- 215.3.9 Constructor(URL as String, StartPlayback as Boolean, win as Window) 25129

215.3.9 Constructor(URL as String, StartPlayback as Boolean, win as Window)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Creates a new instance of the MFPlay player object.
Notes: URL: The string that contains the URL of a media file to open (or file path). This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Win: A reference to a window where the video will appear. For audio-only playback, this parameter can be nil.

The window specified is used for the first selected video stream in the source.

If windows is nil, MFPlay will not display any video.

Please call this in main thread of application only.

- 215.3.8 Constructor(URL as String, StartPlayback as Boolean, win as DesktopWindow) 25128

215.3.10 CreateMediaItemFromURL(URL as String, Sync as Boolean = true, tag as Variant = nil) as MFPMediaItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a media item from a URL.
Notes: URL: String that contains the URL of a media file (or file path).
Sync: If true, the method blocks until it completes. If false, the method does not block and completes asynchronously.

If fSync is true, we return the item on success.

This method does not queue the media item for playback. To queue the item for playback, set MediaItem property.

The CreateMediaItemFromURL method can be called either synchronously or asynchronously:

If Sync is true, the method completes synchronously and returns the new item.
If Sync is false, the method completes asynchronously. When the operation completes, the MediaItemCreated event is invoked. The event call passes the new media item.

If you make multiple asynchronous calls to CreateMediaItemFromURL, they are not guaranteed to complete in the same order. Use the tag to pass data to the event.

Currently, this method raises an error if the URL specifies any of the following protocols: rtsp*, mms*, or mcast.

215.3.11 FrameStep

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Steps forward one video frame.
Notes: This method completes asynchronously. When the operation completes, the FrameStepped event is raised.

The player object does not support frame stepping during reverse playback (that is, while the playback rate is negative).

215.3.12 GetVideoSourceRect(byref Left as Single, byref Top as Single, byref Right as Single, byref Bottom as Single)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the video source rectangle.
Notes: This rectangle defines which portion of the video is displayed. It is specified in normalized coordinates, which are defined as follows:
The upper-left corner of the video image is (0, 0).
The lower-right corner of the video image is (1, 1).
If the source rectangle is { 0, 0, 1, 1 } , the entire image is displayed. This is the default value.

215.3.13 InsertEffect(CLSID as String, isOptional as boolean = false) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Applies an audio or video effect to playback.
Notes: Please pass class id of a Media Foundation transform (MFT) that implements the effect. MFTs expose the IMFTransform interface.

isOptional specifies whether the effect is optional.

Value	Meaning
True	The effect is optional. If the MFPlay player object cannot add the effect, it ignores the effect and continues playback.
False	If the MFPlay player object cannot add the effect, a playback error occurs.

Returns index of the effect, which you pass for RemoveEffect later if needed.

The effect is applied to any media items set after the method is called. It is not applied to the current media item.

For each media item, the effect is applied to the first selected stream of the matching type (audio or video). If a media item has two selected streams of the same type, the second stream does not receive the effect. The effect is ignored if the media item does not contain a stream that matches the effect type. For example, if you set a video effect and play a file that contains just audio, the video effect is ignored, although no error is raised.

The effect is applied to all subsequent media items, until the application removes the effect. To remove an effect, call RemoveEffect or RemoveAllEffects.

If you set multiple effects of the same type (audio or video), they are applied in the same order in which you call InsertEffect.

Remote Playback Optimizations

Audio and video effects might be incompatible with optimizations that are used for remote playback. The following remarks apply only to audio or video effects that are actually used during playback:
If you mark an audio or video effect as required, by setting fOptional to false, MFPlay disables remote playback optimizations.
Otherwise, if all audio/video effects are marked as optional, MFPlay might drop the effects, in order to enable remote playback optimizations.
In other words, required effects have priority over remote optimizations, but optional effects do not.

Non-audio, non-video effects do not affect remote optimizations. Also, if you insert a required effect but the source does not contain any streams of that type, remote optimizations are not disabled.

215.3.14 Pause

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Pauses playback.
Notes: While playback is paused, the most recent video frame is displayed, and audio is silent.

This method completes asynchronously. When the operation completes, the application's Paused event is invoked.

215.3.15 Play

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Starts playback.
Notes: This method completes asynchronously. When the operation completes, the Started event is raised.

215.3.16 RemoveAllEffects

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes all effects that were added with the InsertEffect method.
Notes: The change applies to the next media item that is set on the player. The effects are not removed from the current media item.

215.3.17 RemoveEffect(Handle as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes an effect that was added with the InsertEffect method.
Notes: Please pass the number returned by InsertEffect.

The change applies to the next media item that is set on the player. The effect is not removed from the current media item.

215.3.18 SetVideoSourceRect(Left as Single, Top as Single, Right as Single, Bottom as Single)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the video source rectangle.
Notes: MFPlay clips the video to this rectangle and stretches the rectangle to fill the video window.

This rectangle defines which portion of the video is displayed. It is specified in normalized coordinates, which are defined as follows:
The upper-left corner of the video image is (0, 0).
The lower-right corner of the video image is (1, 1).

To display the entire image, set the source rectangle to { 0, 0, 1, 1 } . This is the default value.

MFPlay stretches the source rectangle to fill the entire video window. By default, MFPlay maintains the source's correct aspect ratio, letterboxing if needed. The letterbox color is controlled by the BorderColor property.

This method fails if no media item is currently set, or if the current media item does not contain video.
To set the video position before playback starts, call this method inside your MediaItemSet event.

215.3.19 Shutdown

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Shuts down the MFPlay player object and releases any resources the object is using.
Notes: After this method is called, most IMFPMediaPlayer methods raise exception about shutdown. Also, any media items created from this instance of the player object are invalidated and most IMFPMediaItem methods also raise exceptions.

The player object automatically shuts itself down when its reference count reaches zero. You can use the Shutdown method to shut down the player before all of the references have been released.

215.3.20 Stop

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stops playback.
Notes: This method completes asynchronously. When the operation completes, the Stopped event is raised.

215.3.21 UpdateVideo

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Updates the video frame.
Notes: This method makes sure the video is updated now, not later.

215.3.22 Properties

215.3.23 AspectRatioMode as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current aspect-ratio correction mode.
Notes: This mode controls whether the aspect ratio of the video is preserved during playback.
See VideoARMode* constants.
(Read and Write property)

215.3.24 Balance as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current audio balance.
Notes: The value can be any number in the following range (inclusive).

Value	Meaning
-1.0	The left channel is at full volume; the right channel is silent.
+1.0	The right channel is at full volume; the left channel is silent.

If the value is zero, the left and right channels are at equal volumes. The default value is zero.
(Read and Write property)

215.3.25 BorderColor as Color

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current color of the video border.
Notes: The border color is used to letterbox the video.
(Read and Write property)

215.3.26 Duration as Double

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the playback duration of the current media item.
Notes: This method calculates the playback duration, taking into account the start and stop times for the media item. To set the start and stop times, use StartPosition and StopPosition properties on the media item. To get the actual duration of the underlying media file, regardless of start and stop times, use Duration property on the item.

For example, suppose that you load a 30-second audio file and set the start time equal to 2 seconds and stop time equal to 10 seconds. The MFPMediaItemMBS.Duration method will return 30 seconds, but the MFPMediaPlayerMBS.Duration method will return 8 seconds.
(Read only property)

215.3.27 FastestSupportedRateForward as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the fastest supported forward playback rates.
Notes: Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values

indicate forward playback, and negative values indicate reverse playback.
(Read only property)

215.3.28 FastestSupportedRateReverse as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the fastest supported reverse playback rates.
Notes: Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read only property)

215.3.29 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

215.3.30 IdealVideoMaxHeight as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum height of video size that can be displayed without significantly degrading performance or image quality.
Notes: (Read only property)

215.3.31 IdealVideoMaxWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum width of video sizes that can be displayed without significantly degrading performance or image quality.
Notes: (Read only property)

215.3.32 IdealVideoMinHeight as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the minimum height of video sizes that can be displayed without significantly degrading performance or image quality.
Notes: (Read only property)

215.3.33 IdealVideoMinWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the minimum width of video sizes that can be displayed without significantly degrading performance or image quality.
Notes: (Read only property)

215.3.34 Looping as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to loop video.
Notes: If set to true, the plugin will call Play automatically when playback ended.
(Read and Write property)

215.3.35 MediaItem as MFPMediaItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Current media item.
Notes: Setting the MediaItem property is asynchronous. Therefore, while set is pending, get will not return the media item that was just set. Instead, the application should implement MediaItemSet event to know when it is done.
(Read and Write property)

215.3.36 Mute as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the audio is muted.
Notes: (Read and Write property)

215.3.37 NativeVideoAspectRateHeight as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The picture aspect ratio of the video.
Notes: (Read only property)

215.3.38 NativeVideoAspectRateWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The picture aspect ratio of the video.
Notes: (Read only property)

215.3.39 NativeVideoHeight as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height of the video, in pixels.
Notes: (Read only property)

215.3.40 NativeVideoWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the video, in pixels.
Notes: (Read only property)

215.3.41 Position as Double

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The playback position.
Notes: If you call this method while playback is stopped, the new position takes effect after playback resumes.

This method completes asynchronously. When the operation completes, the PositionSet event is raised.
If playback was started before SetPosition is called, playback resumes at the new position. If playback was paused, the video is refreshed to display the current frame at the new position.

If you make two consecutive calls to SetPosition, and the second call is made before the first call has completed, the second call supersedes the first. The status code for the superseded call is set to false in the event data for that call. This behavior prevents excessive latency from repeated calls to SetPosition, as each call may force the media source to perform a relatively lengthy seek operation.
(Read and Write property)

215.3.42 Rate as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current playback rate.
Notes: The playback rate is expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read and Write property)

215.3.43 SlowestSupportedRateForward as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the slowest supported forward playback rates.
Notes: Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read only property)

215.3.44 SlowestSupportedRateReverse as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the slowest supported reverse playback rates.
Notes: Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read only property)

215.3.45 State as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current playback state of the MFPlay player object.

Notes: See State* constants.

This property can be read after the player object has been shut down.

Many of the player methods complete asynchronously. While an asynchronous operation is pending, the current state is not updated until the operation completes. When the operation completes, the application receives an event.
(Read only property)

215.3.46 VideoWindow as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the window where the video is displayed.
Notes: Returns HWND as integer.
(Read only property)

215.3.47 Volume as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The audio volume.
Notes: Volume is expressed as an attenuation level, where 0.0 indicates silence and 1.0 indicates full volume (no attenuation).

If you call this method before playback starts, the setting is applied after playback starts.
This method does not change the master volume level for the player's audio session. Instead, it adjusts the per-channel volume levels for audio stream(s) that belong to the current media item. Other streams in the audio session are not affected.
(Read and Write property)

215.3.48 Events

215.3.49 Ended

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Playback has ended.
Notes: The player object sends this event when playback reaches the end of the media file.

215.3.50 Error

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: A playback error has occurred.

215.3.51 FrameStepped

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: A frame-step operation has completed.
Notes: This event is sent when the FrameStep method completes.

215.3.52 MediaItemCleared

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current media item was cleared.
Notes: This event is sent when the ClearMediaItem method completes.

215.3.53 MediaItemCreated(MediaItem as MFPMediaItemMBS, Tag as variant)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: A new media item was created.
Notes: This event is sent when the CreateMediaItemFromURL method completes.

215.3.54 MediaItemSet

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: A media item is ready for playback.
Notes: This event is sent when the SetMediaItem method completes.

215.3.55 Paused

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Playback has paused.
Notes: This event is sent when the Pause method completes.

215.3.56 PositionSet

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The MFPlay player object has seeked to a new playback position.
Notes: This event is sent when the Position setter completes.

215.3.57 RateSet(rate as Single)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The playback rate has changed.
Notes: This event is sent when the rate setter completes.

215.3.58 Started

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Playback has started.
Notes: This event is sent when the Play method completes.

215.3.59 Stopped

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Playback has stopped.
Notes: This event is sent when the Stop method completes.

215.3.60 Constants

States

Constant	Value	Description
StateEmpty	0	Initial state. No media items have been set on the player object.
StatePaused	3	Playback is paused.
StatePlaying	2	Playback is in progress.
StateShutdown	4	The player object was shut down. This state is returned after the application calls Shutdown method.
StateStopped	1	Playback is stopped.

Aspect Ratio Modes

Constant	Value	Description
VideoARModeMask	7	Bitmask to validate flag values. This value is not a valid flag.
VideoARModeNone	0	Do not maintain the aspect ratio of the video. Stretch the video to fit the output rectangle.
VideoARModeNonLinearStretch	4	Apply a non-linear horizontal stretch if the aspect ratio of the destination rectangle does not match the aspect ratio of the source rectangle. The non-linear stretch algorithm preserves the aspect ratio in the middle of the picture and stretches (or shrinks) the image progressively more toward the left and right. This mode is useful when viewing 4:3 content full-screen on a 16:9 display, instead of pillar-boxing. Non-linear vertical stretch is not supported, because the visual results are generally poor. This mode may cause performance degradation. If this flag is set, you must also set the VideoARModePreservePixel and VideoARModePreservePicture flags.
VideoARModePreservePicture	1	Preserve the aspect ratio of the video by letterboxing or within the output rectangle.
VideoARModePreservePixel	2	Correct the aspect ratio if the physical size of the display device does not match the display resolution. For example, if the native resolution of the monitor is 1600 by 1200 (4:3) but the display resolution is 1280 by 1024 (5:4), the monitor will display non-square pixels. If this flag is set, you must also set the VideoARModePreservePicture flag.

Chapter 216

Windows Mutex

216.1 class WindowsMutexMBS

216.1.1 class WindowsMutexMBS

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for a mutex.
Notes: As a mutex must have a unique name you can use this class to find out if an application is allready running.
Try to create a mutex with an unique name and if it allready exists your application was launched twice.

See also MutexMBS class.

216.1.2 Methods

216.1.3 close

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

216.1.4 Create(name as string)

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new mutex.
Notes: The name must be unique and should not contain a backslash.
Use only ASCII strings for this.
Lasterror is set.

216.1.5 Lock

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Locks the
Notes: Blocks until we got the lock.
Lasterror is set.

216.1.6 Open(name as string)

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Trys to open a mutex with the given name.
Notes: Fails if the mutex does not exist.
Lasterror is set.

216.1.7 TryLock as Boolean

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Tries to lock the mutex.
Notes: Returns true if we got the lock or false if not.
Lasterror is set.

216.1.8 Unlock

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Unlocks the mutex.
Notes: Lasterror is set.

216.1.9 Properties

216.1.10 Handle as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle of the Mutex for use with Declares.
Notes: (Read and Write property)

216.1.11 Lasterror as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code reported.
Notes: A windows error code.
Or 0 for okay and -1 for "Function not available or parameters wrong."
(Read and Write property)

216.1.12 Name as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name used to create or open the mutex.
Notes: (Read only property)

Chapter 217

Windows OCR

217.1 class WindowsOCREngineMBS

217.1.1 class WindowsOCREngineMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides optical character recognition (OCR) functionality.
Example:

```
// recognize text in an image file on Windows 10 and newer
If Not WindowsOCREngineMBS.Available Then
MessageBox "OCR is not available."
Return
End If

Var engine As New WindowsOCREngineMBS // uses the user's languages
Var file As FolderItem = SpecialFolder.Desktop.Child("scan.png")
Var result As WindowsOCRResultMBS = engine.RecognizeSync(file)

If result <>Nil Then
MessageBox result.Text
End If
```

Notes: Requires Windows 10 (introduced in 10.0.10240.0)

o use the OCR capabilities of the OcrEngineMBS class in your app, call the RecognizeAsync method. When you call the RecognizeAsync method of the OcrEngine class, the method returns an WindowsOCRResultMBS object, which contains the recognized text and its size and position. The result is split into lines, and the lines are split into words.

- The WindowsOCRResultMBS contains a collection of WindowsOCRLineMBS objects, which you access through the Lines property of the WindowsOCRResultMBS.
- Each WindowsOCRLineMBS object contains a collection of WindowsOCRWordMBS objects, which you access through the Words property of each WindowsOCRLineMBS.
- Each WindowsOCRWordMBS object specifies the text, size, and position information of the word in the image.

Our plugin class allows you to run the OCR operation either synchronously or asynchronously. The asynchronous operation runs in the background on a separated preemptive thread, so your application GUI is not blocked and this is the preferred way.

Alternatively, you can use the synchronous versions, which block the GUI.

217.1.2 Methods

217.1.3 Available as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this class is available.
Example:

```
If WindowsOCREngineMBS.Available Then
// okay
Else
MessageBox "Only for Windows 10 and newer."
End If
```

Notes: Returns false on Windows 8.x.
Reports true on Windows 10240 or later.

217.1.4 AvailableRecognizerLanguages as WindowsOCRLanguageMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns an array of all available OCR languages on the device.
Example:

```
Var languages() As WindowsOCRLanguageMBS = WindowsOCREngineMBS.AvailableRecognizerLanguages

For Each n As WindowsOCRLanguageMBS In languages
MessageBox n.DisplayName+", "+n.LanguageTag
Next
```

217.1.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new instance of the OcrEngine class.
Example:

```
Var Recognizer As New WindowsOCREngine

MessageBox Recognizer.RecognizerLanguage.DisplayName
```

Notes: If any language from GlobalizationPreferences.Languages can be resolved to any of the available OCR languages returns new instance of OcrEngine class, otherwise otherwise raises UnsupportedOperationException.
See also:

- 217.1.6 Constructor(Language as WindowsOCRLanguageMBS) 25151

217.1.6 Constructor(Language as WindowsOCRLanguageMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new instance of the OcrEngine class.
Example:

```
Var Recognizer As New WindowsOCREngine("de-DE")

MessageBox Recognizer.RecognizerLanguage.DisplayName
```

Notes: If the specified language can be resolved to any of the OCR languages available on the device, returns new instance of OcrEngine class, otherwise raises UnsupportedOperationException.

Raises PlatformNotSupportedException when called on macOS or Linux.
See also:

- 217.1.5 Constructor 25151

217.1.7 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

217.1.8 IsLanguageSupported(Language as WindowsOCRLanguageMBS) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if a specified language can be resolved to any of the available OCR languages.
Notes: True, if the specified language can be resolved to any of the available OCR languages; otherwise, false.

217.1.9 RecognizeAsync(ImageFile as FolderItem)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We will ask Windows to load image from the image file and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
Calls event RecognizeCompleted later.
See also:

- 217.1.10 RecognizeAsync(Picture as Picture) 25152
- 217.1.11 RecognizeAsync(PictureData as MemoryBlock) 25153
- 217.1.12 RecognizeAsync(PictureData as String) 25153

217.1.10 RecognizeAsync(Picture as Picture)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We build a bitmap from the picture for Windows and then run OCR.
Calls event RecognizeCompleted later.
See also:

- 217.1.9 RecognizeAsync(ImageFile as FolderItem) 25152

- 217.1.11 RecognizeAsync(PictureData as MemoryBlock) 25153
- 217.1.12 RecognizeAsync(PictureData as String) 25153

217.1.11 RecognizeAsync(PictureData as MemoryBlock)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We will ask Windows to load image from the image data provided and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
Calls event RecognizeCompleted later.
See also:

- 217.1.9 RecognizeAsync(ImageFile as FolderItem) 25152
- 217.1.10 RecognizeAsync(Picture as Picture) 25152
- 217.1.12 RecognizeAsync(PictureData as String) 25153

217.1.12 RecognizeAsync(PictureData as String)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We will ask Windows to load image from the image data provided and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
Calls event RecognizeCompleted later.
See also:

- 217.1.9 RecognizeAsync(ImageFile as FolderItem) 25152
- 217.1.10 RecognizeAsync(Picture as Picture) 25152
- 217.1.11 RecognizeAsync(PictureData as MemoryBlock) 25153

217.1.13 RecognizeSync(ImageFile as FolderItem) as WindowsOCRResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We will ask Windows to load image from the image file and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
We run loops to wait and yield time to threads while waiting for the job to finish.
On success, true is returned and result is set.
In case of error, the error parameter is set with a text.

Raises NilObjectException or WindowsOCRExceptionMBS in case of an error.
See also:

- 217.1.14 RecognizeSync(Picture as Picture) as WindowsOCRResultMBS 25154
- 217.1.15 RecognizeSync(PictureData as MemoryBlock) as WindowsOCRResultMBS 25154
- 217.1.16 RecognizeSync(PictureData as String) as WindowsOCRResultMBS 25155

217.1.14 RecognizeSync(Picture as Picture) as WindowsOCRResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We build a bitmap from the picture for Windows and then run OCR.
Calls event RecognizeCompleted later.
We run loops to wait and yield time to threads while waiting for the job to finish.
On success, true is returned and result is set.
In case of error, the error parameter is set with a text.

Raises NilObjectException or WindowsOCRExceptionMBS in case of an error.
See also:

- 217.1.13 RecognizeSync(ImageFile as FolderItem) as WindowsOCRResultMBS 25153
- 217.1.15 RecognizeSync(PictureData as MemoryBlock) as WindowsOCRResultMBS 25154
- 217.1.16 RecognizeSync(PictureData as String) as WindowsOCRResultMBS 25155

217.1.15 RecognizeSync(PictureData as MemoryBlock) as WindowsOCRResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We will ask Windows to load image from the image data and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
We run loops to wait and yield time to threads while waiting for the job to finish.
On success, true is returned and result is set.
In case of error, the error parameter is set with a text.

Raises NilObjectException or WindowsOCRExceptionMBS in case of an error.
See also:

- 217.1.13 RecognizeSync(ImageFile as FolderItem) as WindowsOCRResultMBS 25153
- 217.1.14 RecognizeSync(Picture as Picture) as WindowsOCRResultMBS 25154

• 217.1.16 RecognizeSync(PictureData as String) as WindowsOCRResultMBS 25155

217.1.16 RecognizeSync(PictureData as String) as WindowsOCRResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We will ask Windows to load image from the image data and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
We run loops to wait and yield time to threads while waiting for the job to finish.
On success, true is returned and result is set.
In case of error, the error parameter is set with a text.

Raises NilObjectException or WindowsOCRExceptionMBS in case of an error.
See also:

• 217.1.13 RecognizeSync(ImageFile as FolderItem) as WindowsOCRResultMBS 25153

• 217.1.14 RecognizeSync(Picture as Picture) as WindowsOCRResultMBS 25154

• 217.1.15 RecognizeSync(PictureData as MemoryBlock) as WindowsOCRResultMBS 25154

217.1.17 Properties

217.1.18 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

217.1.19 MaxImageDimension as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum image pixel dimensions supported by the OCR engine.
Example:

MessageBox Recognizer.MaxImageDimension.ToString

Notes: The maximum image pixel dimensions supported by the OCR engine.
(Read only property)

217.1.20 RecognizerLanguage as WindowsOCRLanguageMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the language being used for text recognition.
Example:

```
Var Recognizer As New WindowsOCREngine

MessageBox Recognizer.RecognizerLanguage.DisplayName
```

Notes: (Read only property)

217.1.21 Yield as Boolean

MBS WinFrameworks Plugin, Plugin Version: 25.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to yield to other Xojo threads.
Notes: If true allows other cooperative threads to run in the background.
(Read and Write property)

217.1.22 Events

217.1.23 RecognizeCompleted(ErrorMessage as String, ErrorCode as Integer, Result as WindowsOCRResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called when the recognize process completes.
Notes: ErrorMessage: The error we report on what went wrong.
ErrorCode: The Windows error code, zero if successful.
Result: The result of the OCR that was initiated by the OcrEngine object.

217.1.24 Stopped(Error as Integer)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called by the engine in case it had to stop.
Notes: Provides Windows error code for the reason.

217.2 class WindowsOCRExceptionMBS

217.2.1 class WindowsOCRExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The class for an exception in the OCR classes.
Notes: Subclass of the RuntimeException class.
Blog Entries

217.3 class WindowsOCRLanguageMBS

217.3.1 class WindowsOCRLanguageMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class that provides information related to BCP-47 language tags such as the language name and the script.
Example:

```
// list the languages Windows can recognize text in and use German if available
Var lines() As String
Var german As WindowsOCRLanguageMBS
For Each lang As WindowsOCRLanguageMBS In WindowsOCREngineMBS.AvailableRecognizerLanguages
lines.Add lang.LanguageTag + ": " + lang.DisplayName
If lang.LanguageTag.BeginsWith("de") Then german = lang
Next
MessageBox String.FromArray(lines, EndOfLine)

If german <>Nil Then
Var engine As New WindowsOCREngineMBS(german)
// engine.RecognizeSync(file), see WindowsOCREngineMBS
End If
```

217.3.2 Methods

217.3.3 Constructor(languageTag as String)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a Language object.
Notes: Pass a BCP-47 language tag.

217.3.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

217.3.5 Properties

217.3.6 CurrentInputMethodLanguageTag as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the BCP-47 language tag for the currently enabled keyboard layout or Input Method Editor (IME).
Notes: This property returns a value for the currently active input method on the thread with keyboard input focus. Calling this on a background thread may not return the expected results.
(Read only property)

217.3.7 DisplayName as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a localized string that is suitable for display to the user for identifying the language.
Notes: (Read only property)

217.3.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

217.3.9 LanguageTag as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the normalized BCP-47 language tag for this language.
Notes: e.g. de-DE for Germany
(Read only property)

217.3.10 NativeName as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the name of the language in the language itself.
Notes: (Read only property)

217.3.11 Script as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the four-letter ISO 15924 script code of the language.
Notes: (Read only property)

217.4 class WindowsOCRLineMBS

217.4.1 class WindowsOCRLineMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a single line of text recognized by the OCR engine and returned as part of the WindowsOCRResultMBS.
Notes: When you call the RecognizeAsync method of the OcrEngine class, the method returns an WindowsOCRResultMBS object. The WindowsOCRResultMBS contains a collection of WindowsOCRLineMBS objects, which you access through the Lines property of the WindowsOCRResultMBS. Each WindowsOCRLineMBS object contains a collection of WindowsOCRWordMBS objects, which you access through the Words property of each WindowsOCRLineMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

217.4.2 Methods

217.4.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

217.4.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

217.4.5 Words as WindowsOCRWordMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the collection of WindowsOCRWordMBS objects that represents the words detected in the current line of text by the RecognizeAsync method.

217.4.6 Properties

217.4.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

217.4.8 Text as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the text of the recognized line.
Notes: (Read only property)

217.5 class WindowsOCRResultMBS

217.5.1 class WindowsOCRResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Contains the results of Optical Character Recognition (OCR).
Notes: When you call the RecognizeAsync method of the OcrEngine class, the method returns an WindowsOCRResultMBS object. The WindowsOCRResultMBS contains a collection of WindowsOCRLineMBS objects, which you access through the Lines property of the WindowsOCRResultMBS. Each WindowsOCRLineMBS object contains a collection of WindowsOCRWordMBS objects, which you access through the Words property of each WindowsOCRLineMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

217.5.2 Methods

217.5.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

217.5.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

217.5.5 Lines as WindowsOCRLineMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the collection of WindowsOCRLineMBS objects that represents the lines of text detected in the image by the RecognizeAsync method.
Notes: When you call the RecognizeAsync method of the OcrEngine class, the method returns an WindowsOCRResultMBS object. The WindowsOCRResultMBS contains a collection of WindowsOCRLineMBS objects, which you access through the Lines property of the WindowsOCRResultMBS. Each WindowsOCRLineMBS object contains a collection of WindowsOCRWordMBS objects, which you access through the Words property of each WindowsOCRLineMBS.

217.5.6 Properties

217.5.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

217.5.8 Text as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the recognized text.
Notes: (Read only property)

217.5.9 TextAngle as Double

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the clockwise rotation of the recognized text, in degrees, around the center of the image.
Notes: The clockwise rotation of the recognized text, in degrees, around the center of the image. If the angle of the text can't be detected, the value of this property is null. If the image contains text at different angles, only part of the text will be recognized correctly.

Use the TextAngle property to overlay recognition results correctly on the original image. If the value of the TextAngle property is not null or 0 (zero), then to overlay the recognized text correctly on the original image, you either have to rotate the original image by the detected angle in a counter-clockwise direction, or rotate the recognized text by the detected angle in a clockwise direction.
(Read only property)

217.6 class WindowsOCRWordMBS

217.6.1 class WindowsOCRWordMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a single word in a line of text recognized by the OCR engine and returned as part of the WindowsOCRLineMBS.
Notes: When you call the RecognizeAsync method of the OcrEngine class, the method returns an WindowsOCRResultMBS object. The WindowsOCRResultMBS contains a collection of WindowsOCRLineMBS objects, which you access through the Lines property of the WindowsOCRResultMBS. Each WindowsOCRLineMBS object contains a collection of WindowsOCRWordMBS objects, which you access through the Words property of each WindowsOCRLineMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

217.6.2 Methods

217.6.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

217.6.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

217.6.5 Properties

217.6.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

217.6.7 Height as Single

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the size in pixels of the recognized word.
Notes: (Read only property)

217.6.8 Text as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the text of the recognized word.
Notes: (Read only property)

217.6.9 Width as Single

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the size in pixels of the recognized word.
Notes: (Read only property)

217.6.10 X as Single

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the position in pixels of the recognized word from the top left corner of image when the value of TextAngle property is 0 (zero).
Notes: (Read only property)

217.6.11 Y as Single

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the position in pixels of the recognized word from the top left corner of image when the value of TextAngle property is 0 (zero).
Notes: (Read only property)

Chapter 218

Windows PDF

218.1 class WindowsPDFDocumentMBS

218.1.1 class WindowsPDFDocumentMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a Portable Document Format (PDF) document.
Example:

```
// render the first page of a PDF file to a picture on Windows
Var file As FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var doc As WindowsPDFDocumentMBS = WindowsPDFDocumentMBS.LoadFromFile(file)

If doc = Nil Then
MessageBox "Failed to load PDF."
Return
End If

Var options As New WindowsPDFPageRenderOptionsMBS
options.DestinationWidth = 800 // height is calculated to keep the aspect ratio
options.BackgroundColor = &cFFFFFF

Var pic As Picture = doc.Page(0).RenderToPicture(options)
MessageBox doc.PageCount.ToString + " pages"
// show pic in a Canvas or ImageViewer
```

Notes: Methods of this class return an STG_E_READFAULT error if there is a problem in reading the Portable Document Format (PDF) document.

- 21.5, page 10: News

218.1.2 Methods

218.1.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
See also:

- 218.1.4 Constructor(other as WindowsPDFDocumentMBS) 25170

218.1.4 Constructor(other as WindowsPDFDocumentMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The copy constructor.
See also:

- 218.1.3 Constructor 25170

218.1.5 ConvertImage(ImageData as String) as String

MBS WinFrameworks Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Converts a picture to PNG.
Example:

```
// read in a HEIC image
Var f as FolderItem = SpecialFolder.Desktop.Child("IMG_4609.HEIC")
Var b as BinaryStream = BinaryStream.Open(f)
```

```
Var s as string = b.Read(b.Length)

// convert to PNG
Var p as string = WindowsPDFDocumentMBS.ConvertImage(s)

// and write out as PNG file
Var o as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var c as BinaryStream = BinaryStream.Create(o, true)
c.Write p
c.close

o.Launch
```

Notes: This is a little utility function to use Windows' built-in image encoders and decoders to convert various image formats like HEIF/HEIC to a PNG image.
Returns new image as string with bytes of PNG image.

218.1.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

218.1.7 LoadFromData(data as MemoryBlock, Password as String = "") as WindowsPDFDocumentMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from data in Memoryblock synchronously.
Notes: Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method raises an exception reporting an ERROR_WRONG_PASSWORD (1323) error if the wrong password is specified.
See also:

- 218.1.8 LoadFromData(data as String, Password as String = "") as WindowsPDFDocumentMBS 25172

218.1.8 LoadFromData(data as String, Password as String = "") as WindowsPDFDocumentMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from data in string synchronously.
Notes: Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method raises an exception reporting an ERROR_WRONG_PASSWORD (1323) error if the wrong password is specified.
See also:

- 218.1.7 LoadFromData(data as MemoryBlock, Password as String = "") as WindowsPDFDocumentMBS 25171

218.1.9 LoadFromDataAsync(data as MemoryBlock, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "")

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from data in MemoryBlock asynchronously.
Notes: Calls the given delegate later.

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method reports an ERROR_WRONG_PASSWORD (1323) error via delegate if the wrong password is specified.
See also:

- 218.1.10 LoadFromDataAsync(data as String, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "") 25172

218.1.10 LoadFromDataAsync(data as String, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "")

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from data in string asynchronously.
Notes: Calls the given delegate later.

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method reports an ERROR_WRONG_PASSWORD (1323) error via delegate if the wrong password is specified.
See also:

- 218.1.9 LoadFromDataAsync(data as MemoryBlock, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "") 25172

218.1.11 LoadFromFile(File as FolderItem, Password as String = "") as WindowsPDFDocumentMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from folderitem synchronously.
Notes: Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method raises an exception reporting an ERROR_WRONG_PASSWORD (1323) error if the wrong password is specified.

218.1.12 LoadFromFileAsync(File as FolderItem, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "")

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from folderitem asynchronously.
Notes: Calls the given delegate later.

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method reports an ERROR_WRONG_PASSWORD (1323) error via delegate if the wrong password is specified.

218.1.13 LoadFromPath(Path as String, Password as String = "") as WindowsPDFDocumentMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from path synchronously.
Notes: Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method raises an exception reporting an ERROR_WRONG_PASSWORD (1323) error if the wrong password is specified.

218.1.14 LoadFromPathAsync(Path as String, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "")

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from path asynchronously.
Notes: Calls the given delegate later.

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method reports an ERROR_WRONG_PASSWORD (1323) error via delegate if the wrong password is specified.

218.1.15 Page(Index as Integer) as WindowsPDFPageMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a page from a Portable Document Format (PDF) document.
Notes: The location of the Portable Document Format (PDF) page relative to its parent document. Starts at zero.

218.1.16 Properties

218.1.17 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

218.1.18 IsPasswordProtected as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets whether the Portable Document Format (PDF) document is password-protected.
Notes: True if the Portable Document Format (PDF) document is password-protected; otherwise, false.
(Read only property)

218.1.19 PageCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of pages in the Portable Document Format (PDF) document.
Notes: (Read only property)

218.1.20 Yield as Boolean

MBS WinFrameworks Plugin, Plugin Version: 25.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to yield to other Xojo threads.
Notes: If true allows other cooperative threads to run in the background.
(Read and Write property)

218.1.21 Delegates

218.1.22 WindowsPDFDocumentLoadedMBS(ErrorMessage as String, ErrorCode as Integer, document as WindowsPDFDocumentMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The delegate called when loading finished.

218.2 class WindowsPDFExceptionMBS

218.2.1 class WindowsPDFExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: The class for exceptions in PDF engine.
Notes: Subclass of the RuntimeException class.

- 21.5, page 72: Windows PDF, New MBS classes let you work with PDFS on Windows. by Stefanie Juchmes

218.3 class WindowsPDFPageDimensionsMBS

218.3.1 class WindowsPDFPageDimensionsMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents the dimensions of a single page in a Portable Document Format (PDF) document.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Xojo Developer Magazine

- 21.5, pages 72 to 73: Windows PDF, New MBS classes let you work with PDFS on Windows. by Stefanie Juchmes

218.3.2 Methods

218.3.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

218.3.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

218.3.5 Properties

218.3.6 ArtBox as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries art box.
Notes: Gets the size of a rectangle that contains the Portable Document Format (PDF) page's contents, including any meaningful surrounding white space, as intended by the Portable Document Format (PDF)

page's creator.
(Read only property)

218.3.7 BleedBox as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries bleed box.
Notes: Gets the size of a rectangle that specifies the clipped region of a Portable Document Format (PDF) page's contents when it is displayed.
(Read only property)

218.3.8 CropBox as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries crop box.
Notes: Gets the size of a rectangle that specifies the cropped region of a Portable Document Format (PDF) page's contents when it is displayed.
(Read only property)

218.3.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

218.3.10 MediaBox as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries media box.
Notes: Gets the size of a rectangle that defines the boundaries of the area that the Portable Document Format (PDF) page will be displayed or printed to.
(Read only property)

218.3.11 TrimBox as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries trim box.
Notes: Gets the size of a rectangle that specifies the intended dimensions of the Portable Document Format (PDF) page after it has been trimmed.
(Read only property)

218.4 class WindowsPDFPageMBS

218.4.1 class WindowsPDFPageMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a single page in a Portable Document Format (PDF) document.
Example:

```
// render the first page of a PDF with the PDF engine built into Windows 10 and newer
Var doc As WindowsPDFDocumentMBS = WindowsPDFDocumentMBS.LoadFromFile(SpecialFolder.Desktop.Child("test.pdf"))
If doc = Nil Or doc.PageCount = 0 Then Return

Var page As WindowsPDFPageMBS = doc.Page(0)
Var pic As Picture = page.RenderToPicture
MessageBox "Page 1 of " + doc.PageCount.ToString + ": " + pic.Width.ToString + " x " + pic.Height.ToString + " pixels"
// show pic in a Canvas or ImageViewer
```

- 21.5, pages 72 to 73: Windows PDF, New MBS classes let you work with PDFS on Windows. by Stefanie Juchmes

218.4.2 Methods

218.4.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
See also:

- 218.4.4 Constructor(other as WindowsPDFPageMBS) 25181

218.4.4 Constructor(other as WindowsPDFPageMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The copy constructor.
See also:

- 218.4.3 Constructor 25180

218.4.5 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

218.4.6 RenderToMemory(Handler as RenderToMemoryFinishedMBS, Options as WindowsPDFPageRenderOptionsMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 24.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Requests asynchronous rendering of the page.
Notes: Calls the handler delegate later with results (or error code).
Produces a MemoryBlock with image data, which you can pass to Picture.FromData to get as picture.

Asynchronous mode will perform the work on a different thread in the background.
See also:

- 218.4.7 RenderToMemory(Options as WindowsPDFPageRenderOptionsMBS = nil) as MemoryBlock 25181

218.4.7 RenderToMemory(Options as WindowsPDFPageRenderOptionsMBS = nil) as MemoryBlock

MBS WinFrameworks Plugin, Plugin Version: 24.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Outputs a stream of data, which represents a Portable Document Format (PDF) page's contents as image.
Notes: Takes a set of display settings, applies them to the output of a Portable Document Format (PDF)

page's contents, and creates a stream with the customized, rendered output as an synchronous action. This asynchronous action can be used to create a customized display image of the Portable Document Format (PDF) page.

Please call RenderToStream if you need image as string, call RenderToMemory if you need a MemoryBlock and call RenderToPicture if you need a picture.
See also:

- 218.4.6 RenderToMemory(Handler as RenderToMemoryFinishedMBS, Options as WindowsPDFPageRenderOptionsMBS = nil) 25181

218.4.8 RenderToPicture(Options as WindowsPDFPageRenderOptionsMBS = nil) as Picture

MBS WinFrameworks Plugin, Plugin Version: 24.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Outputs a stream of data, which represents a Portable Document Format (PDF) page's contents as image.
Example:

```
Var page As WindowsPDFPageMBS = List.RowTagAt(index)
Var options As New WindowsPDFPageRenderOptionsMBS

if out.Width >out.Height then
options.DestinationWidth = out.Width * 2
else
options.DestinationHeight = out.Height * 2
end if

options.setBitmapEncoderJPEG

currentimage = page.RenderToPicture(options)
out.Refresh // refresh canvas to show the picture
```

Notes: Takes a set of display settings, applies them to the output of a Portable Document Format (PDF) page's contents, and creates a stream with the customized, rendered output as an synchronous action. Provides the resulting stream as picture for Xojo.

Please call RenderToStream if you need image as string, call RenderToMemory if you need a MemoryBlock and call RenderToPicture if you need a picture.

218.4.9 RenderToStream(Handler as RenderToStreamFinishedMBS, Options as WindowsPDFPageRenderOptionsMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 24.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Requests asynchronous rendering of the page.
Example:

```
Var page As WindowsPDFPageMBS // current page
page.RenderToStream AddressOf RenderToStreamFinished
```

Notes: Calls the handler delegate later with results (or error code).
Produces a string with the image data.

Asynchronous mode will perform the work on a different thread in the background.
See also:

- 218.4.10 RenderToStream(Options as WindowsPDFPageRenderOptionsMBS = nil) as String 25183

218.4.10 RenderToStream(Options as WindowsPDFPageRenderOptionsMBS = nil) as String

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Outputs a stream of data, which represents a Portable Document Format (PDF) page's contents as image.
Example:

```
Var page As WindowsPDFPageMBS // your page
Var options As New WindowsPDFPageRenderOptionsMBS

if out.Width >out.Height then
options.DestinationWidth = out.Width * 2
else
options.DestinationHeight = out.Height * 2
end if

options.setBitmapEncoderJPEG

Var data as string = page.RenderToStream(options)
if data.Bytes >0 then
currentimage = Picture.FromData(data)
out.Refresh // refresh canvas to show the picture
end if
```

Notes: Takes a set of display settings, applies them to the output of a Portable Document Format (PDF)

page's contents, and creates a stream with the customized, rendered output as an synchronous action. This asynchronous action can be used to create a customized display image of the Portable Document Format (PDF) page.

Please call RenderToStream if you need image as string, call RenderToMemory if you need a MemoryBlock and call RenderToPicture if you need a picture.
See also:

- 218.4.9 RenderToStream(Handler as RenderToStreamFinishedMBS, Options as WindowsPDFPageRenderOptionsMBS = nil) 25183

218.4.11 Properties

218.4.12 Dimensions as WindowsPDFPageDimensionsMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the group of dimension properties for a single page in a Portable Document Format (PDF) document.
Notes: (Read only property)

218.4.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

218.4.14 Index as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the relative position of the Portable Document Format (PDF) page within its parent Portable Document Format (PDF) document.
Notes: Return the position of the Portable Document Format (PDF) page relative to its parent Portable Document Format (PDF) document.

The first page of a Portable Document Format (PDF) document is index 0 (zero).
(Read only property)

218.4.15 IsRendering as Boolean

MBS WinFrameworks Plugin, Plugin Version: 25.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: True if some page is rendering.
Notes: This checks if one of the various Render functions is active.
(Read only property)

218.4.16 PreferredZoom as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Portable Document Format (PDF) page's preferred magnification factor.
Notes: (Read only property)

218.4.17 Rotation as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the constant that the Portable Document Format (PDF) page will be rotated when it's displayed or printed.
Notes: See RotationRotate* constants.
Degrees are expressed relative to a clockwise rotation. Degrees are expressed in multiples of 90.
(Read only property)

218.4.18 RotationAngle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of degrees that the Portable Document Format (PDF) page will be rotated when it's displayed or printed.
Notes: Returns angle from 0 to 360¬∞.
(Read only property)

218.4.19 Size as WindowsPDFSizeMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Portable Document Format (PDF) page's size based on its related CropBox, MediaBox, and Rotation property values.
Notes: (Read only property)

218.4.20 Yield as Boolean

MBS WinFrameworks Plugin, Plugin Version: 25.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to yield to other Xojo threads.
Notes: If true allows other cooperative threads to run in the background.
(Read and Write property)

218.4.21 Constants

Rotations

Constant	Value	Description
RotationNormal	0	No rotation.
RotationRotate180	2	A 180-degree rotation.
RotationRotate270	3	A 270-degree rotation.
RotationRotate90	1	A 90-degree rotation.

218.4.22 Delegates

218.4.23 RenderToMemoryFinishedMBS(ErrorMessage as String, ErrorCode as Integer, Data as MemoryBlock)

MBS WinFrameworks Plugin, Plugin Version: 24.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The delegate called when rendering of a page finished.

218.4.24 RenderToStreamFinishedMBS(ErrorMessage as String, ErrorCode as Integer, Data as String)

MBS WinFrameworks Plugin, Plugin Version: 24.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The delegate called when rendering of a page finished.

218.5 class WindowsPDFPageRenderOptionsMBS

218.5.1 class WindowsPDFPageRenderOptionsMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents display settings for a single page of a Portable Document Format (PDF) document, such as the page's background color and its encoding type.
Example:

```
// render a PDF page as 800 pixels wide picture with a light gray background on Windows
Var doc As WindowsPDFDocumentMBS = WindowsPDFDocumentMBS.LoadFromFile(SpecialFolder.Desktop.Child("test.pdf"))
If doc = Nil Or doc.PageCount = 0 Then Return

Var options As New WindowsPDFPageRenderOptionsMBS
options.DestinationWidth = 800 // height follows the aspect ratio
options.BackgroundColor = &cF0F0F0

Var pic As Picture = doc.Page(0).RenderToPicture(options)
```

218.5.2 Methods

218.5.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: Creates and initializes a new instance of display settings for a single page of a Portable Document Format (PDF) document.

218.5.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

218.5.5 setBitmapEncoderBMP

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets encoding type to BMP.

218.5.6 setBitmapEncoderJPEG

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets encoding type to JPEG.

218.5.7 setBitmapEncoderPNG

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets encoding type to PNG.

218.5.8 setBitmapEncoderTIFF

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets encoding type to TIFF.

218.5.9 Properties

218.5.10 BackgroundColor as Color

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the Portable Document Format (PDF) page's background color.
Notes: The default background color is White.
(Read and Write property)

218.5.11 BitmapEncoderId as String

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the Portable Document Format (PDF) page's encoding type to be used while the page is being converted to a bitmap.
Notes: (Read and Write property)

218.5.12 DestinationHeight as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the final size of the rendering of the Portable Document Format (PDF) page in device-independent pixels (DIPs).
Notes: The value for DestinationHeight is the final size of the rendered page. If DestinationHeight is not specified, the page's aspect ratio is maintained relative to the destination width.
(Read and Write property)

218.5.13 DestinationWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the final size of the rendering of the Portable Document Format (PDF) page in device-independent pixels (DIPs).
Notes: The value for DestinationWidth is the final size of the rendered page. If DestinationWidth is not specified, the page's aspect ratio is maintained relative to the destination height.
(Read and Write property)

218.5.14 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

218.5.15 IsIgnoringHighContrast as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets whether the Portable Document Format (PDF) page uses the system's high contrast display setting.

Notes: (Read and Write property)

218.5.16 SourceRect as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets a portion of the Portable Document Format (PDF) page to be displayed.
Notes: (Read and Write property)

218.6 class WindowsPDFRectMBS

218.6.1 class WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a rectangle.

218.6.2 Properties

218.6.3 Height as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Height of rectangle.
Notes: (Read and Write property)

218.6.4 Width as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Width of rectangle.
Notes: (Read and Write property)

218.6.5 X as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The x origin position.
Notes: (Read and Write property)

218.6.6 Y as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The y origin position.
Notes: (Read and Write property)

218.7 class WindowsPDFSizeMBS

218.7.1 class WindowsPDFSizeMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a size.
Blog Entries

218.7.2 Properties

218.7.3 Height as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Height of rectangle.
Notes: (Read and Write property)

218.7.4 Width as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Width of rectangle.
Notes: (Read and Write property)

Chapter 219

Windows Photos

219.1 class WinPhotoAcquireDeviceSelectionDialogMBS

219.1.1 class WinPhotoAcquireDeviceSelectionDialogMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Provides a dialog box for selecting the device to acquire images from.
Example:

```
// let the user choose a camera or phone to import photos from on Windows
Var dialog As New WinPhotoAcquireDeviceSelectionDialogMBS
dialog.Title = "Import Photos"
dialog.SubmitButtonText = "Import"

Var deviceID As String
Var deviceType As Integer
If dialog.ShowModal(Self, WinPhotoAcquireDeviceSelectionDialogMBS.DeviceFlagAllDevices, deviceID, deviceType) Then
MessageBox "Selected device: " + deviceID + " (type " + deviceType.ToString + ")"
// import with WinPhotoAcquireMBS.CreatePhotoSource(deviceID)
End If
```

- MBS Xojo Plugins, version 20.3pr6

219.1.2 Methods

219.1.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.

219.1.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

219.1.5 ShowModal(Window as DesktopWindow, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Displays a device selection dialog box.
Notes: The function returns when the user selects a device using the modal dialog box.

Window: The parent window.
DeviceFlags: Integer value containing a combination of device flags that indicate which type of devices to display. The device flags may be a combination of any of the DeviceFlags constants.

DeviceId: A string containing the ID of the selected device.
DeviceType: The type of the selected device.

Returns true if default button was clicked and a device selected.
See also:

- 219.1.6 ShowModal(Window as Window, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean 25196
- 219.1.7 ShowModal(WindowHandle as Integer, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean 25197

219.1.6 ShowModal(Window as Window, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Displays a device selection dialog box.
Notes: The function returns when the user selects a device using the modal dialog box.

Window: The parent window.
DeviceFlags: Integer value containing a combination of device flags that indicate which type of devices to display. The device flags may be a combination of any of the DeviceFlags constants.

DeviceId: A string containing the ID of the selected device.
DeviceType: The type of the selected device.

Returns true if default button was clicked and a device selected.
See also:

- 219.1.5 ShowModal(Window as DesktopWindow, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean 25196

219.1.7 ShowModal(WindowHandle as Integer, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Displays a device selection dialog box.
Notes: The function returns when the user selects a device using the modal dialog box.

WindowHandle: Handle to a parent window.
DeviceFlags: Integer value containing a combination of device flags that indicate which type of devices to display. The device flags may be a combination of any of the DeviceFlags constants.

DeviceId: A string containing the ID of the selected device.
DeviceType: The type of the selected device.

Returns true if default button was clicked and a device selected.
See also:

219.1.8 Properties

219.1.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

219.1.10 SubmitButtonText as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The text displayed in the dialog box that prompts the user to select a device.
Notes: (Read and Write property)

219.1.11 Title as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The title of the device selection dialog box.
Notes: (Read and Write property)

219.1.12 Constants

Device Flags

Constant	Value	Description
DeviceFlagAllDevices	&hFFFF	Show all devices.
DeviceFlagCPLMode	&h10000	Show CPL devices.
DeviceFlagDVDevices	64	Show digital video camera devices.
DeviceFlagFSDevices	32	Show removable storage devices, such as CD drives or card readers.
DeviceFlagShowOffline	&h20000	Show devices that are offline. Not supported by all device types.
DeviceFlagSTIDevcies	8	Show devices of type Still Image Architecture (STI).
DeviceFlagTWAINDevices	16	Show TWAIN devices.
DeviceFlagWIACameras	2	Show cameras of type Windows Image Acquisition (WIA).
DeviceFlagWIAScanners	4	Show scanners of type Windows Image Acquisition (WIA).
DeviceFlagWPDDevices	1	Show devices of type Windows Portable Devices (WPD).

Device Types

Constant	Value	Description
DeviceTypeDV	6	DV device.
DeviceTypeFS	5	Specifies that the selected device is a removable drive in the file system.
DeviceTypeSTI	3	Specifies that the type of the selected device is Still Image Architecture (STI).
DeviceTypeTWAIN	4	TWAIN device
DeviceTypeUnknown	0	pecifies that the type of the selected device is unknown.
DeviceTypeWIA	2	Specifies that the type of the selected device is Windows Image Acquisition (WIA).
DeviceTypeWPD	1	Specifies that the type of the selected device is Windows Portable Devices (WPD).

219.2 class WinPhotoAcquireItemMBS

219.2.1 class WinPhotoAcquireItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The WinPhotoAcquireItemMBS interface provides methods for working with items as they are acquired from a device.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Windows Photos Acquire
- MBS Xojo Plugins, version 20.3pr6

219.2.2 Methods

219.2.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

219.2.4 Data as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Reads the data from the file and returns it.

219.2.5 Delete

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Delete method deletes an item.

219.2.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

219.2.7 PropertyKeyCameraSequenceNumber as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The camera sequence number.

219.2.8 PropertyKeyDuplicateDetectionID as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The duplicate detection ID.

219.2.9 PropertyKeyFinalFilename as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The final file name.

219.2.10 PropertyKeyGroupTag as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The group tag.

219.2.11 PropertyKeyIntermediateFile as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The intermediate path name.

219.2.12 PropertyKeyOriginalFilename as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The original path name.

219.2.13 PropertyKeyRelativePathname as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The relative path name.

219.2.14 PropertyKeySkipImport as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: Whether to skip import.

219.2.15 PropertyKeyTransferResult as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The transfer result.

219.2.16 SubItem(Index as Integer) as WinPhotoAcquireItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves a subitem of an item, given the index of the subitem.
Notes: Index: Integer containing the index of the item. Range from 0 to SubItemCount-1.

219.2.17 Thumbnail(width as Integer, Height as Integer) as Picture

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the thumbnail provided for an item.
Notes: Width and height specify the size of the thumbnail.

219.2.18 Properties

219.2.19 CanDelete as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The CanDelete method indicates whether an item may be deleted.
Notes: Indicates that the item can be deleted.
(Read only property)

219.2.20 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

219.2.21 ItemName as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the file name for an item.
Notes: The file name consists of the display name and the extension, even if the Hide extensions for known file types setting is checked in the Windows Folder Options dialog box.
(Read only property)

219.2.22 SubItemCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the number of subitems contained in an item.
Notes: (Read only property)

219.2.23 PropertyValue(key as string) as Variant

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Get or set a property for an item.
Notes: key: Specifies a key for the property to set.

The value is converted to/from variant.
(Read and Write computed property)

219.3 class WinPhotoAcquireMBS

219.3.1 class WinPhotoAcquireMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: This class provides methods for acquiring photos from a device.
Example:

```
// import photos from a device with the Windows import dialog
// deviceID is from WinPhotoAcquireDeviceSelectionDialogMBS
Var deviceID As String // your device
Var acquire As New WinPhotoAcquireMBS
Var source As WinPhotoAcquireSourceMBS = acquire.CreatePhotoSource(deviceID)
If source = Nil Then Return

acquire.Acquire(source, True, Self, "MyApp", Nil) // show progress, no callback
For Each path As String In acquire.Results
System.DebugLog "Imported " + path
Next
```

219.3.2 Methods

219.3.3 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindow as DesktopWindow, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The Acquire method acquires photos from a device.
Notes: PhotoAcquireSource: Pointer to an WinPhotoAcquireSourceMBS object representing the device from which to acquire photos. Initialize this object by calling CreatePhotoSource.
ShowProgress: Flag that, when set to true, indicates that a progress dialog will be shown.
Window: The parent window.
ApplicationName: string containing the application name.
PhotoAcquireProgresCallback: Pointer to an optional WinPhotoAcquireProgressCallBackMBS object. Can

be nil.

To initialize the PhotoAcquireSource parameter passed to Acquire, CreatePhotoSource should be called prior to calling Acquire.
PhotoAcquireProgresCallback provides callback methods that allow you to apply further filtering or control as items are acquired.
To verify that there are items in the device before acquisition, or to selectively acquire items from the device, call InitializeItemList to enumerate the items before calling Acquire.

219.3.4 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindow as Window, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Acquire method acquires photos from a device.
Notes: PhotoAcquireSource: Pointer to an WinPhotoAcquireSourceMBS object representing the device from which to acquire photos. Initialize this object by calling CreatePhotoSource.
ShowProgress: Flag that, when set to true, indicates that a progress dialog will be shown.
Window: The parent window.
ApplicationName: string containing the application name.
PhotoAcquireProgresCallback: Pointer to an optional WinPhotoAcquireProgressCallBackMBS object. Can be nil.

To initialize the PhotoAcquireSource parameter passed to Acquire, CreatePhotoSource should be called prior to calling Acquire.
PhotoAcquireProgresCallback provides callback methods that allow you to apply further filtering or control as items are acquired.
To verify that there are items in the device before acquisition, or to selectively acquire items from the device, call InitializeItemList to enumerate the items before calling Acquire.

- 219.3.5 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindowHandle as Integer, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS) 25207

219.3.5 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindowHandle as Integer, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Acquire method acquires photos from a device.
Notes: PhotoAcquireSource: Pointer to an WinPhotoAcquireSourceMBS object representing the device from which to acquire photos. Initialize this object by calling CreatePhotoSource.
ShowProgress: Flag that, when set to true, indicates that a progress dialog will be shown.
WindowHandle: The parent window handle.
ApplicationName: string containing the application name.
PhotoAcquireProgresCallback: Pointer to an optional WinPhotoAcquireProgressCallBackMBS object. Can be nil.

To initialize the PhotoAcquireSource parameter passed to Acquire, CreatePhotoSource should be called prior to calling Acquire.
PhotoAcquireProgresCallback provides callback methods that allow you to apply further filtering or control as items are acquired.
To verify that there are items in the device before acquisition, or to selectively acquire items from the device, call InitializeItemList to enumerate the items before calling Acquire.

- 219.3.4 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindow as Window, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS) 25206

219.3.6 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.

219.3.7 CreatePhotoSource(Device as String) as WinPhotoAcquireSourceMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: CreatePhotoSource method initializes an WinPhotoAcquireSourceMBS object to pass to Acquire method.
Notes: Device: The device name/ID.

Returns the initialized photo source to acquire photos from.

219.3.8 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

219.3.9 Results as String()

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the paths of all files successfully transferred during the most recent call to Acquire.
Notes: If the file transfer is aborted before any files are transferred, the result is nil.

219.3.10 Properties

219.3.11 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

219.4 class WinPhotoAcquireOptionsDialogMBS

219.4.1 class WinPhotoAcquireOptionsDialogMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The standard dialog to show for options.
Notes: The WinPhotoAcquireOptionsDialogMBS interface is used to display an options dialog box in which the user can select photo acquisition settings such as file name formats, as well as whether or not to rotate images, to prompt for a tag name, or to erase photos from the camera after importing.

219.4.2 Methods

219.4.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.
Notes: Please call Initialize.

219.4.4 Create(Window as DesktopWindow) as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The Create method creates and displays a modeless instance of the photo options dialog box, hosted within a parent window.
Notes: This method is for advanced users, which can position the new window via declares.

Window: The parent window.

Returns the handle for the created dialog box.

The Initialize method should be called prior to the Create method.
The parent window provides OK and Cancel buttons to the new dialog box instance.
See also:

- 219.4.5 Create(Window as Window) as Integer 25210
- 219.4.6 Create(WindowHandle as Integer) as Integer 25210

219.4.5 Create(Window as Window) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Create method creates and displays a modeless instance of the photo options dialog box, hosted within a parent window.
Notes: This method is for advanced users, which can position the new window via declares.

Window: The parent window.

Returns the handle for the created dialog box.

The Initialize method should be called prior to the Create method.
The parent window provides OK and Cancel buttons to the new dialog box instance.
See also:

- 219.4.4 Create(Window as DesktopWindow) as Integer 25209
- 219.4.6 Create(WindowHandle as Integer) as Integer 25210

219.4.6 Create(WindowHandle as Integer) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Create method creates and displays a modeless instance of the photo options dialog box, hosted within a parent window.
Notes: This method is for advanced users, which can position the new window via declares.

WindowHandle: Handle to the parent window.

Returns the handle for the created dialog box.

The Initialize method should be called prior to the Create method.
The parent window provides OK and Cancel buttons to the new dialog box instance.
See also:

- 219.4.4 Create(Window as DesktopWindow) as Integer 25209
- 219.4.5 Create(Window as Window) as Integer 25210

219.4.7 Destroy

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Destroy method closes and destroys the modeless dialog box created with the Create method.
Notes: If you destroy the parent window, the child window will automatically be destroyed.

219.4.8 Initialize(RegistryRoot as String = "")

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Initializes the options dialog box and reads any saved options from the registry.
Notes: Initialize must be called prior to calling Create or DoModal. Failure to do so will cause Create or DoModal to fail.
If Initialize is called while the options dialog box is already displayed, an error will be returned.

RegistryRoot: (optional) String containing the registry root of a custom location to read the acquisition settings from. If this parameter is set to "", the default location will be used.

219.4.9 SaveData

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The SaveData method saves acquisition settings from the options dialog box to the registry so that a subsequent instance of the dialog can be initialized with the same settings.

219.4.10 ShowModal(Window as Window) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The DoModal method creates and displays the options dialog box as a modal dialog box.
Notes: Window: The dialog's parent window.
Returns the code returned when the window is closed.

The modal dialog displayed by DoModal will have OK and Cancel buttons, whereas the OK and Cancel buttons of the modeless dialog displayed by Create must be provided by the parent window.
See also:

- 219.4.11 ShowModal(WindowHandle as Integer) as Integer 25212

219.4.11 ShowModal(WindowHandle as Integer) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The DoModal method creates and displays the options dialog box as a modal dialog box.
Notes: WindowHandle: Handle to the dialog's parent window.
Returns the code returned when the window is closed.

The modal dialog displayed by DoModal will have OK and Cancel buttons, whereas the OK and Cancel buttons of the modeless dialog displayed by Create must be provided by the parent window.
See also:

- 219.4.10 ShowModal(Window as Window) as Integer 25211

219.4.12 Properties

219.4.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

219.5 class WinPhotoAcquireProgressCallBackMBS

219.5.1 class WinPhotoAcquireProgressCallBackMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The WinPhotoAcquireProgressCallBackMBS interface may be implemented if you wish to do extra processing at various stages in the acquisition process.
Blog Entries

- Windows Photos Acquire
- MBS Xojo Plugins, version 20.3pr6

219.5.2 Methods

219.5.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.

219.5.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

219.5.5 Properties

219.5.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

219.5.7 Events

219.5.8 Cancelled(byref Cancelled as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Cancelled method provides extended functionality when a cancellation occurs during an acquisition session.
Notes: The application provides the implementation of the Cancelled method.

Cancelled: a flag that, when set to true, indicates that the operation was canceled.

219.5.9 DirectoryCreated(Directory as String)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The DirectoryCreated method provides extended functionality when a destination directory is created during the acquisition process.
Notes: The application provides the implementation of the DirectoryCreated method.

Directory: containing the directory.

219.5.10 EndDelete(Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The EndDelete method provides extended functionality when deletion of files from the image source is complete.
Notes: The application provides the implementation of the EndDelete method.

Result: Specifies the result of the delete operation.

219.5.11 EndEnumeration(Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The EndEnumeration method provides extended functionality when enumeration of files from the image source is complete.
Notes: The application provides the implementation of the EndEnumeration method.
Result: Specifies the result of the enumeration operation.

219.5.12 EndItemDelete(ItemIndex as Integer, Item as WinPhotoAcquireItemMBS, Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The EndItemDelete method provides extended functionality each time a file is deleted from the image source.
Notes: The application provides the implementation of the EndItemDelete method.

ItemIndex: Integer value containing the item index.
Item: To the deleted WinPhotoAcquireItemMBS object.
Result: Specifies the result of the delete operation.

219.5.13 EndItemTransfer(ItemIndex as Integer, Item as WinPhotoAcquireItemMBS, Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The EndItemTransfer method provides extended functionality each time a file is transferred from the image source.
Notes: The application provides the implementation of the EndItemTransfer method.

ItemIndex: Integer value containing the item index.
Item: Pointer to a photo acquire item object.
Result: Specifies the result of the transfer operation.

219.5.14 EndSession(Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The EndSession method provides extended functionality when an acquisition session is completed.
Notes: The application provides the implementation of the EndSession method.

219.5.15 EndTransfer(Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The EndTransfer method provides extended functionality when the transfer of all files is complete.
Notes: The application provides the implementation of the EndTransfer method.

Result: Specifies the result of the transfer.

219.5.16 ErrorAdvise(Result as Integer, ErrorMessage as String, MessageType as Integer, byref ErrorAdviseResult as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The ErrorAdvise method provides custom error handling for errors that occur during acquisition.
Notes: The application provides the implementation of the ErrorAdvise method.

Result: Specifies the error that occurred.
ErrorMessage: the error message.
MessageType: What type of message. May be one of the following:

Value	Description
AdviseMessageTypeSkipRetryCancel	Specifies that the error that occurred requires a Skip, Retry, or Cancel response. The ErrorAdviseResult parameter must be set to one of the following: AdviseResultSkip, AdviseResultSkipAll, AdviseResultRetry, or AdviseResultAbort.
AdviseMessageTypeRetryCancel	Specifies that the error that occurred requires a Retry or Cancel response. The ErrorAdviseResult parameter must be set to one of the following: AdviseResultRetry or AdviseResultAbort.
AdviseMessageTypeYesNo	Specifies that the error that occurred requires a Yes or No response. The ErrorAdviseResult parameter must be set to one of the following: AdviseResultYes or AdviseResultNo.
AdviseMessageTypeOK	Specifies that the error that occurred requires an OK response. The ErrorAdviseResult parameter must be set to AdviseResultOK.

ErrorAdviseResult: an integer value containing the error advise result. The result should be one of the acceptable types indicated by the MessageType parameter, and must be one of the following:

Value	Description
AdviseResultYes	Specifies a Yes response. Valid if MessageType is AdviseMessageTypeYesNo.
AdviseResultNo	Specifies a No response. Valid if MessageType is AdviseMessageTypeYesNo.
AdviseResultOK	Specifies an OK response. Valid if MessageType is AdviseMessageTypeOK.
AdviseResultSkip	Specifies a Skip response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel.
AdviseResultSkipAll	Specifies a Skip All response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel.
AdviseResultRetry	Specifies a Retry response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel or AdviseMessageTypeRetryCancel.
AdviseResultAbort	Specifies a Cancel response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel or AdviseMessageTypeRetryCancel.

219.5.17 FoundItem(Item as WinPhotoAcquireItemMBS) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The FoundItem method provides extended functionality each time an item is found during enumeration of items from the device.
Notes: This method can be used to exclude an item from the list of items to acquire. The application provides the implementation of the FoundItem method.

Return true to exclude the item from the results of the enumeration. This would allow the caller to exclude videos or camera raw files, for instance.

219.5.18 GetDeleteAfterAcquire(byref DeleteAfterAcquire as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The GetDeleteAfterAcquire method returns a value indicating whether photos should be deleted after acquisition.
Notes: DeleteAfterAcquire: When set to true, indicates that photos should be deleted after acquisition.

219.5.19 GetUserInput(UserInput as WinUserInputStringMBS, byref Result as Variant, DefaultValue as Variant)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The GetUserInput method overrides the default functionality that displays a message prompting the user for string input during acquisition.
Notes: The application provides the implementation of the GetUserInput method.

Result: Variant representing the descriptive input to be obtained.
DefaultValue: Variant representing the default value of the input being requested.

If this method is implemented, the implementation should copy the value of the DefaultValue argument to the Result parameter.

If the progress dialog box is suppressed in Acquire, this method must be implemented in order to assign a default value to the Result parameter. Normally a value is supplied to Result in the course of prompting the user with the default dialog, but when the dialog is suppressed, the application must copy the value of the DefaultValue argument to the Result parameter.

219.5.20 StartDelete(Source as WinPhotoAcquireSourceMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The StartDelete method provides extended functionality when deletion of items from the device begins.
Notes: The implementation of StartDelete is provided by the application.

Source: the WinPhotoAcquireSourceMBS that items are being deleted from.

219.5.21 StartEnumeration(Source as WinPhotoAcquireSourceMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The StartEnumeration method provides extended functionality when the enumeration of items to acquire begins.
Notes: The application provides the implementation of the StartEnumeration method.

Source: the WinPhotoAcquireSourceMBS object that items are being enumerated from.

219.5.22 StartItemDelete(ItemIndex as Integer, Item as WinPhotoAcquireItemMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The StartItemDelete method provides extended functionality each time the deletion of an individual item from the device begins.
Notes: The application provides the implementation of the StartItemDelete method.

ItemIndex: Integer value containing the item index in the list of items to delete.
Item: The WinPhotoAcquireItemMBS object that is being deleted.

219.5.23 StartItemTransfer(ItemIndex as Integer, Item as WinPhotoAcquireItemMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The StartItemTransfer method provides extended functionality each time the transfer of an item begins.
Notes: The application provides the implementation of the StartItemTransfer method.

ItemIndex: Integer value containing the item index in the list of items to transfer.
Item: the WinPhotoAcquireItemMBS object that is to be transferred.

219.5.24 StartTransfer(Source as WinPhotoAcquireSourceMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The StartTransfer method provides additional processing when transfer of items from the device begins.
Notes: The application provides the implementation of the StartTransfer method.

219.5.25 UpdateDeletePercent(Percent as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The UpdateDeletePercent method provides extended functionality when the percentage of items deleted changes.
Notes: The application provides the implementation of the UpdateDeletePercent method.

Percent: Integer value containing the percentage of items deleted.

219.5.26 UpdateTransferPercent(Overall as Boolean, Percent as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The UpdateTransferPercent method provides extended functionality when the percentage of items transferred changes.
Notes: The application provides the implementation of the UpdateTransferPercent method.

Overall: Flag that, when set to TRUE, indicates that the value contained in nPercent is a percentage of the overall transfer progress, rather than a percentage of an individual item's progress.
Percent: Integer value containing the percentage of items transferred.

219.5.27 Constants

Advise Message Types

Constant	Value	Description
AdviseMessageTypeOK	3	Specifies that the error that occurred requires an OK response. The Error viseResult parameter must be set to AdviseResultOK.
AdviseMessageTypeRetryCancel	1	Specifies that the error that occurred requires a Skip, Retry, or Cancel respo The ErrorAdviseResult parameter must be set to one of the following: Ad eResultSkip, AdviseResultSkipAll, AdviseResultRetry, or AdviseResultAb
AdviseMessageTypeSkipRetryCancel	0	Specifies that the error that occurred requires a Retry or Cancel response. ErrorAdviseResult parameter must be set to one of the following: Advise sultRetry or AdviseResultAbort.
AdviseMessageTypeYesNo	2	Specifies that the error that occurred requires a Yes or No response. The E rAdviseResult parameter must be set to one of the following: AdviseResul or AdviseResultNo.

Advise Results

Constant	Value	Description
AdviseResultAbort	6	Specifies a Cancel response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel or AdviseMessageTypeRetryCancel.
AdviseResultNo	1	Specifies a No response. Valid if MessageType is AdviseMessageTypeYesNo.
AdviseResultOK	2	Specifies an OK response. Valid if MessageType is AdviseMessageTypeOK.
AdviseResultRetry	5	Specifies a Retry response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel or AdviseMessageTypeRetryCancel.
AdviseResultSkip	3	Specifies a Skip response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel.
AdviseResultSkipAll	4	Specifies a Skip All response. Valid if MessageType is AdviseMessageTypeRetryCancel.
AdviseResultYes	0	Specifies a Yes response. Valid if MessageType is AdviseMessageTypeYesNo.

219.6 class WinPhotoAcquireSettingsMBS

219.6.1 class WinPhotoAcquireSettingsMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The WinPhotoAcquireSettingsMBS interface is used to work with image acquisition settings, such as file name format.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 22.1pr2
- News from the MBS Xojo Plugins Version 20.3
- Windows Photos Acquire
- MBS Xojo Plugins, version 20.3pr6

219.6.2 Methods

219.6.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

219.6.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

219.6.5 InitializeFromRegistry(RegistryKey as String)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Specifies a registry key from which to initialize settings.

219.6.6 Properties

219.6.7 AcquisitionDateTime as DateTime

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The acquisition time explicitly.
Notes: This property is typically used to force two sessions to show the same acquisition time. If not explicitly set, acquisition time defaults to the current machine time.
(Read and Write property)

219.6.8 AcquisitionTime as Date

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The acquisition time explicitly.
Notes: This property is typically used to force two sessions to show the same acquisition time. If not explicitly set, acquisition time defaults to the current machine time.
(Read and Write property)

219.6.9 Flags as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The photo acquire flags.
Notes: (Read and Write property)

219.6.10 GroupTag as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The group tag for an acquisition session.
Notes: The group tag is stored as a keyword in each file's metadata. It is also used in the file name if the $ (GroupTag) token is present in the format string passed to OutputFileNameTemplate.
(Read and Write property)

219.6.11 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.

Notes: (Read only property)

219.6.12 OutputFilenameTemplate as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Specifies a format string (template) that specifies the format of file names.
Notes: Format strings contain a mix of path literals and tokens. A format string looks like the following:

$ (MyPicturesFolder)\$ (DateAcquired), $ (EventName)\$ (EventName) $ (SequenceNumber).$ (OriginalExtension)

The token format looks like the following, where OptionalPrefix and OptionSuffix are suppressed if the replacement for the TokenIdentifier yields a zero-length string:

$ ([OptionalPrefix] TokenIdentifier:SubToken [OptionalSuffix] | AlternateString)

The caret ("^") is an escape character, so "^$ " would yield "$ " in the final path.
Parentheses and brackets are not allowed as literals within tokens, but can be used outside of tokens. This means you cannot use " [", "] ", "(", or ")" within the OptionalString sub-token unless they are escaped with a caret ("^").
There are a few different classes of tokens, including the following:
SHGetSpecialFolder variables such as the following. These must be the first token, and can only occur once, at most:

- MyPicturesFolder
- MyDocumentsFolder

Session variables such as the following:

- SequenceNumber (The sequence number is used to avoid filename collisions; if it exists, it must be in the file name portion of the path.)
- DateAcquired
- EventName
- UserName
- MachineName

File and metadata variables such as the following:

- DateTaken
- OriginalFilename
- OriginalExtension
- CameraModel
- Width
- Height

Since these tokens are not intended to be visible to users, they will not be localized. For example, $ (DateTaken) will be the same on all versions of Microsoft Windows, regardless of locale or language settings.
As an example, suppose EventName is "Meghan's Birthday" and the naming pattern is as follows:

$ (MyPicturesFolder)\$ (DateAcquired)$ ([,] EventName)\$ (EventName [ ])$ (SequenceNumber).$ (OriginalExtension)
The resulting files would be named as follows:

C:\Documents and Settings\shauniv\My Documents\My Pictures\2003-11-14, Meghan's Birthday\Meghan's Birthday 001.jpg
C:\Documents and Settings\shauniv\My Documents\My Pictures\2003-11-14, Meghan's Birthday\Meghan's Birthday 002.jpg
C:\Documents and Settings\shauniv\My Documents\My Pictures\2003-11-14, Meghan's Birthday\Meghan's Birthday 003.jpg
C:\Documents and Settings\shauniv\My Documents\My Pictures\2003-11-14, Meghan's Birthday\Meghan's Birthday 004.jpg
(Read and Write property)

219.6.13 SequencePaddingWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: A value indicating how wide sequential fields in filenames will be.
Notes: If the value passed to SetSequencePaddingWidth is nonzero and the format string specified in SetOutputFileNameTemplate contains a sequential token, this method sets the width allotted for the sequential token. For example, given the template $ (GroupTag)$ (AcquisitionSequence).$ (OriginalExtension), if padding is set to 0, a file name might appear as

"Image1.jpg"

If padding is set to 3, the file name may appear as

"Image 1.jpg"
(Read and Write property)

219.6.14 SequenceZeroPadding as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Whether zeros or spaces are used to pad sequential file names.
Notes: Flag that, if set to true, indicates that zeros pad sequential file names.
(Read and Write property)

219.6.15 Constants

Flags

Constant	Value	Description
kFlagsAbortOnSettingsUpdate	&h00000800	Abort on settings update.
kFlagsDeleteAfterAcquire	&h00000020	Delete after acquire.
kFlagsDisableAutoRotate	&h00000002	Disable auto rotate.
kFlagsDisableDbIntegration	&h00000010	Disable DB integration.
kFlagsDisableDuplicateDetection	&h00000040	Disable duplicate detection.
kFlagsDisableGroupTagPrompt	&h00000008	Disable group tag prompt.
kFlagsDisableMetadataWrite	&h00000100	Disable metadata write.
kFlagsDisablePlugins	&h00000004	Disable plugins.
kFlagsDisableSettingsLink	&h00000400	Disable settings link.
kFlagsDisableThumbnailProgress	&h00000200	Disable thumbmail progress.
kFlagsEnableThumbnailCaching	&h00000080	Enable thumbnail caching. On by default.
kFlagsImportVideoAsMultipleFiles	&h00001000	Import videos as multiple files.
kFlagsNoGalleryLaunch	&h00000001	Suppresses the explorer window launched after acquisition.

219.7 class WinPhotoAcquireSourceMBS

219.7.1 class WinPhotoAcquireSourceMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: This class is used for acquisition of items from a device.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 22.1pr2
- Windows Photos Acquire
- MBS Xojo Plugins, version 20.3pr6

219.7.2 Methods

219.7.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

219.7.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

219.7.5 InitializeItemList(ForceEnumeration as Boolean, PhotoAcquireProgress as WinPhotoAcquireProgressCallBackMBS, byref ItemCount as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The InitializeItemList method enumerates transferable items on the device and passes each item to the optional progress callback, if it is supplied.
Notes: ForceEnumeration: Flag that, if set to true, indicates that enumeration will be repeated even if the item list has already been initialized. If set to false, this flag indicates that repeated calls to InitializeItemList after the item list has already been initialized will not enumerate items again.
PhotoAcquireProgress: Optional. Pointer to an WinPhotoAcquireProgressCallBackMBS object for events.

ItemCount: Returns the number of items found.

If Acquire is called without first calling InitializeItemList, initialization of the item list is done implicitly. The first time the item list is initialized—either implicitly through Acquire or explicitly by calling InitializeItemList—each item is enumerated. During enumeration, if an WinPhotoAcquireProgressCallBackMBS object is passed to InitializeItemList, its implementation of StartEnumeration, FoundItem, and EndEnumeration may be used to apply further filtering or control to the list of items to be transferred.

219.7.6 Item(Index as Integer) as WinPhotoAcquireItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the WinPhotoAcquireItemMBS object at the given index in the list of items.
Notes: Index: The index from 0 to ItemCount-1.

219.7.7 Properties

219.7.8 DeviceId as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the identifier (ID) of the device.
Notes: (Read only property)

219.7.9 FriendlyName as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the name of the device, formatted for display.
Notes: (Read only property)

219.7.10 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

219.7.11 ItemCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the number of items found by the InitializeItemList method.
Notes: (Read only property)

219.7.12 PhotoAcquireSettings as WinPhotoAcquireSettingsMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Obtains an IPhotoAcquireSettings object for working with acquisition settings.
Notes: (Read only property)

219.8 class WinPhotoExceptionMBS

219.8.1 class WinPhotoExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The class for exceptions in the Windows Photo classes.
Notes: Subclass of the RuntimeException class.
Blog Entries

- MBS Xojo Plugins, version 20.3pr6

219.9 class WinPhotoProgressActionCallbackMBS

219.9.1 class WinPhotoProgressActionCallbackMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The class for an action callback.
Blog Entries

- MBS Xojo Plugins, version 20.3pr6

219.9.2 Methods

219.9.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.

219.9.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

219.9.5 Properties

219.9.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

219.9.7 Events

219.9.8 DoAction(WindowHandle as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Run the action for the progress action.

219.10 class WinPhotoProgressDialogMBS

219.10.1 class WinPhotoProgressDialogMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Provides the progress dialog box that may be displayed when enumerating or importing images.
Notes: The dialog box is modal and runs in its own thread.
Blog Entries

- Windows Photos Acquire
- MBS Xojo Plugins, version 20.3pr6

219.10.2 Methods

219.10.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.

219.10.4 Create(ParentWindow as DesktopWindow)

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Creates and displays a progress dialog box that can be shown during image enumeration and acquisition.
Notes: ParentWindow: The parent window.

The dialog box that is created is modal, and runs in its own thread.
To close the dialog, call Destroy.
See also:

- 219.10.5 Create(ParentWindow as Window) 25232
- 219.10.6 Create(ParentWindowHandle as Integer) 25233

219.10.5 Create(ParentWindow as Window)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Creates and displays a progress dialog box that can be shown during image enumeration and acquisition.

Notes: ParentWindow: The parent window.

The dialog box that is created is modal, and runs in its own thread.
To close the dialog, call Destroy.
See also:

- 219.10.4 Create(ParentWindow as DesktopWindow) 25232
- 219.10.6 Create(ParentWindowHandle as Integer) 25233

219.10.6 Create(ParentWindowHandle as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Creates and displays a progress dialog box that can be shown during image enumeration and acquisition.
Notes: ParentWindowHandle: Handle of the parent window.

The dialog box that is created is modal, and runs in its own thread.
To close the dialog, call Destroy.
See also:

- 219.10.4 Create(ParentWindow as DesktopWindow) 25232
- 219.10.5 Create(ParentWindow as Window) 25232

219.10.7 Destroy

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Closes and disposes of the progress dialog box shown during image enumeration and acquisition.
Notes: Calling Destroy is the only way to close the progress dialog box. If Destroy is not called, the dialog box will remain open. The dialog box is not automatically closed when the operation in progress completes.

219.10.8 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

219.10.9 IsCheckboxChecked(Index as Integer = 0) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The check box in the progress dialog box (typically indicating whether to delete files after transfer) is selected.
Notes: Index: Integer value containing the check box identifier (ID).

219.10.10 Properties

219.10.11 ActionLinkCallback as WinPhotoProgressActionCallbackMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The callback object to receive action callback.
Notes: (Read and Write property)

219.10.12 ActionLinkText as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The link text for the action item.
Notes: (Read and Write property)

219.10.13 Caption as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The caption of the progress dialog box.
Notes: The caption text is displayed above the progress indicator bar in the dialog box.
(Read and Write property)

219.10.14 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

219.10.15 IsCancelled as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The IsCancelled method indicates whether the operation has been canceled via the progress dialog box.
Notes: Returns true to indicate the action has been canceled.
(Read only property)

219.10.16 PercentComplete as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: A value indicating the completed portion of the current operation.
Notes: Integer value indicating the percentage of the operation that has completed. This value may be between 0 and 100 only.

If you pass ProgressIndeterminate to PercentComplete, the progress bar will not progress from left to right (from 0 to 100%), but will instead animate to indicate that an operation with an indeterminate end is taking place.
(Read and Write property)

219.10.17 Picture as Picture

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The thumbnail image displayed in the progress dialog box.
Notes: A bitmap thumbnail (up to 128 x 128 pixels, although it will be scaled to fit if it is too large).
(Read and Write property)

219.10.18 ProgressText as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The text for the progress bar in the progress dialog box.
Notes: (Read and Write property)

219.10.19 ShowsActionLink as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Whether to show an action link.
Notes: (Read and Write property)

219.10.20 Title as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The title of the progress dialog box.
Notes: (Read and Write property)

219.10.21 WindowHandle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The window handle for the dialog.
Notes: (Read only property)

219.10.22 CheckboxCheck(Index as Integer = 0) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Whether the checkbox is checked.
Notes: (Read and Write computed property)

219.10.23 CheckboxText(Index as Integer = 0) as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The text for the check box in the progress dialog box indicating whether to delete images after transfer.
Notes: Index: Integer containing the check box identifier (ID).
(Read and Write computed property)

219.10.24 CheckboxTooltip(Index as Integer = 0) as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The tooltip text for the check box in the progress dialog box.
Notes: Index: Integer containing the check box identifier (ID).
(Read and Write computed property)

219.10.25 CheckboxVisible(Index as Integer = 0) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Whether the checkbox is visible.
Notes: (Read and Write computed property)

219.10.26 Constants

Constants

Constant	Value	Description
ProgressDialogCheckboxIDDefault	0	The ID of the default checkbox.
ProgressIndeterminate	-1	The progress value for indeterminate.

219.11 class WinUserInputStringMBS

219.11.1 class WinUserInputStringMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The object created when asking the user for a string—for example, when obtaining the name of a tag.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 20.3pr6

219.11.2 Methods

219.11.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

219.11.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

219.11.5 MRUEntry(Index as Integer) as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The entry at the given index in the most recently used list.
Notes: Index from 0 to MRUCount-1.

219.11.6 Properties

219.11.7 Default as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The default string used to initialize an edit control (or equivalent).
Notes: (Read only property)

219.11.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

219.11.9 MaxLength as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The maximum string length the user interface (UI) should allow.
Notes: The maximum string length in characters.
(Read only property)

219.11.10 MRUCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The number of items in the list of most recently used items.
Notes: (Read only property)

219.11.11 Prompt as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The title of a prompt if the prompt is a modal dialog box.
Notes: (Read only property)

219.11.12 StringId as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The unlocalized canonical name for the requested string.
Notes: For example, when requesting a tag name, the canonical name might be ”TagName”.
(Read only property)

219.11.13 StringType as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: A value indicating the type of string to obtain from the user.
Notes: A value indicating the type of string to obtain from the user.

See UserInputDefault and UserInputPathElement constants.
(Read only property)

219.11.14 SubmitButtonText as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The text for the submit button.
Notes: (Read only property)

219.11.15 TooltipText as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The tooltip text displayed for a control.
Notes: (Read only property)

219.11.16 Constants

Types

Constant	Value	Description
UserInputDefault	0	Specifies that any string is allowed.
UserInputPathElement	1	Specifies that the string will not accept characters that are illegal in file or directory names (such as * or /).

Chapter 220

Windows Registry

220.1 class RegistryFileTypeMBS

220.1.1 class RegistryFileTypeMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: An easy way to register an document icon for Windows.
Notes: You set up the properties of this class and than you call create.
I suggest that you do it like QuickTime or Winzip. Ask the user on first run if he want's your application to register its file types.
And also provide two buttons in the Preferencesdialog to register or unregister the types.

This class works on Windows 7 only if you run the app as administrator.

This function may fail to run if permissions are denied.
Or it may only affect the shadow registry used by Windows to protect itself from having unauthorized apps editing the real registry.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr5
- Plugin notes

220.1.2 Methods

220.1.3 Create as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates this file type.
Example:

```
Var r as RegistryFileTypeMBS
' set properties for r
Var errorcode as Integer
errorcode=r.create
```

Notes: Returns:

-1 - Run on Mac OS
0 - OK
1 - Failed to create main extension key.
2 - Failed to create the description key for file type.
3 - Failed to create the key for the icon.
4 - Failed to create the key for the open description.
5 - Required parameters not provided.

This function may fail to run if permissions are denied.
Or it may only affect the shadow registry used by Windows to protect itself from having unauthorized apps editing the real registry.

220.1.4 Remove as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes this file type.
Example:

```
Var r as RegistryFileTypeMBS
Var errorcode as Integer

errorcode=r.remove
```

Notes: Returns:

-1 - Run on Mac OS or parameters bad.
0 - OK
x - A Windows error code like 5 for permissions denied.

Note: The return values changed in MBS Plugin 3.2 to now return Windows error codes!

This function may fail to run if permissions are denied.
Or it may only affect the shadow registry used by Windows to protect itself from having unauthorized apps editing the real registry.

220.1.5 Properties

220.1.6 AppFile as FolderItem

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The application to launch to open the file.
Example:

```
Var r as new RegistryFileTypeMBS
r.Appfile=app.applicationfilembs // it is my file ;-)
```

Notes: (Read and Write property)

220.1.7 Description as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The description for this file type.
Example:

```
Var r as new RegistryFileTypeMBS
r.description="Monkeybread File"
```

Notes: The text to show in the explorer in column view.
(Read and Write property)

220.1.8 Extension as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The extension for this file type.
Example:

```
Var r as new RegistryFileTypeMBS
```

```
r.extension=".MBS"
```

Notes: The extension should start with a dot follow by 3 uppercase letters and it should be unique. But as there are more file types than combinations of 3 letters this may be difficult...
(Read and Write property)

220.1.9 FileType as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A internal unique signature for this file type.
Example:

```
Var r as new RegistryFileTypeMBS

r.FileType="MBSFile"
```

Notes: May contain any character except chr(0) and should be ANSI encoded.
(Read and Write property)

220.1.10 Iconfile as FolderItem

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file with the icon.
Example:

```
Var r as new RegistryFileTypeMBS

r.iconfile=app.applicationfileMBS // it is my file ;-)
```

Notes: You can get the icon out of your application (ID 0 is the default icon).
But you can also use DLL files like "Shell32.dll" for some nice icons.
Last but not least you can use an ICO file which Iconographer can create for you from your Mac Icons.
(Read and Write property)

220.1.11 IconID as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ID of the Icon to use.
Example:

```
Var r as new RegistryFileTypeMBS

r.iconid=3
```

Notes: Your icon file may contain more than one icon. Here you can specify which one to use. First is ID 0.
(Read and Write property)

220.1.12 OpenDescription as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The text to show in the context menu for Open.
Example:

```
Var r as new RegistryFileTypeMBS

r.OpenDescription="Open MBS file"
```

Notes: If you don't provide an OpenDescription you'll get "Open".
Here you can describe the default action.
e.g. Stuffit Expander could say "Expand file".
(Read and Write property)

220.2 class RegistryKeyMBS

220.2.1 class RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you access to a Windows Registry Key.
Example:

```
// store and read your app settings in the Windows registry and list the subkeys
Var software As RegistryKeyMBS = RegistryMBS.CurrentUser.Item("Software")
Var settings As RegistryKeyMBS = software.CreateKey("MyCompany\MyApp")
settings.Value("LastUser").asString = "Bob"

MessageBox "Last user: " + settings.Value("LastUser").asString
Var names() As String
For i As Integer = 0 To software.ItemCount - 1
names.Add software.ItemName(i)
Next
System.DebugLog "Software keys: " + String.FromArray(names, ", ")
```

220.2.2 Methods

220.2.3 CopyTree(keyname as string, Dest as RegistryKeyMBS) as boolean

MBS Win Plugin, Plugin Version: 17.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copies the specified registry key, along with its values and subkeys, to the specified destination key.
Notes: Returns true on success and false on failure.

220.2.4 CreateKey(name as string, Use64bitRegistry as boolean = false) as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new subkey.
Notes: If the key is allready present it is just opened.
Returns a registry key or nil on any error.

Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

220.2.5 Delete(keyname as string) as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes the specified subkey key.
Notes: Windows 95: The Delete function deletes a subkey and all its descendants.
Windows NT: The Delete function deletes the specified subkey. The subkey to be deleted must not have subkeys.

With plugin version 3.2 the NT behavior is worked around to match the Windows 95 behavior. So all sub keys are deleted!

220.2.6 DeleteTree(keyname as string) as boolean

MBS Win Plugin, Plugin Version: 17.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes the subkeys and values of the specified key recursively.
Example:

```
Var t as RegistryKeyMBS = RegistryMBS.CurrentUser

// create some keys
Var n as RegistryKeyMBS = t.CreateKey("Hello")
Var w as RegistryKeyMBS = n.CreateKey("World")

w.Value("Test").asString = "Hello"

break // see in regedit

// delete it
if t.DeleteTree("Hello") then
MessageBox "deleted. ok"
else
MessageBox "delete failed"
end if
```

Notes: Returns true on success and false on failure.

220.2.7 Flush

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes all the attributes of the specified open key into the RegistryMBS.

220.2.8 Item(index as Integer) as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the key at the specified index.
Notes: May return nil on any error like missing access rights.
Some keys can't be opened, but ItemName() may return the name of the key.
See also:

- 220.2.9 Item(name as string) as RegistryKeyMBS 25248

220.2.9 Item(name as string) as RegistryKeyMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the key with the specified name.
Notes: May return nil on any error like missing access rights.
Some keys can't be opened, but ItemName() may return the name of the key.
See also:

- 220.2.8 Item(index as Integer) as RegistryKeyMBS 25248

220.2.10 ItemName(index as Integer) as string

MBS Win Plugin, Plugin Version: 6.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the key at the specified index.
Notes: May return "" on any error.

220.2.11 Value(index as Integer) as RegistryValueMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value at the specified index.
See also:

- 220.2.12 Value(name as string) as RegistryValueMBS 25249

220.2.12 Value(name as string) as RegistryValueMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value item with the specified name.
Notes: The value must not exists. So use this function to make a new key.
Use an empty name (e.g. "") for the default key value.

This method was named ValueItem in plugin version before 10.4.
See also:

- 220.2.11 Value(index as Integer) as RegistryValueMBS 25248

220.2.13 ValueName(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the value with the given index.
Notes: May return "" on any error.

220.2.14 Properties

220.2.15 ItemCount as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the count of subkeys.
Example:

```
Var i,c as Integer
Var key as RegistryKeyMBS // the registry item

c=key.ItemCount-1
for i=0 to c
// do something
next
```

Notes: This property calls a System function to get the value. So save it in a local variable instead of calling it in a for loop. See the example.

(Read only property)

220.2.16 name as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the Key.
Notes: (Read only property)

220.2.17 ValueCount as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the count of values.
Example:

```
Var i,c as Integer
Var key as RegistryKeyMBS

c=key.ValueCount
for i=1 to c
// do something
next
```

Notes: This property calls a System function to get the value. So save it in a local variable instead of calling it in a for loop. See the example.
(Read only property)

220.3 class RegistryMBS

220.3.1 class RegistryMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you access to the Windows Registry.
Example:

```
// read a value from the Windows registry
Const path = "HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion"
MessageBox "This OS is: " + RegistryMBS.getStringValue(path, "ProductName")

// list the values of a key
Var key As RegistryKeyMBS = RegistryMBS.Key(path)
If key <>Nil Then
Var names() As String
For i As Integer = 0 To key.ValueCount - 1
names.Add key.ValueName(i)
Next
MessageBox key.ValueCount.ToString + " values:" + EndOfLine + String.FromArray(names, EndOfLine)
End If
```

Notes: Please send me an email if you need some functions which are now not included.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr10
- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr11

220.3.2 Methods

220.3.3 classesRoot as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the ClassesRoot Tree.

220.3.4 CurrentConfig as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the CurrentConfig Tree.

220.3.5 CurrentUser as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the CurrentUser Tree.

220.3.6 getBinaryValue(keypath as string,valuename as string, Use64bitRegistry as boolean = false) as Memoryblock

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you a Memoryblock of the value called valuename in the key found at keypath.
Example:

```
const path="HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion"
Var r as new RegistryMBS
MessageBox "This OS is: "+r.getBinaryValue(path, "ProductName").cstring(0)
```

Notes: Returns nil on any error.
Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

220.3.7 getStringValue(keypath as string,valuename as string, Use64bitRegistry as boolean = false) as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you a String of the value called valuename in the key found at keypath.
Example:

```
const path="HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion"
Var r as new RegistryMBS
MessageBox "This OS is: "+r.getStringValue(path, "ProductName")
```

Notes: Returns "" on any error.
Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

220.3.8 Key(keypath as string, Use64bitRegistry as boolean = false) as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the given path of a key.

Example:

```
const path="HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion"
Var r as new RegistryMBS
MessageBox r.Key(path).Name
```

Notes: If you need you can recreate this function in Xojo code to have some error checking. This function here will return nil on any error.

Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

220.3.9 LocalMachine as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the LocalMachine Tree.

220.3.10 PerformanceData as RegistryKeyMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the PerformanceData Tree.

220.3.11 Users as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the Users Tree.

220.4 class RegistryValueMBS

220.4.1 class RegistryValueMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you access to a value of a RegistryMBS Key.
Example:

```
// list all values of a registry key with type and content
Var key As RegistryKeyMBS = RegistryMBS.Key("HKEY_CURRENT_USER\Control Panel\Desktop")
If key = Nil Then Return

For i As Integer = 0 To key.ValueCount - 1
Var v As RegistryValueMBS = key.Value(i)
If v.isString Then
System.DebugLog v.name + " = " + v.asString
ElseIf v.isLong32 Then
System.DebugLog v.name + " = " + v.asLong32.ToString
ElseIf v.isBinary Then
System.DebugLog v.name + " = " + v.size.ToString + " bytes binary"
End If
Next
```

220.4.2 Methods

220.4.3 Delete as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes this value.
Notes: The RegistryValueMBS object should be destroyed after deleting.

220.4.4 SetBinaryMem(typ as Integer,data as Memoryblock)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the value to the content of the memoryblock.
Notes: Type may be one of this values:

0	No value type
1	Nul terminated string
2	Nul terminated string (with environment variable references)
3	Free form binary
4	32-bit number (LittleEndian)
5	32-bit number (BigEndian)
6	Symbolic Link (unicode)
7	Multiple Unicode strings
8	Resource list in the resource map
9	Resource list in the hardware description
10	Resource requirements list
11	64-bit number

220.4.5 SetBinaryStr(typ as Integer,data as String)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the value to the content of the string.
Notes: Type may be one of this values:

0	No value type
1	Nul terminated string
2	Nul terminated string (with environment variable references)
3	Free form binary
4	32-bit number (LittleEndian)
5	32-bit number (BigEndian)
6	Symbolic Link (unicode)
7	Multiple Unicode strings
8	Resource list in the resource map
9	Resource list in the hardware description
10	Resource requirements list
11	64-bit number

220.4.6 Properties

220.4.7 asBinary as Memoryblock

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value as a memoryblock.
Notes: Can also be used to set the value.
(Read and Write property)

220.4.8 asBinaryString as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value as a string with binary content.
Notes: This string may include chr(0).
Can also be used to set the value.
(Read and Write property)

220.4.9 asLong32 as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value as a 32bit integer.
Notes: Can also be used to set the value.
(Read and Write property)

220.4.10 asLong64 as Int64

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value as a 64bit integer.
Example:

```
Var v as RegistryValueMBS
v.aslong64=v.aslong64+1 // add one
```

Notes: Can also be used to set the value.
(Read and Write property)

220.4.11 asString as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value as a string.
Notes: Can also be used to set the value.
(Read and Write property)

220.4.12 isBinary as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if the value is binary data.
Notes: (Read only property)

220.4.13 isLong32 as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if the value is a 32 bit integer.
Notes: (Read only property)

220.4.14 isLong64 as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if the value is a 64 bit Integer.
Notes: (Read only property)

220.4.15 isString as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if the value is a string.
Notes: (Read only property)

220.4.16 name as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the Value.
Notes: (Read only property)

220.4.17 size as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the size of this value.
Notes: (Read only property)

220.4.18 type as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the type of the value.
Notes: Type may be one of this values:

0	No value type
1	Nul terminated string
2	Nul terminated string (with environment variable references)
3	Free form binary
4	32-bit number (LittleEndian)
5	32-bit number (BigEndian)
6	Symbolic Link (unicode)
7	Multiple Unicode strings
8	Resource list in the resource map
9	Resource list in the hardware description
10	Resource requirements list
11	64-bit number

(Read only property)

Chapter 221

Windows Shortcuts

221.1 class WindowsInternetShortcutMBS

221.1.1 class WindowsInternetShortcutMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to create internet shortcuts on Windows.
Example:

```
#if targetwin32
Var w as WindowsInternetShortcutMBS

w=new WindowsInternetShortcutMBS

w.URL="http://www.monkeybreadsoftware.de"
w.Command=3
w.Icon=windowsSystemFolder.child("shell32.dll")
w.iconID=41
w.Location=SpecialFolder.Desktop.child("A new link to explorer.lnk")
w.Working=volume(0)

if w.CreateInternetShortCut then
if w.AddInternetShortCutIcon then
MessageBox "Shortcut created."
else
MessageBox "Failed to add icon."
end if
else
MessageBox "Failed to create shortcut."
end if
#endif
```

221.1.2 Methods

221.1.3 CreateInternetShortCut as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a shortcut on the specified location.
Notes: Version 10.1: Now adds the icon, too.

221.1.4 Properties

221.1.5 Command as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The code for the showing of the application.
Notes: Use e.g. 3 for full screen.
(Read and Write property)

221.1.6 Icon as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location of the icon file.
Notes: (Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

221.1.7 IconID as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ID of the icon inside the icon file.
Notes: (Read and Write property)

221.1.8 Location as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location where the shortcut is created or modified.
Notes: (Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

221.1.9 url as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The URL where the shortcut will point to.
Notes: (Read and Write property)

221.1.10 WorkingDirectory as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The working directory for the browser.
Notes: (Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

221.2 class WindowsShortCutMBS

221.2.1 class WindowsShortCutMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to create shortcuts on Windows.
Example:

```
Var w as WindowsShortCutMBS

w = new WindowsShortCutMBS

w.Arguments = ""
w.Command = 3
w.Icon = specialfolder.system.child("shell32.dll").NativePath
w.iconID = 41
w.Location = SpecialFolder.Desktop.child("A new link to explorer.lnk").NativePath
w.Target = SpecialFolder.Windows.child("explorer.exe").NativePath
w.WorkingDirectory = volume(0).NativePath

if w.CreateShortCut then
MessageBox "Shortcut created."
else
MessageBox "Failed to create shortcut."
end if
```

Blog Entries

- MBS Xojo Plugins, version 21.6pr3

221.2.2 Methods

221.2.3 CreateShortCut as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a shortcut on the specified location.
Notes: Returns true on success and false on any error.
Version 10.1: Now adds the icon, too.

221.2.4 ResolveShortCut(DisableGUI as boolean=false, DisableSearch as boolean=false) as boolean

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Resolves the shortcut.
Notes: Fills the properties target, description, Argument, WorkingDirectory, Icon and IconID.
Returns false on any error.

Parameters added in plugin version 7.4:

DisableGUI:
Do not display a dialog box if the link cannot be resolved. The time-out duration will be set to the default value of 3,000 milliseconds (3 seconds).

DisableSearch:
Do not execute the search heuristics.

