtomicValueMBS = Processor.makeStringValue("Hello")
Var HashCode As Int32 = a.HashCode

Break
```

Notes: Returns a suitable hashcode.
(Read only property)

168.7.9 LongValue as Int64

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the value converted to an integer using the XPath casting rules
Example:

```
Var Processor As New SaxonProcessorMBS

Var a As XdmAtomicValueMBS = Processor.makeInt64Value(1234)
Var d As Int64 = a.LongValue
Var t As Variant = a.Value

Break
```

Notes: Returns the result of converting to an integer.
zero if the value cannot be cast to an integer.
(Read only property)

168.7.10 PrimitiveTypeName as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the primitive type of this atomic value, as a QName.
Example:

```
Var Processor As New SaxonProcessorMBS

Var a As XdmAtomicValueMBS = Processor.makeBooleanValue(True)
```

```
Var t As String = a.PrimitiveTypeName

Break
```

Notes: The primitive types for this purpose are the 19 primitive types of XML Schema, plus xs:integer, xs:dayTimeDuration and xs:yearMonthDuration, and xs:untypedAtomic. For external objects, the result is xs:anyAtomicType. Returns a string of the QName naming the primitive type of this atomic value. This will always be an atomic type.
(Read and Write property)

168.7.11 Value as Variant

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the value as variant.
Example:

```
Var Processor As New SaxonProcessorMBS

Var a As XdmAtomicValueMBS = Processor.makeSingleValue(12.34)
Var t As Variant = a.Value

Break
```

Notes: Supports string, double, Int32 and Int64.
(Read only property)

168.8 class XdmFunctionItemMBS

168.8.1 class XdmFunctionItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class XdmFunctionItem represents a function item.
Notes: Subclass of the XdmItemMBS class.

168.8.2 Methods

168.8.3 callFunction(processor as SaxonProcessorMBS, arguments() as XdmValueMBS) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Call the function
Example:

```
Var processor As New SaxonProcessorMBS
// load a function
Var func As XdmFunctionItemMBS = XdmFunctionItemMBS.SystemFunction(processor, " { http://www.w3.org/2005/xpatl
functions } lower-case", 1)

// let's build arguments
Var s As XdmValueMBS = processor.makeStringValue("Hello")
Var arguments() As XdmValueMBS
arguments.Add s

// now call it
Var result As XdmValueMBS = func.callFunction(processor, arguments)

// check result in debugger
Var resultString As String = Result.toString
Break
```

Notes: processor: the SaxonProcessor object required in the call of the function.
arguments: the values to be supplied as arguments to the function.
The "function conversion rules" will be applied to convert the arguments to the required type when necessary.

Returns the result of calling the function.

168.8.4 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor for XdmFunctionItem.
Notes: Create an empty XdmFunctionItem
See also:

- 168.8.5 Constructor(other as XdmFunctionItemMBS) 20962

168.8.5 Constructor(other as XdmFunctionItemMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 168.8.4 Constructor 20962

168.8.6 SystemFunction(processor as SaxonProcessorMBS, name as String, arity as Integer) as XdmFunctionItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get a system function.
Example:

```
Var processor As New SaxonProcessorMBS
Var func As XdmFunctionItemMBS = XdmFunctionItemMBS.SystemFunction(processor, " { http://www.w3.org/2005/xpath
functions } parse-json", 1)
Break
```

Notes: This can be any function defined in XPath 3.1 functions and operators, including functions in the math, map, and array namespaces. It can also be a Saxon extension function, provided a licensed Processor is used.

processor: The Saxon Processor object required to get the system function.
name: the name of the function
arity: the number of arguments in the function

Returns the requested function, or null if there is no such function. Note that some functions (those with particular context dependencies) may be unsuitable for dynamic calling.

168.8.7 Properties

168.8.8 Arity as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the arity of the function.
Notes: The arity of the function, that is, the number of arguments in the function's signature.
(Read only property)

168.8.9 Name as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the name of the function as EQName.
Notes: The expanded name, as a string using the notation devised by EQName.
If the name is in a namespace, the resulting string takes the form <code>Q { uri } local</code>. Otherwise, the value is the local part of the name.

Returns the function name as a string in the EQName notation, or nil for an anonymous inline function item.
(Read only property)

168.9 class XdmItemMBS

168.9.1 class XdmItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class XdmItem represents an item in a sequence, as defined by the XDM data model.
Example:

```
// evaluate an XPath expression and check what kind of item came back
Var proc As New SaxonProcessorMBS
Var xpath As XPathProcessorMBS = proc.NewXPathProcessor
xpath.ContextItem = proc.parseXmlFromString("<prices><p>10</p><p>32</p></prices>")

Var item As XdmItemMBS = xpath.evaluateSingle("sum(//p)")
If item <>Nil Then
MessageBox "Result: " + item.StringValue + ", atomic: " + item.isAtomic.ToString + ", node: " +
item.isNode.ToString
End If
```

Notes: An item is either an atomic value, a node, or a function item.

An item is a member of a sequence, but it can also be considered as a sequence (of length one) in its own right. XdmItem</ is a subtype of XdmValue</ because every Item in the XDM data model is also a value.

It cannot be assumed that every sequence of length one will be represented by an XdmItem</. It is quite possible for an XdmValue</ that is not an XdmItem</ to hold a singleton sequence.

Saxon provides two concrete subclasses of XdmItem, namely XdmNode and XdmAtomicValue. Users must not attempt to create additional subclasses.
Subclass of the XdmValueMBS class.

168.9.2 Methods

168.9.3 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an empty XdmItem.
See also:

- 168.9.4 Constructor(other as XdmItemMBS)

168.9.4 Constructor(other as XdmItemMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 168.9.3 Constructor 20964

168.9.5 Properties

168.9.6 isArray as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine whether the item is an Array or some other type of item.
Notes: Returns true if the item is a Xdm Array item, false if it is some other value.
(Read only property)

168.9.7 isAtomic as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine whether the item is an atomic value or some other type of item.
Notes: Returns true if the item is an atomic value, false if it is a node or a function (including maps and arrays)
(Read only property)

168.9.8 isFunction as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine whether the item is a function or some other type of item.
Notes: Returns true if the item is a Xdm function item, false if it is an atomic value or a function (including maps and arrays)
(Read only property)

168.9.9 isMap as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine whether the item is a map or some other type of item.
Notes: Returns true if the item is a Xdm map item, false if it is some other value.
(Read only property)

168.9.10 isNode as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine whether the item is a node or some other type of item.
Notes: Returns true if the item is a node, false if it is an atomic value or a function (including maps and arrays)
(Read only property)

168.9.11 StringValue as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the string value of the item.
Notes: For a node, this gets the string value of the node.

For an atomic value, it has the same effect as casting the value to a string. In all cases the result is the same as applying the XPath string() function.
For atomic values, the result is the same as the result of calling toString. This is not the case for nodes, where toString returns an XML serialization of the node.

Returns the result of converting the item to a string.
(Read only property)

168.10 class XdmMapMBS

168.10.1 class XdmMapMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A map in the XDM data model.
Example:

```
Var Processor As New SaxonProcessorMBS
Var d As New Dictionary
d.Value("Hello") = "World"
Var v As XdmMapMBS = Processor.makeMap(d)

Break // inspect in debugger
```

Notes: A map is a list of zero or more entries, each of which is a pair comprising a key (which is an atomic value) and a value (which is an arbitrary value). The map itself is an XDM item.
An XdmMapMBS is immutable.
Subclass of the XdmFunctionItemMBS class.

168.10.2 Methods

168.10.3 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Default constructor.
Notes: Create an empty XdmMapMBS.
See also:

- 168.10.4 Constructor(other as XdmMapMBS) 20967

168.10.4 Constructor(other as XdmMapMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 168.10.3 Constructor 20967

168.10.5 containsKey(Key as XdmAtomicValueMBS) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if this map contains a mapping for the specified.
Notes: More formally, returns true if and only if this map contains a mapping for a key k such that (key==nil ? k==null : key.equals(k)).
(There can be at most one such mapping.)
key: key whose presence in this map is to be tested.

Returns true if this map contains a mapping for the specified key.

168.10.6 KeySet as XdmAtomicValueMBS()

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the keys present in the map in the form of an unordered array.

168.10.7 Put(Key as XdmAtomicValueMBS, Value as XdmValueMBS) as XdmMapMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a new map containing an additional (key, value) pair.
Notes: If there is an entry with the same key, it is removed.

Returns a new map containing the additional entry. The original map is unchanged.

168.10.8 Remove(Key as XdmAtomicValueMBS) as XdmMapMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a new map in which the entry for a given key has been removed.
Notes: If there is no entry with the same key, the new map has the same content as the old (it may or may not be the same Java object)

key: The key to be removed given as an XdmAtomicValueMBS

Returns a map without the specified entry. The original map is unchanged.

168.10.9 ValueByDouble(Index as Double) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value to which the specified double-valued key is mapped, or nil if this map contains no mapping for the key.
Notes: This is a convenience method to save the trouble of converting the double to an XdmAtomicValue.

key: the key whose associated value is to be returned. This is treated as an instance of xs:double (which will also match entries whose key belongs to another numeric type)

Returns the value to which the specified key is mapped, or NULL if this map contains no mapping for the key.

168.10.10 ValueByInteger(Index as Int32) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value to which the specified integer-valued key is mapped or nil if this map contains no mapping for the key.
Notes: This is a convenience method to save the trouble of converting the integer to an XdmAtomicValue.

key: the key whose associated value is to be returned. This is treated as an instance of xs:integer (which will also match entries whose key belongs to another numeric type)

Returns the value to which the specified key is mapped, or nil if this map contains no mapping for the key.

168.10.11 ValueByKey(Key as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value to which the specified string-valued key is mapped, or nil if this map contains no mapping for the key.
Notes: This is a convenience method to save the trouble of converting the String to an XdmAtomicValue.
key the key whose associated value is to be returned. This is treated as an instance of xs:string (which will also match entries whose key is xs:untypedAtomic or xs:anyURI)

Returns the value to which the specified key is mapped, or nil if this map contains no mapping for the key.

168.10.12 ValueByLong(Index as Int64) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value to which the specified integer-valued key is mapped or nil if this map contains no mapping for the key.
Notes: This is a convenience method to save the trouble of converting the integer to an XdmAtomicValue.

key: the key whose associated value is to be returned. This is treated as an instance of xs:integer (which will also match entries whose key belongs to another numeric type)

Returns the value to which the specified key is mapped, or nil if this map contains no mapping for the key.

168.10.13 ValueByValue(Key as XdmAtomicValueMBS) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value to which the specified key is mapped, or nil if this map contains no mapping for the key.
Notes: key: the key whose associated value is to be returned.

Returns the value to which the specified key is mapped, or nil if this map contains no mapping for the key.

168.10.14 Values as XdmValueMBS()

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a array containing the values found in this map, that is, the value parts of the key-value pairs.
Notes: The result may contain duplicates, and the ordering of the collection is unpredictable.

168.10.15 Properties

168.10.16 isEmpty as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if this map contains no key-value mappings.
Notes: (Read only property)

168.10.17 MapSize as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the number of entries in the map.
Notes: the number of entries in the map. (Note that the size() method returns 1 (one), because an XDM map is an item.)
(Read only property)

168.11 class XdmNodeMBS

168.11.1 class XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This class represents a node in the XDM data model.
Example:

```
// parse XML with Saxon and walk through the child elements
Var proc As New SaxonProcessorMBS
Var doc As XdmNodeMBS = proc.parseXmlFromString("<books><book id=""1"">Xojo</book><book id=""2"">MBS</book></books>")
Var root As XdmNodeMBS = doc.Child(0)

Var lines() As String
For Each book As XdmNodeMBS In root.Children
If book.NodeName = "book" Then lines.Add book.AttributeValue("id") + ": " + book.StringValue
Next
MessageBox root.NodeName + EndOfLine + String.FromArray(lines, EndOfLine)
```

Notes: A Node is an XdmItemMBS, and is therefore an XdmValueMBS in its own right, and may also participate as one item within a sequence value.

The XdmNodeMBS interface exposes basic properties of the node, such as its name, its string value, and its typed value.

Note that node identity cannot be inferred from object identity. The same node may be represented by different XdmNodeMBS instances at different times, or even at the same time.
Subclass of the XdmItemMBS class.

168.11.2 Methods

168.11.3 AttributeNodes as XdmNodeMBS()

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get array of attribute nodes of this element
Notes: Returns nil if this node is not an element.

168.11.4 AttributeValue(Key as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the string value of a named attribute (in no namespace) of this element
Notes: Key: the name of the required attribute, interpreted as a no-namespace name.

Returns "" if this node is not an element, or if this element has no attribute with the specified name. Otherwise return the string value of the selected attribute node.

168.11.5 axisNodes(Axis as Integer) as XdmNodeMBS()

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the array of nodes reachable from this node via a given axis.
Notes: axis: identifies which axis is to be navigated.

See Axis constants.

Returns an array of nodes on the specified axis, starting from this node as the context node.
The nodes are returned in axis order, that is, in document order for a forwards axis and in reverse document order for a reverse axis.

168.11.6 Child(Index as Integer) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the ith child nodes from the current parent node

168.11.7 Children as XdmNodeMBS()

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get all the child nodes from the current parent node.

168.11.8 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.
See also:

- 168.11.9 Constructor(other as XdmNodeMBS) 20974

168.11.9 Constructor(other as XdmNodeMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 168.11.8 Constructor 20973

168.11.10 Properties

168.11.11 AttributeCount as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the number of attribute node for this current node.
Notes: Returns returns the number of attributes on this node, other return zero if this node has no attributes or is not an element.
(Read only property)

168.11.12 BaseUri as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the base URI of this node
Notes: Returns the base URI, as defined in the XDM model. The value may be "" if no base URI is known for the node, for example if the tree was built from a StreamSource with no associated URI, or if the node has no parent.
(Read only property)

168.11.13 ChildCount as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the count of child nodes from the current node.
Notes: Returns int for the count of child nodes
(Read only property)

168.11.14 ColumnNumber as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the column number of the node in a source document.
Notes: Returns the column number of the node, or -1 if not available.
(Read only property)

168.11.15 LineNumber as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the line number of the node in a source document.
Notes: Returns the line number of the node, or -1 if not available.
(Read only property)

168.11.16 LocalName as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the local name of the node.
Notes: Returns the name of the node.
In the case of unnamed nodes (for example, text and comment nodes) return "".
(Read only property)

168.11.17 NodeKind as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the kind of node.
Notes: Returns the kind of node, for example KindElement or KindAttribute.
(Read only property)

168.11.18 NodeName as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the name of the node, as a string in the form of a EQName.
Notes: Returns the name of the node.
In the case of unnamed nodes (for example, text and comment nodes) return "".
(Read only property)

168.11.19 Parent as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the parent of this node.
Notes: Returns the parent of this node (a document or element node), or nil if this node has no parent.
(Read only property)

168.11.20 TypedValue as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the typed value of this node, as defined in XDM
Notes: Returns the typed value. If the typed value is a single atomic value, this will be returned as an instance of XdmAtomicValueMBS.
(Read only property)

168.11.21 Constants

Axis

Constant	Value	Description
AxisAncestor	0	Ancestor
AxisAncestorOrSelf	1	Ancestor Or Self
AxisAttribute	2	Attribut
AxisChild	3	Child
AxisDescendant	4	Descendant
AxisDescendantOrSelf	5	Descendant or Self
AxisFollowing	6	Following
AxisFollowingSibling	7	Following Sibling
AxisNamespace	8	Namespace
AxisParent	9	Parent
AxisPreceding	10	Preceding
AxisPrecedingSibling	11	Preceding Sibling
AxisSelf	12	Self

Node Kinds

Constant	Value	Description
KindAttribute	2	Attribute node
KindComment	8	Comment node
KindDocument	9	Document node
KindElement	1	Regular element
KindNamespace	13	Namespace node
KindProcessingInstruction	7	Processing Instruction
KindText	3	Text node
KindUnknown	0	Unknown or not yet set.

168.12 class XdmValueMBS

168.12.1 class XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: An XdmValue represents a value in the XDM data model.
Example:

```
Var path As String = "/Users/cs/Documents/Development/Libs/saxon/SaxonLibraries/MacOS Universal/libsaxon-eec-12.5.0.dylib"
Var bb As Boolean = SaxonMBS.LoadLibrary(path)

If bb Then
// okay
Else
Print SaxonMBS.LoadErrorString
End If

Var Processor As New SaxonProcessorMBS
Var v As XdmValueMBS = Processor.makeStringValue("Hello")

Break // inspect in debugger
```

Notes: A value is a sequence of zero or more items, each item being an atomic value, a node, or a function item.

168.12.2 Methods

168.12.3 addXdmItem(value as XdmItemMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add an XdmItem to the sequence.

168.12.4 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create an empty value.
See also:

- 168.12.5 Constructor(other as XdmValueMBS)

168.12.5 Constructor(other as XdmValueMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 168.12.4 Constructor 20978

168.12.6 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

168.12.7 Item(Index as Integer) as XdmItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the n'th item in the value, counting from zero.
Notes: index: the item that is required, counting the first item in the sequence as item zero

Returns the n'th item in the sequence making up the value, counting from zero return

Raises OutOfBoundsException if index is out of bound.

168.12.8 Properties

168.12.9 Handle as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

168.12.10 Head as XdmItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the first item in the sequence.
Notes: XdmItem or nil if sequence is empty.

(Read only property)

168.12.11 ObjectCount as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The object count.
Notes: To help debug if objects leak.
(Read only property)

168.12.12 Parent as Variant

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object if any.
Notes: A reference to the parent needed for memory management.
(Read and Write property)

168.12.13 RefCount as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries internal reference count.
Notes: (Read only property)

168.12.14 SequenceSize as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the number of items in the sequence.
Notes: (Read only property)

168.12.15 toString as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a string representation of the value.
Example:

```
Var Processor As New SaxonProcessorMBS
Var a As XdmAtomicValueMBS = Processor.makeStringValue("Hello")
Var s As String = a.toString

Break
```

Notes: The is the result of serializing the value using the adaptive serialization method.
(Read only property)

168.12.16 Type as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the type of the object.
Notes: (Read only property)

168.12.17 Constants

Types

Constant	Value	Description
TypeArray	3	An array of values.
TypeAtomicValue	1	An atomic value.
TypeEmpty	6	An empty value.
TypeFunctionItem	5	A function item.
TypeItem	7	An item.
TypeMap	4	A map (dictionary in Xojo).
TypeNode	2	A node in the XML document.
TypeValue	0	A value.

168.13 class XPathProcessorMBS

168.13.1 class XPathProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: An XPathProcessor represents a factory to compile, load and execute XPath expressions.
Example:

```
Var Processor As New SaxonProcessorMBS
Var xpathProc As XPathProcessorMBS = processor.newXPathProcessor

// parse XML
Var Input As XdmNodeMBS = processor.parseXmlFromString("<out><person>text1</person><person>text2</person><person>text3</person></out>")
xpathProc.ContextItem = Input

Var result As XdmItemMBS = xpathProc.evaluateSingle("//person [ 1 ] ")
Var message As String = result.StringValue
Break // shows text1
```

Notes: XPath 3.1 Basic

Provides all XPath 3.1 features which do not require schema-awareness or higher-order functions. This includes an implementation of maps and arrays, and support for JSON, as well as language constructs retained from earlier XPath versions.

XPath 3.1 Higher-Order

Provides higher-order functions: specifically, the ability to use functions as values, including dynamic function calls, inline functions, partial function application, and a library of built-in higher-order functions.

XPath 3.1 Schema Aware with EE-V license

Provides schema-awareness: specifically, any use of source documents with type annotations, and any use of XPath expressions that contain the names of schema components such as element declarations and types, other than the built-in types.

168.13.2 Methods

168.13.3 AddParameters(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameters given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys to XdmAtomicValue and values XdmValue objects internally and set parameters.

168.13.4 AddProperties(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets properties given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys and values to string and set properties.

168.13.5 clearParameters

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear parameter values set.

168.13.6 clearProperties

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears all properties.

168.13.7 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor.
Notes: Creates a Saxon-HE XPath product
See also:

- 168.13.8 Constructor(other as XPathProcessorMBS) 20984
- 168.13.9 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 20984

168.13.8 Constructor(other as XPathProcessorMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 168.13.7 Constructor 20983
- 168.13.9 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 20984

168.13.9 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Constructor with the SaxonProcessor supplied.
Notes: SaxonProcessor: The SaxonProcessor object
CWD: The current working directory
See also:

- 168.13.7 Constructor 20983
- 168.13.8 Constructor(other as XPathProcessorMBS) 20984

168.13.10 declareNamespace(prefix as String, uri as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Declare a namespace binding as part of the static context for XPath.
Notes: prefix: The namespace prefix. If the value is a zero-length string, this method sets the default namespace for elements and types.
uri: The namespace URI. It is possible to specify a zero-length string to "undeclare" a namespace; in this case the prefix will not be available for use, except in the case where the prefix is also a zero length string, in which case the absence of a prefix implies that the name is in no namespace. Assume the prefix or uri is "".

168.13.11 declareVariable(name as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Declare a variable as part of the static context for XPath expressions.
Notes: compiled using this XPathCompiler.
It is an error for the XPath expression to refer to a variable unless it has been declared. This method declares the existence of the variable, but it does not bind any value to the variable; that is done later, when the XPath expression is evaluated. The variable is allowed to have any type (that is, the required type is item()*).

name: The name of the variable, expressions as a clark name string

168.13.12 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

168.13.13 effectiveBooleanValue(xpathStr as String, encoding as string = "") as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Evaluate the XPath expression, returning the effective boolean value of the result.
Notes: xpathStr: supplied as a character string
encoding: the encoding of the string.

If not specified then the platform default encoding is used.

168.13.14 evaluate(xpathStr as String, encoding as string = "") as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile and evaluate an XPath expression
Notes: xpathStr: supplied as a character string
encoding: the encoding of the string. If not specified then the platform default encoding is used.

Returns a XdmValueMBS representing the results of the expression.

168.13.15 evaluateSingle(xpathStr as String, encoding as string = "") as XdmItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile and evaluate an XPath expression.
Example:

```
Var processor As New SaxonProcessorMBS
Var xpathProc As XPathProcessorMBS = processor.newXPathProcessor
```

```
// parse XML
Var Input As XdmNodeMBS = processor.parseXmlFromString("<out><person>text1</person><person>text2</person><person>text3</person></out>")
xpathProc.ContextItem = Input

Var result As XdmItemMBS = xpathProc.evaluateSingle("//person [ 1 ] ")
Var message As String = result.StringValue

MessageBox message // shows text1
```

Notes: The result is expected to be a single XdmItem or nil.

xpathStr: supplied as a character string
encoding: the encoding of the string. If not specified then the platform default encoding is used.

Returns a XdmItemMBS object or nullptr if the expression returns an empty sequence. If the expression returns a sequence of more than one item, any items after the first are ignored.

168.13.16 importSchemaNamespace(URI as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Import a schema namespace.
Notes: Here we add the element and attribute declarations and type definitions contained in a given namespace to the static context for the XPath expression.

This method will not cause the schema to be loaded. This method will not fail if the schema has not been loaded (but in that case the set of declarations and definitions made available to the XPath expression is empty). The schema document for the specified namespace may be loaded before or after this method is called.

This method does not bind a prefix to the namespace. That must be done separately, using the declareNamespace(String, String) method.

uri: The schema namespace to be imported. To import declarations in a no-namespace schema, supply a zero-length string.

168.13.17 removeParameter(name as String) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove a parameter (name, value) pair.
Notes: Please pass the name of the parameter.
Returns outcome of the removal, true if found.

168.13.18 Properties

168.13.19 BackwardsCompatible as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether XPath 1.0 backwards compatibility mode is to be used
Notes: In backwards compatibility mode, more implicit type conversions are allowed in XPath expressions, for example it is possible to compare a number with a string. The default is false (backwards compatibility mode is off).

Value is true if XPath 1.0 backwards compatibility is to be enabled, false if it is to be disabled.
(Read and Write property)

168.13.20 BaseURI as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The static base URI for XPath expressions compiled using this
Notes: The base URI is part of the static context, and is used to resolve any relative URIs appearing within an XPath expression, for example a relative URI passed as an argument to the doc() function. If no static base URI is supplied, then the current working directory is used.
(Read and Write property)

168.13.21 Caching as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Say whether the compiler should maintain a cache of compiled expressions.
Notes: Caching if set to true, caching of compiled expressions is enabled.

If set to false, any existing cache is cleared, and future compiled expressions will not be cached until caching is re-enabled. The cache is also cleared (but without disabling future caching) if any method is called that changes the static context for compiling expressions, for example declareVariable(QName) or declareNamespace(String, String).
(Read and Write property)

168.13.22 ContextFile as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The context item from file.
Notes: Set either ContextFile or ContextItem.
(Read and Write property)

168.13.23 ContextItem as XdmItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The context item.
Notes: Set either ContextFile or ContextItem.
(Read and Write property)

168.13.24 CWD as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current working directory.
Notes: The path must end with a slash (or a backslash on Windows).
(Read and Write property)

168.13.25 Handle as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

168.13.26 LanguageVersion as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Say whether an XPath 2.0, XPath 3.0, XPath 3.1 or XPath 4.0 processor is required.
Notes: Set the language version for the XPath compiler.

One of the values 1.0, 2.0, 3.0, 3.05, 3.1, 4.0.

Setting the option to 1.0 requests an XPath 2.0 processor running in 1.0 compatibility mode; this is equivalent to setting the language version to 2.0 and backwards compatibility mode to true. Requesting "3.05" gives XPath 3.0 plus the extensions defined in the XSLT 3.0 specification (map types and map constructors).
(Read and Write property)

168.13.27 Parameters as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all parameters.
Notes: Great for viewing them in the debugger.
(Read only property)

168.13.28 Properties as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all properties.
Notes: Great for viewing them in the debugger.
(Read only property)

168.13.29 UnprefixedElementMatchingPolicy as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The policy for matching unprefixed element names in XPath expressions.
Notes: (Read and Write property)

168.13.30 ParameterValue(name as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set a parameter.
Notes: Name: The name of the parameter, as a string.
For namespaced parameter use the JAXP solution i.e. " { uri } name" value of the query parameter.
Assign "" to clear a previously set value.

Some of the properties on this class may just internally set/get a parameter.
(Read and Write computed property)

168.13.31 PropertyValue(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property specific to the processor in use.
Notes: Some of the properties on this class may just internally set/get a property.
(Read and Write computed property)

168.13.32 Constants

Unprefixed element matching policy

Constant	Value	Description
UnprefixedElementMatchingPolicyAnyNamespace	1	Under this policy, unprefixed element names matc element with this local name is matched regardle it can have any namespace, or none)
UnprefixedElementMatchingPolicyDefaultNamespace	0	The standard W3C policy, whereby element name the default namespace for elements and types, as context. In XSLT this can be set using the [xsl attribute.
UnprefixedElementMatchingPolicyDefaultNamespaceOrNone	2	Under this policy, unprefixed element names matc part of the name matches, and (b) the namespac equal to the default namespace for elements and t This policy is provided primarily for use with H predictable whether HTML elements are in the X namespace. It is also useful with other vocabulari times in a namespace and sometimes not. The special rules defined in the HTML5 specification, names are treated as matching names in the XHT item for a step is "a node in an HTML DOM", an names otherwise; since in the XDM data model it tinction between different kinds of DOM, this po names both when matching elements in the XH matching no-namespace elements

168.14 class XQueryProcessorMBS

168.14.1 class XQueryProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: An XQueryProcessor represents a factory to compile, load and execute queries.
Example:

```
Var Processor As New SaxonProcessorMBS
Var query As XQueryProcessorMBS = processor.NewXQueryProcessor

// parse XML
Var Input As XdmNodeMBS = processor.parseXmlFromString("<out><person>text1</person><person>text2</person><person>text3</person></out>")
query.ContextItem = Input

// set our query
query.QueryContent = "<out>{ count(/out/person) } </out>"