For more details check this page in Microsoft's documentation:
http://msdn.microsoft.com/en-us/library/bb774952(v=vs.85).aspx

221.2.5 Properties

221.2.6 Arguments as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Arguments to the application which is linked to the shortcut.
Notes: (Read and Write property)

221.2.7 Command as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The code for the showing of the application.
Notes: Constants which may be useful:

(Read and Write property)

SW_HIDE	= 0
SW_NORMAL	= 1
SW_SHOWMINIMIZED	= 2
SW_SHOWMAXIMIZED	= 3
SW_MAXIMIZE	= 3
SW_SHOWNOACTIVATE	= 4
SW_SHOW	= 5
SW_MINIMIZE	= 6
SW_SHOWMINNOACTIVE	= 7
SW_SHOWNA	= 8
SW_RESTORE	= 9
SW_SHOWDEFAULT	= 10
SW_FORCEMINIMIZE	= 11

221.2.8 Description as String

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The description of the shortcut.
Notes: (Read and Write property)

221.2.9 Icon as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location of the icon file.
Notes: (Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

221.2.10 IconID as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ID of the icon inside the icon file.
Notes: (Read and Write property)

221.2.11 Location as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location where the shortcut is created or modified.
Notes: (Changed from FolderItem to String in plugin version 3.4)

(Read and Write property)

221.2.12 ParentWindow as Variant

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop only.

Function: The parent window used when a dialog must be opened.
Notes: Can reference a Window or DesktopWindow object.
(Read and Write property)

221.2.13 Target as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The target where the shortcut will point to.
Notes: (Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

221.2.14 WorkingDirectory as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The working directory of this shortcut.
Notes: (Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

Chapter 222

Windows Store

222.1 class WindowsStoreAppLicenseMBS

222.1.1 class WindowsStoreAppLicenseMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides license info for the current app, including licenses for products that are offered by the app.
Example:

```
// check whether the app from the Microsoft Store is a trial
// Store is a property of the window: Store As WindowsStoreContextMBS
Store = New WindowsStoreContextMBS(Self)
Store.GetAppLicenseAsync AddressOf GotLicense

// a method in the window:
Sub GotLicense(ErrorCode As Integer, appLicense As WindowsStoreAppLicenseMBS)
If appLicense = Nil Then Return
If appLicense.IsTrial Then
System.DebugLog "Trial, " + Format(appLicense.TrialTimeRemaining / 86400, "0") + " days left"
ElseIf appLicense.IsActive Then
System.DebugLog "Full version"
End If
End Sub
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- New in MBS Xojo Plugins in version 23.1

- News from the MBS Xojo Plugins Version 20.4
- Selling Xojo apps on Windows Store

222.1.2 Methods

222.1.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

222.1.4 Properties

222.1.5 AddOnLicenses as Dictionary

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the collection of licenses for durable add-ons for which the user has entitlements to use.
Notes: This property does not include licenses for consumable add-ons.

Returns a map of key and value pairs, where each key is the Store ID of an add-on SKU from the Microsoft Store catalog and each value is a StoreLicense object that contains license info for the add-on.

This collection contains durable add-on licenses that are currently valid. When a license is expired or no longer valid, it will no longer be available in this collection.
(Read only property)

222.1.6 ExpirationDate as Int64

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the expiration date and time for the app license.
Notes: The expiration date and time for the app license, relative to the system clock.

For usage-limited trials, the expiration date is December 31, 9999. Usage-limited trials are currently available only to some developer accounts in Xbox managed partner programs.
(Read only property)

222.1.7 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets complete license data in JSON format.
Notes: Use the ExtendedJsonData property to access the complete data for the StoreAppLicense object as a JSON-formatted string in your code.
(Read only property)

222.1.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

222.1.9 IsActive as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the license is valid and provides the current user an entitlement to use the app.
Notes: (Read only property)

222.1.10 IsTrial as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the license is a trial license.
Notes: (Read only property)

222.1.11 IsTrialOwnedByThisUser as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the current user has an entitlement for the usage-limited trial that is associated with this app license.
Notes: This property is intended to be used by developers who have configured their app as a usage-limited trial in Partner Center. Usage-limited trials are currently available only to some developer accounts in Xbox managed partner programs.
(Read only property)

222.1.12 SkuStoreId as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the Store ID of the licensed app SKU from the Microsoft Store catalog.
Notes: (Read only property)

222.1.13 TrialTimeRemaining as Double

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the remaining time for the usage-limited trial that is associated with this app license.
Notes: This property is intended to be used by developers who have configured their app as a usage-limited trial in Partner Center. Usage-limited trials are currently available only to some developer accounts in Xbox managed partner programs.

Value is in seconds.
(Read only property)

222.1.14 TrialUniqueId as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a unique ID that identifies the combination of the current user and the usage-limited trial that is associated with this app license.
Notes: This property is intended to be used by developers who have configured their app as a usage-limited trial in Partner Center. Usage-limited trials are currently available only to some developer accounts in Xbox managed partner programs.
(Read only property)

222.2 class WindowsStoreContextMBS

222.2.1 class WindowsStoreContextMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The base class for Windows Store APIs.
Example:

```
// Window1 is a window of the example project.
Var context as New WindowsStoreContextMBS(Window1)
```

Notes: Provides members you can use to access and manage Microsoft Store-related data for the current app. For example, you can use members of this class to get Microsoft Store listing and license info for the current app, purchase the current app or products that are offered by the app, or download and install package updates for the app.

Requires Windows 10 Anniversary Edition (introduced in 10.0.14393.0)

Uses delegates, so only available for Xojo 2013 or newer.

222.2.2 Methods

222.2.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.
See also:

- 222.2.4 Constructor(Parent as DesktopWindow) 25272

• 222.2.5 Constructor(Parent as Window) 25272

222.2.4 Constructor(Parent as DesktopWindow)

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The constructor.
Notes: Initializes store and sets parent window to use for dialogs.
See also:

• 222.2.3 Constructor 25271

• 222.2.5 Constructor(Parent as Window) 25272

222.2.5 Constructor(Parent as Window)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The constructor.
Notes: Initializes store and sets parent window to use for dialogs.
See also:

• 222.2.3 Constructor 25271

• 222.2.4 Constructor(Parent as DesktopWindow) 25272

222.2.6 GetAppLicenseAsync(CompletionHandler as GetAppLicenseCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets license info for the current app, including licenses for add-ons for the current app.
Example:

```
// Window1 is a window of the example project.
Var context as New WindowsStoreContextMBS(Window1)
context.GetAppLicenseAsync AddressOf GetAppLicenseCompleted
```

Notes: Asynchronous version, which returns quickly and calls the given delegate later when done.

The StoreAppLicense object returned by this method provides access to licenses for add-ons and other info, such as whether the license is active. If this method is called while the device is offline, it returns the cached value of the current licenses on the device.

222.2.7 GetAppLicenseSync as WindowsStoreAppLicenseMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets license info for the current app, including licenses for add-ons for the current app.
Notes: Synchronous version, which waits for the result.

The StoreAppLicense object returned by this method provides access to licenses for add-ons and other info, such as whether the license is active. If this method is called while the device is offline, it returns the cached value of the current licenses on the device.

222.2.8 GetAssociatedStoreProductsAsync(productKinds() as String, CompletionHandler as GetStoreProductsCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets Microsoft Store info for the add-ons of the current app for which the user has purchased.
Notes: productKinds: An array of strings that specify the types of add-ons for which you want to retrieve info.

222.2.9 GetStoreProductForCurrentAppAsync(CompletionHandler as GetStoreProductForCurrentAppCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets Microsoft Store listing info for the current app and provides access to a method that you can use to purchase the app for the current user.
Example:

```
// Window1 is a window of the example project.
Var context as New WindowsStoreContextMBS(Window1)
context.GetStoreProductForCurrentAppAsync AddressOf GetStoreProductForCurrentAppCompleted
```

222.2.10 GetStoreProductsAsync(productKinds() as String, storeIds() as String, CompletionHandler as GetStoreProductsCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets Microsoft Store listing info for the specified products that are associated with the current app.
Example:

```
// please change ID for the item to find
```

```
Var StoreIds() As String = Array("12345", "67890")
Var ProductKinds() As String = Array("**Application**", "**Game**", "**Consumable**", "**UnmanagedConsumable**", "**Durable**")

context.GetStoreProductsAsync ProductKinds, StoreIds, AddressOf GetStoreProductsAsyncCompleted
```

Notes: productKinds: An array of strings that specify the types of products for which you want to retrieve listing info.
storeIds: An array of the Store ID strings for the products for which you want to retrieve listing info.

222.2.11 GetUserCollectionAsync(productKinds() as String, CompletionHandler as GetStoreProductsCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets Microsoft Store info for the add-ons of the current app for which the user has purchased.
Notes: productKinds: An array of strings that specify the types of add-ons for which you want to retrieve info.

222.2.12 RequestPurchaseAsync(CompletionHandler as RequestPurchaseCompletedMBS, StoreID as String, PurchaseProperties as WindowsStorePurchasePropertiesMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Requests the purchase for the specified app or add-on and displays the UI that is used to complete the transaction via the Microsoft Store.
Example:

```
// Window1 is a window of the example project.
Var context as New WindowsStoreContextMBS(Window1)

// please change ID for the item to purchase
Const StoreID = "9NCMFFPJRVHC"

context.RequestPurchaseAsync AddressOf RequestPurchaseCompleted, StoreID
```

Notes: This method provides the option to specify additional details for a specific offer within a large catalog of products that are represented by a single listing in the Microsoft Store, including the product name to display to the user during the purchase.

StoreID: The Store ID of the app or the add-on that you want to purchase for the current user.

PurchaseProperties: The optional purchase properties with display name or additional JSON.

222.2.13 RequestRateAndReviewAppAsync(CompletionHandler as RequestRateAndReviewAppCompletedMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Requests the user to rate and review the app.
Example:

```
// Window1 is a window of the example project.
Var context as New WindowsStoreContextMBS(Window1)
context.RequestRateAndReviewAppAsync AddressOf RequestRateAndReviewAppCompleted
```

Notes: This method will display the UI for the user to select a Store rating and add an optional Store review for the product.
The delegate will later be called with the result.

222.2.14 Properties

222.2.15 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

222.2.16 Parent as Variant

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The parent window for dialogs.
Notes: Can reference a Window or DesktopWindow object.
(Read and Write property)

222.2.17 Events

222.2.18 OfflineLicensesChanged

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Raised when the status of the app's license changes (for example, the trial period has expired or the user has purchased the full version of the app).
Notes: When this event is raised, you can get the latest app license from the Microsoft Store by calling the GetAppLicenseAsync method. The WindowsStoreAppLicenseMBS object returned by this method also contains the latest add-on licenses for the app in the AddOnLicenses property.

222.2.19 Constants

Asynchronous Status

Constant	Value	Description
kAsyncStatusCanceled	2	The operation was canceled.
kAsyncStatusCompleted	1	The operation has completed.
kAsyncStatusError	3	The operation has encountered an error.
kAsyncStatusStarted	0	The operation has started.

222.2.20 Delegates

222.2.21 GetAppLicenseCompletedMBS(ErrorCode as Integer, appLicense as WindowsStoreAppLicenseMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The delegate called when app license data was retrieved.
Notes: ErrorCode: The Windows error code in case of a failure.
Blog Entries

- MBS Xojo Plugins, version 23.1pr3

222.2.22 GetStoreProductForCurrentAppCompletedMBS(ErrorCode as Integer, result as WindowsStoreProductResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The delegate called when query is done.
Notes: ErrorCode: The Windows error code in case of a failure.
Blog Entries

- MBS Xojo Plugins, version 23.1pr3

222.2.23 GetStoreProductsCompletedMBS(ErrorCode as Integer, result as WindowsStoreProductQueryResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The delegate for receiving results from product query calls.
Notes: ErrorCode: The Windows error code in case of a failure.
Blog Entries

- MBS Xojo Plugins, version 23.1pr3

222.2.24 RequestPurchaseCompletedMBS(ErrorCode as Integer, result as WindowsStorePurchaseResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The purchase completed and you can query the status.
Notes: ErrorCode: The Windows error code in case of a failure.
Blog Entries

- MBS Xojo Plugins, version 23.1pr3

222.2.25 RequestRateAndReviewAppCompletedMBS(ErrorCode as Integer, result as WindowsStoreRateAndReviewResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The delegate used for RequestRateAndReviewAppAsync method.
Notes: ErrorCode: The Windows error code in case of a failure.
Blog Entries

- MBS Xojo Plugins, version 23.1pr3

222.3 class WindowsStoreExceptionMBS

222.3.1 class WindowsStoreExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The exception class to report exceptions with Windows Store.
Notes: Subclass of the RuntimeException class.
Blog Entries

- Selling Xojo apps on Windows Store

222.4 class WindowsStoreImageMBS

222.4.1 class WindowsStoreImageMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Represents an image that is associated with a product listing in the Windows Store.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- New in MBS Xojo Plugins in version 23.1

222.4.2 Methods

222.4.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

222.4.4 Properties

222.4.5 Caption as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the caption for the image.
Notes: (Read only property)

222.4.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

222.4.7 Height as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the height of the image, in pixels.
Notes: (Read only property)

222.4.8 ImagePurposeTag as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the tag for the image.
Notes: (Read only property)

222.4.9 Uri as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the URI of the image.
Notes: (Read only property)

222.4.10 Width as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the width of the image, in pixels.
Notes: (Read only property)

222.5 class WindowsStoreLicenseMBS

222.5.1 class WindowsStoreLicenseMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Provides license info for a durable add-on that is associated with the current app.
Notes: To retrieve StoreLicense objects for the durable add-ons for the current app, use the WindowsStoreAppLicenseMBS.AddOnLicenses property. This property contains only the add-on licenses that are still valid and provide the current user with an entitlement to use the add-on. When an add-on license expires or is longer valid, it will no longer be available in the WindowsStoreAppLicenseMBS.AddOnLicenses collection. This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

222.5.2 Methods

222.5.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

222.5.4 Properties

222.5.5 ExpirationDate as Int64

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the expiration date and time for the add-on license.
Notes: (Read only property)

222.5.6 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets complete license data in JSON format.
Notes: (Read only property)

222.5.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

222.5.8 InAppOfferToken as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the Store ID of the licensed add-on SKU from the Microsoft Store catalog.
Notes: (Read only property)

222.5.9 IsActive as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: This property is reserved for future use, and it is not intended to be used in the current release.
Notes: Currently, it always returns true.
(Read only property)

222.5.10 SkuStoreId as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets in the product ID for the add-on.
Notes: (Read only property)

222.6 class WindowsStorePriceMBS

222.6.1 class WindowsStorePriceMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Contains pricing info for a product listing in the Microsoft Store.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

222.6.2 Methods

222.6.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

222.6.4 Properties

222.6.5 CurrencyCode as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the ISO 4217 currency code for the market of the current user.
Notes: (Read only property)

222.6.6 FormattedBasePrice as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the base price for the product with the appropriate formatting for the market of the current user.
Notes: (Read only property)

222.6.7 FormattedPrice as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the purchase price for the product with the appropriate formatting for the market of the current user.
Notes: (Read only property)

222.6.8 FormattedRecurrencePrice as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the recurring price for the product with the appropriate formatting for the market of the current user, if recurring billing is enabled for this product.
Notes: (Read only property)

222.6.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

222.6.10 IsOnSale as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the product is on sale.
Notes: (Read only property)

222.6.11 SaleEndDate as Int64

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the end date for the sale period for the product, if the product is on sale.
Notes: (Read only property)

222.7 class WindowsStoreProductMBS

222.7.1 class WindowsStoreProductMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Represents a product that is available in the Microsoft Store.
Example:

```
// show title and price of your app in the Microsoft Store
// Store is a property of the window: Store As WindowsStoreContextMBS
Store = New WindowsStoreContextMBS(Self)
Store.GetStoreProductForCurrentAppAsync AddressOf GotProduct

// a method in the window:
Sub GotProduct(ErrorCode As Integer, result As WindowsStoreProductResultMBS)
If result = Nil Or result.Product = Nil Then
System.DebugLog "No product, error " + ErrorCode.ToString
Return
End If
Var p As WindowsStoreProductMBS = result.Product
System.DebugLog p.Title + " (" + p.StoreId + "): " + p.Price.FormattedPrice
End Sub
```

Notes: Products in the Store are organized in a hierarcy of product, SKU, and availability objects. Products are represented by StoreProduct objects. The SKUs for each product are represented by StoreSku objects, and the availabilities for each SKU are represented by StoreAvailability objects. For more information, see In-app purchases and trials.
To retrieve a StoreProduct object for the current app, use the GetStoreProductForCurrentAppAsync method.
To retrieve StoreProduct objects for products that can be purchased from within the current app, use these methods.

- GetAssociatedStoreProductsAsync
- GetAssociatedStoreProductsWithPagingAsync
- GetStoreProductsAsync
- GetUserCollectionAsync
- GetUserCollectionWithPagingAsync

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

222.7.2 Methods

222.7.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

222.7.4 GetIsAnySkuInstalledAsync(CompletionHandler as GetIsAnySkuInstalledAsyncCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Indicates whether any SKU of this product is installed on the current device.
Notes: This method is intended to be used for products that have downloadable content (DLC).

Starts an asynchronous operation that, on successful completion, returns true if a SKU of this product is installed on the current device; otherwise, false.

222.7.5 Images as WindowsStoreImageMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the images from the Windows Store listing for the product.
Notes: Returns a collection of WindowsStoreImageMBS objects that represent the images from the Windows Store listing for the product.

222.7.6 Keywords as String()

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the keywords that are associated with the product in Partner Center.
Notes: This property only applies to StoreProduct objects that represent add-ons. These strings correspond to the value of the Keywords field in the properties page for the add-on in Partner Center.

222.7.7 RequestPurchaseAsync(CompletionHandler as WindowsStoreContextMBS.RequestPurchaseCompletedMBS, PurchaseProperties as WindowsStorePurchasePropertiesMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Requests the purchase for the specified app or add-on and displays the UI that is used to complete the transaction via the Microsoft Store.
Notes: This method provides the option to specify additional details for a specific offer within a large catalog of products that are represented by a single listing in the Microsoft Store, including the product name to display to the user during the purchase.

StoreID: The Store ID of the app or the add-on that you want to purchase for the current user.
PurchaseProperties: The optional purchase properties with display name or additional JSON.

222.7.8 SKUs as WindowsStoreSKUMBS()

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the list of available SKUs for the product.

222.7.9 Videos as WindowsStoreVideoMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the videos from the Windows Store listing for the product.
Notes: Returns a collection of WindowsStoreVideoMBS objects that represent the videos from the Windows Store listing for the product.

222.7.10 Properties

222.7.11 Description as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the product description from the Microsoft Store listing.
Notes: (Read only property)

222.7.12 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets complete data for the product from the Store in JSON format.
Notes: Use the ExtendedJsonData property to access the complete data for the StoreProduct object as a JSON-formatted string in your code.
(Read only property)

222.7.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

222.7.14 HasDigitalDownload as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the product has optional downloadable content (DLC).
Notes: (Read only property)

222.7.15 InAppOfferToken as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the product ID for this product, if the current StoreProduct represents an add-on.
Notes: Returns the product ID for this product, if the current StoreProduct represents an add-on.
(Read only property)

222.7.16 IsInUserCollection as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the current user has an entitlement to use the default SKU of the product.
Notes: (Read only property)

222.7.17 Language as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the language for the data in the Microsoft Store listing for the product.
Notes: (Read only property)

222.7.18 LinkURI as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the URI to the Microsoft Store listing for the product.
Notes: An example URI is https://www.microsoft.com/store/apps/<Store ID for the product>. If there is no listing page for the product, this link resolves to the Microsoft Store home page.
(Read only property)

222.7.19 Price as WindowsStorePriceMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the price for the default SKU and availability for the product.
Notes: (Read only property)

222.7.20 ProductKind as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the type of the product.
Notes: These values are currently supported: Application, Game, Consumable, UnmanagedConsumable, and Durable.

see
https://docs.microsoft.com/en-us/uwp/api/windows.services.store.storeproduct.productkind?view=winrt-19041#Windows_
(Read only property)

222.7.21 StoreId as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the Store ID for this product.
Notes: For an app, this property corresponds to the Store ID that is available on the App identity page for

the app in Partner Center.
(Read only property)

222.7.22 Title as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the product title from the Microsoft Store listing.
Notes: (Read only property)

222.7.23 Delegates

222.7.24 GetIsAnySkuInstalledAsyncCompletedMBS(ErrorCode as Integer, Installed as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The delegate triggered by GetIsAnySkuInstalledAsync when completed.

222.8 class WindowsStoreProductQueryResultMBS

222.8.1 class WindowsStoreProductQueryResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides response data for a request to retrieve details about products that can be purchased from within the current app.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

222.8.2 Methods

222.8.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

222.8.4 Properties

222.8.5 ExtendedError as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the collection of products returned by the request.
Notes: A dictionary of key and value pairs, where each key is a Store ID for the add-on and the value is a StoreProduct object that represents the add-on.
(Read only property)

222.8.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

222.8.7 Products as Dictionary

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the error code for the request, if the operation encountered an error.
Notes: (Read only property)

222.9 class WindowsStoreProductResultMBS

222.9.1 class WindowsStoreProductResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides response data for a request to retrieve details about the current app.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

222.9.2 Methods

222.9.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

222.9.4 Properties

222.9.5 ExtendedError as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the error code for the request, if the operation encountered an error.
Notes: (Read only property)

222.9.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

222.9.7 Product as WindowsStoreProductMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets info about the current app.
Notes: (Read only property)

222.10 class WindowsStorePurchasePropertiesMBS

222.10.1 class WindowsStorePurchasePropertiesMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Contains additional details that you can pass to a purchase request for a product, including the product name to display to the user during the purchase.
Notes: The RequestPurchaseAsync methods of the WindowsStoreContextMBS, WindowsStoreProductMBS, WindowsStoreSkuMBS, and WindowsStoreAvailabilityMBS classes have overloads that accept an argument of this type.

222.10.2 Methods

222.10.3 Constructor(Name as String = "")

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Initializes a new instance of the StorePurchaseProperties class.
Notes: Optionally pass name.

222.10.4 Properties

222.10.5 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets or sets a JSON-formatted string that contains extended data to pass with the purchase request to the Microsoft Store.
Notes: Use the ExtendedJsonData property to access the complete data for the StorePurchaseProperties object as a JSON-formatted string in your code. For more information about the structure of the data, see Data schemas for Store products.
If you want to associate the purchase request with a custom campaign, you can add a field named DevOfferId to the JSON string that is returned by this property and then assign the updated string to this property. You can then retrieve this value later by accessing the DeveloperOfferId property of a StoreCollectionData object. Here is an example JSON string that includes a DevOfferId field: " { \"DevOfferId\": \"your campaign ID\" } ".
(Read and Write property)

222.10.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

222.10.7 Name as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets or sets the product name that is displayed to the user during the purchase.
Notes: The specified name appears in the title bar of the purchase UI.
(Read and Write property)

222.11 class WindowsStorePurchaseResultMBS

222.11.1 class WindowsStorePurchaseResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides response data for a request to purchase an app or product that is offered by the app.
Notes: The RequestPurchaseAsync methods of the StoreContext, StoreProduct, StoreSku, or StoreAvailability classes return an object of this type.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

222.11.2 Methods

222.11.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

222.11.4 Properties

222.11.5 ExtendedError as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the error code for the purchase request, if the operation encountered an error.
Notes: (Read only property)

222.11.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

222.11.7 Status as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the status of the purchase request.
Notes: (Read only property)

222.11.8 Constants

Purchase Status

Constant	Value	Description
kStatusAlreadyPurchased	1	The current user has already purchased the specified app or add-on.
kStatusNetworkError	3	The purchase request did not succeed because of a network connectivity error.
kStatusNotPurchased	2	The purchase request did not succeed.
kStatusServerError	4	The purchase request did not succeed because of a server error returned by the Microsoft Store.
kStatusSucceeded	0	The purchase request succeeded.

222.12 class WindowsStoreRateAndReviewResultMBS

222.12.1 class WindowsStoreRateAndReviewResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides response data for a request to rate and review the product.
Notes: Requires Windows 10, version 1809 (introduced in 10.0.17763.0)
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Selling Xojo apps on Windows Store

222.12.2 Methods

222.12.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

222.12.4 Properties

222.12.5 ExtendedError as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the error code for the request, if the operation encountered an error.
Notes: (Read only property)

222.12.6 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the complete result data for a rate and review request in JSON format.
Notes: This includes information to determine if a user aborted the dialog and error details if the call was not successful.

Use the ExtendedJsonData property to access the complete data for the StoreRateAndReviewResult object as a JSON-formatted string in your code.
JSON Schema:

{ "type": "object", "properties": { "status": { "enum": ["success", "aborted"] } , "data": { "type": "object", "properties": { "updated": { "type": "boolean" } } , "required": ["updated"] } , "errorDetails": { "type": "string" } } , "required": ["status", "errorDetails"] }
(Read only property)

222.12.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

222.12.8 Status as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the status for the rate and review request for the product.
Notes: (Read only property)

222.12.9 WasUpdated as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the request to rate and review had a successful updated.
Notes: (Read only property)

222.12.10 Constants

Review Status

Constant	Value	Description
kStatusCanceledByUser	1	The request was canceled by the user.
kStatusError	3	The request encountered an error.
kStatusNetworkError	2	The request encountered a network error.
kStatusSucceeded	0	The request was successful.

222.13 class WindowsStoreSKUMBS

222.13.1 class WindowsStoreSKUMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides info for a stock keeping unit (SKU) of a product in the Microsoft Store.
Notes: A SKU is a code that uniquely identifies a particular version of a product or service. It is a very common term used in the field of inventory management. Products in the Store are organized in a hierarcy of product, SKU, and availability objects. Products are represented by StoreProduct objects. The SKUs for each product are represented by StoreSku objects, and the availabilities for each SKU are represented by StoreAvailability objects. For more information, see In-app purchases and trials.
To access the SKUs for a product, use the Skus property of the StoreProduct for the product in which you are interested.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

222.13.2 Methods

222.13.3 BundledSKUs as String()

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the list of Store IDs for the apps or add-ons that are bundled with this product SKU.

222.13.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

222.13.5 GetIsInstalledAsync(CompletionHandler as GetIsInstalledAsyncCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Indicates whether this product SKU is installed on the current device.
Notes: Starts an asynchronous operation that, on successful completion, returns true if this product SKU is installed on the current device; otherwise, false.

222.13.6 Images as WindowsStoreImageMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the images from the Microsoft Store listing for the product SKU.
Notes: Returns a collection of WindowsStoreImageMBS objects that represent the images from the Microsoft Store listing for the product SKU.

222.13.7 RequestPurchaseAsync(CompletionHandler as WindowsStoreContextMBS.RequestPurchaseCompletedMBS, PurchaseProperties as WindowsStorePurchasePropertiesMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Requests the purchase for the specified app or add-on and displays the UI that is used to complete the transaction via the Microsoft Store.
Notes: This method provides the option to specify additional details for a specific offer within a large catalog of products that are represented by a single listing in the Microsoft Store, including the product name to display to the user during the purchase.

StoreID: The Store ID of the app or the add-on that you want to purchase for the current user.
PurchaseProperties: The optional purchase properties with display name or additional JSON.

222.13.8 Videos as WindowsStoreVideoMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the videos from the Microsoft Store listing for the product SKU.
Notes: Returns a collection of WindowsStoreVideoMBS objects that represent the videos from the Microsoft Store listing for the product SKU.

222.13.9 Properties

222.13.10 CustomDeveloperData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the custom developer data string (also called a tag) that contains custom information about the add-on that this product SKU represents.
Notes: The custom developer data provides a way for developers to associate custom contextual information with an add-on. For more information about setting this value for an add-on, see Enter add-on properties.
(Read only property)

222.13.11 Description as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the product SKU description from the Microsoft Store listing.
Notes: (Read only property)

222.13.12 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets complete data for the current product SKU from the Store in JSON format.
Notes: Use the ExtendedJsonData property to access the complete data for the StoreSku object as a JSON-formatted string in your code.
(Read only property)

222.13.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

222.13.14 IsInUserCollection as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the current user has an entitlement to use the current product SKU.
Notes: (Read only property)

222.13.15 IsSubscription as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the current product SKU is a subscription with recurring billing.
Notes: For more information about the subscription, see the WindowsStoreSubscriptionInfoMBS class and SubscriptionInfo property.
(Read only property)

222.13.16 IsTrial as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the current product SKU is a trial SKU.
Notes: (Read only property)

222.13.17 Language as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the language for the data in the Microsoft Store listing for the product SKU.
Notes: (Read only property)

222.13.18 Price as WindowsStorePriceMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the price of the default availability for this product SKU.
Notes: (Read only property)

222.13.19 StoreId as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the Store ID of this product SKU.
Notes: The Store ID returned by this property has the format <product Store ID>/<SKU Store ID>, where:

- <product Store ID>is a 12-character alpha-numeric string, such as 9NBLGGH69M0B. This Store ID

is available in Partner Center, and it is returned by the StoreId property of the related StoreProduct object.

- <SKU Store ID>is a 4-character alpha-numeric string that identifies the SKU. An example complete Store ID returned by this property is 9NBLGGH69M0B/000N.

(Read only property)

222.13.20 Title as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the product SKU title from the Microsoft Store listing.
Notes: (Read only property)

222.13.21 Delegates

222.13.22 GetIsInstalledAsyncCompletedMBS(ErrorCode as Integer, Installed as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The delegate triggered by GetIsInstalledAsync when finished.

222.14 class WindowsStoreVideoMBS

222.14.1 class WindowsStoreVideoMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Represents a video that is associated with a product listing in the Microsoft Store.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

222.14.2 Methods

222.14.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

222.14.4 Properties

222.14.5 Caption as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the caption for the video.
Notes: (Read only property)

222.14.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

222.14.7 Height as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the height of the video, in pixels.
Notes: (Read only property)

222.14.8 PreviewImage as WindowsStoreImageMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the preview image that is displayed for the video.
Notes: (Read only property)

222.14.9 Uri as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the URI of the video.
Notes: (Read only property)

222.14.10 VideoPurposeTag as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the tag for the video.
Notes: (Read only property)

222.14.11 Width as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the width of the video, in pixels.
Notes: (Read only property)

Chapter 223

Windows System Tray

223.1 Globals

223.1.1 HIconFromFileMBS(IconFile as FolderItem, IconID as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a Windows Icon Handle for an icon loaded fromt he given icon file.
Notes: What image depths are used and supported depends on the Windows version.
IconID = 0 points to the first icon in the file.
Returns 0 on failure.

The icon file can be .ico, .exe, .dll or similar files with windows icon resource.
This function is useful for declares where you have to pass a HICON parameter.

- MBS Plugins 11.1 Release notes
- MBS REALbasic Plugins, version 11.1pr2

223.1.2 HIconFromPicturesMBS(Icon as picture, Mask as picture) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a Windows Icon Handle with the given pictures.
Notes: What image depths are used and supported depends on the Windows version.
Returns 0 on failure.
This function is useful for declares where you have to pass a HICON parameter.
Blog Entries

223.2 class WindowsSystemTrayMBS

223.2.1 class WindowsSystemTrayMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to create an item in the system tray.
Example:

```
// show an icon in the Windows notification area with a tooltip and balloon
// MyTrayIcon is a subclass of WindowsSystemTrayMBS with the MouseLeftButtonUp event implemented.
// Tray is a property of the app: Tray As MyTrayIcon
Tray = New MyTrayIcon
Call Tray.SetIconPicture(LogoMBS(16), Nil)
Tray.Tooltip = "MyApp is running"
If Tray.Add Then
Tray.BalloonTitle = "MyApp"
Tray.BalloonText = "Backup finished."
Call Tray.Modify
End If

// in MyTrayIcon:
Sub MouseLeftButtonUp(id As Integer, MouseX As Integer, MouseY As Integer) Handles MouseLeftBut-
tonUp
System.DebugLog "Tray icon clicked."
End Sub
```

Blog Entries

223.2.2 Methods

223.2.3 Add as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds the item to the system tray.
Example:

```
Var e as WindowsSystemTrayMBS // your system tray object

if e.add then
list.addrow "Added icon."
else
list.addrow "Failed to add icon."
end if
```

Notes: Returns true if successful.
You can change the Icon&Mask or the Tooltip string.

223.2.4 Available as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the system tray functions are available.
Notes: Returns true on Windows 95 and newer.
Returns false on Mac OS and Linux.

223.2.5 Modify as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Modifies the item to the system tray.
Notes: Returns true if successful.
You can change the Icon&Mask or the Tooltip string.

223.2.6 Remove as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes the item from the system tray.
Notes: Returns true if successful.

223.2.7 SetFocus as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: This method resets focus back to the system try area.
Notes: May be useful to call as cleanup after some context menu was shown.

223.2.8 SetIconFile(IconFile as FolderItem, IconID as Integer) as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads an icon from the given file.
Example:

```
Var wst as WindowsSystemTrayMBS // your system tray

call wst.SetIconFile(file,1)
```

Notes: Returns true on success and false on failure.
What image depths are used and supported depends on the Windows version.
IconID = 0 points to the first icon in the file.

The icon file can be .ico, .exe, .dll or similar files with windows icon resource.

223.2.9 SetIconPicture(Icon as picture, Mask as picture) as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads the icon from the given picture with mask.
Example:

```
Var myicon as picture // your picture
Var mymask as picture // the mask for the picture
Var wst as WindowsSystemTrayMBS // your system tray

call wst.SetIconPicture(myicon, mymask)
```

Notes: Returns true on success and false on failure.
What image depths are used and supported depends on the Windows version.

Type is 0 for a small icon and 1 for a big icon.

223.2.10 Properties

223.2.11 BalloonMode as Integer

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The balloon mode.
Example:

```
Var s as WindowsSystemTrayMBS

s.BalloonText = "The text for the balloon."
s.BalloonTitle = "The title for the balloon"
s.BalloonMode = 0 // Error mode
```

Notes: 0 is Error, 1 is Info and 2 is warning.
(Read and Write property)

223.2.12 BalloonText as string

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The balloon text to show.
Example:

```
Var wst as WindowsSystemTrayMBS // your system tray object

wst.BalloonTitle="Warning"
wst.BalloonText="You have not clicked on me the last 10 minutes."
call wst.modify
```

Notes: If BalloonTitle or BalloonText are not empty the balloon is shown when you call modify.
(Read and Write property)

223.2.13 BalloonTimeout as Integer

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The balloon timeout in milliseconds.
Example:

```
Var s as WindowsSystemTrayMBS

s.BalloonText = "The text for the balloon."
s.BalloonTitle = "The title for the balloon"
```

```
s.BalloonMode = 0 // Error mode
s.BalloonTimeout = 30000
```

Notes: A value between 10000 and 30000.
Note that Timeout is valid only in Windows 2000 and Windows XP.
(Read and Write property)
See also:

- 223.2.22 BalloonTimeout(id as Integer, MouseX as Integer, MouseY as Integer) 25316

223.2.14 BalloonTitle as string

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The title of the balloon tooltip.
Example:

```
Var s as WindowsSystemTrayMBS

s.BalloonText = "The text for the balloon."
s.BalloonTitle = "The title for the balloon"
s.BalloonMode = 0 // Error mode
```

Notes: If BalloonTitle or BalloonText are not empty the balloon is shown when you call modify.
(Read and Write property)

223.2.15 IconHandle as Integer

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The icon handle currently used for the tray object.
Notes: zero if no handle is there.
(Read and Write property)

223.2.16 ID as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: If you have more than one icon in the system tray, use this ID to see which one is referred to inside an event.
Notes: (Read and Write property)

223.2.17 Tooltip as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The help string for the tooltip.
Example:

```
Var e as WindowsSystemTrayMBS // global

e=new WindowsSystemTrayMBS
e.ID=12345678
e.Tooltip="some text"
e.BalloonText="some text"
e.BalloonTitle="some text"
e.BalloonMode=0
```

Notes: Limited to 63 characters.
(Read and Write property)

223.2.18 UsingNewEvents as Boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the new events are enabled.
Notes: The plugin tries to enable new events if possible. That will only work on Windows 2000 or newer.

New events are:
BalloonTimeout
PopupOpen
ContextMenu
BalloonHide
KeySelected
BalloonUserClick
BalloonShow
Selected
(Read only property)

223.2.19 Events

223.2.20 BalloonHide(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The balloon has been hidden.

223.2.21 BalloonShow(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The balloon was shown.
Notes: You will get one balloon event when it disappears: BalloonHide, BalloonUserClick or BalloonTimeout.

223.2.22 BalloonTimeout(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The balloon was removed because of a timeout.
See also:

- 223.2.13 BalloonTimeout as Integer 25313

223.2.23 BalloonUserClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The user clicked on the balloon to make it away.

223.2.24 ContextMenu(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: You should show a context menu.

223.2.25 KeySelected(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The system tray item was selected by the keyboard.

223.2.26 MouseLeftButtonDoubleClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the left mouse button is pressed for a double click on the system tray icon.

223.2.27 MouseLeftButtonDown(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the left mouse button is pressed on the system tray icon.

223.2.28 MouseLeftButtonUp(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the left mouse button is released on the system tray icon.

223.2.29 MouseMiddleButtonDoubleClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the middle mouse button is pressed for a double click on the system tray icon.

223.2.30 MouseMiddleButtonDown(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the middle mouse button is pressed on the system tray icon.

223.2.31 MouseMiddleButtonUp(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the middle mouse button is released on the system tray icon.

223.2.32 MouseMove(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the mouse is moved over the system tray icon.

223.2.33 MouseRightButtonDoubleClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the right mouse button is pressed for a double click on the system tray icon.

223.2.34 MouseRightButtonDown(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the right mouse button is pressed on the system tray icon.

223.2.35 MouseRightButtonUp(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the right mouse button is pressed on the system tray icon.

223.2.36 PopupOpen(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: You should show a popup menu on the mouse position.

223.2.37 Selected(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The system tray item was selected.

Chapter 224

Windows Taskbar State

224.1 class WindowsTaskbarStateMBS

224.1.1 class WindowsTaskbarStateMBS

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for information about the settings for the Windows taskbar.
Blog Entries

- MBS Real Studio Plugins, version 12.2pr6

224.1.2 Properties

224.1.3 AlwaysOnTop as Boolean

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: True if the taskbar should be always on the top.
Notes: Value is false on any error.
Settable in plugin version 12.2 and newer.
(Read and Write property)

224.1.4 AutoHide as Boolean

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: True if the taskbar automatically hides itself.
Notes: Value is false on any error.

Settable in plugin version 12.2 and newer.
(Read and Write property)

224.1.5 Bottom as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The bottom value of the taskbar dimensions.
Notes: Value is 0 on any error.
(Read and Write property)

224.1.6 Height as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height value of the taskbar dimensions.
Notes: Value is 0 on any error.
(Read and Write property)

224.1.7 Left as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The left value of the taskbar dimensions.
Notes: Value is 0 on any error.
(Read and Write property)

224.1.8 Right as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The right value of the taskbar dimensions.
Notes: Value is 0 on any error.
(Read and Write property)

224.1.9 Top as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The top value of the taskbar dimensions.
Notes: Value is 0 on any error.
(Read and Write property)

224.1.10 Width as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width value of the taskbar dimensions.
Notes: Value is 0 on any error.
(Read and Write property)

Chapter 225

WindowsML

225.1 class WindowsMLExceptionMBS

225.1.1 class WindowsMLExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The exception class for Windows runtime exceptions in WindowsML Plugin part.
Notes: All exceptions should have the HRESULT as errorNumber and the message set.
Subclass of the RuntimeException class.

225.2 class WinLearningModelBindingMBS

225.2.1 class WinLearningModelBindingMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Used to bind values to named input and output features.
Blog Entries

- News from the MBS Xojo Plugins Version 20.5
- Playing with Machine Learning on Windows

225.2.2 Methods

225.2.3 BindWithDouble(name as string, shape() as Integer, values() as Double = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 64-bit floating point values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

225.2.4 BindWithFloat(name as string, shape() as Integer, values() as Single = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 32-bit floating point values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

225.2.5 BindWithFloat16(name as string, shape() as Integer, values() as Single = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 16-bit floating point values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

225.2.6 BindWithImage(name as string, file as folderItem)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given image file.
Notes: Maybe used with features needing image or tensor data.
See also:

- 225.2.7 BindWithImage(name as string, Path as String) 25327

225.2.7 BindWithImage(name as string, Path as String)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given image file.
Notes: Maybe used with features needing image or tensor data.
See also:

- 225.2.6 BindWithImage(name as string, file as folderItem) 25327

225.2.8 BindWithInt16(name as string, shape() as Integer, values() as Int16 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 16-bit signed integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

225.2.9 BindWithInt32(name as string, shape() as Integer, values() as Int32 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 32-bit signed integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

225.2.10 BindWithInt64(name as string, shape() as Integer, values() as Int64 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 64-bit signed integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

225.2.11 BindWithInt8(name as string, shape() as Integer, values() as Int8 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 8-bit signed integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

225.2.12 BindWithUInt16(name as string, shape() as Integer, values() as UInt16 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 16-bit unsigned integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

225.2.13 BindWithUInt32(name as string, shape() as Integer, values() as UInt32 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 32-bit unsigned integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

225.2.14 BindWithUInt64(name as string, shape() as Integer, values() as UInt64 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 64-bit unsigned integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

225.2.15 BindWithUInt8(name as string, shape() as Integer, values() as UInt8 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 8-bit unsigned integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

225.2.16 Clear

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Remove all bindings.

225.2.17 Constructor(Session as WinLearningModelSessionMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Creates a WinLearningModelBindingMBS from the specified WinLearningModelSessionMBS.

225.2.18 HasKey(key as string) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Determines whether the map view contains the specified key.
Notes: Returns true if the map view contains the specified key; otherwise, false.

225.2.19 SetDefaults

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Fills all tensor arrays with empty arrays.

225.2.20 Properties

225.2.21 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

225.2.22 Session as WinLearningModelSessionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The related session.
Notes: (Read only property)

225.3 class WinLearningModelEvaluationResultMBS

225.3.1 class WinLearningModelEvaluationResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Get the results of the evaluation.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Playing with Machine Learning on Windows

225.3.2 Methods

225.3.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

225.3.4 GetTensorBoolean(name as string) as Boolean()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor boolean array.

225.3.5 GetTensorDouble(name as string) as Double()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor double array.

225.3.6 GetTensorFloat(name as string) as Single()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor float array.

225.3.7 GetTensorFloat16(name as string) as Single()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 16-bit float array.

225.3.8 GetTensorInt16(name as string) as Int16()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 16 bit signed integer array.

225.3.9 GetTensorInt32(name as string) as Int32()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 32 bit signed integer array.

225.3.10 GetTensorInt64(name as string) as Int64()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 64 bit signed integer array.

225.3.11 GetTensorInt8(name as string) as Int8()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 8 bit signed integer array.

225.3.12 GetTensorUInt16(name as string) as UInt16()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 16 bit unsigned integer array.

225.3.13 GetTensorUInt32(name as string) as UInt32()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 32 bit unsigned integer array.

225.3.14 GetTensorUInt64(name as string) as UInt64()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 64 bit unsigned integer array.

225.3.15 GetTensorUInt8(name as string) as UInt8()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 8 bit unsigned integer array.

225.3.16 OutputNames as String()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Gets the output feature names of the model.

225.3.17 Properties

225.3.18 CorrelationId as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The optional string that was passed to Evaluate function.
Notes: (Read only property)

225.3.19 ErrorStatus as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: If the evaluation failed, returns an error code for what caused the failure.
Notes: (Read only property)

225.3.20 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

225.3.21 Succeeded as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: True if the evaluation completed successfully; otherwise, false.
Notes: (Read only property)

225.4 class WinLearningModelFeatureDescriptorMBS

225.4.1 class WinLearningModelFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Describes the common properties that all features have.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

225.4.2 Methods

225.4.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

225.4.4 Properties

225.4.5 Description as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: A description of what this feature is used for in the model.
Notes: (Read only property)

225.4.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

225.4.7 Kind as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The kind of feature; use this to know which derived class to use.
Notes: Or use IsA operator in Xojo to determinate which subclass the plugin used.

(Read only property)

225.4.8 Name as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The name you use to bind values to this feature.
Notes: (Read only property)

225.4.9 Required as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: If true, you must bind a value to this feature before calling Evaluate.
Notes: (Read only property)

225.4.10 Constants

Kinds

Constant	Value	Description
KindImage	3	The feature is an image, so use WinLearningModelImageFeatureDescriptorMBS class.
KindMap	2	The feature is a map, so use WinLearningModelMapFeatureDescriptorMBS class.
KindSequence	1	The feature is a sequence, so use WinLearningModelSequenceFeatureDescriptorMBS class.
KindTensor	0	The feature is a tensor, so use WinLearningModelTensorFeatureDescriptorMBS class.

Tensor Kind

Constant	Value	Description
TensorKindBoolean	9	The tensor type is Boolean.
TensorKindComplex128	15	Invalid type.
TensorKindComplex64	14	Invalid type.
TensorKindDouble	11	The tensor type is 64-bit floating point.
TensorKindFloat	1	The tensor type is 32-bit floating point.
TensorKindFloat16	10	The tensor type is 16-bit floating point.
TensorKindInt16	5	The tensor type is 16-bit signed integer.
TensorKindInt32	6	The tensor type is 32-bit signed integer.
TensorKindInt64	7	The tensor type is 64-bit signed integer.
TensorKindInt8	3	The tensor type is 8-bit signed integer.
TensorKindString	8	The tensor type is String.
TensorKindUInt16	4	The tensor type is 16-bit unsigned integer.
TensorKindUInt32	12	The tensor type is 32-bit unsigned integer.
TensorKindUInt64	13	The tensor type is 64-bit unsigned integer.
TensorKindUInt8	2	The tensor type is 8-bit unsigned integer.
TensorKindUndefined	0	Invalid type.

225.5 class WinLearningModelImageFeatureDescriptorMBS

225.5.1 class WinLearningModelImageFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Describes the properties of the image the model is expecting.
Notes: Subclass of the WinLearningModelFeatureDescriptorMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

225.5.2 Properties

225.5.3 BitmapAlphaMode as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Specifies the expected alpha mode of the image.
Notes: (Read only property)

225.5.4 BitmapPixelFormat as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Specifies the expected pixel format (channel ordering, bit depth, and data type).
Notes: (Read only property)

225.5.5 Height as UInt32

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The expected image height.
Notes: (Read only property)

225.5.6 Width as UInt32

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The expected image width.
Notes: (Read only property)

225.5.7 Constants

Alpha Modes

Constant	Value	Description
BitmapAlphaModeIgnore	2	The alpha value is ignored.
BitmapAlphaModePremultiplied	0	The alpha value has been premultiplied. Each color is first scaled by the alpha value.
BitmapAlphaModeStraight	1	The alpha value has not been premultiplied. The alpha channel indicates the transparency of the color.

Bitmap Formats

Constant	Value	Description
BitmapPixelFormatBgra8	87	The pixel format is B8G8R8A8 unsigned integer.
BitmapPixelFormatGray16	57	The pixel format is 16 bpp grayscale.
BitmapPixelFormatGray8	62	The pixel format is 8 bpp grayscale.
BitmapPixelFormatNv12	103	The pixel format is NV12.
BitmapPixelFormatP010	104	The pixel format is P010.
BitmapPixelFormatRgba16	12	The pixel format is R16B16G16A16 unsigned integer.
BitmapPixelFormatRgba8	30	The pixel format is R8G8B8A8 unsigned integer.
BitmapPixelFormatUnknown	0	The pixel format is unknown.
BitmapPixelFormatYuy2	107	The pixel format is YUY2.

225.6 class WinLearningModelMapFeatureDescriptorMBS

225.6.1 class WinLearningModelMapFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The descriptor for a map, which is a collection of (key, value) pairs.
Notes: Subclass of the WinLearningModelFeatureDescriptorMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

225.6.2 Properties

225.6.3 KeyKind as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Map keys can be tensor kinds.
Notes: (Read only property)

225.6.4 ValueDescriptor as WinLearningModelFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Map values can be feature kinds.
Notes: (Read only property)

225.7 class WinLearningModelMBS

225.7.1 class WinLearningModelMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Represents a trained machine learning model.
Example:

```
Var ModelFile as FolderItem =SpecialFolder.Desktop.Child("SqueezeNet.onnx")

if not ModelFile.Exists then
MessageBox "Please download model first!"
quit
end if

Var model as WinLearningModelMBS = WinLearningModelMBS.LoadFromFile(ModelFile)

if model = nil then
MessageBox "Failed to load model!"
// Check path and you need Windows 10
quit
end if
```

Notes: This is the main object you use to interact with Windows ML. You use it to load, bind, and evaluate trained ONNX models:

- Load the model using one of the Load method.
- Enumerate the InputFeatures and OutputFeatures and bind to your model.
- Create a LearningModelSessionMBS and evalaute.

Requires Windows 10.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- News from the MBS Xojo Plugins Version 20.5
- MBS Xojo Plugins, version 20.5pr1
- Playing with Machine Learning on Windows

225.7.2 Methods

225.7.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

225.7.4 InputFeatures as WinLearningModelFeatureDescriptorMBS()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: A list of the model's input features.
Example:

```
Var model as WinLearningModelMBS // your model

Var inputFeatures() as WinLearningModelFeatureDescriptorMBS = model.InputFeatures
for each feature as WinLearningModelFeatureDescriptorMBS in inputFeatures

list.AddRow feature.Name

next
```

225.7.5 LoadFromFile(File as FolderItem) as WinLearningModelMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Loads a model for Windows Machine Learning.
Example:

```
Var ModelFile as FolderItem =SpecialFolder.Desktop.Child("SqueezeNet.onnx")

if not ModelFile.Exists then
MessageBox "Please download model first!"
quit
end if

Var model as WinLearningModelMBS = WinLearningModelMBS.LoadFromFile(ModelFile)

if model = nil then
MessageBox "Failed to load model!"
// Check path and you need Windows 10
quit
end if
```

Notes: Please use an onnx file as you find them on various websites, e.g. start here:
https://docs.microsoft.com/en-us/windows/ai/windows-ml/get-onnx-model

Will rasie an exception about unregistered class if called on older Windows versions before 10.

225.7.6 LoadFromFilePath(Path as String) as WinLearningModelMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Loads a model for Windows Machine Learning.
Notes: Please use an onnx file as you find them on various websites, e.g. start here:
https://docs.microsoft.com/en-us/windows/ai/windows-ml/get-onnx-model

Will rasie an exception about unregistered class if called on older Windows versions before 10.

225.7.7 OutputFeatures as WinLearningModelFeatureDescriptorMBS()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: A list of the model's output features.
Example:

```
Var model as WinLearningModelMBS // your model

Var OutputFeatures() as WinLearningModelFeatureDescriptorMBS = model.OutputFeatures
for each feature as WinLearningModelFeatureDescriptorMBS in OutputFeatures

list.AddRow feature.Name

next
```

225.7.8 Properties

225.7.9 Author as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The name of the model author.
Notes: (Read only property)

225.7.10 Description as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: A description of the model.
Notes: (Read only property)

225.7.11 Domain as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The domain of the model.
Notes: (Read only property)

225.7.12 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

225.7.13 Metadata as Dictionary

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The metadata from the ONNX model.
Notes: (Read only property)

225.7.14 Name as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The name of the model.
Notes: (Read only property)

225.7.15 Version as Int64

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The version of the model.
Notes: (Read only property)

225.8 class WinLearningModelSequenceFeatureDescriptorMBS

225.8.1 class WinLearningModelSequenceFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: A descriptor for a sequence with an array of elements.
Notes: Subclass of the WinLearningModelFeatureDescriptorMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

225.8.2 Properties

225.8.3 ElementDescriptor as WinLearningModelFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The feature descriptor for this sequence element.
Notes: (Read only property)

225.9 class WinLearningModelSessionMBS

225.9.1 class WinLearningModelSessionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Used to evaluate machine learning models.
Blog Entries

- Playing with Machine Learning on Windows

225.9.2 Methods

225.9.3 Constructor(model as WinLearningModelMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Creates a session using the default device.
Notes: model: The trained machine learning model for this session.

225.9.4 Evaluate(bindings as WinLearningModelBindingMBS, correlationId as string = "") as WinLearningModelEvaluationResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Evaluate the machine learning model using the feature values bound in bindings.
Notes: bindings: Holder for associations between model inputs and variable instances.
correlationId: Optional user-supplied string to connect the output results.

MBS Plugins don't support all possible input/output combinations, so if you need something more, please let us know.

225.9.5 Properties

225.9.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

225.9.7 Model as WinLearningModelMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The trained machine learning model for this session.
Notes: (Read only property)

225.10 class WinLearningModelTensorFeatureDescriptorMBS

225.10.1 class WinLearningModelTensorFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Tensors are multi-dimensional arrays of values.
Notes: The layout of tensors is row-major, with tightly packed contiguous data representing each dimension. The total size of a tensor is the product of the size of each dimension.
Subclass of the WinLearningModelFeatureDescriptorMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

225.10.2 Methods

225.10.3 Shape as Integer()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The count and size of each dimension.

225.10.4 Properties

225.10.5 TensorKind as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The data type of the tensor.
Notes: (Read only property)

Chapter 226

WiringPi

226.1 module WiringPiMBS

226.1.1 module WiringPiMBS

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: The module to work with wiring pi library.
Example:

```
// blink a LED on GPIO pin 17 of a Raspberry Pi
If Not WiringPiMBS.LoadLibrary("/usr/lib/libwiringPi.so") Then Return
If WiringPiMBS.wiringPiSetupGpio <>0 Then Return // use BCM pin numbers

WiringPiMBS.pinMode(17, WiringPiMBS.kOUTPUT)
For i As Integer = 1 To 5
WiringPiMBS.digitalWrite(17, WiringPiMBS.kHIGH)
WiringPiMBS.delay(500) // milliseconds
WiringPiMBS.digitalWrite(17, WiringPiMBS.kLOW)
WiringPiMBS.delay(500)
Next
```

Notes: Deprecated as underlaying C library is deprecated.

226.1.2 Methods

226.1.3 analogRead(pin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns the value read on the supplied analog input pin.
Notes: You will need to register additional analog modules to enable this function for devices such as the Gertboard, quick2Wire analog board, etc.

226.1.4 analogWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This writes the given value to the supplied analog pin.
Notes: You will need to register additional analog modules to enable this function for devices such as the Gertboard.

226.1.5 Board40Pin as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Checks if the current Raspberry Pi model uses the 40-pin GPIO header.
Notes: Returns 1 if the board has a 40-pin header, 0 otherwise.

Added in WiringPi Interface v3.7.

226.1.6 delay(HowLong as UInt32)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This causes program execution to pause for at least howLong milliseconds.
Notes: Due to the multi-tasking nature of Linux it could be longer. Note that the maximum delay is an

unsigned 32-bit integer or approximately 49 days.

226.1.7 delayMicroseconds(HowLong as UInt32)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This causes program execution to pause for at least howLong microseconds.
Notes: Due to the multi-tasking nature of Linux it could be longer. Note that the maximum delay is an unsigned 32-bit integer microseconds or approximately 71 minutes.

Delays under 100 microseconds are timed using a hard-coded loop continually polling the system time, Delays over 100 microseconds are done using the system nanosleep() function –You may need to consider the implications of very short delays on the overall performance of the system, especially if using threads.

226.1.8 digitalRead(pin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This function returns the value read at the given pin.
Notes: It will be kHIGH or kLOW (1 or 0) depending on the logic level at the pin.

226.1.9 digitalReadByte as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Reads the state of the first 8 GPIO pins (0–7) and returns them as a bitfield.
Notes: Returns 8-bit value representing each pin,Äôs digital level (1 = HIGH, 0 = LOW).

226.1.10 digitalWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Writes the value kHIGH or kLOW (1 or 0) to the given pin which must have been previously set as an output.
Notes: WiringPi treats any non-zero number as kHIGH, however 0 is the only representation of kLOW.

226.1.11 digitalWriteByte(value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This writes the 8-bit byte supplied to the first 8 GPIO pins.
Notes: It,Äôs the fastest way to set all 8 bits at once to a particular value, although it still takes two write operations to the Pi,Äôs GPIO hardware.

226.1.12 GlobalMemoryAccess as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Checks whether WiringPi has access to the global /dev/mem memory interface, allowing unrestricted hardware control.
Notes: Return:
1 if full memory access is available (root or elevated privileges).
0 if restricted to user-level access (via /dev/gpiomem).
Version: Introduced in Interface v3.3.
Notes: Some advanced features (e.g., hardware PWM, clock outputs) require global access.

226.1.13 gpioClockSet(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sets the clock.

226.1.14 GpioLayout as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns the GPIO layout type of the Raspberry Pi board (e.g., revision 1, 2, 3, etc.).
Notes: Returns an integer identifying the board,Äôs GPIO layout number (used internally to map pins).

This is the recommended way to determine board layout; supersedes piBoardRev().

226.1.15 I2CRead(fd as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device read.
Notes: Some devices present data when you read them without having to do any register transactions.
If the return value is negative then an error has happened and you should consult errno.

226.1.16 I2CReadReg16(fd as Integer, reg as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device read.
Notes: Some devices present data when you read them without having to do any register transactions. Read a 16-bit value from the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

226.1.17 I2CReadReg8(fd as Integer, reg as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device read.
Notes: Some devices present data when you read them without having to do any register transactions. Read an 8-bit value from the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

226.1.18 I2CSetup(devId as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This initialises the I2C system with your given device identifier.
Notes: The ID is the I2C number of the device and you can use the i2cdetect program to find this out. I2CSetup() will work out which revision Raspberry Pi you have and open the appropriate device in /dev.

The return value is the standard Linux filehandle, or -1 if any error –in which case, you can consult errno as usual.

E.g. the popular MCP23017 GPIO expander is usually device Id 0x20, so this is the number you would pass into wiringPiI2CSetup().

226.1.19 I2CSetupInterface(device as string, devId as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This initialises the I2C system with your given device identifier and name.

226.1.20 I2CWrite(fd as Integer, Data as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device write.
Notes: Some devices accept data this way without needing to access any internal registers.
If the return value is negative then an error has happened and you should consult errno.

226.1.21 I2CWriteReg16(fd as Integer, reg as Integer, Data as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device write.
Notes: Some devices accept data this way without needing to access any internal registers.
Write a 16-bit data value into the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

226.1.22 I2CWriteReg8(fd as Integer, reg as Integer, Data as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device write.
Notes: Some devices accept data this way without needing to access any internal registers.
Write a 8-bit data value into the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

226.1.23 LoadLibrary(File as FolderItem) as boolean

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Loads the library.
Notes: Returns true on success or false on failure.
LoadError is set in case of failure.
See also:

- 226.1.24 LoadLibrary(Path as string) as boolean

226.1.24 LoadLibrary(Path as string) as boolean

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Loads the library.
Notes: Returns true on success or false on failure.
LoadError is set in case of failure.
See also:

- 226.1.23 LoadLibrary(File as FolderItem) as boolean 25356

226.1.25 MemorySize(Index as Integer) as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries the memory sizes.
Notes: Looks up memory size in an array.
Index is 0 to 7.

226.1.26 micros as UInt32

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns a number representing the number of microseconds since your program called one of the wiringPiSetup functions.
Notes: It returns an unsigned 32-bit number which wraps after approximately 71 minutes.

226.1.27 millis as UInt32

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns a number representing the number of milliseconds since your program called one of the wiringPiSetup functions.
Notes: It returns an unsigned 32-bit number which wraps after 49 days.

226.1.28 physPinToGpio(physPin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns the BCM_GPIO pin number of the supplied physical pin on the P1 connector.

226.1.29 piBoardId(byref model as Integer, byref Rev as Integer, byref Mem as Integer, byref Maker as Integer, byref OverVolted as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries board identifiers.
Notes: Mem is memory in Megabytes.
Maker, Model and Rev are value which match the constants in this module.

226.1.30 piBoardRev as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns the board revision of the Raspberry Pi.
Notes: It will be either 1 or 2. Some of the BCM_GPIO pins changed number and function when moving from board revision 1 to 2, so if you are using BCM_GPIO pin numbers, then you need to be aware of the differences.

226.1.31 piHiPri(pri as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This attempts to shift your program (or thread in a multi-threaded program) to a higher priority and enables a real-time scheduling.
Notes: The priority parameter should be from 0 (the default) to 99 (the maximum). This won,Äôt make your program go any faster, but it will give it a bigger slice of time when other programs are running. The priority parameter works relative to others –so you can make one program priority 1 and another priority 2 and it will have the same effect as setting one to 10 and the other to 90 (as long as no other programs are running with elevated priorities)

The return value is 0 for success and -1 for error. If an error is returned, the program should then consult the errno global variable, as per the usual conventions.

Note: Only programs running as root can change their priority. If called from a non-root program then nothing happens.

226.1.32 piLock(Key as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Locks a synchronization lock.
Notes: These allow you to synchronise variable updates from your main program to any threads running

in your program. keyNum is a number from 0 to 3 and represents a ,Äúkey,Äù. When another process tries to lock the same key, it will be stalled until the first process has unlocked the same key.

You may need to use these functions to ensure that you get valid data when exchanging data between your main program and a thread –otherwise it,Äôs possible that the thread could wake-up halfway during your data copy and change the data –so the data you end up copying is incomplete, or invalid.

226.1.33 piMakerNames(index as Integer) as string

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Maps maker numbers to names.

226.1.34 piModelNames(index as Integer) as string

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Maps model numbers to names.

226.1.35 pinMode(pin as Integer, mode as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This sets the mode of a pin to either INPUT, OUTPUT, PWM_OUTPUT or GPIO_CLOCK. **Notes:** Note that only wiringPi pin 1 (BCM_GPIO 18) supports PWM output and only wiringPi pin 7 (BCM_GPIO 4) supports CLOCK output modes.

This function has no effect when in Sys mode. If you need to change the pin mode, then you can do it with the gpio program in a script before you start your program.

226.1.36 piRevisionNames(index as Integer) as string

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Maps revision numbers to names.

226.1.37 piUnlock(Key as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Unlocks a synchronization lock.
Notes: These allow you to synchronise variable updates from your main program to any threads running in your program. keyNum is a number from 0 to 3 and represents a ,Äúkey,Äù. When another process tries to lock the same key, it will be stalled until the first process has unlocked the same key.

You may need to use these functions to ensure that you get valid data when exchanging data between your main program and a thread –otherwise it,Äôs possible that the thread could wake-up halfway during your data copy and change the data –so the data you end up copying is incomplete, or invalid.

226.1.38 Processor(Index as Integer) as String

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries the process name.
Notes: Looks up processor name in an array.
Index is 0 to 4.

226.1.39 pullUpDnControl(pin as Integer, pud as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This sets the pull-up or pull-down resistor mode on the given pin, which should be set as an input.
Notes: Unlike the Arduino, the BCM2835 has both pull-up an down internal resistors. The parameter pud should be; kPUD_OFF, (no pull up/down), kPUD_DOWN (pull to ground) or kPUD_UP (pull to 3.3v) The internal pull up/down resistors have a value of approximately 50KŒ© on the Raspberry Pi.

This function has no effect on the Raspberry Pi,Äôs GPIO pins when in Sys mode. If you need to activate a pull-up/pull-down, then you can do it with the gpio program in a script before you start your program.

226.1.40 pwmSetClock(divisor as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This sets the divisor for the PWM clock.

226.1.41 pwmSetMode(mode as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: The PWM generator can run in 2 modes –,Äúbalanced,Äù and ,Äúmark:space,Äù.
Notes: The mark:space mode is traditional, however the default mode in the Pi is ,Äúbalanced,Äù. You can switch modes by supplying the parameter: kPWM_MODE_BAL or kPWM_MODE_MS.

226.1.42 pwmSetRange(range as UInt32)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This sets the range register in the PWM generator.
Notes: The default is 1024.

226.1.43 pwmToneWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Writes a tone.

226.1.44 pwmWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Writes the value to the PWM register for the given pin.
Notes: The Raspberry Pi has one on-board PWM pin, pin 1 (BMC_GPIO 18, Phys 12) and the range is 0-1024. Other PWM devices may have other PWM ranges.

This function is not able to control the Pi,Äôs on-board PWM when in Sys mode.

226.1.45 Read(fd as Integer, count as UInt64) as Memoryblock

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Read attempts to read count bytes of data from the object referenced by the descriptor fildes into a buffer.
Notes: Returns the memoryblock on success (if we got more than zero bytes).
Errno is set in case of error.

226.1.46 RP1Model as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns the Raspberry Pi RP1 I/O controller model version (used on Pi 5 and newer).
Notes: Return: Integer code identifying the RP1 revision.
Version: Added in WiringPi Interface v3.14.

226.1.47 serialClose(fd as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Closes the device identified by the file descriptor given.

226.1.48 serialDataAvail(fd as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns the number of characters available for reading, or -1 for any error condition, in which case errno will be set appropriately.

226.1.49 serialFlush(fd as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This discards all data received, or waiting to be send down the given device.

226.1.50 serialGetchar(fd as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns the next character available on the serial device.
Notes: This call will block for up to 10 seconds if no data is available (when it will return -1)

226.1.51 serialOpen(device as String, Baud as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This opens and initialises the serial device and sets the baud rate.
Notes: It sets the port into ,Äúraw,Äù mode (character at a time and no translations), and sets the read

timeout to 10 seconds. The return value is the file descriptor or -1 for any error, in which case errno will be set as appropriate.

226.1.52 serialPutchar(fd as Integer, c as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sends the single byte to the serial device identified by the given file descriptor.

226.1.53 serialPutData(fd as Integer, data as Memoryblock)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sends the nul-terminated string to the serial device identified by the given file descriptor.
Notes: This sends text with any encoding.

226.1.54 serialPuts(fd as Integer, text as string)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sends the nul-terminated string to the serial device identified by the given file descriptor.
Notes: This sends text with UTF-8 encoding.

226.1.55 setPadDrive(group as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This sets the ,Äústrength,Äù of the pad drivers for a particular group of pins.
Notes: There are 3 groups of pins and the drive strength is from 0 to 7. Do not use this unless you know what you are doing.

226.1.56 setPadDrivePin(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sets the drive strength for a specific GPIO pin.
Notes: Parameters:
pin: GPIO pin number.
value: drive strength (2–16 mA).

Version: Introduced in Interface v3.0.

226.1.57 SetupGpioDevice(PinType as Integer) as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes WiringPi using the /dev/gpiomem or /dev/mem device interface and the specified pin numbering system.
Notes: pinType: pin numbering mode (kWPI_PIN_WPI, kWPI_PIN_BCM, or kWPI_PIN_PHYS constants).

Returns 0 on success, -1 on failure.

Version: Introduced in Interface v3.3.

Notes:
Preferred for modern Raspberry Pi models using the RP1 I/O controller (Pi 5+).
Provides consistent device-level access with correct pin mappings.

226.1.58 SetupPinType(PinType as Integer) as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes WiringPi using a specified pin numbering type.
Notes: pinType:

- kWPI_PIN_WPI (WiringPi numbering)
- kWPI_PIN_BCM (Broadcom numbering)
- kWPI_PIN_PHYS (Physical pin numbering)

Return: 0 on success, -1 on failure.
Version: Added in Interface v3.3.
Notes: A flexible initializer replacing older mode-specific setup functions.

226.1.59 SPIDataRW(channel as Integer, data as Memoryblock) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This performs a simultaneous write/read transaction over the selected SPI bus.
Notes: Data that was in your buffer is overwritten by data returned from the SPI bus.

That,Äôs all there is in the helper library. It is possible to do simple read and writes over the SPI bus using the standard read() and write() system calls though –write() may be better to use for sending data to chains of shift registers, or those LED strings where you send RGB triplets of data. Devices such as A/D and D/A converters usually need to perform a concurrent write/read transaction to work.

226.1.60 SPIGetFd(channel as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries the file descriptor for a channel.

226.1.61 SPISetup(channel as Integer, speed as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This is the way to initialise a channel (The Pi has 2 channels; 0 and 1).
Notes: The speed parameter is an integer in the range 500,000 through 32,000,000 and represents the SPI clock speed in Hz.

The returned value is the Linux file-descriptor for the device, or -1 on error. If an error has happened, you may use the standard errno global variable to see why.

226.1.62 SPISetupMode(channel as Integer, speed as Integer, mode as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This is the way to initialise a channel (The Pi has 2 channels; 0 and 1).
Notes: The speed parameter is an integer in the range 500,000 through 32,000,000 and represents the SPI clock speed in Hz.

The returned value is the Linux file-descriptor for the device, or -1 on error. If an error has happened, you may use the standard errno global variable to see why.

226.1.63 UserLevelAccess as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: The user level access.
Notes: Returns:
1 if running under /dev/gpiomem (non-root, limited hardware control).
0 if using full /dev/mem access.

Notes: Complements wiringPiGlobalMemoryAccess(); both indicate runtime privilege mode.

226.1.64 Version(byref major as Integer, byref minor as Integer)

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Retrieves the version number of the installed WiringPi library.
Notes: major: filled with the major version number.
minor: filled with the minor version number.

226.1.65 wiringPiSetup as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes the library.
Notes: This initialises wiringPi and assumes that the calling program is going to be using the wiringPi pin numbering scheme. This is a simplified numbering scheme which provides a mapping from virtual pin numbers 0 through 16 to the real underlying Broadcom GPIO pin numbers. See the pins page for a table which maps the wiringPi pin number to the Broadcom GPIO pin number to the physical location on the edge connector.

This function needs to be called with root privileges.

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

226.1.66 wiringPiSetupGpio as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes the library.
Notes: This is identical to wiringPiSetup, however it allows the calling programs to use the Broadcom

GPIO pin numbers directly with no re-mapping.

As above, this function needs to be called with root privileges, and note that some pins are different from revision 1 to revision 2 boards.

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

226.1.67 wiringPiSetupPhys as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes the library.
Notes: Identical to wiringPiSetup, however it allows the calling programs to use the physical pin numbers on the P1 connector only.

As above, this function needs to be called with root priviliges.

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

226.1.68 wiringPiSetupSys as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes the library.
Notes: This initialises wiringPi but uses the /sys/class/gpio interface rather than accessing the hardware directly. This can be called as a non-root user provided the GPIO pins have been exported before-hand using the gpio program. Pin numbering in this mode is the native Broadcom GPIO numbers –the same as wiringPiSetupGpio() above, so be aware of the differences between Rev 1 and Rev 2 boards.

Note: In this mode you can only use the pins which have been exported via the /sys/class/gpio interface before you run your program. You can do this in a separate shell-script, or by using the system() function from inside your program to call the gpio program.

Also note that some functions have no effect when using this mode as they,Äôre not currently possible to action unless called with root privileges. (although you can use system() to call gpio to set/change modes if needed)

One of the setup functions must be called at the start of your program or your program will fail to work

correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

226.1.69 wpiPinToGpio(wpiPin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns the BCM_GPIO pin number of the supplied wiringPi pin.
Notes: It takes the board revision into account.

226.1.70 Write(fd as Integer, data as Memoryblock) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Write to a file descriptor.
Notes: Write attempts to write bytes to the object referenced by the descriptor fildes from the memoryblock pointed to by data.
Upon successful completion the number of bytes which were written is returned. Otherwise, a -1 is returned and the global variable errno is set to indicate the error.

226.1.71 Properties

226.1.72 ErrNo as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: The last error code from the underlaying Linux functions.
Notes: must be called directly after a function to have the result from that function.
Calling any other function including writing a debug log, may cause this value to be reset.
(Read only property)

226.1.73 LoadError as String

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns the last load error.
Notes: (Read only property)

226.1.74 Constants

Constants

Constant	Value	Description
kHIGH	1	The constant for high value.
kLOW	0	The constant for low value.

Pin Modes

Constant	Value	Description
kGPIO_CLOCK	3	Configures the pin as a clock output driven by the GPIO hardware clock.
kINPUT	0	Sets the pin as a digital input, used to read HIGH or LOW signals.
kOUTPUT	1	Sets the pin as a digital output, used to write HIGH or LOW signals.
kPM_OFF	7	Resets the pin to input mode, effectively turning off or releasing the line.
kPWM_BAL_OUTPUT	9	Configures PWM in balanced mode, distributing on/off times evenly for certain applications.
kPWM_MS_OUTPUT	8	Configures PWM in mark-space (traditional) mode for stable duty cycles.
kPWM_OUTPUT	2	PWM Output
kPWM_TONE_OUTPUT	6	Tone Output
kSOFT_PWM_OUTPUT	4	Enables software-driven PWM output, useful when hardware PWM is unavailable.
kSOFT_TONE_OUTPUT	5	Enables software-generated square wave tones on the pin.

GPIO Layouts

Constant	Value	Description
kGPIO_LAYOUT_DEFAULT	2	Default
kGPIO_LAYOUT_PI1_REV1	1	Pi 1 A/B Revision 1, 1.1, CM

Interrupt Levels

Constant	Value	Description
kINT_EDGE_BOTH	3	Both
kINT_EDGE_FALLING	1	Failing
kINT_EDGE_RISING	2	Rising
kINT_EDGE_SETUP	0	Setup

Models

Constant	Value	Description
kPI_ALPHA	5	Early pre-production prototype board (,ÄúAlpha,Äù) used for internal testing.
kPI_MODELS_MAX	27	Maximum number of recognized Raspberry Pi model identifiers.
kPI_MODEL_2	4	Raspberry Pi 2 Model B —upgraded to a quad-core CPU and 1GB RAM.
kPI_MODEL_3AP	14	Raspberry Pi 3 Model A+ —smaller version of 3B+ with fewer ports but same CPU.
kPI_MODEL_3B	8	Raspberry Pi 3 Model B —integrated Wi-Fi, Bluetooth, and a faster 64-bit processor.
kPI_MODEL_3BP	13	Raspberry Pi 3 Model B+ —improved networking, CPU speed, and thermal performance.
kPI_MODEL_400	19	Raspberry Pi 400 —keyboard-integrated Pi based on Pi 4 hardware.
kPI_MODEL_4B	17	Raspberry Pi 4 Model B —major upgrade with USB 3.0, dual HDMI, and up to 8GB RAM.
kPI_MODEL_5	23	Raspberry Pi 5 —next-generation model with significant performance and I/O improvements.
kPI_MODEL_500	25	Raspberry Pi 500 —all-in-one keyboard computer version of the Pi 5.
kPI_MODEL_A	0	Original Raspberry Pi Model A —early, low-cost version with fewer USB ports and no Ethernet.
kPI_MODEL_AP	2	Raspberry Pi Model A+ —improved power efficiency and smaller form factor than Model A.
kPI_MODEL_B	1	Original Raspberry Pi Model B —added more RAM, Ethernet, and extra USB ports.
kPI_MODEL_BP	3	Model BP
kPI_MODEL_CM	6	Compute Module (CM1) —compact version designed for embedded applications.
kPI_MODEL_CM3	10	Compute Module 3 —based on Raspberry Pi 3 architecture for embedded systems.
kPI_MODEL_CM3P	16	Compute Module 3+ —enhanced version of CM3 with improved thermal management.
kPI_MODEL_CM4	20	Compute Module 4 —modular version of Pi 4 for embedded use with eMMC and I/O flexibility.
kPI_MODEL_CM4S	21	Compute Module 4S —variant of CM4 compatible with CM3 form factor for easier upgrades.
kPI_MODEL_CM5	24	Compute Module 5 —embedded variant of Raspberry Pi 5.
kPI_MODEL_CM5L	26	Compute Module 5 Lite —cost-reduced version of CM5 without onboard eMMC storage.
kPI_MODEL_ZERO	9	Raspberry Pi Zero —ultra-small, low-cost version with minimal connectivity.
kPI_MODEL_ZERO_2W	18	Raspberry Pi Zero 2 W —upgraded Zero with quad-core CPU and wireless connectivity.
kPI_MODEL_ZERO_W	12	Raspberry Pi Zero W —Zero with built-in Wi-Fi and Bluetooth.

Makers

Constant	Value	Description
kPI_MAKER_EGOMAN	1	Egoman
kPI_MAKER_EMBEST	2	Indicates the board was made by Embest (another authorized producer of Pi boards).
kPI_MAKER_SONY	0	Indicates the board was manufactured by Sony (the primary official manufacturer).
kPI_MAKER_UNKNOWN	3	Used when the manufacturer cannot be identified from the board,Äôs revision code.

Versions

Constant	Value	Description
kPI_VERSION_1	0	Identifies the original Raspberry Pi Model 1 (revision 1) board version.
kPI_VERSION_1_1	1	Identifies Raspberry Pi Model 1 revision 1.1, with minor hardware updates.
kPI_VERSION_1_2	2	Identifies Raspberry Pi Model 1 revision 1.2, which added mounting holes and other small changes.
kPI_VERSION_2	3	Identifies Raspberry Pi 2 or later generation boards with upgraded CPU and memory.

Pull Up/Down

Constant	Value	Description
kPUD_DOWN	1	pull to ground
kPUD_OFF	0	no pull up/down
kPUD_UP	2	pull to 3.3v

PWM Modes

Constant	Value	Description
kPWM_MODE_BAL	1	Balanced
kPWM_MODE_MS	0	Mark:Space

wiringPi modes

Constant	Value	Description
kWPI_MODE_GPIO	1	Uses Broadcom (BCM) GPIO pin numbering as used by the SoC.
kWPI_MODE_GPIO_DEVICE_BCM	5	Uses BCM numbering but through the /dev/gpiomem or /dev/mem interface.
kWPI_MODE_GPIO_DEVICE_PHYS	7	Uses physical pin numbering through the GPIO device interface.
kWPI_MODE_GPIO_DEVICE_WPI	6	Uses WiringPi pin numbering through the GPIO device interface.
kWPI_MODE_GPIO_SYS	2	(Deprecated since 3.2) Used system GPIO interface via /sys/class/ access without root.
kWPI_MODE_PHYS	3	Uses the physical pin numbers on the Raspberry Pi header (1–40).
kWPI_MODE_PIFACE	4	Configures access to the PiFace Digital I/O board.
kWPI_MODE_PINS	0	Uses WiringPi,Äôs own pin numbering scheme (0–16), unique to the l
kWPI_MODE_UNINITIALISED	-1	Indicates that WiringPi has not been initialized or that no mode has yet.

Pin Numbering System

Constant	Value	Description
kWPI_PIN_BCM	1	Refers to the Broadcom (BCM) GPIO numbering used by the Raspberry Pi SoC.
kWPI_PIN_PHYS	3	Refers to the physical pin numbers on the Raspberry Pi,Äôs 40-pin GPIO header.
kWPI_PIN_WPI	2	Refers to the WiringPi,Äôs own internal pin numbering scheme.

Chapter 227

Wordfile

227.1 class WordFileMBS

227.1.1 class WordFileMBS

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Word file editing.
Example:

```
Var f as FolderItem = New FolderItem("test.docx")
Var b as BinaryStream = BinaryStream.Open(f)
Var d as string = b.Read(b.Length)
Var w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = New FolderItem("output.docx")
if w.WriteFile(f) then
MessageBox "OK"
end if
end if
end if
```

Notes: This is a class for reading word files and replacing text to customize document files.
Works for xml and docx files. Does not support old doc file format.

Please report document files where plugin corrupted file or failed to replace text.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

227.1.2 Methods

227.1.3 addMediaFile(name as string, content as string)

MBS Tools Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a media file image.
Notes: You can use this function to add a new image.
You need to add the reference in XML yourself to let the image appear somewhere in the document.

227.1.4 Append(other as WordFileMBS, AddPageBreak as boolean = false) as Boolean

MBS Tools Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends one word file text to other.
Notes: This function takes document part from other word file and copies it,Äôs xml nodes to the current document.
Please only copy from one document to other if they both are made from same template, so internal IDs for styles match.
Returns true on success or false on failure.

Added AddPageBreak parameter in version 19.2. If true, we add a page break between the old and new parts.

227.1.5 AppendTableRow(tag as string) as Integer

MBS Tools Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Duplicates a table row containing a placeholder.
Notes: If you have tables in your template word file and you like to duplicate it, this function can do that and add the new row on the end of the table.

Returns Values

0	success
1	Tag not found.
2	Tag found, but not in a table.
3	Missing main document part.

227.1.6 Constructor

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The private constructor.

227.1.7 Contains(findText as string) as boolean

MBS Tools Plugin, Plugin Version: 21.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if some text exists in the document.
Notes: This is like HasTag function, but doesn't require markers around the text in the document.

227.1.8 DuplicateTableRow(tag as string) as Integer

MBS Tools Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Duplicates a table row containing a placeholder.
Notes: If you have tables in your template word file and you like to duplicate it, this function can do that and add the new row on just after the row to copy.

Returns Values

0	success
1	Tag not found.
2	Tag found, but not in a table.
3	Missing main document part.

227.1.9 FieldNames as String()

MBS Tools Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries field names in the file.
Notes: This looks for form fields in a word file.

227.1.10 GetFieldText(fieldName as string, byref text as String) as boolean

MBS Tools Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries field value.
Notes: The plugin looks for the field with given name and queries it's text.
Returns true if field was found.

227.1.11 HasTag(tag as string) as boolean

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if a tag exists.
Notes: The place holder in the document must start with ¬´ and end with ¬ª characters. The place holder you pass here, should not have those quotes.
Returns true on success or false on failure.

If you change font or style of the text within the marker, it will not be recognized. So please keep all text between and including the ¬´ and ¬ª markers (or whatever is configured) within the same font style.

227.1.12 MediaFiles as String()

MBS Tools Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Lists the media files in the word document.
Example:

```
// read a word file:
Var file As New FolderItem("c:\tmp\test.docx", folderitem.PathModes.Native)
Var wordStream As BinaryStream = BinaryStream.Open(file)
Var wordData As String = wordStream.Read(wordStream.Length)
wordStream.close
Var word As WordFileMBS = WordFileMBS.OpenData(wordData)

// now show list of files in message box
Var MediaFiles() As String = word.MediaFiles
MessageBox Join(MediaFiles, EndOfLine)
```

Notes: e.g. image1.png

227.1.13 OpenData(Data as MemoryBlock) as WordFileMBS

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens data as document.
Notes: You can pass here XML or Docx file content.
Returns nil in case of an error.
See also:

- 227.1.14 OpenData(Data as String) as WordFileMBS 25377

227.1.14 OpenData(Data as String) as WordFileMBS

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens data as document.
Example:

```
Var f as FolderItem = New FolderItem("test.docx")
Var b as BinaryStream = BinaryStream.Open(f)
Var d as string = b.Read(b.Length)
Var w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = New FolderItem("output.docx")
if w.WriteFile(f) then
MessageBox "OK"
end if
end if
end if
```

Notes: You can pass here XML or Docx file content.
Returns nil in case of an error.
See also:

- 227.1.13 OpenData(Data as MemoryBlock) as WordFileMBS 25377

227.1.15 OpenXML(XML as String) as WordFileMBS

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens XML file from text string.
Notes: Returns nil in case of error.

227.1.16 Parts as String()

MBS Tools Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries names of the parts of the document.
Example:

```
Var f as FolderItem = New FolderItem("test.docx")
Var b as BinaryStream = BinaryStream.Open(f)
Var d as string = b.Read(b.Length)
Var w as WordFileMBS = WordFileMBS.OpenData(d)

MessageBox w.XML("footer1")
```

Notes: This may tell you how many headers/footers we found in a docx file.
e.g. "footer1", "header1", "document".

227.1.17 RemoveTableRow(tag as string) as Integer

MBS Tools Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a table row containing a placeholder.
Notes: If you have tables in your template word file and you only fill some rows, you can remove superfluous rows using this function.

Returns Values

0	success
1	Tag not found.
2	Tag found, but not in a table.
3	Missing main document part.

227.1.18 ReplaceTag(tag as string, text as string = "", All as boolean = false) as boolean

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces a placeholder with text.
Example:

```
Var f as FolderItem = New FolderItem("test.docx")
Var b as BinaryStream = BinaryStream.Open(f)
Var d as string = b.Read(b.Length)
Var w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = New FolderItem("output.docx")
if w.WriteFile(f) then
MessageBox "OK"
end if
end if
end if
```

Notes: The place holder in the document must start with ¬´ and end with ¬ª characters. The place holder you pass here, should not have those quotes.
Returns true on success or false on failure.
If you need to replace multi line text like addresses, please use several placeholders, at least one per line.

Version 17.0 and newer can handle multi line text better for normal paragraphs with Chr(13). It creates for you new paragraphs for each line in the new text.

If you change font or style of the text within the marker, it will not be recognized. So please keep all text between and including the ¬´ and ¬ª markers (or whatever is configured) within the same font style.

227.1.19 SetFieldText(fieldName as string, text as String) as boolean

MBS Tools Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets field value.
Notes: The plugin looks for the field with given name and sets it's text.
Returns true if field was found.

227.1.20 SetMarkers(openMarker as String, closeMarker as String) as boolean

MBS Tools Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the markers to look for before/after a tag.
Notes: Default are ¬´ and ¬ª.
Should be different and not empty.
Returns true on success or false on failure.

227.1.21 Substitute(findText as string, replaceText as string = """, All as boolean = false) as boolean

MBS Tools Plugin, Plugin Version: 21.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces some text in the document with new text.
Notes: Like ReplaceTag function, but without markers around the tag.

Handles multi line text better for normal paragraphs with Chr(13). It creates for you new paragraphs for each line in the new text.

If you change font or style of the text within the find text, it will not be recognized. So please keep all text

within the same font style.

227.1.22 Tags as String()

MBS Tools Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of tags.
Notes: Depends on the start/end markers set with OpenMarker/CloseMarker properties.

Can be very useful for debugging to query list of tags found in the document.

227.1.23 WriteFile(path as folderItem) as boolean

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a file to disk.
Example:

```
Var f as FolderItem = New FolderItem("test.docx")
Var b as BinaryStream = BinaryStream.Open(f)
Var d as string = b.Read(b.Length)
Var w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = New FolderItem("output.docx")
if w.WriteFile(f) then
MessageBox "OK"
end if
end if
end if
```

Notes: File extension should be correct, either docx or xml depending on what you loaded.

227.1.24 Properties

227.1.25 Caseless as Boolean

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to compare tag names case insensitive.

Notes: Set to true for case insensitive comparison of ASCII characters.
Default is false.
(Read and Write property)

227.1.26 CloseMarker as String

MBS Tools Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The close marker text.
Notes: Default value is "¬ª".
(Read only property)

227.1.27 OpenMarker as String

MBS Tools Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The open marker text.
Notes: Default value is "¬´".
(Read only property)

227.1.28 SkipDeletedText as Boolean

MBS Tools Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to skip deleted text.
Example:

WordFileMBS.SkipDeletedText = true

Notes: If the word file contains changes, it may log what text was deleted.
We skip deleted text by default.
(Read and Write property)

227.1.29 Text as String

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts text of word file.
Notes: Plugin inserts a few newline characters for detected line ends.

May not give all text. If you miss something, please send us test files.
(Read only property)

227.1.30 XML as String

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The XML found in the document.
Notes: (Read and Write property)
See also:

- 227.1.33 XML(part as String) as String 25384

227.1.31 MediaFile(name as string) as String

MBS Tools Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries or replaces the content of a media file.
Example:

```
Var word As WordFileMBS // open word document

// name one
Var name As String = "image1.jpg"

// or pick from list
'Var MediaFiles() As String = word.MediaFiles
'Var name As String = MediaFiles(0) // first one

// load image
Var ImageFile As FolderItem = SpecialFolder.Desktop.Child("new.jpg")
Var ImageStream As BinaryStream = BinaryStream.Open(ImageFile)
Var ImageData As String = ImageStream.Read(ImageStream.Length)

word.MediaFile(name) = ImageData
```

Notes: You can use this to extract images from word file.
Or to replace a placeholder image with the real image.
For replacement please make sure file type and dimensions match.
Raises KeyNotFoundException if media file with given name is not found.
(Read and Write computed property)

227.1.32 PropertyValue(field as string) as String

MBS Tools Plugin, Plugin Version: 24.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set a metadata property.
Notes: The field name can be title, subject, creator, keywords, description, lastModifiedBy, revision, created or modified.

Raises a KeyNotFoundException if the field is not found on setting.
(Read and Write computed property)

227.1.33 XML(part as String) as String

MBS Tools Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries/Sets XML for a part.
Notes: See Parts array for possible parts.
(Read and Write computed property)
See also:

- 227.1.30 XML as String 25383

Chapter 228

XL

228.1 class XLAutoFilterMBS

228.1.1 class XLAutoFilterMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for auto filter.
Example:

```
// add an auto filter to a table and sort it by the second column, descending
Var book As New XLBookMBS(True)
Var sheet As XLSheetMBS = book.AddSheet("Scores")
Call sheet.WriteString(0, 0, "Name")
Call sheet.WriteString(0, 1, "Points")
Var names() As String = Array("Anna", "Ben", "Clara", "David")
Var points() As Double = Array(72.0, 95.0, 81.0, 64.0)
For i As Integer = 0 To 3
Call sheet.WriteString(i + 1, 0, names(i))
Call sheet.WriteNumber(i + 1, 1, points(i))
Next

Var filter As XLAutoFilterMBS = sheet.AutoFilter
filter.SetRef(0, 4, 0, 1)
Call filter.SetSort(1, True) // column index 1, descending
sheet.ApplyFilter

Call book.Save(SpecialFolder.Desktop.Child("scores.xlsx"))
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

228.1.2 Methods

228.1.3 AddSort(columnIndex as Integer, descending as boolean) as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the sorted column in AutoFilter by zero-based index and its sort order.
Notes: Used for multiple level sorting.
Returns false on error and true on success. Get error info with XLBookMBS.errorMessage.

228.1.4 Column(colId as Integer) as XLFilterColumnMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the AutoFilter column by zero-based index.
Notes: Creates it if it doesn't exist.

228.1.5 ColumnByIndex(colId as Integer) as XLFilterColumnMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the specified AutoFilter column which have a filter information by index.

228.1.6 Constructor

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

228.1.7 GetRef(byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the cell range of AutoFilter with header.
Notes: Returns false if error. Get error info with XLBookMBS.errorMessage.

228.1.8 GetSort(byref columnIndex as Integer, byref descending as Boolean) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the zero-based index of sorted column in AutoFilter and its sort order.
Notes: Returns false if error. Get error info with XLBookMBS.errorMessage.

228.1.9 GetSortEx(byref columnIndex as Integer, byref descending as Boolean, level as Integer) as Boolean

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the zero-based index of sorted column in AutoFilter and its sort order.

228.1.10 GetSortRange(byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the whole range of data to sort.
Notes: Returns false if error. Get error info with XLBookMBS.errorMessage.

228.1.11 SetRef(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the cell range of AutoFilter with header.

228.1.12 SetSort(columnIndex as Integer, descending as Boolean) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the sorted column in AutoFilter by zero-based index and its sort order.
Notes: Returns false on error and true on success. Get error info with XLBookMBS.errorMessage.

228.1.13 Properties

228.1.14 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: The owning book object.
(Read only property)

228.1.15 ColumnSize as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of specified AutoFilter columns which have a filter information.
Notes: (Read only property)

228.1.16 Handle as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

228.1.17 SortLevels as Integer

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the number of sort levels.
Notes: (Read only property)

228.2 class XLBookMBS

228.2.1 class XLBookMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The central class for a workbook.
Example:

```
// create new Excel file, pass true for XLSX format or false for older XLS format
Var book As New XLBookMBS(True)

// add sheet
Var sheet As XLSheetMBS = book.addSheet("Test")
Call sheet.WriteString(2, 1, "Hello World", Nil)

// write file and launch
Var file As FolderItem = SpecialFolder.Desktop.Child("Writing data.xlsx")

If book.Save(file) Then
file.Launch
Else
MessageBox "Failed to create file."+EndOfLine+EndOfLine+book.ErrorMessage
End If
```

Notes: The MBS Xojo XL Plugin is based on LibXL, a powerful library to handle Excel files.

You'll need your own license for LibXL. For more information go here:
https://www.monkeybreadsoftware.de/xojo/plugin-xls.shtml

When you have obtained license file inside your XOJO project place XLBookMBS.SetKeyGlobal call with LibXL license in app.open.

228.2.2 Methods

228.2.3 AddConditionalFormat as XLConditionalFormatMBS

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new conditional format to the workbook for using with conditional formatting rules.
Example:

```
// create a rule to make cells starting with A to be bold
Var cFormat As XLConditionalFormatMBS = book.addConditionalFormat()
cFormat.Font.bold = true

Var cf As XLConditionalFormattingMBS = sheet.addConditionalFormatting()
cf.addRange(2, 10, 1, 1)
cf.addRule(cf.FormatTypeBeginWith, cFormat, "a")
```

Notes: Only for xlsx files.
Requires LibXL in version 4.x

228.2.4 AddCustomNumFormat(customNumFormat as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new custom number format to the workbook.
Notes: The format string customNumFormat indicates how to format and render the numeric value of a cell. See custom format strings guidelines (in FAQ). Returns the custom format identifier. It's used in XLFormatMBS.NumFormat. Returns 0 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.2.5 AddFont(initFont as XLFontMBS = nil) as XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new font to the workbook, initial parameters can be copied from other font.
Notes: Returns nil if error occurs.

The initFont can be from another book.

228.2.6 AddFormat(initFormat as XLFormatMBS = nil) as XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new format to the workbook, initial parameters can be copied from other format.
Example:

```
// define a format for red fill
Var redBackgroundFormat As XLFormatMBS = book.AddFormat
Var c As Color = &cFF0000
// will give back numeric value of color for RGB mode or color index
Var n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Var row As Integer = 5 // 6th row
Var col As Integer = 1 // Column B
Var value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

Notes: Returns nil if error occurs.

The initFormat can be from another book.

228.2.7 AddFormatFromStyle(style as Integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new format to the workbook from the predefined style.
Notes: Returns nil if error occurs.
Please note that after loading a file it will be removed.

See kCellStyle* constants.

228.2.8 AddPicture(path as folderitem) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a picture to the workbook.
Notes: Returns a picture identifier. Supports BMP, DIB, PNG, JPG and WMF picture formats. Use picture identifier with XLSheetMBS.setPicture(). Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Supports BMP, DIB, PNG, JPG and WMF picture formats.
For XLSX files you can embed SVG graphics with LibXL 4.2 or newer.
See also:

- 228.2.9 AddPicture(path as string) as Integer 25392

228.2.9 AddPicture(path as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a picture to the workbook.
Notes: Returns a picture identifier. Supports BMP, DIB, PNG, JPG and WMF picture formats. Use picture identifier with XLSheetMBS.setPicture(). Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Supports BMP, DIB, PNG, JPG and WMF picture formats.
For XLSX files you can embed SVG graphics with LibXL 4.2 or newer.
See also:

- 228.2.8 AddPicture(path as folderitem) as Integer 25392

228.2.10 AddPictureData(data as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a picture to the workbook from memory buffer:
Notes: Returns a picture identifier. Use picture identifier with XLSheetMBS.setPicture(). Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Supports BMP, DIB, PNG, JPG and WMF picture formats.
For XLSX files you can embed SVG graphics with LibXL 4.2 or newer.

228.2.11 AddRichString as XLRichStringMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new rich string to be used in the book.

228.2.12 AddSheet(name as string, initSheet as XLSheetMBS = nil) as XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new sheet to this book, returns the sheet.
Example:

```
// create new Excel file, pass true for XLSX format or false for XLS
Var book As New XLBookMBS(True)

// add sheet
Var sheet As XLSheetMBS = book.addSheet("Test")
Call sheet.WriteString(2, 1, "Hello World", Nil)

// write file and launch
Var file As FolderItem = SpecialFolder.Desktop.Child("Writing data.xlsx")

If book.Save(file) Then
file.Launch
Else
MessageBox "Failed to create file."+EndOfLine+EndOfLine+book.ErrorMessage
End If
```

Notes: Use initSheet parameter if you wish to copy an existing sheet.
Must be from the same book to copy sheet.

Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.2.13 AddStyledText(StyledText as StyledText) as XLRichStringMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds styled text to the book to later assign to a cell.
Notes: We convert attributes like bold, italic, underline, color, font name and size.

228.2.14 available as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the library is available.
Notes: Returns false on PPC targets.

228.2.15 BookRemoveVBA as boolean

MBS XL Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: NRemoves all VBA scripts (macros) from the workbook.
Notes: It should be called after loading xlsm or xlsb files. Returns true if VBA scripts were found and removed.
Returns true on success and false on failure.

228.2.16 BookVersion as Integer

MBS XL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the version number of this book.
Example:

```
Var b as new XLBookMBS
Var v as Integer = b.BookVersion

Var h as Integer = v \256 \256 \256
Var m as Integer = v \256 \256 mod 256
Var l as Integer = v \256 mod 256

MessageBox "libXL "+str(h)+"."+str(m)+"."+str(l)
```

Notes: Version number is encoded as hex number with major version, minor version and bugfix.

228.2.17 Clear

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes all data from a workbook.

228.2.18 ConditionalFormat(index as integer) as XLConditionalFormatMBS

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a conditional format with defined index.
Notes: Index must be less than return value of conditionalFormatSize property.

228.2.19 ConditionalFormats as XLConditionalFormatMBS()

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all conditional formats of the book.

228.2.20 Constructor(xml as boolean = false)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new XLBookMBS object.
Notes: xml: If true, creates a book in xlsx format (xml), else one in xls format (binary).

228.2.21 CopyContent(dest as XLBookMBS, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies all content from one book to other book.
Notes: The plugin loops through all sheets and creates matching sheets on new book.
Formats and fonts are created on the fly.

This allows you to convert from XLS to XLSX or back.
Please report if something is not copied. Of course plugin can only copy what libXL supports, so stuff like movies or diagrams are not copied.

228.2.22 CoreProperties as XLCorePropertiesMBS

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns workbook properties.

228.2.23 CustomNumFormat(fmt as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a custom format string for specified custom format identifier fmt.
Notes: See custom format string guidelines (in FAQ). Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.2.24 DefaultFont(byref fontSize as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a default font name and size for this workbook.
Notes: Returns "" if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.2.25 DelSheet(index as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes a sheet with specified index.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.2.26 Font(index as Integer) as XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a font with defined index.
Notes: Index must be less than return value of fontCount method.

228.2.27 FontCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of fonts in this book.

228.2.28 Fonts as XLFontMBS()

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array with all defined fonts.

228.2.29 Format(index as Integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a format with defined index.
Notes: Index must be less than return value of formatCount method.

228.2.30 FormatCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of formats in this book.

228.2.31 Formats as XLFormatMBS()

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array with all defined formats.

228.2.32 InsertSheet(index as Integer, name as string = """, initSheet as XLSheetMBS = nil) as XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts a new sheet to this book at position index, returns the sheet.
Notes: Use initSheet parameter if you wish to copy an existing sheet. Must be from the same book to copy sheet.

Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.2.33 LibVersion as string

MBS XL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns version of library as string.
Example:

MessageBox XLBookMBS.LibVersion

Notes: Returns for example "3.8.0".
With plugin version 17.4 or newer, this returns 4 numbers, so you may see another .0 on the end.

228.2.34 LibVersionNumber as Integer

MBS XL Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns version of library as number.
Example:

MessageBox str(XLBookMBS.LibVersionNumber)

Notes: Returns for example 3 * 256*256*256 + 8 * 256*256 + 0 * 256 + 0.

228.2.35 Load(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file into memory.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

With the constructor of the XLBookMBS object you decide if you want to load XML format or older binary format. If the format of the book object doesn't match the file, it will fail.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 228.2.36 Load(path as string) as boolean 25398

228.2.36 Load(path as string) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file into memory.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

With the constructor of the XLBookMBS object you decide if you want to load XML format or older binary format. If the format of the book object doesn't match the file, it will fail.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 228.2.35 Load(path as folderitem) as boolean 25398

228.2.37 Load2(path as folderitem) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from file.
Notes: Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 228.2.38 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS 25399
- 228.2.39 Load2(path as string) as XLBookMBS 25400
- 228.2.40 Load2(path as string, byref ErrorMessage as String) as XLBookMBS 25401

228.2.38 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("XING contacts.xlsx")
Var e as string
Var b as XLBookMBS = XLBookMBS.Load2(f,e)

if b = nil then
MessageBox e
Return
end if

Var s as XLSheetMBS = b.Sheet(0)
MessageBox s.ReadString(1,1)
```

Notes: Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 228.2.37 Load2(path as folderitem) as XLBookMBS 25399
- 228.2.39 Load2(path as string) as XLBookMBS 25400
- 228.2.40 Load2(path as string, byref ErrorMessage as String) as XLBookMBS 25401

228.2.39 Load2(path as string) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("XING contacts.xlsx")
Var b as XLBookMBS = XLBookMBS.Load2(f)

if b = nil then
MessageBox e
Return
end if

Var s as XLSheetMBS = b.Sheet(0)
MessageBox s.ReadString(1,1)
```

Notes: Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 228.2.37 Load2(path as folderitem) as XLBookMBS 25399
- 228.2.38 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS 25399
- 228.2.40 Load2(path as string, byref ErrorMessage as String) as XLBookMBS 25401

228.2.40 Load2(path as string, byref ErrorMessage as String) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from file.
Notes: Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 228.2.37 Load2(path as folderitem) as XLBookMBS 25399
- 228.2.38 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS 25399
- 228.2.39 Load2(path as string) as XLBookMBS 25400

228.2.41 LoadError as String

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error message from LoadLibrary call.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.dylib")

if XLBookMBS.LoadLibrary(f) then
MessageBox "OK"
else
MessageBox XLBookMBS.LoadError
end if
```

228.2.42 LoadInfo(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads metadata from an Excel file.
Example:

```
Var f As New FolderItem("/Users/cs/Desktop/test.xlsx", folderitem.PathModes.Native)
Var b As New XLBookMBS(True)

If b.LoadInfo(f) Then

var names() as string
```

```
Var c As Integer = b.SheetCount
For i As Integer = 0 To c-1
names.add b.SheetName(i)
Next

MessageBox Join(names, EndOfLine)

End If
```

Notes: Loads only information about sheets.
Afterwards you can call SheetCount() and SheetName(index).
Returns false if error occurs. Get an error info with the errorMessage property.
See also:

- 228.2.43 LoadInfo(path as string) as boolean 25402

228.2.43 LoadInfo(path as string) as boolean

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads metadata from an Excel file.
Notes: Loads only information about sheets.
Afterwards you can call SheetCount() and SheetName(index).
Returns false if error occurs. Get an error info with the errorMessage property.
See also:

- 228.2.42 LoadInfo(path as folderitem) as boolean 25401

228.2.44 LoadInfoRaw(data as MemoryBlock) as boolean

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads metadata from an Excel file in memory.
Notes: Loads only information about sheets.
Afterwards you can call SheetCount() and SheetName(index).
Returns false if error occurs. Get an error info with the errorMessage property.
See also:

- 228.2.45 LoadInfoRaw(data as string) as boolean 25402

228.2.45 LoadInfoRaw(data as string) as boolean

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads metadata from an Excel file in memory.
Notes: Loads only information about sheets.
Afterwards you can call SheetCount() and SheetName(index).
Returns false if error occurs. Get an error info with the errorMessage property.
See also:

- 228.2.44 LoadInfoRaw(data as MemoryBlock) as boolean 25402

228.2.46 LoadLibrary(File as FolderItem) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the libXL library file.
Example:

```
MessageBox "Version before: "+XLBookMBS.LibVersion

Var f as FolderItem = SpecialFolder.Desktop.Child("libxl.dylib")

if XLBookMBS.LoadLibrary(f) then
MessageBox "Version after: "+XLBookMBS.LibVersion
else
MessageBox XLBookMBS.LoadError
end if
```

Notes: Returns true on success or false on failure.