// and run it
Var result As String = query.runQueryToString
Print "Result: "+result
// shows <?xml version="1.0" encoding="UTF-8"?><out>3</out>
```

Notes: XQuery includes:

- XQuery 3.1 Minimal Conformance: Provides Minimal Conformance (including try/catch and "group-by", as well as language features retained from earlier XQuery versions) as defined in section 5 of the XQuery 3.1 specification.
- XQuery 3.1 Modules: Provides the Module feature, which allows a query to be made up of multiple modules.
- XQuery 3.1 Serialization: Provides the Serialization feature. This allows the output of a query to be serialized as lexical XML, or in other formats including HTML, JSON, and plain text, under the control of serialization parameters contained either in the query itself, or supplied externally.
- XQuery 3.1 Higher-Order: Provides the Higher-Order Function feature. This provides the ability to use functions as values, including dynamic function calls, inline functions, partial function application, and a library of built-in higher-order functions.
- Streaming with EE license: Provides saxon:stream(), an extension function to allow large documents to be processed without holding the whole document in memory.

168.14.2 Methods

168.14.3 AddParameters(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameters given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys to XdmAtomicValue and values XdmValue objects internally and set parameters.

168.14.4 AddProperties(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets properties given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys and values to string and set properties.

168.14.5 clearParameters

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear parameter values set.

168.14.6 clearProperties

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear property values set.

168.14.7 Clone as XQueryProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a cop of the processor.

168.14.8 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor.
See also:

- 168.14.9 Constructor(other as XQueryProcessorMBS) 20993
- 168.14.10 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 20993

168.14.9 Constructor(other as XQueryProcessorMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 168.14.8 Constructor 20993
- 168.14.10 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 20993

168.14.10 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Constructor with the SaxonProcessor supplied.
Notes: Pass the SaxonProcessor object to use.

cwd: set the current working directory. Default is the empty string
See also:

- 168.14.8 Constructor 20993
- 168.14.9 Constructor(other as XQueryProcessorMBS) 20993

168.14.11 declareNamespace(prefix as String, uri as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Declare a namespace binding.
Notes: Declare a namespace binding as part of the static context for queries compiled using this XQueryCompiler. This binding may be overridden by a binding that appears in the query prolog. The namespace binding will form part of the static context of the query, but it will not be copied into result trees unless the prefix is

actually used in an element or attribute name.

Prefix: The namespace prefix. If the value is a zero-length string, this method sets the default namespace for elements and types.
uri: The namespace URI. It is possible to specify a zero-length string to "undeclare" a namespace; in this case the prefix will not be available for use, except in the case where the prefix is also a zero length string, in which case the absence of a prefix implies that the name is in no namespace. Assume the prefix or uri is "".

168.14.12 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

168.14.13 executeQueryToFile(infilename as String, ofilename as string, query as String, encoding as string = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform the Query to file.
Notes: The result is saved to file
infilename: The file name of the source document
ofilename: The file name of where result will be stored
query: The query as string representation.
encoding: The encoding of the query string. If not specified then the platform default encoding is used.

168.14.14 executeQueryToString(infilename as String, query as String, encoding as string = "") as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform the Query to a string representation.
Notes: infilename: The file name of the source document
query: The query as string representation
encoding: the encoding of the query string. If not specified then the platform default encoding is used.

Returns result of as a string.

168.14.15 executeQueryToValue(infilename as String, query as String, encoding as string = "") as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform the Query to a XdmValue representation.
Notes: infilename: The file name of the source document
query: The query as string representation
encoding: the encoding of the query string. If not specified then the platform default encoding is used.

Returns result of the query as a XdmValueMBS.

168.14.16 removeParameter(name as String) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove a parameter (name, value) pair.
Notes: Please pass the name of the parameter.
Returns outcome of the removal, true if found.

168.14.17 runQueryToFile

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Execute the Query cached to file.
Notes: The use of the context item would have had to be set in advance Assume the output filename has been set in advance.

168.14.18 runQueryToString as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Execute the Query cached.
Notes: The use of the context item would have had to be set in advance.
Result as a string.

168.14.19 runQueryToValue as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Execute the Query cached.
Notes: The use of the context item would have had to be set in advance

Returns XdmValueMBS of the result.

168.14.20 Properties

168.14.21 ContextItem as XdmItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The initial context item for the query.
Notes: The initial context item, or nil if there is to be no initial context item.
Please use either ContextItemFromFile, ContextItem or setContextItemFromFile.
(Read and Write property)

168.14.22 ContextItemFromFile as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The source from file for the query.
Notes: Please use either ContextItemFromFile, ContextItem or setContextItemFromFile.
(Read and Write property)

168.14.23 CWD as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current working directory
Notes: The path must end with a slash (or a backslash on Windows).
(Read and Write property)

168.14.24 Handle as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

168.14.25 hasLicense as Boolean

MBS XML Plugin, Plugin Version: 25.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether as license was set.
Notes: (Read only property)

168.14.26 LanguageVersion as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The XQuery language version.
Notes: Say which version of XQuery should be used version "3.1" or "4.0" in the current Saxon release.
(Read and Write property)

168.14.27 OutputFile as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The output file where the result is sent
Notes: (Read and Write property)

168.14.28 Parameters as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all parameters.
Notes: Great for viewing them in the debugger.
(Read only property)

168.14.29 Properties as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all properties.
Notes: Great for viewing them in the debugger.
(Read only property)

168.14.30 QueryBaseURI as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The base URI for the query.
Notes: the static base URI; or "" to indicate that no base URI is available.
(Read and Write property)

168.14.31 QueryContent as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile a query supplied as a string.
Notes: The supplied query is cached for later execution.
Please set either QueryContent or QueryFile.
(Read and Write property)

168.14.32 QueryFile as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile a query supplied as a file name.
Notes: The supplied query is cached for later execution.
Please set either QueryContent or QueryFile.
(Read and Write property)

168.14.33 Streaming as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the streaming option has been set.
Notes: Say whether the query should be compiled and evaluated to use streaming.

This affects subsequent calls on the compile() methods. This option requires Saxon-EE. option if true, the compiler will attempt to compile a query to be capable of executing in streaming mode. If the query cannot be streamed, a compile-time exception is reported. In streaming mode, the source document is supplied as a stream, and no tree is built in memory. The default is false. When streaming = true is specified, this has the additional side-effect of setting the required context item type to "document-node()".

Requires Saxon-EET license.
(Read and Write property)

168.14.34 Updating as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Say whether the query is allowed to be updating.
Notes: XQuery update syntax will be rejected during query compilation unless this flag is set. XQuery Update is supported only under Saxon-EE. updating - true if the query is allowed to use the XQuery Update facility (requires Saxon-EE). If set to false, the query must not be an updating query. If set to true, it may be either an updating or a non-updating query.
(Read and Write property)

168.14.35 ParameterValue(name as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set a parameter.
Notes: Name: The name of the parameter, as a string.
For namespaced parameter use the JAXP solution i.e. " { uri } name" value of the query parameter.
Assign "" to clear a previously set value.

Some of the properties on this class may just internally set/get a parameter.
(Read and Write computed property)

168.14.36 PropertyValue(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property specific to the processor in use.
Notes: XQueryProcessor: set serialization properties
(names start with '!' i.e. name "!method" ->"xml")
'o':outfile name,
's': source as file name
'q': query file name,
'q': current by name,
'qs': string form of the query,
'base': set the base URI of the query,
'dtd': set DTD validation 'on' or
'off' name of the property value of the property

Some of the properties on this class may just internally set/get a property.
(Read and Write computed property)

168.15 class Xslt30ProcessorMBS

168.15.1 class Xslt30ProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: An Xslt30Processor represents a factory to compile, load and execute stylesheets.
Example:

```
Var processor As New SaxonProcessorMBS
Var proc As Xslt30ProcessorMBS = processor.NewXslt30Processor

Var Input As String = "<xsl:stylesheet version='2.0' xmlns:xsl='http://www.w3.org/1999/XSL/Transform'>" +_
"<xsl:template name='go'><a/></xsl:template>" +_
"</xsl:stylesheet>"

Var executable As XsltExecutableMBS = proc.compileFromString(Input)

Var result As XdmValueMBS = executable.callTemplateReturningValue("go")

Print "Result: "+result.toString
```

Notes: It is possible to cache the context and the stylesheet in the Xslt30Processor.

XSLT (Transformation Processing) includes:

- XSLT 3.0 Basic Processor: Provides all mandatory features from the XSLT 3.0 specification (including try/ catch, iterate, accumulators, maps, named modes, content value templates, and extended patterns, as well as features retained from XSLT 2.0).
- XSLT 3.0 Serialization: Provides the serialization feature: specifically, the ability to convert the result trees produced as output of an XSLT transformation to lexical XML, or other formats including HTML, JSON, and plain text, under the control of serialization parameters defined in the stylesheet or via an external API.
- XSLT 3.0 Compatibility: Provides XSLT 1.0 compatibility mode as defined in the XSLT 3.0 specification. If a stylesheet specifies version="1.0", this causes certain constructs to behave in a way that retains the XSLT 1.0 behavior.
- XSLT 3.0 Dynamic Evaluation: Provides use of the XSLT 3.0 instruction xsl:evaluate, which allows dynamic evaluation of XPath expressions.
- XSLT 3.0 XPath 3.1 Feature: Provides full use of XPath 3.1 features, including XPath 3.1 functions, and maps and arrays.,Ä®Note: Saxon supports XPath 3.1 unconditionally in XSLT 3.0 stylesheets, it does not offer a processing mode in which XPath is restricted to version 3.0.

- XSLT 3.0 Higher-Order Functions: Provides higher-order functions: specifically, the ability to use functions as values, including dynamic function calls, inline functions, partial function application, and the standard higher-order functions defined in the XPath 3.1 function library.

168.15.2 Methods

168.15.3 AddParameters(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameters given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys to XdmAtomicValue and values XdmValue objects internally and set parameters.

168.15.4 AddProperties(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets properties given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys and values to string and set properties.

168.15.5 clearParameters

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear parameter values set.

168.15.6 clearProperties

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears all properties.

168.15.7 compileFromAssociatedFile(sourceFile as String) as XsltExecutableMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the stylesheet associated
Notes: via the xml-stylesheet processing instruction (see http://www.w3.org/TR/xml-stylesheet/) with the document specified in the source parameter, and that match the given criteria. If there are several suitable xml-stylesheet processing instructions, then the returned Source will identify a synthesized stylesheet module that imports all the referenced stylesheet module.

Note: the term "compile" here indicates that the stylesheet is converted into an executable form. The compilation uses a snapshot of the properties of the Xslt30Processor at the time this method is invoked.

sourceFile - The file name of the XML document. Returns an XsltExecutable, which represents the compiled stylesheet. The XsltExecutable is immutable and thread-safe; it may be used to run multiple transformations, in series or concurrently. @throws SaxonApiException if the compilation of the stylesheet fails

168.15.8 compileFromFile(stylesheetPath as String) as XsltExecutableMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile a stylesheet file.
Notes: Note: the term "compile" here indicates that the stylesheet is converted into an executable form. The compilation uses a snapshot of the properties of the Xslt30Processor at the time this method is invoked. stylesheet - The file name of the stylesheet document. Returns an XsltExecutable, which represents the compiled stylesheet. The XsltExecutable is immutable and thread-safe; it may be used to run multiple transformations, in series or concurrently.

168.15.9 compileFromFileAndSave(xslFilename as String, filename as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: compile a stylesheet received as a file and save to an exported file (SEF).
Notes: The compiled stylesheet is saved as SEF to file store

xslFilename: file name of the stylesheet
filename: the file to which the compiled package should be saved.

168.15.10 compileFromString(stylesheet as String, encoding as String = "") as XsltExecutableMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile a stylesheet received as a string.
Notes: Note: the term "compile" here indicates that the stylesheet is converted into an executable form. The compilation uses a snapshot of the properties of the Xslt30Processor at the time this method is invoked.

stylesheet: the stylesheet as a lexical string representation
encoding: the encoding of the stylesheet string. If not specified then the platform default encoding is used. Returns an XsltExecutable, which represents the compiled stylesheet. The XsltExecutable is immutable and thread-safe; it may be used to run multiple transformations, in series or concurrently. @throws SaxonApiException if the compilation of the stylesheet fails.

168.15.11 compileFromStringAndSave(stylesheet as String, filename as String, Encoding as String = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile a stylesheet received as a string and save to an exported file (SEF).
Notes: The compiled stylesheet is saved as SEF to file store

stylesheet: the stylesheet as a lexical string representation
filename: the file to which the compiled package should be saved
encoding: the string encoding of the filename. Defaults to JVM default

168.15.12 compileFromXdmNode(mode as XdmNodeMBS) as XsltExecutableMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile a stylesheet received as an XdmNode.
Notes: Note: the term "compile" here indicates that the stylesheet is converted into an executable form. The compilation uses a snapshot of the properties of the Xslt30Processor at the time this method is invoked.

node: the XdmNode object for the stylesheet Returns an XsltExecutable, which represents the compiled stylesheet. The XsltExecutable is immutable and thread-safe; it may be used to run multiple transformations, in series or concurrently. @throws SaxonApiException if the compilation of the stylesheet fails

168.15.13 compileFromXdmNodeAndSave(mode as XdmNodeMBS, filename as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile a stylesheet received as an XdmNode.
Notes: The compiled stylesheet is cached and available for execution later.

node: the XdmNode object for the stylesheet
filename: the file to which the compiled package should be saved

168.15.14 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor.
Notes: Creates a Saxon-HE product.
See also:

- 168.15.15 Constructor(other as Xslt30ProcessorMBS) 21004
- 168.15.16 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 21004

168.15.15 Constructor(other as Xslt30ProcessorMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 168.15.14 Constructor 21004
- 168.15.16 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 21004

168.15.16 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Constructor with the SaxonProcessor supplied.
Notes: SaxonProcessor: the SaxonProcessor object to use.
cwd: The current working directory.
See also:

- 168.15.14 Constructor 21004

• 168.15.15 Constructor(other as Xslt30ProcessorMBS) 21004

168.15.17 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

168.15.18 importPackage(packageFile as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Import a library package.
Notes: Calling this method makes the supplied package available for reference in the xsl:use-package declarations of subsequent compilations performed using this Xslt30Processor.

packageFile: the file name of the package to be imported, which should be supplied as an SEF. If relative, the file name of the SEF is resolved against the cwd, which is set using setcwd().

168.15.19 removeParameter(name as String) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove a parameter (name, value) pair.
Notes: Please pass the name of the parameter.
Returns outcome of the removal, true if found.

168.15.20 transformFileToFile(sourceFile as String, stylesheetFile as String, outputFile as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform a one shot transformation.
Notes: The result is stored in the supplied outputfile.

sourcefile: The file name of the source document
stylesheetfile: The file name of the stylesheet document.
outputfile: The file name where results will be stored

168.15.21 transformFileToString(sourceFile as String, stylesheetFile as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform a one shot transformation.
Notes: The result is returned as a string.

sourcefile: The file name of the source document
stylesheetfile: The file name of the stylesheet document. Returns char array - result of the transformation.

168.15.22 transformFileToValue(sourceFile as String, stylesheetFile as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform a one shot transformation.
Notes: The result is returned as an XdmValue.

sourcefile: The file name of the source document
stylesheetfile: The file name of the stylesheet document. Returns XdmValue - result of the transformation

168.15.23 Properties

168.15.24 BaseOutputURI as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The base output URI.
Notes: The base output URI is used for resolving relative URIs in the href attribute of the xsl:result-document instruction; it is accessible to XSLT stylesheet code using the XPath current-output-uri() function. (Read and Write property)

168.15.25 CWD as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current working directory (cwd).
Notes: This method also applies to the static base URI for XSLT stylesheets when supplied as lexical string. The cwd is used to set the base URI is part of the static context, and is used to resolve any relative URIs appearing within XSLT.

cwd - Current working directory

The path must end with a slash (or a backslash on Windows).
(Read and Write property)

168.15.26 FastCompilation as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Request fast compilation.
Notes: Fast compilation will generally be achieved at the expense of run-time performance and quality of diagnostics. Fast compilation is a good trade-off if (a) the stylesheet is known to be correct, and (b) once compiled, it is only executed once against a document of modest size.
Fast compilation may result in static errors going unreported, especially if they occur in code that is never executed.

The current implementation is equivalent to switching off all optimizations other than just-in-time compilation of template rules. Setting this option, however, indicates an intent rather than a mechanism, and the implementation details may change in future to reflect the intent.

fast - set to true to request fast compilation; set to false to revert to the optimization options defined in the Configuration.
(Read and Write property)

168.15.27 Handle as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

168.15.28 JustInTimeCompilation as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Say whether just-in-time compilation of template rules should be used.
Notes: Recommendation: disable this option unless you are confident that the stylesheet you are compiling is error-free.

jit - true if just-in-time compilation is to be enabled. With this option enabled, static analysis of a template rule is deferred until the first time that the template is matched. This can improve performance when many

template rules are rarely used during the course of a particular transformation; however, it means that static errors in the stylesheet will not necessarily cause the compile(Source) method to throw an exception (errors in code that is actually executed will still be notified to the registered ErrorListener or ErrorList, but this may happen after the compile(Source) method returns).

This option is enabled by default in Saxon-EE, and is not available in Saxon-HE or Saxon-PE.
(Read and Write property)

168.15.29 Parameters as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all parameters.
Notes: Great for viewing them in the debugger.
(Read only property)

168.15.30 Properties as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all properties.
Notes: Great for viewing them in the debugger.
(Read only property)

168.15.31 Relocatable as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Indicate package deployable to a different location.
Notes: Say whether any package produced by this compiler can be deployed to a different location, with a different base URI

relocatable - if true then static-base-uri() represents the deployed location of the package, rather than its compile time location
(Read and Write property)

168.15.32 SaxonProcessor as SaxonProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the SaxonProcessor object.
Notes: (Read only property)

168.15.33 TargetEdition as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The target edition.
Notes: Set the target edition under which the stylesheet will be executed.
edition - the Saxon edition for the run-time environment.
One of "EE", "PE", "HE", or "JS", "JS2", or "JS3".
(Read and Write property)

168.15.34 XsltLanguageVersion as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the XSLT (and XPath) language level to be supported by the processor.
Notes: Set the value to "4.0" to enable support for experimental features defined in the XSLT 4.0 proposal (which is likely to change before it stabilizes).

Value is the language level to be supported. The values "3.0" and "4.0" are recognized
(Read and Write property)

168.15.35 ParameterValue(name as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set a parameter.
Notes: Name: The name of the parameter, as a string.
For namespaced parameter use the JAXP solution i.e. " { uri } name" value of the query parameter.
Assign "" to clear a previously set value.

Some of the properties on this class may just internally set/get a parameter.
(Read and Write computed property)

168.15.36 PropertyValue(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property specific to the processor in use.
Notes: Some of the properties on this class may just internally set/get a property.
(Read and Write computed property)

168.16 class XsltExecutableMBS

168.16.1 class XsltExecutableMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: An XsltExecutable represents the compiled form of a stylesheet.
Example:

```
// transform an XML file with an XSLT stylesheet using Saxon
// The Saxon library must be loaded first with SaxonMBS.LoadLibrary.
Var processor As New SaxonProcessorMBS
Var xslt As Xslt30ProcessorMBS = processor.NewXslt30Processor
Var stylesheet As XsltExecutableMBS = xslt.compileFromFile(SpecialFolder.Desktop.Child("report.xsl").NativePath)

Var html As String = stylesheet.transformFileToString(SpecialFolder.Desktop.Child("data.xml").NativePath)
MessageBox html
```

Notes: An XsltExecutable is created by using one of the compile methods on the Xslt30Processor class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

168.16.2 Methods

168.16.3 AddParameters(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameters given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys to XdmAtomicValue and values XdmValue objects internally and set parameters.

168.16.4 AddProperties(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets properties given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys and values to string and set properties.

168.16.5 applyTemplatesReturningFile(outfile as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Invoke the stylesheet by applying templates to a supplied input sequence, saving the results to file.
Notes: The initial match selection must be set using one of the two methods setInitialMatchSelection or setInitialMatchSelectionFile. The result is stored in the supplied output file.

outfile: The file name where results will be stored.

168.16.6 applyTemplatesReturningString as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Invoke the compiled stylesheet by applying templates to a supplied input.
Notes: The initial match selection must be set using one of the two methods setInitialMatchSelection or setInitialMatchSelectionFile.

168.16.7 applyTemplatesReturningValue as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Invoke the compiled stylesheet by applying templates to a supplied input sequence, Saving the results as an XdmValueMBS.
Notes: The initial match selection must be set using one of the two methods setInitialMatchSelection or setInitialMatchSelectionFile.

168.16.8 callFunctionReturningFile(functionName as String, arguments() as XdmValueMBS, outfile as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Call a public user-defined function in the already compiled stylesheet.
Notes: Here we wrap the result in an XML document, and sending this document to a specified file.

functionName: The name of the function to be called
arguments: Array of XdmValue object - he values of the arguments to be supplied to the function. These will be converted if necessary to the type as defined in the function signature, using the function conversion rules.
outfile: The file name where results will be stored.

168.16.9 callFunctionReturningString(functionName as String, arguments() as XdmValueMBS) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Call a public user-defined function in the compiled stylesheet.
Notes: Here we wrap the result in an XML document, and serialized this document to string value.

functionName: The name of the function to be called
arguments: Array of XdmValueMBS object - he values of the arguments to be supplied to the function. These will be converted if necessary to the type as defined in the function signature, using the function conversion rules.

168.16.10 callFunctionReturningValue(functionName as String, arguments() as XdmValueMBS) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Call a public user-defined function in the already compiled stylesheet.
Notes: Here we wrap the result in an XML document, and return the document as an XdmValueMBS

functionName: The name of the function to be called
arguments: Array of XdmValue object - he values of the arguments to be supplied to the function. These will be converted if necessary to the type as defined in the function signature, using the function conversion rules.

168.16.11 callTemplateReturningFile(templateName as String, outputfile as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Invoke a transformation by calling a named template and save result to file.
Notes: The results of calling the template are wrapped in a document node, which is then sent to the specified file destination. If setInitialTemplateParameters(std::Map, boolean) has been called, then the parameters supplied are made available to the called template (no error occurs if parameters are supplied that are not used).

templateName: The name of the initial template. This must match the name of a public named template in the stylesheet. If the value is nullptr, the clark name for xsl:initial-template is used.
outfile: The file name where results will be stored.

168.16.12 callTemplateReturningString(templateName as String = "") as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Invoke a transformation by calling a named template and return result as a string.
Example:

```
Var processor As New SaxonProcessorMBS
Var proc As Xslt30ProcessorMBS = processor.NewXslt30Processor

Var Input As String = "<xsl:stylesheet version='2.0' xmlns:xsl='http://www.w3.org/1999/XSL/Transform'>"
+_
"<xsl:template name='go'><a/></xsl:template>" +_
"</xsl:stylesheet>"

Var executable As XsltExecutableMBS = proc.compileFromString(Input)

Var result As XdmValueMBS = executable.callTemplateReturningValue("go")

Print "Result: "+result.toString
```

Notes: The results of calling the template are wrapped in a document node, which is then serialized as a string. If setInitialTemplateParameters(std::Map, boolean) has been called, then the parameters supplied are made available to the called template (no error occurs if parameters are supplied that are not used).

templateName: the name of the initial template. This must match the name of a public named template in the stylesheet. If the value is nullptr, the clark name for xsl:initial-template is used.

168.16.13 callTemplateReturningValue(templateName as String = "") as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Invoke a transformation by calling a named template and return result as an XdmValue.
Notes: The results of calling the template are wrapped in a document node, which is then returned as an XdmValue. If setInitialTemplateParameters(std::Map, boolean) has been called, then the parameters supplied are made available to the called template (no error occurs if parameters are supplied that are not used).

templateName: the name of the initial template. This must match the name of a public named template in the stylesheet. If the value is nullptr, the clark name for xsl:initial-template is used.

168.16.14 clearParameters

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear parameter values set.

168.16.15 clearProperties

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears all properties.

168.16.16 clearXslMessages

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear xsl:message data that are held in the Processor.
Notes: If the save to file has been enabled then clearXslMessages does not take affect.

168.16.17 Clone as XsltExecutableMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a clone object of this XsltExecutable object.
Notes: Returns XsltExecutableMBS, a new copy of this object

168.16.18 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

168.16.19 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

168.16.20 exportStylesheet(filename as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Produce a representation of the compiled stylesheet.
Notes: The representation of the compiled stylesheet is in an XML form, suitable for distribution and reloading. If the configuration under which the export takes place is suitably licensed, then license information will be included in the export file allowing execution of the stylesheet without any additional license.

The detailed form of the output representation is not documented.

filename: the destination for the XML document containing the diagnostic representation of the compiled stylesheet. The stream will be closed when writing has finished.

168.16.21 removeParameter(name as String) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove a parameter (name, value) pair.
Notes: Please pass the name of the parameter.
Returns outcome of the removal, true if found.

168.16.22 removeProperty(name as String) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove a property (name, value) pair from the executable.
Notes: name: the name of the property to be removed.

Returns bool, the outcome of the removal.

168.16.23 setCaptureResultDocuments(flag as Boolean, rawResults as Boolean = false)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable the capture of the result-document output into a Dictionary.
Notes: This overrides the default mechanism.

If this option is enabled, then any document created using xsl:result-document is saved (as an XdmNode) in an std::map object where it is accessible using the URI as a key. After the execution of the transforma-

tion a call on the getResultDocuments() method is required to get access to the result-documents in the map.

flag: true causes secondary result documents from the transformation to be saved in a map; false disables this option.
rawResults: true enables the handling of raw destination for resultsDocuments. If not supplied this can also be set on the setResultAsRawValue method. The setResultAsRawValue method has higher priority to this flag

168.16.24 setGlobalContextFromFile(File as FolderItem)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Supply the context item to be used when evaluating global variables and parameters.
Notes: Set the source from file for the transformation.
file: the item to be used as the context item within the initializers of global variables and parameters.

168.16.25 setGlobalContextFromPath(Path as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Supply the context item to be used when evaluating global variables and parameters.
Notes: Set the source from file for the transformation.
Path: the item to be used as the context item within the initializers of global variables and parameters.

168.16.26 SetGlobalContextItem(Item as XdmItemMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Supply the context item to be used when evaluating global variables and parameters.
Notes: Set the source document from an XdmNode for the transformation.

Pass the item to be used as the context item within the initializers of global variables and parameters. Given as a XdmItemMBS object.

168.16.27 setInitialMatchSelection(selection as XdmValueMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The initial value to which templates are to be applied (equivalent to the select attribute of xsl:apply-templates)

Notes: selection: The value to which the templates are to be applied

168.16.28 setInitialMatchSelectionAsFile(Path as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The initial filename to which templates are to be applied (equivalent to the select attribute of xsl:apply-templates).
Notes: The file is parsed internally.
filename: The file name to which the templates are to be applied

168.16.29 setInitialTemplateParameters(values as Dictionary, tunnel as Boolean)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set parameters to be passed to the initial template.
Notes: These are used whether the transformation is invoked by applying templates to an initial source item, or by invoking a named template. The parameters in question are the xsl:param elements appearing as children of the xsl:template element.
The parameters are supplied in the form of a map; the key is a QName given as a string which must match the name of the parameter; the associated value is an XdmValue containing the value to be used for the parameter. If the initial template defines any required parameters, the map must include a corresponding value. If the initial template defines any parameters that are not present in the map, the default value is used. If the map contains any parameters that are not defined in the initial template, these values are silently ignored.

The supplied values are converted to the required type using the function conversion rules. If conversion is not possible, a run-time error occurs (not now, but later, when the transformation is actually run).

The XsltTransformer retains a reference to the supplied map, so parameters can be added or changed until the point where the transformation is run.

The XSLT 3.0 specification makes provision for supplying parameters to the initial template, as well as global stylesheet parameters. Although there is no similar provision in the XSLT 1.0 or 2.0 specifications, this method works for all stylesheets, regardless whether XSLT 3.0 is enabled or not.

parameters: the parameters to be used for the initial template
tunnel: true if these values are to be used for setting tunnel parameters; false if they are to be used for non-tunnel parameters

168.16.30 setSaveXslMessage(show as Boolean, filename as String = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method gives users the option to switch on or off the xsl:message feature.
Notes: It is also possible to send the xsl:message outputs to file given by file name.
show - boolean to indicate if xsl:message should be outputted. Default is on.

filename: If the filename argument is present then the xsl:message output is appended to the given filename with location cwd+filename

168.16.31 transformFileToFile(sourcefile as String, outputfile as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform a one shot transformation.
Notes: The result is stored in the supplied outputfile.

sourcefile: The file name of the source document
outputfile: The file name where results will be stored.

168.16.32 transformFileToString(filename as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform a one shot transformation.
Notes: The result is returned as a string

sourcefile: The file name of the source document Returns char array - result of the transformation.

168.16.33 transformFileToValue(filename as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform a one shot transformation.
Notes: The result is returned as an XdmValueMBS.

sourcefile: The file name of the source document Returns XdmValue - result of the transformation.

168.16.34 transformToFile(source as XdmNodeMBS = nil)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Execute transformation to file. Properties supplied in advance.
Notes: Perform the transformation based upon a compiled stylesheet and source document. Assume the output file has been set in advance

source: source document supplied as an XdmNodeMBS object. nil accepted if source document has been set already.

168.16.35 transformToString(source as XdmNodeMBS = nil) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Execute transformation to string. Properties supplied in advance.
Notes: Perform the transformation based upon what has been cached.
source - source document supplied as an XdmNode object. nullptr accepted if source document has been set already.

Result returned as a string.

168.16.36 transformToValue(source as XdmNodeMBS = nil) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Execute transformation to Xdm Value.
Notes: Properties supplied in advance.

Perform the transformation based upon cached stylesheet and any source document.

source: source document supplied as an XdmNode object. nil accepted if source document has been set already. Returns as an XdmValueMBS.

168.16.37 XslMessages as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the messages written using the xsl:message instruction.
Notes: Returns nil if the user has not enabled capturing of xsl:messages via setSaveXslMessage() Returns

XdmValueMBS, the sequence of xsl:messages as an XdmValue

168.16.38 Properties

168.16.39 BaseOutputURI as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The base output URI.
Notes: The base output URI is used for resolving relative URIs in the href attribute of the xsl:result-document instruction; it is accessible to XSLT stylesheet code using the XPath current-output-uri() function.
(Read and Write property)

168.16.40 CWD as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current working directory (cwd).
Notes: This method also applies to the static base URI for XSLT stylesheets when supplied as lexical string.

The cwd is used to set the base URI is part of the static context, and is used to resolve any relative URIs appearing within XSLT.

cwd: Current working directory

The path must end with a slash (or a backslash on Windows).
(Read and Write property)

168.16.41 GlobalContextItem as XdmItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Supply the context item to be used when evaluating global variables and parameters.
Notes: Set the source document from an XdmNode for the transformation.

Pass the item to be used as the context item within the initializers of global variables and parameters. Given as a XdmItemMBS object.
(Read and Write property)

168.16.42 Handle as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

168.16.43 InitialMode as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The initial mode for the transformation.
Notes: modeName the EQName of the initial mode. Two special values are recognized, in the reserved XSLT namespace: xsl:unnamed to indicate the mode with no name, and xsl:default to indicate the mode defined in the stylesheet header as the default mode. The value null also indicates the default mode (which defaults to the unnamed mode, but can be set differently in an XSLT 3.0 stylesheet).
(Read and Write property)

168.16.44 OutputFile as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The output file of where the transformation result is sent.
Notes: (Read and Write property)

168.16.45 Parameters as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all parameters.
Notes: Great for viewing them in the debugger.
(Read only property)

168.16.46 Properties as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all properties.
Notes: Great for viewing them in the debugger.
(Read only property)

168.16.47 ResultAsRawValue as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to provide result as raw value.
Notes: true if the return type of callTemplate, applyTemplates and transform methods is to return XdmValue, otherwise return XdmNode object with root.

Value is true if return raw result, i.e. XdmValueMBS, otherwise return XdmNodeMBS.
(Read and Write property)

168.16.48 ResultDocuments as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return the result-documents resulting from the execution of the stylesheet.
Notes: Nil is returned if the user has not enabled this feature via the method setCaptureResultDocuments()

Returns dictionary - the map is indexed by the absolute URI of the result document, and the corresponding value is an XdmNode containing the result document (as an in-memory tree, without serialization)
(Read only property)

168.16.49 ParameterValue(name as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set a parameter.
Notes: Name: The name of the parameter, as a string.
For namespaced parameter use the JAXP solution i.e. " { uri } name" value of the query parameter.
Assign "" to clear a previously set value.

Some of the properties on this class may just internally set/get a parameter.
(Read and Write computed property)

168.16.50 PropertyValue(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property specific to the processor in use.
Notes: Some of the properties on this class may just internally set/get a property.

Set or geta property specific to the processor in use. XsltProcessor: set serialization properties (names start with '!' i.e. name "!method" ->"xml") 'o':outfile name, 'it': initial template, 'im': initial mode, 's': source as file name 'm': switch on message listener for xsl:message instructions.
(Read and Write computed property)

Chapter 169

SceneKit

169.1 control DesktopSCNControlMBS

169.1.1 control DesktopSCNControlMBS

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a SCNViewMBS.
Notes: This control embeds a special SCNView subclass.
Designed for Xojo 2021r3 and newer.
Please use view property to access the underlaying object and set properties.

To learn about rendering events, please check here:
https://developer.apple.com/documentation/scenekit/scnscenerendererdelegate?language=objc

169.1.2 Properties

169.1.3 View as SCNViewMBS

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

169.1.4 Events

169.1.5 BoundsChanged

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

169.1.6 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

169.1.7 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

169.1.8 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

169.1.9 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS Mac64bit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

169.1.10 FocusLost

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

169.1.11 FocusReceived

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

169.1.12 FrameChanged

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

169.1.13 MenuBarSelected

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

169.1.14 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown.
If you return False, the system handles the MouseDown so the above event handlers do not get called.

169.1.15 MouseDrag(x as Integer, y as Integer)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

169.1.16 MouseUp(x As Integer, y As Integer)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's

boundaries.

169.1.17 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

169.1.18 rendererDidApplyAnimations(time as double)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells the control to perform any updates that need to occur after actions and animations are evaluated.
Notes: time: The current system time, in seconds. Use this parameter for any time-based elements of your game logic.

SceneKit calls this method exactly once per frame, so long as the SCNViewMBS object (or other SCNSceneRenderer object) displaying the scene is not paused.

Implement this method to add game logic to the rendering loop. Any changes you make to the scene graph during this method are immediately reflected in the displayed scene. That is, SceneKit immediately updates the hierarchy of presentation nodes it uses to render the scene (instead of using the SCNTransactionMBS class to ‚Äúbatch‚Äù your changes).

169.1.19 rendererDidApplyConstraints(time as double)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked on the control once the scene renderer did apply the constraints.
Notes: time The time at which the constraints were simulated.

All modifications done within this method don't go through the transaction model, they are directly applied on the presentation tree.

169.1.20 rendererDidRenderScene(scene as SCNSceneMBS, time as double)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells the control that the renderer has rendered the scene.
Notes: scene: The scene object that was rendered.
time: The current system time, in seconds. If your custom rendering involves animation, use this parameter to compute your own animation state.

Implement this method to perform custom drawing after SceneKit has rendered a scene—for example, to draw overlay content on top of SceneKit content. You should only execute Metal or OpenGL drawing commands (and any setup required to perform them) in this method—the results of modifying SceneKit objects in this method are undefined.

- To render using Metal, use the renderer parameter to retrieve the scene renderer,Äôs currentRenderCommandEncoder object and encode your own drawing commands. If you need to reference other Metal state, see the properties listed in SCNSceneRenderer.
- To render using OpenGL, simply call the relevant OpenGL drawing commands—SceneKit automatically makes its OpenGL context the current context before calling this method. If you need to reference the OpenGL context being rendered into, examine the context property of the renderer parameter.

You must draw using the appropriate graphics technology for the view currently being rendered. Use the renderingAPI property of the renderer object to determine whether Metal or OpenGL is in use.

169.1.21 rendererDidSimulatePhysics(time as double)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells the control to perform any updates that need to occur after physics simulations are performed.
Notes: time: The current system time, in seconds. Use this parameter for any time-based elements of your game logic.

SceneKit calls this event exactly once per frame, so long as the SCNViewMBS object (or other SCNSceneRenderer object) displaying the scene is not paused.

Implement this event to add game logic to the rendering loop. Any changes you make to the scene graph during this method are immediately reflected in the displayed scene. That is, SceneKit immediately updates the hierarchy of presentation nodes it uses to render the scene (instead of using the SCNTransactionMBS class to ,Äúbatch,Äù your changes).

This event is the last opportunity SceneKit provides for you to change the scene graph before rendering.

169.1.22 rendererUpdate(time as double)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells the control to perform any updates that need to occur before actions, animations, and physics are evaluated.
Notes: time: The current system time, in seconds. Use this parameter for any time-based elements of your game logic.

SceneKit calls this method exactly once per frame, so long as the SCNViewMBS object (or other SCNSceneRenderer object) displaying the scene is not paused.

Implement this event to add game logic to the rendering loop. Any changes you make to the scene graph during this method are immediately reflected in the displayed scene. That is, SceneKit immediately updates the hierarchy of presentation nodes it uses to render the scene (instead of using the SCNTransactionMBS class to ,Äúbatch,Äù your changes).

169.1.23 rendererWillRenderScene(scene as SCNSceneMBS, time as double)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells the control that the renderer has cleared the viewport and is about to render the scene.
Notes: scene: The SCNSceneMBS object to be rendered.
time: The current system time, in seconds. If your custom rendering involves animation, use this parameter to compute your own animation state.

Implement this event to perform custom drawing before SceneKit renders a scene—for example, to draw backdrop content underneath SceneKit content. You should only execute Metal or OpenGL drawing commands (and any setup required to perform them) in this event—the results of modifying SceneKit objects during this event are undefined.

To render using Metal, use the renderer parameter to retrieve the scene renderer,Äôs currentRenderCommandEncoder object and encode your own drawing commands. If you need to reference other Metal state, see the properties listed in SCNSceneRenderer.
To render using OpenGL, simply call the relevant OpenGL drawing commands—SceneKit automatically makes its OpenGL context the current context before calling this event. If you need to reference the OpenGL context being rendered into, examine the context property of the renderer parameter.

You must draw using the appropriate graphics technology for the view currently being rendered. Use the renderingAPI property of the renderer object to determine whether Metal or OpenGL is in use.

169.1.24 ScaleFactorChanged(NewFactor as double)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

169.1.25 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS Mac64bit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

169.2 class SCNAccelerationConstraintMBS

169.2.1 class SCNAccelerationConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A SCNAccelerationConstraint caps the acceleration and velocity of a node.
Example:

```
// This example needs a window with SCNControl1, a DesktopSCNControlMBS.
// let a node move smoothly instead of jumping when its position changes
Var node As New SCNNodeMBS(New SCNSphereMBS(0.5))
Var smooth As New SCNAccelerationConstraintMBS
smooth.maximumLinearVelocity = 2 // units per second
smooth.maximumLinearAcceleration = 4
smooth.damping = 0.1
Var constraints() As SCNConstraintMBS
constraints.Add smooth
node.setConstraints constraints

node.Position = New SCNVector3MBS(3, 0, 0) // moves there over time

Var scene As New SCNSceneMBS
scene.rootNode.addChildNode node

Var view As SCNViewMBS = SCNControl1.View
view.scene = scene
view.allowsCameraControl = True // rotate with the mouse
view.autoenablesDefaultLighting = True
```

Notes: Subclass of the SCNConstraintMBS class.
Blog Entries

- MBS Xojo Plugins, version 19.1pr1

169.2.2 Methods

169.2.3 accelerationConstraint as SCNAccelerationConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNAccelerationConstraint object.

169.2.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNAccelerationConstraint object.

169.2.5 Properties

169.2.6 damping as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the damping factor of the receiver.
Notes: Optionally reduce the body's linear velocity each frame to simulate fluid/air friction. Value should be zero or greater. Defaults to 0.1. Animatable.
(Read and Write property)

169.2.7 decelerationDistance as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Controls the distance at which the node should start decelerating.
Notes: Defaults to 0. Animatable.
(Read and Write property)

169.2.8 maximumLinearAcceleration as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Controls the maximum linear acceleration. Defaults to MAXFLOAT. Animatable.
Notes: The maximum linear acceleration is in m.s^-2
(Read and Write property)

169.2.9 maximumLinearVelocity as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Controls the maximum linear velocity. Defaults to MAXFLOAT. Animatable.
Notes: The maximum linear velocity is in m.s
(Read and Write property)

169.3 class SCNActionMBS

169.3.1 class SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A simple, reusable animation that changes attributes of any node you attach it to.
Example:

```
// This example needs a window with SCNControl1, a DesktopSCNControlMBS.
// move a box up and down forever
Var node As New SCNNodeMBS(New SCNBoxMBS(1, 1, 1, 0))
Var up As SCNActionMBS = SCNActionMBS.moveBy(0, 1, 0, 1)
Var down As SCNActionMBS = SCNActionMBS.moveBy(0, -1, 0, 1)
node.runAction SCNActionMBS.repeatActionForever(SCNActionMBS.sequence(Array(up, down)))