While the plugin comes with an internal libXL library, you can use this method to load a different version of the library.
See also:

- 228.2.47 LoadLibrary(Path as string) as boolean 25403

228.2.47 LoadLibrary(Path as string) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the libXL library file.
Notes: Returns true on success or false on failure.

While the plugin comes with an internal libXL library, you can use this method to load a different version of the library.
See also:

- 228.2.46 LoadLibrary(File as FolderItem) as boolean 25403

228.2.48 LoadMT(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads from file.
Notes: Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 228.2.49 LoadMT(path as string) as boolean 25404

228.2.49 LoadMT(path as string) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads from file.
Notes: Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 228.2.48 LoadMT(path as folderitem) as boolean 25404

228.2.50 LoadPartially(path as folderitem, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, keepAllSheets as Boolean = false) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a file only with specified sheet index and row range into memory.
Notes: Returns false if error occurs or true on success.. Get error info with errorMessage function.

keepAllSheets parameter new in 14.2:
If this is true, all sheets are saved back with XL.Book.Save function,
But only one specified sheet is available for processing, thus LibXL can save more memory. It works only for xlsx files, LibXL ignores this flag for xls files.
See also:

- 228.2.51 LoadPartially(path as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, keepAllSheets as Boolean = false) as boolean 25405

228.2.51 LoadPartially(path as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, keepAllSheets as Boolean = false) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a file only with specified sheet index and row range into memory.
Notes: Returns false if error occurs or true on success.. Get error info with errorMessage function.

keepAllSheets parameter new in 14.2:
If this is true, all sheets are saved back with XL.Book.Save function,
But only one specified sheet is available for processing, thus LibXL can save more memory. It works only for xlsx files, LibXL ignores this flag for xls files.

228.2.52 LoadPartiallyUsingTempFile(path as folderitem, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, TempFile as folderitem, keepAllSheets as Boolean = false) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a file only with specified sheet index and row range into memory.
Notes: Specify a temporary file for reducing memory consumption.
Returns false if error occurs or true on success.. Get error info with errorMessage function.

keepAllSheets parameter new in 14.2:
If this is true, all sheets are saved back with XL.Book.Save function,
But only one specified sheet is available for processing, thus LibXL can save more memory. It works only for xlsx files, LibXL ignores this flag for xls files.

This is more a thing for 32-bit applications loading huge files where memory limits may be hit. On 64-bit applications you may not need a temporary file.
See also:

- 228.2.53 LoadPartiallyUsingTempFile(path as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, TempFile as String, keepAllSheets as Boolean = false) as boolean 25405

228.2.53 LoadPartiallyUsingTempFile(path as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, TempFile as String, keepAllSheets as Boolean = false) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a file only with specified sheet index and row range into memory.
Notes: Specify a temporary file for reducing memory consumption.
Returns false if error occurs or true on success.. Get error info with errorMessage function.

228.2.54 LoadRaw(data as MemoryBlock) as boolean

MBS XL Plugin, Plugin Version: 14.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from user's memory buffer.
Notes: Returns false if error occurs. Get error info with errorMessage property.

With the constructor of the XLBookMBS object you decide if you want to load XML format or older binary format. If the format of the book object doesn't match the file, it will fail.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 228.2.55 LoadRaw(data as string) as boolean 25406

228.2.55 LoadRaw(data as string) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from user's memory buffer.
Notes: Returns false if error occurs. Get error info with errorMessage property.

With the constructor of the XLBookMBS object you decide if you want to load XML format or older binary format. If the format of the book object doesn't match the file, it will fail.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can

recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 228.2.54 LoadRaw(data as MemoryBlock) as boolean 25406

228.2.56 LoadRaw2(data as MemoryBlock) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from user's memory buffer.
Notes: Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 228.2.57 LoadRaw2(data as MemoryBlock, byref ErrorMessage as String) as XLBookMBS 25407

228.2.57 LoadRaw2(data as MemoryBlock, byref ErrorMessage as String) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from user's memory buffer.
Notes: Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.

- 228.2.58 LoadRaw2(data as string) as XLBookMBS 25408

228.2.60 LoadRawMT(data as MemoryBlock) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads from memoryblock.
Notes: Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will

block, but keep other background threads running.
See also:

- 228.2.61 LoadRawMT(data as string) as boolean 25409

228.2.61 LoadRawMT(data as string) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads from string.
Notes: Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

228.2.62 LoadRawPartially(data as MemoryBlock, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, keepAllSheets as Boolean = false) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a file from user's memory buffer.
Notes: data: Data buffer
sheetIndex: loads a file only with specified sheet index, -1 loads all sheets
firstRow: the first row of loaded range, -1 loads all rows until lastRow
lastRow: the last row of loaded range, -1 loads all rows after firstRow.
Returns false if error occurs or true on success. Get error info with errorMessage function.

keepAllSheets parameter new in 14.2:
If this is true, all sheets are saved back with XL.Book.Save function,
But only one specified sheet is available for processing, thus LibXL can save more memory. It works only for xlsx files, LibXL ignores this flag for xls files.

228.2.63 LoadRawPartially(data as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, keepAllSheets as Boolean = false) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a file from user's memory buffer.
Notes: data: Data buffer
sheetIndex: loads a file only with specified sheet index, -1 loads all sheets
firstRow: the first row of loaded range, -1 loads all rows until lastRow
lastRow: the last row of loaded range, -1 loads all rows after firstRow.
Returns false if error occurs or true on success. Get error info with errorMessage function.

keepAllSheets parameter new in 14.2:
If this is true, all sheets are saved back with XL.Book.Save function,
But only one specified sheet is available for processing, thus LibXL can save more memory. It works only for xlsx files, LibXL ignores this flag for xls files.

228.2.64 LoadUsingTempFile(path as folderitem, TempFile as folderitem) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads an entire file into memory.
Notes: Specify a temporary file for reducing memory consumption.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 228.2.65 LoadUsingTempFile(path as string, TempFile as String) as boolean 25410

228.2.65 LoadUsingTempFile(path as string, TempFile as String) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads an entire file into memory.
Notes: Specify a temporary file for reducing memory consumption.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 228.2.64 LoadUsingTempFile(path as folderitem, TempFile as folderitem) as boolean 25410

228.2.66 MoveSheet(SourceIndex as integer, DestIndex as Integer) as boolean

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Takes a sheet with SourceIndex and insert it in front of a sheet with DestIndex.
Notes: Returns false if error occurs and true on success.

228.2.67 PackColor(ColorValue as color) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packs red, green and blue components in color type.
Example:

```
// define a format for red fill
Var redBackgroundFormat As XLFormatMBS = book.AddFormat
Var c As Color = &cFF0000
// will give back numeric value of color for RGB mode or color index
Var n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Var row As Integer = 5 // 6th row
Var col As Integer = 1 // Column B
Var value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

See also:

- 228.2.68 PackColor(red as Integer, green as Integer, blue as Integer) as Integer 25411

228.2.68 PackColor(red as Integer, green as Integer, blue as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packs red, green and blue components in color type.
See also:

- 228.2.67 PackColor(ColorValue as color) as Integer 25411

228.2.69 PackDate(d as date) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Packs date and time information into double type.
See also:

- 228.2.70 PackDate(year as Integer, month as Integer, day as Integer, hour as Integer = 0, min as Integer = 0, sec as Integer = 0, msec as Integer = 0) as Double 25412

228.2.70 PackDate(year as Integer, month as Integer, day as Integer, hour as Integer = 0, min as Integer = 0, sec as Integer = 0, msec as Integer = 0) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packs date and time information into double type.
See also:

- 228.2.69 PackDate(d as date) as Double 25412

228.2.71 PackDateTime(d as dateTime) as double

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packs date and time information into double type.

228.2.72 Picture(index as Integer, byref data as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a picture at position index in memory buffer.
Notes: Parameters:
index: position in the workbook
data: reference to buffer

Returns type of picture. See PictureType* constants.

228.2.73 PictureCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of pictures in this workbook.

228.2.74 RemoveAllPhonetics

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes all phonetics data (furigana) from a workbook.

228.2.75 RemovePrinterSettings as boolean

MBS XL Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes all printer settings from the workbook.
Notes: It should be called after loading an Excel file. Returns true if printer settings were found and removed.
Returns true on success and false on failure.

228.2.76 Save(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves current workbook into xls-file.
Example:

```
// create new Excel file, pass true for XLSX format or false for older XLS format
Var book As New XLBookMBS(True)

// add sheet
Var sheet As XLSheetMBS = book.addSheet("Test")
Call sheet.WriteString(2, 1, "Hello World", Nil)

// write file and launch
Var file As FolderItem = SpecialFolder.Desktop.Child("Writing data.xlsx")

If book.Save(file) Then
file.Launch
Else
MessageBox "Failed to create file."+EndOfLine+EndOfLine+book.ErrorMessage
End If
```

Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:

- 228.2.77 Save(path as folderitem, UseTempFile as Boolean) as boolean 25414
- 228.2.78 Save(path as string) as boolean 25414
- 228.2.79 Save(path as string, UseTempFile as Boolean) as boolean 25414

228.2.77 Save(path as folderitem, UseTempFile as Boolean) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves current workbook into the file.
Notes: Use a temporary file for reducing memory consumption.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 228.2.76 Save(path as folderitem) as boolean 25413
- 228.2.78 Save(path as string) as boolean 25414
- 228.2.79 Save(path as string, UseTempFile as Boolean) as boolean 25414

228.2.78 Save(path as string) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves current workbook into xls-file.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:

- 228.2.76 Save(path as folderitem) as boolean 25413

228.2.79 Save(path as string, UseTempFile as Boolean) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves current workbook into the file.
Notes: Use a temporary file for reducing memory consumption.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 228.2.76 Save(path as folderitem) as boolean 25413
- 228.2.77 Save(path as folderitem, UseTempFile as Boolean) as boolean 25414

228.2.80 SaveMT(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves document to file on disk.
Notes: Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 228.2.81 SaveMT(path as string) as boolean 25415

228.2.81 SaveMT(path as string) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves document to file on disk.
Notes: Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 228.2.80 SaveMT(path as folderitem) as boolean 25415

228.2.82 SaveRaw(byref data as MemoryBlock) as boolean

MBS XL Plugin, Plugin Version: 14.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves a xls-file to internal memory buffer.
Notes: Returns false if error occurs. Get error info with errorMessage property.
See also:

- 228.2.83 SaveRaw(byref data as string) as boolean 25415

228.2.83 SaveRaw(byref data as string) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves a xls-file to internal memory buffer.
Notes: Returns false if error occurs. Get error info with errorMessage property.
See also:

- 228.2.82 SaveRaw(byref data as MemoryBlock) as boolean 25415

228.2.84 SaveRawMT(byref data as MemoryBlock) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves document to memoryblock.
Notes: Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 228.2.85 SaveRawMT(byref data as string) as boolean 25416

228.2.85 SaveRawMT(byref data as string) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves document to string.
Notes: Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 228.2.84 SaveRawMT(byref data as MemoryBlock) as boolean 25416

228.2.86 SetDefaultFont(fontName as string, fontSize as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a default font name and size for this workbook.

228.2.87 SetKey(name as string, key as string)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets customer's license key.
Notes: Call this once for each XLBookMBS object and before you read or write data.

If you have keys for more than one platform, please use #if condition to make sure you pass right key for current platform.

228.2.88 SetKeyGlobal(name as string, key as string)

MBS XL Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets customer's license key.
Example:

```
// add this to app.open

#if TargetMacOS then
// Mac license
XLBookMBS.SetKeyGlobal("Your Name", "Your Key")
#elseif TargetLinux then
// Linux license
XLBookMBS.SetKeyGlobal("Your Name", "Your Key")
#elseif TargetWin32 then
// Win license
XLBookMBS.SetKeyGlobal("Your Name", "Your Key")
#else
// missing
#endif
```

Notes: You can call this before using the other plugin functions to set key on application startup. Simply call it in app.open event.

If you have keys for more than one platform, please use #if condition to make sure you pass right key for current platform.
See also:

- 228.2.89 SetKeyGlobal(name as string, key as string) 25417

228.2.89 SetKeyGlobal(name as string, key as string)

MBS XL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Private method to avoid you call this on an object.
Notes: Please call shared method in app.open.
Because if you make a new object and set key, it's too late.
See also:

- 228.2.88 SetKeyGlobal(name as string, key as string) 25417

228.2.90 SetLocale(locale as string)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the locale.
Example:

```
Var book as new XLBookMBS(false)
book.SetLocale "en_US.UTF-8"
```

Notes: Sets the locale for this library. It has no effect for unicode projects.

228.2.91 SetPassword(Password as String)

MBS XL Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the password for reading an encrypted book.
Example:

```
var file as new FolderItem("test.xlsx")
Var doc As New XLBookMBS(True)

doc.SetPassword "secret"

If doc.Load(file) Then
MessageBox "Okay"
Else
MessageBox "Failed to load"+EndOfLine+EndOfLine+doc.ErrorMessage
End If
```

Notes: Must be called on the book before calling the load functions.

228.2.92 Sheet(index as Integer) as XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the sheet with specified index.
Notes: Returns nil if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.2.93 SheetCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of sheets in this book.

228.2.94 SheetName(index as integer) as String

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the name of the sheet.
Notes: To be used with the LoadInfo functions.

228.2.95 Sheets as XLSheetMBS()

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array with all sheets.
Example:

```
Function SheetByName(book as XLBookMBS, name as string) As XLSheetMBS
Var sheets() as XLSheetMBS = book.Sheets
for each s as XLSheetMBS in sheets
if s.Name = name then
Return s
end if
next
End Function
```

228.2.96 SheetType(index as Integer) as Integer

MBS XL Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries type of the sheet.

228.2.97 UnpackColor(ColorValue as Integer) as color

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks color type to red, green and blue components.
See also:

- 228.2.98 UnpackColor(ColorValue as Integer, byref red as Integer, byref green as Integer, byref blue as Integer) 25420

228.2.98 UnpackColor(ColorValue as Integer, byref red as Integer, byref green as Integer, byref blue as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks color type to red, green and blue components.
See also:

- 228.2.97 UnpackColor(ColorValue as Integer) as color 25419

228.2.99 UnpackDate(Value as Double) as date

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Unpacks date and time information from double type.
Notes: Returns nil if error occurs.

- 228.2.100 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean 25420
- 228.2.101 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean 25421
- 228.2.102 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean 25421

228.2.100 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks date and time information from double type.
Notes: Returns false if error occurs.
See also:

- 228.2.99 UnpackDate(Value as Double) as date 25420
- 228.2.101 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean 25421
- 228.2.102 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean 25421

228.2.101 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks date and time information from double type.
Notes: Returns false if error occurs.
See also:

- 228.2.99 UnpackDate(Value as Double) as date 25420
- 228.2.100 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean 25420
- 228.2.102 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean 25421

228.2.102 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks date and time information from double type.
Notes: Returns false if error occurs.
See also:

- 228.2.99 UnpackDate(Value as Double) as date 25420
- 228.2.100 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean 25420
- 228.2.101 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean 25421

228.2.103 UnpackDateTime(Value as double) as dateTime

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks date and time information from double type.
Notes: Returns nil if error occurs.

228.2.104 Properties

228.2.105 ActiveSheet as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Active sheet index in this workbook.
Notes: (Read and Write property)

228.2.106 BiffVersion as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns BIFF version of binary file.
Notes: Used for xls format only.
(Read only property)

228.2.107 CalcMode as integer

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The calculation mode of workbook.
Notes: Cal be manual, auto or automatic except for data tables.
See CalcMode* constants.
(Read and Write property)

228.2.108 ConditionalFormatSize as Integer

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of conditional formats in this book.
Notes: (Read only property)

228.2.109 ErrorCode as Integer

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the last error code.
Notes: See kError* constants.
(Read only property)

228.2.110 ErrorMessage as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the last error message.
Notes: (Read only property)

228.2.111 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

228.2.112 IsDate1904 as boolean

MBS XL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether dates are 1904 based.
Notes: A boolean value that indicates whether the date systems used in the workbook starts in 1904.
True indicates the date system starts in 1904, where January 1, 1904 is the first day in the system.
False indicates the workbook uses the 1900 date system, where January 1, 1900 is the first day in the system.
(Read and Write property)

228.2.113 IsTemplate as boolean

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the workbook is template.
Notes: The template flag: true - workbook is template, false - workbook is not template (default).
This flag must have a value "true" for template files (xlt and xltx).
(Read and Write property)

228.2.114 IsWriteProtected as Boolean

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns whether the workbook is marked as read-only.
Notes: (Read only property)

228.2.115 RefR1C1 as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the R1C1 reference mode is active.
Notes: (Read and Write property)

228.2.116 RgbMode as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the RGB mode is active. Used for xlsx format only.
Notes: true - RGB mode, false - Index mode (default).
In RGB mode use PackColor() and UnpackColor() methods for getting/setting colors. Used for xlsx format only.
(Read and Write property)

228.2.117 Constants

Call Modes

Constant	Value	Description
CalcModeAuto	1	automatic calculation
CalcModeAutoNoTable	2	automatic except for data tables
CalcModeManual	0	manual calculation

Cell Styles

Constant	Value	Description
kCellstyle20Accent1	19	
kCellstyle20Accent2	23	
kCellstyle20Accent3	27	
kCellstyle20Accent4	31	
kCellstyle20Accent5	35	
kCellstyle20Accent6	39	
kCellstyle40Accent1	20	
kCellstyle40Accent2	24	
kCellstyle40Accent3	28	
kCellstyle40Accent4	32	
kCellstyle40Accent5	36	
kCellstyle40Accent6	40	
kCellstyle60Accent1	21	
kCellstyle60Accent2	25	
kCellstyle60Accent3	29	
kCellstyle60Accent4	33	
kCellstyle60Accent5	37	
kCellstyle60Accent6	41	
kCellstyleAccent1	22	
kCellstyleAccent2,	26	
kCellstyleAccent3	30	
kCellstyleAccent4,	34	
kCellstyleAccent5	38	
kCellstyleAccent6,	42	
kCellstyleBad	1	Bad, usually red text on a light red background.
kCellstyleCalc	4	
kCellstyleCheckcell	5	
kCellstyleComma	43	Comma
kCellstyleComma0	44	Comma [0]
kCellstyleCurrency	45	Currency
kCellstyleCurrency0	46	Currency [0]
kCellstyleExplanatory	6	
kCellstyleGood	2	
kCellstyleHeading1	14	
kCellstyleHeading2	15	
kCellstyleHeading3	16	
kCellstyleHeading4	17	
kCellstyleHyperlink	9	
kCellstyleInput	7	Input field style
kCellstyleLinkedCell	10	Linked Cell style.
kCellstyleNeutral	3	Bad, usually brown text on a light orange background.
kCellstyleNormal	0	Normal.
kCellstyleNote	11	Note style
kCellstyleOutput,	8	Output field style
kCellstylePercent	47	Percent
kCellstyleTitle	13	Title style
kCellstyleTotal,	18	Total value style
kCellstyleWarning	12	

Errors

Constant	Value	Description
kErrorActiveCellNotFound	76	Active cell is not found.
kErrorAutofilterNull	22	AutoFilter can't be NULL.
kErrorAutofitError	80	Can't calculate the cell's width.
kErrorBiffrecError	26	Workbook is corrupted, error in BIFF record.
kErrorCellNotFound	40	Cell is not found.
kErrorCellNotMerged	41	Cell is not in merged cells.
kErrorCellTypeIncorrect	42	Cell doesn't contain the requested type.
kErrorCharNotAllowed	39	Some particular symbols are not allowed here.
kErrorColorInvalid	52	Color is invalid.
kErrorColOutOfRange	3	Column is out of range.
kErrorConsistencyError	28	Data inconsistency was found.
kErrorControlNotFound	79	Control is not found.
kErrorConvError	67	String conversion error, probably incorrect locale.
kErrorDataValidNotFound	75	Data validations are not found.
kErrorDateInvalid	65	Date is not recognized.
kErrorDirEntryIncorrectName	62	Found an incorrect name in the directory entry inside xls file.
kErrorException	83	STL exception error.
kErrorFileFormatNotSupported	14	File isn't an Excel file or it is not supported.
kErrorFileNameInvalid	11	File name can't be NULL.
kErrorFileNotAvailable	13	Can't open file or path is incorrect.
kErrorFilterColumnNull	72	Filter column is NULL.
kErrorFilterNotFound	74	Filter is not found.
kErrorFilterValueNotFound	73	Filter value is not found.
kErrorFontNotFound	34	Font is not found.
kErrorFontSizeOutOfRange	18	Font size is out of range.
kErrorFormatNotFound	32	Format is not found.
kErrorFormatNull	31	Format is NULL.
kErrorFormulaSyntaxError	9	Error in formula expression.
kErrorFuncNotSupportedForXls	15	This function is not supported for xls files.
kErrorFuncNotSupportedForXlsx	16	This function is not supported for xlsx files.
kErrorHeightTooHigh	43	Height is too big.
kErrorHyperlinkNotFound	77	Cell doesn't have a hyperlink.
kErrorIgnoredErrAlreadyExist	59	Ignored error already exists.
kErrorIncorrectPassword	1	Incorrect password for encrypted workbook.
kErrorIndexNoSense	5	Indexes are meaningless for this function.
kErrorIndexOutOfRange	4	Index is out of range.
kErrorIOError	27	Can't read or write.
kErrorLastSheet	6	Workbook must contain at least one visible worksheet.
kErrorLoadedInlyInfo	17	Only workbook information was loaded.
kErrorLocaleError	24	Can't apply the specified locale.
kErrorNameAlreadyExist	12	Workbook already contains such a sheet name.
kErrorNamecutoff	8	Name was truncated.
kErrorNamedRangeNotFound	54	Named range is not found.
kErrorNamedRangeskipped	55	Some parts of named range were skipped.
kErrorNoFonts	19	Workbook doesn't have fonts.
kErrorNoFreeColorIndex	51	There is no free color index for xls format.
kErrorNoId	71	ID is not found.
kErrorNoStyles	70	Styles are not found.
kErrorOK	0	Everything was fine.
kErrorOutlineLevelExceeded	23	Exceeded outline level for groups.
kErrorOutOfMemory	29	Not enough memory.
kErrorOverlap	60	Range overlap was detected.
kErrorPageBreakAlreadyExist	56	Page break already exists.
kErrorPageBreakLimit	58	Number of page breaks exceeds the limit.
kErrorPageBreakNotFound	57	Page break is not found.
kErrorParentFormatNotFound	33	Parent format is not found.
kErrorPicError	44	Picture is corrupted or it has unknown format.
kErrorPicNotFound	46	Picture is not found.

Picture Format Constants

Constant	Value	Description
PictureTypeDIB	4	DIB format
PictureTypeEMF	5	EMF format
PictureTypeError	&hFF	Error. Check XLBookMBS.ErrorMessage method.
PictureTypeGIF	2	GIF format.
PictureTypeJPEG	1	JPEG format
PictureTypePICT	6	Mac PICT format.
PictureTypePNG	0	PNG format
PictureTypeSVG	8	SVG format
PictureTypeTIFF	7	TIFF format
PictureTypeWMF	3	WMF format

Sheet Types

Constant	Value	Description
SheetTypeChart	1	Sheet is a chart.
SheetTypeSheet	0	This is a normal sheet.
SheetTypeUnknown	2	Type is unknown.

228.3 class XLConditionalFormatMBS

228.3.1 class XLConditionalFormatMBS

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a format used with conditional formatting.
Example:

```
// highlighting alternating rows
book.RgbMode = true

Var cFormat As XLConditionalFormatMBS = book.addConditionalFormat()
cFormat.FillPattern = cFormat.FillPatternSolid
cFormat.PatternBackgroundColor = book.PackColor(240, 240, 240)

Var cFormatting As XLConditionalFormattingMBS = sheet.addConditionalFormatting()
cFormatting.addRange(4, 20, 1, 10)
cFormatting.addRule(cFormatting.FormatTypeExpression, cFormat, "=MOD(ROW(),2)=0")

For row As Integer = 4 To 19
For col As Integer = 1 To 9
Call sheet.WriteNumber(row, col, row + col)
Next
Next
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 24.2pr1

228.3.2 Methods

228.3.3 Constructor

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

228.3.4 SetBorder(style as Integer = 1)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the border style.
Notes: Sets all four sides. Defaults to thin border.

228.3.5 SetBorderColor(color as Integer)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the border color.

228.3.6 Properties

228.3.7 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parent object.
Notes: The owning book object.
(Read only property)

228.3.8 BorderBottom as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The bottom border style.
Notes: (Read and Write property)

228.3.9 BorderBottomColor as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The color of the bottom border.
Notes: (Read and Write property)

228.3.10 BorderLeft as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The left border style.
Notes: (Read and Write property)

228.3.11 BorderLeftColor as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The color of the left border.
Notes: (Read and Write property)

228.3.12 BorderRight as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The right border style.
Notes: (Read and Write property)

228.3.13 BorderRightColor as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The color of the right border.
Notes: (Read and Write property)

228.3.14 BorderTop as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The top border style.
Notes: (Read and Write property)

228.3.15 BorderTopColor as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The color of the top border.
Notes: (Read and Write property)

228.3.16 CustomNumFormat as String

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Custom number format.
Notes: The format string customNumFormat indicates how to format and render the numeric value of a cell. See custom format strings guidelines.
https://www.libxl.com/custom-format.html
(Read and Write property)

228.3.17 FillPattern as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The fill pattern.
Notes: (Read and Write property)

228.3.18 Font as XLFontMBS

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the pointer to the current used font for this conditional format.
Notes: (Read only property)

228.3.19 Handle as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

228.3.20 NumFormat as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number format identifier.
Notes: The identifier must be a valid built-in number format identifier.

(Read and Write property)

228.3.21 PatternBackgroundColor as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The background color of the fill pattern.
Notes: (Read and Write property)

228.3.22 PatternForegroundColor as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The foreground color of the fill pattern.
Notes: (Read and Write property)

228.3.23 Constants

Border Style Constants

Constant	Value	Description
BorderStyleDashdot	9	dash and dot
BorderStyleDashdotdot	11	dash and dots
BorderStyleDashed	3	dashed
BorderStyleDotted	4	dotted
BorderStyleDouble	6	double
BorderStyleHair	7	hair style
BorderStyleMedium	2	medium
BorderStyleMediumdashdot	10	medium dash and dot
BorderStyleMediumdashdotdot	12	medium dash and dots
BorderStyleMediumdashed	8	medium dashed
BorderStyleNone	0	no border
BorderStyleSlantdashdot	13	medium dash and dot
BorderStyleThick	5	thick
BorderStyleThin	1	thin

Fillpattern Style Constants

Constant	Value	Description
FillPatternDiagcrosshatch	9	Diagonal cross hatch
FillPatternDiagstripe	8	Diagonal stripes
FillPatternGray12P5	17	Gray dots
FillPatternGray25	4	25% Gray
FillPatternGray50	2	50% Gray
FillPatternGray6P25	18	More gray dots
FillPatternGray75	3	75% Gray
FillPatternHorstripe	5	Horizontal stripes
FillPatternNone	0	No filling
FillPatternRevdiagstripe	7	Reverse diagonal stripes
FillPatternSolid	1	Solid fill
FillPatternThickdiagcrosshatch	10	Thick diagonal cross hatch
FillPatternThindiagcrosshatch	16	Thin diagonal cross hatch
FillPatternThindiagstripe	14	Thin diagonal stripes
FillPatternThinhorcrosshatch	15	Thin horizontal cross hatch
FillPatternThinhorstripe	11	Thin horizontal stripes
FillPatternThinrevdiagstripe	13	Thin vertical diagonal stripes
FillPatternThinverstripe	12	Thin vertical stripes
FillPatternVerstripe	6	Vertical stripes

Number Format Constants

Constant	Value	Description
NumformatAccount	41	account value: 5,000
NumformatAccountcur	42	account value with currency symbol: $ 5,000
NumformatAccountD2	43	account value with decimal point: 5,000.00
NumformatAccountD2Cur	44	account value with currency symbol and decimal point: $ 5,000.00
NumformatCurrencyD2Negbra	7	monetary value with decimal point, negative in brackets: ($ 1000.00)
NumformatCurrencyD2NegbraRed	8	monetary value with decimal point, negative is red in brackets: ($ 1000.0
NumformatCurrencyNegbra	5	monetary value, negative in brackets: (1000$)
NumformatCurrencyNegbraRed	6	monetary value, negative is red in brackets: (1000$)
NumformatCustom000P0EPlus0	48	custom value: 15.2E+3
NumformatCustomDMon	16	custom date value: 11-Mar
NumformatCustomDMonYY	15	custom date value: 11-Mar-09
NumformatCustomH0MMSS	46	custom time value: 20:30:55
NumformatCustomHMM	20	custom date value: 8:30
NumformatCustomHMMAM	18	custom date value: 8:30 AM
NumformatCustomHMMSS	21	custom date value: 8:30:00
NumformatCustomHMMSSAM	19	custom date value: 8:30:00 AM
NumformatCustomMDYYYYHMM	22	custom datetime value: 3/11/2009 8:30
NumformatCustoMMMSS	45	custom time value: 30:55
NumformatCustoMMMSS0	47	custom time value: 30:55.0
NumformatCustomMonYY	17	custom date value: Mar-09
NumformatDate	14	date value, depends on OS settings: 3/11/2009
NumformatFractionOneDig	12	fraction value, one digit: 10 1/2
NumformatFractionTwoDig	13	fraction value, two digits: 10 23/95
NumformatGeneral	0	general format
NumformatNumber	1	general number: 1000
NumformatNumberD2	2	number with decimal point: 1000.00
NumformatNumberD2SepNegbra	39	number with thousands separator and decimal point, negative in brac (4,000.00)
NumformatNumberD2SepNegbraRed	40	number with thousands separator and decimal point, negative is red in brac (4,000.00)
NumformatNumberSep	3	number with thousands separator: 100,000
NumformatNumberSepD2	4	number with decimal point and thousands separator: 100,000.00
NumformatNumberSepNegbra	37	number with thousands separator, negative in brackets: (4,000)
NumformatNumberSepNegbraRed	38	number with thousands separator, negative is red in brackets: (4,000)
NumformatPercent	9	percent value, multiply the cell value by 100: 75%
NumformatPercentD2	10	percent value with decimal point, multiply the cell value by 100: 75.00%
NumformatScientificD2	11	scientific value with E character and decimal point: 10.00E+1
NumformatText	49	text value

228.4 class XLConditionalFormattingMBS

228.4.1 class XLConditionalFormattingMBS

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a conditional formatting rule set.
Example:

```
// create a rule to make cells starting with A to be bold
Var cFormat As XLConditionalFormatMBS = book.addConditionalFormat()
cFormat.Font.bold = true

Var cf As XLConditionalFormattingMBS = sheet.addConditionalFormatting()
cf.addRange(2, 10, 1, 1)
cf.addRule(cf.FormatTypeBeginWith, cFormat, "a")
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 24.2pr1

228.4.2 Methods

228.4.3 Add2ColorScaleFormulaRule(minColor as Integer, maxColor as Integer, minType as Integer = 2, minValue as String = "", maxType as Integer = 2, maxValue as String = "", stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that creates a gradated 2-color scale on the cells.
Notes: minColor: the color for minimum;
maxColor: the color for maximum;
minType: the type of minValue, see values above;
minValue: the formula expression for minimum;
maxType: the type of maxValue, see values above;
maxValue: the formula expression for maximum;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

228.4.4 Add2ColorScaleRule(minColor as Integer, maxColor as Integer, minType as Integer = 0, minValue as Double = 0, maxType as Integer = 1, maxValue as Double = 0, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that creates a gradated 2-color scale on the cells.
Example:

```
// creating a gradated Color scale on the cells
Var cf As XLConditionalFormattingMBS = sheet.addConditionalFormatting()
cf.addRange(3, 10, 2, 2)
cf.add2ColorScaleRule(book.PackColor(&hFF, &h71, &h28), book.PackColor(&hFF, &hEF, &h9C))
```

Notes: minColor: the color for minimum;
maxColor: the color for maximum;
minType: the type of minValue, see values below;
minValue: the numeric value for minimum;
maxType: the type of maxValue, see values below;
maxValue: the numeric value for maximum;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

228.4.5 Add3ColorScaleFormulaRule(minColor as Integer, midColor as Integer, maxColor as Integer, minType as Integer = 2, minValue as String = ””, midType as Integer = 2, midValue as String = ””, maxType as Integer = 2, maxValue as String = ””, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that creates a gradated 3-color scale on the cells.
Notes: minColor: the color for minimum;
minColor: the color for midpoint;
maxColor: the color for maximum;
minType: the type of minValue, see values above;
minValue: the formula expression for minimum;
midType: the type of midValue, see values above;
midValue: the formula expression for midpoint;
maxType: the type of maxValue, see values above;
maxValue: the formula expression for maximum;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

228.4.6 Add3ColorScaleRule(minColor as Integer, midColor as Integer, maxColor as Integer, minType as Integer = 0, minValue as Double = 0, midType as Integer = 5, midValue as Double = 0, maxType as Integer = 1, maxValue as Double = 0, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that creates a gradated 3-color scale on the cells.
Notes: minColor: the color for minimum;
minColor: the color for midpoint;
maxColor: the color for maximum;
minType: the type of minValue, see values above;
minValue: the numeric value for minimum;
midType: the type of midValue, see values above;
midValue: the numeric value for midpoint;
maxType: the type of maxValue, see values above;
maxValue: the numeric value for maximum;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

228.4.7 AddAboveAverageRule(format as XLConditionalFormatMBS, aboveAverage as Boolean = true, equalAverage as Boolean = false, stdDev as Integer = 0, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that highlights cells that are above or below the average for all values in the range.
Notes: Format: the conditional format used for highlighting cells, use the addConditionalFormat() for adding conditional formats;
aboveAverage: true for [above average] rule, false for [below average] rule;
equalAverage: true for inclusive of the average itself, false for exclusive of that value, valid only for [above average] rule;
stdDev: the number of standard deviations to include above or below the average, valid only for [above average] rule;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

228.4.8 AddOpNumRule(op as Integer, format as XLConditionalFormatMBS, value1 as double, value2 as double = 0.0, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that highlights cells whose values are compared with a calculated result, using an operator.
Example:

```
// highlighting cells that more than the specified value

const COLOR_LIGHTGREEN = 42

Var cFormat As XLConditionalFormatMBS = book.addConditionalFormat()
cFormat.FillPattern = cFormat.FillPatternSolid
cFormat.PatternBackgroundColor = COLOR_LIGHTGREEN

Var cf As XLConditionalFormattingMBS = sheet.addConditionalFormatting()
cf.addRange(3, 10, 2, 2)
cf.addOpNumRule(cf.FormatOperatorGreaterThan, cFormat, 90)
```

Notes: op: the operator in the conditional formatting rule, see the list of operators below;
Format: the conditional format used for highlighting cells, use the addConditionalFormat() for adding conditional formats;
value1: the numeric value for the expression with the specified operator;
value2: the numeric second optional value for the expression only for some operators;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

228.4.9 AddOpStrRule(op as Integer, format as XLConditionalFormatMBS, value1 as String = """, value2 as String = """, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that highlights cells whose values are compared with a calculated result, using an operator.
Notes: op: the operator in the conditional formatting rule, see the list of operators above;
Format: the conditional format used for highlighting cells, use the addConditionalFormat() for adding conditional formats;
value1: the string value for the expression with the specified operator;
value2: the string second optional value for the expression only for some operators;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

228.4.10 AddRange(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a range to these conditional formatting rules.

228.4.11 AddRule(FormatType as Integer, format as XLConditionalFormatMBS, value as String = """, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that highlights cells whose values correspond to the specified criteria.
Example:

```
// highlighting alternating rows
book.RgbMode = true

Var cFormat As XLConditionalFormatMBS = book.addConditionalFormat()
cFormat.FillPattern = cFormat.FillPatternSolid
cFormat.PatternBackgroundColor = book.PackColor(240, 240, 240)

Var cFormatting As XLConditionalFormattingMBS = sheet.addConditionalFormatting()
cFormatting.addRange(4, 20, 1, 10)
cFormatting.addRule(cFormatting.FormatTypeExpression, cFormat, "=MOD(ROW(),2)=0")

For row As Integer = 4 To 19
For col As Integer = 1 To 9
Call sheet.WriteNumber(row, col, row + col)
Next
Next
```

Notes: FormatType: the conditional format rule type, see the list of types below, see constants;
format: the conditional format used for highlighting cells, use the addConditionalFormat() for adding conditional formats;
value: specifies the criteria for the conditional formatting rule;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true;

228.4.12 AddTimePeriodRule(format as XLConditionalFormatMBS, timePeriod as Integer, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that highlights cells containing dates in the specified time period.
Notes: Format: the conditional format used for highlighting cells, use the addConditionalFormat() for adding conditional formats;
timePeriod: the applicable time period, see the list of values below;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

228.4.13 AddTopRule(format as XLConditionalFormatMBS, value as Integer, bottom as Boolean = false, percent as Boolean = false, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that highlights cells whose values fall in the [top N] or [bottom N] bracket.
Notes: Format - the conditional format used for highlighting cells, use the addConditionalFormat() for adding conditional formats;
value: specifies the [top N] or [bottom N] bracket;
bottom: true for a [bottom N] rule, false for a [top N] rule
percent: true for a percent top/bottom rule;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

228.4.14 Constructor

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

228.4.15 Properties

228.4.16 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parent object.
Notes: The owning book object.
(Read only property)

228.4.17 Handle as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

228.4.18 RuleCount as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of rules added.
Notes: For debugging we count up the rules.
(Read only property)

228.4.19 Constants

Operators

Constant	Value	Description
FormatOperatorBeginsWith	10	'Begins with' operator
FormatOperatorBetween	6	'Between' operator
FormatOperatorContainsText	8	'Contains' operator
FormatOperatorEndsWith	11	'Ends with' operator
FormatOperatorEqual	2	'Equal to' operator
FormatOperatorGreaterThan	5	'Greater than' operator
FormatOperatorGreaterThanOrEqual	4	'Greater than or equal to' operator
FormatOperatorLessThan	0	'Less than' operator
FormatOperatorLessthanOrEqual	1	'Less than or equal to' operator
FormatOperatorNotBetween	7	'Not between' operator
FormatOperatorNotContains	9	'Does not contain' operator
FormatOperatorNotEqual	3	'Not equal to' operator

Time Periods

Constant	Value	Description
FormatTimePeriodLast7Days	0	a date in the last seven days
FormatTimePeriodLastMonth	1	a date occuring in the last calendar month
FormatTimePeriodLastWeek	2	a date occuring last week
FormatTimePeriodNextMonth	3	a date occuring in the next calendar mont
FormatTimePeriodNextWeek	4	a date occuring next week
FormatTimePeriodThisMonth	5	a date occuring in this calendar month
FormatTimePeriodThisWeek	6	a date occuring this week
FormatTimePeriodToday	7	today's date
FormatTimePeriodTomorrow	8	tomorrow's date
FormatTimePeriodYesterday	9	yesterday's date

Format Types

Constant	Value	Description
FormatTypeBeginWith	0	highlights cells that begin with the given text
FormatTypeContainsBlanks	1	highlights cells that are completely blank
FormatTypeContainsErrors	2	highlights cells with formula errors
FormatTypeContainsText	3	highlights cells containing given text
FormatTypeDuplicateValues	4	highlights duplicated values
FormatTypeEndsWith	5	highlights cells ending with given text
FormatTypeExpression	6	highlights cells when the formula result is true
FormatTypeNotContainsBlanks	7	highlights cells that are not blank
FormatTypeNotContainsErrors	8	highlights cells without formula errors
FormatTypeNotContainsText	9	highlights cells that do not contain given text
FormatTypeUniqueValues	10	highlights unique values in the range

Value Operators

Constant	Value	Description
FormatValueOperatorFormula	2	the minimum/midpoint/maximum value for the gradient is determined by a formula
FormatValueOperatorMax	1	indicates that the maximum value in the range shall be used as the maximum value for the gradient
FormatValueOperatorMin	0	indicates that the minimum value in the range shall be used as the minimum value for the gradient
FormatValueOperatorNumber	3	indicates that the minimum/midpoint/maximum value for the gradient is specified by a constant numeric value
FormatValueOperatorPercent	4	value indicates a percentage between the minimum and maximum values in the range shall be used as the minimum/midpoint/maximum value for the gradient
FormatValueOperatorPercentile	5	value indicates a percentile ranking in the range shall be used as the minimum/midpoint/maximum value for the gradient

228.5 class XLCopyOptionsMBS

228.5.1 class XLCopyOptionsMBS

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The options for copying.
Example:

```
// copy a sheet into another workbook with values and formats, but without comments
Var source As New XLBookMBS(True)
If Not source.Load(SpecialFolder.Desktop.Child("source.xlsx")) Then Return

Var target As New XLBookMBS(True)
Var options As New XLCopyOptionsMBS
options.CopyFormat = True
options.CopyComments = False

source.Sheet(0).CopySheet(target, options)
Call target.Save(SpecialFolder.Desktop.Child("copy.xlsx"))
```

228.5.2 Methods

228.5.3 Constructor

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: Initializes object and sets all properties to true.

228.5.4 Properties

228.5.5 CopyColHidden as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy column hidden flags.
Notes: Defaults to true.
(Read and Write property)

228.5.6 CopyComments as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy comments.
Notes: Defaults to true.
(Read and Write property)

228.5.7 CopyFormat as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy formats.
Notes: Defaults to true.
(Read and Write property)

228.5.8 CopyHorPageBreak as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy horizontal page breaks.
Notes: Defaults to true.
(Read and Write property)

228.5.9 CopyMerge as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy merge cells.
Notes: Defaults to true.

(Read and Write property)

228.5.10 CopyNamedRanges as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy named ranges.
Notes: Defaults to true.
(Read and Write property)

228.5.11 CopyPicture as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy pictures.
Notes: Defaults to true.
(Read and Write property)

228.5.12 CopyPrintArea as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy print area.
Notes: Defaults to true.
(Read and Write property)

228.5.13 CopyPrintFit as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy print fit settings.
Notes: Defaults to true.
(Read and Write property)

228.5.14 CopyPrintRepeat as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy print repeat settings.
Notes: Defaults to true.

(Read and Write property)

228.5.15 CopyRowHidden as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy row hidden flags.
Notes: Defaults to true.
(Read and Write property)

228.6 class XLCorePropertiesMBS

228.6.1 class XLCorePropertiesMBS

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for core properties in an Excel file.
Example:

```
Var book As New XLBookMBS(True)
Var cp As XLCorePropertiesMBS = book.CoreProperties
cp.Title = "The title"
cp.Subject = "Test document"
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

228.6.2 Methods

228.6.3 Constructor

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

228.6.4 RemoveAll

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Remove all workbook properties.

228.6.5 Properties

228.6.6 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parent book.
Notes: (Read only property)

228.6.7 Categories as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "categories" property of the workbook.
Notes: (Read and Write property)

228.6.8 Comments as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "comments" property of the workbook.
Notes: (Read and Write property)

228.6.9 Created as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "created" property of the workbook.
Notes: (Read and Write property)

228.6.10 CreatedAsDouble as Double

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "created" property of the workbook.
Notes: Use the dateUnpack() for extract date/time parts from double.
(Read and Write property)

228.6.11 Creator as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "creator" property of the workbook.
Notes: (Read and Write property)

228.6.12 Handle as Integer

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

228.6.13 LastModifiedBy as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "lastModifiedBy" property of the workbook.
Notes: (Read and Write property)

228.6.14 Modified as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "modified" property of the workbook.
Notes: (Read and Write property)

228.6.15 ModifiedAsDouble as Double

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "modified" property of the workbook.
Notes: Use the dateUnpack() for extract date/time parts from double.
(Read and Write property)

228.6.16 Subject as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "subject" property of the workbook.
Example:

```
Var book As New XLBookMBS(True)
Var cp As XLCorePropertiesMBS = book.CoreProperties
cp.Subject = "Test document"
```

Notes: (Read and Write property)

228.6.17 Tags as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "tags" property of the workbook.
Notes: (Read and Write property)

228.6.18 Title as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "title" property of the workbook.
Example:

```
Var book As New XLBookMBS(True)
Var cp As XLCorePropertiesMBS = book.CoreProperties
cp.Title = "The title"
```

Notes: (Read and Write property)

228.7 class XLDataValidationValuesMBS

228.7.1 class XLDataValidationValuesMBS

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for information on a data validation setting.
Example:

```
Var b As New XLBookMBS(True)
Var s As XLSheetMBS = b.AddSheet("test")

Var type As Integer = s.ValidationTypeDecimal
var op as integer = s.ValidationOpBetween

// add a validation
s.AddDataValidation type, op, 1, 2, 3, 4, "1", "3", True

// and check it again
var c as integer = s.DataValidationSize
Var d As XLDataValidationValuesMBS = s.DataValidation(0)

Break
```

228.7.2 Properties

228.7.3 allowBlank as Boolean

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: a boolean value indicating whether the data validation treats empty or blank entries as valid, 'true' means empty entries are OK and do not violate the validation constraints.
Notes: (Read only property)

228.7.4 colFirst as Integer

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: the first column of range.
Notes: (Read only property)

228.7.5 colLast as Integer

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: the last column of range.
Notes: (Read only property)

228.7.6 error as String

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: message text of error alert.
Notes: (Read only property)

228.7.7 errorStyle as Integer

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: the style of error alert used for this data validation.
Notes: (Read only property)

228.7.8 errorTitle as String

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: title bar text of error alert.
Notes: (Read only property)

228.7.9 hideDropDown as Boolean

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: a boolean value indicating whether to display the dropdown combo box for a list type data validation (ValidationTypeList).
Notes: (Read only property)

228.7.10 index as Integer

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: the index of data validation.
Notes: (Read only property)

228.7.11 op as Integer

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: the relational operator of data validation.
Notes: See ValidationOp* constants.
(Read only property)

228.7.12 prompt as String

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: message text of input prompt.
Notes: (Read only property)

228.7.13 promptTitle as String

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: title bar text of input prompt.
Notes: (Read only property)

228.7.14 rowFirst as Integer

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: the first row of range.
Notes: (Read only property)

228.7.15 rowLast as Integer

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: the last row of range.
Notes: (Read only property)

228.7.16 showErrorMessage as Boolean

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: A boolean value indicating whether to display the error alert message when an invalid value has.
Notes: (Read only property)

228.7.17 showInputMessage as Boolean

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: A boolean value indicating whether to display the input prompt message.
Notes: (Read only property)

228.7.18 type as Integer

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The type of data validation.
Notes: See ValidationType* constants.
(Read only property)

228.7.19 value1 as String

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The first value for relational operator.
Notes: Use double quotes if you want to specify a list of values directly (for example "A,B,C") and don't use quotes if you want to specify a reference to area with values (for example A1:A6);
(Read only property)

228.7.20 value2 as String

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: the second value for ValidationOpBetween or ValidationOpNotbetween operator.
Notes: (Read only property)

228.7.21 Constants

Constants

Constant	Value	Description
ValidationOpLessthan	4	ConstantsGroup: Validation Operations
ValidationOpLessthanorequal	5	ConstantsGroup: Validation Operations

Data Validation Error Styles

Constant	Value	Description
ValidationErrstyleInformation	2	This data validation error style uses an information icon in the error alert.
ValidationErrstyleStop	0	This data validation error style uses a stop icon in the error alert.
ValidationErrstyleWarning	1	This data validation error style uses a warning icon in the error alert.

Validation Operations

Constant	Value	Description
ValidationOpBetween	0	Data validation which checks if a value is between two other values.
ValidationOpEqual	2	Data validation which checks if a value is equal to a specified value.
ValidationOpGreaterthan	6	Data validation which checks if a value is greater than a specified value.
ValidationOpGreaterthanorequal	7	Data validation which checks if a value is greater than or equal to a specified value.
ValidationOpNotbetween	1	Data validation which checks if a value is not between two other values.
ValidationOpNotequal	3	Data validation which checks if a value is not equal to a specified value.

Data Validation Types

Constant	Value	Description
ValidationTypeCustom	7	Data validation which uses a custom formula to check the cell value.
ValidationTypeDate	4	Data validation which checks for date values satisfying the given condition.
ValidationTypeDecimal	2	Data validation which checks for decimal values satisfying the given condition.
ValidationTypeList	3	Data validation which checks for a value matching one of list of values.
ValidationTypeNone	0	No data validation.
ValidationTypeTextlength	6	Data validation which checks for text values, whose length satisfies the given condition.
ValidationTypeTime	5	Data validation which checks for time values satisfying the given condition.
ValidationTypeWhole	1	Data validation which checks for whole number values satisfying the given condition.

228.8 class XLFilterColumnMBS

228.8.1 class XLFilterColumnMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for filter column.
Example:

```
// add an auto filter to a sheet showing only rows with sales above 1000
Var book As New XLBookMBS(True)
Var sheet As XLSheetMBS = book.AddSheet("Sales")
Call sheet.WriteString(0, 0, "Region")
Call sheet.WriteString(0, 1, "Sales")
Var regions() As String = Array("North", "South", "West", "East")
Var sales() As Double = Array(1200.0, 800.0, 2000.0, 950.0)
For i As Integer = 0 To 3
Call sheet.WriteString(i + 1, 0, regions(i))
Call sheet.WriteNumber(i + 1, 1, sales(i))
Next

Var filter As XLAutoFilterMBS = sheet.AutoFilter
filter.SetRef(0, 4, 0, 1) // header row and data rows, two columns
Var salesColumn As XLFilterColumnMBS = filter.Column(1)
salesColumn.SetCustomFilter(XLFilterColumnMBS.OperatorGreaterThan, "1000")
sheet.ApplyFilter

Call book.Save(SpecialFolder.Desktop.Child("filtered.xlsx"))
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- LibXL Extras for Xojo
- MBS Xojo Plugins, version 18.4pr9

228.8.2 Methods

228.8.3 AddFilter(Filter as String)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the filter value.

228.8.4 Clear

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear the filter criteria.

228.8.5 Constructor

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

228.8.6 Filter(index as Integer) as String

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the filter value by index.

228.8.7 GetCustomFilterEx(byref Op1 as Integer, byref Value1 as String, byref Op2 as Integer, byref Value2 as String, byref andOp as Boolean) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the custom filter criteria:
Notes: op1 - operator used by the filter comparison in the first filter criteria;
Value1 - value used in the first filter criteria;
op2 - operator used by the filter comparison in the second filter criteria;
Value12 - value used in the second filter criteria;
andOp - flag indicating whether the two criterias have an "and" relationship. True indicates "and", false indicates "or".
Returns false if error. Get error info with XLBookMBS.errorMessage.

228.8.8 GetTop10(byref value as Double, byref top as boolean, byref percent as boolean) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the number of top or bottom items:
Notes: value - number of items;
top - top items if true otherwise bottom items;

percent - using percent instead of number items.
Returns false if error. Get error info with XLBookMBS.errorMessage.

228.8.9 SetCustomFilter(Op as Integer, Value as String)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the custom filter criteria:
Notes: op - operator used by the filter comparison in the filter criteria;
Value - value used in the filter criteria;

228.8.10 SetCustomFilterEx(Op1 as Integer, Value1 as String, Op2 as Integer, Value2 as String, andOp as Boolean = false)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the custom filter criteria:
Notes: op1 - operator used by the filter comparison in the first filter criteria;
Value1 - value used in the first filter criteria;
op2 - operator used by the filter comparison in the second filter criteria;
Value2 - value used in the second filter criteria;
andOp - flag indicating whether the two criterias have an "and" relationship. True indicates "and", false indicates "or".

228.8.11 SetTop10(value as Double, top as boolean = true, percent as boolean = false)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the number of top or bottom items:
Notes: value - number of items;
top - top items if true otherwise bottom items;
percent - using percent instead of number items.

228.8.12 Properties

228.8.13 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The owner object.
Notes: (Read only property)

228.8.14 FilterSize as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of filter values.
Notes: (Read only property)

228.8.15 FilterType as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the filter type of this AutoFilter column.
Notes: can be constants FilterColor, FilterCustom, FilterDynamic, FilterExt, FilterIcon, FilterNotSet, FilterTop10 or FilterValue.
(Read only property)

228.8.16 Handle as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

228.8.17 Index as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the zero-based index of this AutoFilter column.
Notes: (Read only property)

228.8.18 Constants

Filter Types

Constant	Value	Description
FilterColor	4	Specifies the color to filter by.
FilterCustom	2	Custom filter with specified criteria.
FilterDynamic	3	Specifies dynamic filter criteria.
FilterExt	6	Defines flexible storage extensions.
FilterIcon	5	Specifies the icon to filter by.
FilterNotSet	7	No filter.
FilterTop10	1	The top N (percent or number of items) to filter by.
FilterValue	0	Filter by specified values.

Compare Operators

Constant	Value	Description
OperatorEqual	0	Equal
OperatorGreaterThan	1	Greater than
OperatorGreaterThanOrEqual	2	Greater than or equal
OperatorLessThan	3	Less than
OperatorLessThanOrEqual	4	Less than or equal
OperatorNotEqual	5	Not equal

228.9 class XLFontMBS

228.9.1 class XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a font definition.
Example:

```
Var book as XLBookMBS // your book
Var textFont as XLFontMBS = book.addFont()
textFont.size = 8
textFont.name = "Century Gothic"
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

228.9.2 Methods

228.9.3 Constructor

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

228.9.4 Operator_Compare(other as XLFontMBS) as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares two font objects.
Notes: Compares handle instead of Xojo object pointers to make sure that two Xojo objects pointing to the same font are considered equal in Xojo.

228.9.5 Properties

228.9.6 Bold as Boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the font is bold.
Notes: (Read and Write property)

228.9.7 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The owner object.
Notes: As a font is only valid with the owning book, we keep a back reference here.
(Read only property)

228.9.8 ColorRGB as Color

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font color as color value.
Notes: While ColorValue may return indexed color, this property converts to a Xojo color value.
(Read and Write property)

228.9.9 ColorValue as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the font.
Example:

```
Var book as XLBookMBS // your book
Var textFont as XLFontMBS = book.addFont()
textFont.size = 8
textFont.ColorValue = XLFontMBS.ColorGray25
```

Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.

(Read and Write property)

228.9.10 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

228.9.11 Italic as Boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the font is italic.
Notes: If italic doesn't show, maybe check whether the chosen font supports italic.
(Read and Write property)

228.9.12 Name as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the font.
Notes: Default name is "Arial".
(Read and Write property)

228.9.13 Script as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The script style of the font.
Notes: (Read and Write property)

228.9.14 Size as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of the font in points.
Notes: (Read and Write property)

228.9.15 StrikeOut as Boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the font is strikeout.
Notes: (Read and Write property)

228.9.16 Underline as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The underline style of the font.
Notes: See Underline* constants.
(Read and Write property)

228.9.17 Constants

Color Constants

Constant	Value	Description
ColorAqua	49

Script Style Constants

Constant	Value	Description
ScriptNormal	0	
ScriptSub	2	
ScriptSuper	1	

Underline Style Constants

Constant	Value	Description
UnderlineDouble	2	
UnderlineDoubleacc	&H22	
UnderlineNone	0	
UnderlineSingle	1	
UnderlineSingleacc	&H21	

228.10 class XLFormatMBS

228.10.1 class XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a format.
Example:

```
Var book as XLBookMBS // your book
// add font
Var boldFont as XLFontMBS = book.addFont()
boldFont.StrikeOut = true

// add format
Var boldFormat as XLFormatMBS = book.addFormat
boldFormat.font = boldFont

// write on a cell in first sheet
sheet = book.Sheet(0)
call sheet.WriteString(1, 1, "Sales Receipt", boldFormat)
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- 20.5, page 73: Create and Read Excel Spreadsheets, Using LibXL with Xojo by Stefanie Juchmes

228.10.2 Methods

228.10.3 Constructor

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

228.10.4 Operator_Compare(other as XLFontMBS) as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares two format objects.
Notes: Compares handle instead of Xojo object pointers to make sure that two Xojo objects pointing to the same format are considered equal in Xojo.

228.10.5 SetBorder(border as Integer = 1)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the border style.
Notes: See BorderStyle* constants.

228.10.6 SetBorderColor(ColorValue as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the border color.
Notes: If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.

228.10.7 SetFont(font as XLFontMBS) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the font for the format.
Notes: To create a new font use XLBookMBS.addFont(). Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.10.8 SetRotation(rotation as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the text rotation.
Notes: Must be a value from the following table:

Value	Meaning
0 - 90	Text rotated counterclockwise 0 to 90 degrees
91 - 180	Text rotated clockwise 1 to 90 degrees
255	Vertical text

228.10.9 Properties

228.10.10 AlignH as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The horizontal alignment.
Notes: See AlignH* constants.
(Read and Write property)

228.10.11 AlignV as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The vertical alignment.
Notes: See AlignV* constants.
(Read and Write property)

228.10.12 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The object owning this format object.
Notes: As a format is only valid with the owning book, we keep a back reference here.
(Read only property)

228.10.13 BorderBottom as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The bottom border style.
Notes: See BorderStyle* constants.
(Read and Write property)

228.10.14 BorderBottomColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the bottom border.
Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

228.10.15 BorderDiagonal as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The diagonal border.
Notes: see BorderDiagonal* constants.
(Read and Write property)

228.10.16 BorderDiagonalColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the diagonal border.
Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

228.10.17 BorderDiagonalStyle as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The diagonal border style.
Notes: See BorderDiagonal* constants.
(Read and Write property)

228.10.18 BorderLeft as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The left border style.
Notes: See BorderStyle* constants.
(Read and Write property)

228.10.19 BorderLeftColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the left border.
Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

228.10.20 BorderRight as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The right border style.
Notes: See BorderStyle* constants.
(Read and Write property)

228.10.21 BorderRightColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the right border.
Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

228.10.22 BorderTop as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The top border style.
Notes: See BorderStyle* constants.
(Read and Write property)

228.10.23 BorderTopColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the top border.
Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

228.10.24 FillPattern as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The fill pattern.
Notes: See fill pattern constants.
(Read and Write property)

228.10.25 Font as XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font for the format.
Example:

```
// your book
Var book as XLBookMBS

// add font
Var StrikeOutFont as XLFontMBS = book.addFont()
StrikeOutFont.StrikeOut = true

// add format
Var StrikeOutFormat as XLFormatMBS = book.addFormat
```

```
StrikeOutFormat.font = StrikeOutFont

// write on a cell in first sheet
sheet = book.Sheet(0)
call sheet.WriteString(1, 1, "Sales Receipt", StrikeOutFormat)
```

Notes: To create a new font use XLBookMBS.addFont(). Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
(Read and Write property)

228.10.26 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

228.10.27 Hidden as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the hidden protection property is set to true.
Notes: (Read and Write property)

228.10.28 Indent as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The text indentation level.
Notes: Must be less than or equal to 15.
(Read and Write property)

228.10.29 Locked as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the locked protection property is set to true.
Notes: Needs to be used together with XLSheetMBS.Protect property and XLSheetMBS.SetProtectEx method to prevent editing in locked cells.
(Read and Write property)

228.10.30 NumFormat as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number format identifier.
Notes: The identifier must be a valid built-in number format identifier or the identifier of a custom number format. To create a custom format use XLBookMBS.addCustomNumFormat(). Or use one of the NumFormat* constants.
(Read and Write property)

228.10.31 PatternBackgroundColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The background color of the fill pattern.
Example:

```
// define a format for red fill
Var redBackgroundFormat As XLFormatMBS = book.AddFormat
Var c As Color = &cFF0000
// will give back numeric value of color for RGB mode or color index
Var n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Var row As Integer = 5 // 6th row
Var col As Integer = 1 // Column B
Var value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

228.10.32 PatternForegroundColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The foreground color of the fill pattern.

Example:

```
// define a format for red fill
Var redBackgroundFormat As XLFormatMBS = book.AddFormat
Var c As Color = &cFF0000
// will give back numeric value of color for RGB mode or color index
Var n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Var row As Integer = 5 // 6th row
Var col As Integer = 1 // Column B
Var value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

228.10.33 Rotation as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the text rotation.
Notes: Must be a value from the following table:

Value	Meaning
0 - 90	Text rotated counterclockwise 0 to 90 degrees
91 - 180	Text rotated clockwise 1 to 90 degrees
255	Vertical text

(Read only property)

228.10.34 ShrinkToFit as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the cell is shrink-to-fit.
Notes: (Read and Write property)

228.10.35 Wrap as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the cell text is wrapped.
Notes: (Read and Write property)

228.10.36 Constants

Horizontal Alignment Constants

Constant	Value	Description
AlignHCenter	2	Center
AlignHDistributed	7	Distributed
AlignHFill	4	Fill
AlignHGeneral	0	Default
AlignHJustify	5	Justify
AlignHLeft	1	Left
AlignHMerge	6	Center over several cells.
AlignHRight	3	Right

Vertical Alignment Constants

Constant	Value	Description
AlignVBottom	2	Bottom
AlignVCenter	1	Center
AlignVDistributed	4	Distributed
AlignVJustify	3	Justify
AlignVTop	0	Top

Diagonal Border Style Constants

Constant	Value	Description
BorderDiagonalBoth	3	
BorderDiagonalDown	1	
BorderDiagonalNone	0	
BorderDiagonalUp	2	

Border Style Constants

Constant	Value	Description
BorderStyleDashdot	9	dash and dot
BorderStyleDashdotdot	11	dash and dots
BorderStyleDashed	3	dashed
BorderStyleDotted	4	dotted
BorderStyleDouble	6	double
BorderStyleHair	7	hair style
BorderStyleMedium	2	medium
BorderStyleMediumdashdot	10	medium dash and dot
BorderStyleMediumdashdotdot	12	medium dash and dots
BorderStyleMediumdashed	8	medium dashed
BorderStyleNone	0	no border
BorderStyleSlantdashdot	13	dash and dot
BorderStyleThick	5	thick
BorderStyleThin	1	thin

Fillpattern Style Constants

Constant	Value	Description
FillPatternDiagcrosshatch	9	Diagonal cross hatch
FillPatternDiagstripe	8	Diagonal stripes
FillPatternGray12P5	17	Gray dots
FillPatternGray25	4	25% Gray
FillPatternGray50	2	50% Gray
FillPatternGray6P25	18	More gray dots
FillPatternGray75	3	75% Gray
FillPatternHorstripe	5	Horizontal stripes
FillPatternNone	0	No filling
FillPatternRevdiagstripe	7	Reverse diagonal stripes
FillPatternSolid	1	Solid fill
FillPatternThickdiagcrosshatch	10	Thick diagonal cross hatch
FillPatternThindiagcrosshatch	16	Thin diagonal cross hatch
FillPatternThindiagstripe	14	Thin diagonal stripes
FillPatternThinhorcrosshatch	15	Thin horizontal cross hatch
FillPatternThinhorstripe	11	Thin horizontal stripes
FillPatternThinrevdiagstripe	13	Thin vertical diagonal stripes
FillPatternThinverstripe	12	Thin vertical stripes
FillPatternVerstripe	6	Vertical stripes

Number Format Constants

Constant	Value	Description
NumformatAccount	41	account value: 5,000
NumformatAccountcur	42	account value with currency symbol: $ 5,000
NumformatAccountD2	43	account value with decimal point: 5,000.00
NumformatAccountD2Cur	44	account value with currency symbol and decimal point: $ 5,000.00
NumformatCurrencyD2Negbra	7	monetary value with decimal point, negative in brackets: ($ 1000.00)
NumformatCurrencyD2NegbraRed	8	monetary value with decimal point, negative is red in brackets: ($ 1000.0
NumformatCurrencyNegbra	5	monetary value, negative in brackets: (1000$)
NumformatCurrencyNegbraRed	6	monetary value, negative is red in brackets: (1000$)
NumformatCustom000P0EPlus0	48	custom value: 15.2E+3
NumformatCustomDMon	16	custom date value: 11-Mar
NumformatCustomDMonYY	15	custom date value: 11-Mar-09
NumformatCustomH0MMSS	46	custom time value: 20:30:55
NumformatCustomHMM	20	custom date value: 8:30
NumformatCustomHMMAM	18	custom date value: 8:30 AM
NumformatCustomHMMSS	21	custom date value: 8:30:00
NumformatCustomHMMSSAM	19	custom date value: 8:30:00 AM
NumformatCustomMDYYYYHMM	22	custom datetime value: 3/11/2009 8:30
NumformatCustomMMSS	45	custom time value: 30:55
NumformatCustomMMSS0	47	custom time value: 30:55.0
NumformatCustomMonYY	17	custom date value: Mar-09
NumformatDate	14	date value, depends on OS settings: 3/11/2009
NumformatFractionOneDig	12	fraction value, one digit: 10 1/2
NumformatFractionTwoDig	13	fraction value, two digits: 10 23/95
NumformatGeneral	0	general format
NumformatNumber	1	general number: 1000
NumformatNumberD2	2	number with decimal point: 1000.00
NumformatNumberD2SepNegbra	39	number with thousands separator and decimal point, negative in brac (4,000.00)
NumformatNumberD2SepNegbraRed	40	number with thousands separator and decimal point, negative is red in brac (4,000.00)
NumformatNumberSep	3	number with thousands separator: 100,000
NumformatNumberSepD2	4	number with decimal point and thousands separator: 100,000.00
NumformatNumberSepNegbra	37	number with thousands separator, negative in brackets: (4,000)
NumformatNumberSepNegbraRed	38	number with thousands separator, negative is red in brackets: (4,000)
NumformatPercent	9	percent value, multiply the cell value by 100: 75%
NumformatPercentD2	10	percent value with decimal point, multiply the cell value by 100: 75.00%
NumformatScientificD2	11	scientific value with E character and decimal point: 10.00E+1
NumformatText	49	text value

228.11 class XLFormControlMBS

228.11.1 class XLFormControlMBS

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class to represent various form controls on an Excel sheet.
Example:

```
// list the form controls (checkboxes, buttons, lists) on the first sheet of an Excel file
Var book As New XLBookMBS(True)
If Not book.Load(SpecialFolder.Desktop.Child("form.xlsx")) Then Return
Var sheet As XLSheetMBS = book.Sheet(0)

For Each ctl As XLFormControlMBS In sheet.FormControls
Var info As String = ctl.Name + " (type " + ctl.ObjectType.ToString + ")"
If ctl.ObjectType = XLFormControlMBS.ObjectTypeCheckbox Then
info = info + If(ctl.Checked = XLFormControlMBS.CheckedTypeChecked, " checked", " not checked")
End If
If ctl.LinkedCell <>"" Then info = info + ", linked to " + ctl.LinkedCell
System.DebugLog info
Next
```

Notes: This allows you to batch pre-fill form fields in an Excel document.
You may need Excel to create the template with the form fields.

New in LibXL 4.0.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

228.11.2 Methods

228.11.3 AddItem(value as String)

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds the item to a list box or drop-down form control.

228.11.4 ClearItems

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Clears all items from a list box or drop-down form control.

228.11.5 Constructor

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

228.11.6 FromAnchor(byref Col as Integer, byref ColOff as Integer, byref Row as Integer, byref RowOff as Integer) as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the top left location of a control within a document.

228.11.7 InsertItem(Index as Integer, value as String)

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Inserts the item to the specified position to a list box or drop-down form control.

228.11.8 Item(Index as Integer) as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the item by index from a list box or drop-down form control.
Notes: Index in range from zero to ItemCount-1.

228.11.9 ToAnchor(byref Col as Integer, byref ColOff as Integer, byref Row as Integer, byref RowOff as Integer) as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the bottom right location of a control within a document.

228.11.10 Properties

228.11.11 AltText as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Alternative text for the object.
Notes: (Read only property)

228.11.12 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The book reference.
Notes: (Read only property)

228.11.13 Checked as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether a check box is selected or a radio button is selected.
Notes: This attribute only applies to check box and radio button form controls.

See CheckType* constants.
(Read and Write property)

228.11.14 DefaultSize as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the object is at its default size.
Notes: (Read only property)

228.11.15 Disabled as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the object is allowed to run an attached macro.
Notes: (Read only property)

228.11.16 DropLines as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the number of lines in the drop-down before scroll bars are added.
Notes: This attribute only applies to drop-down form controls.
This value must be at least 0 and at most 30000.
(Read and Write property)

228.11.17 Dx as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the width of the scroll bar in pixels.
Notes: This attribute only applies to list boxes, scroll bars, spin boxes and drop-downs.
(Read and Write property)

228.11.18 FirstButton as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the object is the first button in a set of radio buttons.
Notes: This attribute only applies to radio button form controls.
(Read and Write property)

228.11.19 FmlaGroup as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The cell reference in a group box is linked to.
Notes: Only applies to group box form controls.
(Read and Write property)

228.11.20 FmlaLink as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The cell reference is linked to.
Notes: Only applies to check boxes, radio buttons, scroll bars, spin boxes, drop-downs and list boxes.
(Read and Write property)

228.11.21 FmlaRange as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The cell reference with range of source data cells.
Notes: This attribute only applies to list box and drop-down form controls.
(Read and Write property)

228.11.22 FmlaTxbx as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The cell reference with the source data that the form control object's data is linked to.
Notes: This attribute applies only to label and edit box form controls.
Any cell range can be specified but only the first cell in the range is considered.
(Read and Write property)

228.11.23 Handle as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

228.11.24 Horiz as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether the scroll bar is horizontal.
Notes: This attribute only applies to scroll bar form controls.
(Read and Write property)

228.11.25 Inc as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The change in the current value of a scroll bar or a spin box form control as a result of on an increment click.
Notes: It must be at least 0 and at most 30000. This attribute applies only to scroll bar or spin box form controls.
(Read and Write property)

228.11.26 ItemCount as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the number of items in a list box or drop-down form control.
Notes: (Read only property)

228.11.27 LinkedCell as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The worksheet range linked to the control's value.
Notes: (Read only property)

228.11.28 ListFillRange as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The range of source data cells used to populate the list box.
Notes: (Read only property)

228.11.29 Locked as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the object is locked when the sheet is protected.
Notes: (Read only property)

228.11.30 Macro as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The custom function associated with the object.
Notes: (Read only property)

228.11.31 Max as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The maximum value generated by the scroll bar or by the spin box.
Notes: It must be at least 0 and at most 30000. This attribute only applies to scroll bars and spin boxes.
(Read and Write property)

228.11.32 Min as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The minimum value generated by the scroll bar or by the spin box.
Notes: It must be at least 0 and at most 30000. This attribute only applies to scroll bars and spin box.
(Read and Write property)

228.11.33 MultiSel as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The indices of selected items as a comma-delimited list.
Notes: The list indices are one-based.
This attribute is valid only if the attribute selType has the value ”multi”.
This attribute applies only to list box form controls.
(Read and Write property)

228.11.34 Name as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name for this embedded control.
Notes: (Read only property)

228.11.35 ObjectType as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the form control object type.
Notes: See ObjectType constants.
(Read only property)

228.11.36 Print as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the object is printed when the document is printed.
Notes: (Read only property)

228.11.37 Sel as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The index of the selected item.
Notes: The index is one-based.
If set to a value of 0, no items are selected.
This attribute applies only to list box and drop-down form controls.
(Read and Write property)

228.11.38 Constants

Check State

Constant	Value	Description
CheckedTypeChecked	1	Object is checked or selected.
CheckedTypeMixed	2	Mixed selection. Applies only to check boxes.
CheckedTypeUnchecked	0	Object is unchecked or unselected.

Object Types

Constant	Value	Description
ObjectTypeButton	1	Button control
ObjectTypeCheckbox	2	Check-box control
ObjectTypeDialog	11	Dialog control
ObjectTypeDrop	3	Drop-down (combo box) control
ObjectTypeEditbox	10	Edit box control
ObjectTypeGbox	4	Group box control
ObjectTypeLabel	5	Label control
ObjectTypeList	6	List box control
ObjectTypeRadio	7	Radio button control
ObjectTypeScroll	8	Scroll bar control
ObjectTypeSpin	9	Spin box control
ObjectTypeUnknown	0	Unknown control

228.12 class XLRichStringMBS

228.12.1 class XLRichStringMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for the rich text.
Example:

```
// write a cell with a bold red word in an Excel file
Var book As New XLBookMBS(True) // xlsx
Var sheet As XLSheetMBS = book.AddSheet("Sheet1")

Var rich As XLRichStringMBS = book.AddRichString
Var red As XLFontMBS = rich.AddFont
red.Bold = True
red.ColorValue = XLFontMBS.ColorRed
rich.AddText "Important: "
rich.AddText "deadline today", red

Call sheet.WriteRichString(1, 0, rich)
Call book.Save(SpecialFolder.Desktop.Child("rich.xlsx"))
```

Notes: This class allows to have more than one font within one cell.

228.12.2 Methods

228.12.3 AddFont(templateFont as XLFontMBS = nil) as XLFontMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new font to the RichString for using with the addText() method.
Notes: templateFont parameter added for version 20.3.

228.12.4 AddStyledText(StyledText as StyledText)

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds styled text to the rich string.
Notes: We convert attributes like bold, italic, underline, color, font name and size.

228.12.5 AddText(text as String, font as XLFontMBS = nil)

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a piece of text (run) with the specified font to the RichString for mixing different fonts in a single cell.

228.12.6 Constructor(book as XLBookMBS)

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new rich text to be used in the book.

228.12.7 Text(Index as Integer) as String

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a piece of text (run) with the specified index from the RichString.
See also:

- 228.12.13 Text as String 25491
- 228.12.8 Text(Index as Integer, byref font as XLFontMBS) as String 25490

228.12.8 Text(Index as Integer, byref font as XLFontMBS) as String

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a piece of text (run) and font with the specified index from the RichString.
See also:

- 228.12.13 Text as String 25491
- 228.12.7 Text(Index as Integer) as String 25490

228.12.9 Properties

228.12.10 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The reference to the owning book.
Notes: (Read only property)

228.12.11 Handle as Integer

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

228.12.12 StyledText as StyledText

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries styled text with attributes of the rich string.
Notes: We convert attributes like bold, italic, underline, color, font name and size.
(Read only property)

228.12.13 Text as String

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all text from the rich string.
Notes: (Read only property)
See also:

- 228.12.7 Text(Index as Integer) as String 25490
- 228.12.8 Text(Index as Integer, byref font as XLFontMBS) as String 25490

228.12.14 TextCount as Integer

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of text (run) in the RichString.
Notes: (Read only property)

228.13 class XLSheetMBS

228.13.1 class XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an Excel worksheet.
Example:

```
// write a small table with a bold header, a sum formula and a percent column
Var book As New XLBookMBS(True) // xlsx
Var sheet As XLSheetMBS = book.AddSheet("Sales")

Var bold As XLFormatMBS = book.AddFormat
Var boldFont As XLFontMBS = book.AddFont
boldFont.Bold = True
bold.Font = boldFont
Var percent As XLFormatMBS = book.AddFormat
percent.NumFormat = XLFormatMBS.NumformatPercent

Call sheet.WriteString(0, 0, "Region", bold)
Call sheet.WriteString(0, 1, "Sales", bold)
Call sheet.WriteString(0, 2, "Share", bold)
Var regions() As String = Array("North", "South", "West")
Var sales() As Double = Array(1200.0, 800.0, 2000.0)
For i As Integer = 0 To 2
Call sheet.WriteString(i + 1, 0, regions(i))
Call sheet.WriteNumber(i + 1, 1, sales(i))
Call sheet.WriteFormula(i + 1, 2, "B" + Str(i + 2) + "/B5", percent)
Next
Call sheet.WriteFormula(4, 1, "SUM(B2:B4)", bold)
Call sheet.SetCol(0, 2, 15) // column width

Call book.Save(SpecialFolder.Desktop.Child("sales.xlsx"))
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

228.13.2 Methods

228.13.3 AddConditionalFormatting(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer) as XLConditionalFormattingMBS

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a conditional formatting rules to the sheet.
Notes: Only for xlsx files.
Requires LibXL in version 4.x.

Since version 5.1 you need to pass the first area range as parameter.

228.13.4 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String)

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data validation for the specified range (only for xlsx files).
Notes: type: the type of data validation.
op: the relational operator of data validation.
rowFirst: the first row of range;
rowLast: the last row of range;
colFirst: the first column of range;
colLast: the last column of range;

value1: the first value for relational operator;
value2: the second value for ValidationOpBetween or ValidationOpNotBetween operator;
See also:

- 228.13.5 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = """, prompt as String = """, errorTitle as string = """, error as string = """, errorStyle as integer = 0) 25495

228.13.5 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = """, prompt as String = """, errorTitle as string = """, error as string = """, errorStyle as integer = 0)

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data validation for the specified range (only for xlsx files).
Notes: type: the type of data validation.
op: the relational operator of data validation.
rowFirst: the first row of range;
rowLast: the last row of range;
colFirst: the first column of range;
colLast: the last column of range;
value1: the first value for relational operator;
value2: the second value for ValidationOpBetween or ValidationOpNotBetween operator;
allowBlank: a boolean value indicating whether the data validation treats empty or blank entries as valid, 'true' means empty entries are OK and do not violate the validation constraints;
hideDropDown: a boolean value indicating whether to display the dropdown combo box for a list type data validation (ValidationTypeList);
showInputMessage: a boolean value indicating whether to display the input prompt message;
showErrorMessage: a boolean value indicating whether to display the error alert message when an invalid value has been entered, according to the criteria specified;
promptTitle: title bar text of input prompt;
prompt: message text of input prompt;
errorTitle: title bar text of error alert;
error: message text of error alert;
errorStyle: the style of error alert used for this data validation:
See also:

- 228.13.4 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String) 25494

228.13.6 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double)

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data validation for the specified range with double or date values for the relational operator (only for xlsx files).
Notes: See parameters in the addDataValidation() method.
See also:

- 228.13.7 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = """, prompt as String = """, errorTitle as string = """, error as string = """, errorStyle as integer = 0) 25496

228.13.7 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = """, prompt as String = """, errorTitle as string = """, error as string = """, errorStyle as integer = 0)

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data validation for the specified range with double or date values for the relational operator (only for xlsx files).
Notes: See parameters in the addDataValidation() method.
See also:

- 228.13.6 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double) 25496

228.13.8 AddHyperlink(hyperlink as string, rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the new hyperlink.

228.13.9 AddIgnoredError(rowFirst as Integer, colFirst as Integer, rowLast as Integer, colLast as Integer, iError as Integer) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the ignored error for specified range.
Notes: It allows to hide green triangles on left sides of cells. For example, if a cell is formatted as text but contains a numeric value, this is considered to be a potential error because the number won't be treated as a number, for example, in calculations. It is possible to combine a few IgnoredError values with operator | .

Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

228.13.10 AddrToRowCol(addr as string, byref row as Integer, byref col as Integer, byref rowRelative as boolean, byref colRelative as boolean)

MBS XL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a cell reference to row and column.
Example:

```
// create new xls file
Var book as new XLBookMBS(false)

// create sheet
Var sheet as XLSheetMBS = book.AddSheet("Sheet1")

Var row, col as Integer
Var rowRelative, colRelative as boolean

sheet.AddrToRowCol("F7", row, col, rowRelative, colRelative)
MessageBox str(row)+" "+str(col) // shows 6 5
```

228.13.11 AddSelectionRange(sqref as string)

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a range to the selection.

228.13.12 AddTable(Name as String, rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer, hasHeaders as Boolean, tableStyle as Integer) as XLTableMBS

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a table to the sheet with the specified name, range and style.
Notes: Only for xlsx files.

name - the name of the table;
rowFirst - the first row of the table;
rowLast - the last row of the table;
rowLast - the last row of the table;
colFirst - the first column of the table;
colLast - the last column of the table;
hasHeaders - does the specified range include headers or not;
tableStyle - the table style.

See the style table here to see what constant name has what look:
https://www.libxl.com/table.html

Returns the table if successed, nil if failed.

228.13.13 ApplyFilter

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies the AutoFilter to the sheet.
See also:

- 228.13.14 ApplyFilter(AutoFilter as XLAutoFilterMBS) 25498

228.13.14 ApplyFilter(AutoFilter as XLAutoFilterMBS)

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies only the specified AutoFilter to the sheet.
Notes: Only for xlsx files.
See also:

- 228.13.13 ApplyFilter 25498

228.13.15 CellType(row as Integer, col as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns cell's type.
Notes: See CellType constants.

228.13.16 Clear(rowFirst as Integer = 0, rowLast as Integer = 1048575, colFirst as Integer = 0, colLast as Integer = 16383) as Boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears cells in specified area.

228.13.17 ClearPrintArea

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the print area.

228.13.18 ClearPrintRepeats

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears repeated rows and columns on each page.

228.13.19 ColFormat(col as integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns column's format.

228.13.20 ColWidth(col as Integer) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns column width.

228.13.21 ColWidthPx(col as integer) as Integer

MBS XL Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns column width in pixels.

228.13.22 ConditionalFormatting(index as integer) as XLConditionalFormattingMBS

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns conditional formatting rules with the specified index (only for xlsx files).
Notes: The index must be less than the return value of the conditionalFormattingSize() method.

228.13.23 ConditionalFormattings as XLConditionalFormattingMBS()

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all conditional formattings of the sheet.

228.13.24 Constructor

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

228.13.25 CopyCell(rowSrc as Integer, colSrc as Integer, rowDst as Integer, colDst as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies cell with format from (rowSrc, colSrc) to (rowDst, colDst).
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.13.26 CopyCellValue(dest as XLSheetMBS, SourceRow as Integer, DestRow as Integer, SourceColumn as Integer, DestColumn as Integer, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a cell from one sheet to another.
Notes: Source and destination sheets can be in different books.
This copies most properties and all cells.
If something is missing, please let us know.

If options is nil, we copy everything.

If source and dest sheet are the same, does same as CopyCell function.

228.13.27 CopyColumn(dest as XLSheetMBS, SourceColumn as Integer, DestColumn as Integer, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a column from one sheet to another.
Notes: Sheets can be in different books.
This copies most properties and all cells.
If something is missing, please let us know.

If options is nil, we copy everything.

228.13.28 CopyRow(dest as XLSheetMBS, SourceRow as Integer, DestRow as Integer, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a row from one sheet to another.
Notes: Sheets can be in different books.
This copies most properties and all cells.
If something is missing, please let us know.

If options is nil, we copy everything.

228.13.29 CopySheet(dest as XLBookMBS, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a sheet to the other book.
Notes: This copies most properties and all cells.

If something is missing, please let us know.

If options is nil, we copy everything.
See also:

- 228.13.30 CopySheet(dest as XLSheetMBS, Options as XLCopyOptionsMBS = nil) 25502

228.13.30 CopySheet(dest as XLSheetMBS, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the sheet content to the other sheet.
Notes: This copies most properties and all cells.
If something is missing, please let us know.

If options is nil, we copy everything.
See also:

- 228.13.29 CopySheet(dest as XLBookMBS, Options as XLCopyOptionsMBS = nil) 25501

228.13.31 DataValidation(index as Integer) as XLDataValidationValuesMBS

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries details on one data validation.
Example:

```
Var b As New XLBookMBS(True)
Var s As XLSheetMBS = b.AddSheet("test")

Var type As Integer = s.ValidationTypeDecimal
var op as integer = s.ValidationOpBetween

// add a validation
s.AddDataValidation type, op, 1, 2, 3, 4, "1", "3", True

// and check it again
var c as integer = s.DataValidationSize
Var d As XLDataValidationValuesMBS = s.DataValidation(0)

Break
```

228.13.32 DataValidations as XLDataValidationValuesMBS()

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries details on all data validations.

228.13.33 DelHyperlink(index as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes hyperlink by index.
Notes: Index: The index from 0 to HyperlinkSize.

228.13.34 DelMerge(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes merged cells.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.13.35 DelMergeByIndex(index as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes merged cells by index.
Notes: Index: From 0 to MergeSize-1.

228.13.36 DelNamedRange(name as string, scopeId as Integer = -2) as boolean

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes the named range by name.
Notes: Returns false if error occurs. Get error info with XLBookMBS.errorMessage().
scopeId - index of sheet for local named range or ScopeWorkbook for global named range.

228.13.37 FormControl(index as integer) as XLFormControlMBS

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a form control with the specified index.
Notes: The index must be less than the return value of the FormControlCount property.
This allows you to batch pre-fill form fields in an Excel document.
You may need Excel to create the template with the form fields.

228.13.38 FormControls as XLFormControlMBS()

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all form controls of the sheet.

228.13.39 GetActiveCell(byref row as integer, byref col as integer) as boolean

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets an active cell of the sheet.
Notes: Returns true if an active cell is found otherwise returns false.

228.13.40 GetHorPageBreak(index as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns row with horizontal page break at position index.

228.13.41 GetMerge(row as Integer, col as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets merged cells for cell at row, col.
Notes: Result is written in rowFirst, rowLast, colFirst, colLast.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.13.42 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the named range coordianates by name.
Notes: Returns false if specified named range isn't found or error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:

- 228.13.43 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer, ScopeID as Integer, byref Hidden as Integer) as boolean 25505

228.13.43 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer, ScopeID as Integer, byref Hidden as Integer) as boolean

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the named range coordianates by name.
Notes: scopeId - index of sheet for local named range or SCOPE_WORKBOOK for global named range.
hidden - true if named range is hidden and false if isn't.
Returns false if specified named range isn't found or error occurs. Get error info with XLBookMBS.errorMessage.
See also:

- 228.13.42 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as boolean 25504

228.13.44 GetPicture(index as Integer, byref rowTop as Integer, byref colLeft as Integer, byref rowBottom as Integer, byref colRight as Integer, byref width as Integer, byref height as Integer, byref offsetX as Integer, byref offsetY as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a workbook picture index at position index in worksheet.
Notes: Output parameters:
(rowTop, colLeft) - top left position of picture;
(rowBottom, colRight) - bottom right position of picture;
width - width of picture in pixels;
height - height of picture in pixels;
offset_x - horizontal offset of picture in pixels;
offset_y - vertical offset of picture in pixels.

Use XLBookMBS.getPicture() for extracting binary data of picture by workbook picture index.
Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.13.45 GetPrintArea(byref rowFirst as Integer, byref colFirst as Integer, byref rowLast as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the print area.
Notes: Returns false if print area isn't found.

228.13.46 GetPrintFit(byref wPages as Integer, byref hPages as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns whether fit to page option is enabled.
Notes: Output parameters:
wPages - number of pages the sheet width is fit to;
hPages - number of pages the sheet height is fit to.

228.13.47 GetPrintRepeatCols(byref colFirst as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets repeated columns on each page from colFirst to colLast.
Notes: Returns false if repeated columns aren't found.

228.13.48 GetPrintRepeatRows(byref rowFirst as Integer, byref rowLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets repeated rows on each page from rowFirst to rowLast.
Notes: Returns false if repeated rows aren't found.

228.13.49 GetTabRgbColor(byref red as Integer, byref green as Integer, byref blue as Integer) as Boolean

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the sheet's tab RGB color.
Notes: Returns true if the values have been returned.

228.13.50 GetTopLeftView(byref row as Integer, byref col as Integer)

MBS XL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts the first visible row and the leftmost visible column of the sheet.
Example:

```
// create new xls file
Var book as new XLBookMBS(false)

// create sheet
Var sheet as XLSheetMBS = book.AddSheet("Sheet1")

// set top left view
sheet.SetTopLeftView(2,3)

// read values
Var col, row as Integer
sheet.GetTopLeftView(row, col)

MessageBox str(Row)+", "+str(col) // shows 2, 3
```

228.13.51 GetVerPageBreak(index as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns column with vertical page break at position index.

228.13.52 GroupCols(colFirst as Integer, colLast as Integer, collapsed as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Groups columns from colFirst to colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.13.53 GroupRows(rowFirst as Integer, rowLast as Integer, collapsed as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Groups rows from rowFirst to rowLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.13.54 Hyperlink(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as String

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the hyperlink and its coordianates by index.

228.13.55 HyperlinkIndex(row as integer, col as integer) as Integer

MBS XL Plugin, Plugin Version: 23.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if the cell contains a hyperlink.
Notes: Returns an index of hyperlink if exists, -1 if there is no hyperlink in this cell.

228.13.56 InsertCol(colFirst as Integer, colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts columns from colFirst to colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Updates existing named ranges.

228.13.57 InsertColAndKeepRanges(colFirst as integer, colLast as integer) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts columns from colFirst to colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Doesn't update existing named ranges.

228.13.58 InsertRow(rowFirst as Integer, rowLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts rows from rowFirst to rowLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Updates existing named ranges.

228.13.59 InsertRowAndKeepRanges(rowFirst as integer, rowLast as integer) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts rows from rowFirst to rowLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Doesn't update existing named ranges.

228.13.60 IsAutoFilter as boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this sheet has an auto filter.
Notes: Returns true if there is an auto filter, otherwise false.

228.13.61 IsDate(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks that cell contains a date or time value.

228.13.62 IsFormula(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks that cell contains a formula.

228.13.63 IsRichString(row as integer, col as integer) as Boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks that the cell contains a rich string with multiple fonts.
Notes: If return value is true read it with the readRichString() method.

228.13.64 Merge(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the merged cells by index.

228.13.65 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the named range coordianates by index.
See also:

- 228.13.66 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref scopeId as Integer, byref Hidden as Boolean) as string 25510

228.13.66 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref scopeId as Integer, byref Hidden as Boolean) as string

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the named range coordianates by index.
Notes: scopeId - index of sheet for local named range or ScopeWorkbook for global named range.
hidden - true if named range is hidden and false if isn't.
See also:

- 228.13.65 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer) as string 25510

228.13.67 ReadBlank(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads format from blank cell.
Notes: Returns false if specified cell isn't blank or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 228.13.68 ReadBlank(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean 25511

228.13.68 ReadBlank(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads format from blank cell.
Notes: Returns false if specified cell isn't blank or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 228.13.67 ReadBlank(row as Integer, col as Integer) as boolean 25510

228.13.69 ReadBoolean(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a boolean value and its format from cell.
Notes: If nil format is returned then an error occurred. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 228.13.70 ReadBoolean(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean 25511

228.13.70 ReadBoolean(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a boolean value and its format from cell.
Notes: If nil format is returned then an error occurred. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 228.13.69 ReadBoolean(row as Integer, col as Integer) as boolean 25511

228.13.71 ReadComment(row as Integer, col as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a comment from specified cell.
Notes: Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

228.13.72 ReadDate(row as Integer, col as Integer) as date

MBS XL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads a date/time and its format from cell.
Notes: Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 228.13.73 ReadDate(row as Integer, col as Integer, byref format as XLFormatMBS) as date 25512

228.13.73 ReadDate(row as Integer, col as Integer, byref format as XLFormatMBS) as date

MBS XL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads a date/time and its format from cell.
Notes: Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 228.13.72 ReadDate(row as Integer, col as Integer) as date 25512

228.13.74 ReadDateTime(row as integer, col as integer) as dateTime

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a date/time and its format from cell.
Notes: Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.

Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 228.13.75 ReadDateTime(row as integer, col as integer, byref format as XLFormatMBS) as dateTime 25513

228.13.75 ReadDateTime(row as integer, col as integer, byref format as XLFormatMBS) as dateTime

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a date/time and its format from cell.
Notes: Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 228.13.74 ReadDateTime(row as integer, col as integer) as dateTime 25512

228.13.76 ReadError(row as Integer, col as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads error from cell.
Notes: See ErrorType* constants.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

228.13.77 ReadFormula(row as Integer, col as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a formula string and its format from cell.
Notes: Returns nil if specified cell doesn't contain formula or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 228.13.78 ReadFormula(row as Integer, col as Integer, byref format as XLFormatMBS) as string 25514

228.13.78 ReadFormula(row as Integer, col as Integer, byref format as XLFormatMBS) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a formula string and its format from cell.
Notes: Returns nil if specified cell doesn't contain formula or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 228.13.77 ReadFormula(row as Integer, col as Integer) as string 25513

228.13.79 ReadNumber(row as Integer, col as Integer) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a number or date/time and its format from cell.
Notes: Use XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 228.13.80 ReadNumber(row as Integer, col as Integer, byref format as XLFormatMBS) as Double 25514

228.13.80 ReadNumber(row as Integer, col as Integer, byref format as XLFormatMBS) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a number or date/time and its format from cell.
Notes: Use XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 228.13.79 ReadNumber(row as Integer, col as Integer) as Double 25514

228.13.81 ReadRichString(row as integer, col as integer) as XLRichStringMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a rich string with multiple fonts and its format from the cell.
Notes: It's possible to check if the specified cell contains a rich string with the isRichString() method.
Returns nil if the specified cell doesn't contain a string or error occurs.
Get error info with XLBookMBS.ErrorMessage property.
See also:

- 228.13.82 ReadRichString(row as integer, col as integer, byref format as XLFormatMBS) as XLRichStringMBS 25515

228.13.82 ReadRichString(row as integer, col as integer, byref format as XLFormatMBS) as XLRichStringMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a rich string with multiple fonts and its format from the cell.
Notes: It's possible to check if the specified cell contains a rich string with the isRichString() method.
Returns nil if the specified cell doesn't contain a string or error occurs.
Get error info with XLBookMBS.ErrorMessage property.
See also:

- 228.13.81 ReadRichString(row as integer, col as integer) as XLRichStringMBS 25514

228.13.83 ReadString(row as Integer, col as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a string and its format from cell.
Notes: Returns "" if specified cell doesn't contain string or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 228.13.84 ReadString(row as Integer, col as Integer, byref format as XLFormatMBS) as string 25515

228.13.84 ReadString(row as Integer, col as Integer, byref format as XLFormatMBS) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a string and its format from cell.
Notes: Returns "" if specified cell doesn't contain string or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 228.13.83 ReadString(row as Integer, col as Integer) as string 25515

228.13.85 ReadStyledText(row as integer, col as integer) as StyledText

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads rich string of a cell and converts to StyledText.
Notes: We convert attributes like bold, italic, underline, color, font name and size.
See also:

- 228.13.86 ReadStyledText(row as integer, col as integer, byref format as XLFormatMBS) as StyledText 25516

228.13.86 ReadStyledText(row as integer, col as integer, byref format as XLFormatMBS) as StyledText

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads rich string from a cell and returns as StyledText.
Notes: We convert attributes like bold, italic, underline, color, font name and size.
See also:

- 228.13.85 ReadStyledText(row as integer, col as integer) as StyledText 25516

228.13.87 ReadValue(row as integer, col as integer) as Variant

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a value value from a cell.
Notes: Depending on content we return number, boolean, text or date.
Returns nil for empty, error or blank cells.
See also:

- 228.13.88 ReadValue(row as integer, col as integer, byref format as XLFormatMBS) as Variant 25516

228.13.88 ReadValue(row as integer, col as integer, byref format as XLFormatMBS) as Variant

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a value value from a cell.
Notes: Depending on content we return number, boolean, text or date.

Returns nil for empty, error or blank cells.
See also:

- 228.13.87 ReadValue(row as integer, col as integer) as Variant 25516

228.13.89 RemoveCol(colFirst as Integer, colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes columns from colFirst to colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Updates existing named ranges.

228.13.90 RemoveColAndKeepRanges(colFirst as integer, colLast as integer) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes columns from colFirst to colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Doesn't update existing named ranges.

228.13.91 RemoveComment(row as Integer, col as Integer)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a comment from the cell (only for xls format).

228.13.92 RemoveConditionalFormatting(index as Integer) as Boolean

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes conditional formatting rules with the specified index for the sheet (only for xlsx files).
Notes: The index must be less than the return value of the conditionalFormattingSize() method.
Returns true on success and false on failure.

228.13.93 RemoveDataValidations

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes all data validations for the sheet (only for xlsx files).

228.13.94 RemoveFilter

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the AutoFilter from the sheet.

228.13.95 RemovePicture(row as integer, col as integer) as Boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a picture in the specified position.
Notes: Returns false if an error occurs.

228.13.96 RemovePictureByIndex(index as integer) as Boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a picture by specified index. Returns false if an error occurs.

228.13.97 RemoveRow(rowFirst as Integer, rowLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes rows from rowFirst to rowLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Updates existing named ranges.

228.13.98 RemoveRowAndKeepRanges(rowFirst as integer, rowLast as integer) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes rows from rowFirst to rowLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Doesn't update existing named ranges.

228.13.99 RemoveSelection

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes all selection.

228.13.100 RowColToAddr(row as Integer, col as Integer, rowRelative as boolean = true, colRelative as boolean = true) as string

MBS XL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts row and column to a cell reference.
Example:

```
// create new xls file
Var book as new XLBookMBS(false)

// create sheet
Var sheet as XLSheetMBS = book.AddSheet("Sheet1")

MessageBox sheet.RowColToAddr(5,5) // shows F6
MessageBox sheet.RowColToAddr(5,5,false,false) // shows $ F$ 6
```

228.13.101 RowFormat(row as integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns row's format.

228.13.102 RowHeight(row as Integer) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns row height.

228.13.103 RowHeightPx(row as integer) as Integer

MBS XL Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns row height in pixels.

228.13.104 SelectionRange as string

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a range of the selection.

228.13.105 SetActiveCell(row as integer, col as integer)

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an active cell of the sheet.

228.13.106 SetAutoFitArea(rowFirst as Integer = 0, colFirst as Integer = 0, rowLast as Integer = -1, colLast as Integer = -1)

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the borders for autofit column widths feature.
Notes: The method setCol with -1 width value will affect only to the specified limited area.

228.13.107 SetBorder(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer, borderStyle as Integer, borderColor as Integer)

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the border in the specified range of cells.
Notes: rowFirst - the first row of range;
rowLast - the last row of range;
colFirst - the first column of range;
colLast - the last column of range;
borderStyle - the border style;
borderColor - the border color.

228.13.108 SetCol(colFirst as Integer, colLast as Integer, width as Double, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets column width and format for all columns from colFirst to colLast.
Notes: If format is nil then format is ignored. Columns may be hidden. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Column width measured as the number of characters of the maximum digit width of the numbers 0, 1, 2, ..., 9 as rendered in the normal style's font. Value -1 is used for autofit column widths. If format equals 0 then format is ignored. Columns may be hidden.

228.13.109 SetColPx(colFirst as integer, colLast as integer, width as integer, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets column width in pixels and format for all columns from colFirst to colLast.
Notes: Value -1 is used for autofit column widths.
If format equals nil then format is ignored. Columns may be hidden.
Returns false if error occurs. Get an error info with the errorMessage function in XLBookMBS class.

228.13.110 SetFooter(footer as string, margin as Double) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the footer text for the sheet when printed.
Notes: The footer text appears at the bottom of every page when printed. The length of the text must be less than or equal to 255. The footer text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. See setHeader for details. Margin is specified in inches.