Var scene As New SCNSceneMBS
scene.rootNode.addChildNode node

Var view As SCNViewMBS = SCNControl1.View
view.scene = scene
view.allowsCameraControl = True // rotate with the mouse
view.autoenablesDefaultLighting = True
```

Notes: You use actions most often to change the structure and content of the SCNNodeMBS object to which they are attached, but you can also use actions make other changes to the scene. In SceneKit, actions provide an easy way to implement animated behaviors that frequently change in response to user input.

169.3.2 Methods

169.3.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

169.3.4 copy as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the action.

169.3.5 fadeIn(duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that changes the opacity of the node to 1.0.
Notes: duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs opacity property animates from its current value to 1.0.
This action is reversible; the reverse is created as if the following code had been executed:

SCNActionMBS.fadeOut(Duration)

169.3.6 fadeOpacityBy(factor as double, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that adjusts the opacity of a node by a relative value.
Notes: factor: The amount to change the node,Äôs opacity by.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs opacity property animates to its new value.
This action is reversible; the reverse is created as if the following code had been executed:

SCNActionMBS.fadeOpacityBy(-factor, duration)

169.3.7 fadeOpacityTo(opacity as double, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that adjusts the opacity of a node to a new value.
Notes: opacity: The new opacity value of the node.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs opacity property animates to its new value.
This action is not reversible; the reverse of this action has the same duration but does not change anything.

169.3.8 fadeOut(duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that changes the opacity of the node to 0.0.
Notes: duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs opacity property animates from its current value to 0.0.
This action is reversible; the reverse is created as if the following code had been executed:

SCNActionMBS.fadeIn(duration)

169.3.9 group(actions() as SCNActionMBS) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that runs a collection of actions in parallel.
Notes: actions: An array of SCNActionMBS objects.

Returns a new group action object.

When the action executes, the actions that make up the group all start immediately and run in parallel. The duration of the group action is the longest duration among the collection of actions. If an action in the group has a duration less than the group,Äôs duration, the action completes and then idles until the group completes the remaining actions. This matters most when creating a repeating action that repeats a group. This action is reversible; it creates a new group action that contains the reverse of each action specified in the group.

169.3.10 hide as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that hides a node.
Notes: When the action executes, the node,Äôs hidden property is set to true.
This action is reversible; the reverse is equivalent to the unhide action.

169.3.11 javaScriptActionWithScript(script as string, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that executes a JavaScript script periodically over a specified duration.
Notes: script: A string containing JavaScript source code.
seconds: The duration of the action, in seconds.

SceneKit exposes its classes, methods, and functions in the JavaScript context that runs the script—see the SCNJavaScript.h header file for details.

When the action executes, SceneKit runs the script repeatedly until the action,Äôs duration expires. Each time SceneKit runs the script, it computes the elapsed time since the action began executing (as a fraction of the action,Äôs duration between 0.0 and 1.0) and makes it available to the script as a variable named elapsedTime. The script can also reference the SCNNode object running the action as a variable named node.
This action is not reversible; the reverse action executes the same script.

169.3.12 moveBy(delta as SCNVector3MBS, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that moves a node relative to its current position.
Notes: delta: A vector that describes the change to be applied to the node,Äôs position.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs position property animates from its current position to its new position.
This action is reversible; the reverse is created as if the following code had been executed:

Var reverseDelta as SCNVector3MBS = SCNVector3MBS.Vector(-delta.x, -delta.y, -delta.z)
SCNActionMBS.moveBy(reverseDelta, duration)
See also:

- 169.3.13 moveBy(deltaX as double, deltaY as double, deltaZ as double, duration as double) as SCNActionMBS 21039

169.3.13 moveBy(deltaX as double, deltaY as double, deltaZ as double, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that moves a node relative to its current position.
Notes: deltaX: The distance to move the node in the X direction of its parent node,Äôs local coordinate space.
deltaY: The distance to move the node in the Y direction of its parent node,Äôs local coordinate space.
deltaZ: The distance to move the node in the Z direction of its parent node,Äôs local coordinate space.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs position property animates from its current position to its new position.
This action is reversible; the reverse is created as if the following code had been executed:

SCNActionMBS.moveBy(-deltaX, -deltaY, -deltaZ, duration)
See also:

- 169.3.12 moveBy(delta as SCNVector3MBS, duration as double) as SCNActionMBS 21039

169.3.14 moveTo(location as SCNVector3MBS, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that moves a node to a new position.
Notes: location: The coordinates for the node,Äôs new position in its parent node,Äôs local coordinate space.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs position property animates from its current position to its new position.
This action is not reversible; the reverse of this action has the same duration but does not move the node.

169.3.15 removeFromParentNode as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that removes the node from its parent.
Notes: When the action executes, the node is immediately removed from its parent.
This action is not reversible; the reverse of this action is the same action.

169.3.16 repeatAction(action as SCNActionMBS, count as integer) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that repeats another action a specified number of times.
Notes: action: The action to be executed.
count: The number of times to execute the action.

Returns a new action object.

When the action executes, the associated action runs to completion and then repeats, until the count is reached.
This action is reversible; it creates a new action that is the reverse of the specified action and then repeats it the same number of times.

169.3.17 repeatActionForever(action as SCNActionMBS) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that repeats another action forever.
Notes: action: The action to execute.

Returns a new action object.

When the action executes, the associated action runs to completion and then repeats.
This action is reversible; it creates a new action that is the reverse of the specified action and then repeats it forever.
Note
The action to be repeated must have a non-instantaneous duration.

169.3.18 reversedAction as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that reverses the behavior of another action.
Notes: This method always returns an action object; however, not all actions are reversible. When reversed, some actions return an object that either does nothing or performs the same action as the original action. For details on how an action is reversed, see the description of the class method used to create that action.

169.3.19 rotateBy(xAngle as double, yAngle as double, zAngle as double, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that rotates the node in each of the three principal axes by angles relative to its current orientation.
Notes: xAngle: The amount to rotate the node counterclockwise around the x-axis of its local coordinate space, in radians.
yAngle: The amount to rotate the node counterclockwise around the y-axis of its local coordinate space, in radians.
zAngle: The amount to rotate the node counterclockwise around the z-axis of its local coordinate space, in radians.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs rotation property animates to the new angle.

This action is reversible; the reverse is created as if the following code had been executed:

SCNActionMBS.rotateBy(-xAngle, -yAngle, -zAngle, duration)

169.3.20 rotateByAngle(angle as double, axis as SCNVector3MBS, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that rotates the node by an angle around a specified axis.
Notes: angle: The amount to rotate the node counterclockwise around the specified axis, in radians.
axis: A vector in the node,Äôs local coordinate space whose direction specifies the axis of rotation.
duration: The duration, in seconds, of the animation.

Return a new action object.

When the action executes, the node,Äôs rotation property animates to the new angle.
This action is reversible; the reverse is created as if the following code had been executed:

SCNActionMBS.rotateByAngle(-angle, axis, duration)

169.3.21 rotateTo(xAngle as double, yAngle as double, zAngle as double, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that rotates the node to absolute angles in each of the three principal axes.
Notes: xAngle: The amount to rotate the node counterclockwise around the x-axis of its local coordinate space, in radians.
yAngle: The amount to rotate the node counterclockwise around the y-axis of its local coordinate space, in radians.
zAngle: The amount to rotate the node counterclockwise around the z-axis of its local coordinate space, in radians.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs rotation property animates to the new angle. Calling this method is equivalent to calling rotateTo() and passing false for the shortestUnitArc parameter.
This action is not reversible; the reverse of this action has the same duration but does not change anything.
See also:

- 169.3.22 rotateTo(xAngle as double, yAngle as double, zAngle as double, duration as double, shortestUnitArc as boolean) as SCNActionMBS 21043

169.3.22 rotateTo(xAngle as double, yAngle as double, zAngle as double, duration as double, shortestUnitArc as boolean) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that rotates the node to absolute angles in each of the three principal axes.
Notes: xAngle: The amount to rotate the node counterclockwise around the x-axis of its local coordinate space, in radians.
yAngle: The amount to rotate the node counterclockwise around the y-axis of its local coordinate space, in radians.
zAngle: The amount to rotate the node counterclockwise around the z-axis of its local coordinate space, in radians.
duration: The duration, in seconds, of the animation.
shortestUnitArc: If false (the default), the animation interpolates each component of the node,Äôs rotation between its current value and the new value. If true, the animation makes the most direct rotation possible from the node,Äôs current orientation to the new orientation.

Returns a new action object.

When the action executes, the node,Äôs rotation property animates to the new angle.
This action is not reversible; the reverse of this action has the same duration but does not change anything.
See also:

- 169.3.21 rotateTo(xAngle as double, yAngle as double, zAngle as double, duration as double) as SCNActionMBS 21042

169.3.23 rotateToAxisAngle(axisAngle as SCNVector4MBS, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that rotates the node to an absolute angle around a specified axis.
Notes: axisAngle: A four-component vector whose first three components are a vector in the node,Äôs local coordinate space specifying an axis and whose fourth component is the amount to rotate the node counterclockwise around that axis, in radians.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs rotation property animates to the new angle.
This action is not reversible; the reverse of this action has the same duration but does not change anything.

169.3.24 runBlock(del as SCNActionRunBlockMBS, tag as variant = nil) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that executes run the given method.
Notes: When the action executes, SceneKit calls the delegate method. This action takes place instantaneously.
This action is not reversible; the reverse action executes the same delegate method.

169.3.25 scaleBy(scale as double, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that uniformly changes the scale factor of a node by a relative value.
Notes: scale: The amount of change to make to all three components of the node,Äôs scale.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs scale property animates to the new value.
This action is reversible; the reverse is created as if the following code had been executed:

SCNActionMBS.scaleBy(-scale, duration)

169.3.26 scaleTo(scale as double, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that uniformly changes the scale factor of a node to an absolute value.
Notes: scale: The new value for all three components of the node,Äôs scale.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs scale property animates to the new value.
This action is not reversible; the reverse of this action has the same duration but does not change anything.

169.3.27 sequence(actions() as SCNActionMBS) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that runs a collection of actions sequentially.
Notes: actions: An array of SCNActionMBS objects.
Returns a new sequence action object.

When the action executes, the first action in the sequence starts and runs to completion. Subsequent actions in the sequence run in a similar fashion until all of the actions in the sequence have executed. The duration of the sequence action is the sum of the durations of the actions in the sequence.

This action is reversible; it creates a new sequence action that reverses the order of the actions. Each action in the reversed sequence is itself reversed.

169.3.28 unhide as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that ensures a node is not hidden.
Notes: When the action executes, the node,Äôs hidden property is set to false.
This action is reversible; the reverse is equivalent to the hide action.

169.3.29 wait(duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that idles for a specified period of time.
Notes: When the action executes, the action waits for the specified amount of time and then ends. This is typically used as part of a sequence of actions to insert a delay between two other actions. You might also use it in conjunction with the runAction method to trigger code that needs to run at a later time.
This action is not reversible; the reverse of this action is the same action.

169.3.30 Properties

169.3.31 duration as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The duration required to complete an action.
Notes: This is the expected duration of an action,Äôs animation. The actual time an action takes to complete is modified by the action,Äôs timingMode property.

(Read and Write property)

169.3.32 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object references.
Notes: (Read and Write property)

169.3.33 speed as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A speed factor that modifies how fast an action runs.
Notes: The speed factor adjusts how fast an action,Äôs animation runs. For example, a speed factor of 2.0 means the animation runs twice as fast.
(Read and Write property)

169.3.34 timingMode as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The timing mode used to execute an action.
Notes: For possible values, see TimingMode constants. The default value is TimingModeLinear.
(Read and Write property)

169.3.35 Constants

Timing Modes

Constant	Value	Description
TimingModeEaseIn	1	Ease-in pacing. The animation begins slowly, and then speeds up as it progresses.
TimingModeEaseInEaseOut	3	Ease-in ease-out pacing. The animation begins slowly, accelerates through the middle of its duration, and then slows again before completing.
TimingModeEaseOut	2	Ease-out pacing. The animation begins quickly, and then slows as it completes.
TimingModeLinear	0	Linear pacing. The animation progresses evenly throughout its duration.

169.3.36 Delegates

169.3.37 SCNActionRunBlockMBS(node as SCNNodeMBS, tag as variant)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The delegate for the runBlock method.

169.4 class SCNAudioPlayerMBS

169.4.1 class SCNAudioPlayerMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A controller for playback of a positional audio source in a SceneKit scene.
Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("Laser.wav")
audioSource = New SCNAudioSourceMBS(file)
audioPlayer = New MySCNAudioPlayerMBS(audioSource)
audioSource.Volume = 1.0
audioSource.Loops = true
audioSource.load

// now build your nodes
Var someNode as SCNNodeMBS

// show scene
MyView.scene = MyScene
MyView.play

// and add player to plays
someNode.addAudioPlayer(audioPlayer)
```

Notes: An SCNAudioPlayerMBS object controls playback of a positional audio source in a SceneKit scene. To use positional audio, first create a reusable SCNAudioSourceMBS or AVAudioNodeMBS object to provide an audio stream. Then, create an audio player to control the playback of that audio source. Finally, attach the audio player to an SCNNodeMBS object for spatialized 3D audio playback based on the position of that node relative to the scene,Äôs audioListener node.

- MBS Xojo Plugins in version 22.3
- MBS Xojo Plugins, version 22.3pr3

169.4.2 Methods

169.4.3 audioPlayerWithAVAudioNode(audioNode as Variant) as SCNAudioPlayerMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns an audio player (creating one if necessary) to play an audio node.
Notes: Please pass a AVAudioNodeMBS class.

Creating an audio player from an audio node does not attach that node to an AVAudioEngine object for mixing and playback—instead, this option allows you to build your own audio node graph for custom effects before manually adding it to the audioEngine object of the view (or other SceneKit renderer) displaying the scene. Then, after you attach the audio player to an SCNNodeMBS object, SceneKit continually updates the audio node,Äôs 3D mixing parameters to match the position of the scene node.

When you use this method, SceneKit creates an audio player for the specified AVAudioNodeMBS object or, if an audio player for that node already exists and is not in use, SceneKit reuses the existing player object.

169.4.4 audioPlayerWithSource(audioSource as SCNAudioSourceMBS) as SCNAudioPlayerMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns an audio player (creating one if necessary) to play a simple audio source.
Notes: An SCNAudioSourceMBS object represents a distinct source of audio (for example, a sound file) that can be reused and shared by many player objects. Use this method to create an audio player from such a source. When you use this method, SceneKit creates an audio player for the specified SCNAudioSourceMBS object or, if an audio player for that source already exists and is not in use, SceneKit reuses the existing player object.

If instead you want to attach a more complex audio setup to a position in your scene—such as a mixer that varies several audio inputs in response to user input—build that setup using AVAudioNodeMBS objects and create a player for it with the audioPlayerWithAVAudioNode() method.

169.4.5 Constructor(audioSource as SCNAudioSourceMBS)

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Initializes an audio player for playing the specified simple audio source.
Notes: Using this initializer is typically not necessary. Instead, call the audioPlayerWithSource() method, which returns a cached audio player object if one for the specified audio source has already been created and is available for use.

169.4.6 Properties

169.4.7 audioNode as Variant

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The audio node SceneKit uses for mixing audio from this player.
Notes: Value is a AVAudioNodeMBS. We use variant to reduce dependency to other plugins.
(Read only property)

169.4.8 audioSource as SCNAudioSourceMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The source of audio played by this player.
Notes: An SCNAudioSourceMBS object represents a distinct source of audio—for example, a sound file—that can be reused and shared by many player objects. Use a player,Äôs audio source to configure the default values for playback parameters such as volume and reverb. To vary those parameters in real time during playback, use the audioNode property to work with the underlying AVAudioNodeMBS object.
If the player was created with the audioPlayerWithAVAudioNode() method, this property,Äôs value is nil.
(Read only property)

169.4.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

169.4.10 Events

169.4.11 DidFinishPlayback

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: An event called by SceneKit when playback of the player,Äôs audio source has completed.
Notes: The block takes no parameters and returns no value. Use this block to perform actions when a sound finishes playing. For example, after a line of spoken character dialogue finishes playing, you might start playing another line of dialogue.

169.4.12 WillStartPlayback

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: An event called by SceneKit when playback of the player,Äôs audio source is about to begin.

169.5 class SCNAudioSourceMBS

169.5.1 class SCNAudioSourceMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A simple, reusable audio source—music or sound effects loaded from a file—for use in positional audio playback.
Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("Laser.wav")
audioSource = New SCNAudioSourceMBS(file)
audioSource.Volume = 1.0
audioSource.Loops = true
audioSource.load

// now use for SCNAudioPlayerMBS class
```

Notes: To create positional audio effects, create an SCNAudioPlayerMBS object from the audio source to control playback, and add that player object to an SCNNodeMBS object in your scene. SceneKit then automatically spatializes 3D audio effects based on the position of that node relative to the scene,Äôs audioListener node.

169.5.2 Methods

169.5.3 audioSourceNamed(Name as String) as SCNAudioSourceMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns the audio source associated with the specified filename.
Notes: fileName: The name of an audio file. If this filename has not been previously requested, the method looks for an audio file with the specified name in the application,Äôs main bundle.

This method looks in the system caches for an audio source with the specified name and returns that object if it exists. If a matching audio source is not already in the cache, this method locates the audio file with the specified name in the application,Äôs main bundle, then creates a new audio source and caches it for reuse.

169.5.4 Constructor(File as FolderItem)

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Initializes an audio source from the specified audio file.
See also:

- 169.5.5 Constructor(URL as String) 21053

169.5.5 Constructor(URL as String)

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Initializes an audio source from the specified audio file.
See also:

- 169.5.4 Constructor(File as FolderItem) 21053

169.5.6 copy as SCNAudioSourceMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Creates a copy of the audio source object.

169.5.7 Load

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Loads audio data from the source and prepares it for playing.
Notes: This method reads audio data from the source file (specified when initializing the audio source) and performs any decompression necessary to prepare for playing audio. Use this method to control when your app or game incurs the run-time performance cost of such work—for example, you can load all audio source before starting a game level, instead of suffering a frame rate drop upon playing a new audio source during gameplay.
This method has no effect if the shouldStream property,Äôs value is true.

169.5.8 Properties

169.5.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

169.5.10 Loops as Boolean

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the audio source should play repeatedly.
Notes: If this value is true, audio players using this source automatically begin playing again after playback has finished. If this value is false (the default), the audio source plays exactly once.
(Read and Write property)

169.5.11 Positional as Boolean

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether audio from this source uses 3D positional mixing.
Notes: If this value is YES (the default), SceneKit mixes audio from the source based on its position relative to the scene,Äôs audioListener node—that is, the audio source,Äôs volume, reverb, and other parameters automatically change depending on the distance to the listener and other objects in the scene. (To position an audio source in a scene, create an SCNAudioPlayerMBS player from the source and attach that player to an SCNNodeMBS object.)
If you set this property to NO, the source,Äôs audio plays with the same volume (and other mixing parameters) regardless of the listener,Äôs position.
(Read and Write property)

169.5.12 Rate as Single

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The default playback rate for the audio source.
Notes: This property determines the default rate for when a source begins playing. To vary the rate during playback through an SCNAudioPlayerMBS object, use the player,Äôs audioNode property to access real-time audio controls.
(Read and Write property)

169.5.13 ReverbBlend as Single

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The default blend of blend of unmodified and reverb-processed (also called dry and wet) audio

for playback of the audio source.
Notes: This property determines the default reverb blend for when a source begins playing. To vary the reverb blend during playback through an SCNAudioPlayerMBS object, use the player,Äôs audioNode property to access real-time audio controls.
(Read and Write property)

169.5.14 ShouldStream as Boolean

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the audio source should stream content from its source URL when playing.
Notes: If this value is true, audio players using this source do not preload audio buffer data, instead reading directly from the source file while playing audio. If this value is false, SceneKit loads audio buffer data upon playing audio from the source.
(Read and Write property)

169.5.15 Volume as Single

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The default playback volume for the audio source.
Notes: This property determines the default volume for when a source begins playing. To vary the volume during playback through an SCNAudioPlayerMBS object, use the player,Äôs audioNode property to access real-time audio controls.
(Read and Write property)

169.6 class SCNAvoidOccluderConstraintMBS

169.6.1 class SCNAvoidOccluderConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A SCNAvoidOccluderConstraint constraints place the receiver at a position that prevent nodes with the specified category to occlude the target.
Notes: The target node and it's children are ignored as potential occluders.
Subclass of the SCNConstraintMBS class.
Blog Entries

- MBS Xojo Plugins, version 19.1pr1

169.6.2 Methods

169.6.3 avoidOccluderConstraintWithTarget(target as SCNNodeMBS) as SCNAvoidOccluderConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNAvoidOccluderConstraint object.

169.6.4 Constructor(target as SCNNodeMBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNAvoidOccluderConstraint object.

169.6.5 Properties

169.6.6 bias as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines the bias the apply after moving the receiver to avoid occluders.
Notes: Defaults to 10e-5.
A positive bias will move the receiver closer to the target.
(Read and Write property)

169.6.7 occluderCategoryBitMask as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines the category of node to consider as occluder.
Notes: Defaults to 1.
(Read and Write property)

169.6.8 target as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines the target node.
Notes: (Read and Write property)

169.7 class SCNBillboardConstraintMBS

169.7.1 class SCNBillboardConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A constraint that orients a node to always point toward the current camera.
Example:

```
// This example needs a window with SCNControl1, a DesktopSCNControlMBS.
// a text label that always faces the camera
Var node As New SCNNodeMBS(New SCNTextMBS("Label", 0.1))
node.Scale = New SCNVector3MBS(0.05, 0.05, 0.05)

Var billboard As New SCNBillboardConstraintMBS
billboard.freeAxes = SCNBillboardConstraintMBS.SCNBillboardAxisY // only rotate around the Y axis
Var constraints() As SCNConstraintMBS
constraints.Add billboard
node.setConstraints constraints

Var scene As New SCNSceneMBS
scene.rootNode.addChildNode node

Var view As SCNViewMBS = SCNControl1.View
view.scene = scene
view.allowsCameraControl = True // rotate with the mouse
view.autoenablesDefaultLighting = True
```

Notes: An SCNBillboardConstraint object automatically adjusts a node,Äôs orientation so that its local z-axis always points toward the pointOfView node currently being used to render the scene. For example, you can use a billboard constraint to efficiently render parts of a scene using two-dimensional sprite images instead of three-dimensional geometry—by mapping sprites onto planes affected by a billboard constraint, the sprites maintain their orientation with respect to the viewer. To attach constraints to an SCNNodeMBS object, use its constraints property.
Subclass of the SCNConstraintMBS class.

- MBS Xojo Plugins, version 19.1pr1

169.7.2 Methods

169.7.3 billboardConstraint as SCNBillboardConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNBillboardConstraint constraint.
Notes: A billboard constraint forces the receiver to look into the direction of the current point of view.

169.7.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNBillboardConstraint constraint.
Notes: A billboard constraint forces the receiver to look into the direction of the current point of view.

169.7.5 Properties

169.7.6 freeAxes as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the axes on which the billboarding orientation operates. Defaults to SCNBillboardAxisAll.
Notes: (Read and Write property)

169.7.7 Constants

Axes

Constant	Value	Description
SCNBillboardAxisAll	7	Align an affected node such that its orientation always matches that of the view. This is the default option for newly created billboard constraints.
SCNBillboardAxisX	1	Align an affected node such that its x-axis is always parallel to that of the view, leaving it free to rotate otherwise.
SCNBillboardAxisY	2	Align an affected node such that its y-axis is always parallel to that of the view, leaving it free to rotate otherwise.
SCNBillboardAxisZ	4	Align an affected node such that its z-axis is always perpendicular to the viewing plane, leaving it free to rotate otherwise.

169.8 class SCNBoxMBS

169.8.1 class SCNBoxMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: SCNBox represents a box with rectangular sides and optional chamfers.
Example:

```
// This example needs a window with SCNControl1, a DesktopSCNControlMBS.
// show a red box with rounded edges
Var geometry As New SCNBoxMBS(1, 1, 1, 0.1)
geometry.firstMaterial.diffuse.contents = NSColorMBS.systemRedColor
Var node As New SCNNodeMBS(geometry)

Var scene As New SCNSceneMBS
scene.rootNode.addChildNode node

Var view As SCNViewMBS = SCNControl1.View
view.scene = scene
view.allowsCameraControl = True // rotate with the mouse
view.autoenablesDefaultLighting = True
```

Notes: Subclass of the SCNGeometryMBS class.

169.8.2 Methods

169.8.3 box(width as double, height as double, length as double, chamferRadius as double) as SCNBoxMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a box with given width, height, length and chamfer radius.
Notes: width: The width of the box.
height: The height of the box.
length: The length of the box.
chamferRadius: The chamfer radius of the box.

169.8.4 Constructor(width as double, height as double, length as double, chamferRadius as double)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a box with given width, height, length and chamfer radius.
Notes: width: The width of the box.
height: The height of the box.
length: The length of the box.
chamferRadius: The chamfer radius of the box.

169.8.5 Properties

169.8.6 chamferRadius as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The chamfer radius. Animatable.
Notes: If the value is strictly less than 0, the geometry is empty. The default value is 0.
(Read and Write property)

169.8.7 chamferSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of chamfer subdivisions. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 10.
(Read and Write property)

169.8.8 height as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The height of the box. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 1.
(Read and Write property)

169.8.9 heightSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the Y axis. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 1.
(Read and Write property)

169.8.10 length as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The length of the box. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 1.
(Read and Write property)

169.8.11 lengthSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the Z axis. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 1.
(Read and Write property)

169.8.12 width as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The width of the box. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 1.
(Read and Write property)

169.8.13 widthSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the X axis. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 1.
(Read and Write property)

169.9 class SCNCameraControllerMBS

169.9.1 class SCNCameraControllerMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The class for a camera controller.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 18.5pr3

169.9.2 Methods

169.9.3 clearRoll

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Clear the camera roll if any.

169.9.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

169.9.5 dollyToTarget(delta as double)

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Zoom by moving the camera along the axis from the camera position to the target.

169.9.6 rollAroundTarget(delta as double)

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Rotate the camera around the axis from the camera position to the target.
Notes: Delta is in degrees.

169.9.7 rotate(deltaX as double, deltaY as double)

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Rotate delta is in degrees.

169.9.8 stopInertia

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Stop current inertia.

169.9.9 translateInCameraSpace(x as double, y as double, z as double)

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Translate the camera along the local X/Y/Z axis.

169.9.10 Properties

169.9.11 automaticTarget as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Automatically update the target in beginInteraction.
Notes: Defaults to false.
(Read and Write property)

169.9.12 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

169.9.13 inertiaEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Set to true to enable inertia on endInteraction.
Notes: Defaults to false.
(Read and Write property)

169.9.14 inertiaFriction as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The friction coefficient applied to the inertia.
Notes: Defaults to 0.05.
(Read and Write property)

169.9.15 inertiaRunning as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Returns true if inertia is running.
Notes: (Read only property)

169.9.16 maximumHorizontalAngle as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Minimum and maximum horizontal view angles in degrees for SCNInteractionModeFly and SCNInteractionModeOrbitTurntable.
Notes: The angle constraints is not enforced if both horizontal angle properties values are set to 0.
The angle constraints will not be enforced if the initial orientation is outside the given range.
The minimum angle must be inferior to the maximum angle.
Angles are in world space and within the range [-180, 180] .
Defaults to 0.0.
(Read and Write property)

169.9.17 maximumVerticalAngle as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Minimum and maximum vertical view angles in degrees for SCNInteractionModeFly and SCNInteractionModeOrbitTurntable.
Notes: The angle constraints is not enforced if both vertical angle properties values are set to 0.
The angle constraints will not be enforced if the initial orientation is outside the given range.
The minimum angle must be inferior to the maximum angle.

Angles are in world space and within the range [-90, 90] .
Defaults to 0.0.
For example: set to minimum to 0 and maximum to 90 to only allow orbit around the top hemisphere.
(Read and Write property)

169.9.18 minimumHorizontalAngle as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Minimum and maximum horizontal view angles in degrees for SCNInteractionModeFly and SCNInteractionModeOrbitTurntable.
Notes: The angle constraints is not enforced if both horizontal angle properties values are set to 0.
The angle constraints will not be enforced if the initial orientation is outside the given range.
The minimum angle must be inferior to the maximum angle.
Angles are in world space and within the range [-180, 180] .
Defaults to 0.0.
(Read and Write property)

169.9.19 minimumVerticalAngle as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Minimum and maximum vertical view angles in degrees for SCNInteractionModeFly and SCNInteractionModeOrbitTurntable.
Notes: The angle constraints is not enforced if both vertical angle properties values are set to 0.
The angle constraints will not be enforced if the initial orientation is outside the given range.
The minimum angle must be inferior to the maximum angle.
Angles are in world space and within the range [-90, 90] .
Defaults to 0.0.
For example: set to minimum to 0 and maximum to 90 to only allow orbit around the top hemisphere.
(Read and Write property)

169.9.20 pointOfView as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The node describing the point of view.
Notes: (Read and Write property)

169.9.21 target as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The camera target in world space for orbit rotation.
Notes: (Read and Write property)

169.9.22 worldUp as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The up vector in world space used as reference for SCNInteractionModeFly and SCNInteraction-ModeOrbitTurntable camera modes.
Notes: Defaults to (0, 1, 0).
(Read and Write property)

169.10 class SCNCameraMBS

169.10.1 class SCNCameraMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A set of camera attributes that can be attached to a node to provide a point of view for displaying the scene.
Example:

```
// This example needs a window with SCNControl1, a DesktopSCNControlMBS.
// look at a box through a camera with a wide field of view
Var node As New SCNNodeMBS(New SCNBoxMBS(1, 1, 1, 0))

Var scene As New SCNSceneMBS
scene.rootNode.addChildNode node
Var camera As New SCNCameraMBS
camera.FieldOfView = 90

Var cameraNode As New SCNNodeMBS
cameraNode.Camera = camera
cameraNode.Position = New SCNVector3MBS(0, 0, 3)
scene.rootNode.addChildNode cameraNode