228.13.111 SetHeader(header as string, margin as Double) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the header text of the sheet when printed.
Notes: The text appears at the top of every page when printed. The length of the text must be less than or equal to 255. The header text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Special commands are represented by single letter with

Code	Description
&L	specifies the beginning of the left section
&P	specifies the current page number
&N	specifies the total number of pages
&\d { 1,3 }	specifies the text font size, where font size is measured in points, for example: &9 or &36
&S	specifies whether the strikethrough text style is on or off
&X	specifies whether the superscript text style is on or off
&Y	specifies whether the subscript text style is on or off
&C	specifies the beginning of the center section
&D	specifies a date
&T	specifies a time
&G	specifies a picture
&U	specifies whether the single underline text style is on or off
&E	specifies whether the double underline text style is on or off
&R	specifies the beginning of the right section
&Z	specifies a workbook file path
&F	specifies a workbook file name
&A	specifies a sheet name
&"fontname"	specifies the text font, for example: &"Comic Sans MS"
&B	specifies whether the bold text style is on or off
&I	specifies whether the italic text style is on or off
&&	specifies an ampersand character (&)

a leading ampersand ("&"). Margin is specified in inches.

228.13.112 SetHorPageBreak(row as Integer, pageBreak as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets/removes a horizontal page break.
Example:

```
// new document
Var x as new XLBookMBS

// add a sheet
Var s as XLSheetMBS = x.AddSheet

// write a cell
call s.WriteString(5,5, "Hello")
```

Code	Description
&L	specifies the beginning of the left section
&P	specifies the current page number
&N	specifies the total number of pages
&\d { 1,3 }	specifies the text font size, where font size is measured in points, for example: &9 or &36
&S	specifies whether the strikethrough text style is on or off
&X	specifies whether the superscript text style is on or off
&Y	specifies whether the subscript text style is on or off
&C	specifies the beginning of the center section
&D	specifies a date
&T	specifies a time
&G	specifies a picture
&U	specifies whether the single underline text style is on or off
&E	specifies whether the double underline text style is on or off
&R	specifies the beginning of the right section
&Z	specifies a workbook file path
&F	specifies a workbook file name
&A	specifies a sheet name
&"fontname"	specifies the text font, for example: &"Comic Sans MS"
&B	specifies whether the bold text style is on or off
&I	specifies whether the italic text style is on or off
&&	specifies an ampersand character (&)

```
// now put a page break there
if s.SetHorPageBreak(5, true) then
// and now we have one at row 5
MessageBox str(s.GetHorPageBreakCount)+" "+str(s.GetHorPageBreak(0))
end if
```

Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.13.113 SetMerge(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets merged cells for range: rowFirst - rowLast, colFirst - colLast.
Example:

```
// create new xls file
```

```
Var book As New XLBookMBS(True)

// create sheet
Var sheet as XLSheetMBS = book.AddSheet("Sheet1")

// create a format with border
Var borderFormat As XLFormatMBS = book.AddFormat
borderFormat.SetBorder 2
borderFormat.SetBorderColor &hFF0000

// now fill a cell and merge a few more cells.
Var r1 As Boolean = sheet.WriteString(2, 2, "Hello World", borderFormat)
Var r2 As Boolean = sheet.SetMerge(2, 4, 2, 4)

// write file
Var file As FolderItem = SpecialFolder.Desktop.Child("Generate.xlsx")

if book.Save(file) then
file.Launch
else
MessageBox "Failed to create file."+EndOfLine+EndOfLine+book.ErrorMessage
end if
```

Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.13.114 SetNamedRange(name as string, rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer, scopeId as Integer = -2) as boolean

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the named range.
Notes: scopeId - index of sheet for local named range or ScopeWorkbook for global named range.
Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

228.13.115 SetPicture(row as Integer, col as Integer, PictureID as Integer, scale as Double = 1.0, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a picture with pictureId identifier at position row and col with scale factor.
Notes: Use XLBookMBS.addPicture() for getting picture identifier.

scale = 0 means the picture is stretched inside the specified cell or merged area.
See also:

- 228.13.116 SetPicture(row as Integer, col as Integer, PictureID as Integer, width as Integer, height as Integer, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0) 25525

228.13.116 SetPicture(row as Integer, col as Integer, PictureID as Integer, width as Integer, height as Integer, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a picture with pictureId identifier at position row and col with custom size.
Notes: Use XLBookMBS.addPicture() for getting a picture identifier.

Width and height can be -1 for default size of picture.
See also:

- 228.13.115 SetPicture(row as Integer, col as Integer, PictureID as Integer, scale as Double = 1.0, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0) 25524

228.13.117 SetPrintArea(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the print area.

228.13.118 SetPrintFit(wPages as Integer, hPages as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fits sheet width and sheet height to wPages and hPages respectively.

228.13.119 SetPrintRepeatCols(colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets repeated columns on each page from colFirst to colLast.

228.13.120 SetPrintRepeatRows(rowFirst as Integer, rowLast as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets repeated rows on each page from rowFirst to rowLast.

228.13.121 SetProtectEx(protect as boolean = true, password as string = ””, enhancedProtection as Integer = -1)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Protects/unprotects the sheet with password and enchanced parameters below.
Notes: It is possible to combine a few EnhancedProtection values with operator BitwiseOr.

228.13.122 SetRow(row as Integer, height as Double, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets row height and format.
Notes: If format is nil then format is ignored. Row may be hidden. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Height is in points. If you want to convert from pixels to points you can use this calculation: points = pixels * 72 / 96. So for a height of 72 pixel, you pass 54 points.

228.13.123 SetRowPx(row as integer, height as integer, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets row height in pixels.
Notes: If format equals nil then format is ignored. Row may be hidden. Returns false if error occurs. Get an error info with the errorMessage function in XLBookMBS class.

228.13.124 SetTabColor(colorValue as Integer)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color for the sheet's tab.

228.13.125 SetTabRgbColor(red as Integer, green as Integer, blue as Integer)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color for the sheet's tab.

228.13.126 SetTopLeftView(row as Integer, col as Integer)

MBS XL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the first visible row and the leftmost visible column of the sheet.
Example:

```
// create new xls file
Var book as new XLBookMBS(false)

// create sheet
Var sheet as XLSheetMBS = book.AddSheet("Sheet1")

// set top left view
sheet.SetTopLeftView(2,3)

// read values
Var col, row as Integer
sheet.GetTopLeftView(row, col)

MessageBox str(Row)+", "+str(col) // shows 2, 3
```

228.13.127 SetVerPageBreak(row as Integer, pageBreak as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets/removes a vertical page break.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.13.128 Split(row as Integer, col as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Splits a sheet at position (row, col).
Notes: Splits a sheet at position (row, col) or specifies the position of frozen pane. This function allows to freeze a header at top position or freeze some columns on the right.

228.13.129 SplitInfo(byref row as Integer, byref col as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the split information (position of frozen pane) in the sheet.
Notes: row: vertical position of the split;
col: horizontal position of the split.
Returns true on success.

228.13.130 Table(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref headerRowCount as Integer, byref totalsRowCount as Integer) as string

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the table parameters by index.
Notes: headerRowCount - the number of header rows showing at the top of the table. 0 means that the header row is not shown.
totalsRowCount - the number of totals rows that shall be shown at the bottom of the table. 0 means that the totals row is not shown.
Returns a string representing the name of the table.
See also:

- 228.13.131 Table(name as string, byref rowFirst as integer, byref rowLast as integer, byref ColFirst as integer, byref ColLast as integer, byref headerRowCount as integer, byref totalsRowCount as integer) as Boolean 25528

228.13.131 Table(name as string, byref rowFirst as integer, byref rowLast as integer, byref ColFirst as integer, byref ColLast as integer, byref headerRowCount as integer, byref totalsRowCount as integer) as Boolean

MBS XL Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the table parameters by name.
Notes: headerRowCount - the number of header rows showing at the top of the table. 0 means that the header row is not shown.
totalsRowCount - the number of totals rows that shall be shown at the bottom of the table. 0 means that the totals row is not shown.

Returns true if the table is found.
See also:

- 228.13.130 Table(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref headerRowCount as Integer, byref totalsRowCount as Integer) as string 25528

228.13.132 TableByIndex(index as Integer) as XLTableMBS

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a table by the specified index.
Notes: Only for xlsx files.
Returns the table if successed, nil if failed.

228.13.133 TableByName(Name as String) as XLTableMBS

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a table by the specified name.
Notes: Only for xlsx files.
Returns the table if successed, nil if failed.

228.13.134 Tables as XLTableMBS()

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all tables of the sheet.

228.13.135 WriteBlank(row as Integer, col as Integer, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes blank cell with specified format.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

228.13.136 WriteBoolean(row as Integer, col as Integer, value as boolean, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a bool value into cell with specified format.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var format as XLFormatMBS // optional format

Var Success as Boolean = Sheet.WriteBoolean(2, 5, true, format)
```

Notes: If format is nil then format is ignored.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

228.13.137 WriteComment(row as Integer, col as Integer, value as string, author as string, width as Integer, height as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a comment to the cell.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var format as XLFormatMBS // optional format

Var Success as Boolean = Sheet.WriteComment(2, 5, "Sales Worldwide", "Peter", 30, 10)
```

Notes: row and col: cell's position
value: comment string
author: author string
width: width of text box in pixels
height: height of text box in pixels

Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

228.13.138 WriteDate(row as Integer, col as Integer, value as date, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes a date/time into cell with specified format.
Notes: If format is nil then format is ignored. Internally uses XLBookMBS.datePack() for packing date/time

parts to double.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

228.13.139 WriteDateTime(row as integer, col as integer, value as dateTime, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a date/time into cell with specified format.
Notes: If format is nil then format is ignored. Internally uses XLBookMBS.datePack() for packing date/time parts to double.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

228.13.140 WriteError(row as Integer, col as Integer, Error as Integer, format as XLFormatMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes error into the cell with specified format.
Notes: If format equals nil then format is ignored.

228.13.141 WriteFormula(row as Integer, col as Integer, value as string, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a formula into cell with specified format.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var format as XLFormatMBS // optional format

Var Success as Boolean = Sheet.WriteFormula(2, 5, "SUM(E16:E38)", format)
```

Notes: If format is nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

As LibXL does not calculate the result of the formula, it will not encode the result in the Excel file. It does only store the formula, so an app opening the file will have to do the calculation. But QuickLook on Mac OS X does not calculate, so results do not show there.
Examples for formulas are: "TODAY()", "IF(C1>0;ABS(C1*D1);"""")", "SUM(E16:E38)" or "E39+E39*E40".

228.13.142 WriteFormulaBool(row as Integer, col as Integer, Expression as string, value as Boolean, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a formula expression with precalculated bool value into cell with specified format.
Notes: If format equals nil then format is ignored.
Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

228.13.143 WriteFormulaNum(row as Integer, col as Integer, Expression as string, value as Double, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a formula expression with precalculated double value into cell with specified format.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var format as XLFormatMBS // optional format

Var Success as Boolean = Sheet.WriteFormulaNum(2, 5, "SUM(E16:E38)", 123.45, format)
```

Notes: If format equals nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

228.13.144 WriteFormulaString(row as Integer, col as Integer, Expression as string, value as String, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a formula expression with precalculated string value into cell with specified format.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var DollarFormat as XLFormatMBS // the format to use

Var Success as Boolean = Sheet.WriteFormulaString(2, 5, "SUM(E16:E38)", "$ 123.45", DollarFormat)
```

Notes: If format equals nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

228.13.145 WriteNumber(row as Integer, col as Integer, value as Double, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a number or date/time into cell with specified format.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var format as XLFormatMBS // optional format

Var Success as Boolean = Sheet.WriteNumber(2, 5, 123.45, format)
```

Notes: If format is nil then format is ignored. Use XLBookMBS.datePack() for packing date/time parts to double.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

228.13.146 WriteRichString(row as integer, col as integer, RichString as XLRichStringMBS, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a rich string with multiple fonts into the cell with the specified format.
Notes: Add a new rich string with the addRichString() method. If format equals nil then format is ignored.
Returns false if an error occurs. Get error info with XLBookMBS.ErrorMessage property.

228.13.147 WriteString(row as Integer, col as Integer, value as string, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a string into cell with specified format.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var format as XLFormatMBS // optional format
```

```
Var Success as Boolean = Sheet.WriteString(2, 5, "Hello World", format)
```

Notes: If format is nil then format is ignored.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

228.13.148 WriteStringAsNumber(row as integer, col as integer, value as string, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a number into cell with specified format and passes it as text.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var format as XLFormatMBS // optional format

Var Success as Boolean = Sheet.WriteStringAsNumber(2, 5, "123.45", format)
```

Notes: Please pass number as text here to avoid running into rounding errors with floating point numbers.

If format is nil then format is ignored. Use XLBookMBS.datePack() for packing date/time parts to double.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

228.13.149 WriteStyledText(row as integer, col as integer, StyledText as StyledText, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes a styled text to a cell.
Notes: Same as building a rich string based in the StyledText and assigning it to the cell.

We convert attributes like bold, italic, underline, color, font name and size.

228.13.150 Properties

228.13.151 AutoFilter as XLAutoFilterMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the AutoFilter.
Notes: Creates it if it doesn't exist.
Only for xml based files.
(Read only property)

228.13.152 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent book.
Notes: As a sheet is only valid with the owning book, we keep a back reference here.
(Read only property)

228.13.153 ConditionalFormattingSize as Integer

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of conditional formatting rules in this worksheet (only for xlsx files).
Notes: (Read only property)

228.13.154 DataValidationSize as Integer

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of data validations in this worksheet (only for xlsx files).
Notes: (Read only property)

228.13.155 DefaultRowHeight as Double

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default row height measured in point size.
Notes: (Read and Write property)

228.13.156 DisplayGridlines as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the gridlines are displayed.
Notes: True if gridlines are displayed and false if aren't.
(Assigning a value to this property calls setDisplayGridlines internally)
(Read and Write property)

228.13.157 FirstCol as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the first column in the sheet that contains a used cell.
Notes: (Read only property)

228.13.158 FirstFilledCol as Integer

MBS XL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the first column in the sheet that contains a filled cell.
Notes: (Read only property)

228.13.159 FirstFilledRow as Integer

MBS XL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the first row in the sheet that contains a filled cell.
Notes: (Read only property)

228.13.160 FirstRow as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the first row in the sheet that contains a used cell.
Notes: (Read only property)

228.13.161 Footer as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The footer text of the sheet when printed.
Notes: The footer text appears at the bottom of every page when printed. The length of the text must be less than or equal to 255. The footer text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Margin is specified in inches.

Code	Description
&L	specifies the beginning of the left section
&P	specifies the current page number
&N	specifies the total number of pages
&\d { 1,3 }	specifies the text font size, where font size is measured in points, for example: &9 or &36
&S	specifies whether the strikethrough text style is on or off
&X	specifies whether the superscript text style is on or off
&Y	specifies whether the subscript text style is on or off
&C	specifies the beginning of the center section
&D	specifies a date
&T	specifies a time
&G	specifies a picture
&U	specifies whether the single underline text style is on or off
&E	specifies whether the double underline text style is on or off
&R	specifies the beginning of the right section
&Z	specifies a workbook file path
&F	specifies a workbook file name
&A	specifies a sheet name
&"fontname"	specifies the text font, for example: &"Comic Sans MS"
&B	specifies whether the bold text style is on or off
&I	specifies whether the italic text style is on or off
&&	specifies an ampersand character (&)

(Read only property)

228.13.162 FooterMargin as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The footer margin in inches.
Notes: (Read only property)

228.13.163 FormControlCount as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of form controls in this worksheet.
Notes: (Read only property)

228.13.164 GetHorPageBreakCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of horizontal page breaks in the sheet.
Example:

```
// new document
Var x as new XLBookMBS

// add a sheet
Var s as XLSheetMBS = x.AddSheet

// write a cell
call s.WriteString(5,5, "Hello")

// now put a page break there
if s.SetHorPageBreak(5, true) then
// and now we have one at row 5
MessageBox str(s.GetHorPageBreakCount)+" "+str(s.GetHorPageBreak(0))
end if
```

Notes: (Read only property)

228.13.165 GetVerPageBreakCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of vertical page breaks in the sheet.
Notes: (Read only property)

228.13.166 GroupSummaryBelow as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether grouping rows summary is below.

Notes: True if summary is below and false if isn't.
(Read and Write property)

228.13.167 GroupSummaryRight as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether grouping columns summary is right.
Notes: Returns true if summary is right and false if isn't.
(Read and Write property)

228.13.168 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

228.13.169 HCenter as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the sheet is centered horizontally when printed.
Notes: (Read and Write property)

228.13.170 Header as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The header text of the sheet when printed.
Notes: The text appears at the top of every page when printed. The length of the text must be less than or equal to 255. The header text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Special commands are represented by single letter with a leading ampersand ("&"). Margin is specified in inches.

(Read only property)

Code	Description
&L	specifies the beginning of the left section
&P	specifies the current page number
&N	specifies the total number of pages
&\d { 1,3 }	specifies the text font size, where font size is measured in points, for example: &9 or &36
&S	specifies whether the strikethrough text style is on or off
&X	specifies whether the superscript text style is on or off
&Y	specifies whether the subscript text style is on or off
&C	specifies the beginning of the center section
&D	specifies a date
&T	specifies a time
&G	specifies a picture
&U	specifies whether the single underline text style is on or off
&E	specifies whether the double underline text style is on or off
&R	specifies the beginning of the right section
&Z	specifies a workbook file path
&F	specifies a workbook file name
&A	specifies a sheet name
&"fontname"	specifies the text font, for example: &"Comic Sans MS"
&B	specifies whether the bold text style is on or off
&I	specifies whether the italic text style is on or off
&&	specifies an ampersand character (&)

228.13.171 HeaderMargin as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The header margin in inches.
Notes: (Read only property)

228.13.172 Hidden as Integer

MBS XL Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the visible state of this sheet.
Notes: See constants: SheetStateHidden, SheetStateVeryHidden, SheetStateVisible.
(Read and Write property)

228.13.173 HyperlinkSize as Integer

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of hyperlinks in the sheet.
Notes: (Read only property)

228.13.174 Landscape as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to use landscape or portrait mode for printing.
Notes: true - pages are printed using landscape mode, false - pages are printed using portrait mode.
(Read and Write property)

228.13.175 LastCol as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the zero-based index of the column after the last column in the sheet that contains a used cell.
Example:

```
Var book as XLBookMBS // your book instance

// get first sheet
Var sheet as XLSheetMBS = book.Sheet(0)

// show index of last column
Var LastCol as Integer = sheet.LastCol

MessageBox "LastCol: " + str(LastCol)
```

Notes: (Read only property)

228.13.176 LastFilledCol as Integer

MBS XL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the zero-based index of the column after the last column in the sheet that contains a filled cell.
Notes: (Read only property)

228.13.177 LastFilledRow as Integer

MBS XL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the zero-based index of the row after the last row in the sheet that contains a filled cell.
Notes: (Read only property)

228.13.178 LastRow as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the zero-based index of the row after the last row in the sheet that contains a used cell.
Example:

```
Var book as XLBookMBS // your book instance

// get first sheet
Var sheet as XLSheetMBS = book.Sheet(0)

// show index of last row
Var LastRow as Integer = sheet.LastRow

MessageBox "LastRow: " + str(LastRow)
```

Notes: (Read only property)

228.13.179 MarginBottom as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The bottom margin of the sheet in inches.
Notes: (Read and Write property)

228.13.180 MarginLeft as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The left margin of the sheet in inches.
Notes: (Read and Write property)

228.13.181 MarginRight as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The right margin of the sheet in inches.
Notes: (Read and Write property)

228.13.182 MarginTop as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The top margin of the sheet in inches.
Notes: (Read and Write property)

228.13.183 MergeSize as Integer

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of merged cells in this worksheet.
Notes: (Read only property)

228.13.184 Name as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the sheet.
Notes: (Read and Write property)

228.13.185 NamedRangeCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of named ranges in the sheet.
Notes: (Read only property)

228.13.186 Paper as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The paper size.
Notes: See Paper* constants.
(Read and Write property)

228.13.187 PictureCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of pictures in this worksheet.
Notes: (Read only property)

228.13.188 PrintGridlines as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the gridlines are printed.
Notes: True if gridlines are printed and false if aren't.
(Read and Write property)

228.13.189 PrintRowCol as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the row and column headers are printed.
Notes: (Read and Write property)

228.13.190 PrintZoom as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scaling factor for printing as a percentage.
Notes: (Read and Write property)

228.13.191 Protect as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether sheet is protected.
Notes: (Read and Write property)

228.13.192 RightToLeft as boolean

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the text is displayed in right-to-left mode.
Notes: true - the text is displayed in right-to-left mode,
false - the text is displayed in left-to-right mode.
(Read and Write property)

228.13.193 TabColor as Integer

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sheet's tab color.
Notes: For use with documents using indexed colors.
(Read and Write property)

228.13.194 TableSize as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of tables in the sheet.
Notes: (Read only property)

228.13.195 VCenter as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the sheet is centered vertically when printed.
Notes: (Read and Write property)

228.13.196 Zoom as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The zoom level of the current view.
Notes: 100 is a usual view.
(Read and Write property)

228.13.197 CellFormat(row as Integer, col as Integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The cell's format.
Notes: (Read and Write computed property)

228.13.198 ColHidden(col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether column is hidden.
Notes: (Read and Write computed property)

228.13.199 RowHidden(row as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether row is hidden.
Notes: (Read and Write computed property)

228.13.200 Constants

Cell Type Constants

Constant	Value	Description
CellTypeBlank	4	blank
CellTypeBoolean	3	boolean value
CellTypeEmpty	0	empty
CellTypeError	5	error
CellTypeNumber	1	number value
CellTypeStrictDate	6	strict date
CellTypeString	2	string value

Error Type Constants

Constant	Value	Description
ErrorTypeDiv0	7	DIV/0!
ErrorTypeNA	&h2A	N/A
ErrorTypeName	&h1D	NAME?
ErrorTypeNoError	&hFF	No Error.
ErrorTypeNull	0	NULL!
ErrorTypeNum	&h24	NUM!
ErrorTypeRef	&h17	REF!
ErrorTypeValue	&h0F	VALUE!

Ignore Errors

Constant	Value	Description
IgnoreErrorDataValidation	128	Ignore errors when a cell's value in a Table does not comply with the Data Validation rules specified.
IgnoreErrorEmptyCellref	2	Ignore errors when formulas refer to empty cells.
IgnoreErrorEvalError	1	Ignore errors when cells contain formulas that result in an error.
IgnoreErrorInconsistFormula	16	Ignore errors when a formula in a region of your worksheet differs from other formulas in the same region.
IgnoreErrorInconsistRange	8	Ignore errors when formulas omit certain cells in a region.
IgnoreErrorNoError	0	No error.
IgnoreErrorNumberStoredAsText	4	Ignore errors when numbers are formatted as text or are preceded by an apostrophe.
IgnoreErrorTwodigTextyear	32	Ignore errors when formulas contain text formatted cells with years represented as 2 digits.
IgnoreErrorUnlockFormula	64	Ignore errors when unlocked cells contain formulas.

Paper Format Constants

Constant	Value	Description
Paper10X11	45	
Paper10X14	16	10 x 14 in
Paper10X17	17	11 x 17 in
Paper12X11	90	
Paper15X11	46	
Paper9X11	44	
PaperA2	66	
PaperA3	8	A3 297 x 420 mm
PaperA3Extra	63	
PaperA3ExtraTransverse	68	
PaperA3Rotated	76	
PaperA3Transverse	67	
PaperA4	9	A4 210 x 297 mm
PaperA4Extra	53	
PaperA4Plus	60	
PaperA4Rotated	77	
PaperA4Small	10	A4 Small 210 x 297 mm
PaperA4Transverse	55	
PaperA5	11	A5 148 x 210 mm
PaperA5Extra	64	
PaperA5Rotated	78	
PaperA5Transverse	61	
PaperA6	70	
PaperA6Rotated	83	
PaperB4	12	B4 (JIS) 250 x 354
PaperB4Iso	42	
PaperB4Rotated	79	
PaperB5	13	B5 (JIS) 182 x 257 mm
PaperB5Extra	65	
PaperB5Rotated	80	
PaperB5Transverse	62	
PaperB6	88	
PaperB6Rotated	89	
PaperCSize	24	C size sheet
PaperDefault	0	Default paper size
PaperDoubleJapanesePostcardRotated	82	
PaperDSize	25	D size sheet
PaperEnvelope	36	Envelope 110 x 230 mm
PaperEnvelope10	20	US Envelope #10 4 1/8 x 9 1/2
PaperEnvelope11	21	US Envelope #11 4 1/2 x 10 3/8
PaperEnvelope12	22	US Envelope #12 4 3/4 x 11
PaperEnvelope14	23	US Envelope #14 5 x 11 1/2
PaperEnvelope9	19	US Envelope #9 3 7/8 x 8 7/8
PaperEnvelopeB4	33	Envelope B4 250 x 353 mm
PaperEnvelopeB5	34	Envelope B5 176 x 250 mm
PaperEnvelopeB6	35	Envelope B6 176 x 125 mm
PaperEnvelopeC3	29	Envelope C3 324 x 458 mm
PaperEnvelopeC4	30	Envelope C4 229 x 324 mm
PaperEnvelopeC5	28	Envelope C5 162 x 229 mm
PaperEnvelopeC6	31	Envelope C6 114 x 162 mm
PaperEnvelopeC65	32	Envelope C65 114 x 229 mm
PaperEnvelopeDL	27	Envelope DL 110 x 220mm
PaperEnvelopeInvite	47	
PaperEnvelopeMonarch	37	US Envelope Monarch 3.875 x 7.5 in
PaperESize	26	E size sheet
PaperExecutive	7	US Executive 7 1/4 x 10 1/2 in
PaperFanfold	39	US Std Fanfold 14 7/8 x 11 in
PaperFolio	14	Folio 8 1/2 x 13 in

Protection Levels

Constant	Value	Description
ProtectAll	0	Nothing is allowed except cell selections.
ProtectAutofilter	4096	Autofilters are allowed when the sheet is protected.
ProtectDefault	-1	Default protection.
ProtectDeleteColumns	256	Deleting columns is allowed when the sheet is protected.
ProtectDeleteRows	512	Deleting rows is allowed when the sheet is protected.
ProtectFormatCells	4	Formatting cells is allowed when the sheet is protected.
ProtectFormatColumns	8	Formatting columns is allowed when the sheet is protected.
ProtectFormatRows	16	Formatting rows is allowed when the sheet is protected.
ProtectInsertColumns	32	Inserting columns is allowed when the sheet is protected.
ProtectInsertHyperlinks	128	Inserting hyperlinks is allowed when the sheet is protected.
ProtectInsertRows	64	Inserting rows is allowed when the sheet is protected.
ProtectObjects	1	Objects are locked when the sheet is protected.
ProtectPivottables	8192	Pivot tables are allowed when the sheet is protected.
ProtectScenarios	2	Scenarios are locked when the sheet is protected.
ProtectSelLockedCells	1024	Selection of locked cells is locked when the sheet is protected.
ProtectSelUnlockedCells	16384	Selection of unlocked cells is locked when the sheet is protected.
ProtectSort	2048	Sorting is allowed when the sheet is protected.

Scopes

Constant	Value	Description
ScopeUndefined	-2	Undefined scope
ScopeWorkbook	-1	Workbook scope.

Visible State Constants

Constant	Value	Description
SheetStateHidden	1	Sheet is hidden, but can be shown via the user interface.
SheetStateVeryHidden	2	Sheet is hidden and cannot be shown in the user interface.
SheetStateVisible	0	Sheet is visible

Table Styles

Constant	Value	Description
TableStyleDark1	50	Dark 1
TableStyleDark10	59	Dark 10
TableStyleDark11	60	Dark 11
TableStyleDark2	51	Dark 2
TableStyleDark3	52	Dark 3
TableStyleDark4	53	Dark 4
TableStyleDark5	54	Dark 5
TableStyleDark6	55	Dark 6
TableStyleDark7	56	Dark 7
TableStyleDark8	57	Dark 8
TableStyleDark9	58	Dark 9
TableStyleLight1	1	Light 1

Data Validation Error Styles

Constant	Value	Description
ValidationErrstyleInformation	2	This data validation error style uses an information icon in the error alert.
ValidationErrstyleStop	0	This data validation error style uses a stop icon in the error alert.
ValidationErrstyleWarning	1	This data validation error style uses a warning icon in the error alert.

Validation Operations

Constant	Value	Description
ValidationOpBetween	0	Data validation which checks if a value is between two other values.
ValidationOpEqual	2	Data validation which checks if a value is equal to a specified value.
ValidationOpGreaterthan	6	Data validation which checks if a value is greater than a specified value.
ValidationOpGreaterthanorequal	7	Data validation which checks if a value is greater than or equal to a specified value.
ValidationOpLessthan	4	Data validation which checks if a value is less than a specified value.
ValidationOpLessthanorequal	5	Data validation which checks if a value is less than or equal to a specified value.
ValidationOpNotbetween	1	Data validation which checks if a value is not between two other values.
ValidationOpNotequal	3	Data validation which checks if a value is not equal to a specified value.

Data Validation Types

Constant	Value	Description
ValidationTypeCustom	7	Data validation which uses a custom formula to check the cell value.
ValidationTypeDate	4	Data validation which checks for date values satisfying the given condition.
ValidationTypeDecimal	2	Data validation which checks for decimal values satisfying the given condition.
ValidationTypeList	3	Data validation which checks for a value matching one of list of values.
ValidationTypeNone	0	No data validation.
ValidationTypeTextLength	6	Data validation which checks for text values, whose length satisfies the given condition.
ValidationTypeTime	5	Data validation which checks for time values satisfying the given condition.
ValidationTypeWhole	1	Data validation which checks for whole number values satisfying the given condition.

228.14 class XLTableMBS

228.14.1 class XLTableMBS

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a table within an Excel sheet.
Example:

```
// format a range in an Excel sheet as table with header and stripes
Var book As New XLBookMBS(True)
Var sheet As XLSheetMBS = book.AddSheet("Products")
Var headers() As String = Array("Product", "Count", "Price")
For c As Integer = 0 To 2
Call sheet.WriteString(0, c, headers(c))
Next
For r As Integer = 1 To 5
Call sheet.WriteString(r, 0, "Item " + r.ToString)
Call sheet.WriteNumber(r, 1, r * 3)
Call sheet.WriteNumber(r, 2, r * 1.5)
Next

Var table As XLTableMBS = sheet.AddTable("Products", 0, 5, 0, 2, True, XLSheetMBS.TableStyleMedium2)
table.ShowRowStripes = True
System.DebugLog "Table " + table.Name + " covers " + table.Ref

Call book.Save(SpecialFolder.Desktop.Child("table.xlsx"))
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

228.14.2 Methods

228.14.3 Constructor

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

228.14.4 RemoveFilter

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes the AutoFilter from the sheet (only for xlsx files).

228.14.5 Properties

228.14.6 AutoFilter as XLAutoFilterMBS

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the AutoFilter of the table.
Notes: (Read only property)

228.14.7 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The reference to the parent book.
Notes: (Read only property)

228.14.8 ColumnSize as Integer

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of columns in the table.
Notes: (Read only property)

228.14.9 Handle as Integer

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

228.14.10 IsAutoFilter as Boolean

MBS XL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the AutoFilter already exists (only for xlsx files).
Notes: (Read only property)

228.14.11 Name as String

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name of the table.
Notes: (Read and Write property)

228.14.12 Ref as String

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The range on the sheet for this table.
Notes: (Read and Write property)

228.14.13 ShowColumnStripes as Boolean

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether column stripe formatting is applied.
Notes: (Read and Write property)

228.14.14 ShowFirstColumn as Boolean

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the first column in the table should have the style applied.
Notes: (Read and Write property)

228.14.15 ShowLastColumn as Boolean

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the last column in the table should have the style applied.
Notes: (Read and Write property)

228.14.16 ShowRowStripes as Boolean

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether row stripe formatting is applied.
Notes: (Read and Write property)

228.14.17 Style as Integer

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The table style.
Notes: See the style table here to see what constant name has what look:
https://www.libxl.com/table.html
(Read and Write property)

228.14.18 ColumnName(columnIndex as Integer) as String

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The unique name of the table column with the specified index.
Notes: Please note that if you write the name of the column with the WriteString in SheetMBS class, the workbook will be corrupted, because the WriteString() doesn't check if the specified cell belongs to a table.
(Read and Write computed property)

Chapter 229

XML

229.1 class XMLAttributeMBS

229.1.1 class XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLAttributeMBS class refers to an attribute of an XML element.
Notes: Typically the allowable values for the attribute are defined in a documenttype definition.
XMLAttributeMBS objects inherit the XMLNodeMBS interface, but since attributes are not actually child nodes of the elements they are associated with, the DOM does not consider them part of the document tree. Thus, the XMLNodeMBS attributes parentNode, previousSibling, and nextSibling have a null value for XMLAttributeMBS objects. The DOM takes the view that attributes are properties of elements rather than having a separate identity from the elements they are associated with; this should make it more efficient to implement such features as default attributes associated with all elements of a given type. Furthermore, attribute nodes may not be immediate children of a DOMDocumentFragment. However, they can be associated with XMLElementMBS nodes contained within a DOMDocumentFragment. In short, users of the DOM need to be aware that XMLAttributeMBS nodes have some things in common with other objects inheriting the XMLNodeMBS interface, but they also are quite distinct.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.1.2 Methods

229.1.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.1.4 Properties

229.1.5 isId as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether this attribute is known to be of type ID or not.
Notes: When it is and its value is unique, the ownerElement of this attribute can be retrieved using getElementById on XMLDocumentMBS.
(Read only property)

229.1.6 Name as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the name of this attribute.
Notes: (Read only property)

229.1.7 OwnerElement as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLElementMBS node this attribute is attached to or nil if this attribute is not in use.
Notes: (Read only property)

229.1.8 SchemaTypeInfo as XMLTypeInfoMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the type information associated with this attribute.
Notes: the XMLTypeInfoMBS associated with this attribute.
(Read only property)

229.1.9 Specified as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether this is specified.
Notes: Returns true if the attribute received its value explicitly in the XML document, or if a value was assigned programatically with the setValue function. Returns false if the attribute value came from the default value declared in the document's DTD.
(Read only property)

229.1.10 Value as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the value of the attribute.
Notes: The value of the attribute is returned as a string. Character and general entity references are replaced with their values.

Assign something to set the value of the attribute. A text node with the unparsed contents of the string will be created.
(Read and Write property)

229.2 class XMLCDATASectionMBS

229.2.1 class XMLCDATASectionMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: CDATA sections are used to escape blocks of text containing characters that would otherwise be regarded as markup.
Notes: The only delimiter that is recognized in a CDATA section is the "]] >" string that ends the CDATA section. CDATA sections cannot be nested. Their primary purpose is for including material such as XML fragments, without needing to escape all the delimiters.

The data attribute of the XMLTextMBS node holds the text that is contained by the CDATA section. Note that this may contain characters that need to be escaped outside of CDATA sections and that, depending on the character encoding ("charset") chosen for serialization, it may be impossible to write out some characters as part of a CDATA section.

The XMLCDATASectionMBS interface inherits from the XMLCharacterDataMBS interface through the XMLTextMBS interface. Adjacent XMLCDATASectionMBS nodes are not merged by use of the normalize method of the XMLNodeMBS interface. Because no markup is recognized within a XMLCDATASectionMBS, character numeric references cannot be used as an escape mechanism when serializing. Therefore, action needs to be taken when serializing a XMLCDATASectionMBS with a character encoding where some of the contained characters cannot be represented. Failure to do so would not produce well-formed XML.One potential solution in the serialization process is to end the CDATA section before the character, output the character using a character reference or entity reference, and open a new CDATA section for any further characters in the text node. Note, however, that some code conversion libraries at the time of writing do not return an error or exception when a character is missing from the encoding, making the task of ensuring that data is not corrupted on serialization more difficult.
Subclass of the XMLTextMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.2.2 Methods

229.2.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.3 class XMLCharacterDataMBS

229.3.1 class XMLCharacterDataMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for character data.
Notes: The XMLCharacterDataMBS interface extends XMLNodeMBS with a set of attributes and methods for accessing character data in the DOM. For clarity this set is defined here rather than on each object that uses these attributes and methods. No DOM objects correspond directly to XMLCharacterDataMBS, though XMLTextMBS and others do inherit the interface from it. All offsets in this interface start from 0.

As explained in the DOM spec, text strings in the DOM are represented in UTF-16, i.e. as a sequence of 16-bit units. In the following, the term 16-bit units is used whenever necessary to indicate that indexing on XMLCharacterDataMBS is done in 16-bit units.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.3.2 Methods

229.3.3 appendData(data as string)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Append the string to the end of the character data of the node.
Notes: Upon success, data provides access to the concatenation of data.

229.3.4 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.3.5 deleteData(offset as Integer, count as Integer)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Remove a range of characters from the node.
Notes: Upon success, data and length reflect the change.

offset: The offset from which to remove characters. Zero based.

count: The number of characters to delete.

If the sum of offset and count exceeds length then all characters from offset to the end of the data are deleted.

229.3.6 insertData(offset as Integer, data as string)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Insert a string at the specified character offset.
Notes: offset: The character offset at which to insert. Zero based.

229.3.7 replaceData(offset as Integer, count as Integer, data as string)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Replace the characters starting at the specified character offset with the specified string.
Notes: offset: The offset from which to start replacing.
count: The number of characters to replace.

If the sum of offset and count exceeds length, then all characters to the end of the data are replaced (i.e., the effect is the same as a remove method call with the same range, followed by an append method invocation).

229.3.8 substringData(offset as Integer, count as Integer) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Extracts a range of data from the node.
Notes: offset: Start offset of substring to extract. Zero based.
count: The number of characters to extract.

The specified substring. If the sum of offset and count exceeds the length, then all characters to the end of the data are returned.

229.3.9 Properties

229.3.10 Data as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The data content.
Notes: Returns the character data of the node that implements this interface.
The DOM implementation may not put arbitrary limits on the amount of data that may be stored in a XMLCharacterDataMBS node. However, implementation limits may mean that the entirety of a node's data may not fit into a single XMLCh* String. In such cases, the user may call substringData to retrieve the data in appropriately sized pieces.

Can be assigned with new data.
(Read and Write property)

229.3.11 Length as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the number of characters that are available through data and the substringData method below.
Notes: (Read only property)

229.4 class XMLCommentMBS

229.4.1 class XMLCommentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a comment in a xml document.
Notes: This interface inherits from CharacterData and represents the content of a comment, i.e., all the characters between the starting '<!–' and ending '–>'.
Subclass of the XMLCharacterDataMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.4.2 Methods

229.4.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.5 class XMLConfigurationMBS

229.5.1 class XMLConfigurationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLConfigurationMBS interface represents the configuration of a document and maintains a table of recognized parameters.
Example:

```
// parse it
Var doc As New XMLDocumentMBS("<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>")

// create serializer
Var serializer As New XMLSerializerMBS

// options
Var config As XMLConfigurationMBS = serializer.DOMConfig
serializer.NewLine = EndOfLine
config.SpaceFirstLevelElements = False
config.FormatPrettyPrint = True

// and output to string
Var s1 As String = serializer.writeToString(doc)

// options
config.FormatPrettyPrint = False

// and output to string
Var s2 As String = serializer.writeToString(doc)

Break // compare in debugger
```

Notes: Using the configuration, it is possible to change Document.normalizeDocument behavior, such as replacing CDATASection nodes with Text nodes or specifying the type of the schema that must be used when the validation of the Document is requested. XMLConfigurationMBS objects are also used in [DOM Level 3 Load and Save] in the XMLParserMBS and XMLSerializerMBS interfaces.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.5.2 Methods

229.5.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.5.4 Properties

229.5.5 ByteOrderMark as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to include byte order mark byte in output.
Notes: (Read and Write property)

229.5.6 CanonicalForm as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to use canonical form.
Notes: true: Canonicalize the document according to the rules specified in [Canonical XML] . Note that this is limited to what can be represented in the DOM. In particular, there is no way to specify the order of the attributes in the DOM.
false: (default) Do not canonicalize the document.
(Read and Write property)

229.5.7 CDataSections as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to keep CData sections in the document.
Notes: true: (default) Keep CDATASection nodes in the document.
false: Transform CDATASection nodes in the document into Text nodes. The new Text node is then combined with any adjacent Text node.
(Read and Write property)

229.5.8 Comments as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to keep comments.
Notes: true: (default) Keep Comment nodes in the document.
false: Discard Comment nodes in the Document.
(Read and Write property)

229.5.9 DataTypeNormalization as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to perform data type normalization.
Notes: true: Exposed normalized values in the tree.
false: (default) Do not perform normalization on the tree.
(Read and Write property)

229.5.10 DiscardDefaultContent as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to discard default content.
Notes: true: (default) Use whatever information available to the implementation (i.e. XML schema, DTD, the specified flag on Attr nodes, and so on) to decide what attributes and content should be discarded or not. Note that the specified flag on Attr nodes in itself is not always reliable, it is only reliable when it is set to false since the only case where it can be set to false is if the attribute was created by the implementation. The default content won't be removed if an implementation does not have any information available.
false: Keep all attributes and all content.
(Read and Write property)

229.5.11 elementcontentwhitespace as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to keep all white spaces.
Example:

```
Var parser As New XMLParserMBS

// configure the parser
Var DOMConfig As XMLConfigurationMBS = p.DOMConfig
DOMConfig.ElementContentWhitespace=False

// prepare XML input
Var Input As New XMLInputMBS
Input.InputString = kXML2

// and parse
Var xml1 As XMLDocumentMBS = p.parse(Input)

Break
```

Notes: true: (default) Keep all white spaces in the document.

false: Discard white space in element content while normalizing. The implementation is expected to use the isWhitespaceInElementContent flag on Text nodes to determine if a text node should be written out or not.
(Read and Write property)

229.5.12 Entities as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Keep entities in the document.
Notes: true: Keep EntityReference and Entity nodes in the document.
false: (default) Remove all EntityReference and Entity nodes from the document, putting the entity expansions directly in their place. Text nodes are into "normal" form. Only EntityReference nodes to non-defined entities are kept in the document.
(Read and Write property)

229.5.13 FormatPrettyPrint as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to pretty print XML.
Example:

```
// parse it
Var doc As New XMLDocumentMBS("<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>")

// create serializer
Var serializer As New XMLSerializerMBS

// options
Var config As XMLConfigurationMBS = serializer.DOMConfig
serializer.NewLine = EndOfLine
config.SpaceFirstLevelElements = False
config.FormatPrettyPrint = True

// and output to string
Var s1 As String = serializer.writeToString(doc)

// options
config.FormatPrettyPrint = False

// and output to string
Var s2 As String = serializer.writeToString(doc)

Break // compare in debugger
```

Notes: For serializing XML.

Formatting the output by adding whitespace to produce a pretty-printed, indented, human-readable form. The exact form of the transformations is not specified by this specification.
Pretty-printing changes the content of the document and may affect the validity of the document, validating implementations should preserve validity.
(Read and Write property)

229.5.14 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.5.15 ignoreunknowncharacterdenormalizations as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to ignore unknown character normalizations.
Notes: For serializing XML.

If, while verifying full normalization when [XML 1.1] is supported, a character is encountered for which the normalization properties cannot be determined, then raise a "unknown-character-denormalization" warning (instead of raising an error, if this parameter is not set) and ignore any possible denormalizations caused by these characters.

Set to false to report a fatal error if a character is encountered for which the processor cannot determine the normalization properties.
(Read and Write property)

229.5.16 InfoSet as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to only keep the information defined in the XML Information Set.
Notes: true: Only keep in the document the information defined in the XML Information Set [XML Information set] . This forces the following features to false: namespace-declarations, validate-if-schema, entities, datatype-normalization, cdata-sections. This forces the following features to true: whitespace-in-element-content, comments, namespaces. Other features are not changed unless explicitly specified in the description of the features. Note that querying this feature with getFeature returns true only if the individual features

specified above are appropriately set.
false: Setting infoset to false has no effect.
(Read and Write property)

229.5.17 namespacedeclarations as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to include namespace declaration attributes.
Notes: true: (default) Include namespace declaration attributes, specified or defaulted from the schema or the DTD, in the document. See also the section Declaring Namespaces in [XML Namespaces] .
false: Discard all namespace declaration attributes. The Namespace prefixes are retained even if this feature is set to false.
(Read and Write property)

229.5.18 NameSpaces as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to do namespace processing.
Notes: true: (default) Perform the namespace processing as defined in [XML Namespaces] .
false: Do not perform the namespace processing.
(Read and Write property)

229.5.19 normalizecharacters as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to do character normalization.
Notes: true: Perform the W3C Text Normalization of the characters [CharModel] in the document.
false: (default) Do not perform character normalization.
(Read and Write property)

229.5.20 SpaceFirstLevelElements as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to space first level elements for pretty print.
Notes: If true, this adds an extra line feed between the elements that are children of the document root.
(Read and Write property)

229.5.21 splitcdatasections as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to split the CData Sections.
Notes: true: (default) Split CDATA sections containing the CDATA section termination marker ']] >'. When a CDATA section is split a warning is issued.
false: Signal an error if a CDATASection contains an unrepresentable character.
(Read and Write property)

229.5.22 Validate as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to validate against a schema.
Notes: true: Require the validation against a schema (i.e. XML schema, DTD, any other type or representation of schema) of the document as it is being normalized as defined by [XML 1.0] . If validation errors are found, or no schema was found, the error handler is notified. Note also that normalized values will not be exposed to the schema in used unless the feature datatype-normalization is true.
Note: validate-if-schema and validate are mutually exclusive, setting one of them to true will set the other one to false.
false: (default) Only XML 1.0 non-validating processing must be done. Note that validation might still happen if validate-if-schema is true.
(Read and Write property)

229.5.23 validateifschema as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to validate only if a declaration for the document element can be found.
Notes: true: Enable validation only if a declaration for the document element can be found (independently of where it is found, i.e. XML schema, DTD, or any other type or representation of schema). If validation errors are found, the error handler is notified. Note also that normalized values will not be exposed to the schema in used unless the feature datatype-normalization is true.
Note: validate-if-schema and validate are mutually exclusive, setting one of them to true will set the other one to false.
false: (default) No validation should be performed if the document has a schema. Note that validation must still happen if validate is true.
(Read and Write property)

229.5.24 xmldeclaration as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to include declaration.
Notes: For serializing XML.

If a XMLDocumentMBS, XMLElementMBS, or XMLEntityMBS node is serialized, the XML declaration, or text declaration, should be included. The version (xmlVersion if the document is a Level 3 document and the version is non-null, otherwise use the value "1.0"), and the output encoding (see write methods for details on how to find the output encoding) are specified in the serialized XML declaration.

Do not serialize the XML and text declarations. Report a "xml-declaration-needed" warning if this will cause problems (i.e. the serialized data is of an XML version other than [XML 1.0] , or an encoding would be needed to be able to re-parse the serialized data).
(Read and Write property)

229.6 class XMLDocumentFragmentMBS

229.6.1 class XMLDocumentFragmentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: XMLDocumentFragmentMBS is a "lightweight" or "minimal" XMLDocumentMBS object.
Notes: It is very common to want to be able to extract a portion of a document's tree or to create a new fragment of a document. Imagine implementing a user command like cut or rearranging a document by moving fragments around. It is desirable to have an object which can hold such fragments and it is quite natural to use a XMLNodeMBS for this purpose. While it is true that a XMLDocumentMBS object could fulfill this role, a XMLDocumentMBS object can potentially be a heavyweight object, depending on the underlying implementation. What is really needed for this is a very lightweight object. XMLDocumentFragmentMBS is such an object.

Furthermore, various operations – such as inserting nodes as children of another XMLNodeMBS – may take XMLDocumentFragmentMBS objects as arguments; this results in all the child nodes of the XMLDocumentFragmentMBS being moved to the child list of this node.
The children of a XMLDocumentFragmentMBS node are zero or more nodes representing the tops of any sub-trees defining the structure of the document. XMLDocumentFragmentMBS nodes do not need to be well-formed XML documents (although they do need to follow the rules imposed upon well-formed XML parsed entities, which can have multiple top nodes). For example, a XMLDocumentFragmentMBS might have only one child and that child node could be a XMLTextMBS node. Such a structure model represents neither an HTML document nor a well-formed XML document.

When a XMLDocumentFragmentMBS is inserted into a XMLDocumentMBS (or indeed any other XMLNodeMBS that may take children) the children of the XMLDocumentFragmentMBS and not the XMLDocumentFragmentMBS itself are inserted into the XMLNodeMBS. This makes the XMLDocumentFragmentMBS very useful when the user wishes to create nodes that are siblings; the XMLDocumentFragmentMBS acts as the parent of these nodes so that the user can use the standard methods from the XMLNodeMBS interface, such as insertBefore() and appendChild().
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.6.2 Methods

229.6.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.7 class XMLDocumentMBS

229.7.1 class XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLDocumentMBS interface represents the entire XML document.
Example:

```
// parse it
Var doc as new XMLDocumentMBS("<test id=123>abc</test>")

// and make a string:
Var s as string = doc.toString

Break // see in debugger
```

Notes: Conceptually, it is the root of the document tree, and provides the primary access to the document's data.

Since elements, text nodes, comments, processing instructions, etc. cannot exist outside the context of a XMLDocumentMBS, the XMLDocumentMBS interface also contains the factory methods needed to create these objects. The XMLNodeMBS objects created have a ownerDocument attribute which associates them with the XMLDocumentMBS within whose context they were created.

All methods can raise a XMLExceptionMBS object in case of a problem.
Subclass of the XMLNodeMBS class.

229.7.2 Methods

229.7.3 adoptNode(node as XMLNodeMBS) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 23.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Changes the ownerDocument of a node, its children, as well as the attached attribute nodes if there are any.
Notes: If the node has a parent it is first removed from its parent child list. This effectively allows moving a subtree from one document to another.
Should not be needed in Xojo apps.

229.7.4 ClearCache

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Frees the node cache for this document.
Notes: You should usually not need to use this method.

229.7.5 Close

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Explicitly close document.
Notes: This frees memory for all nodes and the XML document now.
You should usually not need to use this method.

229.7.6 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor to create a blank document.
Example:

```
// create blank document
Var doc as new XMLDocumentMBS

Var testNode as XMLElementMBS = doc.createElement("test")

System.DebugLog "doc.append"
call doc.appendChild testNode

System.DebugLog "testNode.append"
call testNode.appendChild doc.createTextNode("Hello World")

// and make a string:
Var s as string = doc.toString

Break // see in debugger
```

- 229.7.8 Constructor(data as String) 25577
- 229.7.9 Constructor(file as FolderItem) 25577
- 229.7.10 Constructor(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) 25577

229.7.7 Constructor(data as MemoryBlock)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience function to parse a document from a memoryblock.
See also:

- 229.7.6 Constructor 25575
- 229.7.8 Constructor(data as String) 25577
- 229.7.9 Constructor(file as FolderItem) 25577
- 229.7.10 Constructor(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) 25577

229.7.8 Constructor(data as String)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience function to parse a document from a string.
Example:

```
// parse it
Var doc as new XMLDocumentMBS("<test id=123>abc</test>")

// and make a string:
Var s as string = doc.toString

Break // see in debugger
```

See also:

- 229.7.7 Constructor(data as MemoryBlock) 25576
- 229.7.9 Constructor(file as FolderItem) 25577
- 229.7.10 Constructor(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) 25577

229.7.9 Constructor(file as FolderItem)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Initializes by loading an XML file.
See also:

- 229.7.6 Constructor 25575
- 229.7.7 Constructor(data as MemoryBlock) 25576
- 229.7.8 Constructor(data as String) 25577
- 229.7.10 Constructor(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) 25577

229.7.10 Constructor(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a DOMDocument object of the specified type with its document element.
Notes: namespaceURI: The namespace URI of the document element to create.

qualifiedName: The qualified name of the document element to be created.
DocumentType: The type of document to be created or nil. When doctype is not nil, its ownerDocument attribute is set to the document being created.
See also:

- 229.7.6 Constructor 25575
- 229.7.7 Constructor(data as MemoryBlock) 25576
- 229.7.8 Constructor(data as String) 25577
- 229.7.9 Constructor(file as FolderItem) 25577

229.7.11 Create as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a blank document.
See also:

- 229.7.12 Create(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) as XMLDocumentMBS 25578

229.7.12 Create(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a DOMDocument object of the specified type with its document element.
Notes: namespaceURI: The namespace URI of the document element to create.
qualifiedName: The qualified name of the document element to be created.
DocumentType: The type of document to be created or nil. When doctype is not nil, its ownerDocument attribute is set to the document being created.

Returns a new XMLDocumentMBS object.
See also:

- 229.7.11 Create as XMLDocumentMBS 25578

229.7.13 createAttribute(Name as String) as XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an XMLAttributeMBS of the given name.
Notes: Note that the XMLAttributeMBS instance can then be set on an XMLElementMBS using the setAttributeNode method.
To create an attribute with a qualified name and namespace URI, use the

createAttributeNS method.

name: The name of the attribute.

Returns a new XMLAttributeMBS object with the nodeName attribute set to name, and localName, prefix, and namespaceURI set to "". The value of the attribute is the empty string.

229.7.14 createAttributeNS(namespaceURI as String, qualifiedName as String) as XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an attribute of the given qualified name and namespace URI.
Notes: namespaceURI: The namespace URI of the attribute to create.
qualifiedName: The qualified name of the attribute to instantiate.

229.7.15 createCDATASection(Data as String) as XMLCDATASectionMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a XMLCDATASectionMBS node whose value is the specified string.

229.7.16 createComment(Text as String) as XMLCommentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a DOMComment node given the specified string.

229.7.17 createDocumentFragment as XMLDocumentFragmentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an empty XMLDocumentFragmentMBS object.

229.7.18 createDocumentType(Name as String, PublicID as String = "", SystemID as String = "") as XMLDocumentTypeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Create a XMLDocumentTypeMBS node.

229.7.19 createElement(Name as String) as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an element of the type specified.
Example:

```
Var doc As New XMLDocumentMBS

Var testNode As XMLElementMBS = doc.createElement("test")
Call doc.appendChild testNode

MessageBox doc.toString
```

Notes: Note that the instance returned implements the XMLElementMBS interface, so attributes can be specified directly on the returned object.

In addition, if there are known attributes with default values, XMLAttributeMBS nodes representing them are automatically created and attached to the element.

To create an element with a qualified name and namespace URI, use the createElementNS method.
tagName The name of the element type to instantiate. For XML, this is case-sensitive.
A new XMLElementMBS object with the nodeName attribute set to tagName, and localName, prefix, and namespaceURI set to "".

229.7.20 createElementNS(namespaceURI as String, qualifiedName as String) as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an element of the given qualified name and namespace URI.
Notes: namespaceURI: The namespace URI of the element to create.
qualifiedName: The qualified name of the element type to instantiate.

229.7.21 createEntity(Name as String) as XMLEntityMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Create a new entity.

Notes: name: The name of the entity to instantiate.

229.7.22 createEntityReference(Text as String) as XMLEntityReferenceMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an XMLEntityReferenceMBS object.
Notes: In addition, if the referenced entity is known, the child list of the XMLEntityReferenceMBS node is made the same as that of the corresponding XMLEntityMBS node.If any descendant of the XMLEntityMBS node has an unbound namespace prefix, the corresponding descendant of the created XMLEntityReferenceMBS node is also unbound; (its namespaceURI is nil). The DOM Level 2 does not support any mechanism to resolve namespace prefixes.

name: The name of the entity to reference.

Returns the new XMLEntityReferenceMBS object.

229.7.23 createNodeIterator(root as XMLNodeMBS = nil, whatToShow as Integer = &hFFFF, entityReferenceExpansion as boolean = false, filter as XMLNodeFilterMBS = nil) as XMLNodeIteratorMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a NodeIterator object.
Notes: NodeIterators are used to step through a set of nodes, e.g. the set of nodes in a NodeList, the document subtree governed by a particular node, the results of a query, or any other set of nodes. The set of nodes to be iterated is determined by the implementation of the NodeIterator. DOM Level 2 specifies a single NodeIterator implementation for document-order traversal of a document subtree. Instances of these iterators are created by calling createNodeIterator().

To produce a view of the document that has entity references expanded and does not expose the entity reference node itself, use the whatToShow flags to hide the entity reference node and set expandEntityReferences to true when creating the iterator. To produce a view of the document that has entity reference nodes but no entity expansion, use the whatToShow flags to show the entity reference node and set expandEntityReferences to false.

root: The root node of the DOM tree
whatToShow: This attribute determines which node types are presented via the iterator.
filter: The filter used to screen nodes .
entityReferenceExpansion: The value of this flag determines whether the children of entity reference nodes are visible to the iterator. If false, they will be skipped over.

229.7.24 createNotation(Name as String) as XMLNotationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Create a Notation.
Notes: name: The name of the notation to instantiate

Returns a XMLNotationMBS that references the newly created XMLNotationMBS node.

229.7.25 createProcessingInstruction(Target as String, Data as string) as XMLCDATASectionMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a XMLProcessingInstructionMBS node given the specified name and data strings.
Notes: target: The target part of the processing instruction.
data: The data for the node.

229.7.26 createTextNode(Text as String) as XMLTextMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a XMLTextMBS node given the specified string.
Example:

```
Var doc As New XMLDocumentMBS
Var element As XMLElementMBS = doc.createElement("test")

Call doc.appendChild element
Call element.appendChild doc.createTextNode("Hello World")

MessageBox doc.toString
```

229.7.27 createTreeWalker(root as XMLNodeMBS = nil, whatToShow as Integer = &hFFFF, entityReferenceExpansion as boolean = false, filter as XMLNodeFilterMBS = nil) as XMLTreeWalkerMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a TreeWalker object.
Notes: TreeWalker objects are used to navigate a document tree or subtree using the view of the document defined by its whatToShow flags and any filters that are defined for the TreeWalker. Any function which

performs navigation using a TreeWalker will automatically support any view defined by a TreeWalker.

Omitting nodes from the logical view of a subtree can result in a structure that is substantially different from the same subtree in the complete, unfiltered document. Nodes that are siblings in the TreeWalker view may be children of different, widely separated nodes in the original view. For instance, consider a Filter that skips all nodes except for XMLTextMBS nodes and the root node of a document. In the logical view that results, all text nodes will be siblings and appear as direct children of the root node, no matter how deeply nested the structure of the original document.

To produce a view of the document that has entity references expanded and does not expose the entity reference node itself, use the whatToShow flags to hide the entity reference node and set expandEntityReferences to true when creating the TreeWalker. To produce a view of the document that has entity reference nodes but no entity expansion, use the whatToShow flags to show the entity reference node and set expandEntityReferences to false

root: The root node of the DOM tree
whatToShow: This attribute determines which node types are presented via the tree-walker.
filter: The filter used to screen nodes
entityReferenceExpansion: The value of this flag determines whether the children of entity reference nodes are visible to the tree-walker. If false, they will be skipped over.

229.7.28 ElementsByTagName(TagName as String) as XMLElementMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns an array of all the XMLElementMBS(s) with a given local name and namespace URI in the order in which they are encountered in a preorder traversal of the XMLDocumentMBS tree.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)

Var elements() As XMLElementMBS = doc.ElementsByTagName("f")

Break
```

Notes: TagName: The tag name of the elements to match on. The special value "*" matches all local names.

Returns a new array object containing all the matched XMLElementMBS(s).

229.7.29 ElementsByTagNameNS(namespaceURI as string, localName as String) as XMLElementMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns an array of all the XMLElementMBS(s) with a given local name and namespace URI in the order in which they are encountered in a preorder traversal of the XMLDocumentMBS tree.
Notes: namespaceURI: The namespace URI of the elements to match on. The special value "*" matches all namespaces.
localName: The local name of the elements to match on. The special value "*" matches all local names.

Returns a new array object containing all the matched XMLElementMBS(s).

229.7.30 evaluate(expression as String, contextNode as XMLNodeMBS, type as Integer) as XMLXPathResultMBS

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Evaluates an XPath expression string and returns a result of the specified type if possible.
Notes: expression: The XPath expression string to be parsed and evaluated.
contextNode: The context is context node for the evaluation of this XPath expression. Must be owned by the same document and must be a XMLDocumentMBS, XMLElementMBS, XMLAttributeMBS, XMLTextMBS, XMLCDATASectionMBS, DOMComment, XMLProcessingInstructionMBS, or XPathNamespace node.
type: If a specific type is specified, then the result will be returned as the corresponding type. This must be one of the codes of the XMLXPathResultMBS clas constants.

Retruns result of the evaluation of the XPath expression as XMLXPathResultMBS class.

Raises exception if the expression is not legal according to the rules of the DOMXPathEvaluator.
Raises exception if the result cannot be converted to return the specified type.

229.7.31 getElementById(elementId as String) as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the XMLElementMBS whose ID is given by elementId.
Example:

```
Var doc As New XMLDocumentMBS("<doc><test id=""1""></test><test id=""2""></test></doc>")

// we mark this id attribute to be the id
Var d1 As XMLElementMBS = doc.DocumentElement.FirstElementChild
```

```
Call d1.SetIdAttribute("id", True)

// now search for it
Var element1 As XMLElementMBS = doc.getElementById("1")
Var element2 As XMLElementMBS = doc.getElementById("2") // not marked!

Break
```

Notes: If no such element exists, returns nil.
Behavior is not defined if more than one element has this ID. The DOM implementation must have information that says which attributes are of type ID. Attributes with the name "ID" are not of type ID unless so defined. Implementations that do not know whether attributes are of type ID or not are expected to return nil.

elementId: The unique id value for an element.

Returns the matching element.

229.7.32 importNode(node as XMLNodeMBS) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Imports a node from another document by cloning it to the current document.
Notes: You don't need to do this manually as the plugin will do it for you in methods as appendChild, replaceChild and insertBefore.

229.7.33 IterateElementsByTagName(TagName as String) as XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the elements with matching tag name.
Example:

```
Var doc As New XMLDocumentMBS("<doc><test id=""1""">abc</test><test id=""2""">def</test></doc>")

For Each e As XMLElementMBS In doc.IterateElementsByTagName("test")
MessageBox e.toString
Next
```

Notes: For use with For Each Loops in Xojo.

229.7.34 IterateElementsByTagNameNS(namespaceURI as string, localName as String) as XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the elements with matching tag name.
Notes: For use with For Each Loops in Xojo.

229.7.35 LoadXml(data as MemoryBlock)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads XML from data.
Notes: Replaces current document with the new one.
See also:

- 229.7.36 LoadXml(data as String) 25586
- 229.7.37 LoadXml(file as FolderItem) 25586

229.7.36 LoadXml(data as String)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads xml from data.
Notes: Replaces current document with the new one.
See also:

- 229.7.35 LoadXml(data as MemoryBlock) 25586
- 229.7.37 LoadXml(file as FolderItem) 25586

229.7.37 LoadXml(file as FolderItem)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads xml file.
Notes: Replaces current document with the new one.
This may reference other files in same folder.
See also:

- 229.7.35 LoadXml(data as MemoryBlock) 25586
- 229.7.36 LoadXml(data as String) 25586

229.7.38 LoadXmlMT(data as MemoryBlock)

MBS XML Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads XML from data.
Notes: Replaces current document with the new one.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 229.7.39 LoadXmlMT(data as String) 25587
- 229.7.40 LoadXmlMT(file as FolderItem) 25587

229.7.39 LoadXmlMT(data as String)

MBS XML Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads xml from data.
Notes: Replaces current document with the new one.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 229.7.38 LoadXmlMT(data as MemoryBlock) 25587
- 229.7.40 LoadXmlMT(file as FolderItem) 25587

229.7.40 LoadXmlMT(file as FolderItem)

MBS XML Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads xml file.
Notes: Replaces current document with the new one.
This may reference other files in same folder.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 229.7.38 LoadXmlMT(data as MemoryBlock) 25587

- 229.7.39 LoadXmlMT(data as String) 25587

229.7.41 NodeFromHandle(Handle as Integer) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a node (or subclass) object based on a handle.
Notes: Raises exception if this handle doesn't belong to this document.

229.7.42 normalizeDocument

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Normalizes the document.
Notes: This method acts as if the document was going through a save and load cycle, putting the document in a "normal" form. The actual result depends on the features being set. See XMLConfigurationMBS for details.

Noticeably this method normalizes XMLTextMBS nodes, makes the document "namespace wellformed", according to the algorithm described below in pseudo code, by adding missing namespace declaration attributes and adding or changing namespace prefixes, updates the replacement tree of XMLEntityReferenceMBS nodes, normalizes attribute values, etc.
Mutation events, when supported, are generated to reflect the changes occurring on the document. Note that this is a partial implementation. Not all the required features are implemented. Currently XMLAttributeMBS and XMLTextMBS nodes are normalized. Features to remove XMLCommentMBS and XMLCDATASectionMBS work.

229.7.43 renameNode(node as XMLNodeMBS, namespaceURI as String, qualifiedName as String) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 23.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Rename an existing node.
Notes: When possible this simply changes the name of the given node, otherwise this creates a new node with the specified name and replaces the existing node with the new node as described below. This only applies to nodes of type ELEMENT_NODE and ATTRIBUTE_NODE.

When a new node is created, the following operations are performed: the new node is created, any registered event listener is registered on the new node, any user data attached to the old node is removed from that node, the old node is removed from its parent if it has one, the children are moved to the new node, if the renamed node is an XMLElementMBS its attributes are moved to the new node, the new node is inserted at the position the old node used to have in its parent's child nodes list if it has one, the user data that was attached to the old node is attach to the new node, the user data event NODE_RENAMED is fired.

When the node being renamed is an XMLAttributeMBS that is attached to an XMLElementMBS, the node is first removed from the XMLElementMBS attributes map. Then, once renamed, either by modifying the existing node or creating a new one as described above, it is put back.

node: The node to rename.
namespaceURI: The new namespaceURI.
qualifiedName: The new qualified name.

229.7.44 Properties

229.7.45 DocType as XMLDocumentTypeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the document type.
Notes: The Document Type Declaration (see XMLDocumentTypeMBS) associated with this document. For XML documents without a document type declaration this returns nil.
The DOM Level 2 does not support editing the Document Type Declaration. docType cannot be altered in any way, including through the use of methods inherited from the XMLNodeMBS interface, such as insertNode or removeNode.
(Read only property)

229.7.46 DocumentElement as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This is a convenience attribute that allows direct access to the child node that is the root element of the document.
Notes: (Read only property)

229.7.47 DocumentURI as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The location of the document or "" if undefined.
Notes: Beware that when the XMLDocumentMBS supports the feature "HTML" , the href attribute of the HTML BASE element takes precedence over this attribute.
(Read and Write property)

229.7.48 DOMConfig as XMLConfigurationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The configuration used when normalizeDocument is invoked.
Notes: (Read only property)

229.7.49 InputEncoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The input encoding.
Example:

```
Var xml As String

xml = "<?xml version='1.0' encoding='ISO-8859-1'?>" +_
EndOfLine.UNIX +_
"<doc><test>tr√§nen√ºberstr√mt</test></doc>"

// make sure the variable has the encoding declared above!
xml = ConvertEncoding(xml, encodings.ISOLatin1)

Var doc As New XMLDocumentMBS(xml)

MessageBox doc.InputEncoding
```

Notes: An attribute specifying the encoding used for this document at the time of the parsing. This is "" when it is not known, such as when the XMLDocumentMBS was created in memory.
(Read only property)

229.7.50 StrictErrorChecking as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether errors checking is enforced or not
Notes: An attribute specifying whether errors checking is enforced or not. When set to false, the implementation is free to not test every possible error case normally defined on DOM operations, and not raise any XMLExceptionMBS. In case of error, the behavior is undefined. This attribute is true by defaults.
(Read and Write property)

229.7.51 XmlEncoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An attribute specifying, as part of the XML declaration, the encoding of this document.
Notes: This is "" when unspecified or when it is not known, such as when the XMLDocumentMBS was created in memory.
(Read only property)

229.7.52 XmlStandalone as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether this is a standalone document.
Notes: An attribute specifying, as part of the XML declaration, whether this document is standalone. This is false when unspecified.
(Read and Write property)

229.7.53 XmlVersion as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An attribute specifying, as part of the XML declaration, the version number of this document.
Notes: This is "" when unspecified.
(Read and Write property)

229.7.54 Constants

Show Values

Constant	Value	Description
ShowAll	&hFFFF	Show all XMLNodeMBS(s).
ShowAttribute	2	Show XMLAttributeMBS nodes. This is meaningful only when creating an XMLNodeIteratorMBS or XMLTreeWalkerMBS with an attribute node as its root; in this case, it means that the attribute node will appear in the first position of the iteration or traversal. Since attributes are never children of other nodes, they do not appear when traversing over the document tree.
ShowCDataSection	8	Show XMLCDATASectionMBS nodes.
ShowComment	&h80	Show DOMComment nodes.
ShowDocument	&h100	Show XMLDocumentMBS nodes.
ShowDocumentFragment	&h400	Show XMLDocumentFragmentMBS nodes.
ShowDocumentType	&h200	Show XMLDocumentTypeMBS nodes.
ShowElement	1	Show XMLElementMBS nodes.
ShowEntity	&h20	Show XMLEntityMBS nodes. This is meaningful only when creating an XMLNodeIteratorMBS or XMLTreeWalkerMBS with an XMLEntityMBS node as its root; in this case, it means that the XMLEntityMBS node will appear in the first position of the traversal. Since entities are not part of the document tree, they do not appear when traversing over the document tree.
ShowEntityReference	&h10	Show XMLEntityReferenceMBS nodes.
ShowNotation	&h800	Show XMLNotationMBS nodes. This is meaningful only when creating an XMLNodeIteratorMBS or XMLTreeWalkerMBS with a XMLNotationMBS node as its root; in this case, it means that the XMLNotationMBS node will appear in the first position of the traversal. Since notations are not part of the document tree, they do not appear when traversing over the document tree.
ShowProcessingInstruction	&h40	Show XMLProcessingInstructionMBS nodes.
ShowText	4	Show XMLTextMBS nodes.

229.8 class XMLDocumentTypeMBS

229.8.1 class XMLDocumentTypeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a document type.
Notes: Each XMLDocumentMBS has a doctype attribute whose value is either nil or a XMLDocumentTypeMBS object. The XMLDocumentTypeMBS interface in the DOM Core provides an interface to the list of entities that are defined for the document, and little else because the effect of namespaces and the various XML schema efforts on DTD representation are not clearly understood as of this writing.

The DOM Level 2 doesn't support editing XMLDocumentTypeMBS nodes.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.8.2 Methods

229.8.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.8.4 Entities as XMLEntityMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: A array containing the general entities, both external and internal, declared in the DTD. Parameter entities are not contained.
Notes: Duplicates are discarded. For example in: <!DOCTYPE
ex SYSTEM "ex.dtd" [<!ENTITY foo "foo"><!ENTITY bar
"bar"><!ENTITY bar "bar2"><!ENTITY % baz "baz">
] ><ex/>

the interface provides access to foo and the first declaration of bar but not the second declaration of bar or baz. Every node in this map also implements the XMLEntityMBS interface.

The DOM Level 2 does not support editing entities, therefore entities cannot be altered in any way.

229.8.5 Notations as XMLNotationMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries array of notations.
Notes: A named node map containing the notations declared in the DTD. Duplicates are discarded. Every node in this map also implements the XMLNotationMBS interface.

The DOM Level 2 does not support editing notations, therefore notations cannot be altered in any way.

229.8.6 Properties

229.8.7 InternalSubset as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal subset as a string, or empty if there is none.
Notes: This is does not contain the delimiting square brackets.The actual content returned depends on how much information is available to the implementation. This may vary depending on various parameters, including the XML processor used to build the document.
(Read only property)

229.8.8 Name as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name of DTD; i.e., the name immediately following the DOCTYPE keyword.
Notes: (Read only property)

229.8.9 PublicId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the public identifier of the external subset.
Notes: (Read only property)

229.8.10 SystemId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the system identifier of the external subset.
Notes: (Read only property)

229.9 class XMLDOMParserMBS

229.9.1 class XMLDOMParserMBS

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class to customize the parser and run it.
Example:

```
Var xml As String = "<test id=""123""></test>"
Var parser As New XMLDOMParserMBS

Parser.ExitOnFirstFatalError = True
parser.DoNamespaces = True
parser.DoSchema = true

// parse it
Var doc As XMLDocumentMBS = Parser.Parse(xml)
// and make a string:
Var s As String = doc.toString

Break
```

Notes: This class wraps XercesDOMParser.

This class implements the Document Object Model (DOM) interface. It should be used by applications which choose to parse and process the XML document using the DOM api's. This implementation also allows the applications to install an error and an entity handler (useful extensions to the DOM specification).

It can be used to instantiate a validating or non-validating parser, by setting a member flag.

229.9.2 Methods

229.9.3 Constructor

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

229.9.4 Parse(data as MemoryBlock) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parses a XML in MemoryBlock.
Notes: Returns new document on success.
See also:

- 229.9.5 Parse(data as string) as XMLDocumentMBS 25597

229.9.5 Parse(data as string) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parses a XML string.
Example:

```
Var xml As String = "<test id=""123""></test>"
Var parser As New XMLDOMParserMBS

// parse it
Var doc As XMLDocumentMBS = Parser.Parse(xml)
// and make a string:
Var s As String = doc.toString

Break
```

Notes: Returns new document on success.
See also:

- 229.9.4 Parse(data as MemoryBlock) as XMLDocumentMBS 25597

229.9.6 Reset

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reset the parser.
Notes: This method resets the state of the DOM driver and makes it ready for a fresh parse run.

229.9.7 Properties

229.9.8 CreateEntityReferenceNodes as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the 'include entity references' flag.
Notes: This method allows the user to specify whether the parser should create entity reference nodes in the DOM tree being produced. When the 'create' flag is true, the parser will create EntityReference nodes in the DOM tree.
The EntityReference nodes and their child nodes will be read-only.
When the 'create' flag is false, no EntityReference nodes will be created.

The replacement text of the entity is included in either case, either as a child of the Entity Reference node or in place at the location of the reference.

The default value is 'true'.
(Read and Write property)

229.9.9 DoNamespaces as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The 'do namespaces' flag
Notes: This method allows users to enable or disable the parser's namespace processing. When set to true, parser starts enforcing all the constraints and rules specified by the NameSpace specification.

The parser's default state is: false.
(Read and Write property)

229.9.10 DoSchema as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The 'do schema' flag.
Notes: This method allows users to enable or disable the parser's schema processing. When set to false, parser will not process any schema found.

The parser's default state is: false.

Note: If set to true, namespace processing must also be turned on.
(Read and Write property)

229.9.11 ExitOnFirstFatalError as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the 'exit on first error' flag.
Notes: This method allows users to set the parser's behaviour when it encounters the first fatal error. If set to true, the parser will exit at the first fatal error. If false, then it will report the error and continue processing.

The default value is 'true' and the parser exits on the first fatal error.
(Read and Write property)

229.9.12 ExternalSchemaLocation as String

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This method allows the user to specify a list of schemas to use.
Notes: If the targetNamespace of a schema specified using this method matches the targetNamespace of a schema occurring in the instance document in the schemaLocation attribute, or if the targetNamespace matches the namespace attribute of the "import" element, the schema specified by the user using this method will be used (i.e., the schemaLocation attribute in the instance document or on the "import" element will be effectively ignored).

The syntax is the same as for schemaLocation attributes in instance documents: e.g, "http://www.example.com file_name.xsd". The user can specify more than one XML Schema in the list.
(Read and Write property)

229.9.13 GenerateSyntheticAnnotations as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the 'generate synthetic annotations' flag.
Notes: A synthetic XSAnnotation is created when a schema component has non-schema attributes but has no child annotations so that the non-schema attributes can be recovered under PSVI.
(Read and Write property)

229.9.14 Handle as Integer

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.9.15 IdentityConstraintChecking as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This method allows users to enable or disable the parser's identity constraint checks.
Notes: By default, the parser does identity constraint checks.
The default value is true.</p>
(Read and Write property)

229.9.16 IncludeIgnorableWhitespace as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the 'include ignorable whitespace' flag
Notes: This method allows the user to specify whether a validating parser should include ignorable whitespaces as text nodes. It has no effect on non-validating parsers which always include non-markup text.
When set to true (also the default), ignorable whitespaces will be added to the DOM tree as text nodes. The method DOMText.isIgnorableWhitespace() will return true for those text
nodes only.
When set to false, all ignorable whitespace will be discarded and no text node is added to the DOM tree. Note: applications intended to process the "xml:space" attribute should not set this flag to false.
And this flag also overrides any schema datateye whitespace facets, that is, all ignorable whitespace will be discarded even though 'preserve' is set in schema datatype whitespace facets.
(Read and Write property)

229.9.17 Threaded as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to run Parse threaded.
Notes: If true, the parsing is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
(Read only property)

229.9.18 ValidateAnnotations as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The 'validlate annotations' flag.
Notes: The value for specifying whether Annotations should be validated or not.
(Read and Write property)

229.9.19 ValidationConstraintFatal as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parser's behaviour when it encounters a validation constraint error.
Notes: If set to true, and the parser will treat validation error as fatal and will exit depends on the state of "getExitOnFirstFatalError". If false, then it will report the error and continue processing.

Note: setting this true does not mean the validation error will be printed with the word "Fatal Error". It is still printed as "Error", but the parser will exit if "setExitOnFirstFatalError" is set to true.
The default value is 'false'.
(Read and Write property)

229.9.20 ValidationSchemaFullChecking as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This method allows the user to turn full Schema constraint checking on/off.
Notes: Only takes effect if Schema validation is enabled.
If turned off, partial constraint checking is done.

Full schema constraint checking includes those checking that may be time-consuming or memory intensive. Currently, particle unique attribution constraint checking and particle derivation restriction checking are controlled by this option.

The parser's default state is: false.
(Read and Write property)

229.9.21 ValidationScheme as Integer

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The validation scheme to be used by this parser.

Notes: The value is one of the ValSchemes enumerated values defined by this class:

ValidateNever	turn off validation
ValidateAlways	turn on validation
ValidateAuto	turn on validation if any internal/external DTD subset have been seen

The parser's default state is: ValidateNever
(Read and Write property)

229.9.22 Constants

Validation

Constant	Value	Description
ValidateAlways	1	The parser will always report validation errors.
ValidateAuto	2	The parser will report validation errors only if a grammar is specified.
ValidateNever	0	Do not report validation errors.

229.10 class XMLElementMBS

229.10.1 class XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a XML element.
Example:

```
// build a small XML document with elements, attributes and text
Var doc As New XMLDocumentMBS
Var root As XMLElementMBS = doc.createElement("contacts")
Call doc.appendChild(root)

Var person As XMLElementMBS = doc.createElement("person")
Var id As XMLAttributeMBS = doc.createAttribute("id")
id.Value = "42"
person.SetAttributeNode id
Call person.appendChild(doc.createTextNode("Jane Miller"))
Call root.appendChild(person)

MessageBox doc.toString + EndOfLine + "id = " + person.AttributeValue("id")
```

Notes: By far the vast majority of objects (apart from text) that authors encounter when traversing a document are XMLElementMBS nodes.

Assume the following XML document:

```
<elementExample id="demo">
<subelement1/>
<subelement2><subsubelement/></subelement2>
</elementExample>
```

When represented using DOM, the top node is an XMLElementMBS node for "elementExample", which contains two child XMLElementMBS nodes, one for "subelement1" and one for "subelement2". "subelement1" contains no child nodes.

Elements may have attributes associated with them; since the XMLElementMBS interface inherits from XMLNodeMBS, the generic XMLNodeMBS interface method getAttributes may be used to retrieve the set of all attributes for an element. There are methods on the XMLElementMBS interface to retrieve either an XMLAttributeMBS object by name or an attribute value by name. In XML, where an attribute value may contain entity references, an XMLAttributeMBS object should be retrieved to examine the possibly fairly complex sub-tree representing the attribute value. On the other hand, in HTML, where all attributes have simple string values, methods to directly access an attribute value can safely be used as a convenience.
Subclass of the XMLNodeMBS class.

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- 21.2, pages 65 to 69: XML for Beginners, Using XML with the MBS Plugin by Stefanie Juchmes

229.10.2 Methods

229.10.3 AttributeNode(Name as String) as XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Retrieves an XMLAttributeMBS node by name.
Notes: name: The name (nodeName) of the attribute to retrieve.

The XMLAttributeMBS node with the specified name (nodeName) or null if there is no such attribute.

229.10.4 AttributeNodeNS(namespaceURI as string, localName as String) as XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Retrieves an XMLAttributeMBS node by local name and namespace URI.
Notes: namespaceURI: The namespace URI of the attribute to retrieve.
localName: The local name of the attribute to retrieve.

The XMLAttributeMBS node with the specified attribute local name and namespace URI or nil if there is no such attribute.

229.10.5 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.10.6 Element(Index as Integer) as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries element with given index.
Notes: Returns nil if index is out of index.

229.10.7 ElementsByTagName(TagName as String) as XMLElementMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a DOMNodeList of all descendant elements with a given tag name, in the order in which they would be encountered in a preorder traversal of the XMLElementMBS tree.
Notes: name: The name of the tag to match on. The special value "*" matches all tags.

A list of matching XMLElementMBS nodes.

229.10.8 ElementsByTagNameNS(namespaceURI as string, localName as String) as XMLElementMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a nodes of all the DOMElements with a given local name and namespace URI in the order in which they would be encountered in a preorder traversal of the XMLDocumentMBS tree, starting from this node.
Notes: namespaceURI: The namespace URI of the elements to match on. The special value "*" matches all namespaces.
localName: The local name of the elements to match on. The special value "*" matches all local names.

229.10.9 HasAttribute(Name as String) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether an attribute exists.
Notes: Returns true when an attribute with a given name is specified on this element or has a default value, false otherwise.

name: The name of the attribute to look for.

Returns true if an attribute with the given name is specified on this element or has a default value, false otherwise.

229.10.10 HasAttributeNS(namespaceURI as string, localName as String) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether an attribute exists.
Notes: Returns true when an attribute with a given local name and namespace URI is specified on this element or has a default value, false otherwise.

namespaceURI: The namespace URI of the attribute to look for.
localName: The local name of the attribute to look for.
true: if an attribute with the given local name and namespace URI is specified or has a default value on this element, false otherwise.

229.10.11 IterateElements as XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the elements.
Example:

```
Var doc As New XMLDocumentMBS("<doc><other>abc</other><test>def</test></doc>")

Var root As XMLElementMBS = doc.DocumentElement
For Each e As XMLElementMBS In root.IterateElements
MessageBox e.toString
Next
```

Notes: For use with For Each Loops in Xojo.

229.10.12 IterateElementsByTagName(TagName as String) as XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the elements with matching tag name.
Example:

```
Var doc As New XMLDocumentMBS("<doc><test id=""1"">abc</test><test id=""2"">def</test></doc>")

Var root As XMLElementMBS = doc.DocumentElement
```

```
For Each e As XMLElementMBS In root.IterateElementsByTagName("test")
MessageBox e.toString
Next
```

Notes: For use with For Each Loops in Xojo.

229.10.13 IterateElementsByTagNameNS(namespaceURI as string, localName as String) as XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the elements with matching tag name.
Notes: For use with For Each Loops in Xojo.

229.10.14 RemoveAttribute(Name as String)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes an attribute by name.
Example:

```
Var xml As String = "<test>test</test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

DocumentElement.AttributeValue("a") = "123"

MessageBox DocumentElement.toString

DocumentElement.RemoveAttribute("a")

MessageBox DocumentElement.toString
```

Notes: If the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

To remove an attribute by local name and namespace URI, use the removeAttributeNS method.

229.10.15 RemoveAttributeNode(Node as XMLAttributeMBS)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes the specified attribute node.
Notes: If the removed XMLAttributeMBS has a default value it is immediately replaced. The replacing attribute has the same namespace URI and local name, as well as the original prefix, when applicable.

229.10.16 RemoveAttributeNS(namespaceURI as string, localName as string)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes an attribute by local name and namespace URI.
Notes: If the removed attribute has a default value it is immediately replaced. The replacing attribute has the same namespace URI and local name, as well as the original prefix.

namespaceURI: The namespace URI of the attribute to remove.
localName: The local name of the attribute to remove.

229.10.17 SetAttributeNode(AttributeNode as XMLAttributeMBS)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a new attribute.
Notes: If an attribute with that name (nodeName) is already present in the element, it is replaced by the new one.
AttributeNode: The XMLAttributeMBS node to add to the attribute list.
If the AttributeNode attribute replaces an existing attribute, the replaced XMLAttributeMBS node is returned, otherwise null is returned.

If the new attribute is from another document, we clone it first.

229.10.18 SetAttributeNodeNS(AttributeNode as XMLAttributeMBS)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a new attribute.
Notes: If an attribute with that local name and namespace URI is already present in the element, it is replaced by the new one.

AttributeNode: The XMLAttributeMBS node to add to the attribute list.
If the newAttr attribute replaces an existing attribute with the same local name and namespace URI, the replaced XMLAttributeMBS node is returned, otherwise nil is returned.

If the new attribute is from another document, we clone it first.

229.10.19 SetIdAttribute(name as string, isID as boolean)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets ID attribute.
Notes: If the parameter isId is true, this method declares the specified attribute to be a user-determined ID attribute. This affects the value of XMLAttributeMBS::isId and the behavior of ElementById in XMLDocumentMBS, but does not change any schema that may be in use, in particular this does not affect the SchemaTypeInfo XMLAttributeMBS of the specified XMLAttributeMBS node. Use the value false for the parameter isId to undeclare an attribute for being a user-determined ID attribute. To specify an XMLAttributeMBS by local name and namespace URI, use the setIdAttributeNS method.

name: The name of the XMLAttributeMBS.
isId: Whether the attribute is of type ID.

229.10.20 SetIdAttributeNode(idAttr as XMLAttributeMBS, isID as boolean)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the id attribute node.
Notes: If the parameter isId is true, this method declares the specified attribute to be a user-determined ID attribute. This affects the value of isId of XMLAttributeMBS and the behavior of getElementById of XMLDocumentMBS, but does not change any schema that may be in use, in particular this does not affect the SchemaTypeInfo of XMLAttributeMBS of the specified XMLAttributeMBS node. Use the value false for the parameter isId to undeclare an attribute for being a user-determined ID attribute.

idAttr: The XMLAttributeMBS node.
isId: Whether the attribute is of type ID.

If the new attribute is from another document, we clone it first.

229.10.21 SetIdAttributeNS(namespaceURI as string, localName as string, isID as boolean)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets id attribute.
Notes: If the parameter isId is true, this method declares the specified attribute to be a user-determined ID attribute. This affects the value of isId of XMLAttributeMBS and the behavior of getElementById of

XMLDocumentMBS, but does not change any schema that may be in use, in particular this does not affect the getSchemaTypeInfo of XMLAttributeMBS of the specified XMLAttributeMBS node. Use the value false for the parameter isId to undeclare an attribute for being a user-determined ID attribute.

namespaceURI: The namespace URI of the XMLAttributeMBS.
localName: The local name of the XMLAttributeMBS.
isId: Whether the attribute is of type ID.

229.10.22 Properties

229.10.23 ChildElementCount as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of child nodes that are of type XMLElementMBS.
Notes: Note: the count is computed every time this function is invoked

The number of XMLElementMBS objects that are direct children of this object (nested elements are not counted), or 0 if there is none.
(Read only property)

229.10.24 FirstElementChild as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The first child of type XMLElementMBS.
Notes: The XMLElementMBS object that is the first element node among the child nodes of this node, or nil if there is none.
(Read only property)

229.10.25 LastElementChild as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The last child of type XMLElementMBS.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

// looping over elements backwards, skips e.g. text nodes and comments
```

```
Var node As XMLElementMBS = DocumentElement.LastElementChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.PreviousElementSibling
// loop ends when there is no next one
Wend
```

Notes: The XMLElementMBS object that is the last element node among the child nodes of this node, or nil if there is none.
(Read only property)

229.10.26 NextElementSibling as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The next sibling node of type XMLElementMBS.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

// looping over elements skips e.g. text nodes and comments
Var node As XMLElementMBS = DocumentElement.FirstElementChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.NextElementSibling
// loop ends when there is no next one
Wend
```

Notes: The XMLElementMBS object that is the next sibling element node in document order, or nil if there is none.
(Read only property)

229.10.27 PreviousElementSibling as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The previous sibling node of type XMLElementMBS.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

// looping over elements backwards, skips e.g. text nodes and comments
Var node As XMLElementMBS = DocumentElement.LastElementChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.PreviousElementSibling
// loop ends when there is no next one
Wend
```

Notes: The XMLElementMBS object that is the previous sibling element node in document order, or nil if there is none.
(Read only property)

229.10.28 SchemaTypeInfo as XMLTypeInfoMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the type information associated with this element.
Notes: (Read only property)

229.10.29 TagName as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name of the element.
Notes: For example, in: <elementExample id="demo">... </elementExample>, tagName has the value "elementExample". Note that this is case-preserving in XML, as are all of the operations of the DOM.
(Read only property)

229.10.30 AttributeValue(Name as String) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Retrieves an attribute value by name.
Example:

```
Var doc As New XMLDocumentMBS
Var node As XMLElementMBS = doc.createElement("Hello")

node.AttributeValue("Hello") = "World"
node.AttributeValue("Value") = "123"
node.AttributeValue("Test") = "Value"

Var attrs() As XMLAttributeMBS = node.AttributeNodes
For Each a As XMLAttributeMBS In attrs
MessageBox a.Name+": "+a.Value
Next
```

Notes: name: The name of the attribute to retrieve.
The XMLAttributeMBS value as a string, or the empty string if that attribute does not have a specified or default value.

If assigned, adds/sets a new attribute.
If an attribute with that name is already present in the element, its value is changed to be that of the value parameter. This value is a simple string, it is not parsed as it is being set. So any markup (such as syntax to be recognized as an entity reference) is treated as literal text, and needs to be appropriately escaped by the implementation when it is written out. In order to assign an attribute value that contains entity references, the user must create an XMLAttributeMBS node plus any XMLTextMBS and XMLEntityReferenceMBS nodes, build the appropriate subtree, and use setAttributeNode to assign it as the value of an attribute.
(Read and Write computed property)

229.10.31 AttributeValueNS(namespaceURI as string, localName as string) as string

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Retrieves an attribute value by local name and namespace URI.
Notes: namespaceURI The namespace URI of the attribute to retrieve.
localName The local name of the attribute to retrieve.

Returns the XMLAttributeMBS value as a string, or an "" if that attribute does not have a specified or default value.

Adds a new attribute when assigned.
If an attribute with the same local name and namespace URI is already present on the element, its prefix is changed to be the prefix part of the qualifiedName, and its value is changed to be the value parameter. This value is a simple string, it is not parsed as it is being set. So any markup (such as syntax to be

recognized as an entity reference) is treated as literal text, and needs to be appropriately escaped by the implementation when it is written out. In order to assign an attribute value that contains entity references, the user must create an XMLAttributeMBS node plus any XMLTextMBS and XMLEntityReferenceMBS nodes, build the appropriate subtree, and use setAttributeNodeNS or setAttributeNode to assign it as the value of an attribute.

namespaceURI: The namespace URI of the attribute to create or alter.
qualifiedName: The qualified name of the attribute to create or alter.
value: The value to set in string form.
(Read and Write computed property)

229.11 class XMLEntityMBS

229.11.1 class XMLEntityMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This interface represents an entity, either parsed or unparsed, in an XML document.
Notes: Note that this models the entity itself not the entity declaration. XMLEntityMBS declaration modeling has been left for a later Level of the DOM specification.
The nodeName attribute that is inherited from XMLNodeMBS contains the name of the entity.
An XML processor may choose to completely expand entities before the structure model is passed to the DOM; in this case there will be no XMLEntityReferenceMBS nodes in the document tree.
XML does not mandate that a non-validating XML processor read and process entity declarations made in the external subset or declared in external parameter entities. This means that parsed entities declared in the external subset need not be expanded by some classes of applications, and that the replacement value of the entity may not be available. When the replacement value is available, the corresponding XMLEntityMBS node's child list represents the structure of that replacement text. Otherwise, the child list is empty.
The DOM Level 2 does not support editing XMLEntityMBS nodes; if a user wants to make changes to the contents of an XMLEntityMBS, every related XMLEntityReferenceMBS node has to be replaced in the structure model by a clone of the XMLEntityMBS's contents, and then the desired changes must be made to each of those clones instead. XMLEntityMBS nodes and all their descendants are readonly.
An XMLEntityMBS node does not have any parent.If the entity contains an unbound namespace prefix, the namespaceURI of the corresponding node in the XMLEntityMBS node subtree is null. The same is true for XMLEntityReferenceMBS nodes that refer to this entity, when they are created using the createEntityReference method of the XMLDocumentMBS interface. The DOM Level 2 does not support any mechanism to resolve namespace prefixes.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.11.2 Methods

229.11.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.11.4 Properties

229.11.5 InputEncoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An attribute specifying the encoding used for this entity at the time of parsing, when it is an

external parsed entity.
Notes: This is empty if it an entity from the internal subset or if it is not known.
(Read only property)

229.11.6 NotationName as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: For unparsed entities, the name of the notation for the entity.
Notes: For parsed entities, this is empty.
(Read only property)

229.11.7 PublicId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The public identifier associated with the entity, if specified.
Notes: If the public identifier was not specified, this is empty.
(Read only property)

229.11.8 SystemId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The system identifier associated with the entity, if specified.
Notes: If the system identifier was not specified, this is empty.
(Read only property)

229.11.9 XmlEncoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An attribute specifying, as part of the text declaration, the encoding of this entity, when it is an external parsed entity.
Notes: This is empty otherwise.
(Read only property)

229.11.10 XmlVersion as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An attribute specifying, as part of the text declaration, the version number of this entity, when it is an external parsed entity.
Notes: This is empty otherwise.
(Read only property)

229.12 class XMLEntityReferenceMBS

229.12.1 class XMLEntityReferenceMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for an entity reference.
Notes: XMLEntityReferenceMBS objects may be inserted into the structure model when an entity reference is in the source document, or when the user wishes to insert an entity reference. Note that character references and references to predefined entities are considered to be expanded by the HTML or XML processor so that characters are represented by their Unicode equivalent rather than by an entity reference. Moreover, the XML processor may completely expand references to entities while building the structure model, instead of providing XMLEntityReferenceMBS objects. If it does provide such objects, then for a given XMLEntityReferenceMBS node, it may be that there is no XMLEntityMBS node representing the referenced entity. If such an XMLEntityMBS exists, then the subtree of the XMLEntityReferenceMBS node is in general a copy of the XMLEntityMBS node subtree. However, this may not be true when an entity contains an unbound namespace prefix. In such a case, because the namespace prefix resolution depends on where the entity reference is, the descendants of the XMLEntityReferenceMBS node may be bound to different namespace URIs.
As for XMLEntityMBS nodes, XMLEntityReferenceMBS nodes and all their descendants are readonly.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.12.2 Methods

229.12.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.13 class XMLExceptionMBS

229.13.1 class XMLExceptionMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for exceptions in the XML world.
Notes: Subclass of the RuntimeException class.

229.14 class XMLInputMBS

229.14.1 class XMLInputMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This interface represents a single input source for an XML entity.
Example:

```
Var xmlText As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"

Var Input As New XMLInputMBS
Input.Encoding = "UTF-8"
Input.InputString = xmlText

Var parser As New XMLParserMBS
Var doc As XMLDocumentMBS = parser.parse(Input)

// inspect document in debugger
MessageBox doc.toString
```

Notes: This interface allows an application to encapsulate information about an input source in a single object, which may include a public identifier, a system identifier, a byte stream (possibly with a specified encoding), and/or a character stream.

There are two places that the application will deliver this input source to the parser: as the argument to the parse method, or as the return value of the XMLResourceResolverMBS.resolveResource method.

The XMLParserMBS will use the XMLInputMBS object to determine how to read XML input. If there is a character stream available, the parser will read that stream directly; if not, the parser will use a byte stream, if available; if neither a character stream nor a byte stream is available, the parser will attempt to open a URI connection to the resource identified by the system identifier.

A XMLInputMBS object belongs to the application: the parser shall never modify it in any way (it may modify a copy if necessary).

229.14.2 Methods

229.14.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

229.14.4 Properties

229.14.5 BaseURI as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The base URI to be used for resolving relative URIs to absolute URIs.
Notes: If the baseURI is itself a relative URI, the behavior is implementation dependent.
(Read and Write property)

229.14.6 Encoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The encoding which will be required for use with the XML text read via a stream opened by this input source.
Example:

```
Var Input As New XMLInputMBS
Input.Encoding = "UTF-8"
Input.InputString = "<test id=""123""></test>"
```

Notes: This is usually not set, allowing the encoding to be sensed in the usual XML way. However, in some cases, the encoding in the file is known to be incorrect because of intermediate transcoding, for instance encapsulation within a MIME document.
(Read and Write property)

229.14.7 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.14.8 InputMemory as MemoryBlock

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The input memoryblock.
Notes: (Read and Write property)

229.14.9 InputString as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The input string.
Example:

```
Var Input As New XMLInputMBS
Input.Encoding = "UTF-8"
Input.InputString = "<test id=""123""">Hello</test>"
```

Notes: (Read and Write property)

229.14.10 IssueFatalErrorIfNotFound as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Indicates if the parser should issue fatal error if this input source is not found.
Notes: If set to false, the parser issue warning message instead.
Default: true
(Read and Write property)

229.14.11 PublicId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The public identifier for this input source.
Notes: The public identifier is always optional: if the application writer includes one, it will be provided as part of the location information.
(Read and Write property)

229.14.12 SystemId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The system identifier for this input source.
Notes: The system id is always required. The public id may be used to map to another system id, but the system id must always be present as a fall back.
If the system ID is a URL, it must be fully resolved.
(Read and Write property)

229.15 class XMLIterateAttributeNodesMBS

229.15.1 class XMLIterateAttributeNodesMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for the iterator over attribute nodes.
Example:

```
Var doc As New XMLDocumentMBS("<doc id=""123"" value=""test""></doc>")

Var root As XMLElementMBS = doc.DocumentElement
For Each e As XMLAttributeMBS In root.IterateAttributeNodes
MessageBox e.Name+": "+e.Value
Next
```

Notes: Used internally for for each loops.

Requires Xojo 2019r2 or newer.

Implements Iterable and Iterator interfaces.

This class is hidden for auto complete as you don't need to use it manually. Please use it using for each loops.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Function: The private constructor.

229.15.4 Iterator as Iterator

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the iterator.

229.15.5 MoveNext as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to next attribute.
Notes: Returns true on success or false when the iterator has no more elements.

229.15.6 Value as Variant

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current value.

229.16 class XMLIterateChildNodesMBS

229.16.1 class XMLIterateChildNodesMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for the iterator over child nodes.
Example:

```
Var doc As New XMLDocumentMBS("<doc><test>abc</test><test>def</test></doc>")

Var root As XMLElementMBS = doc.DocumentElement
For Each e As XMLElementMBS In root.IterateChildNodes
MessageBox e.toString
Next
```

Notes: Used internally for for each loops.

Requires Xojo 2019r2 or newer.

Implements Iterable and Iterator interfaces.

This class is hidden for auto complete as you don't need to use it manually. Please use it using for each loops.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Interfaces: Iterator, Iterable

229.17.2 Methods

229.17.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.17.4 Iterator as Iterator

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the iterator.

229.17.5 MoveNext as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to next element.
Notes: Returns true on success or false when the iterator has no more elements.

229.17.6 Value as Variant

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current value.

229.18 class XMLNodeFilterMBS

229.18.1 class XMLNodeFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Filters are objects that know how to "filter out" nodes.
Example:

```
// iterate over all elements, but leave out the elements inside <comment>
// MyFilter is a subclass of XMLNodeFilterMBS with the acceptNode event implemented.
Var doc As New XMLDocumentMBS("<order><item>Apple</item><comment><item>ignored</item></comment><item>Pear</item></order>")
Var iterator As XMLNodeIteratorMBS = doc.createNodeIterator(doc.DocumentElement, XMLDocumentMBS.ShowElement, False, New MyFilter)

Var names() As String
Var node As XMLNodeMBS = iterator.nextNode
While node <>Nil
Var text As String
If node.FirstChild <>Nil Then text = node.FirstChild.NodeValue
names.Add node.NodeName + ": " + text
node = iterator.nextNode
Wend
MessageBox String.FromArray(names, EndOfLine)

// in MyFilter:
Function acceptNode(node As XMLNodeMBS) As Integer Handles acceptNode
If node.ParentNode <>Nil And node.ParentNode.NodeName = "comment" Then
Return XMLNodeFilterMBS.FilterReject
End If
Return XMLNodeFilterMBS.FilterAccept
End Function
```

Notes: If a XMLNodeIteratorMBS or XMLTreeWalkerMBS is given a XMLNodeFilterMBS, it applies the filter before it returns the next node. If the filter says to accept the node, the traversal logic returns it; otherwise, traversal looks for the next node and pretends that the node that was rejected was not there.

The DOM does not provide any filters. XMLNodeFilterMBS is just an class that users can implement to provide their own filters by filling in the event.

XMLNodeFilterMBSs do not need to know how to traverse from node to node, nor do they need to know anything about the data structure that is being traversed. This makes it very easy to write filters, since the only thing they have to know how to do is evaluate a single node. One filter may be used with a number of different kinds of traversals, encouraging code reuse.

229.18.2 Methods

229.18.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

229.18.4 Destructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

229.18.5 Events

229.18.6 acceptNode(node as XMLNodeMBS) as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Test whether a specified node is visible in the logical view of a XMLTreeWalkerMBS or XMLNodeIteratorMBS.
Notes: This event will be called by the implementation of XMLTreeWalkerMBS and XMLNodeIteratorMBS; it is not normally called directly from user code. (Though you could do so if you wanted to use the same filter to guide your own application logic.)
node: The node to check to see if it passes the filter or not.

A constant to determine whether the node is accepted, rejected, or skipped, as defined above.

229.18.7 Constants

Filter Results

Constant	Value	Description
FilterAccept	1	Accept the node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will return this node.
FilterReject	2	Reject the node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will not return this node. For XMLTreeWalkerMBS, the children of this node will also be rejected. XMLNodeIteratorMBSs treat this as a synonym for FilterSkip.
FilterSkip	3	Skip this single node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will not return this node. For both XMLNodeIteratorMBS and XMLTreeWalkerMBS, the children of this node will still be considered.

229.19 class XMLNodeIteratorMBS

229.19.1 class XMLNodeIteratorMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates a list of nodes.
Example:

```
// collect the text of all text nodes in a document with a node iterator
Var doc As New XMLDocumentMBS
doc.LoadXml "<p>Hello <b>bold</b>and <i>italic</i>world</p>"

Var it As XMLNodeIteratorMBS = doc.createNodeIterator(doc.DocumentElement, 4) // 4 = show text nodes
Var parts() As String
Var node As XMLNodeMBS = it.nextNode
While node <>Nil
parts.Add node.NodeValue
node = it.nextNode
Wend
MessageBox String.FromArray(parts, " | ")
```

Notes: XMLNodeIteratorMBSs are used to step through a set of nodes, e.g. the set of nodes in a DOMNodeList, the document subtree governed by a particular XMLNodeMBS, the results of a query, or any other set of nodes. The set of nodes to be iterated is determined by the implementation of the XMLNodeIteratorMBS. DOM Level 2 specifies a single XMLNodeIteratorMBS implementation for document-order traversal of a document subtree. Instances of these XMLNodeIteratorMBSs are created by calling createNodeIterator().

Implements Iterable and Iterator interfaces.

This class is hidden for auto complete as you don't need to use it manually. Please use it using for each loops.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.19.2 Methods

229.19.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.19.4 nextNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the next node in the set and advances the position of the XMLNodeIteratorMBS in the set.
Notes: After a XMLNodeIteratorMBS is created, the first call to nextNode() returns the first node in the set.
The next XMLNodeMBS in the set being iterated over, or null if there are no more members in that set. @exception DOMException INVALID_STATE_ERR: Raised if this method is called after the detach method was invoked.

229.19.5 previousNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the previous node in the set and moves the position of the XMLNodeIteratorMBS backwards in the set.
Notes: The previous XMLNodeMBS in the set being iterated over, or null if there are no more members in that set.

229.19.6 Properties

229.19.7 Current as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current node.
Notes: Starts with the root node.
(Read only property)

229.19.8 Document as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The owning document.
Notes: (Read only property)

229.19.9 ExpandEntityReferences as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return the expandEntityReferences flag.
Notes: The value of this flag determines whether the children of entity reference nodes are visible to the XMLNodeIteratorMBS. If false, these children and their descendants will be rejected. Note that this rejection takes precedence over whatToShow and the filter. Also note that this is currently the only situation where XMLNodeIteratorMBSs may reject a complete subtree rather than skipping individual nodes.

To produce a view of the document that has entity references expanded and does not expose the entity reference node itself, use the whatToShow flags to hide the entity reference node and set expandEntityReferences to true when creating the XMLNodeIteratorMBS. To produce a view of the document that has entity reference nodes but no entity expansion, use the whatToShow flags to show the entity reference node and set expandEntityReferences to false.
(Read only property)

229.19.10 Filter as XMLNodeFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLNodeFilterMBS used to screen nodes.
Notes: (Read only property)

229.19.11 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.19.12 Root as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The root node of the XMLNodeIteratorMBS, as specified when it was created.
Notes: (Read only property)

229.19.13 WhatToShow as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return which node types are presented via the iterator.
Notes: This attribute determines which node types are presented via the XMLNodeIteratorMBS. The available set of constants is defined in the XMLNodeFilterMBS interface. Nodes not accepted by whatToShow will be skipped, but their children may still be considered. Note that this skip takes precedence over the filter, if any.

Default is ShowAll.
(Read only property)

229.20 class XMLNodeMBS

229.20.1 class XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLNodeMBS interface is the primary datatype for the entire Document Object Model.
Example:

```
// walk through all nodes of an XML document and show type and name
Var doc As New XMLDocumentMBS
doc.LoadXml "<order id=""5""><!– test –><item>Apple</item><item>Pear</item></order>"

Var root As XMLNodeMBS = doc.DocumentElement
For Each n As XMLNodeMBS In root.ChildNodes
Select Case n.NodeType
Case XMLNodeMBS.TypeElement
System.DebugLog "Element " + n.NodeName + " with " + n.ChildCount.ToString + " children: " +
n.FirstChild.NodeValue
Case XMLNodeMBS.TypeComment
System.DebugLog "Comment: " + n.NodeValue
End Select
Next
```

Notes: It represents a single node in the document tree. While all objects implementing the XMLNodeMBS interface expose methods for dealing with children, not all objects implementing the XMLNodeMBS interface may have children. For example, XMLTextMBS nodes may not have children, and adding children to such nodes results in a XMLExceptionMBS being raised.

The attributes nodeName, nodeValue and attributes are included as a mechanism to get at node information without casting down to the specific derived interface. In cases where there is no obvious mapping of these attributes for a specific nodeType (e.g., nodeValue for an XMLElementMBS or attributes for a XMLCommentMBS), this returns nil. Note that the specialized interfaces may contain additional and more convenient mechanisms to get and set the relevant information.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.20.2 Methods

229.20.3 appendChild(newChild as XMLNodeMBS) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds the node newChild to the end of the list of children of this node.
Notes: If the newChild is already in the tree, it is first removed.
newChild The node to add. If it is a XMLDocumentFragmentMBS object, the entire contents of the document fragment are moved into the child list of this node.

If the new node is from another document, we clone it first.

Returns the newly added node.

229.20.4 AttributeNode(Index as Integer) as XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries attribute node by index.
Notes: Index is zero based up to AttributeCount-1.

229.20.5 AttributeNodes as XMLAttributeMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries an array with all attributes.
Example:

```
Var doc As New XMLDocumentMBS
Var node As XMLElementMBS = doc.createElement("Hello")

// add some attributes
node.AttributeValue("Hello") = "World"
node.AttributeValue("Value") = "123"
node.AttributeValue("Test") = "Value"

// now show them all in message dialogs
Var attrs() As XMLAttributeMBS = node.AttributeNodes
```

```
For Each a As XMLAttributeMBS In attrs
MessageBox a.Name+": "+a.Value
Next
```

Notes: Gets a array containing the attributes of this node (if it is an XMLElementMBS) or null otherwise.

229.20.6 Child(Index as Integer) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries child node with given index.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var node As XMLElementMBS = doc.DocumentElement

Var count As Integer = node.ChildCount
Var node0 As XMLNodeMBS = node.Child(0)
Var node1 As XMLNodeMBS = node.Child(1)
Var node2 As XMLNodeMBS = node.Child(2)
Var node3 As XMLNodeMBS = node.Child(3)
'Var node4 As XMLNodeMBS = node.Child(4) // out of bounds exception
Break // see debugger
```

Notes: Index is zero based up to ChildCount-1.

229.20.7 ChildNodes as XMLNodeMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets a DOMNodeList that contains all children of this node.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

Var children() As XMLNodeMBS = DocumentElement.ChildNodes
For Each node As XMLNodeMBS In children
MessageBox node.toString
Next
```

Notes: If there are no children, this is a array containing no nodes.

The array is a static snapshot of the content of the node.

229.20.8 Clone(deep as Boolean) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a duplicate of this node.
Notes: Pass true for deep parameter to copy all sub objects as well.

This function serves as a generic copy constructor for nodes.

The duplicate node has no parent (parentNode returns nil.).

Cloning an XMLElementMBS copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child XMLTextMBS node. Cloning any other type of node simply returns a copy of this node.
deep If true, recursively clone the subtree under the specified node; if false, clone only the node itself (and its attributes, if it is an XMLElementMBS).

229.20.9 compareDocumentPosition(other as XMLNodeMBS) as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compares two nodes for their position in the document.
Notes: Compares the reference node, i.e. the node on which this method is being called, with a node, i.e. the one passed as a parameter, with regard to their position in the document and according to the document order.

other: The node to compare against this node.

Returns how the given node is positioned relatively to this node.

229.20.10 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.20.11 insertBefore(newChild as XMLNodeMBS, refChild as XMLNodeMBS) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Inserts the node newChild before the existing child node refChild.
Notes: If refChild is nil, insert newChild at the end of the list of children.

If newChild is a XMLDocumentFragmentMBS object, all of its children are inserted, in the same order, before refChild. If the newChild is already in the tree, it is first removed. Note that a XMLNodeMBS that has never been assigned to refer to an actual node is == nil.
newChild The node to insert.

refChild The reference node, i.e., the node before which the new node must be inserted.

If the new node is from another document, we clone it first.

Returns the new node.

229.20.12 isDefaultNamespace(namespaceURI as String) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This method checks if the specified namespaceURI is the default namespace or not.
Notes: namespaceURI: The namespace URI to look for.
Returns true if the specified namespaceURI is the default namespace, false otherwise.

229.20.13 isEqualNode(other as XMLNodeMBS) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Tests whether two nodes are equal.
Notes: This method tests for equality of nodes, not sameness (i.e., whether the two nodes are pointers to the same object) which can be tested with XMLNodeMBS::isSameNode. All nodes that are the same will also be equal, though the reverse may not be true.

Two nodes are equal if and only if the following conditions are satisfied: The two nodes are of the same type.The following string attributes are equal: nodeName, localName, namespaceURI, prefix, nodeValue , baseURI. This is: they are both null, or they have the same length and are character for character identical.

The attributes node maps are equal. This is: they are both nil, or they have the same length and for each node that exists in one map there is a node that exists in the other map and is equal, although not necessarily at the same index.The childNodes node lists are equal. This is: they are both nil, or they have the same length and contain equal nodes at the same index. This is true for XMLAttributeMBS nodes as for any other type of node. Note that normalization can affect equality; to avoid this, nodes should be normalized before being compared.

For two XMLDocumentTypeMBS nodes to be equal, the following conditions must also be satisfied: The following string attributes are equal: publicId, systemId, internalSubset. The entities node maps are equal. The notations node maps are equal.

On the other hand, the following do not affect equality: the ownerDocument attribute, the specified attribute for XMLAttributeMBS nodes, the isWhitespaceInElementContent attribute for XMLTextMBS nodes, as well as any user data or event listeners registered on the nodes.

other: The node to compare equality with.
If the nodes, and possibly subtrees are equal, true otherwise false.

229.20.14 isSameNode(other as XMLNodeMBS) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether this node is the same node as the given one.
Notes: This method provides a way to determine whether two XMLNodeMBS references returned by the implementation reference the same object. When two XMLNodeMBS references are references to the same object, even if through a proxy, the references may be used completely interchangeably, such that all attributes have the same values and calling the same DOM method on either reference always has exactly the same effect.

other: The node to test against.

Returns true if the nodes are the same, false otherwise.

229.20.15 IterateAttributeNodes as XMLIterateAttributeNodesMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the attributes.
Example:

```
Var doc As New XMLDocumentMBS("<doc id=""123"" value=""test""></doc>")
```

```
Var root As XMLElementMBS = doc.DocumentElement
For Each e As XMLAttributeMBS In root.IterateAttributeNodes
MessageBox e.Name+": "+e.Value
Next
```

Notes: For use with For Each Loops in Xojo.

229.20.16 IterateChildNodes as XMLIterateChildNodesMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the child nodes.
Example:

```
Var doc As New XMLDocumentMBS("<doc><test>abc</test><test>def</test></doc>")

Var root As XMLElementMBS = doc.DocumentElement
For Each e As XMLElementMBS In root.IterateChildNodes
MessageBox e.toString
Next
```

Notes: For use with For Each Loops in Xojo.

229.20.17 lookupNamespaceURI(prefix as String) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Look up the namespace URI associated to the given prefix, starting from this node.
Notes: The prefix to look for. If this parameter is null, the method will return the default namespace URI if any.
Returns the associated namespace URI or null if none is found.

229.20.18 lookupPrefix(namespaceURI as String) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Look up the prefix associated to the given namespace URI, starting from this node.
Notes: The default namespace declarations are ignored by this method.

namespaceURI: The namespace URI to look for.

Returns an associated namespace prefix if found, null if none is found. If more than one prefix are associated to the namespace prefix, the returned namespace prefix is implementation dependent.

229.20.19 Normalize

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Normalizes the node tree.
Notes: Puts all XMLTextMBS nodes in the full depth of the sub-tree underneath this XMLNodeMBS, including attribute nodes, into a "normal" form where only markup (e.g., tags, comments, processing instructions, CDATA sections, and entity references) separates XMLTextMBS nodes, i.e., there are neither adjacent XMLTextMBS nodes nor empty XMLTextMBS nodes. This can be used to ensure that the DOM view of a document is the same as if it were saved and re-loaded, and is useful when operations (such as XPointer lookups) that depend on a particular document tree structure are to be used.

Note: In cases where the document contains CDATASections, the normalize operation alone may not be sufficient, since XPointers do not differentiate between XMLTextMBS nodes and XMLCDATASectionMBS nodes.

229.20.20 removeChild(Node as XMLNodeMBS)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes the child node indicated by oldChild from the list of children.
Notes: Returns the old node.

229.20.21 replaceChild(newChild as XMLNodeMBS, oldChild as XMLNodeMBS) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Replaces the child node oldChild with newChild in the list of children, and returns the oldChild node.
Notes: If newChild is a XMLDocumentFragmentMBS object, oldChild is replaced by all of the XMLDocumentFragmentMBS children, which are inserted in the same order.

If the newChild is already in the tree, it is first removed.
newChild The new node to put in the child list.
oldChild The node being replaced in the list.

If the new node is from another document, we clone it first.

Returns the old node.

229.20.22 Properties

229.20.23 AttributeCount as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries number of attributes.
Example:

```
Var doc As New XMLDocumentMBS
Var node As XMLElementMBS = doc.createElement("Hello")

node.AttributeValue("Hello") = "World"
node.AttributeValue("Value") = "123"
node.AttributeValue("Test") = "Value"

MessageBox node.AttributeCount.ToString // shows 3
```

Notes: (Read only property)

229.20.24 BaseURI as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The absolute base URI of this node or "" if undefined.
Notes: This value is computed according to. However, when the XMLDocumentMBS supports the feature "HTML" , the base URI is computed using first the value of the href attribute of the HTML BASE element if any, and the value of the documentURI attribute from the XMLDocumentMBS interface otherwise.

When the node is an XMLElementMBS, a XMLDocumentMBS or a a XMLProcessingInstructionMBS, this attribute represents the properties [base URI] defined in . When the node is a XMLNotationMBS, an XMLEntityMBS, or an XMLEntityReferenceMBS, this attribute represents the properties [declaration base URI] .
(Read only property)

229.20.25 ChildCount as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries number of child nodes.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var node As XMLElementMBS = doc.DocumentElement

MessageBox node.ChildCount.ToString+" Children"
```

Notes: (Read only property)

229.20.26 FirstChild as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the first child of this node.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

Var node As XmlNodeMBS = DocumentElement.FirstChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.NextSibling
// loop ends when there is no next one
Wend
```

Notes: If there is no such node, this returns nil.
(Read only property)

229.20.27 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.20.28 hasAttributes as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether this node (if it is an element) has any attributes.
Notes: Returns true if this node has any attributes, false otherwise.
(Read only property)

229.20.29 hasChildren as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This is a convenience method to allow easy determination of whether a node has any children.
Example:

```
Var xml As String = "<test>test</test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

MessageBox "HasChildren: "+DocumentElement.hasChildren.ToString // shows true

DocumentElement.removeChild DocumentElement.FirstChild

MessageBox "HasChildren after removal: "+DocumentElement.hasChildren.ToString // shows false
```

Notes: Returns true if the node has any children, false if the node has no children.
(Read only property)

229.20.30 LastChild as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the last child of this node.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

// loop over nodes backwards
Var node As XmlNodeMBS = DocumentElement.LastChild
While node <>Nil

// show each child
MessageBox node.toString
```

```
node = node.PreviousSibling
// loop ends when there is no previous one
Wend
```

Notes: If there is no such node, this returns nil.
(Read only property)

229.20.31 LocalName as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the local part of the qualified name of this node.
Notes: For nodes created with a DOM Level 1 method, such as createElement from the XMLDocumentMBS interface, it is "".
(Read only property)

229.20.32 NamespaceURI as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The namespace URI.
Notes: Get the namespace URI of this node, or "" if it is unspecified.
This is not a computed value that is the result of a namespace lookup based on an examination of the namespace declarations in scope. It is merely the namespace URI given at creation time.

For nodes of any type other than element and attribute and nodes created with a DOM Level 1 method, such as createElement from the XMLDocumentMBS interface, this is always "".
(Read only property)

229.20.33 NextSibling as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the node immediately following this node.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

Var node As XmlNodeMBS = DocumentElement.FirstChild
```

```
While node <>Nil

// show each child
MessageBox node.toString

node = node.NextSibling
// loop ends when there is no next one
Wend
```

Notes: If there is no such node, this returns nil.
(Read only property)

229.20.34 NodeName as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name of this node, depending on its type.
Notes: This property can also be used with name "Name".
(Read only property)

229.20.35 NodeType as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The type of this node.
Example:

```
Var xml As String = "<test id=""123""">Hello</test>"
Var doc As New XMLDocumentMBS(xml)

MessageBox doc.DocumentElement.NodeType.ToString // shows 1 for element
```

Notes: See Type* constants.
(Read only property)

229.20.36 NodeValue as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the value of this node, depending on its type.
Notes: Sets the value of the node.

Any node which can have a nodeValue will also accept requests to set it to a string. The exact response to this varies from node to node – Attribute, for example, stores its values in its children and has to replace them with a new Text holding the replacement value.

For most types of Node, value is null and attempting to set it will throw XMLExceptionMBS. This will also be thrown if the node is read-only.

This property can also be used with name Value.
(Read and Write property)

229.20.37 OwnerDocument as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the XMLDocumentMBS object associated with this node.
Notes: This is also the XMLDocumentMBS object used to create new nodes.
When this node is a XMLDocumentMBS or a XMLDocumentTypeMBS which is not used with any XMLDocumentMBS yet, this is nil.
(Read only property)

229.20.38 ParentNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the parent of this node.
Notes: All nodes, except XMLDocumentMBS, XMLDocumentFragmentMBS, and XMLAttributeMBS may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, a null XMLNodeMBS is returned.
(Read only property)

229.20.39 Prefix as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the namespace prefix of this node, or "" if it is unspecified.
Notes: Can be set.
Note that setting this attribute, when permitted, changes the nodeName attribute, which holds the qualified name, as well as the tagName and name attributes of the XMLElementMBS and XMLAttributeMBS interfaces, when applicable.

Note also that changing the prefix of an attribute, that is known to have a default value, does not make a

new attribute with the default value and the original prefix appear, since the namespaceURI and localName do not change.
(Read and Write property)

229.20.40 PreviousSibling as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the node immediately preceding this node.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

// loop over nodes backwards
Var node As XmlNodeMBS = DocumentElement.LastChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.PreviousSibling
// loop ends when there is no previous one
Wend
```

Notes: If there is no such node, this returns nil.
(Read only property)

229.20.41 ReferenceCount as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The reference count.
Notes: Helps us to debug memory leaks.
(Read only property)

229.20.42 toString as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an UTF-8 encoded text representation of the XML.
Example:

```
Var xml As String = "<test id=""123""></test>"
Var doc As New XMLDocumentMBS(xml)

MessageBox doc.toString
```

Notes: Convenience function to use XMLSerializerMBS class internally.
(Read only property)

229.20.43 Constants

Document Positions

Constant	Value	Description
DocumentPositionContainedBy	16	The node is contained by the reference node. A node which is con always following, too.
DocumentPositionContains	8	The node contains the reference node. A node which contains is alw ceding, too.
DocumentPositionDisconnected	1	The two nodes are disconnected. Order between disconnected nodes implementation-specific.
DocumentPositionFollowing	4	The node follows the reference node.
DocumentPositionImplementationSpecific	32	The determination of preceding versus following is implementation-sp
DocumentPositionPreceding	2	The second node precedes the reference node.

Types

Constant	Value	Description
TypeAttribute	2	Attribute Node
TypeCDataSection	4	CDataSection Node
TypeComment	8	Comment Node
TypeDocument	9	Document Node
TypeDocumentFragment	11	Document Fragment
TypeDocumentType	10	Document Type Node
TypeElement	1	Element Node
TypeEntity	6	Entity Node
TypeEntityReferenceNode	5	Entity Reference Node
TypeNotation	12	Notation Node
TypeProcessingInstruction	7	Processing Instruction Node
TypeText	3	Text Node

229.21 class XMLNotationMBS

229.21.1 class XMLNotationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This interface represents a notation declared in the DTD.
Notes: A notation either declares, by name, the format of an unparsed entity (see section 4.7 of the XML 1.0 specification), or is used for formal declaration of Processing Instruction targets (see section 2.6 of the XML 1.0 specification). The nodeName attribute inherited from XMLNodeMBS is set to the declared name of the notation.
The DOM Level 1 does not support editing XMLNotationMBS nodes; they are therefore readonly.
A XMLNotationMBS node does not have any parent.
Subclass of the XMLNodeMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.21.2 Properties

229.21.3 PublicId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the public identifier of this notation.
Notes: If the public identifier was not specified, this is "".
(Read only property)

229.21.4 SystemId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the system identifier of this notation.
Notes: If the system identifier was not specified, this is "".
(Read only property)

229.22 class XMLOutputMBS

229.22.1 class XMLOutputMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This interface represents an output destination for data.
Example:

```
Var output As New XMLOutputMBS
output.Encoding = "UTF-8"

// now pass to write method in XMLSerializerMBS class
```

229.22.2 Methods

229.22.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

229.22.4 Properties

229.22.5 Encoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The encoding which will be required for use with the XML text read via a stream opened by this input source.
Example:

```
Var output As New XMLOutputMBS
output.Encoding = "UTF-8"

// now pass to write method in XMLSerializerMBS class
```

Notes: This is usually not set, allowing the encoding to be sensed in the usual XML way. However, in some cases, the encoding in the file is known to be incorrect because of intermediate transcoding, for instance encapsulation within a MIME document.

Pass the name of the encoding to force, e.g. "UTF-8".
(Read and Write property)

229.22.6 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.22.7 SystemId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The system identifier for this input source.
Notes: The system id is always required. The public id may be used to map to another system id, but the system id must always be present as a fall back.

If the system ID is a URL, it must be fully resolved.
(Read and Write property)

229.23 class XMLParserFilterMBS

229.23.1 class XMLParserFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XML parser filter class.
Notes: The XMLParserFilterMBS class provide applications the ability to examine nodes as they are being created during the parse process.
And it lets the application decide what nodes should be in the output DOM tree or not.

229.23.2 Methods

229.23.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

229.23.4 Destructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

229.23.5 Events

229.23.6 acceptNode(node as XMLNodeMBS) as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This eventn will be called by the parser at the completion of the parsing of each node.
Notes: The node and all of its descendants will exist and be complete. The parent node will also exist, although it may be incomplete, i.e. it may have additional children that have not yet been parsed. Attribute nodes are never passed to this function. From within this method, the new node may be freely modified - children may be added or removed, text nodes modified, etc. The state of the rest of the document outside this node is not defined, and the affect of any attempt to navigate to, or to modify any other part of the document is undefined. For validating parsers, the checks are made on the original document, before any modification by the filter. No validity checks are made on any document modifications made by the filter. If this new node is rejected, the parser might reuse the new node and any of its descendants.

node: The newly constructed element. At the time this method is called, the element is complete - it has all of its children (and their children, recursively) and attributes, and is attached as a child to its parent.

Return one of the Filter* constants.

229.23.7 getWhatToShow as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Tells the XMLParserMBS what types of nodes to show to the acceptNode event.
Notes: If a node is not shown to the filter using this attribute, it is automatically included in the DOM document being built. See XMLDocumentMBS for definition of the constants.

229.23.8 startElement(node as XMLElementMBS) as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parser will call this method after each XMLElementMBS start tag has been scanned, but before the remainder of the XMLElementMBS is processed.
Notes: The intent is to allow the element, including any children, to be efficiently skipped. Note that only element nodes are passed to the startElement function. The element node passed to startElement for filtering will include all of the attributes, but none of the children nodes. The XMLElementMBS may not yet be in place in the document being constructed (it may not have a parent node.) A startElement filter function may access or change the attributes for the XMLElementMBS. Changing namespace declarations will have no effect on namespace resolution by the parser.

node: The newly encountered element. At the time this method is called, the element is incomplete - it will have its attributes, but no children.

Return one of the Filter* constants.

229.23.9 Constants

Filter Actions

Constant	Value	Description
FilterAccept	1	Accept the node.
FilterInterrupt	4	Interrupt the normal processing of the document.
FilterReject	2	Reject the node and its children.
FilterSkip	3	Skip this single node. The children of this node will still be considered.

229.24 class XMLParserMBS

229.24.1 class XMLParserMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLParserMBS class provides an API for parsing XML documents and building the corresponding DOM document tree.
Example:

```
Var p As New XMLParserMBS
Var f As FolderItem = SpecialFolder.Desktop.Child("test.xml")

Var doc As XMLDocumentMBS = p.parseFile(f)

// inspect document in debugger
MessageBox doc.NodeName
```

Notes: Please note that asynchronous mode is not yet supported in MBS Plugin.
Blog Entries

- MBS Xojo Plugins in version 22.4

Xojo Developer Magazine

- 20.6, page 8: News

229.24.2 Methods

229.24.3 abort

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Abort the loading of the document that is currently being loaded by the XMLParserMBS.
Notes: If the XMLParserMBS is currently not busy, a call to this method does nothing.
invoking this method will remove the installed filter

229.24.4 Constructor(Asynchronous as Boolean = false, schemaType as string = "")

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Create a new XMLParserMBS.
Notes: The newly constructed parser may then be configured by means of its XMLConfigurationMBS ob-

ject, and used to parse documents by means of its parse method.

async: The mode argument is either synchronous or asynchronous, if async is true then the XMLParserMBS that is created will operate in synchronous mode, if async is false then the XMLParserMBS that is created will operate in asynchronous mode.

schemaType: An absolute URI representing the type of the schema language used during the load of a XMLDocumentMBS using the newly created XMLParserMBS. Note that no lexical checking is done on the absolute URI. In order to create a XMLParserMBS for any kind of schema types (i.e. the XMLParserMBS will be free to use any schema found), use the value "".

Note: For W3C XML Schema [XML Schema Part 1] , applications must use the value "http://www.w3.org/2001/XMLSchema For XML DTD [XML 1.0] , applications must use the value "http://www.w3.org/TR/REC-xml". Other Schema languages are outside the scope of the W3C and therefore should recommend an absolute URI in order to use this method.

229.24.5 parse(inputSource as XMLInputMBS) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parse an XML document from a resource identified by a XMLInputMBS.
Example:

```
Var xmlText As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"

Var Input As New XMLInputMBS
Input.Encoding = "UTF-8"
Input.InputString = xmlText

Var parser As New XMLParserMBS
Var doc As XMLDocumentMBS = parser.parse(Input)

// inspect document in debugger
MessageBox doc.toString
```

Notes: The parser owns the returned XMLDocumentMBS. It will be deleted when the parser is released.

source: The XMLInputMBS from which the source of the document is to be read.

If the XMLParserMBS is a synchronous XMLParserMBS the newly created and populated XMLDocumentMBS is returned.
If the XMLParserMBS is asynchronous then nil is returned since the document object may not yet be constructed when this method returns.

229.24.6 parseFile(file as FolderItem) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parses a file.
Example:

```
Var p As New XMLParserMBS
Var f As FolderItem = SpecialFolder.Desktop.Child("test.xml")

Var doc As XMLDocumentMBS = p.parseFile(f)

// inspect document in debugger
MessageBox doc.NodeName
```

229.24.7 parseURI(URI as String) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parse an XML document from a location identified by a URI reference [IETF RFC 2396] .
Notes: If the URI contains a fragment identifier (see section 4.1 in [IETF RFC 2396]), the behavior is not defined by this specification, future versions of this specification may define the behavior.

The parser owns the returned XMLDocumentMBS. It will be deleted when the parser is released.

uri: The location of the XML document to be read (in Unicode)

If the XMLParserMBS is a synchronous XMLParserMBS the newly created and populated XMLDocumentMBS is returned.
If the XMLParserMBS is asynchronous then nil is returned since the document object is not yet parsed when this method returns.

229.24.8 parseWithContext(inputSource as XMLInputMBS, contextNode as XMLNodeMBS, Action as Integer) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parse an XML fragment from a resource identified by a XMLInputMBS and insert the content into an existing document at the position specified with the context and action arguments.
Example:

```
Var xmlText As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"

Var Input As New XMLInputMBS
Input.Encoding = "UTF-8"
Input.InputString = xmlText

Var parser As New XMLParserMBS

Var doc As New XMLDocumentMBS("", "MyDocument")

// load new test node into the MyDocument
Var newNode As XMLNodeMBS = parser.parseWithContext(Input, doc.DocumentElement, parser.Action-
AppendAsChildren)

// inspect document in debugger
MessageBox doc.toString
```

Notes: When parsing the input stream, the context node (or its parent, depending on where the result will be inserted) is used for resolving unbound namespace prefixes. The context node's ownerDocument node (or the node itself if the node of type document) is used to resolve default attributes and entity references. As the new data is inserted into the document, at least one mutation event is fired per new immediate child or sibling of the context node. If the context node is a XMLDocumentMBS node and the action is ActionReplaceChildren, then the document that is passed as the context node will be changed such that its xmlEncoding, documentURI, xmlVersion, inputEncoding, xmlStandalone, and all other such attributes are set to what they would be set to if the input source was parsed using parse(). This method is always synchronous, even if the XMLParserMBS is asynchronous (when Async() returns true). If an error occurs while parsing, the caller is notified through the ErrorHandler instance associated with the "error-handler" parameter of the XMLConfigurationMBS. When calling parseWithContext, the values of the following configuration parameters will be ignored and their default values will always be used instead: "validate", "validate-if-schema" "element-content-whitespace". Other parameters will be treated normally, and the parser is expected to call the XMLParserMBSFilter just as if a whole document was parsed.

source: The XMLInputMBS from which the source document is to be read. The source document must be an XML fragment, i.e. anything except a complete XML document (except in the case where the context node of type DOCUMENT_NODE, and the action is ActionReplaceChildren), a DOCTYPE (internal subset), entity declaration(s), notation declaration(s), or XML or text declaration(s).

contextNode: The node that is used as the context for the data that is being parsed. This node must be a XMLDocumentMBS node, a XMLDocumentFragmentMBS node, or a node of a type that is allowed as a child of an XMLElementMBS node, e.g. it cannot be an XMLAttributeMBS node.

action: This parameter describes which action should be taken between the new set of nodes being inserted and the existing children of the context node. The set of possible actions is defined in action constants.

Return the node that is the result of the parse operation. If the result is more than one top-level node, the

first one is returned.

229.24.9 resetCachedGrammarPool

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Clear the cached grammar pool.

229.24.10 resetDocumentPool

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reset the documents vector pool and release all the associated memory back to the system.
Notes: When parsing a document using a DOM parser, all memory allocated for a DOM tree is associated to the DOM document.

If you do multiple parse using the same DOM parser instance, then multiple DOM documents will be generated and saved in a vector pool. All these documents (and thus all the allocated memory) won't be deleted until the parser instance is destroyed.

If you don't need these DOM documents anymore and don't want to destroy the DOM parser instance at this moment, then you can call this method to reset the document vector pool and release all the allocated memory back to the system.

It is an error to call this method if you are in the middle of a parse (e.g. in the mid of a progressive parse).

229.24.11 URIText(ID as Integer) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the string corresponding to a URI id from the URI string pool.
Notes: ID: id of the string in the URI string pool.

Returns the URI string corresponding to the URI id.

229.24.12 Properties

229.24.13 Asynchronous as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return whether the parser is asynchronous.
Notes: Value is true if the XMLParserMBS is asynchronous and false if it is synchronous.
(Read only property)

229.24.14 Busy as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return whether the parser is busy parsing.
Notes: Value is true if the XMLParserMBS is currently busy loading a document, otherwise false.
(Read only property)

229.24.15 DOMConfig as XMLConfigurationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get a pointer to the XMLConfigurationMBS object used when parsing an input source.
Example:

```
Var parser As New XMLParserMBS

// configure the parser
Var DOMConfig As XMLConfigurationMBS = p.DOMConfig
DOMConfig.ElementContentWhitespace=False

// prepare XML input
Var Input As New XMLInputMBS
Input.InputString = kXML2

// and parse
Var xml1 As XMLDocumentMBS = p.parse(Input)

Break
```

Notes: This XMLConfigurationMBS is specific to the parse operation.
No parameter values from this XMLConfigurationMBS object are passed automatically to the XMLConfigurationMBS object on the XMLDocumentMBS that is created, or used, by the parse operation. The DOM application is responsible for passing any needed parameter values from this XMLConfigurationMBS object

to the XMLConfigurationMBS object referenced by the XMLDocumentMBS object.
(Read only property)

229.24.16 Filter as XMLParserFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parse filter.
Notes: When the application provides a filter, the parser will call out to the filter at the completion of the construction of each XMLElementMBS node. The filter implementation can choose to remove the element from the document being constructed or to terminate the parse early. The filter is invoked after the operations requested by the XMLConfigurationMBS parameters have been applied. For example, if "validate" is set to true, the validation is done before invoking the filter.

Currently filter can only work in synchronous mode.
(Read and Write property)

229.24.17 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.24.18 SrcOffset as Int64

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the current src offset within the input source.
Notes: (Read only property)

229.24.19 Constants

Actions

Constant	Value	Description
ActionAppendAsChildren	1	Append the result of the parse operation as children of the context node. For this action to work, the context node must be a XMLElementMBS or a XMLDocumentFragmentMBS.
ActionInsertAfter	4	Insert the result of the parse operation as the immediately following sibling of the context node. For this action to work the context node's parent must be a XMLElementMBS or a XMLDocumentFragmentMBS.
ActionInsertBefore	3	Insert the result of the parse operation as the immediately preceding sibling of the context node. For this action to work the context node's parent must be a XMLElementMBS or a XMLDocumentFragmentMBS.
ActionReplace	5	Replace the context node with the result of the parse operation. For this action to work, the context node must have a parent, and the parent must be a XMLElementMBS or a XMLDocumentFragmentMBS.
ActionReplaceChildren	2	Replace all the children of the context node with the result of the parse operation. For this action to work, the context node must be a XMLElementMBS, a XMLDocumentMBS, or a XMLDocumentFragmentMBS.

229.25 class XMLProcessingInstructionMBS

229.25.1 class XMLProcessingInstructionMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The DOMProcessingInstruction interface represents a "processing instruction", used in XML as a way to keep processor-specific information in the text of the document.
Notes: Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.25.2 Methods

229.25.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.25.4 Properties

229.25.5 Data as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The content of this processing instruction.
Notes: This is from the first non white space character after the target to the character immediately preceding the ?<.

Can be set to put in new instruction.
(Read and Write property)

229.25.6 Target as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The target of this processing instruction.
Notes: XML defines this as being the first token following the markup that begins the processing instruction.
(Read only property)

229.26 class XMLSerializerFilterMBS

229.26.1 class XMLSerializerFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: XMLSerializerMBSFilter provide applications the ability to examine nodes as they are being serialized.
Example:

```
// write an XML document to text, leaving out all comments
// MySerializerFilter is a subclass of XMLSerializerFilterMBS with the events implemented.
Var doc As New XMLDocumentMBS("<config><!– internal note –><name>Test</name></config>")

Var serializer As New XMLSerializerMBS
serializer.Filter = New MySerializerFilter
MessageBox serializer.writeToString(doc)

// in MySerializerFilter:
Function getWhatToShow() As Integer Handles getWhatToShow
Return XMLDocumentMBS.ShowComment // only ask about comments
End Function

Function acceptNode(node As XMLNodeMBS) As Integer Handles acceptNode
Return XMLSerializerFilterMBS.FilterReject
End Function
```

Notes: XMLSerializerMBSFilter lets the application decide what nodes should be serialized or not.
The XMLDocumentMBS, XMLDocumentTypeMBS, XMLNotationMBS, and XMLEntityMBS nodes are not passed to the filter.

229.26.2 Methods

229.26.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

229.26.4 Destructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

229.26.5 Events

229.26.6 acceptNode(node as XMLNodeMBS) as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Test whether a specified node is visible in the logical view of a XMLTreeWalkerMBS or XMLNodeIteratorMBS.
Notes: This event will be called by the implementation of XMLTreeWalkerMBS and XMLNodeIteratorMBS; it is not normally called directly from user code. (Though you could do so if you wanted to use the same filter to guide your own application logic.)
node: The node to check to see if it passes the filter or not.

A constant to determine whether the node is accepted, rejected, or skipped, as defined above.

229.26.7 getWhatToShow as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Tells the XMLSerializerMBS what types of nodes to show to the filter.
Notes: See XMLNodeFilterMBS for definition of the constants. The constant SHOW_ATTRIBUTE is meaningless here, attribute nodes will never be passed to a XMLSerializerMBSFilter.

The constants of what types of nodes to show.
Default is ShowAll if event is not implemented.

229.26.8 Constants

Filter Results

Constant	Value	Description
FilterAccept	1	Accept the node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will return this node.
FilterReject	2	Reject the node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will not return this node. For XMLTreeWalkerMBS, the children of this node will also be rejected. XMLNodeIteratorMBSs treat this as a synonym for FilterSkip.
FilterSkip	3	Skip this single node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will not return this node. For both XMLNodeIteratorMBS and XMLTreeWalkerMBS, the children of this node will still be considered.

229.27 class XMLSerializerMBS

229.27.1 class XMLSerializerMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: XMLSerializerMBS provides an API for serializing (writing) a DOM document out in an XML document.
Notes: The XML data is written to an output stream, the type of which depends on the specific language bindings in use. During serialization of XML data, namespace fixup is done when possible.

XMLSerializerMBS accepts any node type for serialization. For nodes of type Document or Entity, well formed XML will be created if possible. The serialized output for these node types is either as a Document or an External Entity, respectively, and is acceptable input for an XML parser. For all other types of nodes the serialized form is not specified, but should be something useful to a human for debugging or diagnostic purposes. Note: rigorously designing an external (source) form for stand-alone node types that don't already have one defined in seems a bit much to take on here.
Within a Document or Entity being serialized, Nodes are processed as follows Documents are written including an XML declaration and a DTD subset, if one exists in the DOM. Writing a document node serializes the entire document. Entity nodes, when written directly by write defined in the XMLSerializerMBS interface, output the entity expansion but no namespace fixup is done. The resulting output will be valid as an external entity. Entity References nodes are serializes as an entity reference of the form "&entityName;") in the output. Child nodes (the expansion) of the entity reference are ignored. CDATA sections containing content characters that can not be represented in the specified output encoding are handled according to the "split-cdata-sections" feature.If the feature is true, CDATA sections are split, and the unrepresentable characters are serialized as numeric character references in ordinary content. The exact position and number of splits is not specified. If the feature is false, unrepresentable characters in a CDATA section are reported as errors. The error is not recoverable - there is no mechanism for supplying alternative characters and continuing with the serialization. All other node types (XMLElementMBS, XMLTextMBS, etc.) are serialized to their corresponding XML source form.

Within the character data of a document (outside of markup), any characters that cannot be represented directly are replaced with character references. Occurrences of '<' and '&' are replaced by the predefined entities < and &. The other predefined entities (>, ', etc.) are not used; these characters can be included directly. Any character that can not be represented directly in the output character encoding is serialized as a numeric character reference.

Attributes not containing quotes are serialized in quotes. Attributes containing quotes but no apostrophes are serialized in apostrophes (single quotes). Attributes containing both forms of quotes are serialized in quotes, with quotes within the value represented by the predefined entity ". Any character that can not be represented directly in the output character encoding is serialized as a numeric character reference.

Within markup, but outside of attributes, any occurrence of a character that cannot be represented in the output character encoding is reported as an error. An example would be serializing the element with the encoding="us-ascii".

When requested by setting the normalize-characters feature on XMLSerializerMBS, all data to be serialized, both markup and character data, is W3C Text normalized according to the rules defined in . The W3C Text normalization process affects only the data as it is being written; it does not alter the DOM's view of the document after serialization has completed.
Namespaces are fixed up during serialization, the serialization process will verify that namespace declarations, namespace prefixes and the namespace URIs associated with Elements and Attributes are consistent. If inconsistencies are found, the serialized form of the document will be altered to remove them. The algorithm used for doing the namespace fixup while seralizing a document is a combination of the algorithms used for lookupNamespaceURI and lookupPrefix. previous paragraph to be defined closer here.
Any changes made affect only the namespace prefixes and declarations appearing in the serialized data. The DOM's view of the document is not altered by the serialization operation, and does not reflect any changes made to namespace declarations or prefixes in the serialized output.
While serializing a document the serializer will write out non-specified values (such as attributes whose specified is false) if the output-default-values feature is set to true. If the output-default-values flag is set to false and the use-abstract-schema feature is set to true the abstract schema will be used to determine if a value is specified or not, if use-abstract-schema is not set the specified flag on attribute nodes is used to determine if attribute values should be written out.
Ref to Core spec (1.1.9, XML namespaces, 5th paragraph) entity ref description about warning about unbound entity refs. Entity refs are always serialized as &foo;, also mention this in the load part of this spec.
When serializing a document the XMLSerializerMBS checks to see if the document element in the document is a DOM Level 1 element or a DOM Level 2 (or higher) element (this check is done by looking at the localName of the root element). If the root element is a DOM Level 1 element then the XMLSerializerMBS will issue an error if a DOM Level 2 (or higher) element is found while serializing. Likewise if the document element is a DOM Level 2 (or higher) element and the XMLSerializerMBS sees a DOM Level 1 element an error is issued. Mixing DOM Level 1 elements with DOM Level 2 (or higher) is not supported.
XMLSerializerMBSs have a number of named features that can be queried or set. The name of XMLSerializerMBS features must be valid XML names. Implementation specific features (extensions) should choose an implementation dependent prefix to avoid name collisions.
Here is a list of properties that must be recognized by all implementations.

"normalize-characters"

true: [optional] (default) Perform the W3C Text Normalization of the characters in document as they are written out. Only the characters being written are (potentially) altered. The DOM document itself is unchanged.
false: [required] do not perform character normalization.

"split-cdata-sections"

true: [required] (default) Split CDATA sections containing the CDATA section termination marker ']] >' or characters that can not be represented in the output encoding, and output the characters using numeric character references. If a CDATA section is split a warning is issued.
false: [required] Signal an error if a CDATASection contains an unrepresentable character.

"validation"

true: [optional] Use the abstract schema to validate the document as it is being serialized. If validation errors are found the error handler is notified about the error. Setting this state will also set the feature use-abstract-schema to true.
false: [required] (default) Don't validate the document as it is being serialized.

"expand-entity-references"

true: [optional] Expand EntityReference nodes when serializing.
false: [required] (default) Serialize all EntityReference nodes as XML entity references.

"whitespace-in-element-content"

true: [required] (default) Output all white spaces in the document.
false: [optional] Only output white space that is not within element content. The implementation is expected to use the isWhitespaceInElementContent flag on Text nodes to determine if a text node should be written out or not.

"discard-default-content"

true: [required] (default) Use whatever information available to the implementation (i.e. XML schema, DTD, the specified flag on Attr nodes, and so on) to decide what attributes and content should be serialized or not. Note that the specified flag on Attr nodes in itself is not always reliable, it is only reliable when it is set to false since the only case where it can be set to false is if the attribute was created by a Level 1 implementation.
false: [required] Output all attributes and all content.

"format-canonical"

true: [optional] This formatting writes the document according to the rules specified in . Setting this feature to true will set the feature "format-pretty-print" to false.
false: [required] (default) Don't canonicalize the output.

"format-pretty-print"

true: [optional] Formatting the output by adding whitespace to produce a pretty-printed, indented, human-readable form. The exact form of the transformations is not specified by this specification. Setting this feature to true will set the feature "format-canonical" to false.
false: [required] (default) Don't pretty-print the result.

"byte-order-mark"

false: [optional] (default) Setting this feature to true will output the correct BOM for the specified encoding.
true: [required] Don't generate a BOM.

"space-first-level-elements"

true: [optional] (default) Setting this feature to true will add an extra line feed between the elements that are children of the document root.
false: [required] Don't add the extra line feed.
Blog Entries

- MBS Xojo Plugins, version 24.2pr1

229.27.2 Methods

229.27.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

229.27.4 writeToBuffer(Node as XMLNodeMBS, output as XMLOutputMBS) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Write out the specified node as described above in the description of XMLSerializerMBS.
Example:

```
// parse it
Var doc As New XMLDocumentMBS("<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>")

// create serializer
Var serializer As New XMLSerializerMBS

// options
serializer.NewLine = EndOfLine.macOS

Var output As New XMLOutputMBS
output.Encoding = "UTF-8"

// and output to string
Var s As String = serializer.writeToBuffer(doc, output)
```

Notes: Writing a Document or Entity node produces a serialized form that is well formed XML. Writing other node types produces a fragment of text in a form that is not fully defined by this document, but that should be useful to a human for debugging or diagnostic purposes.

node: The Document or Entity node to be written. For other node types, something sensible should be written, but the exact serialized form is not specified.
output: The output for the data to be written.

Returns XML if node was successfully serialized and false in case a failure occurred and the failure wasn't canceled by the error handler.

We internally create a memory buffer to output to and return you the output.

229.27.5 writeToFile(Node as XMLNodeMBS, File as FolderItem) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Write out the specified node as described above in the description of XMLSerializerMBS.
Example:

```
// parse it
Var doc As New XMLDocumentMBS("<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>")

// create serializer
Var serializer As New XMLSerializerMBS

Var file As FolderItem = SpecialFolder.Desktop.Child("test.xml")

// and output to string
Var r As Boolean = serializer.writeToFile(doc, file)
```

Notes: Writing a Document or Entity node produces a serialized form that is well formed XML. Writing other node types produces a fragment of text in a form that is not fully defined by this document, but that should be useful to a human for debugging or diagnostic purposes.

node: The Document or Entity node to be written. For other node types, something sensible should be written, but the exact serialized form is not specified.
uri: The destination for the data to be written.

Returns true if node was successfully serialized and false in case a failure occurred and the failure wasn't canceled by the error handler.

229.27.6 writeToString(Node as XMLNodeMBS) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Serialize the specified node as described above in the description of XMLSerializerMBS.
Example:

```
// parse it
Var doc As New XMLDocumentMBS("<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>")

// create serializer
Var serializer As New XMLSerializerMBS

// options
serializer.NewLine = EndOfLine.macOS

// and output to string
Var s As String = serializer.writeToString(doc)
```

Notes: The result of serializing the node is returned as a string. Writing a Document or Entity node produces a serialized form that is well formed XML. Writing other node types produces a fragment of text in a form that is not fully defined by this document, but that should be useful to a human for debugging or diagnostic purposes.

node: The node to be written.

Returns the serialized data, or "" in case a failure occurred and the failure wasn't canceled by the error handler. The returned string is always marked as UTF-16.

229.27.7 writeToURI(Node as XMLNodeMBS, URI as String) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Write out the specified node as described above in the description of XMLSerializerMBS.
Example:

```
// parse it
Var doc As New XMLDocumentMBS("<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>")

// create serializer
Var serializer As New XMLSerializerMBS

Var file As FolderItem = SpecialFolder.Desktop.Child("test.xml")

// and output to string
```

Var r As Boolean = serializer.writeToURI(doc, file.NativePath)

Notes: Writing a Document or Entity node produces a serialized form that is well formed XML. Writing other node types produces a fragment of text in a form that is not fully defined by this document, but that should be useful to a human for debugging or diagnostic purposes.

node: The Document or Entity node to be written. For other node types, something sensible should be written, but the exact serialized form is not specified.
uri: The destination for the data to be written.

Returns true if node was successfully serialized and false in case a failure occurred and the failure wasn't canceled by the error handler.

229.27.8 Properties

229.27.9 DOMConfig as XMLConfigurationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLConfigurationMBS object used by the Serializer when serializing a DOM node.
Notes: (Read only property)

229.27.10 Filter as XMLSerializerFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The filter to decide which elements to output.
Notes: When the application provides a filter, the serializer will call out to the filter before serializing each Node. Attribute nodes are never passed to the filter. The filter implementation can choose to remove the node from the stream or to terminate the serialization early.

filter: The writer filter to be used.
(Read and Write property)

229.27.11 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.27.12 NewLine as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The end-of-line sequence of characters to be used in the XML being written out.
Notes: The only permitted values are these: ""
Use a default end-of-line sequence. DOM implementations should choose the default to match the usual convention for text files in the environment being used. Implementations must choose a default sequence that matches one of those allowed by 2.11 "End-of-Line Handling". However, Xerces-C++ always uses LF when this property is set to nil since otherwise automatic translation of LF to CR-LF on Windows for text files would result in such files containing CR-CR-LF. If you need Windows-style end of line sequences in your output, consider writing to a file opened in text mode or explicitly set this property to CR-LF.

The default value for this attribute is "" to use default.
(Read and Write property)

229.28 class XMLTextMBS

229.28.1 class XMLTextMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a piece of XML text.
Notes: The XMLTextMBS interface inherits from XMLCharacterDataMBS and represents the textual content (termed character data in XML) of an XMLElementMBS or XMLAttributeMBS. If there is no markup inside an element's content, the text is contained in a single object implementing the XMLTextMBS interface that is the only child of the element. If there is markup, it is parsed into the information items (elements, comments, etc.) and XMLTextMBS nodes that form the list of children of the element.

When a document is first made available via the DOM, there is only one XMLTextMBS node for each block of text. Users may create adjacent XMLTextMBS nodes that represent the contents of a given element without any intervening markup, but should be aware that there is no way to represent the separations between these nodes in XML or HTML, so they will not (in general) persist between DOM editing sessions. The normalize() method on XMLNodeMBS merges any such adjacent XMLTextMBS objects into a single node for each block of text.
Subclass of the XMLCharacterDataMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Xojo Developer Magazine

- 21.2, pages 68 to 69: XML for Beginners, Using XML with the MBS Plugin by Stefanie Juchmes

229.28.2 Methods

229.28.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.28.4 splitText(Offset as Integer) as XMLTextMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Breaks this node into two nodes at the specified offset, keeping both in the tree as siblings.
Notes: After being split, this node will contain all the content up to the offset point. A new node of the same type, which contains all the content at and after the offset point, is returned. If the original node had a parent node, the new node is inserted as the next sibling of the original node. When the offset is equal to the length of this node, the new node has no data.
offset: The 16-bit unit offset at which to split, starting from 0.

Returns the new node, of the same type as this node.

Raises exception in case of error.

229.28.5 Properties

229.28.6 IsElementContentWhitespace as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether this text node contains element content whitespace, often abusively called "ignorable whitespace".
Notes: The text node is determined to contain whitespace in element content during the load of the document or if validation occurs while using normalizeDocument().
(Read only property)

229.28.7 WholeText as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns all text of DOMText nodes logically-adjacent text nodes to this node, concatenated in document order.
Notes: When assigned, substitutes the a specified text for the text of the current node and all logically-adjacent text nodes.
(Read and Write property)

229.29 class XMLTreeWalkerMBS

229.29.1 class XMLTreeWalkerMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Allows you to walk over a xml tree.
Example:

```
// walk over all elements of an XML document in document order
Var doc As New XMLDocumentMBS
doc.LoadXml "<library><book><title>Xojo</title></book><book><title>MBS</title></book></library>"

Var walker As XMLTreeWalkerMBS = doc.createTreeWalker(doc.DocumentElement, 1) // 1 = show elements only
Var names() As String
Var node As XMLNodeMBS = walker.CurrentNode
While node <>Nil
names.Add node.NodeName
node = walker.nextNode
Wend
MessageBox String.FromArray(names, " >")
```

Notes: XMLTreeWalkerMBS objects are used to navigate a document tree or subtree using the view of the document defined by their whatToShow flags and filter (if any). Any function which performs navigation using a XMLTreeWalkerMBS will automatically support any view defined by a XMLTreeWalkerMBS.
Omitting nodes from the logical view of a subtree can result in a structure that is substantially different from the same subtree in the complete, unfiltered document. Nodes that are siblings in the XMLTreeWalkerMBS view may be children of different, widely separated nodes in the original view. For instance, consider a XMLNodeFilterMBS that skips all nodes except for XMLTextMBS nodes and the root node of a document. In the logical view that results, all text nodes will be siblings and appear as direct children of the root node, no matter how deeply nested the structure of the original document.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins in version 22.4
- New XML Plugin for Xojo

Xojo Developer Magazine

- 20.6, page 9: News

229.29.2 Methods

229.29.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.29.4 firstChild as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the first visible child of the current node, and returns the new node.
Notes: If the current node has no visible children, returns null, and retains the current node.
The new node, or null if the current node has no visible children in the XMLTreeWalkerMBS's logical view.

229.29.5 lastChild as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the last visible child of the current node, and returns the new node.
Notes: If the current node has no visible children, returns null, and retains the current node.
The new node, or null if the current node has no children in the XMLTreeWalkerMBS's logical view.

229.29.6 nextNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the next visible node in document order relative to the current node, and returns the new node.
Notes: If the current node has no next node, or if the search for nextNode attempts to step upward from the XMLTreeWalkerMBS's root node, returns null, and retains the current node.
The new node, or null if the current node has no next node in the XMLTreeWalkerMBS's logical view.

229.29.7 nextSibling as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the next sibling of the current node, and returns the new

node.
Notes: If the current node has no visible next sibling, returns null, and retains the current node.
The new node, or null if the current node has no next sibling. in the XMLTreeWalkerMBS's logical view.

229.29.8 ParentNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to and returns the closest visible ancestor node of the current node.
Notes: If the search for parentNode attempts to step upward from the XMLTreeWalkerMBS's root node, or if it fails to find a visible ancestor node, this method retains the current position and returns null.
The new parent node, or null if the current node has no parent in the XMLTreeWalkerMBS's logical view.

229.29.9 previousNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the previous visible node in document order relative to the current node, and returns the new node.
Notes: If the current node has no previous node, or if the search for previousNode attempts to step upward from the XMLTreeWalkerMBS's root node, returns null, and retains the current node.
The new node, or null if the current node has no previous node in the XMLTreeWalkerMBS's logical view.

229.29.10 previousSibling as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the previous sibling of the current node, and returns the new node.
Notes: If the current node has no visible previous sibling, returns null, and retains the current node.
The new node, or null if the current node has no previous sibling. in the XMLTreeWalkerMBS's logical view.

229.29.11 Properties

229.29.12 CurrentNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return the node at which the XMLTreeWalkerMBS is currently positioned.
Notes: Can be assigned to move:
The node at which the XMLTreeWalkerMBS is currently positioned.

Alterations to the DOM tree may cause the current node to no longer be accepted by the XMLTreeWalkerMBS's associated filter. currentNode may also be explicitly set to any node, whether or not it is within the subtree specified by the root node or would be accepted by the filter and whatToShow flags. Further traversal occurs relative to currentNode even if it is not part of the current view, by applying the filters in the requested direction; if no traversal is possible, currentNode is not changed.
(Read and Write property)

229.29.13 Document as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The owning document.
Notes: (Read only property)

229.29.14 ExpandEntityReferences as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The value of this flag determines whether the children of entity reference nodes are visible to the XMLTreeWalkerMBS.
Notes: If false, these children and their descendants will be rejected. Note that this rejection takes precedence over whatToShow and the filter, if any.
To produce a view of the document that has entity references expanded and does not expose the entity reference node itself, use the whatToShow flags to hide the entity reference node and set expandEntityReferences to true when creating the XMLTreeWalkerMBS. To produce a view of the document that has entity reference nodes but no entity expansion, use the whatToShow flags to show the entity reference node and set expandEntityReferences to false.
(Read only property)

229.29.15 Filter as XMLNodeFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The filter used to screen nodes.
Notes: (Read only property)

229.29.16 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.29.17 Root as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The root node of the DOMTreeWalker, as specified when it was created.
Notes: (Read only property)

229.29.18 WhatToShow as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This attribute determines which node types are presented via the DOMTreeWalker.
Notes: The available set of constants is defined in the DOMNodeFilter interface. Nodes not accepted by whatToShow will be skipped, but their children may still be considered. Note that this skip takes precedence over the filter, if any.
Default is ShowAll.
(Read only property)

229.30 class XMLTypeInfoMBS

229.30.1 class XMLTypeInfoMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLTypeInfoMBS interface represent a type used by XMLElementMBS or XMLAttributeMBS nodes, specified in the schemas associated with the document.
Notes: The type is a pair of a namespace URI and name properties, and depends on the document's schema. This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.30.2 Methods

229.30.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.30.4 isDerivedFrom(typeNamespaceArg as String, typeNameArg as String, derivationMethod as Integer) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This method returns if there is a derivation between the reference type definition, i.e. the XMLTypeInfoMBS on which the method is being called, and the other type definition, i.e. the one passed as parameters.
Notes: typeNamespaceArg: The namespace of the other type definition.
typeNameArg: The name of the other type definition.
derivationMethod: The type of derivation and conditions applied between two types, as described in the list of constants provided in this interface.

If the document's schema is a DTD or no schema is associated with the document, this method will always return false.
If the document's schema is an XML Schema, the method will true if the reference type definition is derived from the other type definition according to the derivation parameter. If the value of the parameter is 0 (no bit is set to 1 for the derivationMethod parameter), the method will return true if the other type definition can be reached by recursing any combination of { base type definition } , { item type definition } , or { member type definitions } from the reference type definition.

229.30.5 Properties

229.30.6 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.30.7 TypeName as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns The name of a type declared for the associated XMLElementMBS or XMLAttributeMBS, or "" if unknown.
Notes: (Read only property)

229.30.8 TypeNamespace as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The namespace of the type declared for the associated XMLElementMBS or XMLAttributeMBS or "" if the XMLElementMBS does not have declaration or if no namespace information is available.
Notes: (Read only property)

229.30.9 Constants

DerivationMethods

Constant	Value	Description
DerivationExtension	2	If the document's schema is an XML Schema [XML Schema Part 1] , this constant represents the derivation by extension. The reference type definition is derived by extension from the other type definition if the other type definition can be reached recursively following the { base type definition } property from the reference type definition, and at least one of the derivation methods involved is an extension.
DerivationList	8	If the document's schema is an XML Schema [XML Schema Part 1] , this constant represents the list. The reference type definition is derived by list from the other type definition if there exists two type definitions T1 and T2 such as the reference type definition is derived from T1 by DerivationRestriction or DerivationExtension, T2 is derived from the other type definition by DerivationRestriction, T1 has { variety } list, and T2 is the { item type definition } . Note that T1 could be the same as the reference type definition, and T2 could be the same as the other type definition.
DerivationRestriction	1	If the document's schema is an XML Schema [XML Schema Part 1] , this constant represents the derivation by restriction if complex types are involved, or a restriction if simple types are involved. The reference type definition is derived by restriction from the other type definition if the other type definition is the same as the reference type definition, or if the other type definition can be reached recursively following the { base type definition } property from the reference type definition, and all the derivation methods involved are restriction.
DerivationUnion	4	If the document's schema is an XML Schema [XML Schema Part 1] , this constant represents the union if simple types are involved. The reference type definition is derived by union from the other type definition if there exists two type definitions T1 and T2 such as the reference type definition is derived from T1 by DerivationRestriction or DerivationExtension, T2 is derived from the other type definition by DerivationRestriction, T1 has { variety } union, and one of the { member type definitions } is T2. Note that T1 could be the same as the reference type definition, and T2 could be the same as the other type definition.

229.31 class XMLValidatorMBS

229.31.1 class XMLValidatorMBS

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for the XML validator.
Example:

```
Var ValidXMLLines(), InvalidXMLLines(), schemaLines() As String

// we build a scheme and two XML files:
schemaLines.add "<xs:schema xmlns:xs=""http://www.w3.org/2001/XMLSchema"" elementFormDefault=""qualified""">"
schemaLines.add ""
schemaLines.add " <xs:element name=""person""">"
schemaLines.add " <xs:complexType>"
schemaLines.add " <xs:sequence>"
schemaLines.add " <xs:element name=""name"" type=""xs:string""/>"
schemaLines.add " <xs:element name=""age"" type=""xs:int""/>"
schemaLines.add " <xs:element name=""email"" type=""xs:string""/>"
schemaLines.add " </xs:sequence>"
schemaLines.add " </xs:complexType>"
schemaLines.add " </xs:element>"
schemaLines.add ""
schemaLines.add "</xs:schema>"

ValidXMLLines.add "<person>"
ValidXMLLines.add " <name>John Doe</name>"
ValidXMLLines.add " <age>30</age>"
ValidXMLLines.add " <email>john.doe@example.com</email>"
ValidXMLLines.add "</person>"

InvalidXMLLines.add "<person>"
InvalidXMLLines.add " <name>John Doe</name>"
InvalidXMLLines.add " <age>thirty</age>" // invalid: not an integer
InvalidXMLLines.add "</person>"

Var Schema As String = Join(schemaLines, EndOfLine)
Var ValidXML As String = Join(ValidXMLLines, EndOfLine)
var InvalidXML as string = Join(InvalidXMLLines, EndOfLine)

// let's validate them and see what results we get
Var validator As New XMLValidatorMBS(Schema)
Var r1 As Integer = validator.ValidateString(ValidXML)
// r1 is 0 for valid XML
Var r2 As Integer = validator.ValidateString(InvalidXML)
// r2 is 1871 as there is a mistake
```

Break

Notes: Using the validator in LibXML.

- New XML Validator class for Xojo

Xojo Developer Magazine

- 17.4, page 10: News

229.31.2 Methods

229.31.3 CanonicalXML(XML as String, Mode as Integer = 0) as String

MBS Util Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates the canonical version of the XML.
Example:

```
Var x1 As String = "<test id='123'><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var x2 As String = XMLValidatorMBS.CanonicalXML(x1)
```

Break

Notes: Raises UnsupportedOperationException in case of a parse or serialization error.

The output mode:
Can be 0 for Original C14N 1.0 spec, 1 for Exclusive C14N 1.0 spec or 2 for C14N 1.1 spec.

229.31.4 Constructor(File as FolderItem)

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor taking file path to XML file.
Example:

```
Var f As FolderItem = SpecialFolder.Desktop.Child("schema.xsd")
Var v As New XMLValidatorMBS(f)
```

Notes: May raise an XMLException if the XML can't be parsed or the validator can't be initialized.
XML should have unix line endings (char 10), be saved as UTF-8 and itself a valid XML, so we can parse it corectly.
See also:

- 229.31.5 Constructor(XMLSchema as String) 25689

229.31.5 Constructor(XMLSchema as String)

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor taking XML text.
Notes: May raise an XMLException if the XML can't be parsed or the validator can't be initialized.

For MBS Plugin 20.2 this function accepts also a file name/path to initialize.
XML should have unix line endings (char 10), be saved as UTF-8 and itself a valid XML, so we can parse it corectly.
See also:

- 229.31.4 Constructor(File as FolderItem) 25689

229.31.6 Destructor

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

229.31.7 LoadIconvLibrary(path as String, byref Error as String) as boolean

MBS Util Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the iconv library.
Notes: The XML classes may use libiconv for text encoding conversion.

If you explicitly need, you can load the library on start of solution.

MBS Plugin may try to load iconv.dll/dylib/so automatically when first iconv function is called.

229.31.8 Message(index as Integer) as XMLValidatorMessageMBS

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a message by index.
Notes: Index from 0 to MessageCount-1.

229.31.9 Messages as XMLValidatorMessageMBS()

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries array of messages recorded while validating.

229.31.10 SetCurrentWorkingDirectory(path as folderitem) as boolean

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets current working directory for the application.
Notes: The library looks in current directory to find related files.
So if your schema or the XML file to check references other files, please set the diretory.

Returns true on success or false on failure.
See also:

- 229.31.11 SetCurrentWorkingDirectory(path as String) as boolean 25690

229.31.11 SetCurrentWorkingDirectory(path as String) as boolean

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets current working directory for the application.
Notes: The library looks in current directory to find related files.
So if your schema or the XML file to check references other files, please set the diretory.

Returns true on success or false on failure.
See also:

- 229.31.10 SetCurrentWorkingDirectory(path as folderitem) as boolean 25690

229.31.12 ValidateFile(file as FolderItem) as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validates XML file against a XML schema.
Example:

```
Var f As FolderItem = SpecialFolder.Desktop.Child("schema.xsd")
Var v As New XMLValidatorMBS(f)

Var t As FolderItem = SpecialFolder.Desktop.Child("test.xml")
Var r As Integer = v.ValidateFile(t)
```

Notes: Validate a document tree in memory.
Returns 0 if the document is schemas valid, a positive error code number otherwise and -1 in case of internal or API error.

See messages array for the logged error and warning messages.
Please pass in XML file path and a valid XSD schema.

Use SetCurrentWorkingDirectory with file.parent to set working directory if needed.

XML should have unix line endings (char 10), be saved as UTF-8 and itself a valid XML, so we can parse it corectly.
See also:

- 229.31.13 ValidateFile(path as string) as Integer 25691

229.31.13 ValidateFile(path as string) as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validates XML file against a XML schema.
Notes: Validate a document tree in memory.
Returns 0 if the document is schemas valid, a positive error code number otherwise and -1 in case of internal or API error.

See messages array for the logged error and warning messages.
Please pass in XML file path and a valid XSD schema.

Use SetCurrentWorkingDirectory with file.parent to set working directory if needed.

XML should have unix line endings (char 10), be saved as UTF-8 and itself a valid XML, so we can parse it corectly.
See also:

- 229.31.12 ValidateFile(file as FolderItem) as Integer 25691

229.31.14 ValidateString(text as string) as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validates XML text against a XML schema.
Notes: Validate a document tree in memory.
Returns 0 if the document is schemas valid, a positive error code number otherwise and -1 in case of internal or API error.

See messages array for the logged error and warning messages.

XML should have unix line endings (char 10), be saved as UTF-8 and itself a valid XML, so we can parse it corectly.

229.31.15 Properties

229.31.16 MessageCount as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of messages we recorded in validation.
Notes: (Read only property)

229.31.17 SchemaHandle as Integer

MBS Util Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal schema handle.
Notes: (Read only property)

229.31.18 SchemaValidatorHandle as Integer

MBS Util Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal schema validator handle.
Notes: (Read only property)

229.31.19 Events

229.31.20 Error(message as XMLValidatorMessageMBS)

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error event called for validation errors.

229.31.21 Warning(message as XMLValidatorMessageMBS)

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The warning event called for validation warnings.

229.32 class XMLValidatorMessageMBS

229.32.1 class XMLValidatorMessageMBS

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an error or warning message in XML validator.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- New XML Validator class for Xojo

229.32.2 Methods

229.32.3 Constructor

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The private constructor.

229.32.4 Destructor

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

229.32.5 Properties

229.32.6 Code as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error code.
Notes: (Read only property)

229.32.7 FileName as String

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The filename if available.
Notes: (Read only property)

229.32.8 IsError as Boolean

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this was reported as error and not as warning.
Notes: (Read only property)

229.32.9 IsWarning as Boolean

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this was reported as warning and not as error.
Notes: (Read only property)

229.32.10 Line as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The line number in the XML file if available.
Notes: (Read only property)

229.32.11 Message as String

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The message text.
Notes: (Read only property)

229.33 class XMLXPathResultMBS

229.33.1 class XMLXPathResultMBS

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for an XPath result.
Example:

```
// find nodes with an XPath expression and loop over the results
Var doc As New XMLDocumentMBS
doc.LoadXml "<shop><item price=""5""">Apple</item><item price=""12""">Melon</item><item price=""3""">Lemon<

Var result As XMLXPathResultMBS = doc.evaluate("//item [ @price >4 ] ", doc, XMLXPathResultMBS.Re-
sultTypeOrderedNodeSnapshot)
Var lines() As String
For i As Integer = 0 To result.SnapshotLength - 1
If result.snapshotItem(i) Then lines.Add result.NodeValue.FirstChild.NodeValue
Next

Var count As XMLXPathResultMBS = doc.evaluate("count(//item)", doc, XMLXPathResultMBS.Result-
TypeNumber)
MessageBox count.NumberValue.ToString + " items, more than 4: " + String.FromArray(lines, ", ")
```

Notes: The DOMXPathResult interface represents the result of the evaluation of an XPath 1.0 or XPath 2.0 expression within the context of a particular node. Since evaluation of an XPath expression can result in various result types, this object makes it possible to discover and manipulate the type and value of the result.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Xojo Developer Magazine

- 21.5, page 10: News

229.33.2 Methods

229.33.3 Constructor

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.33.4 iterateNext as Boolean

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates and returns true if the current result is the next item from the sequence or false if there are no more items.
Notes: Returns True if the current result is the next item from the sequence or false if there are no more items.

Raises exception if ResultType is not ResultTypeUnorderedNodeIterator or ResultTypeOrderedNodeIterator (XPath 1.0) or if ResultType is not ResultTypeIteratorResult (XPath 2.0).

229.33.5 snapshotItem(size as Integer) as Boolean

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the current result to the indexth item in the snapshot collection.
Notes: If index is greater than or equal to the number of items in the list, this method returns false. Unlike the iterator result, the snapshot does not become invalid, but may not correspond to the current document if it is mutated.

Returns true if the current result is the next item from the sequence or false if there are no more items.

Raises exception if ResultType is not ResultTypeUnorderedNodeSnapshot or ResultTypeOrderedNodeSnapshot (XPath 1.0) or if ResultType is not ResultTypeSnapshotResult (XPath 2.0).

229.33.6 Properties

229.33.7 BooleanValue as Boolean

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the boolean value of this result.
Notes: Raises exception if ResultType is not ResultTypeBoolean (XPath 1.0) or if current result cannot be properly converted to boolean (XPath 2.0).
Raises exception if there is no current result in the result object (XPath 2.0).
(Read only property)

229.33.8 Document as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parent document used to create these results.
Notes: (Read only property)

229.33.9 IntegerValue as Integer

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the integer value of this result (XPath 2 only).
Notes: The value of this integer result.
Raises exception if current result cannot be properly converted to int (XPath 2.0).
Raises exception if there is no current result in the result object (XPath 2.0).
(Read only property)

229.33.10 InvalidIteratorState as Boolean

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Signifies that the iterator has become invalid.
Notes: True if ResultType is ResultTypeUnorderedNodeIterator or ResultTypeOrderedNodeIterator (XPath 1.0) or ResultTypeIteratorResult (XPath 2.0) and the document has been modified since this result was returned.

Raises exception if ResultType is not ResultTypeUnorderedNodeIterator or ResultTypeOrderedNodeIterator (XPath 1.0) or if ResultType is not ResultTypeIteratorResult (XPath 2.0).
(Read only property)

229.33.11 isNode as Boolean

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the result has a current result and the value is a node (XPath 2 only).
Notes: This function is necessary to distinguish between a string value and a node of type string as returned by the TypeInfo() function.
(Read only property)

229.33.12 NodeValue as XMLNodeMBS

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the node value of this result.
Notes: The value of this node result, which may be nil.
Raises exception if ResultType is not ResultTypeAnyUnorderedNode, ResultTypeFirstOrderedNode, ResultTypeUnorderedNodeIterator, ResultTypeOrderedNodeIterator, ResultTypeUnorderedNodeSnapshot, or ResultTypeOrderedNodeSnapshot (XPath 1.0) or if current result is not a node (XPath 2.0). Raises exception if there is no current result in the result object.
(Read only property)

229.33.13 NumberValue as Double

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the number value of this result.
Notes: If the native double type of the DOM binding does not directly support the exact IEEE 754 result of the XPath expression, then it is up to the definition of the binding to specify how the XPath number is converted to the native binding number.
Raises exception if ResultType is not ResultTypeNumber (XPath 1.0) or if current result cannot be properly converted to double (XPath 2.0).
Raises exception if there is no current result in the result object (XPath 2.0).
(Read only property)

229.33.14 ResultType as Integer

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the result type of this result.
Notes: A code representing the type of this result, as defined by the type constants.
(Read only property)

229.33.15 SnapshotLength as Integer

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of items in the result snapshot.
Notes: Valid values for snapshotItem indices are 0 to snapshotLength-1 inclusive.

Raises exception if ResultType is not ResultTypeUnorderedNodeSnapshot or ResultTypeOrderedNodeSnapshot (XPath 1.0) or if ResultType is not ResultTypeSnapshotResult (XPath 2.0).

(Read only property)

229.33.16 StringValue as String

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the string value of this result.
Notes: The value of this string result.
Raises exception if ResultType is not ResultTypeString (XPath 1.0) or if current result cannot be properly converted to string (XPath 2.0).
Raises exception if there is no current result in the result object (XPath 2.0).
(Read only property)

229.33.17 TypeInfo as XMLTypeInfoMBS

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the DOM type info of the current result node or value (XPath 2 only).
Notes: (Read only property)

229.33.18 Constants

Result Types

Constant	Value	Description
ResultTypeAny	0	[XPath 1.0] This code does not represent a specific type. An evaluatio an XPath expression will never produce this type. If this type is reques then the evaluation returns whatever type naturally results from evalua of the expression. If the natural result is a node set when ResultTypeA was requested, then ResultTypeUnorderedNodeIterator is always the resul type. Any other representation of a node set must be explicitly requested.
ResultTypeAnyUnorderedNode	8	[XPath 1.0] The result is a node set as defined by XPath 1.0 and wil accessed as a single node, which may be null if the node set is empty. Docum modification does not invalidate the node, but may mean that the result n no longer corresponds to the current document. This is a convenience t permits optimization since the implementation can stop once any node in resulting set has been found. If there is more than one node in the actual res the single node returned might not be the first in document order.
ResultTypeBoolean	3	[XPath 1.0] The result is a boolean as defined by XPath 1.0. Docum modification does not invalidate the boolean, but may mean that reevalua would not yield the same boolean.
ResultTypeFirstOrderedNode	9	[XPath 1.0] The result is a node set as defined by XPath 1.0 and wil accessed as a single node, which may be null if the node set is empty. Docum modification does not invalidate the node, but may mean that the result n no longer corresponds to the current document. This is a convenience t permits optimization since the implementation can stop once the first nod document order of the resulting set has been found. If there are more than node in the actual result, the single node returned will be the first in docum order.
ResultTypeFirstResult	100	[XPath 2.0] The result is a sequence as defined by XPath 2.0 and wil accessed as a single current value or there will be no current value if the quence is empty. Document modification does not invalidate the value, may mean that the result no longer corresponds to the current document. T is a convenience that permits optimization since the implementation can s once the first item in the resulting sequence has been found. If there is m than one item in the actual result, the single item returned might not be first in document order.
ResultTypeIteratorResult	101	[XPath 2.0] The result is a sequence as defined by XPath 2.0 that wil accessed iteratively. Document modification invalidates the iteration.
ResultTypeNumber	1	[XPath 1.0] The result is a number as defined by XPath 1.0. Docum modification does not invalidate the number, but may mean that reevalua would not yield the same number.
ResultTypeOrderedNodeIterator	5	[XPath 1.0] The result is a node set as defined by XPath 1.0 that wil accessed iteratively, which will produce document-ordered nodes. Docum modification invalidates the iteration.
ResultTypeOrderedNodeSnapshot	7	[XPath 1.0] The result is a node set as defined by XPath 1.0 that wil accessed as a snapshot list of nodes that will be in original document or Document modification does not invalidate the snapshot but may mean t reevaluation would not yield the same snapshot and nodes in the snapshot r have been altered, moved, or removed from the document.
ResultTypeSnapshotResult	102	[XPath 2.0] The result is a sequence as defined by XPath 2.0 that will be cessed as a snapshot list of values. Document modification does not invalid the snapshot but may mean that reevaluation would not yield the same sn shot and any items in the snapshot may have been altered, moved, or remo from the document.
ResultTypeString	2	[XPath 1.0] The result is a string as defined by XPath 1.0. Document m fication does not invalidate the string, but may mean that the string no lon corresponds to the current document.
ResultTypeUnorderedNodeIterator	4	[XPath 1.0] The result is a node set as defined by XPath 1.0 that wil accessed iteratively, which may not produce nodes in a particular order. D ument modification invalidates the iteration. This is the default type retur if the result is a node set and ResultTypeAny is requested.
ResultTypeUnorderedNodeSnapshot	6	[XPath 1.0] The result is a node set as defined by XPath 1.0 that wil

Chapter 230

XMP

230.1 class XMPAssertNotifyMBS

230.1.1 class XMPAssertNotifyMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This class provides a way to get notified for Assertion.
Notes: Only one instance can be registered at a given time.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr2

230.1.2 Events

230.1.3 Assert(text as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: An assertion was reported.
Example:

```
Sub Assert(text as string)
MessageBox text
End Sub
```

Notes: Display it to the user or just log it for debugging.

230.2 class XMPDateTimeMBS

230.2.1 class XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The expanded type for a date and time.
Example:

```
// parse an XMP date with time zone and convert it to UTC
Var d As New XMPDateTimeMBS("2024-05-17T14:30:00+02:00")
MessageBox "Local: " + d.Str + EndOfLine + _
"Year: " + d.Year.ToString + ", hour: " + d.Hour.ToString + ", time zone: " + d.TimezoneHour.ToString

d.ConvertToUTCTime
MessageBox "UTC: " + d.Str

// build a date-only value
Var birthday As New XMPDateTimeMBS
birthday.Year = 1990
birthday.Month = 7
birthday.Day = 4
MessageBox birthday.Str
```

Notes: Dates and time in the serialized XMP are ISO 8601 strings. The XMPDateTimeMBS class allows easy conversion with other formats.

DateTime values are occasionally used in cases with only a date or only a time component. A date without a time has zeros in the XMPDateTimeMBS class for all time fields. A time without a date has zeros for all date fields (year, month, and day).

230.2.2 Methods

230.2.3 ClearTimeZone

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resets the timezone by setting all time zone properties to zero.

230.2.4 Clone as XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this date.
Notes: Not just a new reference to the same object, but a real copy.

230.2.5 Compare(other as XMPDateTimeMBS) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compare the order of two date/time values.
Notes: Returns:
-1 if self is before other or other=nil
0 if self matches other
+1 if self is after other

230.2.6 Constructor

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain the current date and time.
Notes: The returned time is UTC, properly adjusted for the local time zone. The resolution of the time is not guaranteed to be finer than seconds.
See also:

- 230.2.7 Constructor(text as string) 25705

230.2.7 Constructor(text as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to date/time.
See also:

- 230.2.6 Constructor 25705

230.2.8 ConvertToLocalTime

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make sure a time is local.
Notes: If the time zone is not the local zone, the time is adjusted and the time zone set to be local.

230.2.9 ConvertToUTCTime

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make sure a time is UTC.
Notes: If the time zone is not UTC, the time is adjusted and the time zone set to be UTC.

230.2.10 IsDateOnly as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether only the date is defined for this datetime object.

230.2.11 IsTimeOnly as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether only the time is defined for this datetime object.

230.2.12 Operator_Convert as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from date/time to string.
See also:

- 230.2.13 Operator_Convert(text as string) 25706

230.2.13 Operator_Convert(text as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to date/time.
See also:

- 230.2.12 Operator_Convert as string 25706

230.2.14 SetTimeZone

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the local time zone.
Notes: Any existing time zone value is replaced, the other date/time fields are not adjusted in any way.

230.2.15 Str as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from date/time to string.

230.2.16 Properties

230.2.17 Day as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The day of the month in the range 1..31.
Notes: (Read and Write property)

230.2.18 hasDate as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property to tell if the date is defined in this object.
Notes: (Read and Write property)

230.2.19 hasTime as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property to tell if the time is defined in this object.
Notes: (Read and Write property)

230.2.20 hasTimeZone as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether there is a time zone set.
Notes: (Read and Write property)

230.2.21 Hour as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The hour in the range 0..23.
Notes: (Read and Write property)

230.2.22 Minute as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minute in the range 0..59.
Notes: (Read and Write property)

230.2.23 Month as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The month in the range 1..12.
Notes: (Read and Write property)

230.2.24 NanoSecond as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Nanoseconds within a second, often left as zero.
Notes: (Read and Write property)

230.2.25 Second as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The second in the range 0..59.
Notes: (Read and Write property)

230.2.26 TimezoneHour as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time zone hour in the range 0..23.
Notes: (Read and Write property)

230.2.27 TimezoneMinute as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time zone minute in the range 0..59.
Notes: (Read and Write property)

230.2.28 TimezoneSign as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The "sign" of the time zone, 0 means UTC, -1 is west, +1 is east.
Notes: The "sign" of the time zone, kTimeIsUTC (0) means UTC, kTimeWestOfUTC (-1) is west, kTimeEastOfUTC (+1) is east.
(Read and Write property)

230.2.29 Year as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The year, can be negative.
Notes: (Read and Write property)

230.2.30 Constants

Constants

Constant	Value	Description
kXMP_TimeEastOfUTC	1	One of the constants for the TimezoneSign property. UTC time.
kXMP_TimeIsUTC	0	One of the constants for the TimezoneSign property. Time zone is east of UTC.
kXMP_TimeWestOfUTC	-1	One of the constants for the TimezoneSign property. Time zone is west of UTC.

230.3 class XMPExceptionMBS

230.3.1 class XMPExceptionMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception class for the other XMP classes.
Notes: For current plugins (6.4): Windows and MachO works, Carbon/Classic PEF crashes on an exception. Linux not tested.

Nearly every method or function may raise this exception, so catch it!
Subclass of the RuntimeException class.

230.4 class XMPFilesMBS

230.4.1 class XMPFilesMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for access to the main (document-level) metadata in a file.
Example:

```
// read the XMP metadata of a JPEG file, change the creator tool and write it back
Var files As New XMPFilesMBS
If Not files.OpenFile(SpecialFolder.Desktop.Child("photo.jpg"), &h20202020, XMPFilesMBS.kOpenForUpdate) Then
MessageBox "Can't open file."
Return
End If

Var meta As XMPMetaMBS
Var packet As String
Var info As XMPPacketInfoMBS
If files.GetXMP(meta, packet, info) Then
meta.SetProperty(XMPMetaMBS.kNS_XMP, "CreatorTool", "MyApp 1.0")
If files.CanPutXMP(meta) Then files.PutXMP(meta)
End If

files.CloseFile(0)
```

Notes: The Adobe XMP Toolkit's file handling component, XMPFiles, is a front end to a set of format-specific file handlers that support file I/O for XMP. The file handlers implement smart, efficient support for those file formats for which the means to embed XMP is defined in the XMP Specification. Where possible, this support allows:

- Injection of XMP where none currently exists
- Expansion of XMP without regard to existing padding
- Reconciliation of the XMP and other legacy forms of metadata.

TXMPFiles is designed for use by clients interested in the metadata and not in the primary file content; the Adobe Bridge application is a typical example. TXMPFiles is not intended to be appropriate for files authored by an application; that is, those files for which the application has explicit knowledge of the file format.

Supported file formats:
PDF, PostScript, EPS, JPEG, JPEG2K, TIFF, GIF, PNG, SWF, FLA, FLV, MOV, AVI, CIN, WAV, MP3, SES, CEL, MPEG, MPEG2, MPEG4, WMAV, AIFF, P2, XDCAM_FAM, XDCAM_SAM, XDCAM_EX, AVCHD, SonyHDV, HTML, XML, Text, Photoshop, Illustrator, InDesign, AEProject, AEProjTemplate,

AEFilterPreset, EncoreProject, PremiereProject, PremiereTitle and UCF.

Based on the XMP-Toolkit-SDK from Adobe.

This constructor crashes on Linux with 14.0 plugins and Xojo 2011r1 and 2011r3. Some change in 2011r4 makes it work, so up to Xojo 2014 we don't see the crash.

230.4.2 Methods

230.4.3 CanPutXMP(xmpPacket as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: CanPutXMP() reports whether this file can be updated with a specific XMP packet.
Notes: Use to determine if the file can probably be updated with a given set of XMP metadata. This depends on the size of the packet, the options with which the file was opened, and the capabilities of the handler for the file format. The function obtains the length of the serialized packet for the provided XMP, but does not keep it or modify it, and does not cause the file to be written when closed.
See also:

- 230.4.4 CanPutXMP(xmpPacket as XMPMetaMBS) as boolean 25712

230.4.4 CanPutXMP(xmpPacket as XMPMetaMBS) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function:

CanPutXMP() reports whether this file can be updated with a specific XMP packet,
passed in a string object.
See also:

- 230.4.3 CanPutXMP(xmpPacket as string) as boolean 25712

230.4.5 CheckFileFormat(path as string) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: CheckFileFormat() tries to determine the format of a file.
Notes: CheckFileFormat tries to determine the format of a file, returning an format value. It uses the same logic as OpenFile will use to select a smart handler.

path: The path for the file, appropriate for the local operating system. Passed as a UTF-8 string. The path is the same as would be passed to OpenFile.

Returns the file's format if a smart handler would be selected, otherwise kUnknownFile.

230.4.6 CheckPackageFormat(path as string) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: CheckPackageFormat() tries to determine the format of a "package" folder.
Notes: CheckPackageFormat tries to determine the format of a "package" given the name of the top level folder, returning an XMP_FileFormat value. Examples of recognized packages include the video formats P2, XDCAM, or Sony HDV. These packages contain collections of "clips", stored as multiple files in specific subfolders.

Path: The path for the top level folder, appropriate for the local operating
system. Passed as an UTF-8 string. The path is not the same as would be passed to OpenFile. For example the path passed to CheckPackageFormat might be ".../MyMovie", while the path passed to OpenFile would be ".../MyMovie/SomeClip".

Returns the package's format if a smart handler would be selected, otherwise kUnknownFile.

230.4.7 CloseFile(closeFlags as Integer)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: CloseFile() explicitly closes an opened file.
Notes: Performs any necessary output to the file and closes it. Files that are opened for update are written to only when closing.

If the file is opened for read-only access (passing kOpenForRead), the disk
file is closed immediately after reading the data from it; the XMPFiles object, however, remains in the open state. You must call CloseFile() when finished using it. Other methods, such as GetXMP(), can only be used between the OpenFile() and CloseFile() calls. The XMPFiles destructor does not call CloseFile(); if you call it without closing, any pending updates are lost.

If the file is opened for update (passing kOpenForUpdate), the disk file remains

open until CloseFile() is called. The disk file is only updated once, when CloseFile() is called, regardless of how many calls are made to PutXMP().

closeFlags: Option flags for optional closing actions. This bit-flag constant is defined:

- kUpdateSafely - Write into a temporary file then swap for crash safety.

230.4.8 Constructor

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor initializes an object that is associated with no file.
Notes: The destructor does not call CloseFile(); pending updates are lost when the destructor is run.
See also:

- 230.4.9 Constructor(path as folderitem, format as Integer=&h20202020, OpenFlags as Integer=0) 25714
- 230.4.10 Constructor(path as string, format as Integer=&h20202020, OpenFlags as Integer=0) 25715

230.4.9 Constructor(path as folderitem, format as Integer=&h20202020, OpenFlags as Integer=0)

MBS XMP Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a file for metadata access.
Notes: Opens a file for the requested forms of metadata access. Opening the file at a minimum causes the raw XMP packet to be read from the file. If the file handler supports legacy metadata reconciliation then legacy metadata is also read, unless kOpenOnlyXMP is passed. If the file handler supports native thumbnails and kOpenCacheTNail is passed, the native thumbnail is cached.
If the file is opened for read-only access (passing kOpenForRead), the disk file is closed immediately after reading the data from it; the XMPFiles object, however, remains in the open state. You must call CloseFile() when finished using it. Other methods, such as GetXMP(), can only be used between the OpenFile() and CloseFile() calls. The XMPFiles destructor does not call CloseFile(); if you call it without closing, any pending updates are lost.
If the file is opened for update (passing kOpenForUpdate), the disk file remains open until CloseFile() is called. The disk file is only updated once, when CloseFile() is called, regardless of how many calls are made to PutXMP().
Typically, the XMP is not parsed and legacy reconciliation is not performed until GetXMP() is called, but this is not guaranteed. Specific file handlers might do earlier parsing of the XMP. Delayed parsing and early disk file close for read-only access are optimizations to help clients implementing file browsers, so that they can access the file briefly and possibly display a thumbnail, then postpone more expensive XMP processing until later.

path: The path for the file, appropriate for the local operating system.
format: The format of the file. If the format is unknown (kUnknownFile) the format is determined from the file content. The first handler to check is guessed from the file's extension. Passing a specific format value is generally just a hint about what file handler to try first (instead of the one based on the extension). If kOpenStrictly is set, then any format other than kUnknownFile requires that the file actually be that format; otherwise an exception is thrown.
openFlags: A set of option flags that describe the desired access. By default (zero) the file is opened for read-only access and the format handler decides on the level of reconciliation that will be performed. A logical OR of these bit-flag constants:

- kOpenForRead - Open for read-only access.
- kOpenForUpdate - Open for reading and writing.
- kOpenOnlyXMP - Only the XMP is wanted, no reconciliation.
- kOpenCacheTNail - Cache thumbnail if possible, GetThumbnail will be called.
- kOpenStrictly - Be strict about locating XMP and reconciling with other forms. By default, a best effort is made to locate the correct XMP and to reconcile XMP with other forms (if reconciliation is done). This option forces stricter rules, resulting in exceptions for errors. The definition of strictness is specific to each handler, there might be no difference.
- kOpenUseSmartHandler - Require the use of a smart handler.
- kOpenUsePacketScanning - Force packet scanning, do not use a smart handler.

Throws an exception for serious problems.

- 230.4.8 Constructor 25714
- 230.4.10 Constructor(path as string, format as Integer=&h20202020, OpenFlags as Integer=0) 25715

230.4.10 Constructor(path as string, format as Integer=&h20202020, OpenFlags as Integer=0)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Alternate constructor associates the new XMPFiles object with a specific file.
Notes: Calls OpenFile() to open the specified file after performing a default construct.

path: The path for the file, specified as an UTF-8 string. (use FolderItem.NativePath)
format: A format hint for the file, if known.
openFlags: Options for how the file is to be opened (for read or read/write, for example). Use a logical OR of these bit-flag constants:

- kOpenForRead
- kOpenForUpdate
- kOpenOnlyXMP
- kOpenCacheTNail
- kOpenStrictly
- kOpenUseSmartHandler
- kOpenUsePacketScanning
- kOpenLimitedScanning
- kOpenInBackground

The destructor does not call CloseFile(); pending updates are lost when the destructor is run.
See also:

- 230.4.8 Constructor 25714
- 230.4.9 Constructor(path as folderitem, format as Integer=&h20202020, OpenFlags as Integer=0) 25714

230.4.11 GetFileInfo(byref path as string, byref openFlags as UInt32, byref format as UInt32, byref handlerFlags as UInt32) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetFileInfo() retrieves basic information about an opened file.
Notes: path: A buffer in which to return the path passed to OpenFile(). Can be null if value is not wanted.

openFlags: A variable in which to return the option flags passed to OpenFile.
format: A variable in which to return the file format.
handlerFlags: [out] A variable in which to return the handler's capability flags.

Returns true if the file object is in the open state; that is, OpenFile() has been called but CloseFile() has not. False otherwise. Even if the file object is open, the actual disk file might be closed in the host file-system sense; see OpenFile().

230.4.12 GetFormatInfo(format as Integer, byref handlerFlags as UInt32) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetFormatInfo() reports what features are supported for a specific file format.
Example:

```
Var flags as UInt32
if XMPFilesMBS.GetFormatInfo(XMPFilesMBS.kJPEGFile, flags) then

if BitwiseAnd(flags, XMPFilesMBS.kCanInjectXMP) <>0 then
MessageBox "Can inject first-time XMP into an existing file."
end if

if BitwiseAnd(flags, XMPFilesMBS.kCanExpand) <>0 then
MessageBox "Can expand XMP or other metadata in an existing file."
end if

if BitwiseAnd(flags, XMPFilesMBS.kCanRewrite) <>0 then
MessageBox "Can copy one file to another, writing new metadata (as in SaveAs)."
end if

if BitwiseAnd(flags, XMPFilesMBS.kCanReconcile) <>0 then
MessageBox "Supports reconciliation between XMP and other forms."
end if

if BitwiseAnd(flags, XMPFilesMBS.kAllowsOnlyXMP) <>0 then
MessageBox "Allows access to just the XMP, ignoring other forms."
end if

if BitwiseAnd(flags, XMPFilesMBS.kReturnsTNail) <>0 then
MessageBox "File handler returns native thumbnail information."
end if

if BitwiseAnd(flags, XMPFilesMBS.kReturnsRawPacket) <>0 then
MessageBox "File handler returns raw XMP packet information and string."
end if

end if
```

Notes: The file handlers for different file formats vary considerably in what features they support. Support depends on both the general capabilities of the format and the implementation of the handler for that format.

format: The file format whose support flags are desired.
handlerFlags: A variable in which to return a logical OR of option bit flags.
The following constants are defined:

- kCanInjectXMP - Can inject first-time XMP into an existing file.
- kCanExpand - Can expand XMP or other metadata in an existing file.
- kCanRewrite - Can copy one file to another, writing new metadata (as in SaveAs)
- kCanReconcile - Supports reconciliation between XMP and other forms.
- kAllowsOnlyXMP - Allows access to just the XMP, ignoring other forms.

This is only meaningful if kCanReconcile is set.

- kReturnsTNail - File handler returns native thumbnail information.
- kReturnsRawPacket - File handler returns raw XMP packet information and string.

Even if kReturnsRawPacket is set, the returned packet information might have an
offset of -1 to indicate an unknown offset. While all file handlers should be able to return the raw packet, some might not know the offset of the packet within the file. This is typical in cases where external libraries are used. These cases might not even allow return of the raw packet.

Returns true if the format has explicit "smart" support, false if the format is handled by the default packet scanning plus heuristics.

230.4.13 GetVersionInfo as XMPVersionInfoMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetVersionInfo() retrieves version information for the XMPFiles component.

230.4.14 GetXMP(byref xmp as XMPMetaMBS, byref xmppacket as string, byref PacketInfo as XMPPacketInfoMBS) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetXMP() retrieves the XMP metadata from an open file.
Notes: The function reports whether XMP is present in the file; you can choose to retrieve any or all of the parsed XMP, the raw XMP packet, or information about the raw XMP packet. The options provided when the file was opened determine if reconciliation is done with other forms of metadata.

xmp: An XMP object in which to return the parsed XMP metadata.
xmppacket: An string in which to return the raw XMP packet as stored in
the file. The encoding of the packet is given in the packetInfo. Returns an
empty string if the low level file handler does not provide the raw packet.
packetInfo: A packetinfo object in which to return the location and form of the raw XMP in the file. PacketInfo.charForm and PacketInfo.writeable reflect the
raw XMP in the file. The parsed XMP property values are always UTF-8. The writeable flag is taken from the packet trailer; it applies only to "format ignorant" writing. The PacketInfo object always reflects the state of the XMP in the file. The offset, length, and character form do not change as a result of calling PutXMP() unless the file is also written. Some file handlers might not return location or contents of the raw packet string. To determine whether one does, check the kReturnsRawPacket bit returned by GetFormatInfo(). If the low-level file handler does not provide the raw packet location, PacketInfo.offset and PacketInfo.length are both 0, PacketInfo.charForm is UTF-8, and PacketInfo.writeable is false.

230.4.15 OpenFile(path as folderitem, format as Integer=&h20202020, OpenFlags as Integer=0) as boolean

MBS XMP Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Alternate constructor associates the new XMPFiles object with a specific file.
Notes: Calls OpenFile() to open the specified file after performing a default construct.

path: The path for the file, specified as folderitem.
format: A format hint for the file, if known.
openFlags: Options for how the file is to be opened (for read or read/write, for example). Use a logical OR of these bit-flag constants:

- kOpenForRead
- kOpenForUpdate
- kOpenOnlyXMP
- kOpenCacheTNail
- kOpenStrictly
- kOpenUseSmartHandler
- kOpenUsePacketScanning
- kOpenLimitedScanning
- kOpenInBackground

The destructor does not call CloseFile(); pending updates are lost when the destructor is run.
See also:

- 230.4.16 OpenFile(path as string, format as Integer=&h20202020, OpenFlags as Integer=0) as boolean 25720

230.4.16 OpenFile(path as string, format as Integer=&h20202020, OpenFlags as Integer=0) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a file for metadata access.
Notes: Opens a file for the requested forms of metadata access. Opening the file at a minimum causes the raw XMP packet to be read from the file. If the file handler supports legacy metadata reconciliation then legacy metadata is also read, unless kOpenOnlyXMP is passed. If the file handler supports native thumbnails and kOpenCacheTNail is passed, the native thumbnail is cached.
If the file is opened for read-only access (passing kOpenForRead), the disk file is closed immediately after reading the data from it; the XMPFiles object, however, remains in the open state. You must call CloseFile() when finished using it. Other methods, such as GetXMP(), can only be used between the OpenFile() and CloseFile() calls. The XMPFiles destructor does not call CloseFile(); if you call it without closing, any pending updates are lost.
If the file is opened for update (passing kOpenForUpdate), the disk file remains open until CloseFile() is called. The disk file is only updated once, when CloseFile() is called, regardless of how many calls are made to PutXMP().
Typically, the XMP is not parsed and legacy reconciliation is not performed until GetXMP() is called, but this is not guaranteed. Specific file handlers might do earlier parsing of the XMP. Delayed parsing and early disk file close for read-only access are optimizations to help clients implementing file browsers, so that they can access the file briefly and possibly display a thumbnail, then postpone more expensive XMP processing until later.

path: The path for the file, specified as an UTF-8 string. (use FolderItem.NativePath)
format: The format of the file. If the format is unknown (kUnknownFile) the format is determined from the file content. The first handler to check is guessed from the file's extension. Passing a specific format value is generally just a hint about what file handler to try first (instead of the one based on the extension). If kOpenStrictly is set, then any format other than kUnknownFile requires that the file actually be that format; otherwise an exception is thrown.
openFlags: A set of option flags that describe the desired access. By default (zero) the file is opened for read-only access and the format handler decides on the level of reconciliation that will be performed. A logical OR of these bit-flag constants:

- kOpenForRead - Open for read-only access.
- kOpenForUpdate - Open for reading and writing.
- kOpenOnlyXMP - Only the XMP is wanted, no reconciliation.
- kOpenCacheTNail - Cache thumbnail if possible, GetThumbnail will be called.
- kOpenStrictly - Be strict about locating XMP and reconciling with other forms. By default, a best effort is made to locate the correct XMP and to reconcile XMP with other forms (if reconciliation is

done). This option forces stricter rules, resulting in exceptions for errors. The definition of strictness is specific to each handler, there might be no difference.

- kOpenUseSmartHandler - Require the use of a smart handler.
- kOpenUsePacketScanning - Force packet scanning, do not use a smart handler.

Returns true if the file is succesfully opened and attached to a file handler. False for anticipated problems, such as passing kOpenUseSmartHandler but not having an appropriate smart handler. Throws an exception for serious problems.

- 230.4.15 OpenFile(path as folderitem, format as Integer=&h20202020, OpenFlags as Integer=0) as boolean 25719

230.4.17 PutXMP(xmpPacket as string)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: PutXMP() updates the XMP metadata in this object without writing out the file,
Notes: Overloads the basic form of the function, allowing you to pass the metadata as a string object instead of an XMP object. It is otherwise identical; see details in the canonical form.
See also:

- 230.4.18 PutXMP(xmpPacket as XMPMetaMBS) 25721

230.4.18 PutXMP(xmpPacket as XMPMetaMBS)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: PutXMP() updates the XMP metadata in this object without writing out the file.
Notes: This function supplies new XMP for the file. However, the disk file is not written until the object is closed with CloseFile(). The options provided when the file was opened determine if reconciliation is done with other forms of metadata.
See also:

- 230.4.17 PutXMP(xmpPacket as string) 25721

230.4.19 Events

230.4.20 Abort as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This event is called periodically to allow a user to cancel time-consuming operations.
Notes: The event should return true to signal an abort, which results in an

exception being thrown.