Var view As SCNViewMBS = SCNControl1.View
view.scene = scene
view.allowsCameraControl = True // rotate with the mouse
view.autoenablesDefaultLighting = True
```

Notes: To display a scene, you must designate a node whose camera property contains a camera object as the point of view.

The SCNNode object containing a camera defines a point of view—that is, the position and orientation of the camera. A camera,Äôs direction of view is always along the negative z-axis of the node,Äôs local coordinate system. To point the camera at different parts of your scene, use the position, rotation, or transform property of the node containing it. (Alternatively, to ensure that a camera always points at a particular element of your scene even when that element moves, attach a SCNLookAtConstraint object to the node containing the camera.)

An SCNCamera object itself defines the shape and, in part, the appearance of the rendered scene as seen from its point of view. By default, a camera defines a perspective projection, whose field of view (FOV) and near and far visibility limits you control using the properties listed in Adjusting Camera Perspective and illustrated below.

Xojo Developer Magazine

- 23.2, pages 77 to 78: Playing Tennis (Part 1), Playing Tennis with Xojo and MBS by Stefanie Juchmes-Simonis

169.10.2 Methods

169.10.3 camera as SCNCameraMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new camera object.
Notes: To use the camera to display a scene, attach it to the camera property of a node and then select that node using the pointOfView property of the view (or layer or renderer) rendering the scene.

169.10.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new camera object.
Notes: To use the camera to display a scene, attach it to the camera property of a node and then select that node using the pointOfView property of the view (or layer or renderer) rendering the scene.

169.10.5 copy as SCNCameraMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the camera.

169.10.6 Properties

169.10.7 ApertureBladeCount as Integer

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The number of physical camera aperture blades simulated by SceneKit for depth-of-field effects.
Notes: When the wantsDepthOfField setting is enabled, SceneKit renders scenes using the camera with a depth-of-field blur (also called bokeh) effect modeled after those created by a real-world physical camera. One feature of real-world camera bokeh effects is the tendency of distant bright points to blur into larger shapes based on the shape of the aperture between the camera's lens and its imaging plane (film or sensor). Physical cameras control aperture using a mechanism that moves several flat blades in or out to create a

smaller or larger opening, so the natural bokeh effect in traditional photography produces polygon-shaped blur effects.
This property controls the number of blades in the simulated camera aperture, and thus the polygon shape seen in the resulting bokeh effect. For example, a blade count of 6 (the default) causes distant bright points to blur into hexagon shapes. Increasingly large blade counts result in the bokeh effect appearing more circular, as shown below.
(Read and Write property)

169.10.8 AutomaticallyAdjustsZRange as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the camera automatically adjusts its zNear and zFar depth limits.
Notes: The default value of this property is false, specifying that the camera,Äôs zNear and zFar properties control its depth limits. If you change this property,Äôs value to true, SceneKit automatically adjusts the depth limits at render time to fit the bounding box of the scene. Changing the values of the zNear and zFar properties automatically resets this property,Äôs value to false.
(Read and Write property)

169.10.9 averageGray as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The luminance level to use as the midpoint of a tone mapping curve.
Notes: When using a High Dynamic Range (HDR) camera, SceneKit applies a process called tone mapping to translate the wide range of luminance values in the visible scene to the narrower range of brightness values that can be shown on a display. SceneKit determines a tone mapping curve from the minimumExposure, maximumExposure, exposureOffset, and whitePoint properties, along with this property which serves as a constant estimate of scene luminance.
The default value is 0.18. By setting this property to a higher or lower value, you can compensate for scenes with darker or brighter content. Alternatively, by setting the wantsExposureAdaptation property, you can allow SceneKit to automatically adjust exposure as the visible contents of the scene change.
This property has no effect if the wantsHDR value is false. If the exposureAdaptationDarkeningSpeedFactor value is true, SceneKit ignores this property, and instead computes the average luminance currently visible to the camera during rendering.
(Read and Write property)

169.10.10 bloomBlurRadius as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The radius, in pixels, for the blurring portion of the bloom effect applied to highlights in the

rendered scene. Animatable.
Notes: A bloom effect adds a soft glow to highlights (areas of bright color) in the rendered scene, simulating the way bright highlights appear to the human eye or a physical camera in a real-world scene. The bloom effect combines selective brightening and blurring effects; this property controls the blur portion of the effect. A value of zero effectively disables the bloom effect, and higher values result in a broader, softer glow. The default value is 4.0 pixels.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
To enable this behavior, you must first enable the wantsHDR setting.
(Read and Write property)

169.10.11 bloomIntensity as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The magnitude of bloom effect to apply to highlights in the rendered scene. Animatable.
Notes: A bloom effect adds a soft glow to highlights (areas of bright color) in the rendered scene, simulating the way bright highlights appear to the human eye or a physical camera in a real-world scene. This property controls the strength of the bloom effect; lower values result in a subtle effect, and higher values create very bright glow. The default value is 0.0, resulting in no bloom effect.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
To enable this behavior, you must first enable the wantsHDR setting.
(Read and Write property)

169.10.12 bloomThreshold as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The brightness threshold at which to apply a bloom effect to highlights in the rendered scene. Animatable.
Notes: A bloom effect adds a soft glow to highlights (areas of bright color) in the rendered scene, simulating the way bright highlights appear to the human eye or a physical camera in a real-world scene. This property controls the brightness level required to trigger the bloom effect; lower values apply the effect to more of the scene, and higher values apply the effect only to the brightest white areas. The default value is 1.0.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
To enable this behavior, you must first enable the wantsHDR setting.
(Read and Write property)

169.10.13 colorFringeIntensity as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The blend factor for fading the color fringing effect applied to the rendered scene.
Notes: Color fringing applies an effect that separately blurs the color components of each rendered pixel,

adding subtle rainbow edge effects to the rendered scene that simulate the effects of chromatic aberration in a physical camera. Higher values for this property result in brighter, more vivid color fringing, and lower values create a subtler effect. The default value of 1.0 leaves the color fringing effect at its most vivid.
This property controls a fade between the color fringing effect and the otherwise-normally-rendered image. The colorFringeStrength property controls the breadth of the color fringing effect.
To enable this behavior, you must first enable the wantsHDR setting.
(Read and Write property)

169.10.14 colorFringeStrength as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The magnitude of color fringing effect to apply to the rendered scene.
Notes: Color fringing applies an effect that separately blurs the color components of each rendered pixel, adding subtle rainbow edge effects to the rendered scene that simulate the effects of chromatic aberration in a physical camera. Higher values create a more pronounced color shift, creating wider rainbow fringes; lower values spread colors across shorter distances, creating a subtler effect. The default value of 0.0 disables the color fringing effect entirely.
This property controls the breadth of color fringing. The colorFringeIntensity property controls the blend factor between the color-fringed and the otherwise-normally-rendered image.
To enable this behavior, you must first enable the wantsHDR setting.
(Read and Write property)

169.10.15 colorGrading as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A texture for applying color grading effects to the entire rendered scene.
Notes: The contents value for this material property must be a 3D color lookup table, or a 2D texture image that represents such a table arranged in a horizontal strip.

see also
https://developer.apple.com/documentation/scenekit/scncamera/1644114-colorgrading
(Read only property)

169.10.16 contrast as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: An adjustment factor to apply to the overall visual contrast of the rendered scene.
Notes: A value of 0.0 (the default) leaves the rendered scene unchanged. Positive values increase contrast between bright and dark areas, and negative values reduce contrast, shifting the rendered scene towards a

uniform gray.
To enable this behavior, you must first enable the wantsHDR setting.
(Read and Write property)

169.10.17 exposureAdaptationBrighteningSpeedFactor as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The relative duration of automatically animated exposure transitions from dark to bright areas.
Notes: When using a High Dynamic Range (HDR) camera, SceneKit applies a process called tone mapping to translate the wide range of luminance values in the visible scene to the narrower range of brightness values that can be shown on a display. When the wantsExposureAdaptation property is enabled, SceneKit automatically adjusts the tone mapping curve based on the average luminance currently visible to the camera, and creates automatic transitions between exposure levels.
SceneKit automatically determines the overall duration of exposure-level animations based on the values of this property and the exposureAdaptationDarkeningSpeedFactor property. The default value is 0.4, resulting in brightening animations that are slightly faster than darkening animations.
This property has no effect if either of the wantsHDR or wantsExposureAdaptation values is false.
(Read and Write property)

169.10.18 exposureAdaptationDarkeningSpeedFactor as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The relative duration of automatically animated exposure transitions from bright to dark areas.
Notes: When using a High Dynamic Range (HDR) camera, SceneKit applies a process called tone mapping to translate the wide range of luminance values in the visible scene to the narrower range of brightness values that can be shown on a display. When the wantsExposureAdaptation property is enabled, SceneKit automatically adjusts the tone mapping curve based on the average luminance currently visible to the camera, and creates automatic transitions between exposure levels.
SceneKit automatically determines the overall duration of exposure-level animations based on the values of this property and the exposureAdaptationDarkeningSpeedFactor property. The default value is 0.6, resulting in darkening animations that are slightly faster than brighting animations.
This property has no effect if either of the wantsHDR or wantsExposureAdaptation values is false.
(Read and Write property)

169.10.19 exposureOffset as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A logarithmic bias that adjusts the results of SceneKit,Äôs tone mapping operation, brightening or darkening the visible scene.
Notes: When using a High Dynamic Range (HDR) camera, SceneKit applies a process called tone mapping

to translate the wide range of luminance values in the visible scene to the narrower range of brightness values that can be shown on a display. SceneKit determines a tone mapping curve from the minimumExposure, maximumExposure, exposureOffset, and whitePoint properties, along with a measure of scene luminance.
Use this property to bias the tone mapping curve. The default exposure offset is zero, specifying no bias. Positive values result in a brighter scene, and negative values result in a darker scene.
This property has no effect if the wantsHDR value is false.
(Read and Write property)

169.10.20 FieldOfView as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The vertical or horizontal viewing angle of the camera.
Notes: The projectionDirection property determines whether this fieldOfView property measures the camera's vertical or horizontal viewing angle, and SceneKit automatically calculates the viewing angle in the other direction to match the aspect ratio of the view displaying the scene. For example, a fieldOfView of 60 and the default SCNCameraProjectionDirectionVertical projection, presented fullscreen on a 16:9 display in portrait orientation, results in a vertical viewing angle of 60¬∞ and a horizontal viewing angle of 33.75¬∞.
You can choose to specify viewing angle either directly, using this fieldOfView property, or in terms that model a physical camera, using the sensorHeight and focalLength properties. Setting the fieldOfView property causes SceneKit to automatically recalculate the focalLength value, and setting the sensorHeight or focalLength property recalculates fieldOfView.
(Read and Write property)

169.10.21 FocalBlurSampleCount as Integer

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The number of pixel samples SceneKit uses to create depth-of-field blur effects.
Notes: When the wantsDepthOfField setting is enabled, SceneKit renders depth-of-field blur (also called bokeh) effects using a blur filter that samples multiple points in the image. Sampling a larger number of points produces a higher quality visual effect at a higher performance cost, and vice versa. The default sample count is 25.
(Read and Write property)

169.10.22 FocalLength as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The camera's focal length, in millimeters.
Notes: The sensorHeight and focalLength properties determine the camera's horizontal and vertical viewing angles using terms that model physical camera devices. (Alternatively, you can work with viewing angle directly though the fieldOfView property.) For example, with the default sensor height of 24 mm and default

focal length of 50 mm, the vertical field of view is 60¬∞.
Setting the fieldOfView property causes SceneKit to automatically recalculate the focalLength value, and setting the sensorHeight or focalLength property recalculates fieldOfView.
(Read and Write property)

169.10.23 focusDistance as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The distance from the camera at which objects appear in sharp focus. Animatable.
Notes: Objects at this distance from the camera appear perfectly focused. Objects nearer to or farther from the camera than this distance appear increasingly blurred, with the behavior of the blur effect depending on the fStop, apertureBladeCount and focalBlurSampleCount properties. The default focus distance is 2.5.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

169.10.24 fStop as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The physical camera aperture simulated by SceneKit for depth-of-field effects. Animatable.
Notes: F-stop numbers describe the light-gathering area of a physical camera's imaging system, and are typically expressed as the denominator of a ratio including the camera's focal length í, such as í/2 or í/5.6. A larger denominator indicates a smaller aperture, allowing less light to pass from the camera's lens through to the imaging plane (sensor or film), and a smaller denominator indicates a larger aperture that lets more light through.
SceneKit uses aperture measurements to simulate depth-of-field blur effects (also called bokeh) approximating those produced by a physical camera. A larger fStop number (or aperture denominator) causes most of the scene to appear in focus, with extremely close or far depths showing slight blurring; a smaller number results in only a narrow range of depths appearing in focus, and a more pronounced blur effect for the rest of the scene. The default fStop value is 5.6.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

169.10.25 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

169.10.26 maximumExposure as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The minimum exposure value to use in tone mapping.
Notes: When using a High Dynamic Range (HDR) camera, SceneKit applies a process called tone mapping to translate the wide range of luminance values in the visible scene to the narrower range of brightness values that can be shown on a display. SceneKit determines a tone mapping curve from the minimumExposure, maximumExposure, exposureOffset, and whitePoint properties, along with a measure of scene luminance.
Exposure values are exponential: a value of 1.0 doubles brightness, a value of 2.0 quadruples brightness, a value of -1.0 halves brightness, and so on. The default value is 15.0. Decreasing the value causes brighter portions of the scene to become over-exposed (uniformly white, losing definition). Increasing the value adds more dynamic range for brighter portions of the scene; however, a greater breadth of difference between the minimum and maximum exposures decreases contrast.
This property has no effect if the wantsHDR value is false.
(Read and Write property)

169.10.27 minimumExposure as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The minimum exposure value to use in tone mapping.
Notes: When using a High Dynamic Range (HDR) camera, SceneKit applies a process called tone mapping to translate the wide range of luminance values in the visible scene to the narrower range of brightness values that can be shown on a display. SceneKit determines a tone mapping curve from the minimumExposure, maximumExposure, exposureOffset, and whitePoint properties, along with a measure of scene luminance.
Exposure values are exponential: a value of 1.0 doubles brightness, a value of 2.0 quadruples brightness, a value of -1.0 halves brightness, and so on. The default value is -15.0. Increasing the value causes darker portions of the scene to become under-exposed (uniformly black, losing definition). Decreasing the value adds more dynamic range for darker portions of the scene; however, a greater breadth of difference between the minimum and maximum exposures decreases contrast.
This property has no effect if the wantsHDR value is false.
(Read and Write property)

169.10.28 motionBlurIntensity as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A factor that determines the intensity of motion blur effects. Animatable.
Notes: The default intensity of zero results in no motion blur effect. Higher values (toward a maximum of 1.0) create more pronounced motion blur effects.
Motion blur is not supported when wide-gamut color rendering is enabled. Wide-gamut rendering is enabled by default on supported devices; to opt out, set the SCNDisableWideGamut key in your app's Info.plist file.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

169.10.29 Name as String

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A name associated with the camera object.
Notes: You can provide a descriptive name for a camera object to make managing your scene graph easier. Cameras loaded from a scene file may have names assigned by an artist using a 3D authoring tool. Use the SCNSceneSourceMBS class to examine cameras in a scene file without loading its scene graph.
(Read and Write property)

169.10.30 orthographicScale as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the camera,Äôs magnification factor when using an orthographic projection.
Notes: In an orthographic projection, equally sized objects appear equally sized regardless of their distance from the camera. To switch between orthographic and perspective projections, see the usesOrthographicProjection property.
(Read and Write property)

169.10.31 ProjectionDirection as Integer

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The axis used to determine field of view or orthographic scale.
Notes: The fieldOfView property measures view angle in a single primary direction, determined by this projectionDirection property. For the other direction, SceneKit automatically adjusts field of view depending on the aspect ratio of the view presenting the scene.
For example, with the default projection direction of SCNCameraProjectionDirectionVertical, setting fieldOfView to 60 results in a vertical view angle of 60¬∞. If the scene appears on a display with a 4:3 aspect ratio, the horizontal view angle is 80¬∞. However, if the scene appears on a 16:9 display, the horizontal view angle is 106¬∞.
This property has a similar effect on scaling for orthographic projections. The orthographicScale property measures the scale factor in the direction of the projectionDirection property, and SceneKit automatically calculates scale factor in the other direction according to aspect ratio.
(Read and Write property)

169.10.32 projectionTransform as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The camera,Äôs projection transformation.
Notes: This transformation expresses the combination of all the camera,Äôs geometric properties: projection type (perspective or orthographic), field of view, depth limits, and orthographic scale (if applicable). SceneKit uses this transformation to convert points in the camera node,Äôs coordinate space to the renderer,Äôs 2D space when rendering and processing events.
You can use this transformation directly if your app needs to convert between view and renderer coordinates for other purposes. Alternatively, if you compute your own projection transform matrix, you can set this property to override the transformation synthesized from the camera,Äôs geometric properties.
(Read and Write property)

169.10.33 saturation as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: An adjustment factor to apply to the overall color saturation of the rendered scene.
Notes: A value of 1.0 (the default) leaves scene colors unchanged. Greater values result in oversaturated colors, and a value of 0.0 makes the rendered scene entirely grayscale.
To enable this behavior, you must first enable the wantsHDR setting.
(Read and Write property)

169.10.34 screenSpaceAmbientOcclusionBias as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: An offset for modulating ambient occlusion effects.
Notes: Ambient occlusion is an effect that improves material shading by calculating the amounts of ambient light that reach various parts of a surface, creating shadows on parts of a geometry where incoming light is obscured by other parts of the geometry. (You can provide pre-rendered ambient occlusion effects for a material using its ambientOcclusion property.) Screen-space ambient occlusion (SSAO) provides a real-time approximation of this effect for the entire scene viewed through the camera.
This screenSpaceAmbientOcclusionBias value is used in an intermediate stage of calculating the SSAO effect, and measures a distance in scene units. Increasing or decreasing this value from its default of 0.03 can help to offset unrealistic effects produced by changing other SSAO settings.
(Read and Write property)

169.10.35 screenSpaceAmbientOcclusionDepthThreshold as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum depth difference, in units of scene space, at which to apply ambient occlusion effects.
Notes: Ambient occlusion is an effect that improves material shading by calculating the amounts of ambient light that reach various parts of a surface, creating shadows on parts of a geometry where incoming light

is obscured by other parts of the geometry. (You can provide pre-rendered ambient occlusion effects for a material using its ambientOcclusion property.) Screen-space ambient occlusion (SSAO) provides a real-time approximation of this effect for the entire scene viewed through the camera.
This screenSpaceAmbientOcclusionDepthThreshold property controls the effect of relative distance from the camera on SSAO effects. Higher values create more shadowing effects between foreground and background elements of the scene, but this can result in unrealistic dark halos around foreground elements that are far from the background. Lower values avoid dark halo effects, but create less visual separation between scene elements at different distances from the camera. The default value is 0.2 units.
(Read and Write property)

169.10.36 screenSpaceAmbientOcclusionIntensity as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The intensity of the screen-space ambient occlusion effect applied in camera rendering.
Notes: Ambient occlusion is an effect that improves material shading by calculating the amounts of ambient light that reach various parts of a surface, creating shadows on parts of a geometry where incoming light is obscured by other parts of the geometry. (You can provide pre-rendered ambient occlusion effects for a material using its ambientOcclusion property.) Screen-space ambient occlusion (SSAO) provides a real-time approximation of this effect for the entire scene viewed through the camera.
The default value of this property is zero, disabling SSAO effects. Increasing the intensity value creates deeper, bolder shadows.
(Read and Write property)

169.10.37 screenSpaceAmbientOcclusionNormalThreshold as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The magnitude of the blur effect applied to create ambient occlusion shadows.
Notes: Ambient occlusion is an effect that improves material shading by calculating the amounts of ambient light that reach various parts of a surface, creating shadows on parts of a geometry where incoming light is obscured by other parts of the geometry. (You can provide pre-rendered ambient occlusion effects for a material using its ambientOcclusion property.) Screen-space ambient occlusion (SSAO) provides a real-time approximation of this effect for the entire scene viewed through the camera.
SSAO shadowing includes a blur effect to realistically soften differences in shadow between adjacent pixels, which depends on both the smoothness of scene geometry and this factor. Larger blur factors create a softer, more spread-out blur; smaller factors create coarser shadowing effects.
(Read and Write property)

169.10.38 screenSpaceAmbientOcclusionRadius as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The distance, in units of scene space, at which ambient occlusion takes effect.
Notes: Ambient occlusion is an effect that improves material shading by calculating the amounts of ambient light that reach various parts of a surface, creating shadows on parts of a geometry where incoming light is obscured by other parts of the geometry. (You can provide pre-rendered ambient occlusion effects for a material using its ambientOcclusion property.) Screen-space ambient occlusion (SSAO) provides a real-time approximation of this effect for the entire scene viewed through the camera.