230.4.21 Constants

Constants

Constant	Value	Description
kAEFilterPresetFile	&h46465820	One of the constants to specify a file type.
kAEProjectFile	&h41455020	One of the constants to specify a file type.
kAEProjTemplateFile	&h41455420	One of the constants to specify a file type. After Effects Project Template
kAIFFFile	&h41494646	One of the constants to specify a file type.
kAllowsOnlyXMP	&h00000020	One of the option bit flags for GetFormatInfo Allows access to just the XMP, ignoring other forms.
kAllowsSafeUpdate	&h00000200	One of the option bit flags for GetFormatInfo The file handler allows crash-safe file updates.
kArrayLastItem	-1	The index constant for the last item.
kAVCHDFile	&h41564844	One of the constants to specify a file type.
kAVIFile	&h41564920	One of the constants to specify a file type. Cineon
kCanExpand	2	One of the option bit flags for GetFormatInfo Can expand XMP or other metadata in an existing file.
kCanInjectXMP	1	One of the option bit flags for GetFormatInfo Can inject first-time XMP into an existing file.
kCanReconcile	&h00000010	One of the option bit flags for GetFormatInfo Supports reconciliation between XMP and other forms.
kCanRewrite	4	One of the option bit flags for GetFormatInfo Can copy one file to another, writing new metadata.
kCELFile	&h43454C20	One of the constants to specify a file type. Audition loop
kChar16BitBig	2	One of the constants to define the character format. 16-bit big-endian
kChar16BitLittle	3	One of the constants to define the character format. 16-bit little-endian
kChar16BitMask	2	One of the constants to define the character format.
kChar32BitBig	4	One of the constants to define the character format. 32-bit big-endian
kChar32BitLittle	5	One of the constants to define the character format. 32-bit little-endian
kChar32BitMask	4	One of the constants to define the character format.
kChar8Bit	0	One of the constants to define the character format. 8-bit
kCharLittleEndianMask	1	One of the constants to define the character format.
kCharUnknown	1	One of the constants to define the character format. Variable or not-yet-known cases
kCINFile	&h43494E20	One of the constants to specify a file type.
kEncoreProjectFile	&h4E434F52	One of the constants to specify a file type.
kEPSFile	&h45505320	One of the constants to specify a file type. encapsulated PostScript
kFLAFile	&h464C4120	One of the constants to specify a file type.
kFLVFile	&h464C5620	One of the constants to specify a file type.
kFolderBasedFormat	&h00001000	One of the option bit flags for GetFormatInfo The format is folder oriented, for example the P2 video format.
kGIFFile	&h47494620	One of the constants to specify a file type.
kHandlerOwnsFile	&h00000100	One of the option bit flags for GetFormatInfo The file handler does the file open and close.
kHTMLFile	&h48544D4C	One of the constants to specify a file type.
kIllustratorFile	&h41492020	One of the constants to specify a file type.
kInDesignFile	&h494E4444	One of the constants to specify a file type.
kJPEG2KFile	&h4A505820	One of the constants to specify a file type. JPEG 2000, ISO 15444-1
kJPEGFile	&h4A504547	One of the constants to specify a file type.
kMOVFile	&h4D4F5620	One of the constants to specify a file type. Quicktime
kMP3File	&h4D503320	One of the constants to specify a file type.

230.5 class XMPIteratorMBS

230.5.1 class XMPIteratorMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The XMPIteratorMBS class provides a uniform means to iterate over several XMP data structures, including the schema and properties within an XMP object plus global tables such as registered namespaces.
Example:

```
// list all properties in XMP metadata
Var meta As New XMPMetaMBS
meta.SetProperty(XMPMetaMBS.kNS_XMP, "CreatorTool", "MyApp 1.0")
meta.SetLocalizedText(XMPMetaMBS.kNS_DC, "title", "", "x-default", "Sunset")

Var iter As New XMPIteratorMBS(meta)
Var schemaNS, propPath, propValue As String
Var lines() As String
While iter.NextItem(schemaNS, propPath, propValue)
If propPath <>"" Then lines.Add propPath + " = " + propValue
Wend

MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Note: Only XMP object iteration is implemented at this time. There are no table iterators yet.

Iteration over the schema and properties within an XMP object is the most important and complex use of XMPIteratorMBS. It is helpful to have a thorough understanding of the XMP data tree. One way to learn this is to create some complex XMP and examine the output of XMPMetaMBS.DumpObject. This is also described in the XMP Specification, in the XMP Data Model chapter.
The top of the XMP data tree is a single root node. This does not explicitly appear in the dump and is never visited by an iterator (that is, it is never returned from XMPIteratorMBS.Next). Beneath the root are schema nodes. These are just collectors for top level properties in the same namespace. They are created and destroyed implicitly. Beneath the schema nodes are the property nodes. The nodes below a property node depend on its type (simple, struct, or array) and whether it has qualifiers.

A XMPIteratorMBS constructor defines a starting point for the iteration and options that control how it proceeds. By default the iteration starts at the root and visits all nodes beneath it in a depth first manner. The root node is not visited, the first visited node is a schema node. You can provide a schema name or property path to select a different starting node. By default this visits the named root node first then all nodes beneath it in a depth first manner.

The XMPIteratorMBS.Next method delivers the schema URI, path, and option flags for the node being visited. If the node is simple it also delivers the value. Qualifiers for this node are visited next. The fields

of a struct or items of an array are visited after the qualifiers of the parent.

The options to control the iteration are:

kXMP_IterJustChildren	Visit just the immediate children of the root. Skip the root itself and all nodes below the immediate children. This omits the qualifiers of the immediate children, the qualifier nodes being below what they qualify.
kXMP_IterJustLeafNodes	Visit just the leaf property nodes and their qualifiers.
kXMP_IterJustLeafName	Return just the leaf component of the node names. The default is to return the full path name.
kXMP_IterIncludeAliases	Include aliases as part of the iteration. Since aliases are not actual nodes the default iteration does not visit them.
kXMP_IterOmitQualifiers	Do not visit the qualifiers of a node.

230.5.2 Methods

230.5.3 Constructor

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Empty constructor which does nothing.
See also:

- 230.5.4 Constructor(meta as XMPMetaMBS, options as Integer=0) 25725
- 230.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0) 25726
- 230.5.6 Constructor(meta as XMPMetaMBS, schemaNS as string, propName as string, options as Integer=0) 25727
- 230.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 25727

230.5.4 Constructor(meta as XMPMetaMBS, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an iterator for the global tables of the XMP toolkit.
Notes: options: Option flags to control the iteration.

The available option flags are:

Note: Not yet implemented in the XMP SDK.
See also:

kXMP_IterJustChildren	= &h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= &h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= &h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= &h1000	Omit all qualifiers.

- 230.5.3 Constructor 25725
- 230.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0) 25726
- 230.5.6 Constructor(meta as XMPMetaMBS, schemaNS as string, propName as string, options as Integer=0) 25727
- 230.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 25727

230.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an iterator for the global tables of the XMP toolkit.
Notes: schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= &h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= &h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= &h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= &h1000	Omit all qualifiers.

Note: Not yet implemented in the XMP SDK.

- 230.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 25727

230.5.6 Constructor(meta as XMPMetaMBS, schemaNS as string, propName as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an iterator for the global tables of the XMP toolkit.
Notes: schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
propName: Optional property name to restrict the iteration. May be an arbitrary path expression. Omitted (visit all properties) by passing "". If not empty a schema URI must also be provided.
options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= &h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= &h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= &h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= &h1000	Omit all qualifiers.

Note: Not yet implemented in the XMP SDK.
See also:

- 230.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 25727

230.5.7 Constructor(schemaNS as string, propName as string, options as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an iterator for the properties within an XMP object.
Notes: On success handle is not 0.

schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
propName: Optional property name to restrict the iteration. May be an arbitrary path expression. Omitted (visit all properties) by passing "". If not empty a schema URI must also be provided.
options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= &h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= &h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= &h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= &h1000	Omit all qualifiers.

230.5.8 NextItem() as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Visit the next node in the iteration.
See also:

- 230.5.9 NextItem(byref schemaNS as string) as boolean 25728
- 230.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 25729
- 230.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean 25729
- 230.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 25730

230.5.9 NextItem(byref schemaNS as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Visit the next node in the iteration.
Notes: Parameters:

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.
propValue	A string that is assigned the value of the current property.
options	An integer that is assigned the flags describing the current property.

See also:

- 230.5.8 NextItem() as boolean 25728
- 230.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 25729
- 230.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean 25729
- 230.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 25730

230.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Visit the next node in the iteration.
Notes: Parameters:

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.

See also:

- 230.5.8 NextItem() as boolean 25728
- 230.5.9 NextItem(byref schemaNS as string) as boolean 25728
- 230.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean 25729
- 230.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 25730

230.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Visit the next node in the iteration.
Notes: Parameters:

See also:

- 230.5.8 NextItem() as boolean 25728
- 230.5.9 NextItem(byref schemaNS as string) as boolean 25728

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.
propValue	A string that is assigned the value of the current property.

- 230.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 25729
- 230.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 25730

230.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Visit the next node in the iteration.
Notes: Parameters:

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.
propValue	A string that is assigned the value of the current property.
options	An integer that is assigned the flags describing the current property.

See also:

- 230.5.8 NextItem() as boolean 25728
- 230.5.9 NextItem(byref schemaNS as string) as boolean 25728
- 230.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 25729
- 230.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean 25729

230.5.13 Skip(options as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Skip some portion of the remaining iterations.
Notes: The available option flags are:

kXMP_IterSkipSubtree	= 1	Skip the subtree below the current node.
kXMP_IterSkipSiblings	= 2	Skip the subtree below and remaining siblings of the current node.

230.6 class XMPMetaMBS

230.6.1 class XMPMetaMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The main class for the Adobe XMP SDK.
Example:

```
// create XMP metadata, set some properties and read them back
Var meta As New XMPMetaMBS
meta.SetProperty(XMPMetaMBS.kNS_XMP, "CreatorTool", "MyApp 1.0")
meta.SetLocalizedText(XMPMetaMBS.kNS_DC, "title", "", "x-default", "Sunset at the beach")

Var tool As String
Var options As Integer
If meta.GetProperty(XMPMetaMBS.kNS_XMP, "CreatorTool", tool, options) Then
System.DebugLog "Creator tool: " + tool
End If

MessageBox meta.SerializeToBuffer
```

- MBS Real Studio Plugins, version 12.5pr2

230.6.2 Methods

230.6.3 AppendArrayItem(schemaNS as string, arrayName as string, arrayOptions as Integer, itemValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends an item to an array.
Notes: AppendArrayItem simplifies construction of an array by not requiring that you pre-create an empty array. The array that is assigned is created automatically if it does not yet exist. Each call to AppendArrayItem appends an item to the array. The corresponding parameters have the same use as SetArrayItem. The arrayOptions parameter is used to specify what kind of array. If the array exists, it must have the specified form.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be null or the empty string. Has the same namespace prefix usage as propPath in GetProperty.
arrayOptions	Option flags describing the array form. The only valid bits are those that are part of kXMP_PropArrayFormMask: kXMP_PropValueIsArray (&h200), kXMP_PropArrayIsOrdered (&h400), kXMP_PropArrayIsAlternate (&h800), or kXMP_PropArrayIsAltText (&h1000).
itemValue	An UTF-8 string that is the value of the array item, if the array item has a value. Has the same usage as propValue in GetProperty.
itemOptions	Option flags describing the item.

230.6.4 ApplyTemplate(WorkingXMP as XMPMetaMBS, template as XMPMetaMBS, actions as Integer)

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies an xmp template.

230.6.5 CatenateArrayItems(schemaNS as string, arrayName as string, separator as string, quotes as string, options as Integer) as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a single edit string from an array of strings.
Notes:

xmpObj	The XMP object containing the array to be catenated.
schemaNS	The schema namespace URI for the array. Must not be an empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string. Each item in the array must be a simple string value.
separator	The string to be used to separate the items in the catenated string. Defaults to "; ", ASCII semicolon and space (U+003B, U+0020).
quotes	The characters to be used as quotes around array items that contain a separator. Defaults to '"', ASCII quote (U+0022).
options	Option flags to control the catenation.

returns the string with the catenated array items.

230.6.6 Clone as XMPMetaMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the XMPMeta Object.
Notes: Deep copy, not just a new reference.
Returns nil on any error.

230.6.7 ComposeArrayItemPath(schemaNS as string, arrayName as string, itemIndex as Integer) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the path expression for an item in an array.
Notes:

schemaNS	The namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem always refers to the last existing array item.

Returns the composed path. This will be of the form <tt>ns:arrayName [i] </tt>, where "ns" is the prefix for schemaNS and "i" is the decimal representation of itemIndex. If the value of itemIndex is kXMP_ArrayLastItem, the path is <tt>ns:arrayName [last()] </tt>.

230.6.8 ComposeFieldSelector(schemaNS as string, arrayName as string, fieldNS as string, fieldName as string, fieldValue as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the path expression to select an alternate item by a field's value.
Notes: The path syntax allows two forms of "content addressing" that may be used to select an item in an array of alternatives. The form used in ComposeFieldSelector lets you select an item in an array of structs based on the value of one of the fields in the structs. The other form of content addressing is shown in ComposeLangSelector.

For example, consider a simple struct that has two fields, the name of a city and the URI of an FTP site in that city. Use this to create an array of download alternatives. You can show the user a popup built from the values of the city fields. You can then get the corresponding URI as follows:

path=ComposeFieldSelector (schemaNS, "Downloads", fieldNS, "City", chosenCity)

exists = GetStructField (schemaNS, path, fieldNS, "URI", uri)

schemaNS	The namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string.
fieldNS	The namespace URI for the field used as the selector. Must not be an empty string.
fieldName	The name of the field used as the selector. Must be a simple XML name, must not be an empty string. It must be the name of a field that is itself simple.
fieldValue	The desired value of the field.

Returns the string with the composed path. This will be of the form <tt>ns:arrayName [fNS:fieldName='fieldValue'] </tt>, where "ns" is the prefix for schemaNS and "fNS" is the prefix for fieldNS.

230.6.9 ComposeLangSelector(schemaNS as string, arrayName as string, langName as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the path expression to select an alternate item by language.
Notes: The path syntax allows two forms of "content addressing" that may be used to select an item in an array of alternatives. The form used in ComposeLangSelector lets you select an item in an alt-text array based on the value of its <tt>xml:lang</tt>qualifier. The other form of content addressing is shown in ComposeFieldSelector.

ComposeLangSelector does not supplant SetLocalizedText or GetLocalizedText.
They should generally be used, as they provide extra logic to choose the appropriate language and maintain consistency with the 'x-default' value. ComposeLangSelector gives you an path expression that is explicitly and only for the language given in the langName parameter.

schemaNS	The namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string.
langName	The RFC 3066 code for the desired language.

Returns the composed path. This will be of the form <tt>ns:arrayName [\@xml:lang='langName'] </tt>, where "ns" is the prefix for schemaNS.

230.6.10 ComposeQualifierPath(schemaNS as string, structName as string, qualNS as string, qualName as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the path expression for a qualifier.
Notes: schemaNS The namespace URI for the property to which the qualifier is attached. Must not be an empty string.
propName The name of the property to which the qualifier is attached. May be a general path expression, must not be an empty string.
qualNS The namespace URI for the qualifier. May be an empty string if the qualifier is in the XML empty namespace.
qualName The name of the qualifier. Must be a simple XML name, must not be an empty string.
Returns the composed path. This will be of the form <tt>ns:propName/?qNS:qualName</tt>, where "ns" is the prefix for schemaNS and "qNS" is the prefix for qualNS.

230.6.11 ComposeStructFieldPath(schemaNS as string, structName as string, fieldNS as string, fieldName as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the path expression for a field in a struct.
Notes:

schemaNS	The namespace URI for the struct. Must not be null or the empty string.
structName	The name of the struct. May be a general path expression, must not be an empty string.
fieldNS	The namespace URI for the field. Must not be an empty string.
fieldName	The name of the field. Must be a simple XML name, must not be an empty string.

Returns the composed path. This will be of the form <tt>ns:structName/fNS:fieldName</tt>, where "ns" is the prefix for schemaNS and "fNS" is the prefix for fieldNS.

230.6.12 Constructor

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor, creates an empty object.
See also:

- 230.6.13 Constructor(data as memoryblock, Offset as Integer, Size as Integer) 25737
- 230.6.14 Constructor(data as string) 25737

230.6.13 Constructor(data as memoryblock, Offset as Integer, Size as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an object and parse one buffer of RDF into it.
Notes: This constructor creates a new TXMPMeta object and populates it with metadata from a buffer containing serialized RDF. This buffer must be a complete RDF parse stream. Pass "" to construct an empty XMPMetaMBS object. The result of an actual parse is identical to creating an empty object then calling XMPMetaMBS.ParseFromBuffer. The RDF must be complete. If you need to parse with multiple buffers, create an empty object and use XMPMetaMBS.ParseFromBuffer.
See also:

- 230.6.12 Constructor 25736
- 230.6.14 Constructor(data as string) 25737

230.6.14 Constructor(data as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an object and parse one buffer of RDF into it.
Notes: This constructor creates a new TXMPMeta object and populates it with metadata from a buffer containing serialized RDF. This buffer must be a complete RDF parse stream. Pass "" to construct an empty XMPMetaMBS object. The result of an actual parse is identical to creating an empty object then calling XMPMetaMBS.ParseFromBuffer. The RDF must be complete. If you need to parse with multiple buffers, create an empty object and use XMPMetaMBS.ParseFromBuffer.

230.6.15 ConvertFromBool(value as boolean) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from Boolean to string.

230.6.16 ConvertFromDate(value as XMPDateTimeMBS) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from date/time to string.

230.6.17 ConvertFromFloat(value as Double, format as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from floating point to string.
Notes: format: Optional C sprintf format for the conversion. Defaults to "%f".

230.6.18 ConvertFromInt(value as Integer, format as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from integer to string.
Notes: format: Optional C sprintf format for the conversion. Defaults to "%d".

230.6.19 ConvertFromInt64(value as Int64, format as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from integer to string.
Notes: format: Optional C sprintf format for the conversion. Defaults to "%d".

230.6.20 ConvertToBool(value as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to Boolean.

230.6.21 ConvertToDate(value as string) as XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to date/time.

230.6.22 ConvertToFloat(value as string) as Double

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to floating point.

230.6.23 ConvertToInt(value as string) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to integer.

230.6.24 ConvertToInt64(value as string) as Int64

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to 64 bit integer.

230.6.25 CountArrayItems(schemaNS as string, arrayName as string) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts array items of given array.
Notes: Returns 0 on any error.

230.6.26 CurrentDateTime as XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Current date and time as a XMPDateTimeMBS object.
Notes: Returns nil on any error.

230.6.27 DecodeFromBase64(text as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decode from Base64 encoded string to raw data.
Example:

```
Var x as XMPMetaMBS
x=new XMPMetaMBS
MessageBox x.DecodeFromBase64("dGVzdA==") // test
```

Notes: This is a global method which does not need a valid handle.

230.6.28 DeleteArrayItem(schemaNS as string, arrayName as string, itemIndex as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeleteArrayItem deletes the given XMP subtree rooted at the given array item.
Notes: It is not an error if the array item does not exist.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not "". Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem (-1) always refers to the last existing array item.

230.6.29 DeleteLocalizedText(schemaNS as string="", altTextName as string="", genericLang as string="", specificLang as string="")

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes localized text.

230.6.30 DeleteNamespace(namespaceURI as string)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes a namespace from the registry.
Notes: Not implemented?

Does nothing if the URI is not registered, or if the parameter is null or the empty string.

namespaceURI: The URI for the namespace.

230.6.31 DeleteProperty(schemaNS as string, propName as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeleteProperty deletes the given XMP subtree rooted at the given property.
Notes: It is not an error if the property does not exist.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.

230.6.32 DeleteQualifier(schemaNS as string, structName as string, qualNS as string, qualName as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeleteQualifier deletes the given XMP subtree rooted at the given qualifier.
Notes: It is not an error if the qualifier does not exist.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. Has the same usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be "" Has the same namespace prefix usage as the propName parameter.

230.6.33 DeleteStructField(schemaNS as string, structName as string, fieldNS as string, fieldName as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeleteStructField deletes the given XMP subtree rooted at the given struct field.
Notes: It is not an error if the field does not exist.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be "". Has the same namespace prefix usage as the structName parameter.

230.6.34 DoesArrayItemExist(schemaNS as string, arrayName as string, itemIndex as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DoesArrayItemExist tells if the array item exists.
Notes: Returns true if the array item exists.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem (-1) always refers to the last existing array item.

230.6.35 DoesPropertyExist(schemaNS as string, propName as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DoesPropertyExist tells if the property exists.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.

230.6.36 DoesQualifierExist(schemaNS as string, structName as string, qualNS as string, qualName as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DoesQualifierExist tells if the qualifier exists.
Notes: Returns true if the qualifier exists.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. Has the same usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be "". Has the same namespace prefix usage as the propName parameter.

230.6.37 DoesStructFieldExist(schemaNS as string, structName as string, fieldNS as string, fieldName as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DoesStructFieldExist tells if the struct field exists.
Notes: Returns true if the field exists.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be "". Has the same namespace prefix usage as the structName parameter.

230.6.38 DumpNamespaces(output as XMPTextOutputMBS) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DumpNamespaces dumps the list of registered namespace URIs and prefixes.
Notes: This is a global method which does not need a valid handle.
Returns status code. (0=success and -1=error)

230.6.39 DumpObject(output as XMPTextOutputMBS) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DumpObject dumps the content of an XMP object.
Notes: Returns status code. (0=success and -1=error)

230.6.40 DuplicateSubtree(dest as XMPMetaMBS, sourceNS as string, sourceRoot as string, destNS as string=””, destRoot as string=””, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replicate a subtree from one XMP object into another, possibly at a different location.
Notes: Parameters:

self	The source XMP object.
dest	The destination XMP object.
sourceNS	The schema namespace URI for the source subtree.
sourceRoot	The root location for the source subtree. May be a general path expression, must not be null or the empty string.
destNS	The schema namespace URI for the destination. Defaults to the source namespace.
destRoot	The root location for the destination. May be a general path expression. Defaults to the source location.
options	Option flags to control the separation.

230.6.41 EncodeToBase64(text as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from raw data to Base64 encoded string.
Example:

```
Var x as XMPMetaMBS
x=new XMPMetaMBS
```

MessageBox x.EncodeToBase64("test") // dGVzdA==

Notes: This is a global method which does not need a valid handle.

230.6.42 Erase

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Restores the object to a "just constructed" state.

230.6.43 GetArrayItem(schemaNS as string, arrayName as string, itemIndex as Integer, byref itemValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetArrayItem provides access to items within an array.
Notes: The index is passed as an integer, you need not worry about the path string syntax for array items, convert a loop index to a string, etc.

Returns true if the array item exists.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem (-1) always refers to the last existing array item.
itemValue	A string that is assigned the value of the array item, if the array item has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the array item.

230.6.44 GetLocalizedText(schemaNS as string, altTextName as string, genericLang as string, specificLang as string, byref actualLang as string, byref itemValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetLocalizedText returns information about a selected item in an alt-text array.
Notes: The array item is selected according to the rules given above.

Returns true if an appropriate array item exists.

Parameters:

schemaNS	The namespace URI for the alt-text array. Has the same usage as in GetProperty.
altTextName	The name of the alt-text array. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
genericLang	The name of the generic language as an RFC 3066 primary subtag. May be "" if no generic language is wanted.
specificLang	The name of the specific language as an RFC 3066 tag. Must not be null or the empty string.
actualLang	A string that is assigned the language of the selected array item, if an appropriate array item is found.
itemValue	A string that is assigned the value of the array item, if an appropriate array item is found.
options	An integer variable that is assigned option flags describing the array item.

230.6.45 GetNamespacePrefix(namespaceURI as string, byref namespacePrefix as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain the prefix for a registered namespace URI.
Notes: It is not an error if the namespace URI is not registered. The output namespacePrefix string is "" if the namespace URI is not registered.

Parameters:

namespaceURI	The URI for the namespace. Must not be null or the empty string.
namespacePrefix	Returns the prefix registered for this URI, with a terminating ':'.

Returns true if the namespace URI is registered.

This is a global method which does not need a valid handle.

230.6.46 GetNamespaceURI(namespacePrefix as string, byref namespaceURI as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain the URI for a registered namespace prefix.
Notes: It is not an error if the namespace prefix is not registered. The output namespaceURI string is "" if the namespace prefix is not registered.

Parameters:

namespacePrefix	The prefix for the namespace. Must not be "".
namespaceURI	Returns the URI registered for this prefix.

Returns true if the namespace prefix is registered.

This is a global method which does not need a valid handle.

230.6.47 GetProperty(schemaNS as string, propName as string, byref propValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetProperty is the simplest property getter, mainly for top level simple properties or after using the path composition functions.
Notes: Returns true if the property exists.

Parameters:

230.6.48 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean) as boolean

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyBoolean returns the value of a Boolean property as a boolean.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. May be an empty string if the first component of the propName path contains a namespace prefix. The URI must be for a registered namespace.
propName	The name of the property. May be a general path expression, must not be an empty string. Using a namespace prefix on the first component is optional. If present without a schemaNS value then the prefix specifies the namespace. The prefix must be for a registered namespace. If both a schemaNS URI and propName prefix are present, they must be corresponding parts of a registered namespace.
propValue	A string that is assigned the value of the property, if the property has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the property.

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A boolean variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 230.6.49 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean, byref options as Integer) as boolean 25748

230.6.49 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyBoolean returns the value of a Boolean property as a boolean.
Notes: Returns true if the property exists.

Parameters:

See also:

- 230.6.48 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean) as boolean 25747

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A boolean variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

230.6.50 GetPropertyDate(schemaNS as string, propName as string, byref propValue as XMPDateTimeMBS, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetProperty_Date returns the value of a date/time property as an XMPDateTimeMBS object.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A XMPDateTimeMBS variable that is assigned the value of the property.
options	An integer variable that is assigned option flags describing the property.

230.6.51 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double) as boolean

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyFloat returns the value of a flaoting point property as a double value.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A double variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 230.6.52 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double, byref options as Integer) as boolean 25750

230.6.52 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyFloat returns the value of a flaoting point property as a double value.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A double variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 230.6.51 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double) as boolean 25749

230.6.53 GetPropertyInt64Double(schemaNS as string, propName as string, byref propValue as Double, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyInt64Double returns the value of a 64 bit integer property as a double value.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A double variable that is assigned the value of the property.
options	An integer variable that is assigned option flags describing the property.

230.6.54 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer) as boolean

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyInteger returns the value of an integer property as an integer.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	An integer variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 230.6.55 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer, byref options as Integer) as boolean 25751

230.6.55 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyInteger returns the value of an integer property as an integer.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	An integer variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 230.6.54 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer) as boolean 25751

230.6.56 GetPropertyInteger64(schemaNS as string, propName as string, byref propValue as Int64, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves the value of an integer property as an Int64.
Notes: Reports whether a property exists, and retrieves its binary value and property type information.

schemaNS: The namespace URI; see GetProperty().
propName: The name of the property. Can be a general path expression, must not be empty string; see GetProperty() for namespace prefix usage.

propValue: A variable in which to return the binary value.

options: A variable in which to return the option flags describing the property, a logical OR of allowed bit-flag constants; see kPropValueIsStruct and following.

Returns true if the property exists.

230.6.57 GetQualifier(schemaNS as string, propName as string, qualNS as string, qualName as string, byref qualValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetQualifier provides access to a qualifier attached to a property.
Notes: The namespace for the qualifier is passed as a URI, you need not worry about the path string syntax. In many regards qualifiers are like struct fields.

The names of qualifiers should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix. This is unreliable since the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Note: Qualifiers are only supported for simple leaf properties at this time. (in the XMP SDK)

Returns true if the qualifier exists.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be an empty string. Has the same namespace prefix usage as the propName parameter.
qualValue	A string variable that is assigned the value of the qualifier, if the qualifier has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the qualifier.

230.6.58 GetStructField(schemaNS as string, structName as string, fieldNS as string, fieldName as string, byref itemValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetStructField provides access to fields within a nested structure.
Notes: The namespace for the field is passed as a URI, you need not worry about the path string syntax.

The names of fields should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix. This is unreliable since the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Returns true if the field exists.

Parameters:

230.6.59 GetVersionInfo as XMPVersionInfoMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves runtime version information.

230.6.60 Iterator(schemaNS as string, propName as string, options as Integer) as XMPIteratorMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be an empty string. Has the same namespace prefix usage as the structName parameter.
fieldValue	An string variable that is assigned the value of the field, if the field has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the field. May be null if the flags are not wanted.

Function: Creates an iterator for the properties within an XMP object.
Notes: Returns nil on failure.

schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
propName: Optional property name to restrict the iteration. May be an arbitrary path expression. Omitted (visit all properties) by passing "". If not empty a schema URI must also be provided.
options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= &h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= &h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= &h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= &h1000	Omit all qualifiers.

230.6.61 MergeFromJPEG(extendedXMP as XMPMetaMBS)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: merges standard and extended XMP retrieved from a JPEG file.
Notes: When an extended partition stores properties that do not fit into the JPEG file limitationof 64K bytes, this function integrates those properties back into the same XMP object with those from the standard XMP packet.

self: An XMP object which the caller has initialized from the standard XMP packet in a JPEG file. The extended XMP is added to this object.

extendedXMP: An XMP object which the caller has initialized from the extended XMP packet in a JPEG file.

230.6.62 PackageForJPEG(byref standardXMP as string, byref extendedXMP as string, byref extendedDigest as string)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: creates XMP serializations appropriate for a JPEG file.
Notes: The standard XMP in a JPEG file is limited to 64K bytes. This function serializes the XMP metadata in an XMP object into a string of RDF (see \c SerializeToBuffer) the data does not fit into the 64K byte limit, it creates a second packet string with the extended data.

self: The XMP object containing the metadata.
standardXMP: A string object in which to return the full standard XMP packet.

extendedXMP: A string object in which to return the serialized extended XMP, empty if not needed.

extendedDigest: A string object in which to return an MD5 digest of the serialized extended XMP, empty if not needed.

230.6.63 ParseFromBuffer(buffer as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: ParseFromBuffer parses RDF from a series of input buffers.
Notes: The buffers may be any length. The buffer boundaries need not respect XML tokens or even Unicode characters.

Parameters:

buffer	Input data buffer. Termination of an input loop is convenient by passing kXMP_ParseMoreBuffers (2) for all real input, then having a final call with a zero length and kXMP_NoOptions.
options	Options controlling the parsing.

The available options are:

Note: The kXMP_StrictAliasing option is not yet implemented.

kXMP_ParseMoreBuffers	= 2	This is not the last buffer of input, more calls follow.
kXMP_RequireXMPMeta	= 1	The x:xmpmeta XML element is required around rdf:RDF.
kXMP_StrictAliasing	= 4	Do not reconcile alias differences, throw an exception.

230.6.64 RegisterNamespace(namespaceURI as string, suggestedPrefix as string, byref registeredPrefix as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Register a namespace URI with a suggested prefix.
Example:

```
Var x as new XMPMetaMBS
Var registeredPrefix as string

call x.RegisterNamespace ("xwnv", "xwnv", registeredPrefix)

x.SetProperty "xwnv","MZSTID","test"

MessageBox x.SerializeToBuffer
```

Notes: It is not an error if the URI is already registered, no matter what the prefix is. If the URI is not registered but the suggested prefix is in use, a unique prefix is created from the suggested one. The actual registeed prefix is always returned. The function result tells if the registered prefix is the suggested one.

Parameters:

namespaceURI	The URI for the namespace. Must be a valid XML URI.
suggestedPrefix	The suggested prefix to be used if the URI is not yet registered. Must be a valid XML name.
registeredPrefix	Returns the prefix actually registered for this URI.

Returns true if the registered prefix matches the suggested prefix.

Note: No checking is presently done on either the URI or the prefix.

This is a global method which does not need a valid handle.

230.6.65 RemoveProperties(schemaNS as string="", propName as string="", options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove multiple properties from an XMP object.
Notes: RemoveProperties was created to support the File Info dialog's Delete button, and has been been generalized somewhat from those specific needs. It operates in one of three main modes depending on the schemaNS and propName parameters:
Non-empty schemaNS and propName - The named property is removed if it is an external property, or if the kXMPUI_DoAllProperties option is passed. It does not matter whether the named property is an actual property or an alias.
Non-empty schemaNS and empty propName - The all external properties in the named schema are removed. Internal properties are also removed if the kXMPUI_DoAllProperties option is passed. In addition, aliases from the named schema will be removed if the kXMPUI_IncludeAliases option is passed.
Empty schemaNS and empty propName - All external properties in all schema are removed. Internal properties are also removed if the kXMPUI_DoAllProperties option is passed. Aliases are implicitly handled because the associated actuals are.
It is an error to pass and empty schemaNS and non-empty propName.

xmpObj	The XMP object containing the properties to be removed.
schemaNS	Optional schema namespace URI for the properties to be removed.
propName	Optional path expression for the property to be removed.
options	Option flags to control the deletion. The defined flags are: kXMPUI_DoAllProperties - Do internal properties in addition to external properties. kXMPUI_IncludeAliases - Include aliases in the "named schema" case above.

230.6.66 SeparateArrayItems(schemaNS as string, arrayName as string, options as Integer, catedStr as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Separate a single edit string into an array of strings.
Notes: Parameters:

230.6.67 SerializeToBuffer(options as Integer, padding as Integer, newline as string, indent as string="", baseIndent as Integer=0) as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SerializeToBuffer serializes an XMP object into a string as RDF.
Notes: Returns the serialized RDF.

xmpObj	The XMP object containing the array to be updated.
schemaNS	The schema namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not an empty string. Each item in the array must be a simple string value.
options	Option flags to control the separation.
catedStr	The string to be separated into the array items.

Parameters:

options	Option flags to control the serialization.
padding	The amount of padding to be added if a writeable XML packet is created. If zero is passed (the default) an appropriate amount of padding is computed.
newline	The string to be used as a line terminator. If empty it defaults to linefeed, U+000A, the standard XML newline.
indent	The string to be used for each level of indentation in the serialized RDF. If empty it defaults to two ASCII spaces, U+0020.
baseIndent	The number of levels of indentation to be used for the outermost XML element in the serialized RDF. This is convenient when embedding the RDF in other text.

The available option flags are:

kXMP_OmitPacketWrapper	= &h10	Do not include an XML packet wrapper.
kXMP_ReadOnlyPacket	= &h20	Create a read-only XML packet wapper.
kXMP_UseCompactFormat	= &h40	Use a highly compact RDF syntax and layout.
kXMP_WriteAliasComments	= &h400	Include XML comments for aliases.
kXMP_IncludeThumbnailPad	= &h100	Include typical space for a JPEG thumbnail in the padding if no xmp:Thumbnails property is present.
kXMP_ExactPacketLength	= &h200	The padding parameter provides the overall packet length. The actual amount of padding is computed. An exception is thrown if the packet exceeds this length with no padding.

The specified options must be logically consistent, an exception is thrown if not. You cannot specify both kXMP_OmitPacketWrapper along with kXMP_ReadOnlyPacket, kXMP_IncludeThumbnailPad, or kXMP_ExactPacketLength.
In addition, one of the following encoding options may be included:

See also:

kXMP_EncodeUTF8	= 0	Encode as UTF-8, the default.
kXMP_EncodeUTF16Big	= 2	Encode as big-endian UTF-16.
kXMP_EncodeUTF16Little	= 3	Encode as little-endian UTF-16.
kXMP_EncodeUTF32Big	= 4	Encode as big-endian UTF-32.
kXMP_EncodeUTF32Little	= 5	Encode as little-endian UTF-32.

- 230.6.68 SerializeToBuffer(options as Integer=0, padding as Integer=0) as string 25759

230.6.68 SerializeToBuffer(options as Integer=0, padding as Integer=0) as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SerializeToBuffer serializes an XMP object into a string as RDF.
Example:

```
Var x as new XMPMetaMBS
Var registeredPrefix as string

call x.RegisterNamespace ("xwnv", "xwnv", registeredPrefix)

x.SetProperty "xwnv","MZSTID","test"

MessageBox x.SerializeToBuffer
```

Notes: Same as other SerializeToBuffer method, but with newline="", indent=0 and baseIndent=0.
See also:

- 230.6.67 SerializeToBuffer(options as Integer, padding as Integer, newline as string, indent as string="", baseIndent as Integer=0) as string 25757

230.6.69 SetArrayItem(schemaNS as string, arrayName as string, itemIndex as Integer, itemValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetArrayItem provides access to items within an array.
Notes: The index is passed as an integer, you need not worry about the path string syntax for array items, convert a loop index to a string, etc. The array passed to SetArrayItem must already exist. See also AppendArrayItem.

In normal usage the selected array item is modified. A new item is automatically appended if the index is the array size plus 1. A new item may be inserted before or after any item by using one of the following option flags:

kXMP_InsertBeforeItem	= &h4000	Insert a new array item before the selected one.
kXMP_InsertAfterItem	= &h8000	Insert a new array item after the selected one.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem always refers to the last existing array item.
itemValue	An UTF-8 string that is the value of the array item, if the array item has a value. Has the same usage as propValue in GetProperty.
options	Option flags describing the item. See the earlier description.

230.6.70 SetLocalizedText(schemaNS as string, altTextName as string, genericLang as string, specificLang as string, itemValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetLocalizedText modifies the value of a selected item in an alt-text array.
Notes: Creates an appropriate array item if necessary, and handles special cases for the x-default item.

If the selected item is from a match with the specific language, the value of that item is modified. If the existing value of that item matches the existing value of the x-default item, the x-default item is also modified. If the array only has 1 existing item (which is not x-default), an x-default item is added with the given value.
If the selected item is from a match with the generic language and there are no other generic matches, the value of that item is modified. If the existing value of that item matches the existing value of the x-default item, the x-default item is also modified. If the array only has 1 existing item (which is not x-default), an x-default item is added with the given value.
If the selected item is from a partial match with the generic language and there are other partial matches, a new item is created for the specific language. The x-default item is not modified.
If the selected item is from the last 2 rules then a new item is created for the specific language. If the array only had an x-default item, the x-default item is also modified. If the array was empty, items are created for the specific language and x-default.

Parameters:

schemaNS	The namespace URI for the alt-text array. Has the same usage as in GetProperty.
altTextName	The name of the alt-text array. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
genericLang	The name of the generic language as an RFC 3066 primary subtag.
specificLang	The name of the specific language as an RFC 3066 tag. Must not be an empty string.
itemValue	An UTF-8 string that is the new value for the appropriate array item.
options	Option flags, none are defined at present.

230.6.71 SetProperty(schemaNS as string, propName as string, propValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetProperty is the simplest property setter, mainly for top level simple properties or after using the path composition functions.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	An UTF-8 string that is the value of the property, if the property has a value. Arrays and non-leaf levels of structs do not have values.
options	Option flags describing the property.

230.6.72 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyBoolean sets the value of a Boolean property from a boolean.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The bool value to be assigned to the property.
options	An integer variable that is assigned option flags describing the property.

See also:

- 230.6.73 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean, options as Integer) 25762

230.6.73 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean, options as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyBoolean sets the value of a Boolean property from a boolean.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The bool value to be assigned to the property.
options	An integer variable that is assigned option flags describing the property.

See also:

- 230.6.72 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean) 25761

230.6.74 SetPropertyDate(schemaNS as string, propName as string, propValue as XMPDateTimeMBS, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyDate sets the value of a date/time property from an XMPDateTimeMBS object.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The XMPDateTimeMBS object to be assigned to the property.
options	Option flags describing the property.

230.6.75 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyFloat sets the value of a floating point property from a double.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The double float value to be assigned to the property.
options	Option flags describing the property.

See also:

- 230.6.76 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double, options as Integer) 25763

230.6.76 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double, options as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyFloat sets the value of a floating point property from a double.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The double float value to be assigned to the property.
options	Option flags describing the property.

See also:

- 230.6.75 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double) 25762

230.6.77 SetPropertyInt64Double(schemaNS as string, propName as string, propValue as Double, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyInt64Double sets the value of a 64 bit integer property from a double.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The double value to be assigned to the property.
options	Option flags describing the property.

230.6.78 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyInteger sets the value of an integer property from an integer.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The long integer value to be assigned to the property.
options	Option flags describing the property.

See also:

- 230.6.79 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer, options as Integer) 25764

230.6.79 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer, options as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyInteger sets the value of an integer property from an integer.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The long integer value to be assigned to the property.
options	Option flags describing the property.

See also:

- 230.6.78 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer) 25764

230.6.80 SetPropertyInteger64(schemaNS as string, propName as string, propValue as Int64, options as Integer=0)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the value of an integer property using an Int64.
Notes: Sets a property with a binary value, creating it if necessary.

schemaNS: The namespace URI; see GetProperty().
propName: The name of the property. Can be a general path expression, must not be "" or the empty string; see GetProperty() for namespace prefix usage.
propValue: The new binary value.
options: Option flags describing the property; a logical OR of allowed bit-flag constants; see kPropValueIsStruct and following. Must match the type of a property that already exists.

230.6.81 SetQualifier(schemaNS as string, propName as string, qualNS as string, qualName as string, qualValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetQualifier provides access to a qualifier attached to a property.
Notes: The namespace for the qualifier is passed as a URI, you need not worry about the path string syntax. In many regards qualifiers are like struct fields. See the introductory discussion of qualified properties for more information.

The names of qualifiers should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix, which is unreliable because the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. Has the same usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be an empty string. Has the same namespace prefix usage as the propName parameter.
qualValue	An UTF-8 string that is the value of the qualifier, if the qualifier has a value. Has the same usage as propValue in GetProperty.
options	Option flags describing the qualifier.

230.6.82 SetStructField(schemaNS as string, structName as string, fieldNS as string, fieldName as string, fieldValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetStructField provides access to fields within a nested structure.
Notes: The namespace for the field is passed as a URI, you need not worry about the path string syntax.

The names of fields should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix, which is unreliable because the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be null or the empty string. Has the same namespace prefix usage as the structName parameter.
fieldValue	An UTF-8 string that is the value of the field, if the field has a value. Has the same usage as propValue in GetProperty.
options	Option flags describing the field.

230.6.83 Sort

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sorts the data model tree of an XMP object.
Notes: Use this function to sort the data model of an XMP object into a canonical order. This can be convenient when comparing data models, (e.g. by text comparison of DumpObject output).

At the top level the namespaces are sorted by their prefixes. Within a namespace, the top level properties are sorted by name. Within a struct, the fields are sorted by their qualified name, i.e. their XML prefix:local form. Unordered arrays of simple items are sorted by value. Language Alternative arrays are sorted by the xml:lang qualifiers, with the "x-default" item placed first.

230.6.84 Properties

230.6.85 GlobalOptions as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets or retrieves the set of global option flags.
Notes: (Read and Write computed property)

230.6.86 Name as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The object name.
Notes: (Read and Write computed property)

230.6.87 Constants

Constants

Constant	Value	Description
kAllowCommas	&h10000000	One of the optic Used by Catena

230.7 class XMPPacketInfoMBS

230.7.1 class XMPPacketInfoMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for information about a xmp packet.
Blog Entries

- Tip of the day: Change EXIF metadata

230.7.2 Properties

230.7.3 CharForm as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Character format using the values kChar8Bit, kChar16BitBig, etc.
Notes: (Read and Write property)

230.7.4 HasWrapper as Boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if there is a packet wrapper, the "<?xpacket...>" XML processing instructions.
Notes: (Read and Write property)

230.7.5 Length as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packet length in the file in bytes, -1 if unknown.
Notes: (Read and Write property)

230.7.6 Offset as Int64

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packet offset in the file in bytes, -1 if unknown.
Notes: (Read and Write property)

230.7.7 PadSize as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packet padding size in bytes, zero if unknown.
Notes: (Read and Write property)

230.7.8 Writeable as Boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if there is a packet wrapper and the trailer says writeable by dumb packet scanners.
Notes: (Read and Write property)

230.8 class XMPScannerMBS

230.8.1 class XMPScannerMBS

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to scan any file stream for XMP data.
Example:

```
Var c,n,i,l as Integer
Var xs as XMPScannerMBS
Var xn as XMPSnipMBS
Var s as string
Var x as XMPMetaMBS
Var b as BinaryStream
Var source as FolderItem

// get file
source=FolderItem.ShowOpenFileDialog("any")
if source=nil then Return

b=source.OpenAsBinaryFile(false)

if b=nil then Return

// read file to memory
l=b.Length
s=b.Read(l)

// scan for xmp blocks
MessageBox "Scanning "+str(lenb(s))+" of "+str(l)+" bytes."

xs=new XMPScannerMBS(l)
xs.Scan(s,0)

MessageBox "Found "+str(xs.Report)+" blocks"

n=xs.Report-1

c=0
for i=0 to n

xn=xs.Snip(i)

if xn.State=3 then // found
if xn.Length>50 then
try
b.Position=xn.Offset
```

```
s=b.Read(xn.Length)

// debug output xmp data
'WriteInputXMP dest,s

// try to parse
x=new XMPMetaMBS(s)

// work with xmp meta data
catch r as XMPExceptionMBS
MessageBox "ExtractXMP failed on: "+r.message
end try
else
MessageBox "Found small xmp block? "+str(xn.Length)
end if
end if
next
```

230.8.2 Methods

230.8.3 Constructor

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor doing nothing.
See also:

- 230.8.4 Constructor(StreamLength as Integer) 25772

230.8.4 Constructor(StreamLength as Integer)

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Constructor to create a XMPScanner which reads the given number of bytes.
See also:

- 230.8.3 Constructor 25772

230.8.5 Report as Integer

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Produces a report of what is known about the input stream.
Notes: The snipps found are saved in an array which you can access using the snip() function. Returns the

number of entries in this array.

230.8.6 Scan(Buffer as string, Offset as Int64)

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scans the given part of the input, incorporating it in to the known snips.
Notes: The Offset is the offset of this block of input relative to the entire stream.

230.8.7 Snip(index as UInt32) as XMPSnipMBS

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the snip with the given index.
Notes: index is zero based.
Returns nil on any error.
You must call Report before this method.

230.8.8 SnipCount as UInt32

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of snips found so far.

230.8.9 StreamAllScanned as boolean

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if all of the stream has been seen.

230.9 class XMPSnipMBS

230.9.1 class XMPSnipMBS

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for the XMP Snips found by the XMPScannerMBS class.

230.9.2 Properties

230.9.3 Access as Integer

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The read-only/read-write access from the end attribute.
Notes: (Read and Write property)

230.9.4 BytesAttr as Int64

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the bytes attribute, -1 if not present.
Notes: (Read only property)

230.9.5 CharForm as Integer

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: How the packet is divided into characters.
Notes: The values allow easy testing for 16/32 bit and big/little endian.

eChar8Bit	= 0
eChar16BitBig	= 2
eChar16BitLittle	= 3
eChar32BitBig	= 4
eChar32BitLittle	= 5

(Read and Write property)

230.9.6 EncodingAttr as String

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the encoding attribute, if any, with nulls removed.
Notes: (Read and Write property)

230.9.7 Length as Int64

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The length in bytes of this snip.
Notes: (Read only property)

230.9.8 Offset as Int64

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The byte offset of this snip within the input stream.
Notes: (Read only property)

230.9.9 OutOfOrder as Integer

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: If true, this snip was seen before the one in front of it.
Notes: (Read and Write property)

230.9.10 State as Integer

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The state of this snip.
Notes: constants:

(Read and Write property)

eNotSeenSnip	0	This snip has not been seen yet.
ePendingSnip	1	This snip is an input buffer being processed.
eRawInputSnip	2	This snip is raw input, it doesn't contain any part of an XMP packet.
eValidPacketSnip	3	This snip is a complete, valid XMP packet.
ePartialPacketSnip	4	This snip contains the start of a possible XMP packet.
eBadPacketSnip	5	This snip contains a complete, but semantically incorrect XMP packet.

230.10 class XMPTextOutputMBS

230.10.1 class XMPTextOutputMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: An event class for text output.
Notes: You may want to make a subclass which collects all the strings into one string or write them to a file.

230.10.2 Events

230.10.3 Output(text as string) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: New text arrived.
Notes: You may get more than one event per line.
Return 0 for success or something else for failure.

230.11 class XMPVersionInfoMBS

230.11.1 class XMPVersionInfoMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The XMP Version class.
Example:

```
Var v as XMPVersionInfoMBS
v=XMPMetaMBS.GetVersionInfo
MessageBox v.Message
```

Notes: Constructor sets values.

230.11.2 Properties

230.11.3 Build as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A rolling build number, monotonically increasing in a release.
Notes: (Read and Write property)

230.11.4 Flags as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Individual feature implementation flags.
Notes: (Read and Write property)

230.11.5 IsDebug as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if this is a debug build.
Notes: (Read and Write property)

230.11.6 Major as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The primary release number, the "1" in version "1.2.3".
Notes: (Read and Write property)

230.11.7 Message as String

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A comprehensive version information string.
Example:

```
Var v as XMPVersionInfoMBS
v=XMPMetaMBS.GetVersionInfo
MessageBox v.Message
```

Notes: (Read and Write property)

230.11.8 Micro as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tertiary release number, the "3" in version "1.2.3".
Notes: (Read and Write property)

230.11.9 Minor as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The secondary release number, the "2" in version "1.2.3".
Notes: (Read and Write property)

Chapter 231

XojoRuntime

231.1 Globals

231.1.1 AllObjectsOfClassMBS(ClassName as String) as Variant()

MBS Util Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Find all objects with given class using IsA operator.
Example:

```
Var AllWindows() As Variant = AllObjectsOfClassMBS("Window")
Var AllMenuItems() As Variant = AllObjectsOfClassMBS("MenuItem")
Var AllDictionary() As Variant = AllObjectsOfClassMBS("Dictionary")

Break
```

Notes: Similar to using Runtime.IterateObjects directly, loop over all objects and do a check with ISA operator on each one. The plugin is a bit more efficient doing this and returns matching items as array of variant.

Raises exception if class name is empty or not a known class to the Xojo runtime.
Blog Entries

- MBS Xojo Plugins, version 21.1pr4

231.1.2 ArrayDoubleMBS(paramArray values as Double) as Double()

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array with given values.
Example:

```
// works
Var a() As Double = ArrayDoubleMBS(1, 2, 3)

// failes
Var b() As Double = Array(1,2,3)
```

Notes: With picking the right array function (ArrayDoubleMBS, ArrayStringMBS, ArrayInt64MBS, ArrayVariantMBS or ArrayIntegerMBS), you define what type of array you like. The Array function determinates the type based on value types, so it often isn't what we want.

Pass as many parameters as needed, just like Array() function.

231.1.3 ArrayInt64MBS(paramArray values as Int64) as Int64()

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array with given values.
Example:

```
// works
Var a() As Int64 = ArrayInt64MBS(1, 2, 3.0)

// failes
Var b() As Int64 = Array(1,2,3.0)
```

Notes: With picking the right array function (ArrayDoubleMBS, ArrayStringMBS, ArrayInt64MBS, ArrayVariantMBS or ArrayIntegerMBS), you define what type of array you like. The Array function determinates the type based on value types, so it often isn't what we want.

Pass as many parameters as needed, just like Array() function.

231.1.4 ArrayIntegerMBS(paramArray values as Integer) as Integer()

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array with given values.
Example:

```
// works
Var a() As Integer = ArrayIntegerMBS(1, 2, 3.0)

// failes
Var b() As Integer = Array(1,2,3.0)
```

Notes: With picking the right array function (ArrayDoubleMBS, ArrayStringMBS, ArrayInt64MBS, ArrayVariantMBS or ArrayIntegerMBS), you define what type of array you like. The Array function determinates the type based on value types, so it often isn't what we want.

Pass as many parameters as needed, just like Array() function.

231.1.5 ArrayIsAMBS(v as Variant, ClassName as string) as boolean

MBS Util Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if variant contains an array of the given class type.
Example:

```
Var w() as MouseCursor
w.Add System.Cursors.ArrowEastWest
w.Add System.Cursors.ArrowNorthSouth

Var v as Variant = w

if ArrayIsAMBS(w, "MouseCursor") then
MessageBox "OK"
end if
```

Notes: If the variant contains an array of some class, variant or object and has at least one value, the plugin checks this first value for being of type of the same class. Like an ISA check.
This helps to solve feedback case 12213.
Returns false if variant has no array, if variant is nil, if array is not an array of objects or if first object is nil.

231.1.6 ArrayStringMBS(paramArray values as String) as String()

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array with given values.
Example:

```
Var a() As String = ArrayStringMBS("Hello", "World")
```

Notes: With picking the right array function (ArrayDoubleMBS, ArrayStringMBS, ArrayInt64MBS, ArrayVariantMBS or ArrayIntegerMBS), you define what type of array you like. The Array function determinates the type based on value types, so it often isn't what we want.

Pass as many parameters as needed, just like Array() function.

231.1.7 ArrayVariantMBS(paramArray values as Variant) as Variant()

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array with given values.
Example:

```
Var a() As Variant = ArrayVariantMBS(1, 2, 3.0, True, False)
```

Notes: With picking the right array function (ArrayDoubleMBS, ArrayStringMBS, ArrayInt64MBS, ArrayVariantMBS or ArrayIntegerMBS), you define what type of array you like. The Array function determinates the type based on value types, so it often isn't what we want.

Pass as many parameters as needed, just like Array() function.

231.1.8 GetArrayAllocatedSizeMBS(v as variant) as integer

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries allocated array size in bytes.
Example:

```
Var a() As Integer // 8 byte per integer in 64-bit

System.DebugLog "allocated: "+Str(GetArrayAllocatedSizeMBS(a))

Redim a(9) // changes to 80 bytes

System.DebugLog "allocated: "+Str(GetArrayAllocatedSizeMBS(a))

Redim a(19) // changes to 160 bytes

System.DebugLog "allocated: "+Str(GetArrayAllocatedSizeMBS(a))

a.Add 123

System.DebugLog "allocated: "+Str(GetArrayAllocatedSizeMBS(a))
// shows 288, adds space for 16 more values
```

Notes: This function uses internal knowledge of the array layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

Stopped working on Windows in recent Xojo versions, so we deprecated it.

231.1.9 GetArrayDataPointerMBS(v as variant) as Ptr

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries base pointer for the array data.
Notes: The pointer changes when append/insert/redim allocates new memory block.

This function uses internal knowledge of the array layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

231.1.10 GetAutoMemoryAddressMBS(o as auto) as integer

MBS Util Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Queries memory address of auto object.
Example:

```
Var t As Auto = "Hello World"
Var o As Auto = "Hello "

o = o + "World"

Var s As Auto = t

Var ta As Integer = GetAutoMemoryAddressMBS(t)
Var oa As Integer = GetAutoMemoryAddressMBS(o)
Var sa As Integer = GetAutoMemoryAddressMBS(s)

// s and t show same address, but o is different
MessageBox Hex(ta)+EndOfLine+Hex(oa)+EndOfLine+Hex(sa)

// and s and t show address in const segment in the app, while o is dynamically allocated and has an heap address
```

Notes: Allows you to compare if two variables refer same object.

231.1.11 GetDelegateParametersMBS(del as variant) as String

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries parameter signature of a delegate.
Example:

```
Var aDelegate As ADelegate
aDelegate = AddressOf someFunction

Var p As String = GetDelegateParametersMBS(aDelegate)
MessageBox p
```

Notes: This function uses internal knowledge of the delegate layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.
Blog Entries

231.1.12 GetDelegateTargetMBS(del as variant) as Variant

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries target object of a delegate.
Example:

```
Var aDelegate As ADelegate
aDelegate = AddressOf someFunction

Var target As Variant = GetDelegateTargetMBS(aDelegate)
MessageBox "target: "+Introspection.GetType(target).fullname
```

Notes: This function uses internal knowledge of the delegate layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

231.1.13 GetDelegateWeakMBS(del as variant) as Boolean

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries weak flag of a delegate.
Example:

```
Var aDelegate As ADelegate
aDelegate = AddressOf someFunction

Var weak As Boolean = GetDelegateWeakMBS(aDelegate)
MessageBox "weak: "+Str(weak)
```

Notes: This function uses internal knowledge of the delegate layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.
Blog Entries

231.1.14 GetObjectMemoryAddressMBS(o as object) as integer

MBS Util Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries memory address of object.
Example:

```
Var a As Integer = GetObjectMemoryAddressMBS(app)

// show address
MessageBox Hex(a)
```

Notes: Allows you to compare if two variables refer same object.
Blog Entries

- MBS Real Studio Plugins, version 11.2pr8

231.1.15 GetObjectReferenceCountMBS(o as object) as integer

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries object reference count.
Example:

```
Var o As Object = Window1

System.DebugLog "Reference count: "+Str(GetObjectReferenceCountMBS(o))

Var k as Object = o

System.DebugLog "Reference count: "+Str(GetObjectReferenceCountMBS(o))

Var v as Variant = o

System.DebugLog "Reference count: "+Str(GetObjectReferenceCountMBS(o))

v = Nil
k = nil

System.DebugLog "Reference count: "+Str(GetObjectReferenceCountMBS(o))
```

Notes: This function uses internal knowledge of the object layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

231.1.16 GetStringMemoryAddressMBS(s as string) as integer

MBS Util Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries memory address of string.
Example:

```
Var t As String = "Hello World"
Var o As String = "Hello "

o = o + "World"

Var s As String = t

Var ta As Integer = GetStringMemoryAddressMBS(t)
Var oa As Integer = GetStringMemoryAddressMBS(o)
Var sa As Integer = GetStringMemoryAddressMBS(s)

// s and t show same address, but o is different
```

```
MessageBox Hex(ta)+EndOfLine+Hex(oa)+EndOfLine+Hex(sa)

// and s and t show address in const segment in the app, while o is dynamically allocated and has an heap address
```

Notes: Allows you to compare if two variables refer same string.
Blog Entries

- MBS Real Studio Plugins, version 11.2pr8

231.1.17 GetStringReferenceCountMBS(s as string) as integer

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries string reference count.
Example:

```
Var a As String = "World"
Var s As String = "Hello "+a // use + to make new string

System.DebugLog "Reference count: "+Str(GetStringReferenceCountMBS(s))

Var k As String = s

System.DebugLog "Reference count: "+Str(GetStringReferenceCountMBS(s))

Var v As Variant = s

System.DebugLog "Reference count: "+Str(GetStringReferenceCountMBS(s))

v = ""
k = ""

System.DebugLog "Reference count: "+Str(GetStringReferenceCountMBS(s))
```

Notes: This function uses internal knowledge of the string layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

231.1.18 GetTextMemoryAddressMBS(s as text) as integer

MBS Util Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Queries memory address of text object.

Example:

```
Var t As Text = "Hello World"
Var n As Integer = GetTextMemoryAddressMBS(t)
MessageBox Hex(n)
```

Notes: Allows you to compare if two variables refer same text.

231.1.19 GetVariantArrayMBS(VariantContainingArray as Variant) as Variant()

MBS Util Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a variant containing array for an array and returns it as an array of variant.
Example:

```
Var test() as Dictionary
test.Add new Dictionary

// this fails
Var vv As Variant = test
Var t() As Variant = vv

// this works!
Var v() as Variant = GetVariantArrayMBS(test)
Var dic as Dictionary = v(0)
Break
```

Notes: Works with all arrays of objects (any type).
Raises exception if the array can't be converted or the variant contains no array.

231.1.20 GetVariantArrayUboundMBS(v as Variant) as Integer

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries array ubound for an array inside a variant.
Notes: If you have an array in the variant, you'd normally assign it to an array to query values from array. This function queries ubound directly.
Returns -3 if variant is nil and -2 if variant contains not an object array.
Updated in 13.5 plugins to raise exception is array is nil.
Blog Entries

- Arrays in Xojo
- Useful array and variant functions
- Variant Helper functions in MBS Xojo Plugins
- MBS Xojo / Real Studio Plugins, version 13.5pr8
- MBS Real Studio Plugins, version 13.0pr8

231.1.21 GetVariantArrayValueMBS(v as Variant, index as Integer) as Variant

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a variant from an array inside a variant.
Example:

```
// some part of app builds an array
Var a() as pair
a.Add 1:"Hello"
a.Add 2:"World"

// passes it as Variant somewhere else

Var v as Variant = a

// and later you may want to get values back without knowing the array type

// this raises TypeMismatchException
'dim o() as Object = v

// so use plugin to get objects:
Var v1 as Variant = GetVariantArrayValueMBS(v, 0)
Var v2 as Variant = GetVariantArrayValueMBS(v, 1)

// now you can check type and cast to the object type
Var p1 as pair = v1
Var p2 as pair = v2
```

MessageBox p1.Right+" "+p2.Right

Notes: This function is to allow getting objects from an array inside a variant without known the class used to declare array.
Returns nil on any error.

Updated in 13.5 plugins to raise exception is array is nil.

Also updated in v13.5 to work with object, variant, string, date, integer, double, single, boolean, Int64 arrays. Other array types will raise exception.
Blog Entries

231.1.22 GetVariantAsDictionaryArrayMBS(v as variant) as Dictionary()

MBS Util Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Casts a variant to a dictionary array.
Example:

```
Var d As New Dictionary
Var v() As Variant
v.Add d
v.Add Nil

Var va as Variant = v
'Dim dic() As Dictionary = va // type mismatch exception
Var dic() As Dictionary = GetVariantAsDictionaryArrayMBS(va) // works

Break
```

Notes: Raises exception if variant does not have an object/variant array.
If it contains a non-dictionary object, we raise an exception.
Blog Entries

- MBS Xojo Plugins, version 20.4pr7

231.1.23 GetVariantTypeMBS(va as variant) as Integer

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries variant type.
Example:

```
Var i As Int32 = 5
Var u As UInt32 = 5
Var vi As Variant = i
Var vu As Variant = u
Var ti As Integer = vi.Type // 2
Var tu As Integer = vu.Type // 2
Var mi As Integer = GetVariantTypeMBS(vi) // 2
Var mu As Integer = GetVariantTypeMBS(vu) // 102

Break // check in debugger
```

Notes: Same as variant.type or VarType() function, but returns 102 for UInt32 and 103 for UInt64.
This way plugin functions internally can distinguish between variants with unsigned vs. signed data types.

231.1.24 ObjectIsAMBS(o as object, ClassName as string) as boolean

MBS Util Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if a given object is of a given class.
Example:

```
// you must know exact name of class

Var v as Variant = Window1

if ObjectIsAMBS(v, "window1.window1") then
MessageBox "OK"
end if

v = System.Cursors.MagnifyLarger

if ObjectIsAMBS(v, "MouseCursor") then
MessageBox "OK"
end if
```

Notes: Like ISA operator, but with class name as string.
Returns false if o is nil.
Blog Entries

- Useful array and variant functions
- MBS Real Studio Plugins, version 12.3pr11

231.1.25 SetVariantArrayValueMBS(v as Variant, index as Integer, value as Variant)

MBS Util Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an object from an array of objects inside a variant.
Example:

```
// some part of app builds an array
Var a() as pair

// passes it as Variant somewhere else

Var v as Variant = a

// and later you may want to put values in array without knowing object type for array

// this raises TypeMismatchException
'dim o() as Object = v
```

```
// so use plugin

SetVariantArrayValueMBS(v, 0, 1:"Hello")
SetVariantArrayValueMBS(v, 1, 2:"World")

MessageBox a(0).Right+" "+a(1).Right
```

Notes: This function is to allow setting objects in an array inside a variant without known the class used to declare array.
Also updated to work with object, variant, string, date, integer, double, single, boolean, Int64 arrays. Other array types will raise exception.
Be sure to only put objects of right class in the array! Else you risk crashes.

If index is 1 bigger than ubound, we append an element.

231.1.26 GetEncodingOfStringMBS(s as string) as UInt32

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the internal value for the encoding.
Example:

```
Var s as string = "Hello"

MessageBox hex(GetEncodingOfStringMBS(s)) // shows 8000100 for UTF8
```

Notes: Only useful on Xojo 4.5 and newer.
Some example values for encoding:

Renamed from GetStringEncoding to GetEncodingOfString in MBS Plugin 3.1.
Xojo Developer Magazine

- 2.4, page 43: Cross platform streams, We write our own binary stream to save our data by Christian Schmitz

MacRoman	0	Also for ASCII or binary data used.
WindowsLatin1	&h0500	ANSI codepage 1252
ISOLatin1	&h0201	ISO 8859-1
NextStepLatin	&h0B01	NextStep encoding
Unicode	&h0100	16 bit Unicode
UTF8	&h08000100	8 bit Unicode
Invalid	&hFFFFFFFF	(Binary)
Invalid	&hFFFF	(Binary)

231.1.27 SetEncodingOfStringMBS(s as string, encoding as UInt32)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the internal value for the encoding of this string.
Example:

```
Var s as string = "√§√√º"
Var t as string = ConvertEncoding(s, encodings.UTF16)
Var m as MemoryBlock = t // memoryblock has bytes from UTF16 string without knowning the encoding
Var u as string = m // convert back to a string without encoding

MessageBox u // shows wrong characters
SetEncodingOfStringMBS u, 256 // set to UTF-16
MessageBox u
```

Notes: Only useful on Xojo 4.5 and newer.
Some example values for encoding:

MacRoman	0	Also for ASCII or binary data used.
WindowsLatin1	&h0500	ANSI codepage 1252
ISOLatin1	&h0201	ISO 8859-1
NextStepLatin	&h0B01	NextStep encoding
Unicode	&h0100	16 bit Unicode
UTF8	&h08000100	8 bit Unicode
Invalid	&hFFFFFFFF	(Binary)
Invalid	&hFFFF	(Binary)

Renamed from SetStringEncoding to SetEncodingOfString in MBS Plugin 3.1.
Xojo Developer Magazine

- 2.4, page 43: Cross platform streams, We write our own binary stream to save our data by Christian Schmitz

231.1.28 GetArrayDimensionMBS(v as variant) as integer

MBS Util Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries number of dimensions in an array.
Example:

```
Var test3(7,7,7) As Integer

Var t As Integer = GetArrayDimensionMBS(test3)
MessageBox Str(t)+" dimensions" // shows 3
```

Blog Entries

231.2 class MemoryStatisticsMBS

231.2.1 class MemoryStatisticsMBS

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Class for Malloc memory statistics.
Example:

```
// show memory usage of the application
Var stats As MemoryStatisticsMBS = MemoryStatisticsMBS.MemoryStatistics

MessageBox "Used: " + Format(stats.BytesUsed / 1024 / 1024, "0.0") + " MB" + EndOfLine + _
"Free: " + Format(stats.BytesFree / 1024 / 1024, "0.0") + " MB" + EndOfLine + _
"Total: " + Format(stats.BytesTotal / 1024 / 1024, "0.0") + " MB"
```

231.2.2 Methods

231.2.3 Compact

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Compacts memory.
Notes: Asks malloc to free empty pages to the OS.

231.2.4 Constructor

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: The constructor.
Notes: Initializes the properties.

231.2.5 MemoryStatistics as MemoryStatisticsMBS

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Queries statistics for malloc.

231.2.6 Properties

231.2.7 BytesFree as Integer

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Number of bytes free.
Notes: Memory used for objects, but now available for reuse with new objects.
And can't be freed usually as several objects share same memory page, so we keep the page.
(Read only property)

231.2.8 BytesTotal as Integer

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Total bytes allocated currently from OS.
Notes: Free and used blocks.
(Read only property)

231.2.9 BytesUsed as Integer

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Used bytes of memory.
Notes: Within total memory, the number of bytes currently in use.
This is what Xojo reports for Runtime.MemoryUsed.
(Read only property)

231.2.10 ChunksFree as Integer

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Number of free chunks.
Notes: Could be freed.
(Read only property)

231.2.11 ChunksUsed as Integer

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Number of chunks in use.
Notes: Not available on Linux.
(Read only property)

Chapter 232

List of Questions in the FAQ

- 233.0.1 Can anyone help me convert seconds to time in this format hh:mm:ss? 25811
- 233.0.2 Do you have plugins for Android? 25812
- 233.0.3 How do I get the proper highlight color on Mac OS X for active/inactive selection? 25812
- 233.0.4 How to catch delete key? 25813
- 233.0.5 How to convert cmyk to rgb? 25814
- 233.0.6 How to delete a folder? 25815
- 233.0.7 How to detect if CPU if 64bit processor? 25816
- 233.0.8 How to query variant type string for a variant? 25817
- 233.0.9 How to refresh a htmlviewer on Windows? 25818
- 233.0.10 Is there an example for vector graphics in Xojo? 25819
- 233.0.11 Picture functions do not preserve resolution values? 25820
- 233.0.12 A toolbox call needs a rect - how do I give it one? 25820
- 233.0.13 API client not supported? 25820
- 233.0.14 Can I access Microsoft Access Database with Java classes? 25821
- 233.0.15 Can I create PDF from Xojo Report using DynaPDF? 25822
- 233.0.16 Can I use AppleScripts in a web application? 25822
- 233.0.17 Can I use graphics class with DynaPDF? 25822
- 233.0.18 Can I use sockets on a web application? 25823
- 233.0.19 Can I use your ChartDirector plugin on a web application? 25823

- 233.0.20 Can I use your DynaPDF plugin on a web application? 25824
- 233.0.21 Can I use your plugin controls on a web application? 25825
- 233.0.22 Can you get an unique machine ID? 25825
- 233.0.23 ChartDirector: Alignment Specification 25825
- 233.0.24 ChartDirector: Color Specification 25826
- 233.0.25 ChartDirector: Font Specification 25830
- 233.0.26 ChartDirector: Mark Up Language 25833
- 233.0.27 ChartDirector: Parameter Substitution and Formatting 25835
- 233.0.28 ChartDirector: Shape Specification 25839
- 233.0.29 Copy styled text? 25840
- 233.0.30 Do you have code to validate a credit card number? 25841
- 233.0.31 Do you have plugins for X-Rite EyeOne, eXact or i1Pro? 25842
- 233.0.32 Does SQL Plugin handle stored procedures with multiple result sets? 25842
- 233.0.33 Does the plugin home home? 25842
- 233.0.34 folderitem.absolutepath is limited to 255 chars. How can I get longer ones? 25843
- 233.0.35 Has anyone played round with using CoreImage to do things like add dissolve transitions say when changing from one tab to another within a window? 25843
- 233.0.36 How can I detect whether an Intel CPU is a 64bit CPU? 25844
- 233.0.37 How can I disable the close box of a window on Windows? 25845
- 233.0.38 How can I get all the environment variables from Windows? 25846
- 233.0.39 How can i get similar behavior to Roxio Toast or iTunes where clicking a 'burn' button allows the next inserted blank CD-R to bypass the Finder and be accepted by my application? 25846
- 233.0.40 How can I get text from a PDF? 25847
- 233.0.41 How can I get text from a Word Document? 25847
- 233.0.42 How can I get the item string for a given file creator? 25847
- 233.0.43 How can I launch an app using it's creator code? 25848
- 233.0.44 How can I learn what shared libraries are required by a plugin on Linux? 25849
- 233.0.45 How can I validate an email address? 25850
- 233.0.46 How do I decode correctly an email subject? 25851
- 233.0.47 How do I enable/disable a single tab in a tabpanel? 25852

25803

- 233.0.48 How do I find the root volume for a file? 25852
- 233.0.49 How do I get the current languages list? 25853
- 233.0.50 How do I get the Mac OS Version? 25854
- 233.0.51 How do I get the printer name? 25854
- 233.0.52 How do I make a metal window if RB does not allow me this? 25855
- 233.0.53 How do I make a smooth color transition? 25855
- 233.0.54 How do I read the applications in the dock app? 25856
- 233.0.55 How do I truncate a file? 25857
- 233.0.56 How do update a Finder's windows after changing some files? 25858
- 233.0.57 How to access a USB device directly? 25858
- 233.0.58 How to add icon to file on Mac? 25858
- 233.0.59 How to ask the Mac for the Name of the Machine? 25859
- 233.0.60 How to automatically enable retina in my apps? 25859
- 233.0.61 How to avoid leaks with Cocoa functions? 25860
- 233.0.62 How to avoid trouble connecting to oracle database with SQL Plugin? 25860
- 233.0.63 How to avoid ___NSAutoreleaseNoPool console messages in threads? 25861
- 233.0.64 How to bring app to front? 25861
- 233.0.65 How to bring my application to front? 25861
- 233.0.66 How to catch Control-C on Mac or Linux in a console app? 25862
- 233.0.67 How to change name of application menu? 25862
- 233.0.68 How to change the name in the menu bar of my app on Mac OS X? 25863
- 233.0.69 How to check if a folder/directory has subfolders? 25863
- 233.0.70 How to check if Macbook runs on battery or AC power? 25864
- 233.0.71 How to check if Microsoft Outlook is installed? 25865
- 233.0.72 How to check on Mac OS which country or language is currently selected? 25865
- 233.0.73 How to code sign my app with plugins? 25866
- 233.0.74 How to collapse a window? 25867
- 233.0.75 How to compare two pictures? 25867
- 233.0.76 How to compile PHP library? 25869

- 233.0.77 How to convert a BrowserType to a String with WebSession.Browser? 25870
- 233.0.78 How to convert a EngineType to a String with WebSession.Engine? 25871
- 233.0.79 How to convert a PlatformType to a String with WebSession.Platform? 25871
- 233.0.80 How to convert a text to iso-8859-1 using the TextEncoder? 25872
- 233.0.81 How to convert ChartTime back to Xojo date? 25873
- 233.0.82 How to convert line endings in text files? 25873
- 233.0.83 How to convert picture to string and back? 25874
- 233.0.84 How to copy an array? 25875
- 233.0.85 How to copy an dictionary? 25875
- 233.0.86 How to copy parts of a movie to another one? 25875
- 233.0.87 How to create a birthday like calendar event? 25876
- 233.0.88 How to create a GUID? 25877
- 233.0.89 How to create a Mac picture clip file? 25877
- 233.0.90 How to create a PDF file in Xojo? 25878
- 233.0.91 How to create EmailAttachment for PDF Data in memory? 25878
- 233.0.92 How to create PDF for image files? 25879
- 233.0.93 How to CURL Options translate to Plugin Calls? 25880
- 233.0.94 How to delete file with ftp and curl plugin? 25881
- 233.0.95 How to detect display resolution changed? 25881
- 233.0.96 How to detect retina? 25881
- 233.0.97 How to disable force quit? 25882
- 233.0.98 How to disable the error dialogs from Internet Explorer on javascript errors? 25882
- 233.0.99 How to display a PDF file in Xojo? 25882
- 233.0.100 How to do a lottery in RB? 25882
- 233.0.101 How to do an asycron DNS lookup? 25884
- 233.0.102 How to draw a dushed pattern line? 25884
- 233.0.103 How to draw a nice antialiased line? 25885
- 233.0.104 How to dump java class interface? 25886
- 233.0.105 How to duplicate a picture with mask or alpha channel? 25886

25805

- 233.0.106 How to enable assistive devices? 25887
- 233.0.107 How to encrypt a file with Blowfish? 25888
- 233.0.108 How to extract text from HTML? 25888
- 233.0.109 How to find empty folders in a folder? 25889
- 233.0.110 How to find iTunes on a Mac OS X machine fast? 25889
- 233.0.111 How to find network interface for a socket by it's name? 25889
- 233.0.112 How to find version of Microsoft Word? 25891
- 233.0.113 How to fix CURL error 60/53 on connecting to server? 25891
- 233.0.114 How to format double with n digits? 25892
- 233.0.115 How to get a time converted to user time zone in a web app? 25892
- 233.0.116 How to get an handle to the frontmost window on Windows? 25893
- 233.0.117 How to get CFAbsoluteTime from date? 25893
- 233.0.118 How to get client IP address on web app? 25894
- 233.0.119 How to get fonts to load in charts on Linux? 25894
- 233.0.120 How to get fonts to load in DynaPDF on Linux? 25895
- 233.0.121 How to get GMT time and back? 25895
- 233.0.122 How to get good crash reports? 25896
- 233.0.123 How to get list of all threads? 25896
- 233.0.124 How to get parameters from webpage URL in Xojo Web Edition? 25896
- 233.0.125 How to get the color for disabled textcolor? 25897
- 233.0.126 How to get the current free stack space? 25898
- 233.0.127 How to get the current timezone? 25898
- 233.0.128 How to get the current window title? 25900
- 233.0.129 How to get the cursor blink interval time? 25901
- 233.0.130 How to get the list of the current selected files in the Finder? 25901
- 233.0.131 How to get the Mac OS system version? 25902
- 233.0.132 How to get the Mac OS Version using System.Gestalt? 25902
- 233.0.133 How to get the screensize excluding the task bar? 25903
- 233.0.134 How to get the size of the frontmost window on Windows? 25903

- 233.0.135 How to get the source code of a HTMLViewer? 25904
- 233.0.136 How to get Xojo apps running Linux? 25904
- 233.0.137 How to handle really huge images with GraphicsMagick or ImageMagick? 25905
- 233.0.138 How to handle tab key for editable cells in listbox? 25905
- 233.0.139 How to hard link MapKit framework? 25906
- 233.0.140 How to have a PDF downloaded to the user in a web application? 25907
- 233.0.141 How to hide all applications except mine? 25907
- 233.0.142 How to hide script errors in HTMLViewer on Windows? 25908
- 233.0.143 How to hide the grid/background/border in ChartDirector? 25908
- 233.0.144 How to hide the mouse cursor on Mac? 25908
- 233.0.145 How to insert image to NSTextView or TextArea? 25908
- 233.0.146 How to jump to an anchor in a htmlviewer? 25909
- 233.0.147 How to keep a movieplayer unclickable? 25910
- 233.0.148 How to keep my web app from using 100% CPU time? 25910
- 233.0.149 How to kill a process by name? 25910
- 233.0.150 How to know how many CPUs are present? 25911
- 233.0.151 How to know the calling function? 25911
- 233.0.152 How to launch an app using it's creator code? 25912
- 233.0.153 How to launch disc utility? 25912
- 233.0.154 How to list devices with CoreAudio? 25913
- 233.0.155 How to make a lot of changes to a REAL SQL Database faster? 25913
- 233.0.156 How to make a NSImage object for my retina enabled app? 25914
- 233.0.157 How to make a window borderless on Windows? 25914
- 233.0.158 How to make an alias using AppleEvents? 25915
- 233.0.159 How to make AppleScripts much faster? 25916
- 233.0.160 How to make double clicks on a canvas? 25916
- 233.0.161 How to make my Mac not sleeping? 25918
- 233.0.162 How to make my own registration code scheme? 25918
- 233.0.163 How to make small controls on Mac OS X? 25919

25807

- 233.0.164 How to mark my Mac app as background only? 25920
- 233.0.165 How to move a file or folder to trash? 25920
- 233.0.166 How to move an application to the front using the creator code? 25921
- 233.0.167 How to move file with ftp and curl plugin? 25921
- 233.0.168 How to normalize string on Mac? 25922
- 233.0.169 How to obscure the mouse cursor on Mac? 25922
- 233.0.170 How to open icon file on Mac? 25923
- 233.0.171 How to open PDF in acrobat reader? 25923

- 233.0.173 How to open special characters panel on Mac? 25924
- 233.0.174 How to optimize picture loading in Web Edition? 25924
- 233.0.175 How to parse XML? 25925
- 233.0.176 How to play audio in a web app? 25925
- 233.0.177 How to pretty print xml? 25926
- 233.0.178 How to print to PDF? 25927
- 233.0.179 How to query Spotlight's Last Open Date for a file? 25927
- 233.0.180 How to quit windows? 25928
- 233.0.181 How to read a CSV file correctly? 25929
- 233.0.182 How to read resourcefork with named path? 25929
- 233.0.183 How to read the command line on windows? 25929
- 233.0.184 How to render PDF pages with PDF Kit? 25930
- 233.0.185 How to restart a Mac? 25931
- 233.0.186 How to resume ftp upload with curl plugin? 25931
- 233.0.187 How to rotate a PDF page with CoreGraphics? 25931
- 233.0.188 How to rotate image with CoreImage? 25932
- 233.0.189 How to run a 32 bit application on a 64 bit Linux? 25933
- 233.0.190 How to save HTMLViewer to PDF with landscape orientation? 25933
- 233.0.191 How to save RTFD? 25934
- 233.0.192 How to scale a picture proportionally with mask? 25934

- 233.0.193 How to scale a picture proportionally? 25935
- 233.0.194 How to scale/resize a CIImageMBS? 25936
- 233.0.195 How to scale/resize a picture? 25937
- 233.0.196 How to search with regex and use unicode codepoints? 25937
- 233.0.197 How to see if a file is invisible for Mac OS X? 25938
- 233.0.198 How to set cache size for SQLite or REALSQLDatabase? 25939
- 233.0.199 How to set the modified dot in the window? 25939
- 233.0.200 How to show a PDF file to the user in a Web Application? 25939
- 233.0.201 How to show Keyboard Viewer programmatically? 25940
- 233.0.202 How to show the mouse cursor on Mac? 25941
- 233.0.203 How to shutdown a Mac? 25941
- 233.0.204 How to sleep a Mac? 25942
- 233.0.205 How to speed up rasterizer for displaying PDFs with DynaPDF? 25942
- 233.0.206 How to use PDFLib in my RB application? 25942
- 233.0.207 How to use quotes in a string? 25942
- 233.0.208 How to use Sybase in Web App? 25943
- 233.0.209 How to use the Application Support folder? 25943
- 233.0.210 How to use the IOPMCopyScheduledPowerEvents function in Xojo? 25944
- 233.0.211 How to validate a GUID? 25946
- 233.0.212 How to walk a folder hierarchie non recursively? 25947
- 233.0.213 I got this error: PropVal, QDPictMBS.Name (property value), Type mismatch error. Expected CGDataProviderMBS, but got Variant, Name:QDPictMBS 25948
- 233.0.214 I registered the MBS Plugins in my application, but later the registration dialog is shown. 25948
- 233.0.215 I want to accept Drag & Drop from iTunes 25949
- 233.0.216 I'm drawing into a listbox but don't see something. 25950
- 233.0.217 I'm searching for a method or so to move a window from position x.y to somewhere else on the screen. 25951
- 233.0.218 If I use one of your plug-ins under windows, would this then impose the use of dll after compilation or my would my compiled soft still be a stand-alone single file software? 25951
- 233.0.219 Is the fn key on a powerbook keyboard down? 25951

25809

- 233.0.220 Is there a case sensitive Dictionary? 25952
- 233.0.221 Is there a way to use the MBS plugin to get only the visible item and folder count on a volume? 25952
- 233.0.222 Is there an easy way I can launch the Displays preferences panel? 25953
- 233.0.223 List of Windows Error codes? 25953
- 233.0.224 Midi latency on Windows problem? 25953
- 233.0.225 My Xojo Web App does not launch. Why? 25954
- 233.0.226 SQLDatabase not initialized error? 25954
- 233.0.227 Textconverter returns only the first x characters. Why? 25955
- 233.0.228 The type translation between CoreFoundation/Foundation and Xojo data types. 25955
- 233.0.229 Uploaded my web app with FTP, but it does not run on the server! 25958
- 233.0.230 What classes to use for hotkeys? 25958
- 233.0.231 What do I need for Linux to get picture functions working? 25958
- 233.0.232 What does the NAN code mean? 25959
- 233.0.233 What font is used as a 'small font' in typical Mac OS X apps? 25959
- 233.0.234 What is last plugin version to run on Mac OS X 10.4? 25960
- 233.0.235 What is last plugin version to run on PPC? 25960
- 233.0.236 What is last version of the plugins for macOS 32-bit? 25960
- 233.0.237 What is the difference between Timer and WebTimer? 25960
- 233.0.238 What is the list of Excel functions? 25961
- 233.0.239 What is the replacement for PluginMBS? 25962
- 233.0.240 What to do on Xojo reporting a conflict? 25962
- 233.0.241 What to do with a NSImageCacheException? 25962
- 233.0.242 What to do with MySQL Error 2014? 25962
- 233.0.243 What to do with SQL Plugin reporting Malformed string as error? 25963
- 233.0.244 Where is CGGetActiveDisplayListMBS? 25963
- 233.0.245 Where is CGGetDisplaysWithPointMBS? 25963
- 233.0.246 Where is CGGetDisplaysWithRectMBS? 25963
- 233.0.247 Where is CGGetOnlineDisplayListMBS? 25963
- 233.0.248 Where is GetObjectClassNameMBS? 25963

- 233.0.249 Where is NetworkAvailableMBS? 25964
- 233.0.250 Where is StringHeight function in DynaPDF? 25964
- 233.0.251 Where is XLSDocumentMBS class? 25965
- 233.0.252 Where to get information about file formats? 25965
- 233.0.253 Where to register creator code for my application? 25965
- 233.0.254 Which Mac OS X frameworks are 64bit only? 25965
- 233.0.255 Which plugins are 64bit only? 25966
- 233.0.256 Why application doesn't launch because of a missing ddraw.dll!? 25966
- 233.0.257 Why application doesn't launch because of a missing shlwapi.dll!? 25966
- 233.0.258 Why do I hear a beep on keydown? 25967
- 233.0.259 Why does folderitem.item return nil? 25967
- 233.0.260 Why doesn't showurl work? 25967
- 233.0.261 Why don't the picture functions not work on Linux? 25967
- 233.0.262 Why have I no values in my chart? 25968
- 233.0.263 Will application size increase with using plugins? 25968
- 233.0.264 XLS: Custom format string guidelines 25968
- 233.0.265 Xojo doesn't work with your plugins on Windows 98. 25969
- 233.0.266 Xojo or my RB application itself crashes on launch on Mac OS Classic. Why? 25969

Chapter 233

The FAQ

233.0.1 Can anyone help me convert seconds to time in this format hh:mm:ss?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Sure, here's a routine I use (which has an advantage over the previously-posted Date-based solution in that you don't have to rely on the creation of an object – all that happens is some division and string concatenation):
Example:

```
Function SecsToTimeString(timeInSecs as Integer, padHours as boolean, padMinutes as boolean) as string
// Given an amount time (in seconds), generates a string representing that amount
// of time. The padHours and padMinutes parameters determine whether to display
// hours and minutes if their values are zero.

// Examples:
// timeInSecs = 90, padHours = true; returns "00:01:30"
// timeInSecs = 1, padHours = false, padMinutes = true; returns "00:01"
// timeInSecs = 3601, padMinutes = false; returns "01:00:01"

Var hours, minutes, seconds as Integer
Var hoursString, minutesString as string

hours = timeInSecs / 3600
minutes = (timeInSecs mod 3600) / 60
seconds = timeInSecs mod 60

if hours = 0 then
if padHours then
hoursString = "00:"
else
hoursString = ""
end if
```

```
else
hoursString = Format(hours, "##\:")
end if
if minutes = 0 then
if hours <>0 or padMinutes then
minutesString = "00:"
else
minutesString = ""
end if
else
minutesString = Format(minutes, "00\:")
end if

return hoursString + minutesString + Format(seconds, "00")
End Function
```

Notes: (from the rb mailinglist)

233.0.2 Do you have plugins for Android?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Since there is no plugin SDK for Android, we have no way to make a plugin for Android.
Notes: We support macOS, Windows, Linux and iOS.

233.0.3 How do I get the proper highlight color on Mac OS X for active/inactive selection?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use functions from NSColor to get proper highlight color in RGB:
Example:

```
Function ProperHighlightColor(active as Boolean) As Color
#if TargetCocoa
Var theColor As NSColorMBS
If active Then
theColor = NSColorMBS.alternateSelectedControlColor
Else
theColor = NSColorMBS.secondarySelectedControlColor
End If

Var rgbColor As NSColorMBS = theColor.colorUsingColorSpaceName(NSColorSpaceMBS.NSCalibratedRG-
BColorSpace)
```

```
If rgbColor <>Nil Then
Var red as Integer = rgbColor.redComponent * 255.0
Var green as Integer = rgbColor.greenComponent * 255.0
Var blue as Integer = rgbColor.blueComponent * 255.0
Return RGB(red, green, blue)
Else
Return HighlightColor
End If
#else
return HighlightColor
#endif
End Function
```

Notes: As you see we convert color to Calibrated RGB for best results.

233.0.4 How to catch delete key?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: The following is the code in keydown event catches delete or backspace keys.
Example:

```
Function KeyDown(Key As String) As Boolean
if asc(key) = 8 or asc(key) = 127 then
MessageBox "Delete"
Return true
end if
End Function
```

233.0.5 How to convert cmyk to rgb?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

The following is the code to convert cmyk values to an RGB color datatype.
It's just a basic estimate of the color values. If you are looking for completely color accurate solution, this is not it. It should work for most people. :)
Example:

```
Function CMYKToRGB(c as Integer, m as Integer, y as Integer, k as Integer) As color
// converts c,m,y,k values (0-100) to color data type RGB
// place this in a method. Supply C,M,Y,K values-
// it returns color datatype

Var color_RGB as color
Var r, g, b as Integer

r=255-round(2.55*(c+k))
if r<0 then
r=0
end if
g=255-round(2.55*(m+k))
if g<0 then
g=0
end if
b=255-round(2.55*(y+k))
if b<0 then
b=0
end if

color_RGB=RGB(r,g,b)

return color_RGB

End Function
```

- 233.0.9 How to refresh a htmlviewer on Windows? 25818

233.0.6 How to delete a folder?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: The following is the code deletes a folder recursively.
Example:

```
Sub deletefolder(f as folderitem)
Var files(-1) as FolderItem

if f=nil then Return

// delete single file
if f.Directory=false then
f.Delete
Return
end if

// get a list of all items in that folder
Var i,c as Integer
c=F.Count
for i=1 to c
files.Append f.TrueItem(i)
next

// delete each item
for each fo as FolderItem in files
if fo=nil then
' ignore
elseif fo.Directory then
deletefolder fo
fo.delete
else ' file
fo.Delete
end if
next

f.Delete
```

```
End Sub
```

233.0.7 How to detect if CPU if 64bit processor?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Via CPUID you can ask CPU:
Example:

```
Var c as new CPUIDMBS

if c.Flags(CPUIDMBS.kFeatureLM) then
MessageBox "64-bit CPU"
else
MessageBox "32-bit CPU"
end if
```

Notes: Should work on all intel compatible CPUs.

233.0.8 How to query variant type string for a variant?

Plugin Version: 20.5, Platforms: macOS, Linux, Windows.

Answer: The following example function returns type string for variant.
Example:

```
Public Function VariantTypeString(v as Variant) as string
// Xojo's VarType doesn't know Unsigned integers
'Dim type As Integer = VarType(v)

// MBS VarType can detect unsigned integer
Var type As Integer = GetVariantTypeMBS(v)

Var IsArray As Boolean = BitwiseAnd(type, Variant.TypeArray) = Variant.TypeArray

// type without array
type = BitwiseAnd(type, Bitwise.OnesComplement(Variant.TypeArray))

// build a dictionary to map types on first call
Static TypeMap As Dictionary
If TypeMap = Nil Then
TypeMap = New Dictionary
TypeMap.Value(Variant.TypeBoolean) = "Boolean"
TypeMap.Value(Variant.TypeCFStringRef) = "CFStringRef"
TypeMap.Value(Variant.TypeColor) = "Color"
TypeMap.Value(Variant.TypeCString) = "CString"
TypeMap.Value(Variant.TypeCurrency) = "Currency"
TypeMap.Value(Variant.TypeDate) = "Date"
TypeMap.Value(Variant.TypeDateTime) = "DateTime"
TypeMap.Value(Variant.TypeDouble) = "Double"
TypeMap.Value(Variant.TypeInt32) = "Int32"
TypeMap.Value(Variant.TypeInt64) = "Int64"
TypeMap.Value(Variant.TypeInteger) = "Integer"
TypeMap.Value(Variant.TypeNil) = "Nil"
TypeMap.Value(Variant.TypeObject) = "Object"
TypeMap.Value(Variant.TypeOSType) = "OSType"
TypeMap.Value(Variant.TypePString) = "PString"
TypeMap.Value(Variant.TypePtr) = "Ptr"
TypeMap.Value(Variant.TypeSingle) = "Single"
TypeMap.Value(Variant.TypeString) = "String"
TypeMap.Value(Variant.TypeStructure) = "Structure"
TypeMap.Value(Variant.TypeText) = "Text"
TypeMap.Value(Variant.TypeWindowPtr) = "WindowPtr"
TypeMap.Value(Variant.TypeWString) = "WString"

// MBS extra types
TypeMap.Value(Variant.TypeInt32+100) = "UInt32"
TypeMap.Value(Variant.TypeInt64+100) = "UInt64"
```

```
End If

// lookup type

#if DebugBuild then
If Not TypeMap.HasKey(type) Then
Break // missing type
End If
#endif

If IsArray Then
Return "Array of " + TypeMap.Lookup(type,"?")
Else
Return TypeMap.Lookup(type,"?")
End If
End Function
```

233.0.10 Is there an example for vector graphics in Xojo?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Try this example inside the paint event of a window:
Example:

```
Var v as Group2D
Var r as RectShape
Var s as StringShape

const pi=3.14

s=new StringShape
s.Text="Hello World!"
s.TextFont="Geneva"
s.TextSize=24
s.FillColor=rgb(0,0,255)
s.Italic=true
s.y=5
s.x=0

r=new RectShape

r.X=0
r.y=0
r.Height=100
r.Width=180
r.BorderColor=rgb(255,0,0)
r.FillColor=rgb(0,255,0)
r.BorderWidth=5
r.Border=50

v=new Group2d
v.Append r
v.Append s
v.Rotation=pi*-20.0/180.0
v.x=150
v.y=150

g.DrawObject v
```

233.0.11 Picture functions do not preserve resolution values?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Yes, the picture functions return pictures with no/default resolution values.
Example:

```
Var l as Picture = LogoMBS(500)

l.HorizontalResolution = 300
l.VerticalResolution = 300

Var r as Picture = l.Rotate90MBS

MessageBox str(r.HorizontalResolution)+" x "+str(r.VerticalResolution)

r.HorizontalResolution = l.HorizontalResolution
r.VerticalResolution = l.VerticalResolution

MessageBox str(r.HorizontalResolution)+" x "+str(r.VerticalResolution)
```

Notes: So please fix them yourself after calling a function.

Maybe in the future this changes, but currently you can't really set this easily from plugin code.

233.0.12 A toolbox call needs a rect - how do I give it one?

Plugin Version: all, Platforms: macOS, Windows.

Answer: Fill a memoryblock like this:
Example:

```
Var MB As Memoryblock
MB = NewMemoryBlock(8)
MB.Short(0) = Window1.Top
MB.Short(2) = Window1.Left
MB.Short(4) = Window1.Height+Window1.Top // bottom
MB.Short(6) = Window1.Width+Window1.Left // right
```

233.0.13 API client not supported?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: If you get this exception message on SQLConnectionMBS.Connect, we may have a problem.

Notes: First case is that the given thing is not supported (e.g. MS SQL directly on Mac).
Second case is that the plugin compilation went wrong and the support for the database was not linked into the plugin. Like MySQL missing or MS SQL on Windows missing. In that case please contact us to fix the plugin.

233.0.14 Can I access Microsoft Access Database with Java classes?

Plugin Version: all, Platform: Windows.

Answer: You can use ucanaccess to access databases created with Microsoft
Example:

```
Var options(-1) as string

// load all the jar files we have in a folder called java:

Var appFolder as FolderItem = New FolderItem("")

Var count as Integer = appFolder.Parent.Child("java").Count
Var libjs() as string
For i as Integer = 1 to count
Var f As FolderItem = appFolder.Parent.Child("java").item(i)
If f <>Nil and f.Exists Then
libjs.Add f.NativePath+";"
End If
Next

// now init virtual machine
Var librery as string = Join(libjs, "")
Var vm as new JavaVMMBS(librery)

if vm.Handle = 0 then
MessageBox "Failed to initialize virtual machine"
else
// now make a new database connection with ucanaccess
Var d as new JavaDatabaseMBS(vm,"net.ucanaccess.jdbc.UcanaccessDriver")
Var DbFile as FolderItem = appFolder.Parent.Child("Database11.accdb")
Var j as JavaConnectionMBS = d.getConnection("jdbc:ucanaccess://"+DbFile.NativePath)

// select and show values
Var r as JavaResultSetMBS = j.MySelectSQL("Select * From test")
while r.NextRecord
MessageBox r.getString("FirstName") +" "+ r.getString("LastName")
wend

end if
```

```
Exception e as JavaExceptionMBS
MessageBox e.message+" errorcode: "+str(e.ErrorNumber)
```

Notes: see website:
http://ucanaccess.sourceforge.net/site.html

233.0.15 Can I create PDF from Xojo Report using DynaPDF?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Yes, we have a graphics class integration for DynaPDF.
Notes: Since MBS Plugin in version 19.2, we can integrate reports with Xojo.

233.0.16 Can I use AppleScripts in a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Yes, but they run on the server, not on the client.
Example:

```
Var a as new AppleScriptMBS

// query my application name
a.Compile "tell application ""System Events"" to return name of current application"

// run
a.Execute

// show result
Label1.text = a.Result

// shows something like "My Application.fcgi.debug"
```

Notes: This can be useful to control the server from remote, if and only if the your sever is running Mac OS X.

233.0.17 Can I use graphics class with DynaPDF?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Sorry, no. We can't provide a graphics subclass from plugin.
Notes: The is a feature request to allow graphics subclasses:

Feedback case 11391: feedback://showreport?report_id=11391

233.0.18 Can I use sockets on a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Yes, but they run on the server, not on the client.
Notes: You can use HTTPSocket, SMTPSocket, POP3Socket, SMTPSecureSocket, SecurePOP3Socket, EasyTCPSocket, EasyUDPSocket, AutoDiscovery, our Bonjour classes or our CURL* classes. But all of them work on the server, not on the client.

This means if you search for a printer with Bonjour, you can find the printers in the local network on your server hosting site. Using SMTPSocket may be a good idea for sending emails from the server like notifications.

233.0.19 Can I use your ChartDirector plugin on a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Yes, our ChartDirector plugin works just fine on the Xojo Web Edition.
Example:

```
// The data for the pie chart
Var data(-1) as Double=array(55.0, 18.0, 25.0, 22.0, 18.0, 30.0, 35.0)

// The labels for the pie chart, Words are chosen random to check font!
Var labels(-1) as string=array("Germany","Italy","France","Spain","UK","Poland","Russia")

// The colors to use for the sectors
Var colors(-1) as Integer

colors.Add &h66aaee
colors.Add &heebb22
colors.Add &hbbbbbb
colors.Add &h8844ff

if TargetLinux then
CDBaseChartMBS.SetFontSearchPath "/usr/share/fonts/truetype/msttcorefonts"
end if

// Create a PieChart object of size 360 x 300 pixels
Var c as new CDPieChartMBS(700, 600)

c.setBackground(c.linearGradientColor(0, 0, 0, c.getHeight(), &h0000cc, &h000044))
```

```
c.setRoundedFrame(&hffffff, 16)
Var tt as CDTextBoxMBS = c.addTitle("ChartDirector Demonstration", "timesbi.ttf", 18)
tt.setMargin(0, 0, 16, 0)
tt.setFontColor(&hFFFFFF)

// Set the center of the pie at (180, 140) and the radius to 100 pixels
c.setPieSize 350,300,150
// Set the sector colors
c.setColors(c.kDataColor, colors)

// Draw the pie in 3D with a pie thickness of 20 pixels
c.set3D(20)

Var t as CDTextBoxMBS = c.setLabelStyle("arialbd.ttf", 10, &h000000)
t.setBackground(CDPieChartMBS.kSameAsMainColor, CDPieChartMBS.kTransparent, CDPieChartMBS.soft-
Lighting(CDPieChartMBS.kRight, 0))
t.setRoundedCorners(8)

// Use local gradient shading for the sectors, with 5 pixels wide
// semi-transparent white (bbffffff) borders
c.setSectorStyle(CDPieChartMBS.kLocalGradientShading, &hbbffffff, 0)

// Set the pie data and the pie labels
c.setData data,labels
call c.setLabelStyle "arialbd.ttf",18

Var pic as picture = c.makeChartPicture
Var wp as new WebPicture(pic, Picture.FormatJPEG) // JPEG makes it smaller and faster

ImageView1.Picture=wp
```

Notes: Be aware that our plugin produces pictures for you, which you assign to ImageViews. Transferring those pictures takes time, so you can optimize that with using WebPicture class. There you can decide between different compressions to improve speed (use JPEG instead of PNG).

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.

233.0.20 Can I use your DynaPDF plugin on a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Yes, our DynaPDF plugin works just fine on the Xojo Web Edition.
Notes: PDF files are created on the server. You may want to offer a preview to the user which uses reduced resolution images to reduce the time to download the PDF.

See our Create PDF example for the Xojo Web Edition.

233.0.21 Can I use your plugin controls on a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: No.

233.0.22 Can you get an unique machine ID?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: There is nothing like an unique machine ID.
Notes: 1:
You can use the MAC IDs of the network interfaces.
This can be changed by the user with software tools.
And the list of network interfaces changes if user reorder the interfaces.

2:
You can use the system folder creation date/time.
This may stay equal after cloning machines or after migration to new PC.

3:
You can use the Mac Serialnumber.
Mac only and it can happen that a Mac does not have a serial number.

4:
You can use the x86 CPU ID.
This is x86 CPU only and does not avoid running on the same CPU in different PCs.

233.0.23 ChartDirector: Alignment Specification

Plugin Version: 8.2, Platforms: macOS, Linux, Windows.

Answer: ChartDirector: Alignment Specification
Notes: In many ChartDirector objects, you may specify the alignment of the object's content relative to its boundary. For example, for a TextBox object, you may specify the text's alignment relative to the box

boundary by using TextBox.setAlignment.

The ChartDirector API defines several constants for the alignment options.

Constant	Value	Description
BottomLeft	1	The leftmost point on the bottom line.
BottomCenter	2	The center point on the bottom line.
BottomRight	3	The rightmost point on the bottom line.
Left	4	The leftmost point on the middle horizontal line.
Center	5	The center point on the middle horizontal line.
Right	6	The rightmost point on the middle horizontal line.
TopLeft	7	The leftmost point on the top line.
TopCenter	8	The center point on the top line.
TopRight	9	The rightmost point on the top line.
Bottom	2	The center point on the bottom line. Same as BottomCenter.
Top	8	The center point on the top line. Same as TopCenter.
TopLeft2	10	An alternative top-left position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, TopLeft2 refers to refers to the left of the top side, while TopLeft refers to the top of the left side. The reverse applies for a horizontal axis.
TopRight2	11	An alternative top-right position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, TopRight2 refers to refers to the right of the top side, while TopRight refers to the top of the right side. The reverse applies for a horizontal axis.
BottomLeft2	12	An alternative bottom-left position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, BottomLeft2 refers to refers to the left of the bottom side, while BottomLeft refers to the bottom of the left side. The reverse applies for a horizontal axis.
BottomRight2	13	An alternative bottom-right position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, BottomRight2 refers to refers to the right of the bottom side, while BottomRight refers to the bottom of the right side. The reverse applies for a horizontal axis.

233.0.24 ChartDirector: Color Specification

Plugin Version: 8.2, Platforms: macOS, Linux, Windows.

Answer: ChartDirector: Color Specification
Notes: Many functions in the ChartDirector API accept colors as parameters. ChartDirector supports colors specified in web and HTML compatible ARGB format, in which ARGB refers to the Alpha transparency, Red, Green and Blue components of the color.

In addition to ARGB colors, ChartDirector supports ”dynamic” colors. A dynamic color is a color that changes depending on the position of the pixels. The ”dynamic” colors that ChartDirector supports include ”pattern colors”, ”metal colors”, ”gradient colors”, ”zone colors” and ”dash line colors”.

ChartDirector supports specifying colors indirectly using ”palette colors”. When a ”palette color” is used, the color is specified as an index to a palette. The actual color is looked up from the palette.ARGB Color
ARGB color consists of 4 components - alpha transparency, red, green and blue. The four components are encoded as a 32-bit number, with each component occupying 8 bits. In hexadecimal notation, it is AARRGGBB, where AA, RR, GG and BB are the alpha transparency, red, green and blue components.

Each component ranges from 00 - FF (0 - 255), representing its intensity. For example, pure red color is 00FF0000, pure green color is 0000FF00, and pure blue color is 000000FF. White color is 00FFFFFF, and black color is 00000000.

Most programming language requires you to put special prefix in front of hexadecimal characters. For C++, the prefix is ”0x”. For example, the syntax for the hexadecimal number 00FFFFFF is 0x00FFFFFF, or simply 0xFFFFFF.
For the alpha transparency component, a zero value means the color is not transparent all at. This is equivalent to traditional RGB colors. A non-zero alpha transparency means the color is partially transparent. The larger the alpha transparency, the more transparent the color will be. If a partially transparent color is used to draw something, the underlying background can still be seen.

For example, 80FF0000 is a partially transparent red color, while 00FF0000 is a non-transparent red color.

Note that ChartDirector’s ARGB color is web and HTML compatible. For example, red is FF0000, the same as in HTML. There are many resources on the web that provide tables in which you can click a color and it will show its HTML color code. These color codes can be used in ChartDirector.

If alpha transparency is FF (255), the color is totally transparent. That means the color is invisible. It does not matter what the RGB components are. So in ChartDirector, only one totally transparent color is used - FF000000. All other colors of the form FFnnnnnn are reserved to represent palette colors and dynamic colors, and should not be interpreted as the normal ARGB colors.

The totally transparent color FF000000 is often used in ChartDirector to disable drawing something. For example, if you want to disable drawing the border of a rectangle, you can set the border color to totally transparent.

For convenience, ChartDirector defines a constant called Transparent, which is equivalent to FF000000.Pattern Color
A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

Pattern colors are created using BaseChart.patternColor, BaseChart.patternColor2, DrawArea.patternColor and DrawArea.patternColor2. The patternColor method creates pattern colors using an array of colors as a bitmap. The patternColor2 method creates pattern colors by loading the patterns from image files.

These methods return a 32-bit integer acting as a handle to the pattern color. The handle can be used in any ChartDirector API that expects a color as its input.Metal Color
A metal color is a color of which the brightness varies smoothly across the chart surface as to make the surface looks shiny and metallic. ChartDirector supports using any color as the base color of the metal color. In particular, using yellow and grey as the base colors will result in metal colors that look gold and silver.

Metal colors are most often used as background colors of charts. They are created using CDBaseChartMBS.metalColor, CDBaseChartMBS.goldColor and CDBaseChartMBS.silverColor. The first method allows you to specify an arbitrary base color. The second and third methods use yellow and grey as the base colors, resulting in gold and silver metal colors.

These methods return a 32-bit integer acting as a handle to the gradient color. The handle can be used in any ChartDirector API that expects a color as its input.Gradient Color
A gradient color is a color that changes progressively across a direction.

Gradient colors are created using BaseChart.gradientColor, BaseChart.gradientColor2, DrawArea.gradientColor and DrawArea.gradientColor2. The gradientColor method creates a 2-point gradient color that changes from color A to color B. The gradientColor2 method creates a multi-point gradient colors that changes from color A to B to C ....

These methods return a 32-bit integer acting as a handle to the gradient color. The handle can be used in any ChartDirector API that expects a color as its input.

One common use of multi-point gradient colors is to define colors that have metallic look and feel. Please refer to DrawArea.gradientColor2 for details.Dash Line Colors
A dash line color is a color that switches on and off periodically. When used to draw a line, the line will appear as a dash line.

Dash line colors are created using BaseChart.dashLineColor and DrawArea.dashLineColor. They accept a line color and a dash pattern code as arguments, and return a 32-bit integer acting as a handle to the dash line color. The handle can be used in any ChartDirector API that expects a color as its input.Zone Colors
A zone color is for XY charts only. It is a color that automatically changes upon reaching a data threshold value along the x-axis or y-axis. Zone colors are created using Layer.xZoneColor, Layer.yZoneColor, XYChart.xZoneColor or XYChart.yZoneColor.Palette Colors
Palette colors are colors of the format FFFFnnnn, where the least significant 16 bits (nnnn) are the index to the palette. A palette is simply an array of colors. For a palette color, the actual color is obtained by looking up the palette using the index. For example, the color FFFF0001 is the second color in the palette (first color is index 0).

The colors in the palette can be ARGB colors or "dynamic" colors (pattern, gradient and dash line colors).

The first eight palette colors have special significance. The first three palette colors are the background color, default line color, and default text color of the chart. The 4th to 7th palette colors are reserved for future use. The 8th color is a special dynamic color that is equal to the data color of the "current data set".

The 9th color (index = 8) onwards are used for automatic data colors. For example, in a pie chart, if the sector colors are not specified, ChartDirector will automatically use the 9th color for the first sector, the 10th color for the second sector, and so on. Similarly, for a multi-line chart, if the line colors are not specified, ChartDirector will use the 9th color for the first line, the 10th color for the second line, and so on.

The ChartDirector API defines several constants to facilitate using palette colors.

Constant	Value	Description
Palette	FFFF0000	The starting point of the palette. The first palette color is (Palette + 0). The nth palette color is (Palette + n - 1).
BackgroundColor	FFFF0000	The background color.
LineColor	FFFF0001	The default line color.
TextColor	FFFF0002	The default text color.
[Reserved]	FFFF0003 - FFFF0006	These palette positions are reserved. Future versions of ChartDirector may use these palette positions for colors that have special significance.
SameAsMainColor	FFFF0007	A dynamic color that is equal to the data color of the current data set. This color is useful for objects that are associated with data sets. For example, in a pie chart, if the sector label background color is SameAsMainColor, its color will be the same as the corresponding sector color.
DataColor	FFFF0008	The starting point for the automatic data color allocation.

When a chart is created, it has a default palette. You may modify the palette using BaseChart.setColor, BaseChart.setColors, or BaseChart.setColors2.

The advantages of using palette colors are that you can change the color schemes of the chart in one place. ChartDirector comes with several built-in palettes represented by the following predefined constants.

Constant	Description
defaultPalette	An array of colors representing the default palette. This palette is designed for drawing charts on white backgrounds (or lightly colored backgrounds).
whiteOnBlackPalette	An array of colors useful for drawing charts on black backgrounds (or darkly colored backgrounds).
transparentPalette	An array of colors useful drawing charts on white backgrounds (or lightly colored backgrounds). The data colors in this palette are all semi-transparent.

233.0.25 ChartDirector: Font Specification

Plugin Version: 8.2, Platforms: macOS, Linux, Windows.

Answer: ChartDirector: Font Specification
Notes: Font Name
In ChartDirector, the font name is simply the file name that contains the font. For example, under the Windows platform, the "Arial" font is "arial.ttf", while the "Arial Bold" font is "arialbd.ttf".

NOTE: Mac OS X Specific Information
In Mac OS X, in addition to ".ttf", ChartDirector also supports Mac OS X font file formats, such as Font Suitcase files and Datafork files (.dfont). These files often contain multiple fonts. For example, the "GillSans.dfont" file contains 6 fonts.

So in addition to the file name, an index is needed to determine the font. The index is specified by appending a " | " character to the font name, followed by the index number. For example, the third font in "GillSans.dfont" is denoted as "GillSans.dfont | 2". (Note: The first font starts at 0.) If no index number is provided, the first font is assumed.

ChartDirector also supports using Mac OS X Font Manager names. For example, one may use "Gill Sans Light Italic" instead of using "GillSans.dfont | 1" as the font name. However, the Mac OS X Font Manager is active only if someone has logged into the Mac GUI console, so this method is only recommended for developing applications that run on the GUI console.

The sample programs that come with ChartDirector are designed to run on all operating systems, so they use generic font file names (eg. "arial.ttf") instead of Mac OS X specific names. To allow them to run on Mac OS X, ChartDirector on Mac OS X has a built-in table to map common font file names to Mac OS X font names:

"arial.ttf", "arialbd.ttf", "ariali.ttf" and "arialbi.ttf" are mapped to "Arial | 0" (Arial), "Arial | 1" (Arial Bold), "Arial | 2" (Arial Italic) and "Arial | 3" (Arial Bold Italic)

"times.ttf", "timesbd.ttf", "timesi.ttf" and "timesbi.ttf" are mapped to "Times New Roman | 0" (Times New Roman), "Times New Roman | 1" (Times New Roman Bold), "Times New Roman | 2" (Times New Roman Italic) and "Times New Roman | 3" (Times New Roman Bold Italic)

"cour.ttf", "courbd.ttf", "couri.ttf" and "courbi.ttf" are mapped to "Courier New | 0" (Courier New), "Courier New | 1" (Courier New Bold), "Courier New | 2" (Courier New Italic) and "Courier New | 3" (Courier New Bold Italic)

Font Location
ChartDirector on Windows does not come with any font files. It relies on the operating system's font files in the " [windows] \Fonts" directory. To see what fonts are installed in your operating system and their file names, use the File Explorer to view that directory.

ChartDirector on Windows will also search for the font files in the ”fonts” subdirectory (if it exists) under the directory where the ChartDirector DLL ”chartdir.dll” is installed. This is useful for private fonts. Also, for some especially secure web servers, the web anonymous user may not have access to the ” [windows] \Fonts” directory. In this case, you may copy the font files to the above subdirectory.

ChartDirector on Mac OS X relies on operating system font files in ”/Library/Fonts” and ”/System/Library/Fonts”.

ChartDirector on Linux, FreeBSD and Solaris assume the fonts files are in the ”fonts” subdirectory under the directory where the ChartDirector shared object ”libchartdir.so” is installed. ChartDirector on Linux, FreeBSD and Solaris come with a number of font files in the ”fonts” subdirectory.

To keep the download size small, ChartDirector on Linux, FreeBSD and Solaris only come with some commonly used fonts. You may download additional fonts from the Internet. In particular, the Microsoft fonts at
http://sourceforge.net/project/showfiles.php?group_id=34153&release_id=105355
is highly recommended. Please refer to
http://www.microsoft.com/typography/faq/faq8.htm
on how you could use the fonts legally in your system.

ChartDirector supports True Type fonts (.ttf), Type 1 fonts (.pfa and .pfb) and Windows bitmap fonts (.fon). On Mac OS X, ChartDirector also supports Font Suitcase and Datafork (.dfont) files. On Linux, FreeBSD and Solaris, ChartDirector also supports Portable Compiled Fonts (.pcf fonts).

If you want ChartDirector to search other directories for the font files, you may list the directories in an environment variable called ”FONTPATH”.

If you specify an absolute path name for the font file, ChartDirector will use the absolute path name and will not search other directories.Artificial Boldening and Italicizing
Whereas most popular font comes with different styles for ”normal”, ”bold”, ”italic” and ”bold italic”, some fonts only come with one style (the normal style). For example, the Monotype Corsiva font that comes with MS Office only has the normal style (mtcorsva.ttf). For these cases, you may append the ”Bold” and/or ”Italic” words after the font file name (separated with a space) to ask ChartDirector to artificially bolden and/or italicize the font. For example, you may specify the font name as ”mtcorsva.ttf Bold”.Font List
Instead of specifying a single font file as the font name, you may specify a list of font files as the font name, separated by semi-colons. This is useful when using international characters that are only available in some fonts.

For example, if you would like to use the Arial font (”arial.ttf”) for western characters, and the MingLiu font ”mingliu.ttc” for Chinese characters (since the Arial font does not have Chinese characters), you may specify the font name as ”arial.ttf;mingliu.ttc”. In this case, ChartDirector will try the Arial font first. If it cannot find a certain character there, it will try the MingLiu font.Indirect Font Names

ChartDirector supports several special keywords for specifying the font name indirectly. When these keywords are used as font names, ChartDirector will look up the actual font names from a font table. The keywords are as follows:

Keywords	Description
"normal"	This default normal font, which is the first font in the font table. This is initially mapped to "arial.ttf" (Arial).
"bold"	The default bold font, which is the second font in the font table. This is initially mapped to "arialbd.ttf" (Arial Bold).
"italic"	The default italic font, which is the third font in the font table. This is initially mapped to "ariali.ttf" (Arial Italic).
"boldItalic"	The default bold-italic font, which is the fourth font in the font table. This is initially mapped to "arialbi.ttf" (Arial Bold Italic).
"fontN"	The (N + 1)th font in the font table (the first font is "font0").

The font table can be modified using BaseChart.setFontTable or DrawArea.setFontTable.

The advantage of using indirect font names is that you can change the fonts fonts in your charts in one place.Font Index
Most font files contain one font. However, it is possible a font file contains multiple fonts (that is, a font collection). For example, in True Type fonts, font files with extension ".ttc" may represent a font collection.

If a font file contains multiple font, the font index can be used to specify which font to use. By default, the font index is 0, which means the first font in the font file will be used.Font Size
The font size decides how big a font will appear in the image. The font size is expressed in a font unit called points. This is the same unit used in common word processors.

Instead of specifying font size, some ChartDirector API (eg. TextBox.setFontSize) allow you to specify font height and font width separately. You may use different point sizes for font height and font width to create special effects.Font Color
This is the color to draw the font. (See Color Specification on how colors are represented in ChartDirector.)Font Angle
This is the angle in degrees by which the font should be rotated anti-clockwise.Vertical Layout
By default, text are laid out horizontally, with characters being drawn from left to right.

ChartDirector also supports vertical layout, with characters being drawn from top to bottom. For example, you may use BaseChart.addText to add text that are laid out vertically. Vertical layout is common for oriental languages such as Chinese, Japanese and Korean.

233.0.26 ChartDirector: Mark Up Language

Plugin Version: 8.2, Platforms: macOS, Linux, Windows.

Answer: ChartDirector: Mark Up Language
Notes: ChartDirector Mark Up Language (CDML) is a language for including formatting information in text strings by marking up the text with tags.

CDML allows a single text string to be rendered using multiple fonts, with different colors, and even embed images in the text.Font Styles
You can change the style of the text by using CDML tags. For example, the line:

<*font=timesi.ttf,size=16,color=FF0000>Hello <*font=arial.ttf,size=12,color=8000*>world!
will result in the following text rendered:

In general, all tags in CDML are enclosed by <* and *>. Attributes within the tags determine the styles of the text following the tags within the same block.

If you want to include <* in text without being interpreted as CDML tags, use «* as the escape sequence.

The following table describes the supported font style attributes in CDML. See Font Specification for details on various font attributes.

Note that unlike HTML tags, no double or single quotes are used in the tags. It is because CDML tags are often embedded as string literals in source code. The double or single quotes, if used, will conflict with the string literal quotes in the source code. Therefore in CDML, no quotes are necessary and they must not be used.

Also, unlike HTML tags, CDML uses the comma character as the delimiter between attributes. It is because certain attributes may contain embed spaces (such as the font file name). So space is not used as the delimiter and the comma character is used instead.

Note the font attribute above starts a new style section, while other attributes just modify the current style section. You may use <*/font*>to terminate a style section, which will restore the font styles to the state before the style section.Blocks and Lines
In CDML, a text string may contain multiple blocks. A block may contain multiple lines of text by separating them with new line characters ("\n") or with <*br*>. The latter is useful for programming languages that cannot represent new line characters easily.

For example, the line:

<*size=15*><*block*><*color=FF*>BLOCK<*br*>ONE<*/*>and <*block*><*color=FF00*>BLOCK<*br*>TWO

Attribute	Description
font	Starts a new style section, and sets the font name. You may use this attribute without a value (that is, use ”font” instead of ”font=arial.ttf”) to create a new style section without modifying the font name.
size	The font size.
width	The font width. This attribute is used to set the font width and height to different values. If the width and height are the same, use the size attribute.
height	The font height. This attribute is used to set the font width and height to different values. If the width and height are the same, use the size attribute.
color	The text color in hex format.
bgColor	The background color of the text in hex format.
underline	The line width of the line used to underline the following characters. Set to 0 to disable underline.
sub	Set the following text to be in subscript style. This attribute does not need to have a value. (You may use ”sub” as the attribute instead of ”sub=1”.)
super	Set the following text to be in superscript style. Set the following text to be in superscript style. This attribute does not need to have a value. (You may use ”super” as the attribute instead of ”super=1”.)
xoffset	Draw the following the text by shifting the text horizontally from the original position by the specified offset in pixels.
yoffset	Draw the following the text by shifting the text vertically from the original position by the specified offset in pixels.
advance	Move the cursor forward (to the right) by the number of pixels as specified by the value this attribute.
advanceTo	Move the cursor forward (to the right) to the position as specified by the value this attribute. The position is specified as the number of pixels to the right of the left border of the block. If the cursor has already passed through the specified position, the cursor is not moved.

will result in the following text rendered:

The above example contains a line of text. The line contains two blocks with the characters ” and ” in between. Each block in turn contains two lines. The blocks are defined using <*block*>as the start tag and <*/*>as the end tag.

When a block ends, font styles will be restored to the state before entering the block.Embedding Images
CDML supports embedding images in text using the following syntax:

<*img=my_image_file.png*>
where my_image_file.png is the path name of the image file.

For example, the line:

<*size=20*>A <*img=sun.png*>day
will result in the following text rendered:

ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath or DrawArea.setSearchPath on the directory that ChartDirector will search for the file.

The <*img*>tag may optionally contain width and height attributes to specify its pixel width and height. In this case, ChartDirector will stretch or compress the image if necessary to the required width and height.Blocks Attributes
CDML supports nesting blocks, that is, a block can contain other sub-blocks. Attributes are supported in the <*block*>tag to control the alignment and orientation of the sub-blocks. The <*img=my_image_file.png*>is treated as a block for layout purposes.

For example, the line:

<*block,valign=absmiddle*><*img=molecule.png*><*block*>Hydrazino\nMolecule<*/*><*/*>
will result in the following text rendered:

the above starts <*block,valign=absmiddle*>which specifies its content should align with each others in the vertical direction using the absolute middle alignment. The block contains an image, followed by a space characters, and then another block which has two lines of text.

The following table describes the supported attributes inside <*block*>tag:

233.0.27 ChartDirector: Parameter Substitution and Formatting

Plugin Version: 8.2, Platforms: macOS, Linux, Windows.

Answer: ChartDirector: Parameter Substitution and Formatting
Notes: ChartDirector charts often contain a lot of text strings. For example, sector labels in pie charts, axis labels for x and y axes, data labels for the data points, HTML image maps, etc, are all text strings.

ChartDirector uses parameter substitution to allow you to configure precisely the information contained in the text and their format.
Format Strings
In parameter substitution, format strings are used to specify the entities to be include into labels and how

to format numbers and dates.

For example, when drawing a pie chart with side label layout, the default sector label format string is:

" { label } ({ percent } %)"

When the sector label is actually drawn, ChartDirector will replace " { label } " with the sector name, and " { percent } " with the sector percentage. So the above label format will result is a sector label similar to "ABC (34.56%)".

You may change the sector label format by changing the format string. For example, you may change it to:

" { label } : US$ { value | 2 } K ({ percent } %)"

The sector label will then become something like "ABC: US$ 123.00 (34.56%)".

In general, in ChartDirector parameter substitution, parameters enclosed by curly brackets will be substituted with their actual values when creating the texts.

For parameters that are numbers or dates/times, ChartDirector supports a special syntax in parameter substitution to allow formatting for these values. Please refer to the Number Formatting and Date/Time Formatting sections below for details.

Parameter Expressions

ChartDirector supports numeric expressions in format strings. They are denoted by enclosing the expression with curly brackets and using "=" as the first character. For example:

"USD { value } (Euro { = { value } *0.9 })"

In the above, " { value } " will be substituted with the actual value of the sector. The expression " { = { value } *0.9 } " will be substituted with the actual value of the sector multiplied by 0.9.

ChartDirector parameter expressions support operators "+", "-", "*", "/", "%" (modulo) and "^" (exponentiation). Operators "*", "/", "%", "^" is computed first, followed by "+" and "-". Operators of the same precedence are computed from left to right). Parenthesis "(" and ")" can be used to change the computation order.

Parameters for Pie Charts

The following table describes the parameters available for pie charts.

Parameters for All XY Chart Layers

The followings are parameters that are apply to all XY Chart layers in general. Some layer types may have additional parameters (see below).

Note that certain parameters are inapplicable in some context. For example, when specifying the aggregate label of a stacked bar chart, the { dataSetName } parameter is inapplicable. It is because a stacked bar is composed of multiple data sets. It does not belong to any particular data set and hence does not have a data set name.

Additional Parameters for Line Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for Trend Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for Box-Whisker Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for HLOC and CandleStick Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for Vector Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Parameters for All Polar Layers
The followings are parameters that are apply to all Polar Chart layers in general. Some layer types may have additional parameters (see below).

Additional Parameters for PolarVector Layers
The followings are parameters that are in additional to the parameters for all Polar Chart layers.

Parameters for Axis
The following table describes the parameters available for pie charts.

Number Formatting
For parameters that are numbers, ChartDirector supports a number of formatting options in parameter substitution.

For example, if you want a numeric field { value } to have a precision of two digits to the right of the decimal point, use ',' (comma) as the thousand separator, and use '.' (dot) as the decimal point, and you may use { value | 2,. } . The number 123456.789 will then be displayed as 123,456.79.

For numbers, the formatting options are specified using the following syntax:

{ [param] | [a] [b] [c] [d] }

where:

If this field starts with "E" or "e", followed by a number, it means formatting the value using scientific notation with the specified number of decimal places. If the "E" or "e" is not followed by a number, 3 is assumed.

For example, { value | E4 } will format the value 10.3 to 1.0300E+1, and { value | e4 } will format the same value to 1.0300e+1.

If this field starts with "G" or "g", followed by a number, it means formatting the value using the scientific notation only if the value is large and requires more than the specified number of digits, or the value is less than 0.001. If scientific notation is used, the number following "G" or "g" also specifies the number of significant digits to use. If the "G" or "g" is not followed by a number, 4 is assumed.

For example, consider the format string { value | G4 } . The value 10 will be formatted to 10. The value 100000 will be formatted to 1.000E+5. Similarly, for { value | g4 } , the value 10 will be formatted to 10, while the value 100000 will be formatted to 1.000e+5.

If you skip this argument, ChartDirector will display the exact value using at most 6 decimal places.

You may skip [b] [c] [d] . In this case, the default will be used.

Date/Time Formatting
For parameters that are dates/times, the formatting options can be specified using the following syntax:

{ [param] | [datetime_format_string] }

where [datetime_format_string] must start with an english character (A-Z or a-z) that is not "G", "g", "E" or "e", and may contain any characters except ' } '. (If it starts with "G", "g", "E" or "e", it will be considered as a number format string.)

Certain characters are substituted according to the following table. Characters that are not substituted will be copied to the output.

For example, a parameter substitution format of { value | mm-dd-yyyy } will display a date as something similar to 09-15-2002. A format of { value | dd/mm/yy hh:nn:ss a } will display a date as something similar to 15/09/02 03:04:05 pm.

If you want to include characters in the format string without substitution, you may enclose the characters

in single or double quotes.

For example, the format { value | mmm '<*color=dd0000*>'yyyy } will display a date as something like Jan <*color=dd0000*>2005 (the <*color=dd0000*>is a CDML tag to specify red text color). Note that the <*color=dd0000*>tag is copied directly without substitution, even it contains "dd" which normally will be substituted with the day of month.
Escaping URL/HTML/CDML characters
Parameter substitution is often used to create HTML image maps. In HTML, some characters has special meanings and cannot be used reliably. For example, the '>' is used to represent the end of an HTML tag.

Furthermore, if the field happens to be used as an URL, characters such as '?', '&' and '+' also have special meanings.

By default, ChartDirector will escape template fields used in URL and query parameters when generating image maps. It will modify URL special characters to the URL escape format "%XX" (eg. "?" will become "%3F"). After that, it will modify HTML special characters to the HTML escape format "&#nn;" (eg. ">" will become ">".). Similarly, it will escape other attributes in the image map using HTML escape format (but not URL escape format).

In addition to escaping HTML and URL special characters, ChartDirector will also remove CDML fields in creating image maps. It is because CDML is only interpreted in ChartDirector, should not be useful outside of ChartDirector (such as in browser tool tips).

In some cases, you may not want ChartDirector to escape the special characters. For example, if the parameters have already been escaped before passing to ChartDirector, you may want to disable ChartDirector from escaping them again.

ChartDirector supports the following special fields to control the escape methods - " { escape_url } ", " { noescape_url } ", " { escape_html } ", " { noescape_html } ", " { escape_cdml } " and { noescape_cdml } ". These fields enable/disable the escape methods used in the template fields that follow them.

233.0.28 ChartDirector: Shape Specification

Plugin Version: 8.2, Platforms: macOS, Linux, Windows.

Answer: ChartDirector: Shape Specification
Notes: Several ChartDirector API accept shape specification as arguments. For example, BarLayer.setBarShape and BarLayer.setBarShape2 can be used to specify shapes of bars in bar charts, while DataSet.setDataSymbol, DataSet.setDataSymbol4, PolarLayer.setDataSymbol and PolarLayer.setDataSymbol4 can be used to specify shapes for data symbols.

Note that in addition to shapes, in many cases ChartDirector also accepts images or custom draw objects for

data representation. For example, see DataSet.setDataSymbol2, DataSet.setDataSymbol3, PolarLayer.setDataSymbol2 and PolarLayer.setDataSymbol3.

Built-In Shapes

Built-in shapes are specified as integers. The integers can be explicit constants, or can be generated by a ChartDirector method for parameterized shapes. For example, a circle is represented by an explicit constant CircleShape (=7). On the other hand, the number representing a polygon depends on the number of sides the polygon has, so it is generated by using the PolygonShape method, passing in the number of sides as argument.

The following table illustrates the various ChartDirector shapes:

Custom Shapes

In ChartDirector, custom shapes are specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 1000 x 1000 units, in which the x-axis is from -500 to 500 going from left to right, and the y-axis is from 0 to 1000 going from bottom to top.

ChartDirector will automatically scale the polygon so that 1000 units will become to the pixel size as requested by the various ChartDirector API.

As an example, the shape of the standard diamond shape in ChartDirector is represented as an array with 8 numbers:

0, 0, 500, 500, 0, 1000, -500, 500

233.0.29 Copy styled text?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: How to quickly copy styled text from one textarea to another?
Example:

```
// This example needs a window with TextArea1 and TextArea2.
#if TargetWin32 then
TextArea1.WinRTFDataMBS = TextArea2.WinRTFDataMBS
#elseif TargetMacOS then
TextArea1.NSTextViewMBS.textStorage.setAttributedString TextArea2.NSTextViewMBS.textStorage
```

```
#else
TextArea1.StyledText = TextArea2.StyledText
#endif
```

Notes: The code above uses special plugin functions on Mac and Windows and falls back to framework for Linux.

233.0.30 Do you have code to validate a credit card number?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can check the checksum to tell if a credit card number is not valid.
Example:

```
Var strNumber As String
Var nLength as Integer
Var nValue as Integer
Var nChecksum as Integer
Var nIndex as Integer

strNumber = EditField1.Text
nLength = Len(strNumber)
nChecksum = 0

For nIndex = 0 To nLength - 2
nValue = Val(Mid(strNumber, nLength - (nIndex + 1), 1)) * (2 - (nIndex Mod 2))
If nValue <10 Then
nChecksum = nChecksum + nValue
Else
nChecksum = nChecksum + (nValue - 9)
End If
Next

If Val(Mid(strNumber, Len(strNumber), 1)) = (10 - (nChecksum Mod 10)) Mod 10 Then
MessageBox("The credit card number looks valid")
Else
MessageBox("The credit card number is invalid")
End IF
```

Notes: Here's some code that will validate the checksum for a credit card. It works for Visa, MasterCard, American Express and Discover. Not sure about others, but I imagine they use the same basic algorithm. Of course, this doesn't actually mean that the credit card is valid, it's only useful for helping the user catch typos.

The above code doesn't have any error checking and it expects that the credit card number will be entered without spaces, dashes or any other non-numeric characters. Addressing those issues will be an exercise left

to the reader. :)

(From Mike Stefanik)

233.0.31 Do you have plugins for X-Rite EyeOne, eXact or i1Pro?

Plugin Version: all.

Answer: Our EyeOne plugin is available on request for licensees of the X-Rite SDKs.
Notes: Please first go to X-Rite and get a SDK license.
Than we can talk about the plugin.

233.0.32 Does SQL Plugin handle stored procedures with multiple result sets?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Yes, the plugin can work with multiple recordsets.
Notes: You need to use SQLCommandMBS class. When you get back results, you use FetchNext to walk over all records in the first result set. Than you simply start again with FetchNext to get the second record set.
Even the RecordSet functions should work, just use them twice to get all records from both record sets.

233.0.33 Does the plugin home home?

Plugin Version: all, Platform: macOS.

Answer: Yes, we like to know who is using the plugin, so the plugin may contact our server.
Notes: Please note that this does not affect your users as the plugin will only do this in the IDE and the relevant plugin part is never included in your applications.

The plugin if used for some hours, does contact our server to provide statistical data about Xojo version and OS versions. This way we know what versions are used. We can return the version number of the current plugin which may be visible in future versions somehow. And we transmit partial licenses data so we can track use of illegal license keys.

If you do not like to have this, you can block Xojo IDE from contacting our website via your Firewall.
Blocking the transfer will not disable the plugin or change the features.
Or contact us for a plugin version which explicitly does not contain this feature.

233.0.34 folderitem.absolutepath is limited to 255 chars. How can I get longer ones?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Paths on a Mac are not unique, so use them only to display them to the user.
Example:

```
Function AbsolutePath(f as FolderItem) As String
Var s as string
Var nf as FolderItem
nf = f
s = ""
while nf<>nil
s = nf.name + ":" + s
nf = nf.parent
wend
Return s
End Function
```

233.0.35 Has anyone played round with using CoreImage to do things like add dissolve transitions say when changing from one tab to another within a window?

Platform: macOS.

Answer: This code implements animations for a tabpanel change:
Example:

```
// in a tabpanel.change event:

Var r as CGSTransitionRequestMBS
Var co as new CGSConnectionMBS
Var cw as CGSWindowMBS
Var ct as CGSTransitionMBS
static OldTab as Integer

cw=co.CGSWindow(Window1)
If cw = Nil Then
return // 10.3...
End If
r=new CGSTransitionRequestMBS
r.TransitionType=r.CGSFlip
r.HasBackGround=false
r.HasBackColor=false
r.Win=cw
// watch the value of the clicked tab versus the last tab
```

```
if TabPanel1.Value=0 or TabPanel1.Value <OldTab then
r.TransitionOption=r.CGSLeft
ct=co.NewTransition(r)
if ct<>Nil then
Refresh
ct.Invoke(1)
ct.Wait(1)
ct.Release
else
MessageBox "Error creating the transition."
end if
else
r.TransitionOption=r.CGSRight
ct=co.NewTransition(r)
if ct<>Nil then
Refresh
ct.Invoke(1)
ct.Wait(1)
ct.Release
else
MessageBox "Error creating the transition."
end if
end if
// Keep track of the last tab clicked
OldTab = TabPanel1.Value
```

Notes: See CGS* classes for more details.

233.0.36 How can I detect whether an Intel CPU is a 64bit CPU?

Plugin Version: all.

Answer: Look on the CPU family returned by sysctl:
Example:

```
Function is64bit() As Boolean

#if TargetLittleEndian

Var m as MemoryBlock = NewMemoryBlock(8)
Var family as Integer
Var s as string

m=SystemControlNameToMIBMBS("hw.cpufamily")
m=SystemControlMBS(m)
```

```
if m<>nil then
m.LittleEndian=True
family=m.Long(0)

const CPUFAMILY_INTEL_6_14 = &h73d67300 //* "Intel Core Solo" and "Intel Core Duo" (32-bit Pentium-M with SSE3) */
const CPUFAMILY_INTEL_6_15 = &h426f69ef //* "Intel Core 2 Duo" */
const CPUFAMILY_INTEL_6_23 = &h78ea4fbc //* Penryn */
const CPUFAMILY_INTEL_6_26 = &h6b5a4cd2 //* Nehalem */

Select case family
case CPUFAMILY_INTEL_6_14
Return false
case CPUFAMILY_INTEL_6_15
Return true
case CPUFAMILY_INTEL_6_23
Return true
case CPUFAMILY_INTEL_6_26
Return true
// newer CPUs may be missing here
end Select

end if

#endif

Return false

Exception
Return false
End Function
```

Notes: This code is written for Mac OS X where you only have a limited number of possible CPUs.

233.0.37 How can I disable the close box of a window on Windows?

Plugin Version: all, Platform: Windows.

Answer: The following code will remove the close item from the system menu of the window.
Example:

```
#if TargetWin32 then
Declare Function GetSystemMenu Lib "user32" (hwnd as Integer, bRevert as Integer) as Integer
Declare Function RemoveMenu Lib "user32" (hMenu as Integer, nPosition as Integer, wFlags as Integer) as Integer
Var hSysMenu as Integer
```

```
hSysMenu = GetSystemMenu(me.WinHWND, 0)
RemoveMenu hSysMenu, &HF060, &H0
#endif
```

Notes: The window may not be updated directly.

233.0.38 How can I get all the environment variables from Windows?

Plugin Version: all, Platform: Windows.

Answer: Try this code:
Example:

```
#if targetWin32
declare function GetEnvironmentStrings Lib "kernel32" () as ptr
Var m as memoryBlock
Var n as Integer

m=GetEnvironmentStrings()

n=0
do
MessageBox m.cstring(n)
while m.byte(n)<>0
n=n+1
wend
n=n+1
loop until m.byte(n)=0
#endif
```

Notes: The MBS Plugin has an EnvironmentMBS class for this.

233.0.39 How can i get similar behavior to Roxio Toast or iTunes where clicking a 'burn' button allows the next inserted blank CD-R to bypass the Finder and be accepted by my application?

Plugin Version: all, Platform: macOS.

Answer: You need to get a media reservation.
Example:

```
Var d as DRDeviceMBS // get a device
d.AcquireMediaReservation
```

Notes: Use the plugin function AcquireMediaReservation and later release it using ReleaseMediaReservation.
See plugin examples on how to use it and check Apples DiscRecording framework documentation for more details.

233.0.40 How can I get text from a PDF?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Crossplatform you can use DynaPDF Pro.
Notes: On Mac OS X you can also use PDFKit for the same job.
While DynaPDF Pro gives you each bit of text with rotation, font information and encoding details, PDFKit gives you only the text string for a PDF page.

233.0.41 How can I get text from a Word Document?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: to get the text string from a doc file, use the NSAttributedStringMBS class.
Notes: The NSAttributedStringMBS class is Mac OS X only and we have currently no solution for Windows or Linux.

Use the NSAttributedStringMBS.initWithDocFormat(data as string) as boolean method.

233.0.42 How can I get the item string for a given file creator?

Plugin Version: all.

Answer: Try this function:
Example:

```
Sub pullNativeDocs(aCREA As string)
Var result as Integer
Var m, k as memoryBlock
Var f as folderItem
Var newType as string
Var anIcon As picture
Var ofs as Integer

Declare Function GetFileTypesThatAppCanNativelyOpen Lib "Carbon" (appVRefNumHint as Short, appSignature as OSType, nativeTypes as Ptr) as Short Inline68K("701CABFC")
Declare Function GetDocumentKindString Lib "Carbon" (docVRefNum as Short, docType as OSType, docCreator as OSType, kindString as ptr) as Short Inline68K("7016ABFC")
```

```
ListBox1.deleteAllRows

m = newMemoryBlock(1024)
result = GetFileTypesThatAppCanNativelyOpen(Volume(0).MacVRefNum, aCREA, m)
if result <>0 then
ListBox1.addRow "<Not found.>"
return
end if

do
if m.byte(ofs*4) = 0 then
exit
else
newType = m.OSTypeMBS(ofs*4)
ListBox1.addRow newType
k = newMemoryBlock(64)
result = GetDocumentKindString(Volume(0).MacVRefNum, newType, aCREA, k)
if result = 0 then
ListBox1.CellTextAt(ofs,1) = k.pString(0)
ofs = ofs + 1
else
ListBox1.CellTextAt(ofs,1) = "(unknown)"
end if

end if
loop

End Sub
```

Notes: Change "Translation" to "CarbonLib" for Mac OS X.

233.0.43 How can I launch an app using it's creator code?

Plugin Version: all, Platform: macOS.

Answer: Send an AppleEvent "odoc" with the creator code to the Finder ("MACS"):
Example:

```
Function LaunchByCreator(C As String) As Boolean
Var A As AppleEvent
A = NewAppleEvent("aevt","odoc","MACS")
A.ObjectSpecifierParam("—-") = GetUniqueIDObjectDescriptor("appf",nil,C)
return A.Send
End Function
```

233.0.44 How can I learn what shared libraries are required by a plugin on Linux?

Plugin Version: all, Platform: macOS.

Answer: Please use the ldd command in the terminal.
Notes: You build an app on any platform, but for Linux.
For the resulting .so files in the libs folder, you can run the ldd command with the library path as parameter. It shows you references lib files and you can make sure you have those installed.

This is a sample run of our graphicsmagick plugin:

```
cs@Ubuntu32:
textasciitilde /MeinProgramm/MeinProgramm Libs$ ldd libMBSGraphicsMagickPlugin17744.so
Linux-gate.so.1 =>(0xb76ee000)
libdl.so.2 =>/lib/i386-Linux-gnu/libdl.so.2 (0xb6f0e000)

cs@Ubuntu32:
textasciitilde /MeinProgramm/MeinProgramm Libs$

As you see all library have been found and their load address is printed behind the na,e.
If a library is missing, you usually see the address missing there or being zero.

233.0.45 How can I validate an email address?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can try this code:
Example:

```
// This example needs a window with StaticText2.
Var re As RegEx
re = New RegEx
Var rm As RegExMatch

re.SearchPattern = " [ a-z0-9!#$ %&'*+/=?^_' { | }
textasciitilde - ] +(?:\. [ a-z0-9!#$ %&'*+/=?^_' { | }
textasciitilde - ] +)*@(?: [ a-z0-9 ] (?: [ a-z0-9- ] * [ a-z0-9 ] )?\.)+ [ a-z0-9 ] (?: [ a-z0-9- ] * [ a-z0-9 ] )?"
rm = re.Search(editField1.Text)

if rm = Nil Then
StaticText2.text = editField1.Text + " not valid email"
Else
StaticText2.Text = editField1.Text + " is valid"
End if
```

Notes: Adapted from:
http://www.regular-expressions.info/email.html

233.0.46 How do I decode correctly an email subject?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: The following code can be used to decode an email subject including several encodings including Base 64.
Example:

```
Var src as string // input

Var theRegex as Regex
Var theRegexMatch as RegexMatch
Var result, infoCharset, encodedPart as string
Var theStart as Integer

if instr(src, "=?") >0 then
theRegex = new Regex
theRegex.Options.Greedy = false
theRegex.searchPattern = "(.*)=\?(.+)\?(Q | B)\?(.+)\?="
theRegexMatch = theRegex.search(src)
while theRegexMatch <>nil
theStart = theRegexMatch.subExpressionStartB(0) + len(theRegexMatch.subExpressionString(0))

result = result + theRegexMatch.subExpressionString(1)
infoCharset = theRegexMatch.subExpressionString(2)
encodedPart = theRegexMatch.subExpressionString(4)
if theRegexMatch.subExpressionString(3) = "B" then
encodedPart = DecodeBase64(encodedPart)
elseif theRegexMatch.subExpressionString(3) = "Q" then
encodedPart = DecodeQuotedPrintable(encodedPart)
end if
if right(result, 1) = " " then
result = mid(result, 1, len(result)-1)
end if
encodedPart = encodedPart.DefineEncoding(GetInternetTextEncoding(infoCharset))
result = result + encodedPart

theRegex.SearchStartPosition = theStart
theRegexMatch = theRegex.search()
wend

result = result + mid(src, theStart+1)

else
result = src
end if
```

```
// theRegexMatch = theRegex.search
```

MessageBox result

Notes: May not look nice depending on the controls used.
This is no longer needed when using MimeEmailMBS class which decodes for you.

233.0.47 How do I enable/disable a single tab in a tabpanel?

Plugin Version: all, Platform: macOS.

Answer: Use the TabpanelEnabledMBS method.
Example:

```
TabpanelEnabledMBS(TabPanel1, 1, false)
```

Notes: Use Carbon for MachO and CarbonLib for Mac Carbon and AppearanceLib for Mac OS Classic as library.
For Cocoa, please use enabled property of NSTabViewItemMBS class.

233.0.48 How do I find the root volume for a file?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Try this function:
Example:

```
Function GetRootVolume(f as FolderItem) as FolderItem
Var root, dum as folderItem
if f <>nil then
root = f // f might be the volume
do
dum = root.parent
if dum <>nil then
root = dum
end if
loop until dum = nil
return root
end if
End Function
```

233.0.49 How do I get the current languages list?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
Var p as new CFPreferencesMBS
Var a as CFArrayMBS
Var s as CFStringMBS
Var o as CFObjectMBS
Var sa(-1) as string

o=p.CopyAppValue("AppleLanguages",".GlobalPreferences")

if o<>Nil then
a=CFArrayMBS(o)

Var i,c as Integer

c=a.Count-1
for i=0 to c
o=a.Item(i)

if o isa CFStringMBS then
s=CFStringMBS(o)
sa.Add s.str
end if
next
end if

MessageBox Join(sa,EndOfLine)
```

Notes: On Mac OS X you can get the list of current languages like this list:

de
en
ja
fr
es
it
pt
pt-PT
nl
sv
nb
da

fi
ru
pl
zh-Hans
zh-Hant
ko

Which has German (de) on the top for a German user.
This code has been tested on Mac OS X 10.5 only.

233.0.50 How do I get the Mac OS Version?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
Var i as Integer
if system.gestalt("sysv", i) then
//do this in an 'If' in case you don't get any value back at all and system.gestalt returns boolean
if i = &h750 then //If OS is 7.5
//do stuff
elseif i = &h761 then //If OS is 7.6.1
//do stuff
end if
end if
```

Notes: The MBS Plugin has a function SystemInformationMBS.OSVersionString for this.

233.0.51 How do I get the printer name?

Plugin Version: all.

Answer: For Mac OS Classic see the code below and for Mac OS X use the Carbon Print Manager Classes from the MBS Plugin.
Example:

```
Var s as String
Var i as Integer

s=app.ResourceFork.GetResource("STR ",-8192)
if s<>"" then
i=ascb(leftb(s,1))
s=mid(s,2,i)
```

```
MessageBox s
end if
```

Notes: A note from Craig Hoyt:

After looking at your example I had a little deja-vu experience. Several years ago I played around with this same code if FutureBasic. I discovered that it did not and still doesn't provide the 'Printer Name', it does return the print driver name. If it returns 'LaserWriter 8' as the print driver you can look into this file and get the 'PAPA' resource #-8192 to get the actual Printer Name. Unfortunately this does not hold true for other printers. My Epson and HP Printers (the Epson has an Ethernet Card and the HP is USB) do not provide this info in their drivers. As far as I can tell it only returns the name by polling the printer itself.

233.0.52 How do I make a metal window if RB does not allow me this?

Plugin Version: all, Platform: macOS.

Answer: The following declare turns any window on Mac OS X 10.2 or newer into a metal one.
Example:

```
declare sub ChangeWindowAttributes lib "Carbon" (win as windowptr, a as Integer, b as Integer)

ChangeWindowAttributes Window1,256,0
```

Notes: May not look nice depending on the controls used.

233.0.53 How do I make a smooth color transition?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

I'd like to show in a report some bars, which start with color A and end with color B.

The color change should be very smooth.

My problem: If I would start from 255,0,0 and end by 0,0,0, I would have 255 different colors. If the bars are longer than 255 pixels, would

this look nice?
Example:

```
// Window.Paint:
Sub Paint(g As Graphics)
Var w,w1,x,p as Integer
Var c1,c2,c as color
Var p1,p2 as Double

c1=rgb(255,0,0) // start color
c2=rgb(0,255,0) // end color

w=g.Width
w1=w-1

for x=0 to w1
p1=x/w1
p2=1.0-p1

c=rgb(c1.red*p1+c2.red*p2, c1.green*p1+c2.green*p2, c1.blue*p1+c2.blue*p2)

g.ForeColor=c
g.DrawLine x,0,x,g.Height

next
End Sub
```

Notes:

Try the code above in a window paint event handler.

233.0.54 How do I read the applications in the dock app?

Plugin Version: all, Platform: macOS.

Answer: Use CFPreferencesMBS class like in this example:
Example:

```
// Reads file names from persistent dock applications and puts them into the list

Var pref as new CFPreferencesMBS

Var persistentapps as CFStringMBS = NewCFStringMBS("persistent-apps")
Var ApplicationID as CFStringMBS = NewCFStringMBS("com.apple.dock")
Var tiledata as CFStringMBS = NewCFStringMBS("tile-data")
Var filelabel as CFStringMBS = NewCFStringMBS("file-label")
```

```
// get the array of persistent applications from dock preferences
Var o as CFObjectMBS = pref.CopyValue(persistentapps, ApplicationID, pref.kCFPreferencesCurrentUser,
pref.kCFPreferencesAnyHost)

if o isa CFArrayMBS then
Var a as CFArrayMBS = CFArrayMBS(o)

// walk over all items in array
Var c as Integer = a.Count-1
for i as Integer = 0 to c

// get dictionary describing item
o = a.Item(i)

if o isa CFDictionaryMBS then
Var d as CFDictionaryMBS = CFDictionaryMBS(o)

// and pick tile data dictionary
o = d.Value(tiledata)
if o isa CFDictionaryMBS then
d = CFDictionaryMBS(o)

// and pick there the file label
o = d.Value(filelabel)
if o isa CFStringMBS then
// and display it
Var name as string = CFStringMBS(o).str
List.AddRow name
end if
end if
end if

next

else
MessageBox "Failed to read dock preferences."
end if
```

Notes: You can use the CFPreferencesMBS.SetValue to change a value and CFPreferencesMBS.Synchronize to write the values to disc. You may need to restart the Dock.app if you modified things.

233.0.55 How do I truncate a file?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: In a binarystream you can set the length property to truncate.

233.0.56 How do update a Finder's windows after changing some files?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
Var f as folderitem // some file
Var ae as appleevent
ae=newappleevent("fndr","fupd","MACS")
ae.folderitemparam("—-")=f
if not ae.send then
//something went wrong
end if
```

Notes: The folderitem.finderupdate from the MBS Plugin does something like this.

233.0.57 How to access a USB device directly?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: First, it depends on the device.
Notes: Some devices can be talked directly from user mode code, but some require a kernel driver.

For some devices you can use plugins to access them like:

- Audio and Video sources using the QTGrabberClassMBS
- Mass storage devices using the folderitem class.
- Serial devices using the System.SerialPort function.
- HID USB devices can be used with MacHIDMBS, WinHIDMBS or LinuxHIDInterface class.
- Any USB device may be used with MacUSBMBS or WinUSBMBS classes.

In general it is always the best to take the most high level access to have others do the work for the details.

233.0.58 How to add icon to file on Mac?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use FolderItem.AddCustomIcon or NSWorkspaceMBS.setIcon functions.
Notes: Please close any open stream for the file you want to add an icon.

233.0.59 How to ask the Mac for the Name of the Machine?

Plugin Version: all, Platform: macOS.

Answer: Using Apple Events you can use this code:
Example:

```
Function Computername() As string

Var theEvent as AppleEvent
Var err as boolean

theEvent = newAppleEvent("mchn","getd","MACS")

err = theEvent.send

return theevent.ReplyString

End Function
```

Notes: Code above is for Mac OS 9!
Also the MBS Plugin has a function for this which may be faster and work also on Macs without Filesharing (which handles this event).

233.0.60 How to automatically enable retina in my apps?

Plugin Version: all, Platform: macOS.

Answer: You can run a build script on each build with this code:
Example:

```
Var App As String = CurrentBuildLocation + "/" + CurrentBuildAppName + ".app"
Call DoShellCommand("/usr/bin/defaults write " + App + "/Contents/Info ""NSHighResolutionCapable""
YES")
```

Notes: This will set the NSHighResolutionCapable flag to YES.

233.0.61 How to avoid leaks with Cocoa functions?

Plugin Version: all, Platform: macOS.

Answer: You can try this code on Mac OS X:
Example:

```
// in a Timer Action event:
Sub Action()
static LastPool as NSAutoreleasePoolMBS = nil
static CurrentPool as NSAutoreleasePoolMBS = nil

LastPool = CurrentPool
CurrentPool = new NSAutoreleasePoolMBS
End Sub
```

Notes: With Xojo 2009r4 the code above should not be needed as Xojo runtime does automatically handle the NSAutoreleasePools for you. For older Xojo versions you need to use code with a timer with the action event above to avoid memory leaks.

Please do not use Xojo 2009r4 and newer with plugins before version 9.5. You can get crashes there which typically show a line with a objc_msgSend call.

233.0.62 How to avoid trouble connecting to oracle database with SQL Plugin?

Plugin Version: all, Platform: macOS.

Answer: For oracle the most important thing is to point the plugin to the libraries from oracle.
Notes: In environment variables, the paths like ORACLE_HOME must be defined.
On Mac OS X you also need to define DYLD_LIBRARY_PATH to point to the dylib files from oracle.

For that you need to modify /etc/launchd.conf for Mac OS X 10.8 and newer.
In older versions those variables in .MacOSX/environment.plist file in user's home.

Another way for the case you bundle things inside your app is to use the LSEnvironment key in info.plist.
In info.plist it looks like this:

```
<key>LSEnvironment</key>
<dict>
<key>test</key>
<string>Hello World</string>
</dict>
```

233.0.63 How to avoid ___NSAutoreleaseNoPool console messages in threads?

Plugin Version: all, Platform: macOS.

Answer: You need to use your own NSAutoreleasePool on a thread like this:
Example:

```
sub MyThread.run
Var pool as new NSAutoreleasePoolMBS
// do work here

pool=nil
end sub
```

Notes: For more details read here:
http://developer.apple.com/mac/library/documentation/Cocoa/Reference/Foundation/Classes/NSAutoreleasePool_Class/Reference/Reference.html

233.0.64 How to bring app to front?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: On Mac you can use this code:
Example:

```
// First way:
app.FrontMostMBS = true

// second way:
Var p as new ProcessMBS
p.GetCurrentProcess
p.FrontProcess = true

// third way:
NSApplicationMBS.sharedApplication.activateIgnoringOtherApps(true)

// for Windows:
RemoteControlMBS.WinBringWindowToTop
```

Notes: This will bring a Mac app to the front layer.

233.0.65 How to bring my application to front?

Plugin Version: all, Platform: macOS.

Answer: This makes SimpleText (Code ttxt) to the frontmost application:
Example:

```
Var A As AppleEvent
A = NewAppleEvent("misc","actv","")
If Not A.Send then
Beep
end if
```

Notes: (Code is Mac only)

233.0.66 How to catch Control-C on Mac or Linux in a console app?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use SignalHandlerMBS class for this.
Example:

```
// watch for Control-C on Mac
call SignalHandlerMBS.SetFlagHandler(2)

Var ende as boolean = false
do
if SignalHandlerMBS.IsFlagSet(2) then
Print "Flag 2 set. Existing..."
ende = true
end if

DoEvents 1
loop until ende
```

Notes: The signal is catched, a flag is set and you can ask later in your normal application flow for the result.

233.0.67 How to change name of application menu?

Plugin Version: all, Platforms: macOS, Windows.

Answer: Use this code to change the application menu name on Mac OS X:
Example:

```
Var mb as new MenubarMBS
Var m as MenuMBS = mb.item(1) // 1 is in my tests the app menu
if m<>Nil then
m.MenuTitle = "Hello World"
```

```
end if
```

Notes: This code is for Carbon only.

233.0.68 How to change the name in the menu bar of my app on Mac OS X?

Plugin Version: all, Platform: macOS.

Answer:

You mean it screws up if the file name of the bundle itself is different than the name of the executable file in the MacOS folder within the bundle? If so, you should find something like this within your Info.plist file (or the 'plst' resource that the RB IDE builds for you):

```
<key>CFBundleExecutable</key>
<string>Executable file name here</string>
```

Just make sure that file name matches.

However, if your question involves how you can change the name of the app that appears in the menu and the dock, that's different. You can make this name different from the file name by changing the CFBundleName key:

```
<key>CFBundleName</key>
<string>Name for menu here</string>
```

Note that if you use my free AppBundler program, this second part is taken care of for you – just fill in a custom name in the right field. You can find AppBundler (from Thomas Reed) at http://www.bitjuggler.com/products/appbundler/ .

233.0.69 How to check if a folder/directory has subfolders?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use code like this to check all items in a folder:
Example:

```
Function HasSubFolder(folder as FolderItem) As Boolean
Var c as Integer = folder.Count
```

```
for i as Integer = 1 to c
Var item as FolderItem = folder.TrueItem(i)

if item<>Nil and item.Directory then
Return true
end if
next

End Function
```

Notes: We use trueitem() here to avoid resolving alias/link files.
Also we check for nil as we may not have permission to see all items.
And if one is a directory, we return without checking the rest.

233.0.70 How to check if Macbook runs on battery or AC power?

Plugin Version: all, Platform: macOS.

Answer: Please use our IOPowerSourcesMBS class like this:
Example:

```
Function PowerSourceState() as Integer
Var p as new IOPowerSourcesMBS

// check all power sources
Var u as Integer = p.Count-1
for i as Integer = 0 to u
Var d as CFDictionaryMBS = p.Item(i)
if d<>nil then
// check if they have a power source state key:
Var o as CFObjectMBS = d.Value(NewCFStringMBS("Power Source State"))
if o isa CFStringMBS then
Var s as string = CFStringMBS(o).str

'MessageBox s

if s = "AC Power" then
Return 1
elseif s = "Battery Power" then
Return 2
end if
end if
end if
next
Return 0 // unknown
End Function
```

Notes: If you want to check the CFDictionaryMBS content, simply use a line like "dim x as dictionary = d.dictionary" and check the contents in the debugger.

233.0.71 How to check if Microsoft Outlook is installed?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: If you need Outlook for Scripting, you should simply check registry for the required Outlook.Application class:
Example:

```
Function OutlookInstalled() As Boolean
#if TargetWin32 then

try
Var r as new RegistryItem("HKEY_CLASSES_ROOT\Outlook.Application\CLSID", false)

Return true

catch r as RegistryAccessErrorException
// not installed
Return false

end try

#else

// Windows only, so false on other platforms
Return false

#endif

End Function
```

233.0.72 How to check on Mac OS which country or language is currently selected?

Plugin Version: all, Platform: macOS.

Answer: The code below returns a country value.
Example:

```
Var result as Integer
```

```
IF TargetMacOS THEN

CONST smScriptLang = 28
CONST smSystemScript = -1

DECLARE FUNCTION GetScriptManagerVariable LIB "Carbon" ( selector as Integer) as Integer
DECLARE FUNCTION GetScriptVariable LIB "Carbon" ( script as Integer, selector as Integer) as Integer

result=GetScriptVariable(smSystemScript, smScriptLang)

END IF
```

Notes: Returns values like:

For more values, check "Script.h" in the frameworks.

233.0.73 How to code sign my app with plugins?

Plugin Version: all, Platform: macOS.

Answer: When you try to code sign the application with plugin dylibs on Mac OS X, you may see error message that there is actually a signature included.
Notes: Please use the -f command line parameter with codesign utility to overwrite our MBS signature.
We sign our plugins for MacOS, iOS and Windows to make sure they have not been modified.

In terminal, you do like this:

```
cd <Path to folder of app>

xattr -cr <Appname>.app
codesign -f -s "Developer ID Application: <Your Name>" <Appname>.app/Contents/Frameworks/*.dylib
codesign -f -s "Developer ID Application: <Your Name>" <Appname>.app/Contents/Frameworks/*.framework
codesign -f -s "Developer ID Application: <Your Name>" <Appname>.app
```

Please use the name of your certificate (See keychain), the name of your app and the path to the app folder.
If you have helper apps you need to sign them first.
You can use a build step to automatically sign your app on build.

233.0.74 How to collapse a window?

Plugin Version: all, Platform: macOS.

Answer: Use this function (Mac only):
Example:

```
Sub CollapseRBwindow(w as window, CollapseStatus as boolean)
Var state, err as Integer
Var wh as MemoryBlock

Declare Function CollapseWindow Lib "Carbon" (window as Integer,collapse as Integer) as Integer

IF CollapseStatus THEN
state = 1
ELSE
state = 0
END IF

err = CollapseWindow(w.MacWindowPtr, state)

End Sub
```

Notes: Also the MBS Plugin has a window.collapsedmbs property you can set.
For Windows the MBS Plugin has a window.isiconicmbs property.

233.0.75 How to compare two pictures?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can try this code:
Example:

```
Function ComparePictures(p as picture,q as picture) as Integer
Var r,u as RGBSurface
Var x,y,n,m,h,w as Integer
Var w1,w2,h1,h2,d1,d2 as Integer
Var c1,c2 as color

h1=p.Height
h2=q.Height
w1=p.Width
w2=q.Width
d1=p.Depth
d2=q.Depth

if d1<>d2 then
```

```
Return 1
elseif w1<>w2 then
return 2
elseif h1<>h2 then
Return 3
else
r=p.RGBSurface
u=q.RGBSurface

if r=nil or u=nil then
Return -1
else
h=h1-1
w=w1-1
m=min(w,h)

for n=0 to m
c1=r.Pixel(n,n)
c2=u.Pixel(n,n)
if c1<>c2 then
Return 4
end if
next

for y=0 to h
for x=0 to w
c1=r.Pixel(x,y)
c2=u.Pixel(x,y)
if c1<>c2 then
Return 5
end if
next
next

// 0 for equal
// -1 for error (no RGBsurface)
// 1 for different depth
// 2 for different width
// 3 for different height
// 4 for different pixels (fast test)
// 5 for different pixels (slow test)
end if
end if

Exception
Return -1
End Function
```

Notes: Remember that this only works on bitmap pictures, so the picture.BitmapMBS function may be useful.

233.0.76 How to compile PHP library?

Plugin Version: all, Platform: macOS.

Answer: You have to download the source code and compile a static version of the library.
Notes: This instructions were written based on PHP 5.2.6 on Mac OS X:

- Best take a new Mac with current Xcode version installed.
- Download the source code archive. e.g. "php-5.2.6.tar.bz2"
- Expand that archive on your harddisc.
- Open terminal window
- change directory to the php directory. e.g. "cd /php-5.2.6"
- execute this two lines to define the supported CPU types and the minimum Mac OS X version:
- export CFLAGS="-arch ppc -arch i386 -mmacosx-version-min=10.3"
- export CXXFLAGS="-arch ppc -arch i386 -mmacosx-version-min=10.3"
- the command "./configure help" does show the configure options.
- use configure with a line like this:
- ./configure –enable-embed –with-curl -enable-ftp –enable-zip –enable-sockets –enable-static –enable-soap –with-zlib –with-bz2 –enable-exif –enable-bcmath –enable-calendar
- start the compilation with "make all"
- other option is to use "make install" which first does the same as "make all" and than does some installation scripts.
- you may get an error about a duplicate symbole __yytext. Search the file "zend_ini_scanner.c", search a line with "char *yytext;" and change it to "extern char *yytext;".
- On the end you get a lot of error messages, but you have a working library (named libphp5.so) file in the invisible ".libs" folder inside your php source folder.

Possible problems and solutions:

- If the path to your files has spaces, you can get into trouble. e.g. "/RB Plugins/PHP" is bad as files will be searched sometimes in "/RB".

- If you have in /usr/local/lib libraries which conflict with the default libraries, you can get into trouble.
- If you installed some open source tools which compiled their own libraries, you can get into conflicts.
- if you have to reconfigure or after a problem, you may need to use "make clean" before you start "make all" again.

Feel free to install additional libraries and add more packages to the configure line.

233.0.77 How to convert a BrowserType to a String with WebSession.Browser?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use code like this:
Example:

```
Function GetBrowserName(s as WebSession.BrowserType) As string
Select case s
case WebSession.BrowserType.Android
Return "Andriod"
case WebSession.BrowserType.Blackberry
Return "Blackberry"
case WebSession.BrowserType.Chrome
Return "Chrome"
case WebSession.BrowserType.ChromeOS
Return "ChromeOS"
case WebSession.BrowserType.Firefox
Return "Firefox"
case WebSession.BrowserType.InternetExplorer
Return "InternetExplorer"
case WebSession.BrowserType.Opera
Return "Opera"
case WebSession.BrowserType.Safari
Return "Safari"
case WebSession.BrowserType.SafariMobile
Return "SafariMobile"
case WebSession.BrowserType.Unknown
Return "Unknown"
else
Return "Unkown: "+str(integer(s))
end Select

End Function
```

233.0.78 How to convert a EngineType to a String with WebSession.Engine?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use code like this:
Example:

```
Function GetRenderingEngineName(s as WebSession.EngineType) As string
Select case s
case WebSession.EngineType.Gecko
Return "Gecko"
case WebSession.EngineType.Presto
Return "Presto"
case WebSession.EngineType.Trident
Return "Trident"
case WebSession.EngineType.Unknown
Return "Unknown"
case WebSession.EngineType.WebKit
Return "WebKit"
else
Return "Unkown: "+str(integer(s))
end Select

End Function
```

233.0.79 How to convert a PlatformType to a String with WebSession.Platform?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use code like this:
Example:

```
Function GetPlatformName(s as WebSession.PlatformType) As string
Select case s
case WebSession.PlatformType.Blackberry
Return "Blackberry"
case WebSession.PlatformType.iPad
Return "iPad"
case WebSession.PlatformType.iPhone
Return "iPhone"
case WebSession.PlatformType.iPodTouch
Return "iPodTouch"
case WebSession.PlatformType.Linux
Return "Linux"
case WebSession.PlatformType.Macintosh
Return "Macintosh"
```

```
case WebSession.PlatformType.PS3
Return "PS3"
case WebSession.PlatformType.Unknown
Return "Unknown"
case WebSession.PlatformType.WebOS
Return "WebOS"
case WebSession.PlatformType.Wii
Return "Wii"
case WebSession.PlatformType.Windows
Return "Windows"
else
Return "Unkown: "+str(integer(s))
end Select

End Function
```

233.0.80 How to convert a text to iso-8859-1 using the TextEncoder?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

This code can help you althrough it's not perfect.
You need to set lc to the current color you use.
Example:

```
Var outstring as string
Var theMac, thePC as textencoding
Var Mac2PC as textconverter

theMac = getTextEncoding(0) // MacRoman
thePC = getTextEncoding(&h0201) // ISOLatin1

Mac2PC = getTextConverter(theMac, thePC)
// if you wanted to do the opposite just create a converter
// PC2Mac = getTextConverter(thePC, theMac)

outstring = Mac2PC.convert("Bj√rn, this text should be converted")
Mac2PC.clear
```

Notes:

You have to call Mac2PC.clear after every conversion to reset the encoding engine.
See also newer TextConverterMBS class.

233.0.81 How to convert ChartTime back to Xojo date?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: We have this example code:
Example:

```
Function ChartTimeToDate(ChartTime as Double) As date
static diff as Double = 0.0

if diff = 0.0 then
Var d2 as Double = CDBaseChartMBS.chartTime(2015, 1, 1)
Var da as new date(2015, 1, 1)
Var ts as Double = da.TotalSeconds

diff = ts - d2
end if

Var d as new date
d.TotalSeconds = diff + ChartTime

Return d
End Function
```

Notes: As you see we calculate the difference in base date from Date and ChartTime and later use difference to convert.

233.0.82 How to convert line endings in text files?

Plugin Version: all, Platform: macOS.

Answer: You can simply read file with TextInputStream and write with new line endings using TextOutputStream class.
Example:

```
Var inputfile as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var outputfile as FolderItem = SpecialFolder.Desktop.Child("output.txt")
Var it as TextInputStream = TextInputStream.Open(inputfile)
Var ot as TextOutputStream = TextOutputStream.Create(outputfile)

ot.Delimiter = EndOfLine.Windows // new line ending
while not it.EOF
ot.WriteLine it.ReadLine
wend
```

Notes: TextInputStream will read any input line endings and with delimiter property in TextOutputStream

you can easily define your new delimiter.

233.0.83 How to convert picture to string and back?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use this plugin functions:
Notes: JPEG:

JPEGStringToPictureMBS(buf as string) as picture
JPEGStringToPictureMBS(buf as string,allowdamaged as Boolean) as picture
PictureToJPEGStringMBS(pic as picture,quality as Integer) as string

PNG:

PictureToPNGStringMBS(pic as picture, gamma as single) as string
PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single) as string
PictureToPNGStringMBS(pic as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string
PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string
PNGStringToPictureMBS(data as string, gamma as single) as picture
PNGStringToPNGPictureMBS(data as string, gamma as single) as PNGpictureMBS

Tiff:

TIFFStringToPictureMBS(data as string) as picture
TIFFStringToTiffPictureMBS(data as string) as TiffPictureMBS

BMP:

BMPStringtoPictureMBS(data as string) as picture
Picture.BMPDataMBS(ResolutionValueDPI as Integer=72) as string

GIF:

GifStringToGifMBS(data as string) as GIFMBS
GifStringToPictureMBS(data as string) as Picture

233.0.84 How to copy an array?

Plugin Version: all, Platform: macOS.

Answer: You can use a function like this to copy an array:
Example:

```
Function CopyArray(a() as Double) as Double()
Var r() as Double
for each v as Double in a
r.Add v
next
Return r
End Function
```

Notes: If needed make several copies of this method with different data types, not just double.
For a deep copy of an array of objects, you need to change code to also make a copy of those objects.

233.0.85 How to copy an dictionary?

Plugin Version: all, Platform: macOS.

Answer: You can use a function like this to copy a dictionary:
Example:

```
Function CopyDictionary(d as Dictionary) As Dictionary
Var r as new Dictionary
for each key as Variant in d.keys
r.Value(key) = d.Value(key)
next
Return r
End Function
```

Notes: If needed make several copies of this method with different data types, not just double.
For a deep copy of an dictionary of objects, you need to change code to also make a copy of those objects.

233.0.86 How to copy parts of a movie to another one?

Plugin Version: all, Platforms: macOS, Windows.

Answer: The code below copies ten seconds of the snowman movie to the dummy movie starting at the 5th second.
Example:

```
Var f as FolderItem
```

```
Var md as EditableMovie
Var ms as EditableMovie

f=SpecialFolder.Desktop.Child("Our First Snowman.mov")
ms=f.OpenEditableMovie

ms.SelectionStartMBS=5
ms.SelectionLengthMBS=10

f=SpecialFolder.Desktop.Child("dummy.mov")
md=f.CreateMovie

MessageBox str(md.AddMovieSelectionMBS(ms))
```

Notes: If result is not 0, the method fails.

233.0.87 How to create a birthday like calendar event?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
// start a connection to the calendar database
Var s as new CalCalendarStoreMBS

// needed for the error details
Var e as NSErrorMBS

Var r as CalRecurrenceRuleMBS = CalRecurrenceRuleMBS.initYearlyRecurrence(1, nil) // repeat every year without end

Var a as new CalAlarmMBS // add alarm
a.action = a.CalAlarmActionDisplay
a.relativeTrigger = -3600*24 // 24 Hours before

// create a new calendar
Var c as new CalEventMBS

Var d as new date(2011, 04, 20) // the date

Var calendars() as CalCalendarMBS = s.calendars

// set properties
c.Title="Test Birthday"
c.startDate=d
```

```
c.recurrenceRule = r
c.calendar=calendars(0) // add to first calendar
c.addAlarm(a)
c.endDate = d
c.isAllDay = true

// save event
call s.saveEvent(c,s.CalSpanAllEvents, e)
if e<>nil then
MessageBox e.localizedDescription
else
MessageBox "New event was created."
end if
```

Notes: This adds an event to iCal for the given date with alarm to remember you and repeats it every year.

233.0.88 How to create a GUID?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use the UUIDMBS class for this.

233.0.89 How to create a Mac picture clip file?

Plugin Version: all, Platform: Windows.

Answer: You can use code like this one.
Example:

```
Var f As FolderItem
Var p As Picture

f=SpecialFolder.Desktop.Child("Test.pictClipping")
if f=nil then Return

p=new Picture(300,200,32) 'Make a sample picture
p.Graphics.ForeColor=RGB(0,255,255)
p.Graphics.FillOval 0,0,99,99
p.Graphics.ForeColor=RGB(255,0,0)
p.Graphics.DrawOval 0,0,99,99

Var r As ResourceFork 'ResourceFork is needed for a clip file
```

```
// Please define a file type Any
r=f.CreateResourceFork("Any")

// get PICT data using plugin function
Var pictdata as string = p.PicHandleDataMBS
r.AddResource(pictdata,"PICT",256,"Picture")

Var m as new MemoryBlock(8)

m.LittleEndian = false
m.Int16Value(0) = 0
m.Int16Value(2) = 0
m.Int16Value(4) = p.Width
m.Int16Value(6) = p.Height

r.AddResource(m,"RECT",256,"")

'Values taken from a sample file and irrelevant to the problem
Var data as string = DecodeBase64("AQAAAAAAAAAAAAAAAAAACAFRDRVIAAAABAAAAAAAAAABUQ0lQAAAAA
r.AddResource(data,"drag",128,"") 'ditto
r.Close
```

Notes: In general Apple has deprecated this, but a few application still support clippings.

233.0.90 How to create a PDF file in Xojo?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Check our DynaPDF plugin and the examples.
Notes: An alternative can be to use the CoreGraphics and Cocoa functions on Mac OS X.
For Windows, we can only suggest our DynaPDF plugin.

233.0.91 How to create EmailAttachment for PDF Data in memory?

Plugin Version: all, Platform: macOS.

Answer: You can use code like the one below:
Example:

```
Function EmailAttachmentFromPDFData(PDFData as string, filename as string) As EmailAttachment
Var a as new EmailAttachment

a.data = EncodeBase64(PDFData, 76)
a.ContentEncoding = "base64"
```

```
a.MIMEType = "application/pdf"
a.MacType = "PDF "
a.MacCreator = "prvw"
a.Name = filename

Return a
End Function
```

Notes: Compared to sample code from Xojo documentation, we set the mime type correct for PDF.
The MacType/MacCreator codes are deprecated, but you can still include them for older Mac email clients.
"prvw" is the creator code for Apple's preview app.

233.0.92 How to create PDF for image files?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use DynaPDF like this:
Example:

```
Function CreatePrintPDF(jpgFiles() as folderitem, pdfFile as FolderItem, PageWidth as Integer, PageHeight
as Integer) As Boolean
// have files?
If pdfFile = Nil Then Return False
If jpgFiles = Nil Then Return False

If jpgFiles.LastIndex <0 Then Return False

// new DynaPDF
Var pdf As New MyDynapdfMBS

// page width/height in MilliMeter
Var pdfWidth as Integer = PageWidth * 72 / 25.4
Var pdfHeight as Integer = PageHeight * 72 / 25.4

// put your license here
Call pdf.SetLicenseKey "Starter"

// create pdf
Call pdf.CreateNewPDF pdfFile

// set a couple of options
Call pdf.SetPageCoords(MyDynaPDFMBS.kpcTopDown)
Call pdf.SetResolution(300)
Call pdf.SetUseTransparency(False)
Call pdf.SetSaveNewImageFormat(False)
Call pdf.SetGStateFlags(MyDynaPDFMBS.kgfUseImageColorSpace, False)
```

```
Call pdf.SetJPEGQuality(100)

// set page size
Call pdf.SetBBox(MyDynaPDFMBS.kpbMediaBox, 0, 0, pdfWidth, pdfHeight)
Call pdf.SetPageWidth(pdfWidth)
Call pdf.SetPageHeight(pdfHeight)

// append pages with one image per page
For i as Integer = 0 To jpgFiles.LastIndex
Call pdf.Append
Call pdf.InsertImageEx(0, 0, pdfWidth, pdfHeight, jpgFiles(i), 1)
Call pdf.EndPage
Next

// close
Call pdf.CloseFile

Return True
End Function
```

Notes: This is to join image files in paper size to a new PDF.
e.g. scans in A4 into an A4 PDF.

233.0.93 How to CURL Options translate to Plugin Calls?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Below a few tips on how to translate command line CURL calls to plugin calls.
Notes: curl -vX PUT http://localhost:5984/appserials/78569238475/DocumentRegister.docx?rev=3-25634563456 –data-binary @DocumentRegister.docx -H "Content-Type: application/msword"

- The option -v means verbose. You can use OptionVerbose and listen for messages in the DebugMessage event.
- The option -X PUT means we want to do a HTTP PUT Request. So set OptionPut to true. Also you will want to set OptionUpload to true as you upload data.
- We have the URL which you put into OptionURL property.
- The –data-binary option tells CURL to pass the given data. With the @ before the data, it is intrepreted as a file name, so the data is read from the given file. You'll need to open this file and pass data with the Read event as needed. (See CURLS ftp file upload example project)
- The last option -H specifies an additional header for the upload. Pas this additional header with the SetOptionHTTPHeader method.

curl -X PUT http://127.0.0.1:5984/appserials/f2f4e540bf8bb60f61cfcd4328001c59 -d ' { "type":"Product","description":"Application Serial","acronym":"AppSerial","dateAdded":"2011-03-21 14:57:36" } '

- Option -X PUT like above.
- Pass the URL again in OptionURL
- This time data is passed in command line for CURL. You'd put this data in the quotes into a string and make it available in the Read event. (See CURLS ftp upload example project)

233.0.94 How to delete file with ftp and curl plugin?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can set post/pre quotes to have ftp commands executed before or after the download/upload.
Example:

```
Var d as CURLMBS // your curl object

// delete file
Var ws() As String
ws.Add "DELE Temp.txt"

d.SetOptionPostQuote(ws)
```

Notes: Use SetOptionPostQuote, SetOptionPreQuote or SetOptionQuote.
The ftp commands you pass here are native ftp commands and not the commands you use with ftp applications. To delete use DELE and the file path.

233.0.95 How to detect display resolution changed?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: On Mac OS X simply listen for display changed notifications.
Notes: Use the "Distribution Notification Center.rbp" example project as a base and use it to listen to notifications with the name "O3DeviceChanged".

233.0.96 How to detect retina?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Please use Window.BackingScaleFactorMBS to query the factor.
Example:

MessageBox str(Window1.BackingScaleFactorMBS)

233.0.97 How to disable force quit?

Plugin Version: all, Platform: macOS.

Answer:

Please visit this website and get the control panel for Mac OS 9 there:
http://www3.sk.sympatico.ca/tinyjohn/DFQ.html

For Mac OS X use the MBS Plugin with the SetSystemUIModeMBS method.
Notes:

Please use presentationOptions in NSApplicationMBS for Cocoa applications.

233.0.98 How to disable the error dialogs from Internet Explorer on javascript errors?

Plugin Version: all, Platform: Windows.

Answer: You can use this code in the htmlviewer open event:
Example:

```
if targetwin32 then
HTMLViewer1._ole.Content.value("Silent") = True
end if
```

Notes: This disables the error dialogs from Internet Explorer.

233.0.99 How to display a PDF file in Xojo?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: On Mac OS X you can use CoreGraphics or PDFKit to display a PDF.
Notes: An alternative can be to load the PDF into a htmlviewer so the PDF plugin can display it.
On Windows you may need to use the Acrobat ActiveX control from Adobe or launch Acrobat Reader.

233.0.100 How to do a lottery in RB?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Try this function:
Example:

```
Sub Lotto(max as Integer,count as Integer,z() as Integer)
// Lotto count numbers of max put into the array z beginning at index 0
Var n(0) as Integer ' all the numbers
Var m as Integer ' the highest field in the current array
Var i,a,b,d as Integer ' working variables

'fill the array with the numbers
m=max-1
redim n(m)

for i=0 to m
n(i)=i+1
next

' unsort them by exchanging random ones
m=max*10
for i=1 to m
a=rnd*max
b=rnd*max

d=n(a)
n(a)=n(b)
n(b)=d
next

' get the first count to the dest array
m=count-1
redim z(m)
for i=0 to m
z(i)=n(i)
next

'sort the result
z.sort
End Sub

Sub Open()
// Test it

Var za(0) as Integer ' the array of the numbers

lotto 49,6,za ' 6 of 49 in Germany

' and display them
```

```
StaticText1.text=str(za(0))+chr(13)+str(za(1))+chr(13)+str(za(2))+chr(13)+str(za(3))+chr(13)+str(za(4))+chr(13)+str(z
End Sub
```

233.0.101 How to do an asycron DNS lookup?

Plugin Version: all, Platform: Windows.

Answer: use CFHostMBS class (Mac OS X only).
Notes: Xojo internal functions and plugin DNS functions are sycronized.
You can use DNSLookupThreadMBS class for doing them asyncron.

233.0.102 How to draw a dushed pattern line?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can try this code:
Example:

```
// call like this: DrawDushedPatternLine g,0,0,width,height,10

Sub DrawDushedPatternLine(g as graphics,x1 as Integer,y1 as Integer,x2 as Integer,y2 as Integer, partlen
as Integer)
Var x,y,ox,oy as Double
Var dx,dy as Double
Var w,h,d as Double
Var b as Boolean

w=x2-x1
h=y2-y1

d=sqrt(w*w+h*h)

dx=w/d*partlen
dy=h/d*partlen

b=true
x=x1
while (x<x2) and (y<y2)
ox=x
oy=y

x=x+dx
y=y+dy

if b then
```

```
g.DrawLine ox,oy,x,y
end if

b=not b
wend

End Sub
```

Notes: It would be possible to add this to the plugin, but I think it's better if you do it in plain Xojo code, so it even works on Windows.

233.0.103 How to draw a nice antialiased line?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

This code can help you althrough it's not perfect.
You need to set lc to the current color you use.
Example:

```
Sub drawLine(xs as Integer, ys as Integer, xe as Integer, ye as Integer, face as RGBSurface, lineColor as color)
Var intX, intY, count, n, xDiff, yDiff as Integer
Var v, v1, floatX, floatY, xx, yy, xStep, yStep as Double
Var c as color

const st=1.0

xDiff=xe-xs
yDiff=ye-ys
count=max(abs(xDiff), abs(yDiff))
xStep=xDiff/count
yStep=yDiff/count
xx=xs
yy=ys
for n=1 to count
intX=xx
intY=yy
floatX=xx-intX
floatY=yy-intY

v=(1-floatX)*(1-floatY)*st
v1=1-v
c=face.pixel(intX, intY)
```

```
face.pixel(intX, intY)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
v=floatX*(1-floatY)*st
v1=1-v
c=face.pixel(intX+1, intY)
face.pixel(intX+1, intY)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
v=(1-floatX)*floatY*st
v1=1-v
c=face.pixel(intX, intY+1)
face.pixel(intX, intY+1)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
v=floatX*floatY*st
v1=1-v
c=face.pixel(intX+1, intY+1)
face.pixel(intX+1, intY+1)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)

xx=xx+xStep
yy=yy+yStep
next

End Sub
```

Notes:

PS: st should be 1 and face should be a RGBSurface or a Graphics object.

233.0.104 How to dump java class interface?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: In terminal you can use "javap -s <classname>" to display the class with the method names and parameters.
Notes: For example show ResultSet class: javap -s java.sql.ResultSet

233.0.105 How to duplicate a picture with mask or alpha channel?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use code like this function:
Example:

```
Function Duplicate(extends p as Picture) As Picture
#if RBVersion >= 2011.04 then
if p.HasAlphaChannel then

// create nw picture and copy content:
Var q as new Picture(p.Width, p.Height)
```

```
q.Graphics.DrawPicture p,0,0

Return q

end if
#endif

// create new picture
Var q as new Picture(p.Width, p.Height, 32)

// get mask
Var oldMask as Picture = p.mask(false)
if oldMask = nil then
// no mask, so simple copy
q.Graphics.DrawPicture p,0,0
Return q
end if

// remove mask
p.mask = nil

// copy picture and mask
q.Graphics.DrawPicture p, 0, 0
q.mask.Graphics.DrawPicture oldMask,0,0

// restore mask
p.mask = oldmask

Return q
End Function
```

Notes: Simply copy it to a module and call it like this: q = p.duplicate.
The code above works with old Xojo versions because of the #if even if your RS version does not support alpha channel pictures. This way it's future proof.

233.0.106 How to enable assistive devices?

Plugin Version: all, Platform: macOS.

Answer: You can use AppleScript code like below:
Notes: tell application "System Events"
activate

set UI elements enabled to true

```
return UI elements enabled
end tell
```

You can run this with AppleScriptMBS class.

233.0.107 How to encrypt a file with Blowfish?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use code like this:
Example:

```
Var fi as FolderItem = SpecialFolder.Desktop.Child("test.xojo_binary_project")
Var fo as FolderItem = SpecialFolder.Desktop.Child("test.encrypted")

// read input
Var bi as BinaryStream = BinaryStream.Open(fi)
Var si as string = bi.Read(bi.Length)
bi.Close

// encrypt
Var so as string = BlowfishMBS.Encrypt("MyKey",si)

// write output
Var bo as BinaryStream = BinaryStream.Create(fo)
bo.Write so
bo.Close
```

Notes: Of course you can decrypt same way, just use Decrypt function and of course swap files.

233.0.108 How to extract text from HTML?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use both RemoveHTMLTagsMBS and DecodingFromHTMLMBS like this:
Example:

```
Var html as string = "<p><B>Gr&uuml;&szlig;e</B></P>"
Var htmltext as string = RemoveHTMLTagsMBS(html)
Var text as string = DecodingFromHTMLMBS(htmltext)

MessageBox text // shows: Gr√º√üe
```

Notes: You can use it together with RemoveHTMLTagsMBS to remove html tags. What you get will be

the text without tags.
DecodingFromHTMLMBS turns HTML escapes back to unicode characters. Like ä to √§.

233.0.109 How to find empty folders in a folder?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Try this code:
Example:

```
Var folder as folderitem // your folder

Var c as Integer = folder.count
for i as Integer = 1 to c
Var item as folderitem = folder.trueitem(i)
if item = nil then
// ignore
elseif item.directory then
// folder
if item.count = 0 then
// found empty folder
end if
end if
next
```

233.0.110 How to find iTunes on a Mac OS X machine fast?

Plugin Version: all, Platform: macOS.

Answer: You can try Launch Services.
Example:

```
Var f as FolderItem

f=LaunchServicesFindApplicationForInfoMBS("hook","com.apple.iTunes","iTunes.app")

MessageBox f.NativePath
```

233.0.111 How to find network interface for a socket by it's name?

Plugin Version: all, Platform: macOS.

Answer: You can use our plugin to build a lookup table.
Example:

```
Function FindNetworkInterface(name as string) As NetworkInterface
name = name.trim

if name.len = 0 then Return nil

// search by IP/MAC
Var u as Integer = System.NetworkInterfaceCount-1
for i as Integer = 0 to u
Var n as NetworkInterface = System.GetNetworkInterface(i)
if n.IPAddress = name or n.MACAddress = name then
Return n
end if
next

// use MBS Plugin to build a mapping
Var interfaces() as NetworkInterfaceMBS = NetworkInterfaceMBS.AllInterfaces
Var map as new Dictionary

for each n as NetworkInterfaceMBS in interfaces
Var IPv4s() as string = n.IPv4s
Var IPv6s() as string = n.IPv6s

for each IPv4 as string in IPv4s
map.Value(IPv4) = n.Name
next
for each IPv6 as string in IPv6s
map.Value(IPv6) = n.Name
next
if n.MAC<>"" then
map.Value(n.MAC) = n.Name
end if
next

// now search interfaces by name, IPv4 or IPv6
for i as Integer = 0 to u
Var n as NetworkInterface = System.GetNetworkInterface(i)
if map.Lookup(n.IPAddress, "") = name then
Return n
end if

if map.Lookup(n.MACAddress, "") = name then
Return n
end if
next

End Function
```

Notes: The code above uses a lookup table build using NetworkInterfaceMBS class to find the network interface by name.

233.0.112 How to find version of Microsoft Word?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use code like this:
Example:

```
// find Word
Var f as FolderItem = LaunchServicesFindApplicationForInfoMBS("","com.microsoft.Word","")

// open bundle
Var c as new NSBundleMBS(f)

// read info
Var d as Dictionary = c.infoDictionary

// show version
MessageBox d.Lookup("CFBundleVersion","")
```

Notes: Older versions of Word can be found with creator code "MSWD".

233.0.113 How to fix CURL error 60/53 on connecting to server?

Plugin Version: all, Platform: macOS.

Answer: You probably connect with SSL and you have no valid certificate.
Example:

```
Var d as new CURLSMBS

// Disable SSL verification
d.OptionSSLVerifyHost = 0 // don't verify server
d.OptionSSLVerifyPeer = 0 // don't proofs certificate is authentic

// With SSL Verification:
Var cacert as FolderItem = New FolderItem("cacert.pem")
d.OptionCAInfo = cacert.NativePath
d.OptionSSLVerifyHost = 2 // verify server
d.OptionSSLVerifyPeer = 1 // proofs certificate is authentic
```

Notes: You can either use the code above to disable the SSL verification and have no security.

Or you use the cacert file and enable the verification. Than you only get a connection if the server has a valid certificate.

see also:
http://curl.haxx.se/ca/

233.0.114 How to format double with n digits?

Plugin Version: all, Platform: macOS.

Answer: You can use the FormatMBS function for this.
Example:

```
Var d as Double = 123.4567890
ListBox1.AddRow FormatMBS("%f", d)
ListBox1.AddRow FormatMBS("%e", d)
ListBox1.AddRow FormatMBS("%g", d)

ListBox1.AddRow FormatMBS("%5.5f", d)
ListBox1.AddRow FormatMBS("%5.5e", d)
ListBox1.AddRow FormatMBS("%5.5g", d)

d = 0.000000123456
ListBox1.AddRow FormatMBS("%f", d)
ListBox1.AddRow FormatMBS("%e", d)
ListBox1.AddRow FormatMBS("%g", d)

ListBox1.AddRow FormatMBS("%5.5f", d)
ListBox1.AddRow FormatMBS("%5.5e", d)
ListBox1.AddRow FormatMBS("%5.5g", d)
```

Notes: see FormatMBS for details.
In general %f is normal style, %e is scientific and %g is whichever gives best result for given space.

233.0.115 How to get a time converted to user time zone in a web app?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use the WebSession.GMTOffset property.
Example:

```
Sub Open()
// current date on server
Var d as new date
```

```
Var s as string = d.LongTime

// adjust to client GMT offset
d.GMTOffset = d.GMTOffset + Session.GMTOffset

Var t as string = D.LongTime

MessageBox s+EndOfLine+t
End Sub
```

233.0.116 How to get an handle to the frontmost window on Windows?

Plugin Version: all, Platform: Windows.

Answer: This function returns a handle for the frontmost window:
Example:

```
Function GetForegroundWindowHandle() as Integer
#if targetwin32 then
declare function GetForegroundWindow Lib "user32.dll" as Integer
Return GetForegroundWindow()
#endif
End Function
```

233.0.117 How to get CFAbsoluteTime from date?

Plugin Version: all, Platforms: macOS, Windows.

Answer: Use code like this:
Example:

```
Var d as new date
Var t as CFTimeZoneMBS = SystemCFTimeZoneMBS
Var g as new CFGregorianDateMBS
g.Day = d.Day
g.Month = d.Month
g.Year = d.Year
g.Minute = d.Minute
g.Hour = d.Hour
g.Second = d.Second

Var at as CFAbsoluteTimeMBS = g.AbsoluteTime(t)
Var x as Double = at.Value

MessageBox str(x)
```

Notes: As you see we need a timezone and put the date values in a gregorian date record.
Now we can query absolute time for the given timezone.

233.0.118 How to get client IP address on web app?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use the WebSession.RemoteAddress property.
Example:

```
Sub Open()
Title = Session.RemoteAddress
End Sub
```

233.0.119 How to get fonts to load in charts on Linux?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Please use the SetFontSearchPath method in the CDBaseChartMBS class to specify where your fonts are.
Example:

```
if TargetLinux then
CDBaseChartMBS.SetFontSearchPath "/usr/share/fonts/truetype;/usr/share/fonts/truetype/msttcorefonts"
else
// on Mac and Windows we use system fonts.
end if

// also you can later switch default fonts:

Var Chart as CDBaseChartMBS // your chart

#If TargetARM And TargetLinux Then
// use specific fonts on Linux on Raspberry Pi
Call Chart.setDefaultFonts("/usr/share/fonts/truetype/piboto/PibotoLt-Regular.ttf","/usr/share/fonts/truetype/piboto/Pi
#EndIf
```

Notes: On macOS, iOS and Windows, the fonts are loaded from the system's font folder.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.

233.0.120 How to get fonts to load in DynaPDF on Linux?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Please use the AddFontSearchPath method in the DynaPDFMBS class to specify where your fonts are.
Example:

```
Var d as new DynaPDFMBS
if TargetLinux then
call d.AddFontSearchPath "/usr/share/fonts/truetype", true
else
// on Mac and Windows we use system fonts.
end if
```

Notes: On Mac OS X and Windows, the fonts are loaded from the system's font folder.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.

233.0.121 How to get GMT time and back?

Plugin Version: all, Platform: macOS.

Answer: You can use the date class and the GMTOffset property.
Example:

```
// now
Var d as new date

// now in GMT
Var e as new date
e.GMTOffset = 0

// show
MessageBox str(d.TotalSeconds,"0.0")+" "+str(e.TotalSeconds, "0.0")

Var GMTTimeStamp as Double = e.TotalSeconds

// restore
Var f as new date

// add GMT offset here
f.TotalSeconds = GMTTimeStamp + f.GMTOffset*3600
// because here it's removed
f.GMTOffset = f.GMTOffset
```

```
MessageBox d.ShortTime+" ("+str(d.GMTOffset)+") "+str(d.TotalSeconds,"0.0")+EndOfLine+_
e.ShortTime+" ("+str(e.GMTOffset)+") "+str(e.TotalSeconds,"0.0")+EndOfLine+_
f.ShortTime+" ("+str(f.GMTOffset)+") "+str(f.TotalSeconds,"0.0")
```

Notes: It's sometimes a bit tricky with the date class as setting one property often changes the others.

233.0.122 How to get good crash reports?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Check this website from the webkit website:
Notes: http://webkit.org/quality/crashlogs.html

233.0.123 How to get list of all threads?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use the runtime module like in this function:
Example:

```
Function Threads() As Thread()
#pragma DisableBackgroundTasks
Var t() as Thread

Var o as Runtime.ObjectIterator=Runtime.IterateObjects
While o.MoveNext
if o.Current isa Thread then
t.Add thread(o.current)
end if
Wend

Return t
End Function
```

Notes: This returns an array of all thread objects currently in memory.
The pragma is important here as it avoids thread switches which may cause a thread to be created or deleted.

233.0.124 How to get parameters from webpage URL in Xojo Web Edition?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use the Webpage.ParametersReceived event.
Example:

```
Sub ParametersReceived(Variables As Dictionary)
for each key as Variant in Variables.keys
MessageBox key+" ->"+Variables.Value(key)
next
End Sub
```

Notes: The text encodings of this strings is not defined in Xojo 2010r5. Please use DefineEncoding.

233.0.125 How to get the color for disabled textcolor?

Plugin Version: all, Platform: macOS.

Answer: Ask the appearance manager:
Example:

```
Function GetThemeTextColor(inColor as Integer, inDepth as Integer, inColorDev as Boolean) As Color
declare function GetThemeTextColor lib "Carbon" (inColor as Integer, inDepth as Integer, inColorDev as
Boolean, outColor as Ptr) as Integer

Var i as Integer
Var col as MemoryBlock

col = newMemoryBlock(6)

i = GetThemeTextColor(inColor, inDepth, inColorDev, col)

return RGB(col.UShort(0)\256, col.UShort(2)\256, col.UShort(4)\256)
End Function
```

Notes: The color for this is:

const kThemeTextColorDialogInactive = 2.

c = GetThemeTextColor(kThemeTextColorDialogInactive, Screen(0).Depth, true)

For Mac OS X you should use "CarbonLib" instead of "AppearanceLib" ...

233.0.126 How to get the current free stack space?

Plugin Version: all, Platform: macOS.

Answer: You can something like the code below:
Example:

```
Sub ShowStackSize()
Var threadid as Integer
Var size as Integer

declare function GetCurrentThread lib "Carbon" (byref threadid as Integer) as short
declare function ThreadCurrentStackSpace lib "Carbon" (threadid as Integer, byref size as Integer) as short

if GetCurrentThread(threadid)=0 then
if 0=ThreadCurrentStackSpace(threadid,size) then
MessageBox str(size)
end if
end if
End Sub
```

Notes: For Mac OS 9, use "ThreadLib" instead of "CarbonLib". You can use #if if you like for that.

233.0.127 How to get the current timezone?

Plugin Version: all, Platforms: macOS, Windows.

Answer:

You can use the TimeZoneMBS class or the CFTimeZoneMBS class.
Or code like below:
Example:

```
Function GMTOffsetInMinutes() as Integer
// Returns the offset of the current time to GMT in minutes.
// supports Mac OS and Windows, but not Linux yet (let me know if
// you have code for that, please)
//
// Note that the offset is not always an even multiple of 60, but
// there are also half hour offsets, even one 5:45h offset

// This version by Thomas Tempelmann (rb@tempel.org) on 25 Nov 2005
// with a fix that should also make it work with future Intel Mac targets.
//
// Using code from various authors found on the RB NUG mailing list

Var result, bias, dayLightbias as Integer
```

```
Var info as memoryBlock
Var offset as Integer

#if targetMacOS then

Declare Sub ReadLocation lib "Carbon" (location As ptr)

info = NewMemoryBlock(12)
ReadLocation info
if false then
// bad, because it does not work on Intel Macs:
'offset = info.short(9) * 256 + info.byte(11)
else
offset = BitwiseAnd (info.long(8), &hFFFFFF)
end

offset = info.short(9) * 256 + info.byte(11)
offset = offset \60
return offset

#endif

#if targetWin32 then

Declare Function GetTimeZoneInformation Lib "Kernel32" ( tzInfoPointer as Ptr ) as Integer
// returns one of
// TIME_ZONE_ID_UNKNOWN 0
// – Note: e.g. New Delhi (GMT+5:30) and Newfoundland (-3:30) return this value 0
// TIME_ZONE_ID_STANDARD 1
// TIME_ZONE_ID_DAYLIGHT 2

info = new MemoryBlock(172)
result = GetTimeZoneInformation(info)

bias = info.Long(0)
// note: the original code I found in the NUG archives used Long(84) and switched to Long(0)
// only for result=1 and result=2, but my tests found that Long(0) is also the right value for result=0

if result = 2 then
daylightBias = info.long(168)
end if
offset = - (bias + dayLightbias)
return offset

#endif

End Function
```

233.0.128 How to get the current window title?

Plugin Version: all, Platform: macOS.

Answer: The code below returns the current window title for the frontmost window on Mac OS X if Accessibilty services are
Example:

```
Function CurrentWindowTitle() As string
// your application needs permissions for accessibility to make this work!

Var SystemWideElement,FocusedApplicationElement,FocusedWindowElement as AXUIElementMBS
Var FocusedApplication,FocusedWindow,Title as AXValueMBS
Var s as String
Var cs as CFStringMBS

SystemWideElement=AccessibilityMBS.SystemWideAXUIElement
if SystemWideElement<>nil then
FocusedApplication=SystemWideElement.AttributeValue(AccessibilityMBS.kAXFocusedApplicationAttribute)
if FocusedApplication.Type=AccessibilityMBS.kAXUIElementMBSTypeID then
FocusedApplicationElement=new AXUIElementMBS
FocusedApplicationElement.Handle=FocusedApplication.Handle
FocusedApplicationElement.RetainObject

FocusedWindow=FocusedApplicationElement.AttributeValue(AccessibilityMBS.kAXFocusedWindowAttribute)

if FocusedWindow<>nil and AccessibilityMBS.kAXUIElementMBSTypeID=FocusedWindow.Type then

FocusedWindowElement=new AXUIElementMBS
FocusedWindowElement.Handle=FocusedWindow.Handle
FocusedWindowElement.RetainObject

Title=FocusedWindowElement.AttributeValue(AccessibilityMBS.kAXTitleAttribute)
if Title<>nil and Title.Type=kCFStringMBSTypeID then
cs=new CFStringMBS
cs.handle=Title.Handle
cs.RetainObject
Return cs.str
end if
end if
end if
end if
End Function
```

233.0.129 How to get the cursor blink interval time?

Plugin Version: all, Platform: macOS.

Answer: On Mac OS you can use GetCaretTime from the toolbox.
Example:

```
declare function GetCaretTime lib "Carbon" () as Integer

MessageBox str(GetCaretTime())+" ticks"
```

Notes: 60 ticks make one second.

233.0.130 How to get the list of the current selected files in the Finder?

Plugin Version: all, Platform: macOS.

Answer:

Use the AppleScript like this one:

```
tell application "finder"
return selection
end tell
```

Which translates into this AppleEvent:

```
Process("Finder").SendAE "core,getd,'—-':obj { form:prop, want:type(prop), seld:type(sele), from:'null'() }
"
```

and as Xojo code it looks like this:
Example:

```
Var ae as appleevent
Var o1 as appleeventObjectSpecifier
Var f as folderItem
Var aList as appleeventdescList
Var i as Integer
Var dateiname as string

// setup the AppleEvent
o1=getpropertyObjectDescriptor( nil, "sele")
ae= newappleEvent("core", "getd", "MACS")
ae.objectSpecifierParam("—-")=o1
```

```
// send it
if ae.send then
// got the list
alist=ae.replyDescList

// now show the list of filename into an editfield:

for i=1 to alist.count
f=alist.folderItemItem(i)

dateiname=f.name
// editfield1 with property "multiline=true"!
editfield1.text=editfield1.text + dateiname + chr(13)
next
end if
```

233.0.131 How to get the Mac OS system version?

Plugin Version: all, Platform: macOS.

Answer: The following code queries the value and displays the version number:
Example:

```
Var first as Integer
Var second as Integer
Var third as Integer
Var l as Integer

if System.Gestalt("sysv",l) then

Third=Bitwiseand(l,15)
second=Bitwiseand(l\16,15)
first=Bitwiseand(l\256,15)+10*Bitwiseand(l\256\16,15)
end if

if First>=10 then
MessageBox "Mac OS X "+str(First)+"."+str(Second)+"."+str(third)
else
MessageBox "Mac OS "+str(First)+"."+str(Second)+"."+str(third)
end if
```

233.0.132 How to get the Mac OS Version using System.Gestalt?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
Var s As String
Var b As Boolean
Var i, resp as Integer

// Systemversion
b = System.Gestalt("sysv", resp)
If b then
s = Hex(resp)
For i =Len(s)-1 DownTo 1
s=Left(s,i)+"."+Mid(s,i+1)
Next
MessageBox "Systemversion: Mac OS " + s
end if
```

Notes: The MBS Plugin has a SystemInformationMBS.OSVersionString function for this.

233.0.133 How to get the screensize excluding the task bar?

Plugin Version: all, Platform: Windows.

Answer: Try this code:
Notes: Use the Screen class with the available* properties.

233.0.134 How to get the size of the frontmost window on Windows?

Plugin Version: all, Platform: Windows.

Answer: Try this code:
Notes: Make yourself a class for the WindowRect with four properties:

```
Bottom as Integer
Left as Integer
Right as Integer
Top as Integer
```

Add the following method to your class:

```
Sub GetWindowRect(windowhandle as Integer)
Var err as Integer
Var mem as memoryBlock
```

```
#if targetwin32 then
Declare Function GetWindowRect Lib "user32.dll" (hwnd as Integer, ipRect As Ptr) as Integer

mem = newmemoryBlock(16)
err = GetWindowRect(windowhandle, mem)
Left = mem.long(0)
Top = mem.Long(4)
Right = mem.Long(8)
Bottom = mem.Long(12)
#endif
End Sub
```

Good to use for the MDI Master Window!

233.0.135 How to get the source code of a HTMLViewer?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
// This example needs a window with HTMLViewer1.
// for Windows:

MessageBox HTMLViewer1.IEHTMLTextMBS

// for MacOS with WebKit 2.x:

MessageBox HTMLViewer1.WKWebViewMBS.HTMLText
```

233.0.136 How to get Xojo apps running Linux?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You need to install some requuire packages.
Notes: You need CUPS as well as GTK packages. On 64 bit systems also the ia32-libs package.

Please note that you need a x86 compatible Linux. So no PPC, Power, ARM or other CPUs.

233.0.137 How to handle really huge images with GraphicsMagick or ImageMagick?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Sometimes it may be better to use an extra application to process images.
Notes: A typical 32 bit app made with Xojo can use around 1.8 GB on Windows and 3 GB on Mac OS X. Some images may be huge, so that processing them causes several copies of the image to be in memory. With a 500 MB image in memory, doing a scale or rotation may require a temp image. So with source, temp and dest images with each 500 MB plus your normal app memory usage, you may hit the limit of Windows with 1.8 GB.

In that case it may be worth running a tool like gm in the shell class. gm is the command line version of GraphicsMagick. There you can run the 64 bit version which is not limited in memory like your own application. Also you can monitor progress and keep your app responsive.

233.0.138 How to handle tab key for editable cells in listbox?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use code like this function:
Example:

```
Function HandleTabInList(list as listbox, row as Integer, column as Integer, key as String) As Boolean
// Handle tab character in Listbox.CellKeyDown event

Select case asc(key)
case 9
if Keyboard.AsyncShiftKey then
// back

// look for column left
for i as Integer = column-1 downto 0
if list.ColumnType(i) >= list.TypeEditable then
list.EditCell(row, i)
Return true
end if
next

// not found, so look in row before
row = row - 1
if row >= 0 then
for i as Integer = list.ColumnCount-1 downto 0
if list.ColumnType(i) >= list.TypeEditable then
list.EditCell(row, i)
Return true
```

```
end if
next
end if
else
// forward

// look for column right
for i as Integer = column+1 to list.ColumnCount-1
if list.ColumnType(i) >= list.TypeEditable then
list.EditCell(row, i)
Return true
end if
next

// not found, so look in row below
row = row + 1
if row <list.ListCount then
for i as Integer = 0 to list.ColumnCount-1
if list.ColumnType(i) >= list.TypeEditable then
list.EditCell(row, i)
Return true
end if
next
end if
end if
end Select
End Function
```

Notes: You call it from CellKeyDown event like this:

```
EventHandler Function CellKeyDown(row as Integer, column as Integer, key as String) As Boolean
if HandleTabInList(me, row, column, key) then Return true
End EventHandler
```

As you see in the code, we handle tab and shift + tab for moving back and forward. Also we wrap to previous/next row if needed. Feel free to extend this to wrap from last to first row or create a new row for editing.

233.0.139 How to hard link MapKit framework?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Our MapKit classes weak link the framework. If you need hard linking it for the App Store, you can add this method to a class:
Example:

```
Sub ReferenceMapKit()
// just put this in window or app class

#if TargetMachO and Target64Bit then
Declare sub testing Lib "MapKit" Selector "test" (id as ptr)
testing(nil)
#endif

End Sub
```

Notes: No need to call the method.
Just having it in a window or app, will cause the compiler to hard link the framework.

233.0.140 How to have a PDF downloaded to the user in a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use a WebHTMLViewer control and load the PDF file with the PDF plugin from the browser.
Example:

```
Var CurrentFile as WebFile // a property of the WebPage

// define the PDF file
CurrentFile = new WebFile
CurrentFile.Filename = "test.pdf"
CurrentFile.MIMEType = "application/pdf"
CurrentFile.Data = "some pdf data" // MyDynaPDF.GetBuffer
CurrentFile.ForceDownload = true

// start the download
showurl(CurrentFile.url)
```

Notes: See our Create PDF example for the Xojo Web Edition.

233.0.141 How to hide all applications except mine?

Platform: macOS.

Answer: The code below will on Mac OS hide all applications except your one:
Example:

```
Var p as new ProcessMBS
```

```
p.GetFirstProcess
do
if not p.FrontProcess then
p.Visible=false
end if
loop until not p.GetNextProcess
```

233.0.142 How to hide script errors in HTMLViewer on Windows?

Plugin Version: all, Platform: Windows.

Answer: Set Internet Explorer to silent mode with code like this:
Example:

```
HTMLViewer1._ole.Content.value("Silent") = True
```

Notes: Simply put this code in the open event of your htmlviewer control (using me instead of htmlviewer1).

233.0.143 How to hide the grid/background/border in ChartDirector?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: If you want to hide something in a chart, simply assign the kTransparent constant as color.

233.0.144 How to hide the mouse cursor on Mac?

Plugin Version: all, Platform: macOS.

Answer: Try this declare:
Example:

```
Declare Sub HideCursor Lib "Carbon" () Inline68K("A852")
```

```
HideCursor
```

Notes: The MBS Plugin has this function and supports it on Windows, too.

233.0.145 How to insert image to NSTextView or TextArea?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: With NSTextViewMBS you can use this code to insert file:
Example:

```
// insert a file to textview

Public Sub InsertFile(textview as NSTextViewMBS, f as FolderItem)
// read to file
Var b as BinaryStream = BinaryStream.Open(f)
Var s as string = b.Read(b.Length)

// build wrapper
Var fileWrapper as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(s)
fileWrapper.preferredFilename = f.name

// make attachment
Var fileAttachment as new NSTextAttachmentMBS(fileWrapper)
Var attributedString as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithAttachment(fileAttachment)

// add to a NSTextViewMBS
textview.insertText attributedString

End Sub
```

Notes: For TextArea you can query the underlaying NSTextViewMBS object via TextArea.NSTextViewMBS method.

233.0.146 How to jump to an anchor in a htmlviewer?

Plugin Version: all, Platforms: macOS, Windows.

Answer: You can use javascript to change the current window's location.
Example:

```
// This example needs a window with HTMLViewer1.
// load website
HTMLViewer1.LoadURL "http://www.monkeybreadsoftware.net/addressbook-abpersonmbs.shtml"

// later jump to anchor named "16":

if TargetWin32 then
call HTMLViewer1.IERunJavaScriptMBS "window.location = ""#16"""
end if
```

233.0.147 How to keep a movieplayer unclickable?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: To keep the user away from clicking on a playing Movie you can just drop a Canvas in front of the Movieplayer and take the clicks there.
Example:

```
// This example needs a window with Canvas1.
Function Canvas1.MouseDown(X as Integer, Y as Integer) as boolean
return true // take it and do nothing
End Function
```

233.0.148 How to keep my web app from using 100% CPU time?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: On Linux and MacOS you can use renice command in the terminal. On Windows use the task manager to reduce priority.
Notes: If you launch your app with nohup on Linux or Mac OS X like this from the terminal or a script:

```
nohup /webapps/MyApp/MyApp &
```

you can simply have a second line saying this:

```
renice 20 $ !
```

which tells the system to lower priority to lowest value for the latest background process.

233.0.149 How to kill a process by name?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can kill a process (or application) by name if you loop over all the processes and kill the one you need.
Example:

```
Var p as new ProcessMBS
p.GetfirstProcess ' get first
do
if p.name = "TextEdit" then
call p.KillProcess
Return
```

```
end if
loop until not p.GetNextProcess
```

Notes: You may want to check the result of killProcess function. Not every user is allowed to kill every application.

233.0.150 How to know how many CPUs are present?

Plugin Version: all, Platform: macOS.

Answer: Try this function:
Example:

```
Function GetCPUCount() as Integer
Declare Function MPProcessors Lib "Carbon" () as Integer

Return MPProcessors()
End Function
```

Notes: Your app will than need that library to launch on Classic. To avoid this the MBS plugin checks if this library is available and return 1 if it's not available.

233.0.151 How to know the calling function?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: On Mac you can use a helper function like this this code:
Example:

```
Public Function CallingFunction() as string
// Query name of calling function of a function

#Pragma BreakOnExceptions false

try

// raise a dummy exception
Var r as new NilObjectException
raise r

catch x as NilObjectException

// get stack
Var stack() as string = x.Stack
```

```
// pick function name and return
Var name as string = stack(2)
Return name

end try
End Function
```

Notes: You need to include function names in your application.

233.0.152 How to launch an app using it's creator code?

Plugin Version: all, Platform: macOS.

Answer: Send an AppleEvent "oapp" with the creator code to the Finder ("MACS"):
Example:

```
Var a as AppleEvent
Var creator as string

creator = "MSIE" ' here the Internet Explorer

a = NewAppleEvent("aevt", "odoc", "MACS")
a.Timeout = -1

a.ObjectSpecifierParam("—-") = GetUniqueIDObjectDescriptor("appf", nil, creator)

if not a.send then
MessageBox "An error has occurred"
else

end if
```

233.0.153 How to launch disc utility?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use this code:
Example:

```
Var f as FolderItem = LaunchServicesFindApplicationForInfoMBS("","com.apple.DiskUtility","")

if f<>Nil then
f.Launch
end if
```

Notes: This works even if people renamed the disc utility or moved it to another folder.

233.0.154 How to list devices with CoreAudio?

Plugin Version: all, Platform: Windows.

Answer: You can query the list of devices and loop to ask for the name of each device:
Example:

```
var ids As MemoryBlock
var outSize As Integer
var deviceName As String
var outWriteable As Boolean

var c as New CoreAudioMBS
c.AudioHardwareGetPropertyInfo c.kAudioHardwarePropertyDevices, outSize, outWriteable

var numDevices as integer = outSize / 4

// Get the device IDs for each device
ids=c.AudioHardwareGetPropertyMemory(c.kAudioHardwarePropertyDevices)

For i as integer = 0 To numDevices-1
var id as integer =ids.Long(i*4) // 4 bytes per integer
var m as MemoryBlock = c.AudioDeviceGetPropertyMemory(id, 0, False, c.kAudioDevicePropertyDevice-
Name)

If m<>Nil Then
deviceName=m.CString(0)
End If

System.DebugLog str(id)+": "+deviceName

Next
```

233.0.155 How to make a lot of changes to a REAL SQL Database faster?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You may try to embed your changes to the database between two transaction calls.
Example:

```
Var db as Database // some database
```

```
db.SQLExecute "BEGIN TRANSACTION"
// Do some Stuff
db.SQLExecute "END TRANSACTION"
```

Notes: This can increase speed by some factors.

233.0.156 How to make a NSImage object for my retina enabled app?

Plugin Version: all, Platform: macOS.

Answer: You can use code like this:
Example:

```
Function NewRetinaImage(pic as Picture, mask as Picture = nil) As NSImageMBS
// first make a NSImageMBS from it
Var n as new NSImageMBS(pic, mask)

// now set to half the size, so we have 2x pixels for the image
n.size = new NSSizeMBS(n.width/2, n.height/2)

// and return
Return n
End Function
```

Notes: The thing to do is to have 2x the pixels, but assign a size to the image which gives it the right size in points.
You can pass the NSImageMBS from here to NSMenuItemMBS. For Retina displays, the full resolution is used. For others it will be reduced.

233.0.157 How to make a window borderless on Windows?

Plugin Version: all, Platform: Windows.

Answer: Try this declares:
Example:

```
// Sets window to borderless popup type, and sets its initial dimensions.
// Call this method, then Win32SetBorderlessPos, and then RB's Show
// method. Use RB Frame type 7 (Global Floating Window).

Const SWP_NOMOVE = &H2
Const SWP_FRAMECHANGED = &H20
Const HWND_TOPMOST = -1
Const GWL_STYLE = -16
```

```
Const WS_POPUPWINDOW = &H80880000

Var styleFlags as Integer

#If TargetWin32 Then

Declare Function SetWindowLong Lib "user32" Alias "SetWindowLongA" (hwnd as Integer, nIndex as Integer, dwNewLong as Integer) as Integer
Declare Function SetWindowPos Lib "user32" (hwnd as Integer, hWndInstertAfter as Integer, x as Integer, y as Integer, cx as Integer, cy as Integer, flags as Integer) as Integer

styleFlags = SetWindowLong( w.WinHWND, GWL_STYLE, WS_POPUPWINDOW )
styleFlags = BitwiseOr( SWP_FRAMECHANGED, SWP_NOMOVE )
styleFlags = SetWindowPos( w.WinHWND, HWND_TOPMOST, 0, 0, wd, ht, styleFlags )

#EndIf
```

233.0.158 How to make an alias using AppleEvents?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
Sub MakeAlias(folder as folderitem, target as folderitem, aliasname as string)
Var ev as AppleEvent
Var myResult as boolean
Var properties as AppleEventRecord

ev = NewAppleEvent("core","crel","MACS")
ev.MacTypeParam("kocl") = "alis"
ev.FolderItemParam("to ") = target
ev.FolderItemParam("insh") = folder

properties=new AppleEventRecord
properties.StringParam("pnam")=aliasname

ev.RecordParam("prdt")=properties

myResult = ev.send
// true on success, false on error
End Sub
```

Notes: Call it like this:
MakeAlias SpecialFolder.Desktop, SpecialFolder.Desktop.Child("Gif Copy.rb"), "test.rb alias"

Seems to not work on Mac OS X 10.6

233.0.159 How to make AppleScripts much faster?

Plugin Version: all, Platform: macOS.

Answer: use "ignoring application responses" like in this example:
Notes: on run { fn,fpx,fpy }
ignoring application responses
tell app "Finder" to set the position of folder fn to fpx,fpy
end ignoring
end run

233.0.160 How to make double clicks on a canvas?

Plugin Version: all, Platform: macOS.

Answer:

Update: Newer Xojo versions support DoubleClick event, so you don't need this code.

Here's my tip from the tips list on how to add a double-click event to the Canvas control. The technique could easily be used for a window or any Rectcontrol:

Because of its built-in drawing methods, the Canvas control is often used to create custom interface controls. But while the Canvas control has event handlers for most mouse events, it doesn't have an event handler for DoubleClick events. Fortunately, you can add a double-click event handler to a Canvas control easily. Basically, you're going to create a new class based on Canvas and add a double-click event to that. You can then use the new class anytime you need a Canvas with a double-click event.

To create a new Canvas class with a DoubleClick event handler, do this:

1. Add a new class to your project.
2. Set the Super property of the new class to "Canvas".
3. Change the name of this new class to "DoubleClickCanvas".

A double-click occurs when two clicks occur within the users double-click time (set in the Mouse control panel on both Macintosh and Windows) and within five pixels of each other. So, you'll need a few properties to store when and where the last click occurred.

4. Add a new property with the following declaration and mark it as private: lastClickTicks as Integer

5. Add a new property with the following declaration and mark it as private: lastClickX as Integer
6. Add a new property with the following declaration and mark it as private: lastClickY as Integer

Since the Canvas control doesn't have a DoubleClick event, you will need to add one.

7. Add a new event to your class by choosing New Event from the Edit menu and enter "DoubleClick" as the event name.

Double-clicks occur on MouseUp. In order for the mouseUp event to fire, you must return True in the MouseDown event.

8. In the MouseDown event, add the following code:
Return True

In the MouseUp event, you will need to determine what the users double-click time is. This value is represented on both the Mac and Windows in ticks. A tick is 1/60th of a second. Since there isn't a built-in function for this, you'll need to make a toolbox call. The mouseUp event code below makes the appropriate toolbox call for both Macintosh and Windows. It then compares the time of the users last click to the time of the current click and compares the location of the users last click to the location of the current click.

9. Add the following code to the MouseUp event:

```
Var doubleClickTime, currentClickTicks as Integer

#if targetMacOS then
Declare Function GetDblTime Lib "Carbon" () as Integer
doubleClickTime = GetDblTime()
#endif

#if targetWin32 then
Declare Function GetDoubleClickTime Lib "User32.DLL" () as Integer
doubleClickTime = GetDoubleClickTime()/60 // convert to ticks from milliseconds
#endif

currentClickTicks = ticks
//if the two clicks happened close enough together in time
if (currentClickTicks - lastClickTicks) <= doubleClickTime then
//if the two clicks occurred close enough together in space
if abs(X - lastClickX) <= 5 and abs(Y - LastClickY) <= 5 then
DoubleClick //a double click has occurred so call the event
end if
end if
lastClickTicks = currentClickTicks
lastClickX = X
```

lastClickY = Y

10. Now to test out your new DoubleClickCanvas, drag the class from the Project window to a window in your project to create an instance of it.

11. Double-click on the canvas you just added to your window to open the Code Editor. Notice that the canvas has a DoubleClick event handler. In this event handler, add the following code:
BEEP

233.0.161 How to make my Mac not sleeping?

Plugin Version: all, Platform: macOS.

Answer: Just inform the Mac OS about some system activity with code like this:
Example:

```
Sub UpdateSystemActivity()

#if TargetCarbon
declare function myUpdateSystemActivity lib "Carbon" alias "UpdateSystemActivity" (activity as Integer)
as short

const OverallAct = 0 // Delays idle sleep by small amount */
const UsrActivity = 1 // Delays idle sleep and dimming by timeout time */
const NetActivity = 2 // Delays idle sleep and power cycling by small amount */
const HDActivity = 3 // Delays hard drive spindown and idle sleep by small amount */
const IdleActivity = 4 // Delays idle sleep by timeout time */

Var e as Integer

e=myUpdateSystemActivity(UsrActivity)

// you may react on an error if e is not 0 after the call.

#endif
End Sub
```

Notes: You may use another constant if you prefer some different behavior.
Call it maybe every second.

233.0.162 How to make my own registration code scheme?

Plugin Version: all, Platform: Windows.

Answer: There are excellent articles about how to make a registratin code scheme, but you can also simply use our RegistrationEngineMBS class.
Notes: If you need a license text, why not use the one from Xojo as a starting point?

233.0.163 How to make small controls on Mac OS X?

Plugin Version: all, Platform: macOS.

Answer: You can try this code on Mac OS X:
Example:

```
// This example needs a window with CheckBox1.
'/*
'* Use the control's default drawing variant. This does not apply to
'* Scroll Bars, for which Normal is Large.
'*/
const kControlSizeNormal = 0

'/*
'* Use the control's small drawing variant. Currently supported by
'* the Check Box, Combo Box, Radio Button, Scroll Bar, Slider and Tab
'* controls.
'*/
const kControlSizeSmall = 1

'/*
'* Use the control's small drawing variant. Currently supported by
'* the Indeterminate Progress Bar, Progress Bar and Round Button
'* controls.
'*/
const kControlSizeLarge = 2

'/*
'* Control drawing variant determined by the control's bounds. This
'* ControlSize is only available with Scroll Bars to support their
'* legacy behavior of drawing differently within different bounds.
'*/
const kControlSizeAuto = &hFFFF

const kControlSizeTag = "size"

declare function SetControlData lib "Carbon" (controlhandle as Integer, part as short, tagname as OS-
Type, size as Integer, data as ptr) as short

Var m as MemoryBlock

m=NewMemoryBlock(2)
```

```
m.UShort(0)=kControlSizeSmall

Title=str(SetControlData(CheckBox1.Handle, 0, kControlSizeTag, 2, m))
```

233.0.164 How to mark my Mac app as background only?

Plugin Version: all, Platform: macOS.

Answer: You can run a build script on each build with this code:
Example:

```
Var App As String = CurrentBuildLocation + "/" + CurrentBuildAppName + ".app"
Call DoShellCommand("/usr/bin/defaults write " + App + "/Contents/Info ""NSUIElement"" YES")
```

Notes: This will set the NSUIElement flag to YES.

233.0.165 How to move a file or folder to trash?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use code like below:
Example:

```
Function MoveToTrash(f as FolderItem) As Boolean
#if TargetMacOS then
Var r as FolderItem
Var e as Integer = MacFileOperationMBS.MoveObjectToTrashSync(f, r, MacFileOperationMBS.kFSFileOperationDefaultOptions)

if e = 0 then
Return true // Ok
end if

#elseif TargetWin32 then
Var w as new WindowsFileCopyMBS

Var flags as Integer = w.FileOperationAllowUndo + w.FileOperationNoErrorUI + w.FileOperationSilent + w.FileOperationNoConfirmation
if w.FileOperationDelete(f, flags) then
Return true // OK
end if

flags = w.FileOperationNoErrorUI + w.FileOperationSilent + w.FileOperationNoConfirmation
if w.FileOperationDelete(f, flags) then
Return true // OK
```

```
end if
#else
// Target not supported
break
Return false
#endif
End Function
```

Notes: If you want to move a file to trash, you could use f.movefileto f.trashfolder, but that will overwrite existing files in the trash. You can use our MacFileOperationMBS class to move a file on Mac to the trash. And it uses the same code as the Finder, so files are renamed when the same name is already in use in the trash:

On Windows we use WindowsFileCopyMBS class.
Requires Mac OS X 10.5.

233.0.166 How to move an application to the front using the creator code?

Plugin Version: all, Platform: macOS.

Answer: This makes SimpleText (Code ttxt) to the frontmost application:
Example:

```
Var a as appleevent

a=newappleEvent("misc","actv","ttxt")

if a.send then
end if
```

Notes: (Code is Mac only)

233.0.167 How to move file with ftp and curl plugin?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can set post/pre quotes to have ftp commands executed before or after the download/upload.
Example:

```
Var d as CURLMBS // your curl object

// rename/move file
Var ws() As String
ws.Add "RNFR Temp.txt"
```

```
ws.Add "RNTO MyFile.txt"

d.SetOptionPostQuote(ws)
```

Notes: Use SetOptionPostQuote, SetOptionPreQuote or SetOptionQuote.
The ftp commands you pass here are native ftp commands and not the commands you use with ftp applications. So rename is two commands. First RNFR to tell where to rename from and second RNTO with the new file name. To delete use DELE and the file path.

233.0.168 How to normalize string on Mac?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use code like below:
Example:

```
Function Normalize(t as string) As string
const kCFStringNormalizationFormD = 0 // Canonical Decomposition
const kCFStringNormalizationFormKD = 1 // Compatibility Decomposition
const kCFStringNormalizationFormC = 2 // Canonical Decomposition followed by Canonical Composition
const kCFStringNormalizationFormKC = 3 // Compatibility Decomposition followed by Canonical Composition

Var s as CFStringMBS = NewCFStringMBS(t)
Var m as CFMutableStringMBS = s.Normalize(kCFStringNormalizationFormD)

Return m.str
End Function
```

Notes: This uses Apple's CFString functions to normalize unicode variants.

233.0.169 How to obscure the mouse cursor on Mac?

Plugin Version: all, Platform: macOS.

Answer: Try this declare:
Example:

```
Declare Sub ObscureCursor Lib "Carbon" ()

ObscureCursor
```

Notes: The MBS Plugin has this function, but it's not supported for Windows.

233.0.170 How to open icon file on Mac?

Plugin Version: all, Platform: macOS.

Answer: Use the NSImageMBS class like this:
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.ico")
Var n as new NSImageMBS(f)

Window1.Backdrop = n.CopyPictureWithMask
```

233.0.171 How to open PDF in acrobat reader?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
Var pdf as FolderItem = SpecialFolder.Desktop.Child("test.pdf")

// open PDF in Acrobat Reader on Mac:

// find app
Var bundleID as string = "com.adobe.Reader"
Var app as FolderItem = LaunchServicesFindApplicationForInfoMBS("", bundleID, "")

if app<>nil then

// launch app with parameters

Var docs() as FolderItem
docs.Add pdf

Var param as new LaunchServicesLaunchParameterMBS
param.Defaults = true
param.Application = app

Var x as FolderItem = LaunchServicesOpenXMBS(docs, param)

// on failure, simply launch it
if x = nil then
pdf.Launch(true)
end if

else
pdf.Launch(true)
```

```
end if
```

Notes: On Windows, simply use pdf.launch or WindowsShellExecuteMBS.

233.0.172 How to open printer preferences on Mac?

Plugin Version: all, Platform: macOS.

Answer: You can use our OpenMacOSXPreferencesPaneMBS function like this:
Example:

```
Var e as Integer = OpenMacOSXPreferencesPaneMBS("PrintAndFax")
if 0 = e then
MessageBox "OK"
elseif e = -43 then
MessageBox "File not found."
else
MessageBox "Error: "+str(e)
end if
```

233.0.173 How to open special characters panel on Mac?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: We have functions for that in Cocoa and Carbon.
Example:

```
Var a as new NSApplicationMBS
a.orderFrontCharacterPalette
```

Notes: For Cocoa, you can use orderFrontCharacterPalette method in NSApplicationMBS class.

Or simply for Carbon and Cocoa the ShowCharacterPaletteMBS method.

233.0.174 How to optimize picture loading in Web Edition?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use the WebPicture class.
Notes: Take your picture and create a WebPicture object. Store this WebPicture in a property of the WebPage, Session or app (as global as possible). On the first time you use this picture on an user session,

the browser will load it. Second time you use it, the browser will most likely pick it from the cache.
Having pictures in App or some module reuses the same picture for all sessions which reduces memory footprint.
This does not work well with pictures you change very often or use only for one webpage on one user.

If you like to see an example, check our Map example.

233.0.175 How to parse XML?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use code like this:
Example:

```
Var s as string = "<test><test /></test>"

try
Var x as new XmlDocument(s)
MessageBox "OK"
catch xe as XmlException
MessageBox "invalid XML"
end try
```

Notes: If you got an exception, you have a parse error.

233.0.176 How to play audio in a web app?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use the HTML5 audio tag and control it with javscript.
Notes: This is just another example app I made today. It plays a christmas song. The audio file is provided by the application to the server, so no external web server is needed and this application can run stand alone. To compile and run you need Xojo 2010r5.

In the open event we search the audio files and open them as binarystreams. We create the two webfile objects. Those webfiles are part of the app class, so we have them globally. There we set the data with the content of our streams. We also define file names and mime types. They are needed so browser know what we have here:

```
audioFileM4V = new WebFile
audioFileM4V.Data = bM.Read(BM.Length)
audioFileM4V.Filename = "music.m4a"
```

audioFileM4V.MIMEType = ”audio/m4a”

audioFileOGG = new WebFile
audioFileOGG.Data = bO.Read(BO.Length)
audioFileOGG.Filename = ”music.ogg”
audioFileOGG.MIMEType = ”audio/ogg”

Next in the open event of the webpage we have a PageSource control. The location is set to be before content. In the open event we define the html code for this. First we pick the URLs for the audio files. Than we build the html to use the audio tag. As you see, we give it an ID for later use and have it preload automatically. If you add an autoplay tag, you can have the audio play right away. Inside the audio tag we have two sources so we provide audio for both Firefox (OGG) and Safari (MPEG4). Finally we have a text to display if HTML5 audio tag is not supported.

You can set the source in the EditSource event:

Var urlo as string = app.audioFileOGG.URL
Var urlm as string = app.audioFileM4V.URL
me.Source = ”<audio id=””mymusic”” preload=””auto””><source src=”””+urlo+””” type=””audio/ogg”” /><source src=”””+urlm+””” type=””audio/mpeg”” />Your browser does not support the audio element.</audio>”

Next in the Play button we execute code to play the audio. This is a short javascript code which searches in the html document for the element with the ID ”mymusic” which is the ID of our audio tag above. Once we got the object, we call it’s play method to start playback.

me.ExecuteJavaScript(”document.getElementById(’mymusic’).play();”)

same for pause:

me.ExecuteJavaScript(”document.getElementById(’mymusic’).pause();”)

and finally for changing volume:

me.ExecuteJavaScript(”document.getElementById(’mymusic’).volume=”+str(me.Value/100.0)+”;”)

233.0.177 How to pretty print xml?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use the XML Transform method with the right XLS.
Notes: Learn more here:
http://docs.xojo.com/index.php/XMLDocument.Transform

233.0.178 How to print to PDF?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: This code below shows how to redirect printing to a PDF file on Mac OS X.
Example:

```
// get Xojo printer setup
Var p as new PrinterSetup

// now put it into NSPrintInfo to manipulate
Var n as new NSPrintInfoMBS
n.SetupString = p.SetupString

// change destination to file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
n.SetSaveDestination(f)

// move back
p.SetupString = n.SetupString

// and print as usual
Var g as Graphics = OpenPrinter(p)
g.DrawString "Hello World", 20, 20
```

Notes: And you can use normal graphics class for that.

233.0.179 How to query Spotlight's Last Open Date for a file?

Plugin Version: all, Platform: macOS.

Answer: You can use a MDItemMBS objec to query this value:
Example:

```
Function LastOpenedDate(Extends F As FolderItem, DefaultOtherDates As Boolean = True) As Date
#If TargetMacOS Then
Var xMDItem as New MDItemMBS(F)
Var xDate as Variant

If xMDItem <>Nil Then
xDate = xMDItem.GetAttribute(xMDItem.kMDItemLastUsedDate).DateValue
```

```
If xDate IsA Date Then Return xDate
Else
If xDate <>Nil Then Break
End If
#EndIf

If DefaultOtherDates Then
If F.ModificationDate <>Nil Then Return F.ModificationDate
If F.CreationDate <>Nil Then Return F.CreationDate
End If
End Function
```

Notes: Thanks for Josh Hoggan for this example code.

233.0.180 How to quit windows?

Plugin Version: all, Platform: Windows.

Answer: Try this code:
Example:

```
#if targetwin32 then
Var i1,i2,r as Integer
declare function ExitWindowsEx lib "user32" (uFlags as Integer, dwReserved as Integer) as Integer
i1 = 2
i2 = 0
r = ExitWindowsEx(i1,i2)
if r<>0 then
' Error()
end if

#endif
```

Notes: uFlags parameters:

```
'4 = EWX_Force
'0 = EWX_Logoff
'2 = EWX_Reboot
'1 = EWX_shutdown, should shut down computer
```

Also check the ExitWindowsMBS method.

233.0.181 How to read a CSV file correctly?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: With all the rules for quotes and delimiters, you can simply use the SplitCommaSeparatedValuesMBS method in our plugins like this:
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.csv")
Var t as TextInputStream = f.OpenAsTextFile

while not t.EOF
Var s as string = t.ReadLine(encodings.ASCII)

Var items() as string = SplitCommaSeparatedValuesMBS(s, ";", """")

List.AddRow ""
Var u as Integer = items.LastIndex
for i as Integer = 0 to u
List.CellTextAt(List.LastAddedRowIndex,i) = items(i)
next

wend
```

Notes: Please make sure you choose the right text encoding.

233.0.182 How to read resourcefork with named path?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use ..namedfork in the file path.
Example:

```
Var f As FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var p As String = f.NativePath+"/..namedfork/rsrc"
var d as new FolderItem(p, FolderItem.PathModes.Native)
Var b As BinaryStream = BinaryStream.Open(d)
var a as string = b.Read(b.Length)
// see resource fork in debugger, if exists
Break
```

233.0.183 How to read the command line on windows?

Plugin Version: all, Platform: Windows.

Answer: Try this code:
Example:

```
#if targetwin32 then
Var line as string
Var mem as MemoryBlock

Declare Function GetCommandLineA Lib "kernel32" () As Ptr

mem=GetCommandLineA()
s=mem.cstring(0)

#endif
```

Notes: Newer Xojo versions have a system.commandline property.

233.0.184 How to render PDF pages with PDF Kit?

Plugin Version: all, Platform: Windows.

Answer: Try this code:
Example:

```
// choose a file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")

// open it as PDF Document
Var sourceFile as New PDFDocumentMBS(f)

if sourceFile.handle <>0 then // it is a PDF file

// get upper bound of pages
Var c as Integer = sourceFile.pageCount-1

// from first to last page
for n as Integer = 0 to c

// pick that page
Var page as PDFPageMBS = sourceFile.pageAtIndex(n)

// render to image
Var p as NSImageMBS = page.Render

// and convert to RB picture and display
Backdrop = p.CopyPictureWithMask
```

```
next

end if
```

Notes: PDFKit works only on Mac OS X.

233.0.185 How to restart a Mac?

Plugin Version: all, Platform: macOS.

Answer: Ask the Finder via Apple Events:
Example:

```
Var ae as appleevent
ae=newappleEvent("FNDR","rest","MACS")
if not ae.send then
MessageBox "The computer couldn't be restarted."
end if
```

233.0.186 How to resume ftp upload with curl plugin?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: CURL supports that and you simply need to set the right options.
Notes: First of course OptionUpload must be true. Second OptionFTPAppend must be true so the OptionResumeFrom is used. Store there (or in OptionResumeFromLarge) your start value.
Don't forget to implement the read event and return data there as requested.

233.0.187 How to rotate a PDF page with CoreGraphics?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: This code opens a PDF and draws the first page into a new PDF with 90¬∞ rotation.
Example:

```
// Rotate a PDF page

// our files
Var sourcefile as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var destfile as FolderItem = SpecialFolder.Desktop.Child("rotated.pdf")

// open PDF
Var pdf as CGPDFDocumentMBS = sourcefile.OpenAsCGPDFDocumentMBS
```

```
// query media size of first page
Var r as CGRectMBS = pdf.MediaBox(1)

// create new PDF
Var c as CGContextMBS = destfile.NewCGPDFDocumentMBS(r,"title","Author","Creator")

// create rotated rectangle
Var nr as new CGRectMBS(0,0,r.Height,r.Width)

// create new page
c.BeginPage nr
c.SaveGState

const pi = 3.14159265

// rotate by 90¬∞
c.RotateCTM pi*1.5

// fix origin
c.TranslateCTM -r.width,0

// draw PDF
c.DrawCGPDFDocument pdf,r,1

// cleanup
c.RestoreGState
c.EndPage

c = nil

// show in PDF viewer
destfile.Launch
```

Notes: This code is Mac only as it needs CoreGraphics.

233.0.188 How to rotate image with CoreImage?

Plugin Version: all, Platform: macOS.

Answer: Use the code like the one below:
Example:

```
// Rotate image with CoreImage

// load image
```

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var image as new CIImageMBS(f)

// rotate 45 degree
Var n as new NSAffineTransformMBS
n.rotateByDegrees(45)

Var TransformFilter as new CIFilterAffineTransformMBS
TransformFilter.inputImage = image
TransformFilter.inputTransform = n

// get result
Var resultImage as CIImageMBS = TransformFilter.outputImage

// for saving to file
Var outputImage as NSImageMBS = resultImage.RenderNSImage(false)

f = SpecialFolder.Desktop.Child("output.png")
Var b as BinaryStream = BinaryStream.Create(f, true)
b.Write outputImage.PNGRepresentation

// as Xojo picture object for display
Var pic as Picture = outputImage.CopyPictureWithMask

Backdrop = pic
```

233.0.189 How to run a 32 bit application on a 64 bit Linux?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Install 32 bit compatibility libraries.
Notes: The package is called ia32-libs for ubuntu (and others).
Some applications need to be run on a 32 bit system as they need some hardware related libraries. Like libUSB or libHID for USB devices.

233.0.190 How to save HTMLViewer to PDF with landscape orientation?

Plugin Version: all, Platform: macOS.

Answer: You can use NSPrintInfoMBS to change the options for PrintToPDFFile function.
Example:

```
// This example needs a window with HTMLViewer1.
// make it landscape
Var n as NSPrintInfoMBS = NSPrintInfoMBS.sharedPrintInfo
```

```
n.orientation = n.NSLandscapeOrientation

// save html to file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
call HTMLViewer1.PrintToPDFFileMBS(f,10,30,10,30)
```

Notes: You may want to reset options later.
This code is only for Mac OS X.

233.0.191 How to save RTFD?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: With NSTextViewMBS you can use this code to save to RTFD:
Example:

```
// save text as RTFD including image attachments
Var f as FolderItem = FolderItem.ShowSaveFileDialog(FileTypes1.ApplicationRtfd, "test.rtfd")

if f = nil then Return

Var a as NSAttributedStringMBS = textView.textStorage
Var w as NSFileWrapperMBS = a.RTFDFileWrapperFromRange(0, a.length, DocumentAttributes)

Var e as NSErrorMBS
if w.writeToFile(f, e) then

else
MessageBox e.LocalizedDescription
end if
```

Notes: For TextArea you can query the underlaying NSTextViewMBS object via TextArea.NSTextViewMBS method.

233.0.192 How to scale a picture proportionally with mask?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: For a proportional scaling, we calculate the new picture size relative to the target maximum size.
Example:

```
Function ProportinalScaledWithMask(extends pic as Picture, Width as Integer, Height as Integer) As Picture
// Calculate scale factor
```

```
Var faktor as Double = min( Height / Pic.Height, Width / Pic.Width)

// Calculate new size
Var w as Integer = Pic.Width * faktor
Var h as Integer = Pic.Height * faktor

// create new picture
Var NewPic as new Picture(w,h,32)

// check if we have a mask and clear it
Var m as picture = pic.mask(False)
pic.mask = nil

// draw picture in the new size
NewPic.Graphics.DrawPicture Pic, 0, 0, w, h, 0, 0, Pic.Width, Pic.Height

if m <>nil then
// restore mask and scale it
pic.mask = m
NewPic.mask.Graphics.DrawPicture m, 0, 0, w, h, 0, 0, Pic.Width, Pic.Height
end if

// return result
Return NewPic
End Function
```

Notes: This version handles mask. As you see we actually have to remove mask in order to copy the picture part correctly.

233.0.193 How to scale a picture proportionally?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: For a proportional scaling, we calculate the new picture size relative to the target maximum size.
Example:

```
Function ProportionalScaled(extends pic as Picture, Width as Integer, Height as Integer) As Picture
// Calculate scale factor

Var faktor as Double = min( Height / Pic.Height, Width / Pic.Width)

// Calculate new size
Var w as Integer = Pic.Width * faktor
Var h as Integer = Pic.Height * faktor
```

```
// create new picture
Var NewPic as new Picture(w,h,32)

// draw picture in the new size
NewPic.Graphics.DrawPicture Pic, 0, 0, w, h, 0, 0, Pic.Width, Pic.Height

// return result
Return NewPic
End Function
```

Notes: This does not handle mask, but you can scale the mask the same way and assign it to the new picture.
(see other FAQ entry with mask)

233.0.194 How to scale/resize a CIImageMBS?

Plugin Version: all, Platform: Windows.

Answer: Use the CIFilterLanczosScaleTransform filter to scale down a picture to a specific size.
Example:

```
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = CIImageMBS.imageWithPicture(pic)

Var filter As New CIFilterLanczosScaleTransformMBS

Const targetWidth = 600.0
Const targetHeight = 400.0

Var scale As Double = targetHeight / image.Extent.Height
Var aspect As Double = targetWidth / (image.Extent.Width * scale)

filter.inputImage = image
filter.inputScale = scale
filter.inputAspectRatio = aspect

Var result As Picture = filter.outputImage.RenderPicture

Backdrop = result
```

Notes: This is same code as our scaleTo convenience method.

233.0.195 How to scale/resize a picture?

Plugin Version: all, Platform: Windows.

Answer: There are several ways to scale or resize a picture. The easiest way may be the ScaleMBS function in the Picture class.
Example:

```
Var Original,Scaled as Picture

Original=LogoMBS(500)
Scaled=Original.ScaleMBS(100,100,true)
```

Notes: The plugin ways:
- GraphicsMagick can scale/resize.
- CoreImage scale filter may result in the fastest and best images on Mac OS X 10.4.
- NSImageMBS can scale, but is Mac OS X only.
- CGImageMBS can scale, but is Mac OS X only.
- CIImageMBS can scale, but is Mac OS X only.
- QuickTime Graphics exporter and importer can be connected to scale. (this was used more often a few years ago)
- ImageMagick can scale very nice and crossplatform. But the ImageMagick libraries are big.
- The picture.ScaleMBS function is self written and results in equal output on Mac, Windows and Linux without any additional libraries installed.
- Picture.ScalingMBS does crossplatform scaling with several modes.

with pure Xojo:
- make a new picture and draw the old one with new size inside.

233.0.196 How to search with regex and use unicode codepoints?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can specify unicode characters in search string with backslash x and digits.
Example:

```
Var r as RegExMbs
Var s as string
Var c as Integer

s="123 √§√√º ABC 456"

r=new RegExMBS
if r.Compile(".√.") then
c=r.Execute(s,0)
MessageBox str(c)+" "+str(r.Offset(0))+" "+str(r.Offset(1))
```

```
// shows: 1 4 10
// 1 for ubound of the offset array
// 4 for 4 bytes before the matched pattern
// 10 for the 10 bytes before the end of the matched pattern
end if

r=new RegExMBS
if r.Compile(".\xF6.") then // finds √ using Unicode codepoint
c=r.Execute(s,0)
MessageBox str(c)+" "+str(r.Offset(0))+" "+str(r.Offset(1))
// shows: 1 4 10
// 1 for ubound of the offset array
// 4 for 4 bytes before the matched pattern
// 10 for the 10 bytes before the end of the matched pattern
end if
```

233.0.197 How to see if a file is invisible for Mac OS X?

Plugin Version: all, Platform: macOS.

Answer: Try this function:
Example:

```
Function Invisible(F As FolderItem) As Boolean
Var TIS As TextInputStream
Var S,All As String
Var I as Integer
Var g as folderitem

If Left(F.Name,1)="." or not f.visible Then
Return True
End If

g=F.Parent.Child(".hidden")
If g.Exists Then
TIS=g.OpenAsTextFile
if tis<>Nil then
All=TIS.ReadAll
For I=1 to CountFields(All,Chr(11))
S=NthField(All, Chr(11), I)
If S=F.name Then
Return True
End If
Next
end if
End if
End Function
```

233.0.198 How to set cache size for SQLite or REALSQLDatabase?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You use the pragma cache_size command on the database.
Example:

```
// set cache size to 20000 pages which is about 20 MB for default page size
Var db as REALSQLDatabase
db.SQLExecute "PRAGMA cache_size = 20000"
```

Notes: Default cache size is 2000 pages which is not much.
You get best performance if whole database fits in memory.
At least you should try to have a cache big enough so you can do queries in memory.
You only need to call this pragma command once after you opened the database.

233.0.199 How to set the modified dot in the window?

Plugin Version: all, Platform: macOS.

Answer: Try this declares:
Example:

```
Window1.ModifiedMBS=true
```

233.0.200 How to show a PDF file to the user in a Web Application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use a WebHTMLViewer control and load the
Example:

```
// This example needs a window with HTMLViewer1.
Var CurrentFile as WebFile // a property of the WebPage

// define the PDF file
CurrentFile = new WebFile
CurrentFile.Filename = "test.pdf"
CurrentFile.MIMEType = "application/pdf"
CurrentFile.Data = "some pdf data" // MyDynaPDF.GetBuffer

// load into html viewer
```

HTMLViewer1.URL = CurrentFile.URL

Notes: See our Create PDF example for the Xojo Web Edition.

233.0.201 How to show Keyboard Viewer programmatically?

Platform: macOS.

Answer: Use Xojo or AppleScript to launch the KeyboardViewerServer.app.
Example:

```
Var a as new AppleScriptMBS
Var text as string
Var lines(-1) as string

lines.Add "set theApplication to ""KeyboardViewerServer"""
lines.Add "set thePath to ""/System/Library/Components/KeyboardViewer.component/Contents/SharedSupport/KeyboardViewerServer.app"""
lines.Add ""
lines.Add "set POSIXPath to ((POSIX file thePath) as string)"
lines.Add "tell application ""System Events"" to set isRunning to 0 <(count (application processes whose name is theApplication))"
lines.Add "if isRunning then tell application POSIXPath to quit"
lines.Add "delay 0.15"
lines.Add ""
lines.Add "ignoring application responses"
lines.Add " tell application POSIXPath to run"
lines.Add "end ignoring"

text=join(lines,EndOfLine.macintosh)

a.Compile text
a.Execute
```

Notes: AppleScript code:

```
set theApplication to "KeyboardViewerServer"
set thePath to "/System/Library/Components/KeyboardViewer.component/Contents/SharedSupport/KeyboardViewerServer.app"

set POSIXPath to ((POSIX file thePath) as string)
tell application "System Events" to set isRunning to 0 <(count (application processes whose name is theApplication))
```

```
if isRunning then tell application POSIXPath to quit
delay 0.15

ignoring application responses
tell application POSIXPath to run
end ignoring
```

233.0.202 How to show the mouse cursor on Mac?

Plugin Version: all, Platform: macOS.

Answer: Try this declare:
Example:

```
Declare Sub ShowCursor Lib "Carbon" ()

ShowCursor
```

Notes: The MBS Plugin has this function and supports it on Windows, too.

233.0.203 How to shutdown a Mac?

Plugin Version: all, Platform: macOS.

Answer: Ask the Finder via Apple Events:
Example:

```
Var ae as appleevent
ae=newappleEvent("FNDR","shut","MACS")
if not ae.send then
MessageBox "The computer couldn't be shutdown."
end if
```

Notes: Or toolbox call (Attention: This method will stop the computer immediataly: No document asked to be saved, all applications quitting without knowing).

```
Declare Sub ShutDwnPower Lib "Carbon" ()
ShutDwnPower
```

233.0.204 How to sleep a Mac?

Plugin Version: all, Platform: macOS.

Answer: Ask the Finder via Apple Events:
Example:

```
Var ae as appleevent
ae=newappleEvent("FNDR","slep","MACS")
if not ae.send then
MessageBox "The computer doesn't want to sleep."
end if
```

233.0.205 How to speed up rasterizer for displaying PDFs with DynaPDF?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Here a few speed tips:
Notes:

- Use the DynaPDFRasterizerMBS function instead of our render functions.
- Reuse DynaPDFRasterizerMBS as long as the target picture size doesn't change.
- Import only the PDF pages you want to display.
- Let DynaPDF do zooming, rotating or other effects instead of you change it.

233.0.206 How to use PDFLib in my RB application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: The PDFlib plugin was discontinued in favor of our DynaPDF plugin.
Notes: If you need help to move, please contact us.

233.0.207 How to use quotes in a string?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Just double them.
Example:

```
MessageBox "This String contains ""quotes""."
```

233.0.208 How to use Sybase in Web App?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Please use our MBS Xojo SQL Plugin to connect to a Sybase Database in your web application.
Notes: If you see db.Connect giving the error message "cs_ctx_alloc ->CS_MEM_ERROR", than some things are not setup right for Sybase.
The Apache process may not have all the SYBASE environment variables being set when the CGI was launched.

Adding these lines to /etc/httpd/conf/httpd.conf stopped the faux memory errors for us:

SetEnv LD_LIBRARY_PATH /opt/sybase/OCS-15_0/lib:/opt/sybase/OCS-15_0/lib3p64:/opt/sybase/OCS-15_0/lib3p:
SetEnv SYBROOT /opt/sybase
SetEnv SYBASE_OCS /opt/sybase
SetEnv SYBASE /opt/sybase

233.0.209 How to use the Application Support folder?

Plugin Version: all, Platform: macOS.

Answer:

I was saving a registration code for an app to the Preferencefolder.
People on the list have suggested that it would be better in
the ApplicationSupportFolder. How do I save the file called CWWPrefs
into that folder using MBS?

I have checked for examples and the docs but can't see how to apply it

//f = SpecialFolder.Preferences.child("CWWPrefs")
f = ApplicationSupportFolderMBS(-32768)
Example:

```
Var folder,file as FolderItem

folder = createApplicationSupportFolderMBS(-32763)

if folder=nil then
// Some very old Mac OS Versions may not support it
// or the plugin may fail for any reason
folder=SpecialFolder.Preferences
end if
```

```
file=folder.Child("CWWPrefs")

MessageBox file.NativePath
```

Notes:

You may not be able to write there with a normal user account!

233.0.210 How to use the IOPMCopyScheduledPowerEvents function in Xojo?

Plugin Version: all, Platform: macOS.

Answer: You can use the following code which does this using the SoftDeclareMBS class.
Example:

```
Sub Open()
Var c as CFDateMBS
Var t as CFAbsoluteTimeMBS

// get current date
c=NewCFDateMBS

// in absolute time (seconds since x)
t=c.AbsoluteTime

// add 600 seconds (= 10 Minutes)
t.Value=t.Value+600

// Make a Date from it
c=t.Date

// Schedule the event
// 0 on success
// E00002C1 for missing root rights
Title=hex(schedulePowerEvent(c, "wake"))

// Just for information, display the scheduled stuff
CFShowMBS CopyScheduledPowerEvents
End Sub

Function CopyScheduledPowerEvents() As cfarrayMBS
Var s as SoftDeclareMBS
Var m as MemoryBlock

s=new SoftDeclareMBS
```

```
if s.LoadLibrary("IOKit.framework") then
if s.LoadFunction("IOPMCopyScheduledPowerEvents") then
if s.CallFunction(0,nil) then
Return NewCFArrayMBSHandle(s.Result,true)
else
MessageBox "Failed to Call IOPMCopyScheduledPowerEvents."
end if
else
MessageBox "Failed to load IOPMCopyScheduledPowerEvents."
end if
else
MessageBox "Failed to load IOKit."
end if

Return nil
End Function

Function SchedulePowerEvent(time_to_wake as CFDateMBS, Type as CFStringMBS) as Integer
Var s as SoftDeclareMBS
Var m as MemoryBlock

'/*
'* Types of power event
'* These are potential arguments to IOPMSchedulePowerEvent().
'* These are all potential values of the kIOPMPowerEventTypeKey in the CFDictionaries
'* returned by IOPMCopyScheduledPowerEvents().
'*/
'/*!
'@define kIOPMAutoWake
'@abstract Value for scheduled wake from sleep.
'*/
'#define kIOPMAutoWake "wake"
'
'/*!
'@define kIOPMAutoPowerOn
'@abstract Value for scheduled power on from off state.
'*/
'#define kIOPMAutoPowerOn "poweron"
'
'/*!
'@define kIOPMAutoWakeOrPowerOn
'@abstract Value for scheduled wake from sleep, or power on. The system will either wake OR
'power on, whichever is necessary.
'*/
'
'#define kIOPMAutoWakeOrPowerOn "wakepoweron"
'/*!
'@define kIOPMAutoSleep
```

```
'@abstract Value for scheduled sleep.
'*/
'
'#define kIOPMAutoSleep "sleep"
'/*!
'@define kIOPMAutoShutdown
'@abstract Value for scheduled shutdown.
'*/
'
'#define kIOPMAutoShutdown "shutdown"

s=new SoftDeclareMBS

if s.LoadLibrary("IOKit.framework") then
if s.LoadFunction("IOPMSchedulePowerEvent") then

m=NewMemoryBlock(12)
m.Long(0)=time_to_wake.handle
m.Long(4)=0 // nil
m.Long(8)=type.Handle

if s.CallFunction(3,m) then
Return s.Result
end if
end if
end if

End Function
```

Notes: Requires Mac OS X and to execute root rights.

233.0.211 How to validate a GUID?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use this function below which uses a regular expression to verify that the string is a valid UUID/GUID:
Example:

```
Function IsGUID(guid as string) As Boolean
Var r as new RegEx

r.SearchPattern = "^(\{ { 0,1 } ( [ 0-9a-fA-F ] ) { 8 } -( [ 0-9a-fA-F ] ) { 4 } -( [ 0-9a-fA-F ] ) { 4 } -( [ 0-9a-fA-F ] ) { 4 } -( [ 0-9a-fA-F ] ) { 12 } \} { 0,1 } )$ "

Return r.Search(guid)<>nil
```

```
End Function
```

Notes: Simply parsing the GUID with CFUUIDMBS does not give the same result as CFUUIDMBS will also take a string like "DDDD".

233.0.212 How to walk a folder hierarchie non recursively?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use code like this one:
Example:

```
Sub Walk(folder as FolderItem)
Var folders() as FolderItem

folders.Add folder

while folders.LastIndex>=0

Var currentFolder as FolderItem = folders.pop

Var c as Integer = currentFolder.Count
for i as Integer = 1 to c
Var item as FolderItem = currentFolder.TrueItem(i)

if item = Nil then
// no permission
elseif item.Visible then // only visible

if item.Directory then
folders.Add item
else
// work with file here
end if

end if

next

wend
End Sub
```

Notes: As you see we go with a long loop which runs until we don't have more folders to process.
We ignore items we can't access due to permission limits.
And we only work visible items.

If you like, check folderitem.isBundleMBS on item to handle packages and applications better on Mac OS X.

233.0.213 I got this error: PropVal, QDPictMBS.Name (property value), Type mismatch error. Expected CGDataProviderMBS, but got Variant, Name:QDPictMBS

Plugin Version: all, Platform: macOS.

Answer: The plugins MacOSX and MacOSXCF belong together. If you use one part, please also install the other part.
Notes: We splitted the plugin because the Xojo IDE on Windows crashed on compilation.

233.0.214 I registered the MBS Plugins in my application, but later the registration dialog is shown.

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: There are two main reasons.
Notes: 1. you may use the plugin before registering them. This is often the case if you register in a window open event and use the plugin in a control open event.
On the console on Mac OS X or Windows, you may see a message like this "MBS Plugins were used by the application before the RegisterMBSPlugin function was called. Please fix this in your code!".

2. you may have mixed different plugin versions which are not compatible.
In this case you can see a message "Internal plugin registration error." on the console on Mac OS X. Newer plugins may show a message dialog reporting this. Older version simply think they are not registered.

If the installer just merges old and new applications, users may have libraries of older and newer plugin versions in the libs folder. If your application loads the wrong version, the registration fails.

If you use remote debugging, make sure you clear the tempory files there, too. Otherwise you may have old DLLs on your hard disc which may disturb your application.

You can run into issues if you use your registration code on different places of your app. Please register only once in app.open (or app Constructor). If you have several codes, simply call them one after the other.

Also check that you only call RegisterMBSPlugin with valid serial number. If you later call RegisterMBSPlugin with Demo like in example code above, you remove the license.

Next check if you can clear the Xojo caches and that helps. This includes the Xojo Scratch folder and

the Plugins & Project caches. Simply locate those folders and delete them. For Windows look in hidden AppData folder in your user folder. For Mac, please check
textasciitilde /Library/Caches and your temp folders.

Finally make sure you use the right serial number. Not an older one or a misspelled one.

233.0.215 I want to accept Drag & Drop from iTunes

Plugin Version: all, Platform: macOS.

Answer: You need to accept AcceptMacDataDrop "itun" and Handle the DropObject.
Example:

```
Sub Open()
Window1.AcceptMacDataDrop "itun"
End Sub

Sub DropObject(obj As DragItem)
Var s as string
Var f as folderItem
Var d as CFDictionaryMBS
Var o as CFObjectMBS
Var key as CFStringMBS
Var dl as CFDictionaryListMBS
Var i,c as Integer
Var u as CFURLMBS
Var file as FolderItem

if obj.MacDataAvailable("itun") then
s = obj.MacData("itun")

// Parse XML
o=NewCFObjectMBSFromXML(NewCFBinaryDataMBSStr(s))

// Make dictionary
if o isa CFDictionaryMBS then
d=CFDictionaryMBS(o)

// get Tracks Dictionary
key=NewCFStringMBS("Tracks")
o=d.Value(key)

if o isa CFDictionaryMBS then
d=CFDictionaryMBS(o)
dl=d.List
```

```
// Walk over all entries in the Tracks dictionary
c=dl.Count-1
for i=0 to c
o=dl.Value(i)

if o isa CFDictionaryMBS then
d=CFDictionaryMBS(o)

key=NewCFStringMBS("Location")
o=d.Value(key)
if o isa CFStringMBS then
u=NewCFURLMBSCFStringMBS(CFStringMBS(o),nil)

file=u.file
if file<>nil then
MessageBox file.NativePath
end if
end if
end if
next
end if
end if
end if
End Sub
```

Notes: The code above inside a window on Xojo 5.5 with MBS Plugin 5.3 will do it nice and show the paths.

233.0.216 I'm drawing into a listbox but don't see something.

Plugin Version: all.

Answer: If you draw this in a listbox cellbackground, you need to draw on the correct position
Example:

```
Function CellBackgroundPaint(g As Graphics, row as Integer, column as Integer) As Boolean
Var f as FolderItem
f=SpecialFolder.Desktop
f.DrawWideIconMBS(g,ListBox1.left,ListBox1.top+row*20,16)
Return true
End Function
```

Notes: Try this in a listbox. The Graphics object there has a cliping and an offset which the plugin doesn't know about.

233.0.217 I'm searching for a method or so to move a window from position x.y to somewhere else on the screen.

Platform: macOS.

Answer:

The code I produced in RB isn't smooth enough. Is there a call in MBS, if not, can it be done? The speed of it has to be like the show of a DrawerWindow.

Try the declare below for Carbon. With WindowLib it will work on Mac OS 8.5 and newer.
Notes:

See Window.Transition functions.

233.0.218 If I use one of your plug-ins under windows, would this then impose the use of dll after compilation or my would my compiled soft still be a stand-alone single file software?

Platforms: macOS, Linux, Windows.

Answer: Stand alone.
Notes: Xojo compiles all used plugins into the application binary.
Some plugin parts need external dlls but you will find that in the documentation. (e.g. pdflib for some classes)

233.0.219 Is the fn key on a powerbook keyboard down?

Plugin Version: all, Platform: macOS.

Answer: I am unable to figure out how or if it is possible to detect if the fn key is down on a powerbook keyboard. Is it possible?
Example:

```
' Window.Open Event of a blank project:

Var i as Integer

for i=0 to 127
if keyboard.asynckeydown(i) then
title=str(i) // found
return
end if
next
title="" // not found
```

Notes: This test application shows the keycode (decimal) 63 for the fn key.

233.0.220 Is there a case sensitive Dictionary?

Plugin Version: all.

Answer: The MBS Plugin has several classes which can work as a replacement.
Notes: First you could use VariantToVariantHashMapMBS or VariantToVariantOrderedMapMBS.
If you know that all keys are Strings or Integers only, you can use the specialized classes which are a little bit faster due to avoiding variants:

IntegerToIntegerHashMapMBS class
IntegerToIntegerOrderedMapMBS class
IntegerToStringHashMapMBS class
IntegerToStringOrderedMapMBS class
IntegerToVariantHashMapMBS class
IntegerToVariantOrderedMapMBS class
StringToStringHashMapMBS class
StringToStringOrderedMapMBS class
StringToVariantHashMapMBS class
StringToVariantOrderedMapMBS class

233.0.221 Is there a way to use the MBS plugin to get only the visible item and folder count on a volume?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use the DirectorySizeMBS class for this as in the example below:
Example:

```
Var d as DirectorySizeMBS

d=new DirectorySizeMBS

// volume(1) as my boot volume is very full
if d.update(volume(1),true,0) then
MessageBox str(d.VisibleItemCount)+" visible items, "+str(d.HiddenItemCount)+" invisible items."
end if
```

Notes: Complete Question: Is there a way to use the MBS plugin to get only the visible item and folder count on a volume? The FileCount and FolderCount properties of
VolumeInformationMBS seem to provide the total # of items including
invisible items such as .DS_Store and more importantly .Trashes which
is causing me a great amount of difficulty during a recursive scan of a

volume. I've got a progress bar which uses the total of the filecount and foldercount properties as the maximum value, but my routine needs to filter out all invisible items, as it is creating a catalog of a volume for archiving purposes. Any thoughts how I could get accurate number.

233.0.222 Is there an easy way I can launch the Displays preferences panel?

Plugin Version: all, Platform: macOS.

Answer: Use the code below:
Example:

```
Var error as Integer

error=OpenMacOSXPreferencesPaneMBS("Displays")
if error<>0 then
MessageBox "Failed to launch QuickTime System Preferences panel."
end if
```

233.0.223 List of Windows Error codes?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: We have a list of windows error codes on our website.
Notes: http://www.monkeybreadsoftware.de/xojo/winerror.shtml

233.0.224 Midi latency on Windows problem?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: The issue is system related, not a problem with RB or the plugin.
Notes: Two things will adversely affect the timing:

(1) latency of the software synthesizer output driver. The default Windows wavetable synthesizer has considerable latency. I don't know how many milliseconds, but it is noticeable.

(2) latency of the digital audio output driver. Different systems have different drivers for different audio hardware. My Dell laptop has a minimum 15ms latency in the audio driver.

These two things put together were causing a very sluggish MIDI response. I was able to verify these as the culprits by routing MIDI directly out of RB into a sample player, which only introduces the latency of (2)

and does not include latency of (1).

I don't know how widely known are these facts, if not then you may want to add this information to the documentation, since Windows programmers using the MIDI plugin may not know those problems, and might mistakenly blame your plugin, as I did :) Sorry about that!

(From Aaron Andrew Hunt)

233.0.225 My Xojo Web App does not launch. Why?

Plugin Version: all, Platform: macOS.

Answer: Here is a list of checks to do for Linux apache installations with Xojo or Xojo Web applications:
Notes: Just a list of checks to do for Linux apache installations:

- You have 64bit Linux? Than you need 32 bit compatibility libraries.
- The folder of your app is writable? Set permissions to 777.
- The cgi script is executable? Set permissions to 755.
- The app file itself is executable? Set permissions to 755.
- You uploaded cgi file as text, so it has unix line endings? (this often gives error "Premature end of script headers" in apache log)
- You uploaded config.cfg file and made it writable? Set permissions to 666.
- Your apache allows execution of cgi scripts? You enabled cgi for apache and uncommented addhandler command for CGI on a new apache installation?
- You uploaded the app file and libraries as binary files? Upload as text breaks them.
- You did upload the libs folder?
- You don't have code in app.open, session.open and other events which crashes app right at launch?
- You don"t have a print command in your app.open event? (see feedback case 23817)
- You allowed htaccess file to overwrite permissions?

233.0.226 SQLDatabase not initialized error?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Before you can use SQLDatabaseMBS, it must be initialized.
Example:

Var d as new SQLDatabaseMBS

Notes: This happens normally when you use "new SQLDatabaseMBS".
But if you just have a SQLConnectionMBS and get a recordset there, the initialization may not have happend, yet.
So please simply add a line "dim d as new SQLDatabaseMBS" to your app.open code after registration, so the plugin part can initialize and late provide recordsets.

233.0.227 Textconverter returns only the first x characters. Why?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

Some older Xojo versions limit the Textconverter to around 1024 characters in input and output.
This should be fixed with RB5.
Notes:

Xojo seems not to support Textconverters at all on Windows.

233.0.228 The type translation between CoreFoundation/Foundation and Xojo data types.

Plugin Version: all, Platform: macOS.

Answer: The plugin does conversion between Cocoa/Carbon data types and native Xojo data types. The following list help you knowing what the current plugins support:
Notes: Cocoa NSObject to Variant:

nil ->nil
NSDictionary ->Dictionary
NSData ->MemoryBlock
NSString ->String
NSAttributedString ->NSAttributedStringMBS
NSDate ->Date
NSNumber ->double/integer/Int64/UInt64/UInt32/Boolean
NSURL ->String
NSValue with NSRect ->NSRectMBS
NSValue with NSPoint ->NSPointMBS
NSValue with NSSize ->NSSizeMBS
NSValue with NSRange ->NSRangeMBS
NSValue with QTTime ->QTTimeMBS
NSValue with QTTimeRange ->QTTimeRangeMBS
NSArray ->Array of Variant

QuartzFilter ->QuartzFilterMBS

- ->*MBS

Variant to Cocoa NSObject:

nil ->nil
Dictionary ->NSDictionary
Boolean ->NSNumber
Integer ->NSNumber
Color ->NSColor
Int64 ->NSNumber
Single ->NSNumber
Double ->NSNumber
Date ->NSDate
MemoryBlock ->NSData
String ->NSString
NSImageMBS ->NSImage
NSAttributedStringMBS ->NSAttributedString
NSColorMBS ->NSColor
NSRectMBS ->NSValue with NSRect
NSSizeMBS ->NSValue with NSSize
NSPointMBS ->NSValue with NSPoint
NSRangeMBS ->NSValue with NSRange
NSBurnMBS ->NSBurn
NSViewMBS ->NSView
NSFontMBS ->NSFont
NSParagraphStyleMBS ->NSParagraphStyle
NSAttributedStringMBS ->NSAttributedString
WebPolicyDelegateMBS ->WebPolicyDelegate
WebUIDelegateMBS ->WebUIDelegate
WebFrameLoadDelegateMBS ->WebFrameLoadDelegate
WebResourceLoadDelegateMBS ->WebResourceLoadDelegate
NSIndexSetMBS ->NSIndexSet
QTTimeMBS ->QTTime
QTTimeRangeMBS ->QTTimeRange
Array of Variant ->NSArray
Array of String ->NSArray
CFStringMBS ->NSString
CFNumberMBS ->NSNumber
CFDataMBS ->NSData
CFURLMBS ->NSURL
CFArrayMBS ->NSArray
CFDictionaryMBS ->NSDictionary
CFBinaryDataMBS ->NSDate

Carbon CFTypeRef to Variant:

CFDictionaryRef ->Dictionary
CFStringRef ->String
CFDataRef ->String
CFURL ->String
CFNumber ->Integer/Double/Int64
CFArray ->Array
CFDate ->date
nil ->nil
CGColorSpace ->CGColorSpaceMBS
CGColor ->CGColorMBS
CGImage ->CGImageMBS
CF* ->CF*MBS

Variant to Carbon CFTypeRef:

Dictionary ->CFDictionaryRef
Boolean ->CFBooleanRef
Color ->CFNumberRef
Integer ->CFNumberRef
Int64 ->CFNumberRef
Single ->CFNumberRef
Double ->CFNumberRef
String ->CFStringRef
Color ->CGColorRef
Date ->CFDateRef
nil ->nil
Memoryblock ->CFDataRef
FolderItem ->CFURLRef
Dictionary ->CFDictionaryRef
Array of Variant/String/Date/Double/Single/Int64/Integer ->CFArray
CGRectMBS ->CGRect as CFDataRef
CGSizeMBS ->CGSize as CFDataRef
CGPointMBS ->CGPoint as CFDataRef
CGColorMBS ->CGColor
CGColorSpaceMBS ->CGColorSpace
CGImageMBS ->CGImage
CGDataConsumerMBS ->CGDataConsumer
CGDataProviderMBS ->CGDataProvider
CF*MBS ->CF*

Strings without encodings should be put into dictionaries as memoryblocks.

233.0.229 Uploaded my web app with FTP, but it does not run on the server!

Plugin Version: all, Platform: Windows.

Answer: If you see errors like a simple "Segmentation Fault" on Linux or some other wired errors, you may want to check your FTP upload mode. It must be binary for web apps. ASCII mode corrupts the application.

233.0.230 What classes to use for hotkeys?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Please use CarbonHotKeyMBS class on Mac and WindowsKeyFilterMBS on Windows.
Notes: CarbonHotKeyMBS will also work fine in Cocoa apps.

233.0.231 What do I need for Linux to get picture functions working?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: In order to get our plugins working on Linux systems without GUI, the plugin loads graphics libraries dynamically.
Notes: To get it working, the plugin tries to load gtk with this paths:

- libgtk-x11-2.0.so"
- libgtk-x11-2.0.so.0"
- /usr/lib/libgtk-x11-2.0.so"
- /usr/lib32/libgtk-x11-2.0.so"
- /usr/lib/libgtk-x11-2.0.so.0"
- /usr/lib32/libgtk-x11-2.0.so.0"

gdk is loaded with this paths:

- libgdk-x11-2.0.so"
- libgdk-x11-2.0.so.0"
- /usr/lib/libgdk-x11-2.0.so"
- /usr/lib32/libgdk-x11-2.0.so"
- /usr/lib/libgdk-x11-2.0.so.0"

- /usr/lib32/libgdk-x11-2.0.so.0"

For the paths without explicit path, the system will search in /lib, /usr/lib and all directories in the LD_LIBRARY_PATH environment variable.

233.0.232 What does the NAN code mean?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

233.0.233 What font is used as a 'small font' in typical Mac OS X apps?

Plugin Version: all, Platform: macOS.

Answer:

Xojo 4.5 has a constant "SmallSystem" to use for a font name.
For older versions try this code:
Example:

```
Sub GetThemeFont(fontType as Integer, ByRef fontName as String, ByRef fontSize as Integer, ByRef fontStyle as Integer)
Var err as Integer
Var theFont, theFontSize, theFontStyle as MemoryBlock

const smSystemScript = -1

Declare Function GetThemeFont Lib "Carbon" (inFontID as Integer, inScript as Integer, outFontName as Ptr, outFontSize as Ptr, outStyle as Ptr) as Integer

theFont = NewMemoryBlock(256) //Str255
theFontSize = NewMemoryBlock(2) //SInt16
theFontStyle = NewMemoryBlock(1) //Style

err = GetThemeFont(fontType, smSystemScript, theFont, theFontSize, theFontStyle)

if err = 0 then
fontName = theFont.PString(0)
fontSize = theFontSize.UShort(0)
fontStyle = theFontStyle.Byte(0)
else
fontName = ""
fontSize = 0
fontStyle = 0
end if
```

```
End Sub
```

233.0.234 What is last plugin version to run on Mac OS X 10.4?

Plugin Version: all, Platform: Windows.

Answer: Last Version with 10.4 support is version 15.4.
Notes: With version 15.4 you can build applications for OS X 10.4 and newer.
For Version 16.0 we disabled 10.4 and moved minimum to 10.5. We may be able to enable it again to build a version of 16.x, but may need to charge for this by hour.

233.0.235 What is last plugin version to run on PPC?

Plugin Version: all, Platform: Windows.

Answer: Last Version with PPC is 15.4.
Notes: With version 15.4 you can build PPC applications for OS X 10.4 and newer.
For Version 16.0 we disabled PPC. We may be able to enable it again to build a PPC version of 16.x, but may need to charge for this by hour.

233.0.236 What is last version of the plugins for macOS 32-bit?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Please use version 23.0 or older.
Notes: We stopped including 32-bit code for macOS in version 23.1.
Please us older versions if you use an old Xojo.

Xojo 2017r3 and newer load our 64-bit plugins.

233.0.237 What is the difference between Timer and WebTimer?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Time is server side and WebTimer client side.
Notes: Timer is the normal timer class in Xojo. It runs on the server. On the side the WebTimer runs on the client. It triggers a request to the server to perform the action. So a WebTimer is good to keep the connection running and the website updated regularly. A timer on the server is good to make regular jobs like starting a database backup every 24 hours.

233.0.238 What is the list of Excel functions?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Below a list of function names known by LibXL.
Notes: LibXL parses the functions and writes tokens to the excel file. So even if Excel can do more functions, we can only accept the ones known by LibXL.

ABS, ABSREF, ACOS, ACOSH, ACTIVE.CELL, ADD.BAR, ADD.COMMAND, ADD.MENU, ADD.TOOLBAR, ADDRESS, AND, APP.TITLE, AREAS, ARGUMENT, ASC, ASIN, ASINH, ATAN, ATAN2, ATANH, AVEDEV, AVERAGE, AVERAGEA, BAHTTEXT, BETADIST, BETAINV, BINOMDIST, BREAK, CALL, CALLER, CANCEL.KEY, CEILING, CELL, CHAR, CHECK.COMMAND, CHIDIST, CHIINV, CHITEST, CHOOSE, CLEAN, CODE, COLUMN, COLUMNS, COMBIN, CONCATENATE, CONFIDENCE, CORREL, COS, COSH, COUNT, COUNTA, COUNTBLANK, COUNTIF, COVAR, CREATE.OBJECT, CRITBINOM, CUSTOM.REPEAT, CUSTOM.UNDO, DATE, DATEDIF, DATESTRING, DATEVALUE, DAVERAGE, DAY, DAYS360, DB, DBCS, DCOUNT, DCOUNTA, DDB, DEGREES, DELETE.BAR, DELETE.COMMAND, DELETE.MENU, DELETE.TOOLBAR, DEREF, DEVSQ, DGET, DIALOG.BOX, DIRECTORY, DMAX, DMIN, DOCUMENTS, DOLLAR, DPRODUCT, DSTDEV, DSTDEVP, DSUM, DVAR, DVARP, ECHO, ELSE, ELSE.IF, ENABLE.COMMAND, ENABLE.TOOL, END.IF, ERROR, ERROR.TYPE, EVALUATE, EVEN, EXACT, EXEC, EXECUTE, EXP, EXPONDIST, FACT, FALSE, FCLOSE, FDIST, FILES, FIND, FINDB, FINV, FISHER, FISHERINV, FIXED, FLOOR, FOPEN, FOR, FOR.CELL, FORECAST, FORMULA.CONVERT, FPOS, FREAD, FREADLN, FREQUENCY, FSIZE, FTEST, FV, FWRITE, FWRITELN, GAMMADIST, GAMMAINV, GAMMALN, GEOMEAN, GET.BAR, GET.CELL, GET.CHART.ITEM, GET.DEF, GET.DOCUMENT, GET.FORMULA, GET.LINK.INFO, GET.MOVIE, GET.NAME, GET.NOTE, GET.OBJECT, GET.PIVOT.FIELD, GET.PIVOT.ITEM, GET.PIVOT.TABLE, GET.TOOL, GET.TOOLBAR, GET.WINDOW, GET.WORKBOOK, GET.WORKSPACE, GETPIVOTDATA, GOTO, GROUP, GROWTH, HALT, HARMEAN, HELP, HLOOKUP, HOUR, HYPERLINK, HYPGEOMDIST, IF, INDEX, INDIRECT, INFO, INITIATE, INPUT, INT, INTERCEPT, IPMT, IRR, ISBLANK, ISERR, ISERROR, ISLOGICAL, ISNA, ISNONTEXT, ISNUMBER, ISPMT, ISREF, ISTEXT, ISTHAIDIGIT, KURT, LARGE, LAST.ERROR, LEFT, LEFTB, LEN, LENB, LINEST, LINKS, LN, LOG, LOG10, LOGEST, LOGINV, LOGNORMDIST, LOOKUP, LOWER, MATCH, MAX, MAXA, MDETERM, MEDIAN, MID, MIDB, MIN, MINA, MINUTE, MINVERSE, MIRR, MMULT, MOD, MODE, MONTH, MOVIE.COMMAND, N, NA, NAMES, NEGBINOMDIST, NEXT, NORMDIST, NORMINV, NORMSDIST, NORMSINV, NOT, NOTE, NOW, NPER, NPV, NUMBERSTRING, ODD, OFFSET, OPEN.DIALOG, OPTIONS.LISTS.GET, OR, PAUSE, PEARSON, PERCENTILE, PERCENTRANK, PERMUT, PHONETIC, PI, PIVOT.ADD.DATA, PMT, POISSON, POKE, POWER, PPMT, PRESS.TOOL, PROB, PRODUCT, PROPER, PV, QUARTILE, RADIANS, RAND, RANK, RATE, REFTEXT, REGISTER, REGISTER.ID, RELREF, RENAME.COMMAND, REPLACE, REPLACEB, REPT, REQUEST, RESET.TOOLBAR, RESTART, RESULT, RESUME, RETURN, RIGHT, RIGHTB, ROMAN, ROUND, ROUNDBAHTDOWN, ROUNDBAHTUP, ROUNDDOWN, ROUNDUP, ROW, ROWS, RSQ, RTD, SAVE.DIALOG, SAVE.TOOLBAR, SCENARIO.GET, SEARCH, SEARCHB, SECOND, SELECTION, SERIES, SET.NAME, SET.VALUE, SHOW.BAR, SIGN, SIN, SINH, SKEW, SLN, SLOPE, SMALL, SPELLING.CHECK, SQRT, STANDARDIZE, STDEV, STDEVA, STDEVP, STDEVPA, STEP, STEYX, SUBSTITUTE, SUBTOTAL, SUM, SUMIF, SUMPRODUCT, SUMSQ, SUMX2MY2, SUMX2PY2, SUMXMY2, SYD, T, TAN, TANH, TDIST, TERMINATE, TEXT, TEXT.BOX, TEXTREF, THAIDAYOFWEEK, THAIDIGIT, THAIMONTHOFYEAR, THAINUMSOUND, THAINUMSTRING, THAISTRINGLENGTH, THAIYEAR, TIME, TIMEVALUE, TINV, TODAY, TRANSPOSE, TREND, TRIM, TRIMMEAN, TRUE, TRUNC, TTEST, TYPE, UNREGISTER, UPPER, USDOLLAR, USERDEFINED, VALUE, VAR, VARA, VARP, VARPA, VDB, VIEW.GET,

VLOOKUP, VOLATILE, WEEKDAY, WEIBULL, WHILE, WINDOW.TITLE, WINDOWS, YEAR and ZTEST.

233.0.239 What is the replacement for PluginMBS?

Plugin Version: all, Platform: macOS.

Answer: Use the SoftDeclareMBS class to load libraries dynamically.

233.0.240 What to do on Xojo reporting a conflict?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

I get an error like "This item conflicts with another item of the same name" when using one of the plugin functions.

Xojo just wants to tell you that you dropped something in the plugins folder what is not a plugin.
Notes:

Some users dropped the examples, the documentation or other files into the plugins folder. Don't do it.

233.0.241 What to do with a NSImageCacheException?

Plugin Version: all, Platforms: macOS, Windows.

Answer: You need to add exception handlers for NSExceptionMBS in order to catch this exception.
Notes: You may also add code to write the stack of the exception into a log file for later locating the error source.

A NSImage has several image representations in memory. So basicly you pass in the base image and for whatever size an image is needed, the NSImage class will create a cache image representation of the requested size so on the next query it can use that cache for the same requested size.

233.0.242 What to do with MySQL Error 2014?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can get this error on MySQL if you have a recordset open while you create another one.

233.0.243 What to do with SQL Plugin reporting Malformed string as error?

Plugin Version: all, Platform: macOS.

Answer: Please make sure the table and/or database fields have a text encoding set.
Notes: For Firebird our plugin tries to use UTF-8 encoding if possible and to correctly convert between various tables, the tables and their fields need to have a text encoding defined.
e.g. if the text field in the table is windows-1252 and the other ISO 8859-5, then the Firebird database can convert them to UTF-8 and deliver texts to the plugin.
If encoding is set to none, it may get confused for non-ascii text.

233.0.244 Where is CGGetActiveDisplayListMBS?

Plugin Version: all, Platform: Windows.

Answer: This is now CGDisplayMBS.GetActiveDisplayList.

233.0.245 Where is CGGetDisplaysWithPointMBS?

Plugin Version: all, Platform: Windows.

Answer: This is now CGDisplayMBS.GetDisplaysWithPoint.

233.0.246 Where is CGGetDisplaysWithRectMBS?

Plugin Version: all, Platform: Windows.

Answer: This is now CGDisplayMBS.GetDisplaysWithRect.

233.0.247 Where is CGGetOnlineDisplayListMBS?

Plugin Version: all, Platform: Windows.

Answer: This is now CGDisplayMBS.GetOnlineDisplayList.

233.0.248 Where is GetObjectClassNameMBS?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Please use this replacement method:
Example:

```
Function GetObjectClassNameMBS(o as Object) As string
Var t as Introspection.TypeInfo = Introspection.GetType(o)
Return t.FullName
End Function
```

Notes: GetObjectClassNameMBS was removed from the plugins.

233.0.249 Where is NetworkAvailableMBS?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: We removed NetworkAvailableMBS some versions ago. It was not working right and basicly it's not useful. If you want to check whether you have a network, than do a DNS resolve:
Example:

```
// two independent domain names
const domain1 = "www.google.com"
const domain2 = "www.macsw.de"

// resolve IPs
Var ip1 as string = DNSNameToAddressMBS(Domain1)
Var ip2 as string = DNSNameToAddressMBS(Domain2)

// if we got IPs and not the same IPs (error/login pages)
if len(ip1)=0 or len(ip2)=0 or ip1=ip2 then
MessageBox "no connection"
else
MessageBox "have connection"
end if
```

Notes: This way you can detect whether you got something from DNS. And you can make sure that a DNS redirection to a login page won't catch you.

233.0.250 Where is StringHeight function in DynaPDF?

Plugin Version: all, Platform: Windows.

Answer: Use the function GetFTextHeight or GetFTextHeightEx.
Notes: Be aware that GetFTextHeight works with format commands and you may want to escape your text if you don't use them.

233.0.251 Where is XLSDocumentMBS class?

Plugin Version: all, Platform: macOS.

Answer: This class has been removed in favor of XLBookMBS class.
Notes: This classes have been removed XLSCellMBS, XLSDocumentMBS, XLSFormatRecordMBS, XLSMerged-CellsMBS, XLSRowMBS and XLSSheetMBS.

233.0.252 Where to get information about file formats?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

Please visit this web page:
http://www.wotsit.org

233.0.253 Where to register creator code for my application?

Plugin Version: all, Platform: macOS.

Answer:

Register at Apple:
http://developer.apple.com/dev/cftype/information.html

233.0.254 Which Mac OS X frameworks are 64bit only?

Plugin Version: all, Platform: macOS.

Answer: Some frameworks from Mac OS X do not support 32 bit applications, so we can't provide plugins for Xojo until 64bit target is available.
Notes: For Mac OS X 10.8:

- Accounts
- EventKit
- GLKit
- Social

and in 10.9:

- Accounts
- AVKit
- EventKit
- GameController
- GLKit
- MapKit
- MediaLibrary
- Social
- SpriteKit

In general Apple makes all new frameworks being 64 bit only.

233.0.255 Which plugins are 64bit only?

Plugin Version: all, Platform: macOS.

Answer: Some of our plugins work only in 64 bit modes as operating systems do not provide 32 bit code.
Notes: This effects currently: EventKit, Accounts, Social frameworks from Apple and our matching plugins.

233.0.256 Why application doesn't launch because of a missing ddraw.dll!?

Plugin Version: all, Platform: Windows.

Answer: Some RB versions require that you install DirectX from Microsoft on your Windows.

233.0.257 Why application doesn't launch because of a missing shlwapi.dll!?

Plugin Version: all, Platform: Windows.

Answer: Some RB versions require that you install the Internet Explorer from Microsoft on your Windows.
Notes: This bug is for several older Windows 95 editions.

233.0.258 Why do I hear a beep on keydown?

Plugin Version: all, Platform: Windows.

Answer: When the user presses a key, RB goes through all keydown event handlers till on returns true.
Notes: If no keydown event handler returns true for the key, a beep is performed.

233.0.259 Why does folderitem.item return nil?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Because Xojo fails to make a folderitem for you. Reason may be an alias file which can't be resolved or simply that you don't have enough access rights to read the folder content.
Notes: A more rarely reason is that the directory changed and the file with the given index or name does no longer exist.

233.0.260 Why doesn't showurl work?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

There are three main reasons:

1. showurl is not supported by Xojo in 68k applications.
2. there is now application defined for the protocol (e.g. http) in the Internet Control panel.
3. You don't have Internet Config installed.

You can use the InternetConfigMBS class to check for this stuff.

233.0.261 Why don't the picture functions not work on Linux?

Plugin Version: all, Platform: macOS.

Answer: Please make sure libcairo is installed.
Notes: For accessing pictures on Linux, the MBS Plugin relays on the cairo library.
Please install the package if you don't have it already.
Our plugin looks for library called libcairo.so or libcairo.so.2.

233.0.262 Why have I no values in my chart?

Plugin Version: all, Platforms: macOS, Windows.

Answer: You have no data points visible, there may be several reasons:
Notes: For example one of the data values may be infinite or invalid.
Or the scaling may be out of range, so you simply see nothing.

233.0.263 Will application size increase with using plugins?

Plugin Version: all, Platform: Windows.

Answer: All plugins used by your application will be included in the application.
Notes: If you use no plugins, your application will not change size.
And if you use one class from the plugins, your application size will increase by a few kilobytes.
The documentation of the plugins include a list of all plugin parts and their sizes for the different platforms.

233.0.264 XLS: Custom format string guidelines

Plugin Version: all, Platform: macOS.

Answer: You have to download the source code and compile a static version of the library.
Notes: Up to four sections of format codes can be specified. The format codes, separated by semicolons, define the formats for positive numbers, negative numbers, zero values, and text, in that order. If only two sections are specified, the first is used for positive numbers and zeros, and the second is used for negative numbers. If only one section is specified, it is used for all numbers. Four sections example:

#,###.00_); [Red] (#,###.00);0.00;"sales "@

The following table describes the different symbols that are available for use in custom number formats.

Specify colors

To set the text color for a section of the format, type the name of one of the following eight colors in square brackets in the section. The color code must be the first item in the section.

[Black]
[Green]
[White]
[Blue]
[Magenta]
[Yellow]

[Cyan]
[Red]

Instead of using the name of the color, the color index can be used, like this [Color3] for Red. Valid numeric indexes for color range from 1 to 56, which reference by index to the legacy color palette.
Specify conditions

To set number formats that will be applied only if a number meets a specified condition, enclose the condition in square brackets. The condition consists of a comparison operator and a value. Comparison operators include: = Equal to; >Greater than; <Less than; >= Greater than or equal to, <= Less than or equal to, and <>Not equal to. For example, the following format displays numbers that are less than or equal to 100 in a red font and numbers that are greater than 100 in a blue font.
[Red] [<=100] ; [Blue] [>100]
If the cell value does not meet any of the criteria, then pound signs ("#") are displayed across the width of the cell.
Dates and times

Examples

233.0.265 Xojo doesn't work with your plugins on Windows 98.

Plugin Version: all, Platform: Windows.

Answer: Please upgrade your Windows version.

233.0.266 Xojo or my RB application itself crashes on launch on Mac OS Classic. Why?

Plugin Version: all.

Answer:

You may check if the application has enough memory to be loaded.
RB should have on Mac OS Classic more than 20 MB of RAM.
I preferred to use 50 MB and for an application a 10 MB partition is a good way to start.

Attribute	Description
width	The width of the block in pixels. By default, the width is automatically determined to be the width necessary for the contents of the block. If the width attribute is specified, it will be used as the width of the block. If the width is insufficient for the contents, the contents will be wrapped into multiple lines.
height	The height of the block in pixels. By default, the height is automatically determined to be the height necessary for the contents of the block. If the height attribute is specified, it will be used as the height of the block.
maxwidth	The maximum width of the block in pixels. If the content is wider than maximum width, it will be wrapped into multiple lines.
truncate	The maximum number of lines of the block. If the content requires more than the maximum number of lines, it will be truncated. In particular, if truncate is 1, the content will be truncated if it exceeds the maximum width (as specified by maxwidth or width) without wrapping. The last few characters at the truncation point will be replaced with "...".
linespacing	The spacing between lines as a ratio to the default line spacing. For example, a line spacing of 2 means the line spacing is two times the default line spacing. The default line spacing is the line spacing as specified in the font used.
bgColor	The background color of the block in hex format.
valign	The vertical alignment of sub-blocks. This is for blocks that contain sub-blocks. Supported values are baseline, top, bottom, middle and absmiddle. The value baseline means the baseline of sub-blocks should align with the baseline of the block. The baseline is the underline position of text. This is normal method of aligning text, and is the default in CDML. For images or blocks that are rotated, the baseline is the same as the bottom. The value top means the top line of sub-blocks should align with the top line of the block. The value bottom means the bottom line of sub-blocks should align with the bottom line of the block. The value middle means the middle line of sub-blocks should align with the middle line of the block. The middle line is the middle position between the top line and the baseline. The value absmiddle means the absolute middle line of sub-blocks should align with the absolute middle line of the block. The absolute middle line is the middle position between the top line and the bottom line.
halign	The horizontal alignment of lines. This is for blocks that contain multiple lines. Supported values are left, center and right. The value left means the left border of each line should align with the left border of the block. This is the default. The value center means the horizontal center of each line should align with the horizontal center of the block. The value right means the right border of each line should align with the right border of the block.
angle	Rotate the content of the block by an angle. The angle is specified in degrees in counter-clockwise direction.

Parameter	Description
sector	The sector number. The first sector is 0, while the nth sector is (n-1).
dataSet	Same as { sector } . See above.
label	The text label of the sector.
dataSetName	Same as { label } . See above.
value	The data value of the sector.
percent	The percentage value of the sector.
fieldN	The (N + 1)th extra field. For example, { field0 } means the first extra field. An extra field is an array of custom elements added using BaseChart.addExtraField or BaseChart.addExtraField2.

Parameter	Description
x	The x value of the data point. For an enumerated x-axis (see Axis.setLabels on what is an enumerated axis), the first data point is 0, and the nth data point is (n-1).
xLabel	The bottom x-axis label of the data point.
x2Label	The top x-axis label of the data point.
value	The value of the data point.
accValue	The sum of values of all data points that are in the same x position and same data group as the current data point, and with data set number less than or equal to the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
totalValue	The sum of values of all data points that are in the same x position and same data group as the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
percent	The percentage of the data point based on the total value of all data points that are in the same x position and same data group as the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
accPercent	The accumulated percentage of the data point based on the total value of all data points that are in the same x position and same data group as the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
gpercent	The percentage of the data point based on the total value of all data points in a layer.
dataSet	The data set number to which the data point belongs. The first data set is 0. The nth data set is (n-1).
dataSetName	The name of the data set to which the data point belongs.
dataItem	The data point number within the data set. The first data point is 0. The nth data point is (n-1).
dataGroup	The data group number to which the data point belongs. The first data group is 0. The nth data group is (n-1).
dataGroupName	The name of the data group to which the data point belongs.
layerId	The layer number to which the data point belongs. The first layer is 0. The nth layer is (n-1).
fieldN	The (N + 1)th extra field. For example, { field0 } means the first extra field. An extra field is an array of custom elements added using Layer.addExtraField, Layer.addExtraField2, BaseChart.addExtraField or BaseChart.addExtraField2. { fieldN } means the extra field is indexed by the data point number. The Pth data point corresponds to the Pth element of the extra field.
diFieldN	Same as fieldN. See above.
dsFieldN	Similar to fieldN, except that dsFieldN means the extra field is indexed by data set number. The Pth data set corresponds to the Pth element of the extra field.
dsdiFieldN	Similar to fieldN, except that dsdiFieldN means the extra fields are indexed by both the data set number and data point number. The Pth data item of the Qth data set corresponds to the Pth element of the (N + Q)th extra field.

Parameter	Description
zx	The symbol scale in the x dimension. Applicable for layers with symbol scales set by LineLayer.setSymbolScale.
zy	The symbol scale in the y dimension. Applicable for layers with symbol scales set by LineLayer.setSymbolScale.
z	The symbol scale without distinguishing the dimension to use. Applicable for layers with symbol scales set by LineLayer.setSymbolScale.

Parameter	Description
slope	The slope of the trend line.
intercept	The y-intercept of the trend line.
corr	The correlation coefficient in linear regression analysis.
stderr	The standard error in linear regression analysis.

Parameter	Description
top	The value of the top edge of the box-whisker symbol.
bottom	The value of the bottom edge of the box-whisker symbol.
max	The value of the maximum mark of the box-whisker symbol.
min	The value of the minimum mark of the box-whisker symbol.
med	The value of the median mark of the box-whisker symbol.

Parameter	Description
high	The high value.
low	The low value.
open	The open value.
close	The close value.

Parameter	Description
dir	The direction of the vector.
len	The length of the vector.

Parameter	Description
radius	The radial value of the data point.
value	Same as { radius } . See above.
angle	The angular value of the data point.
x	Same as { angle } . See above.
label	The angular label of the data point.
xLabel	Same as { label } . See above.
name	The name of the layer to which the data point belongs.
dataSetName	Same as { name } . See above.
i	The data point number. The first data point is 0. The nth data point is (n-1).
dataItem	Same as { i } . See above.
z	The symbol scale. Applicable for layers with symbol scales set by PolarLayer.setSymbolScale.
fieldN	The (N + 1)th extra field. For example, { field0 } means the first extra field. An extra field is an array of custom elements added using Layer.addExtraField, Layer.addExtraField2, BaseChart.addExtraField or BaseChart.addExtraField2. { fieldN } means the extra field is indexed by the data point number. The Pth data point corresponds to the Pth element of the extra field.
diFieldN	Same as fieldN. See above.
dsFieldN	Similar to fieldN, except that dsFieldN means the extra field is indexed by layer index. The Pth layer corresponds to the Pth element of the extra field.
dsdiFieldN	Similar to fieldN, except that dsdiFieldN means the extra fields are indexed by both the data set number and data point number. The Pth data item of the Qth layer corresponds to the Pth element of the (N + Q)th extra field.

Parameter	Description
dir	The direction of the vector.
len	The length of the vector.

Parameter	Description
value	The axis value at the tick position.
label	The axis label at the tick position.

Parameter	Description
[param]	The name of the parameter
[a]	If this field a number, it specifies the number of decimal places (digits to the right of the decimal point).

[b]

textasciitilde ' for no thousand separator. The default is '
textasciitilde ', which can be modified using BaseChart.setNumberFormat.

The thousand separator. Should be a non-alphanumeric character (not 0-9, A-Z, a-z). Use '

[c]

The decimal point character. The default is '.', which can be modified using BaseChart.setNumberFormat.

[d]

textasciitilde ' for no negative sign character. The default is '-', which can be modified using BaseChart.setNumberFormat.

The negative sign character. Use '

Parameter	Description
yyyy	The year in 4 digits (e.g. 2002)
yyy	The year showing only the least significant 3 digits (e.g. 002 for the year 2002)
yy	The year showing only the least significant 2 digits (e.g. 02 for the year 2002)
y	The year showing only the least significant 1 digits (e.g. 2 for the year 2002)
mmm	The month formatted as its name. The default is to use the first 3 characters of the english month name (Jan, Feb, Mar ...). The names can be configured using BaseChart.setMonthNames.
mm	The month formatted as 2 digits from 01 - 12, adding leading zero if necessary.
m	The month formatted using the minimum number of digits from 1 - 12.
MMM	The first 3 characters of the month name converted to upper case. The names can be configured using BaseChart.setMonthNames.
MM	The first 2 characters of the month name converted to upper case. The names can be configured using BaseChart.setMonthNames.
M	The first character of the month name converted to upper case. The names can be configured using BaseChart.setMonthNames.
dd	The day of month formatted as 2 digits from 01 - 31, adding leading zero if necessary.
d	The day of month formatted using the minimum number of digits from 1 - 31.
w	The name of the day of week. The default is to use the first 3 characters of the english day of week name (Sun, Mon, Tue ...). The names can be configured using BaseChart.setWeekDayNames.
hh	The hour of day formatted as 2 digits, adding leading zero if necessary. The 2 digits will be 00 - 23 if the 'a' option (see below) is not specified, otherwise it will be 01 - 12.
h	The hour of day formatted using the minimum number of digits. The digits will be 0 - 23 if the 'a' option (see below) is not specified, otherwise it will be 01 - 12.
nn	The minute formatted as 2 digits from 00 - 59, adding leading zero if necessary.
n	The minute formatted using the minimum number of digits from 00 - 59.
ss	The second formatted as 2 digits from 00 - 59, adding leading zero if necessary.
s	The second formatted using the minimum number of digits from 00 - 59.
a	Display either 'am' or 'pm', depending on whether the time is in the morning or afternoon. The text 'am' and 'pm' can be modified using BaseChart.setAMPM.

Shape Id	Value	Description
SquareShape	1	Square shape. See (1, 1) above.
DiamondShape	2	Diamond shape. See (2, 1) above.
TriangleShape	3	Triangle shape pointing upwards. See (3, 1) above.
RightTriangleShape	4	Triangle shape pointing rightwards. See (4, 1) above.
LeftTriangleShape	5	Triangle shape pointing leftwards. See (5, 1) above.
InvertedTriangleShape	6	Triangle shape pointing downwards. See (1, 2) above.
CircleShape	7	Circle shape. See (2, 2) above.
StarShape	[Method]	Star shapes of various points. See (2, 3), (2, 4), (2, 5), (3, 1), (3, 2), (3, 3), (3, 4), (3, 5) above for stars with 3 to 10 points.
PolygonShape	[Method]	Polygon shapes symmetrical about a vertical axis with a vertex at the top center position. See (4, 1), (4, 3), (4, 5), (5, 1) for polygons of 5 to 8 sides.
Polygon2Shape	[Method]	Polygon shapes symmetrical about a vertical axis but without any vertex at the top center position. See (4, 2), (4, 4) for polygons of 5 and 6 sides.
CrossShape	[Method]	'+' shapes. See (5, 2), (5, 3), (5, 4), (5, 5), (6, 1), (6, 2), (6. 3) for '+' shape with arm width of 0.1 - 0.7.
Cross2Shape	[Method]	'X' shapes. See (6, 4), (6, 5), (7, 1), (7, 2), (7, 3), (7, 4), (7, 5) for 'X' shapes with arm width of 0.1 - 0.7.

Nan	Meaning
1	Invalid square root (negative number, usually)
2	Invalid addition (indeterminate such as infinity + (-infinity))
4	Invalid division (indeterminate such as 0/0)
8	Invalid multiplication (indeterminate such as 0*infinity)
9	Invalid modulo such as (a mod 0)
17	Try to convert invalid string to a number like val(”x7”)
33	Invalid argument in a trig function
34	Invalid argument in an inverse trig function
36	Invalid argument in a log function
37	Invalid argument in Pow function
38	Invalid argument in toolbox financial function
40	Invalid argument in hyperbolic function
42	Invalid argument in a gamma function

Symbol	Description and result
0	Digit placeholder. For example, if the value 8.9 is to be displayed as 8.90, use the format #.00
#	Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the application shall not display extra zeros when the number typed has fewer digits on either side of the decimal than there are # symbols in the format. For example, if the custom format is #.##, and 8.9 is in the cell, the number 8.9 is displayed.
?	Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the application shall put a space for insignificant zeros on either side of the decimal point so that decimal points are aligned in the column. For example, the custom format 0.0? aligns the decimal points for the numbers 8.9 and 88.99 in a column.
. (period)	Decimal point.
%	Percentage. If the cell contains a number between 0 and 1, and the custom format 0% is used, the application shall multiply the number by 100 and adds the percentage symbol in the cell.
, (comma)	Thousands separator. The application shall separate thousands by commas if the format contains a comma that is enclosed by number signs (#) or by zeros. A comma that follows a placeholder scales the number by one thousand. For example, if the format is #.0,, and the cell value is 12,200,000 then the number 12.2 is displayed.
E- E+ e- e+	Scientific format. The application shall display a number to the right of the "E" symbol that corresponds to the number of places that the decimal point was moved. For example, if the format is 0.00E+00, and the value 12,200,000 is in the cell, the number 1.22E+07 is displayed. If the number format is #0.0E+0, then the number 12.2E+6 is displayed.
$ -+/():space	Displays the symbol. If it is desired to display a character that differs from one of these symbols, precede the character with a backslash (\). Alternatively, enclose the character in quotation marks. For example, if the number format is (000), and the value 12 is in the cell, the number (012) is displayed.
\	Display the next character in the format. The application shall not display the backslash. For example, if the number format is 0\!, and the value 3 is in the cell, the value 3! is displayed.
*	Repeat the next character in the format enough times to fill the column to its current width. There shall not be more than one asterisk in one section of the format. If more than one asterisk appears in one section of the format, all but the last asterisk shall be ignored. For example, if the number format is 0*x, and the value 3 is in the cell, the value 3xxxxxx is displayed. The number of x characters that are displayed in the cell varies based on the width of the column.
_ (underline)	Skip the width of the next character. This is useful for lining up negative and positive values in different cells of the same column. For example, the number format _(0.0_);(0.0) aligns the numbers 2.3 and -4.5 in the column even though the negative number is enclosed by parentheses.
"text"	Display whatever text is inside the quotation marks. For example, the format 0.00 "dollars" displays 1.23 dollars when the value 1.23 is in the cell.
@	Text placeholder. If text is typed in the cell, the text from the cell is placed in the format where the at symbol (@) appears. For example, if the number format is "Bob "@" Smith" (including quotation marks), and the value "John" is in the cell, the value Bob John Smith is displayed.
